**DEPARTMENT OF TRANSPORTATION AND RE-
LATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2000**

TUESDAY, DECEMBER 14, 1999

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met, at 2 p.m., in the Z.J. Loussac Library,
Assembly Chamber, Anchorage, AL, Hon. Ted Stevens presiding.

Present: Senator Stevens.

Also present: Representative Don Young.

**OVERSIGHT HEARING ON ALASKA AVIATION ISSUES FOR
THE 21ST CENTURY**

FEDERAL AVIATION ADMINISTRATION

**STATEMENT OF PATRICK N. POE, REGIONAL ADMINISTRATOR, ALAS-
KA REGION**

NONDEPARTMENTAL WITNESSES

STATEMENT OF:

**PAUL BOWERS, ALASKA DEPARTMENT OF TRANSPORTATION, DI-
RECTOR, STATEWIDE AVIATION**

**MORTON V. PLUMB, JR., DIRECTOR, ANCHORAGE INTERNATIONAL
AIRPORT**

**JAMES D. LABELLE, CHIEF, ALASKA OFFICE, NATIONAL TRANS-
PORTATION SAFETY BOARD**

RICHARD HARDING, PRESIDENT, PENINSULA AIRWAYS

**TOM WARDLEIGH, PRESIDENT, ALASKA AVIATION SAFETY FOUN-
DATION**

FELIX MAGUIRE, PRESIDENT, ALASKA AIRMEN'S ASSOCIATION

KEN ACTON, AVIATION CONSULTANT

OPENING STATEMENT OF SENATOR TED STEVENS

Senator STEVENS. Thank you, Congressman Young, for joining us. I know that you have a great interest in aviation also. I am sort of singing to the choir, but we all know that no other State is more dependent on aviation than Alaska is, with 70 percent of our communities accessible only by air. Alaskans count on aircraft to deliver supplies, food and medicine. They are crucial to evacuation of the ill and injured.

And I think the people that live in the Lower 48 have a hard time grasping the concept that we use aircraft as they use almost

every other form of transportation—cars, buses, and trucks. Aircraft cover the whole spectrum of transportation.

And I am pleased to see you here, Tom. This summer, Tom Wardleigh took me back 50 years and helped me renew my pilot's license and helped me get a float plane license, so it is good to see you here, my friend. As president of the Alaska Aviation Safety Foundation, I know you are deeply committed to the goals that we are trying to pursue here.

I chair the Senate Appropriations Committee, and I am also on the Aviation Subcommittee of the Senate Commerce Committee. Very soon, my good friend and colleague here, Congressman Don Young, will chair the House Transportation and Infrastructure Committee. This will give us, I think, the first time in history where we have such a complete coverage of all of the facets of the legislative process of our national government that affect aviation. The two of us, like all of you, are deeply committed to improving aviation safety in Alaska.

PREPARED STATEMENT

I have a longer opening statement, incidentally, to print in the record, but that is my opening statement for today. I want to thank all of you for coming and give Congressman Young a chance to make an opening statement if he wishes to make one.

[The statement follows:]

PREPARED STATEMENT OF SENATOR TED STEVENS

Good afternoon everyone. I'm pleased to see such a fine panel representing Alaska aviation today. As you know, we're here to discuss aviation issues facing us in the new millennium. Your complete prepared statements will be made part of the record, each of you will get five minutes to summarize your statements, and then we should have some time left over for questions.

Let me begin by stating the obvious: There is not another state in the Union more dependent on aviation for its way of life than Alaska. Let me repeat that—There is no other state in the Union more dependent on aviation than Alaska.

More than 70 percent of our 300 plus communities are accessible only by air. Alaskans in those communities count on aircraft to deliver mail, supplies, food, and medicine. When someone in a remote village becomes too ill to be treated locally, evacuation by air becomes a matter of life or death. People who live in the lower 48 have a hard time grasping that concept. They don't understand that we use small airplanes like they use buses and taxis. They have highways—we use skyways. Alaska has the highest per capita aircraft ownership in the country. In relation to its population, Alaska has more flights, by far, than any other state. Frank, Don and I spend a lot of time trying to convince our colleagues that Alaska requires special consideration when it comes to aviation legislation and funding. We've been fairly successful in that endeavor—but we cannot afford to stop educating others on the special reliance Alaska has on aviation.

Flying is an inherently dangerous occupation made relatively safe through technology innovations, the world's best air traffic control system and, most important, well-trained, experienced pilots. For safe air transport, we need excellence in all three areas—the machine, the pilot, and ground support.

We need to redouble our efforts to procure and deploy safety enhancing equipment and weather reporting capabilities. We have some of the roughest terrain and weather in North America. The vast majority of our low altitude airspace is not radar monitored. Most of our intrastate air traffic takes place below 10,000 feet. And the planes we fly are, on average, older than most planes flown in the lower 48. Does this mean we cannot improve aviation safety in Alaska? The answer is, "No." We can—and must—continue to improve aviation safety. Every one of us participating in this hearing today can make a positive impact on aviation safety.

That is why we're here today—to talk about where we want to be ten, twenty,, or even a hundred years from now. All of you work in the aviation community every day. Some of you, like me, are licensed pilots—so your commitment to improving

how we fly in Alaska is personal. I see my good friend Tom Wardleigh at the witness table. He helped me get my float plane license last summer. As president of the Alaskan Aviation Safety Foundation, Tom is deeply committed to improving aviation safety.

I chair the Senate Appropriations Committee and sit on the Aviation Subcommittee of the Senate Commerce Committee. Soon, Congressman Young will chair the House Transportation and Infrastructure Committee. Senator Murkowski chairs Energy and Natural Resources. All of us are deeply committed to improving aviation safety in Alaska. Most states have a heck of a lot more than three legislators fighting for their interests. But I'll tell you, when Frank, Don and I get together—the “three amigos” can more than hold our own in pursuing Alaska's interests.

We can fight the broad aviation policy battles in Washington—making sure our government recognizes and honors Alaska's unique aviation needs. We can also work to maximize federal funding for Alaska aviation. But nothing we do can really make a difference without the mutual cooperation and commitment of the people in this room and throughout the aviation community in Alaska.

Safety improvements are not borne of increased regulation. Some people in this room, maybe on this panel, may not agree with me on this. But I know, personally, that Alaska has some of the finest pilots in the world. Our job is to provide the best possible environment for them to practice their essential profession.

I hope our discussion here today is a step toward improving that environment and the air transportation system that is so critical to Alaska's future.

STATEMENT OF HON. DON YOUNG

Mr. YOUNG. Thank you, Senator, and I have a written statement that will be submitted for the record, without objection. My interest, as the Senator has mentioned before, is the safety factor, but also the capability of our Alaskans to travel without a great deal of hindrance, to arrive at their destinations on time, and to make sure that we will be able to improve the capability of the FAA and the runways, the lighting system, navigation systems, and to make it safe and practical for every Alaskan that participates in air transportation.

It is my vision that we will improve these airports, that we will be able to solve many of these problems in the future. I will say that there are many different feelings about this issue. Everyone seeks safety. I know that, and there are some who believe that we are doing everything possible.

The air transportation industry, which employs over 10,000 people in this State, is one of the largest employers in the State of Alaska. We want to allow the aviation industry, to continue growing and improving service without any undue hardships, and yet do it safely. It is going to be my goal to see that this will be achieved.

PREPARED STATEMENT

Thank you, Senator, for having this hearing. I think it will be important. We have two panels, I believe, and we will hear from the expertise in that field, and with that I am ready to do business. [The statement follows:]

PREPARED STATEMENT OF CONGRESSMAN DON YOUNG

Chairman Stevens—thank you for the opportunity to participate in this hearing. I'll keep my remarks brief.

Every Alaskan knows aviation plays a major role in Alaska. Without a major road system only 100 of Alaska's 300 communities can be served by road. With over 1,100 airstrips and airports and more than 9,700 registered aircraft and 10,605 pilots, it is easy to understand how vital aviation is to Alaska. Further, because of Alaska's

distinct geographic location between Europe and Asia, Anchorage International Airport lands more freight than any other airport in the nation. Fairbanks International is also becoming a player in the cargo arena. It is also a well recognized fact that Alaska's air transport industry provides over 10,000 aviation related jobs.

