## FOREWORD

This is the second revision of the ETDE/INIS Joint Thesaurus, including all updates up to September 2006. It contains 21 147 valid descriptors and 9 114 forbidden terms.

The Joint Thesaurus contains the controlled terminology for indexing all information within the subject scopes of the International Nuclear Information System (INIS) and the Energy Technology Data Exchange (ETDE). The terminology is intended for use in subject descriptions for input or retrieval of information in these systems.

The basic terminology in this thesaurus goes back to the 1969 edition of the EURATOM Thesaurus. The structure subsequently given to that terminology was the result of a systematic study performed by INIS subject specialists. Further expansion of the thesaurus terminology was done by ETDE to incorporate information on all forms of energy.

The ETDE/INIS Joint Thesaurus is the result of continued editing, carried out in parallel to the processing of the INIS and ETDE databases. Any suggestions for improvements to the present document are welcome. Comments should be sent to either the INIS or the ETDE Thesaurus Specialist at the following contact addresses:

### ***About ETDE***

The Energy Technology Data Exchange (ETDE) is a consortium of countries that share energy science and technology information through ETDE's Energy Database and ETDE World Energy Base (ETDEWEB). ETDE was established as an Implementing Agreement in 1987 under the auspices of the International Energy Agency (IEA); it collaborates with other IEA entities as appropriate. A current list of ETDE member countries may be found at <http://www.etde.org/organization.html>. ETDEWEB is accessible to persons in ETDE member countries and approved developing countries at <http://www.etde.org/etdeweb/>.

ETDE's focus is to cover subjects of interest to the IEA and ETDE's international audience of database users. The information covered includes such important topics as environmental aspects of energy production, consumption, and use; energy efficiency and conservation; energy policy; renewable energy sources; end-use technology; fusion, fossil, and nuclear energy; and advanced energy systems. Coverage also includes the basic sciences that support energy R&D, such as aspects of chemistry, engineering, environmental sciences (with emphasis on global climate change), physics, biomedical sciences, materials science, computer science, mathematics, and instrumentation related to energy technology.

Printed copies of the Joint Thesaurus are available only from the INIS sources listed on the following page. ETDE will no longer provide printed copies, but users may contact the ETDE Operating Agent if assistance or advice is needed.

### ***About the IEA***

When the International Energy Agency (IEA) was founded in 1974, the main objective of its member countries (26 as of 2006) was to reduce dependence on imported oil through the development of alternative sources while improving energy efficiency. More recently, concerns such as greenhouse gas emissions and globalization have underlined the need for international co-operation. For more than 30 years, technology collaboration has been a fundamental building block among IEA Member and non-member countries in facilitating progress of new or improved energy technologies. There are currently 40 Implementing Agreements in the areas of fossil fuels, renewable energies and hydrogen, end-use (buildings, industry and transport), fusion and cross-sectional activities. For more information see <http://www.iea.org>.

## AVAILABILITY TO INIS USERS

### *About INIS*

INIS, the International Nuclear Information System, is the world's leading information system on the peaceful uses of nuclear energy. INIS is operated by the International Atomic Energy Agency (IAEA) in collaboration with its Member States and cooperating international organizations. INIS was established in 1970, and since then has been successfully fulfilling its mission to create a reservoir of nuclear information for current and future generations; provide quality nuclear information services to Member States, and assist with the development of a culture of information and knowledge sharing. INIS processes most of the world's scientific and technical literature on a wide range of subjects from nuclear engineering, safeguards and non-proliferation to applications in agriculture and health. The subject scope was developed to respond to the information needs of the international community in the areas of the IAEA's interests and activities covering the peaceful uses of nuclear science and technology. For more information see <http://www.iaea.org/inisnkm>.

### *About the IAEA*

The International Atomic Energy Agency (IAEA) is the world's intergovernmental forum for cooperation in the peaceful uses of nuclear energy. It was founded in 1957 in accordance with a decision of the General Assembly of the United Nations. Its Statute states that "The Agency shall seek to accelerate and enlarge the contribution of atomic energy to peace, health and prosperity throughout the world. It shall ensure, so far as it is able, that assistance provided by it or at its request or under its supervision or control is not used in such a way as to further any military purpose."

## PREFACE

“A thesaurus is a terminological control device used in translating from the natural language of documents, indexers or users into a more constrained ‘system language’ (document language, information language)”. It is also “a controlled and dynamic vocabulary of semantically and generically related terms which covers a specific domain of knowledge”. The Joint Thesaurus fits this definition adopted by UNESCO.<sup>1</sup>

The domain of knowledge covered by the Joint Thesaurus includes physics (in particular, plasma physics, atomic and molecular physics, and especially nuclear and high-energy physics), chemistry, materials science, earth sciences, radiation biology, radioisotope effects and kinetics, applied life sciences, radiology and nuclear medicine, isotope and radiation source technology, radiation protection, radiation applications, engineering, instrumentation, fossil fuels, synthetic fuels, renewable energy sources, advanced energy systems, fission and fusion reactor technology, safeguards and inspection, waste management, environmental aspects of the production and consumption of energy from nuclear and non-nuclear sources, energy efficiency and energy conservation, economics and sociology of energy production and use, energy policy, and nuclear law.