The average Alaskan flies nine times a year, compared to the average American, who flies twice a year. This brings me to an issue I have a great interest in—aviation safety. According to the General Accounting Office, the number of people using the airways will grow to over a billion by 2002. With that many people in the air, it is crucial that we continue to modernize our air traffic control systems. In Alaska that means making the investment at small, rural airports with the installation of runway lighting, runway lengthening and paving, accurate weather reporting and modern communications systems.

Nationally, the U.S. Air Traffic Control System remains one of the top systems in the world. Unfortunately, the FAA's current modernization program has experienced cost overruns and schedule slippages which have caused delays with implementation. Congress will address this and other issues when it returns next year.

Although there are other equally important issues, I want to conclude my statement with the subject of funding. The resources to upgrade safety and make airport improvements exists.

How much is actually needed and how to spend taxpayers money are issues that Congress will need to resolve next year. It is my position that all Americans deserve safe and affordable air travel, and that taxpayers are provided with a healthy return on their investment.

Thank you Senator Stevens for the opportunity to speak on these important issues and I look forward to hearing the testimony of the witnesses.

Senator STEVENS. Thank you very much. My staff has prepared a short handout for all of you. I do not know if you have got a copy of it, but I want to point out the statement that is in there that last month I met with Linda Rosenstock, who is Director of the National Institute of Safety and Health, and the Director of the Alaska Office, George Conway, to discuss ways to enhance aviation safety in Alaska.

Linda has agreed to focus on recommendations of Jim Hall from the National Transportation Safety Board. He came here last August to help us find ways to improve aviation safety, and he brought back a series of recommendations, including a proposal for an industry-guided initiative to reduce accidents and fatalities, focusing on voluntary compliance.

Congress has agreed to my request to make additional resources available to Dr. Rosenstock, as well as the FAA and NTSB, to further the study, so we look forward to the witnesses today telling us what they think about that study, and what we ought to do to concentrate our total efforts on aviation safety.

[The information follows:]

ALASKA'S AVIATORS

As a lifelong pilot, safety has always been number one on my flight checklist, both in the cockpit and in the Congress. In August, Jim Hall, Chairman of the National Transportation Safety Board, came to Alaska to find ways to improve aviation safety in Alaska. He came back to Washington with recommendations including a proposal for an industry-guided initiative to reduce accidents and fatalities focusing on voluntary compliance rather than new government regulations.

Below is a short summary of some of the safety initiatives Congress funded this year along with other projects of interest to the aviation industry in our state.

If you have questions about any of these provisions, you may call my chief of staff, Mitch Rose, at 202-224-3004 or any of my Alaska offices located in Anchorage, Fairbanks, Ketchikan, Wasilla, and Kenai. My Washington office is open until 7:00 p.m. Eastern Standard Time (3:00 p.m. Alaska Standard Time) for your convenience.

AVIATION SAFETY INITIATIVE

Last month I met with Linda Rosenstock, Director of the National Institute of Occupational Safety and Health and the director of the Alaska office, George Conway, to discuss ways to enhance aviation safety in Alaska.

She agreed to focus on the recommendations of Jim Hall and to pursue a voluntary effort with Alaska's air carriers, pilots, and taxi services. A similar approach has dramatically reduced accidents in the fishing and logging industries and has all but eliminated occupational fatalities in what were the two most dangerous occupations in the nation. Congress agreed to my request to make additional resources available to Dr. Rosenstock as well as to the FAA and the NTSB.

MIKE-IN-HAND

Many remote village airports have no automated weather reporting equipment or FAA weather personnel. As a result, pilots must rely on dated weather forecasts rather than real-time field observations.

Under a new federal program called "Mike-in-hand," any airport with regular, part time, or contract employees will be able to report weather conditions directly to inbound pilots via VHF radio. At my request, sufficient funds were provided to acquire the necessary equipment, train personnel, and initiate the program.

MOUNTAIN PASS CAMERAS

At last year's mini-conference, a number of pilots indicated that remote video cameras were a valuable flight tool.

Through a new NTSB-recommended initiative, cameras will now be placed in dangerous mountain passes where weather conditions change rapidly. The cameras will provide real-time color weather pictures to pilots who can make the decision on whether to fly through a pass without having to go in to take a look. This will reduce the risks that pilots face.

ST. GEORGE INSTRUMENT LANDING

No longer will pilots be locked out of St. George Island for weeks at a time because weather is below NDB minimums. By the end of next year, the FAA will finally have an ILS in place at St. George. Congress agreed to fund the plan this year.

AUTOMATED SURFACE OBSERVING SYSTEM

Funding was provided to continue this project.

JUNEAU WEATHER RESEARCH

Additional funding was made available at my request to continue weather research on turbulence and wind shear at Juneau International Airport. This project is a continuation of a multi-year effort initiated in response to several weather related mishaps in Juneau.

ALASKA CAPSTONE

This program, which will install state of the art cockpit upgrades for participating aircraft, along with airport, communication and GPS modernization throughout the Bethel region, is the test bed for the entire nation. When fully operational, CAPSTONE will be an integrated, nonradar, low-altitude, IFIR airspace designed to bring Alaska's airports into the 21st century.

ALASKAN NAS INTERFACILITY COMMUNICATIONS SYSTEM (ANICS)

Congress fully funded this project which integrates interagency communications throughout Alaska.

Senator STEVENS. Our first panel this morning—this afternoon. You know—if it's Tuesday it's Anchorage, right—is Pat Poe, Director of the Alaska Region, Paul Bowers, the Director of Statewide Aviation for the Alaska Department of Transportation, Mort Plumb, Director of Anchorage International Airport, and Jim LaBelle of the National Transportation Safety Board. Gentlemen, you are at your liberty to see who goes first. Do you want to toss

a coin, or proceed in the order I read them? It is all right with me, whatever you want to do.

Thank you for taking the time to be with us. We are, incidentally, going to take this record back. This is an official hearing, and it will be reported to the Appropriations Committee and be part of our consideration of the legislative package for aviation early next year.

So Pat, do you want to go first?

STATEMENT OF PAT POE

Mr. POE. Yes, sir. Thank you, Senator, Congressman, ladies and gentlemen.

At the outset, let me respond, Senator, to your question about my reaction and the FAA reaction to the proposed collective effort of NIOSH, the NTSB and the National Weather Service. I think that study in the background upon which it is based is absolutely excellent. We are eager and more than ready to participate. We have done two other studies earlier, that lend some relationship and support to that, and I think this will be an excellent building block.

If I might just a moment, I was told the light was going to be on. It would give me an indication of when I should talk, and there is no light, so I am not sure if I am ahead of my time.

Senator STEVENS. Well, I decided that you all have been asked to talk about 5 minutes, but I was not going to ring the bell on you, so we turned off the light. Let me make a correction on this hand-out of ours. It is George Conway, not George Newman, and I apologize for that.

But we do hope you will keep it about 5 minutes, but I do not think the time we have that the people are here to listen to it. We want to hear your views about what we can do to assist you to improve aviation safety. That is really our target today.

Mr. POE. Great. Thank you, Senator. Well, let me say this, that in the few minutes that I have I am going to focus on some of the new initiatives, the things that are being done in Alaska. As I think all of you know, we have had a consistently high accident rate, and if we expect something different, I think we have to do something different.

CAPSTONE PROJECT

I want to point out that the items which I will cover are really a product of two things, one, cooperation with our industry, and second the direct support that we enjoy and get from our congressional delegation. The first of the items is the Capstone project, which concentrates in the Yukon-Kuskokwim Delta in the Bethel area, a radius of 200 miles, and we are equipping at Government expense a total of 150 aircraft.

Those aircraft will have, within their cockpits, for the pilot, information as to the moving map of the terrain. It will change colors if the pilot does not have the altitude to clear the obstacle. It will also show the targeting, the position of other similarly equipped aircraft, and in phase 2 of Capstone it is possible to uplink radar images so that you will see all aircraft, not just those that are Capstone-equipped.

It also will uplink weather information. As the aircraft moves, it will downlink its position and potentially in the future be an aid to air traffic control. We have done Indian testing. It takes the generated downlink and through satellite brought it into the Anchorage Center, and it appears on the screen just as though it were a radar-generated target. In the event that there is a mishap, the ability to immediately initiate a very successful and timely search and rescue is made possible by the ground tracking capability associated with this technology.

The University of Alaska here at Anchorage, under contract to the FAA, is doing the training. The first beta training class was conducted the week of December 7. They will also do an evaluation covering 3 years, totally independently of the FAA to determine the beneficial impact of the Capstone project.

If I might say, I think we've come a long way in the 1 year since we first got the appropriation, and it is a project that has been made possible by the very close support of the industry.

WEATHER CAMERAS

I want to talk briefly, too, as to the Alaska weather cameras. I notice this is covered in some of the other information. We have cameras up and operational, four of which belong to the University of Alaska Fairbanks. It was a part of the doctoral program effort. They have asked that we take those cameras, and the reality of the situation, why we are studying it, certainly we will.

With the \$1.7 million that has been appropriated this year, it is feasible by the end of this coming calendar year we will have 25 of these cameras operational. They give you the ability to go on the Internet and see a clear day picture and a current day picture and give the pilot the added information as to whether this is the right time to fly, or perhaps not. It also has an archiving capability, so we can look to see if the weather is worsening or getting better.

The bottom line for all of that is, it is intended to help the pilot make the best possible decision. The user community has identified a total of 50 sites at which they would like to have weather cameras.

Another program in which I personally am more than enthusiastic about, for which the FAA cannot take any credit, is the training of the Alaska Native community to be the future commercial pilots for the State of Alaska. Yute Air, Will Johnson, head division, worked with the Association of Villager Council Presidents, and the Kuskokwim Tribal College at the University of Alaska here at Anchorage.

Students from 14 villages are going through training. Seven of them have their private pilots licenses, and they are now going on to their commercial licenses. There is a grant from the State that is going to continue that program. The FAA presented an award to the president of the Association of Village Council Presidents for that initiative.

ALASKA AIRPORTS

In terms of airports, we have a good story there, and it is a good story that belongs collectively to all of the airport sponsors as well as the FAA Airport Division. If you go back to about 1990, the AIP

grants were about \$50 million. For the past 2 years it exceeded \$80 million. During this decade, \$3 to \$4 billion have gone toward improvement, and working with the community, the Airports Division has developed a regional airport plan.

I do not want to leave without acknowledging the ongoing infrastructure effort. A great many of the people of the FAA in the State of Alaska worked daily to keep the current systems as active and robust and growing as is possible. An example of that might be that every year we initiate about 120 new projects. In 1997, we have 40 weather-reporting sensor stations. Today, we have 87, more than doubled.

With 17 days left until the year 2000, I am pleased to report that in June the FAA was judged to be Y2K-compliant. I want to acknowledge the close relationship we have enjoyed with the State, and also with the DOT, which has declared the airports under its control Y2K-compliant. Certainly we are going to have a lot of people working over New Year's, and I will be one of them, just to be there, just in case, but we have a high confidence that comes from working together.

PREPARED STATEMENT

So in closing, this is the end of my first year in the State of Alaska, and it has been terrific. It is a warm community. There are no bashful pilots in the State of Alaska, so you certainly get to know their thoughts quickly.

With that, that concludes my statement. Thank you.
[The statement follows:]

PREPARED STATEMENT OF PATRICK N. POE

Senator Stevens and Congressman Young. Good Afternoon. I am Patrick Poe, the Federal Aviation Administration's ("FAA") Regional Administrator for the Alaskan Region. I appreciate the opportunity to appear before you today to discuss the status of aviation in Alaska and the many efforts that are under way to improve service to the 10,000 Alaskan pilots, the thousands of passengers and people of Alaska who depend upon aviation.

In my first year as Regional Administrator, I have attended many public meetings and have had numerous conversations with Alaskans across the state. I know that the people here are well informed about the FAA and our basic mission. As Administrator Garvey has repeatedly stated, our first priority is safety. Within Alaska, aviation remains the primary, and in some areas the sole, means of transportation. Increasing the level of safety in Alaska is critically important. We have recently undertaken a number of initiatives to improve the level of safe operations within Alaska. These initiatives include the Capstone program, the Alaska weather camera project, and the investment of millions of dollars from the Airport Improvement Program ("AIP") to improve and develop Alaska's aviation infrastructure. In addition, we have undertaken a number of initiatives that will place Alaska in the forefront of aerospace in the 21st century, most notably, the licensing of the first commercial space launches at Kodiak.

As I stated above, safety remains our top priority. Here in Alaska, we are cognizant of the unique weather and terrain that poses greater challenges to aviation. Indeed, for the past decade, there has been one accident every other day. And there has been an aviation-related fatality every nine days. We were sadly reminded of this by the crash last Tuesday of a plane departing from Bethel where all six persons on board were killed. In light of these statistics, the FAA developed the Capstone project. Capstone is an effort to use new technology to improve safe operations and substantially reduce the number of accidents. Under a contract with UPS Aviation Technologies, the Capstone project will equip up to 150 aircraft with government-furnished Global Positioning System based avionics. Coupled with a ground system of weather observation equipment, Capstone will provide pilots with terrain data and position reports of similarly-equipped aircraft. Capstone will increase the

number of airports served by an instrument approach. We believe that by equipping commercial aircraft in the Yukon-Kuskokwim Delta, an area in western Alaska not covered by radar that was selected for the test, we can make a substantial reduction in accidents.

It is important to note that the Capstone project reflects a real partnership between the FAA and the aviation industry within Alaska. We have had industry user participation throughout the entire design of the project. In addition to UPS Aviation Technologies, we are partnering with the University of Alaska, which is conducting pilot training in the use of the new equipment, and will conduct baseline research for use in measuring project results.

Another exciting program that is up and running this year is the Alaska Weather Cam project. This project places video cameras at bush airstrips and other remote locations to provide real time views of landing areas and mountain passes. To date the cameras are in operation at ten locations, four of which were initiated by the University of Alaska at Fairbanks. These cameras offer multiple views at each location, and compare a clear day picture with current conditions. Views are archived for later viewing and to track trends. Pilots can access the views of the landing areas and mountain passes through the FAA's Internet site. Additional funding will permit us to expand the program and install more cameras next year. In the meantime, we are exploring how to better use the visual information in our Flight Service Stations and are considering such issues as liability for interpreting the data to pilots, who ultimately have to make the decision to fly or not.

The Capstone and weather camera initiatives demonstrate that the Alaskan Region is a leader in demonstrating how to use new technologies to improve safety and develop greater efficiencies in the system to take aviation into the 21st century. But that leadership is not limited to commercial aviation. As I noted above, the Alaskan Region is Kodiak launch facility. Kodiak is the first commercial space launch facility to operate outside of a Federal facility. To date there have been two launches and more are anticipated in 2000.

Leading aviation into the 21st century is not limited to improvements in the operational aspects of aviation. The Alaska Region has made tremendous strides in our outreach to the Alaska Native community to educate the community about aviation and to increase awareness of the employment opportunities in the aviation industry here in Alaska. Our aviation education program delivers information and material to village schools as remote as Tununak. We support the cooperative effort of the Kuskokwim Tribal College, Yute Air and the University of Alaska to train Alaskans as pilots.

This outreach activity ties in with our safety initiatives because we believe that people who live here and understand the geography and climatic conditions will make better pilots in the long run. At present, Alaska does not produce enough of its own pilots to staff the industry so carriers must hire pilots from the lower 48. Very often, those pilots work a few years here in Alaska, build hours and leave, and the cycle starts over again. As a result of this summer's program, seven Alaskan Natives obtained their pilot's licenses and several are working toward commercial ratings. I was very pleased to be able to personally, recognize the work of one of the sponsors of the program, the Association of Village Council Presidents, at this year's Alaska Federation of Natives convention.