The terms in the Joint Thesaurus are listed alphabetically. For each alphabetical entry, a “word block”, containing the terms associated with this particular entry, is displayed. In the word block, terms that have a hierarchical relationship to the entry are identified by the symbols **BT** for *Broader Term*, and **NT** for *Narrower Term*; a term with an affirmative relationship is identified by **RT**, for *Related Term*; terms with a preferential relationship are identified by **USE** or **SEE**, and **UF** for *Used For*, and **SF** for *Seen For*. In case of multiple **USE** relationships for a forbidden term, **all** listed descriptors should be used to index or search a given concept. In case of multiple **SEE** relationships, **one or more** of the listed descriptors should be considered for indexing or searching this concept.

A non-descriptor may refer to a descriptor that has *Narrower Terms*. Users of the Joint Thesaurus should always refer to the word block of that descriptor, to ensure that the most specific term is chosen. For all terms, only one level of *Broader Terms* is shown. If terms have additional levels of broader terms, e.g. **BT2**, **BT3**, etc., this is indicated by an asterisk, e.g. **\*BT1**. Up to ten levels of *Narrower Terms* are shown for all terms. If terms have additional levels of narrower terms, such as **NT11**, **NT12**, etc., this is indicated by an asterisk, e.g. **\*NT10**.

The dates printed after each descriptor indicate when the term was introduced in either the ETDE or the INIS database and hence its earliest usage in the respective data base. If only one date is given, the descriptor was introduced in both databases at the same time. If the descriptor is **not** followed by a date, it already existed in the thesaurus **before 30 June 1975**. In April 2000, a major addition of terminology to the INIS Thesaurus was made, by including new terms from the ETDE Thesaurus. These terms can be identified by the INIS date (Apr 2000). When searching for entries in the alphabetic listing, users should take note of the following sort order:

- comma “,”
- dash “/”
- space “ ” and hyphen “-“
- Arabic numerals 0-9
- Roman alphabet A-Z

Numbers, which include single and multiple digits, are sorted by the initial digit first, e.g. the isotopes BORON 10 and BORON 19 appear before BORON 7 and BORON 9. In the same way, RUTHENIUM 100 appears before RUTHENIUM 88. All terms, in which the first character is a number, appear before the letter A.

Additions and changes to the vocabulary of controlled terminology in the current Thesaurus revision are summarized in cumulative monthly updates. They are available from the INIS Members Area on the INIS and NKM website and the ETDE website. These updates include the first-level broader terms, related terms, scope notes for the new descriptors, and the descriptor(s) to be used for each new forbidden term. Since the updates are cumulative, new changes in any update are marked with an arrow for easy recognition. In addition, the final update to the previous Thesaurus revision is available from the INIS Members Area web page and the ETDE web site. This update contains all changes to the previous revision, as implemented in the current version of the Joint Thesaurus.

INIS: 1980-07-24; ETDE: 1979-09-26

This method uses simple chemical oxidation and reduction reactions to simultaneously deacid and pulverize spent fuel, release the volatile fission products, and restore the fuel to the proper form for refabrication and recycle. This method is highly proliferation resistant.

1996-10-23

(Prior to March 1997

DIPHENYLCARBAZONES was a valid

ETDE descriptor.)

UF diphenylcarbazones

\*BT1 carbonic acid derivatives

\*BT1 organic nitrogen compounds

NT1 dithizone

**CARBENES**

INIS: 1983-02-03; ETDE: 1978-03-03

*Organic radicals containing divalent carbon as CH<sub>2</sub>, CHO<sub>H</sub>, CHF, etc.*

**CEA-ADL DUAL ALKALI PROCESS**

INIS: 2000-04-12; ETDE: 1978-06-14

Flue gas is passed through an absorption section where sulfur dioxide, chlorides, and sulfur trioxide are removed via contact with a solution of sodium salts. The sodium/sulfur salts are reacted with hydrated lime in a special 2-stage reactor to regenerate the sodium. Calcium/sulfur solids produced are separated from the liquor containing regenerated sodium compounds and disposed of. The regenerated liquor is recirculated to the absorption section.

**CHROMIUM-MOLYBDENUM STEELS**

1994-09-30

Steels containing Cr and Mo as main alloying elements; Cr content is higher than Mo content.

(Until November 1983 this was a valid descriptor. From November 1983 until September 1994 the concept was indexed to CHROMIUM ALLOYS, MOLYBDENUM ALLOYS and the most specific appropriate term from the STEELS hierarchy.)

## COALCON PROCESS

INIS: 2000-04-12; ETDE: 1975-11-28

*Low-temperature, intermediate-pressure process for hydrocarbonization of finely divided low-rank coal or high-boiling tars in a fluidized bed to produce chars, tars, and gases. It was originally designed for a subbituminous coal having high tar and potentially high phenolic yields during carbonization, but it is currently being developed for high-sulfur, high-volatile bituminous coals.*

**EXXON GASIFICATION PROCESS**

INIS: 2000-04-12; ETDE: 1976-09-14  
*Coal is reacted with steam in a fluidized-bed gasifier at 1500-1700 degrees F. To provide the necessary heat, a stream of circulating char is withdrawn from the gasifier and partially burned with air in a char heater to raise its temperature. The heated char is returned to the gasifier after separation from the flue gas. The product gas is a medium-btu gas suitable for methanation to sng.*

**EXXON LIQUEFACTION PROCESS**

INIS: 2000-04-12; ETDE: 1976-09-14  
*Crushed coal is slurried with a recycle solvent, preheated to about 800 degrees F, and then pumped into the liquefaction reactor operating at about 2,000 P.S.I. Preheated hydrogen is also added to the reactor. The product from the liquefaction reactor is sent to the separation step where gas, naphtha, recycle solvent, distillate, and heavy bottoms are separated by distillation.*