In addition to improving safety in the air, the FAA's Airport Improvement Program is critical to improving the airport infrastructure throughout Alaska. The AIP program, which was funded for fiscal year 1999 at \$1.95 billion, provides funding to communities nationwide for critical infrastructure projects. Since 1990, annual AIP grants to Alaska have increased from approximately \$50 million to \$80 million. While some may not understand why Alaska should garner such amounts, you here know that we are a young state just developing the airport infrastructure that is essential for both air commerce and aviation safety. Our Airports Division, working with the sponsors such as the State of Alaska Department of Transportation and Public Facilities, developed a regional airports plan that addresses the needs for expanded runways, lighting and safety features. One of the most significant projects is the expansion and renovation of Anchorage International Airport. We were able to support the project with a letter of intent ("LOI") for future federal funding in the amount of \$48 million that enabled the State to proceed with bonding.

The AIP program is just one aspect of the investment FAA continues to make in terms of navigation aids, communications systems and other facilities. Our construction program includes approximately 120 projects annually. Overall the region's total budget last year including AIP grants, construction, personnel and operating costs equaled \$270 million.

Finally, I would like to note that we are now just 17 days away from the Year 2000. As you know, the FAA systems were deemed compliant in June. We in the

Alaska Region want to take this opportunity to express our appreciation for the cooperation of the State of Alaska and other governmental agencies and businesses with whom we have conducted Y2K exercises and discussed contingency plans. I assure you that the Region will be monitoring events December 30 through January 2 with additional personnel on the job.

In closing, I wish to thank each of you for your support of the FAA in Alaska. Our challenge here is very different from that of the agency in other regions of the country. We know that Alaskans are especially dependent upon aviation and we are committed to maintaining the best and safest system we can in partnership with the aviation community. I look forward to working with you on these and future projects within Alaska.

This concludes my prepared statement. I would be pleased to answer any questions that you may have.

Senator STEVENS. Thank you very much. Paul, do you want to go next?

STATEMENT OF PAUL BOWERS

Mr. BOWERS. Thank you, Senator. Good afternoon, and thank you for the opportunity to address this forum on Alaska aviation issues. There are three primary points I would like to speak to. The first one is the deficiencies in our rural Alaska airport system.

As you noted, we have an extensive aviation program here that is very dependent, that the communities are very dependent on for transportation. But unlike the rest of the country, where the airport infrastructure is relatively mature, where well-established, long, lighted, paved runways are commonplace, Alaska has a relatively immature airport infrastructure, where ours are typically rough-surfaced, short, and unlighted. That creates a bit of a problem when the State is so dependent upon them.

Of the 286 publicly owned, publicly used airports, the DOT operates 262 of them. Of them, 177 are gravel-surfaced, 43 are paved, 42 are float facilities. Of these, 94 are 3,000 foot in length or less, and 42 are less than 2,000 foot. IFR-capable airports are also in short supply, with only 61 of the 262 IFR capable.

Basically the needs for airport development have far surpassed funding. Even though we have done exceedingly well with AIP funds in recent years, we have needs that far exceed the supply. Historic AIP levels still leave unaddressed approximately \$265 million in the next 5 years alone of infrastructure that is not being met with the current AIP level.

The second point I would like to note is the FAA national focus on airport safety area improvements, which we believe is detrimental to the runway infrastructure improvements that are actually needed. Briefly, the issue here is the FAA on a national basis prioritizes and allocates AIP dollars for improvements to safety areas, that area that is immediately adjacent to the runway that is brought to grade, free of obstructions, and the purpose of which is to reduce the risk to aircraft in the event of undershoot, or overrun, or some other unplanned excursion from the runway. The relative beneficial use perspective is important here in that the runway is used each and every time for take-off and landing, whereas the safety area is potentially utilized only if there is a problem, and often those problems develop from the runway surface itself.

In the lower 48, where we have got a well-established runway system, a national safety area priority policy does, indeed, make sense. We believe it does not make sense in Alaska, where so many

of our airport runways are substandard. That is the real problem that needs to be addressed here, and we believe this national policy uses up precious AIP dollars that could and should first be used to actually improve the runway surface. We believe this well-meaning but misdirected national priority system needs to be changed, and we would like some relief from that.

The third issue is that DOT supports the 5-year aviation strategic plan that was developed by the Alaska Aviation Coordination Council. That is an ad hoc group of aviation interests, period, that outlined fiscal year 200 through 2004 infrastructure deficiencies and needs and an associated resolution methodology.

The key elements of that that DOT supports are that public owned and used airports should be a minimum of 300 feet in length, if practical, with lights, and have at least some minimal shelter for passengers from inclement weather, that airports with scheduled service should have an all-weather approach and landing capability, that collection and dissemination of weather information should be available State-wide, and that so-called CNS, communication, navigation and surveillance capability, should also be State-wide. That, as Pat Poe noted, would support sufficient routing, traffic, and train avoidance, real-time flight locating, and enhanced search and rescue.

And finally, site-specific operational needs should be addressed, like video cameras and other nontraditional systems to relay mountain pass information and visibility information, for example.

Finally, we note that a lot of the accidents are caused between airports, and that lack of weather data and a lack of communication capability is the real problem. For example, there is no official weather west of Bethel, and coincidentally, or not coincidentally, that is a high accident area of the State. The strategic plan, which is a derivative of the Capstone program, addresses these issues.

PREPARED STATEMENT

DOT also supports expansion of the Capstone program on a State-wide basis, and with those issues, improving our rural airport system, applying FAA or AIP funding to runway improvements first, and supporting the Alaska aviation strategic plan I think will go a long way toward reducing our accident rate and making safer aviation in Alaska.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF PAUL BOWERS

This paper on Alaskan Aviation Issues is submitted as backup to verbal testimony of Paul Bowers, A.A.E., Director, Statewide Aviation, Department of Transportation & Public Facilities (DOT&PF), State of Alaska, before Senator Ted Stevens' Congressional Hearing re Alaskan Aviation Issues for the 21st Century, Loussac Library, Anchorage, AK, December 14, 1999. Issues are set forth as follows:

Deficiencies in Rural Alaska Airport Infrastructure

Unlike the other 49 states, where airport infrastructure is "mature", with well established, long, paved, lighted runways being commonplace, Alaska has a relatively immature airport infrastructure. Here gravel surfaced, short, unlighted airport runways are the norm. Ironically, this is where aviation and an airport system are vitally important. This is because our rural airport system effectively becomes our rural road system, as geographically some 90 percent of Alaska is inaccessible by road, which affects about 30 percent of the state population that has no year round

means of community ingress or egress except by air. That means no emergency medical, no commerce, no transportation link to the rest of the state or the world, except by air. And often that air service is via short, unlighted gravel surface runways.

Specifically, our Alaskan airport infrastructure consists of 286 publicly owned, public use airports, of which the State DOT&PF operates 262. Of these, 177 are gravel surfaces, 43 are paved, and 42 are seaplane basins. 94 airports are less than 3,000 feet in length (and of these, 42 are less than 2000 feet in length!). Most (237 of 262) are non-certificated (meaning they do not meet national airport FAR 139 certification standards that include Airport Rescue and Firefighting [ARFF] equipment and trained personnel; an emergency response plan; and maintenance standards). Additionally, Nav aids are limited; only 61 of 262 state airports are equipped to support Instrument Flight Rule (IFR) usage.

Airport Development money is the missing ingredient to improve this airport infrastructure situation. Historically, the Airport Improvement Program (AIP—which is presently awaiting Congressional action) has provided approximately one half of our continuing airport infrastructure needs. However, that level still leaves airport development needs of approximately \$265 million over the next five years unaddressed. Specific infrastructure deficiencies are defined and attached as part of the below referenced Five Year Plan.

FAA National Priority Focuses on Airport Safety Area Improvements, to the resultant detriment of Alaska Airport Runway Improvements

FAA follows a national policy of prioritizing and allocating AIP dollars for development of airport safety areas whenever any runway development or improvement is undertaken. (The “Safety Area” is that area surrounding the runway on the sides and ends that is brought to grade and free of obstructions, the purpose of which is to reduce risks to aircraft in the event of an undershoot, overrun, or other unplanned excursion from the runway). A relative use perspective is important here: the runway is used for each takeoff and landing, whereas the safety area is potentially utilized only when the pilot using the runway develops a problem, often resulting from activity on the runway.)

In the lower 48 where well established runways are commonplace, this national safety-area-priority policy makes sense. However, it does not make sense in Alaska, where so many of our airport runways are substandard (typically rough surfaced, too short, and unlighted, with minimal nav aids), which is the real airport problem that needs addressing. If the runway length and width were up to reasonable standards, there would likely be less need for the safety area. Please note the DOT&PF is not opposed to Safety Area development. Rather it is a question of timing: DOT&PF fully supports safety area development after the primary issue of fixing poor condition runways is addressed. This FAA national policy uses up precious AIP dollars that could, and should, be used first to actually improve the runway surface. We need specific relief from this well meaning but mis-directed national prioritization policy.

Support for the Five Year Aviation Strategic Plan

The Alaska Aviation Coordination Council, an ad-hoc group of Alaskan aviation interests, has prepared a statement of fiscal year 2000 through 2004 Alaska Aviation infrastructure deficiencies and needs, with associated resolution methodology. The key elements of that plan DOT&PF supports are:

- Publicly owned and used airports should be a minimum of 3, 300 feet in length, with runway lights, and have at least a minimal shelter for passengers from inclement weather.
- Airports with scheduled air service should have an “all weather” approach and landing capability.
- Statewide availability of weather information systems (collection and dissemination).
- Communications, navigation and surveillance (so-called CNS) capability should be available state-wide to support efficient routing, traffic and terrain avoidance, real time flight locating, and enhanced search and rescue. CNS will include both Automated Dependent Surveillance Broadcast (ADS-B) data link and strategically placed radar in the Bethel area.

Statewide availability of Flight Information data that addresses site specific operational needs, such as Video Cameras and other Non-traditional systems (i.e., relay of mountain pass visibility information, VASI in lieu of PAPI light systems, etc.).

The intent of this Strategic Plan is to improve aviation safety in Alaska and literally bring Alaskan aviation into the 21st century. While doing so, it is important to note that the majority of aircraft accidents happen during phases of flight other

than takeoff or landing. If this is to be remedied, the problems causing the accidents need to be addressed.

A recurrent causal theme in Alaskan aviation accidents is lack of weather data and/or lack of communication capability to validate pilot decisions (for example, there is no official weather west of Bethel!). Both of these issues are addressed in the Strategic Plan, which in part is an outgrowth of the FAA Capstone program now underway in the Yukon-Kuskokwim area.

Capstone is a widely supported effort will gain ten much needed AWOS (Automated Weather Observation Station) installations, and Capstone avionics installations will enable weather and communication info transmission to so equipped aircraft, as well as positional awareness and aircraft tracking capability for Search and Rescue purposes. DOT&PF supports expansion of the Capstone program statewide.

Bald Eagles/Aircraft Hazards

Bald eagles nests on airport property near or within the approach and departure ends of runways create safety hazards for both the aircraft and the eagles. The Bald and Golden Eagle Protection Act of 1940 prevents airports and the Fish and Wildlife Service from removing these hazards. Furthermore some nests are in or near trees that violate FAA height restrictions, but the trees cannot be removed or shortened because of the restrictions in this Act.

This Act needs to be amended to allow removal of bald eagle nests in areas that create safety hazards for aircraft. Such amendment could, of course, be specific to Alaska if necessary, as Alaska has many bald eagles and has extensive alternate habitat for these birds.

In summary, we believe much safer aviation in Alaska will result from improving our rural airport system, applying precious AIP funding to runway improvements first, and implementing an Alaska Aviation Strategic Plan. Thank you for the opportunity to explain these aviation infrastructure needs. Attached is a copy of the Alaska Aviation Coordination Council Five Year Strategic Plan. Please advise if any questions or additional information is desired.

ALASKA AVIATION COORDINATION COUNCIL

STRATEGIC PLAN—FISCAL YEAR 2000 THROUGH 2004

Intent

To articulate Alaska Aviation infrastructure deficiencies and needs, and to outline a resolution methodology.

Background

Alaska is unique in lacking highway infrastructure. In a State that literally comprises 16 percent of the total U.S. land mass, only about 10 percent of the State geographically is accessible by road. This forces those non-road accessed communities, comprising 30 percent of the population, to heavily rely on aviation for day sustenance, transportation (schools, work, etc.), and livelihood.

Vision

That Alaska will enjoy an air transportation system that has safe, efficient, and reliable access to population centers and other areas of general and commercial interest. This same transportation system would enhance the health and welfare of residents and visitors alike, while serving as a vehicle for commerce throughout the State.

Discussion

Federal Programs involving disbursement of dollars for transportation normally balance highway and aviation needs. However, in Alaska, environmental, logistical, and financial limitations, preclude highway construction in many areas, forcing transportation requirements to be highly dependent on aviation. As a general rule, highway funding is not available to be used for aviation infrastructure. The resulting imbalance is a transportation infrastructure that is inadequate and unable to provide the safety and efficiency commonly expected of transportation systems in the rest of the United States. No where else in this country is there a complete dependency on aviation for basic transportation and commerce as in Alaska.

A safer airport and aviation infrastructure in Alaska will bring Alaska up to par with other states' basic transportation systems.

Key Elements of a Safe and Efficient Alaskan Air Transportation Infrastructure Include

Publicly owned and used airports should be a minimum of 3,300 feet in length,¹ with runway lights, and have at least a minimal shelter for passengers from inclement weather.

Airports with scheduled air service have an “all weather” approach and landing capability.

Availability of weather information systems (collection and dissemination).

Communications, navigation and surveillance (CNS) capability should be available state-wide to support efficient routing, traffic and terrain avoidance, real time flight locating, and enhanced search and rescue. CNS will include both Automated Dependent Surveillance Broadcast (ADS-B) data link and strategically placed radar in the Bethel area.

Availability of Flight Information data that addresses site specific operational needs, such as Video Cameras and other Non-traditional systems (i.e., relay of mountain pass visibility information, VASI in lieu of PAPI light systems, etc.).

A change of U.S. Postal Service policies to remove pressure on carriers to deliver U.S. Mail within strict time periods without consideration of weather.

Stable (local) aviation work force, including an emphasis on aviation education.

A Standing Aviation Advisory Council to ensure continuous safety and user need assessment and input to ensure effective planning and development.

Comparison of Alaskan Air Transportation Infrastructure to What is Needed

Public airports minimum 3,300 foot length, runway lights, and minimal shelter.—150 Alaska airports are less than 3,300 feet (35 runways less than 2,000 feet). 71 airports unlighted. More than half of rural airports without minimal passenger shelter.

Airports with scheduled air service have an “all weather” approach and landing capability.—176 public use Alaska airports do not have basic instrument approach capability. Weather information, communications capability, and approach procedures are required to support commercial, passenger, and U.S. Mail operations.

Communications, navigation and surveillance (CNS) capability should be available statewide to support efficient routing, traffic and terrain avoidance, real timeflight locating, and enhanced search and rescue.—194 locations in Alaska need CNS capability. Data-link ground stations to provide CNS capability are projected in the Safe Flight 21 budget line items for fiscal year 1902.

Stable (local) aviation workforce.—Alaska currently has a high turnover in the aviation work force. This appears to be due to a combination of factors.

At the entry level, non-local pilots, dispatchers, mechanics and other skilled workers often serve in bush locations while building experience enroute to promotion elsewhere. In turn, their successors are also of non-local origin, because local bush based personnel do not have the entry-level training and skills required for employment in the aviation industry, which training is not readily available in the bush environment. The resulting systemic turnover has historically precluded a stable, experienced workforce, which likely contributed to the higher accident rate associated with rural operations. Local training and aviation-focus educational opportunities can remedy this.

Conversely, at the senior level, imposition of FAR Part 121 rules on historically Part 135 operations, specifically the mandatory retirement at age 60 rule, is forcing experienced and locally knowledgeable airmen into comparatively early retirement. Waiver of the age 60 rule for Alaskan operations would beneficially resolve this.

As a direct result of these two issues, Alaska aviation experience levels are eroded, and aviation safety is significantly and adversely impacted.

Flight Information data needed to address site specific operational needs.—Site specific operational needs can be addressed through non-traditional application of technology, such as Video Cameras in mountain passes to supplement weather (visibility, etc.) information and associated technology to relay such information, improved runway alignment information from older VASI equipment in lieu of newer PAPI approach light systems, etc.

U.S. Postal Service policies pressure carriers to deliver U.S. Mail regardless of weather.—Present system penalizes carriers, by loss of Postal revenue, who do not deliver mail within specific allocated timeframes. U.S. Mail distribution system should be revamped to allow redispach of mail without penalization of carriers who decline to fly in unsafe conditions.

¹Nominal 3,300 foot Runway length, with lights, will accommodate FAA recommended minimum 3,200 foot length for instrument flight operations, plus 100 feet to accommodate terrain and temperature induced density altitude differences at various sites throughout Alaska.

Bethel Radar.—The Capstone program does not currently include radar for the Bethel area, or elsewhere in Alaska. Radar is recommended, initially in Bethel, ultimately elsewhere as needed, as it is necessary to view both the ADS-B equipped and non-equipped aircraft. Capstone will not be able to supply ADS-B equipment for all of the ‘resident’ aircraft flying in the Bethel area, plus other non-ADS-B-equipped aircraft periodically fly in or through the Bethel area. Radar will provide the locations of these non-equipped aircraft to air traffic control, allowing a comparison of the effectiveness of ADS-B to eventually replace radar. The MICRO-EARTS equipment currently used at the Anchorage Air Traffic Control Center has software in the final stages of testing and approval to allow both radar and ADS-B aircraft position reports to be displayed.

Continuous safety and user need assessment to ensure effective planning and development.—Currently, no formal communication mechanism exists between the FAA and the aviation community at large to ensure effective feedback and/or advice in planning programs or resolving issues. Informal processes (i.e., Alaskan Aviation Coordination Council, Capstone industry Council, Weather Enhancement Group, etc.) lack the structure and authority necessary to ensure follow-up and accountability.

Existing legislation empowers the FAA Administrator with authority to waive or modify regulations as necessary to address specific Alaska aviation issues. However, current processes do not provide a widely accepted forum that effectively works towards resolution of such issues. As a result, Alaska specific aviation issues are often worked congressionally prior to sufficient constructive dialogue between FAA and the aviation community. Often this results in a ‘situation’ mentality, wherein issues are not formally addressed or effectively resolved until a crisis level is reached. Multiple examples exist of issues that could have been better addressed through improved communications.

A formal “Alaskan Federal Aviation Advisory Council” to the Alaskan Region FAA, that includes multiple representative elements of the Alaskan aviation community, is recommended to address this communication deficiency.

FIVE YEAR PLAN²

Year 1—fiscal year 2000:

- Establish a formal Alaskan Aviation Advisory Council comprised of the Alaskan aviation industry to assist the Alaskan Region FAA planning efforts.
- Coordination and assessment of Alaska aviation infrastructure needs.
- Phase in (over initial three years) funding of the State Five-Year Airport Capital Improvement Program.
- Establish Alaska site-specific supplemental weather, NAV-aid, and lighting systems operational needs.
- Develop locally available aviation skills training programs.

Year 2—fiscal year 2001:

- Begin airport infrastructure enhancements.
- Develop/Publish GPS approaches.
- Standardize ADS/FIS system design.
- Begin installation of Alaska site-specific supplemental weather, NAV-aids and lighting systems equipment (including Bethel radar).

Year 3—fiscal year 2002:

- Continue airport infrastructure enhancements.
- Flight check & publish approaches.
- Begin ADS-B/FIS equipment installations.
- Continue installation of Alaska site-specific supplemental weather, NAV-aids and lighting systems equipment.

Year 4—fiscal year 2003:

- Continue airport infrastructure enhancements.
- Continue ADS-B/FIS equipment installations.
- Continue weather and lighting systems.
- Expand CNS network to ARTCC and FSSs.

Year 5—fiscal year 2004:

- Complete Five-Year airport infrastructure enhancements.
- Complete ADS-B/FIS equipment installations.
- Complete weather and lighting systems.

²The grand total cost of this five year plan is estimated at \$265,130,000. The most efficient way to complete this five-year program is to receive one-fifth of the funding in each of the next five years, or approximately \$53 million each year. This will allow the project development work and actual construction work to be completed within the target 5 year period.

List of specific infrastructure improvement needs and estimated improvement costs at runways less than 3,300 foot lengths provides detail re above is attached.

AACC FIVE YEAR AVIATION STRATEGIC PLAN

| Community | Existing surface | Existing length | Existing inst. appr. | Total estimated cost | Notes |
|-------------------------------------|------------------|-----------------|-----------------------|----------------------|---|
| AKIACHAK | Gravel | 1,600 | | \$4,000,000 | |
| ALAKANUK | Gravel | 2,200 | | 7,000,000 | |
| ALEKNAGIK | Gravel | 2,100 | | 3,000,000 | |
| ANVIK | Gravel | 2,900 | NDB, GPS | 7,500,000 | |
| ATMAUTLUAK | Gravel | 2,000 | | 2,400,000 | |
| CHEFORNAK | Gravel | 2,600 | | 7,000,000 | |
| CHEVAK | Gravel | 2,600 | | 6,500,000 | |
| CHICKEN | Gravel | 2,500 | | 4,500,000 | Road accessible in summer only. Creek relocation required for extension. |
| CHIGNIK | Gravel | 2,600 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| CHIGNIK FLATS | Gravel | 1,600 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| CHIGNIK LAKE | Gravel | 2,800 | Terrain limited | 3,000,000 | |
| CHUATHBALUK | Gravel | 1,500 | | 6,500,000 | |
| CLARKS POINT | Gravel | 2,600 | | 8,200,000 | |
| CORDOVA | Gravel | 1,800 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| CROOKED CREEK | Gravel | 2,000 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| DEERING | Gravel | 2,600 | | 3,000,000 | |
| EEK | Gravel | 1,400 | | 2,800,000 | |
| EKWOK | Gravel | 2,700 | | 2,500,000 | |
| ENGLISH BAY | Gravel | 1,800 | Terrain limited | 5,000,000 | Airport expansion not practical, road to Nanwalak best transportation solution. |
| FALSE PASS | Gravel | 2,100 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| GOODNEWS | Gravel | 2,800 | | 2,500,000 | |
| GRAYLING | Gravel | 2,300 | | 1,500,000 | |
| KARLUK | Gravel | 2,000 | | 2,500,000 | |
| KIPNUK | Gravel | 2,100 | | 5,500,000 | |
| KOBUK | Gravel | 2,300 | | 3,500,000 | |
| KOKHONAK | Gravel | 2,800 | | 2,500,000 | |
| KONGIGANAK | Gravel | 1,900 | | 3,780,000 | |
| KWETHLUK | Gravel | 1,700 | | 4,500,000 | |
| KWIGILLINGOK | Gravel | 2,500 | | 3,000,000 | |
| LARSEN BAY | Gravel | 2,700 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| LEVELOCK | Gravel | 1,900 | | 3,000,000 | |
| LIME VILLAGE | Gravel | 1,400 | | 500,000 | |
| LITTLE DIOMEDE ISLAND/IGNALUK | Gravel | 100 | Terrain limited | 1,000,000 | Runway construction not practical. Expand heliport, erosion stabilization. |

AACC FIVE YEAR AVIATION STRATEGIC PLAN—Continued

| Community | Existing surface | Existing length | Existing inst. appr. | Total estimated cost | Notes |
|----------------------------------|------------------|-----------------|-----------------------|----------------------|---|
| MANLEY HOT SPRINGS | Gravel | 2,900 | | 4,500,000 | Cannot be extended, project would relocate runway. |
| MANOKOTAK | Gravel | 2,700 | | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| MOUNTAIN VILLAGE | Gravel | 2,500 | | 2,500,000 | |
| NEW STUYAHOK | Gravel | 1,800 | | 8,500,000 | |
| NIGHTMUTE | Gravel | 1,600 | | 4,500,000 | |
| NIKOLAI | Gravel | 2,300 | | 3,200,000 | |
| NONDALTON | Gravel | 2,800 | | 2,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| NUNAPITCHUK | Gravel | 2,000 | | 1,200,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| OLD HARBOR | Gravel | 2,700 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| OUZINKIE | Gravel | 2,100 | | 8,500,000 | |
| PERRYVILLE | Gravel | 2,500 | | 2,500,000 | |
| PILOT STATION | Gravel | 2,500 | | 7,000,000 | Master plan underway to identify relocation site. |
| PORT GRAHAM | Gravel | 2,000 | | 4,500,000 | Relocation required. |
| PORT LIONS | Gravel | 2,200 | | 7,000,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| QUINHAGAK | Gravel | 2,600 | | 5,300,000 | Relocation required. |
| RUSSIAN MISSION | Gravel | 2,700 | | 4,500,000 | |
| SELDOVIA | Gravel | 1,800 | Terrain limited | 4,500,000 | Terrain Limited, may not be able to construct full 3,300 foot length. |
| SHAGELUK | Gravel | 2,300 | | 5,200,000 | |
| STEVENS VILLAGE | Gravel | 2,100 | | 8,300,000 | |
| STONY RIVER | Gravel | 2,500 | | 7,000,000 | Relocation required for a 3,300 foot RWY. |
| TAKOTNA | Gravel | 1,700 | | 5,500,000 | Relocation required for a 3,300 foot RWY. |
| TOKSOOK BAY | Gravel | 1,800 | | 4,500,000 | |
| TULUKSAK | Gravel | 2,500 | | 3,500,000 | |
| TUNTUTULIAK | Gravel | 1,800 | | 2,750,000 | |
| TUNUNAK | Gravel | 2,000 | | 5,000,000 | |
| Total for Runways | | | | 255,130,000 | |
| Bethel Area Terminal Radar | | | | 10,000,000 | |
| Grand Total | | | | 265,130,000 | |

Notes: (1) The average runway reconstruction cost is approximately \$4,500,000. This number was used through this estimate where detailed costing is not available. Airports requiring site relocation may require additional funds to complete.
 (2) Capital installation costs of automatic Weather Reporting machines, such as AWOS-3, are approximately \$150,000 each per installation. This does not include annual operational costs. The machines could be installed with the airport improvement project as a portion of the project and turned over to the FAA for operation and maintenance.

STATEMENT OF MORTON V. PLUMB, JR.

Senator STEVENS. Thank you very much. Mort, do you have a statement?

Mr. PLUMB. Senator Stevens, Congressman Young, we have a few prepared comments, and also present some for entrance into the record.

Senator STEVENS. All of the prepared statements will be printed in the record in full, and your comments will appear after each one of those individually.

Mr. PLUMB. Anchorage International Airport is the gateway to Alaska and Anchorage residents and for all Alaska visitors. The Gateway Alaska road and terminal improvements program will address many of the passenger service needs. Additional passenger service needs may include people-mover connector between the domestic and international terminal, and in the future we will need to reconstruct the apron and the jetways at the international terminal.

KOREAN VISA WAIVER REQUIREMENTS

Relaxation of the Korean visa waiver requirements would be very helpful. Current U.S. regulations require Korean visitors to apply for a visa to enter the United States. This requirement has had a negative impact on the development of international tourism to Alaska as it applies to South Korea.

The State of Alaska has felt the damaging impacts of this restrictive policy. This is evident by Korean Airlines flights that are bypassing Anchorage, servicing Vancouver, British Columbia, and Toronto. As such, the State of Alaska would like to encourage the formalization of talks by the State Department to develop a pilot program for relaxing of visa requirements for travelers between South Korea and Alaska with regard to liberalizing passenger service for Alaska.

In an effort to expand both international and domestic passenger opportunities, the Alaska International Airport System would like to see established a pilot program for the liberalization of passenger service for Alaska. This program would allow for travel between Alaska and other domestic points via international carrier. Allowing international carriers to enplane and deplane domestic passengers enhances route profitability, increases international air service to less competitive markets, and provides Alaskans direct air service to additional destinations.

AIR CARGO BUSINESS

Cargo is big business at Anchorage International Airport. Air cargo is the fastest-growing sector at Anchorage International Airport. The airport is responding with a focus on marketing and infrastructure. In marketing, a comprehensive program for retaining and expanding and attracting cargo activity focuses on two levels.

On the international level, the airport is seeking to take maximum advantage of our global location that we can reach 95 percent of the industrial centers of the northern hemisphere within 9 hours flight time. We are seeking liberalization of international aviation agreements to open up new cargo transfer opportunities

for foreign and domestic carriers. The Alaska International Airport System would like to encourage the formalization of talks between USDOT and the State Department to liberalize international air cargo service beyond open skies, and look at relaxing regulations against seventh and eighth freedoms.

With regard to infrastructure, Anchorage International Airport faces global challenges to its current role as the world-class air cargo crossroads, long-range aircraft in the next decade, a trend we cannot control. Foreign airports hungry for their piece of our pie is another trend we cannot control. However, modern and efficient airport facilities is something we can control.

LAKE HOOD FLOAT PLANE FACILITY

The Alaska International Airport System, with the critical assistance of the FAA airport improvement program, must continue to improve its competitive position to serve air cargo markets. With regard to general aviation, Lake Hood provides access to rural Alaska for both residents and tourists. No other public float plane facilities exist in the Anchorage area. Additional needs to support this vital facility include:

- Relocation of tie-downs from Anchorage International to Lake Hood to reduce taxi distances and vehicle-aircraft conflicts.

- Dredging Lake Hood to remove shallow areas in the lake that create safety concerns during low water periods.

- Construct shoreline stabilization in eroding areas. This could be developed as a Corps of Engineers project.

- Address safety concerns by constructing a safety area at Hood strip, establishing buffer areas around the taxiways and constructing new taxiways where aircraft can taxi on the roadways.

- Support for a new float plane facility to serve Anchorage and the Matsui area is very sorely needed.

REGULATORY AND SAFETY ISSUES

With regard to regulatory and safety issues, wetlands mitigations, wetlands and airports in Alaska are generally incompatible. Wetlands often attract birds, creating hazards for aircraft operations. Airports in Alaska must fill wetlands to both reduce bird hazards as well as construct necessary aviation infrastructure. FAA safety guidelines regarding wetlands are in conflict with wetland regulations under the Clean Water Act.

While the FAA guidelines require elimination of wetlands that create safety hazards, other Federal agencies restrict construction on the airport during nesting season, require expensive wetlands replacement mitigation at airports, and limits the types of land uses that can occur on airport wetlands.

Anchorage International Airport air traffic control tower. Certain parts of the airfield at Anchorage International Airport cannot be seen by the air traffic control tower. Lack of tower visibility reduces safety and increases aircraft delays. Furthermore, the tower is currently located within the terminal road loop on land that could otherwise be used for other necessary functions at the airport.

Runway and aircraft deicing is necessary for safe aircraft operations in the air and on the ground. Deicing chemicals are under

increasing control and regulation by the Environmental Protection Agency because of their effect on water bodies around the airports. Capture and treatment of deicing chemicals is difficult and expensive. Many less expensive solutions at other airports do not work in Alaska. A deicing collection facility and treatment plant may be required for the airport to continue to grow and provide for safe operations in an environmentally friendly manner.

PREPARED STATEMENT

Senator, Congressman, this concludes my testimony. Thank you for the opportunity, and thank you for the support at Anchorage International Airport.

[The statement follows:]

PREPARED STATEMENT OF MORTON V. PLUMB

PASSENGER SERVICES/BUSINESS OPPORTUNITIES

Passenger Facilities

Anchorage International Airport is the gateway to Alaska for Anchorage residents, rural Alaska, and visitors. The Governor's Gateway Alaska road and terminal improvements program will address many passenger services needs. Additional passenger service needs include:

- Upgraded (with people mover) connector between domestic and international terminal
- Reconstructed international passenger terminal apron and jetways
- Additional parking and rental car facilities

Relaxation of Korean Visa Requirements

Current U.S. regulations require Korean visitors apply for a visa to enter the U.S. This requirement has had a negative impact on the development of international tourism to Alaska as it applies to South Korea.

The current application requirements generally require the traveler to take an additional trip to another city to apply and obtain a U.S. visa.

The State of Alaska has felt the damaging impacts of this restrictive policy. This is evident by Korean Airlines flights that are bypassing Anchorage and servicing Vancouver, British Columbia and Toronto.

As such, the State of Alaska would like to encourage the formalization of talks by the State Department to develop a pilot program for the relaxing of Visa requirements for travelers between South Korea and Alaska.

Liberalization of Passenger Service for Alaska

In an effort to expand both international and domestic passenger opportunities, the Alaska International Airport System would like to see established a pilot program for the liberalization of passenger service for Alaska. This program would allow for travel between Alaska and other domestic points via an international carrier.

Allowing international carriers to enplane and deplane domestic passengers enhances route profitability, increases international air service to less competitive markets, and provides Alaskans direct air service to additional destinations.

CARGO SERVICES/BUSINESS OPPORTUNITIES

Air Cargo is the fastest growing sector at Anchorage International Airport. The Airport is responding with a focus on marketing and infrastructure.

Marketing

A comprehensive program for retaining, expanding and attracting cargo activity focuses on two levels:

1. On the international level, the Airport is seeking to take maximum advantage of our global location reaching 95 percent of the industrialized centers of the Northern Hemisphere within 9 hours flight time. We are:

A. Seeking liberalization of international aviation agreements to open up new cargo transfer opportunities for foreign and domestic carriers here. The Alaska International Airport System would like to encourage the formalization of talks between the U.S. DOT and the State Department to liberalize international air cargo

service beyond Open Skies and look at relaxing the regulations against seventh and eighth freedom flights.

B. Strengthening business relationships with industry leaders by frequent air carrier and air freight forwarder contact to ride the wave of change in “time definite” delivery of cargo and small packages.

—This requires personal contact in airline headquarters in Asia, Europe and the United States.

—The Airport brings many airline executives to our turf at our annual “Top of the World Air Cargo Summit”.

—The Airport participates in national policy formation affecting cargo issues by serving as Chair of the Airports Council International Air Cargo Subcommittee.

—Airport staff provides practical assistance to carriers and logistics providers in locating usable airport land, operating efficiently and keeping reliability at the highest levels.

2. Within Alaska shipping more fresh and live Alaskan seafood is certainly the best opportunity in exports. Our Seafood Working Group is tackling obstacles and has a goal of doubling air shipped fish and shellfish in three years.

Infrastructure

AIA faces global challenges to its current role as a world class air cargo crossroads:

—Long range aircraft in the next decade, a trend we cannot control

—Foreign airports hungry for their piece of the pie, another trend we cannot control

—Modern, efficient airport facilities, which we can do something about.

Modern and efficient infrastructure is essential to keep abreast of technological change and the pace of growth. Infrastructure improvements at AIA include new taxiways to reduce airfield delays, cargo support facilities, seamless access under runways between airparks, emergency operations center and maintenance facilities to ensure a safe and efficient operating environment, and navigational improvements.

The Alaska International Airport System, with the critical assistance of the FAA Airport Improvement Program, must continue to improve its competitive position to serve air cargo markets.

GENERAL AVIATION SERVICES/BUSINESS OPPORTUNITIES

Lake Hood provides access to rural Alaska for both residents and tourists. No other public floatplane facilities exist in the Anchorage area. Additional needs to support this vital facility include:

—Relocation of tie downs from Anchorage International to Lake Hood to reduce taxi distances and vehicle/aircraft conflicts and free up space at AIA for other uses.

—Dredging Lake Hood to remove shallow areas in the Lake that create safety concerns during low water periods. Construct shoreline stabilization in eroding areas. This could be developed as a Corps of Engineers project.

—Address safety concerns by constructing a safety area at Hood Strip, establishing buffer areas around taxiways, and constructing new taxiways where aircraft taxi on roadways.

—Support for a new floatplane facility to serve the Anchorage/Mat-Su area, address unmet demand for floatplane slips, and relieve airspace and airport congestion.

REGULATORY/SAFETY

Wetlands Mitigation and Bird Hazards

Wetlands and airports in Alaska are generally incompatible. Wetlands often attract birds, creating hazards for aircraft operations. Airports in Alaska must fill wetlands to both reduce bird hazards as well as construct necessary aviation infrastructure. FAA safety guidelines regarding wetlands are in conflict with wetland regulations under the Clean Water Act. While the FAA guidelines require elimination of wetlands that create safety hazards, other federal agencies restrict construction on the airport during nesting season, require expensive wetlands replacement (mitigation) near airports, and limit types of land uses that can occur on airport wetlands.

Airspace Capacity

The FAA is completing an Anchorage Area Airspace Study that is identifying ways to reduce aircraft delays in the air and on the ground in the Anchorage area.

While the study is not yet complete, it appears some ideas, such as establishing new flight procedures, corridors, or constructing new runways or taxiways at Elmendorf and Anchorage International Airport will require further evaluation. Because the issues are complex and involve many levels of government and many airports, a formal interagency working group may be needed.

Anchorage International Airport Air Traffic Control Tower

Certain parts of the airfield at Anchorage International Airport cannot be seen by the Air Traffic Control Tower. Lack of tower visibility reduces safety and increases aircraft delays. Furthermore, the tower is currently located within the terminal road loop, on land that could otherwise be used for terminal parking and terminal-related functions. These safety, efficiency and land use concerns could easily be addressed if the Air Traffic Control Tower at Anchorage International Airport was relocated.

Deicing

Runway and aircraft deicing is necessary for safe aircraft operations in the air and on the ground. Deicing chemicals are under increasing control and regulation by the Environmental Protection Agency because of their affect on water bodies around airports. Capture and treatment of deicing chemicals is difficult and expensive. Many less expensive solutions at other airports do not work in Alaska. A deicing collection and treatment facility may be required for the airport to continue to grow and provide for safe operations in an environmentally friendly manner.

Senator STEVENS. And we are going to have some questions about that, Mort.

Jim LaBelle.

STATEMENT OF JAMES D. LABELLE

Mr. LABELLE. Good afternoon, Senator Stevens and Congressman Young. It is a pleasure to represent the National Transportation Safety Board before you today regarding aviation safety in Alaska.

Flight operations in Alaska are diverse, with challenging environments, which is rough terrain, adverse weather, and unique air transportation requirements. Due to the large geographic area and the lack of other forms of transportation, aviation is often the only way to travel. These challenges increase the risk to safe flight operations.

Because of Alaska's unique aviation needs, the National Transportation Safety Board has had a longstanding interest in aviation safety in Alaska. In 1980, the safety board published a special study on the air taxi industry in Alaska. Although we have seen improvements to the safety of the aviation system in Alaska as a result of recommendations issued from that study, investigations indicated that the safety issues identified in the 1980 study continue to be a concern. Therefore, in 1995, the safety board published a second study on aviation safety in Alaska.

As a result of that study, new safety recommendations were issued regarding weather observing and reporting, airport inspections and airport condition reporting, pilot flight, duty, and rest times, visual and instrument flight rules, and the needs of special aviation operations in Alaska.

ACTIONS TAKEN IN RESPONSE TO NTSB STUDY

The safety board is encouraged by the actions taken since publication of our study. For example, a demonstration project for a satellite-based navigation and traffic surveillance is underway in the Yukon-Kuskokwim region as part of the FAA's Capstone project.

The FAA approved the use of single-engined airplanes for commercial passenger-carrying flight operations under instrument flight rules.

The FAA and the National Weather Service implemented a test program in which color video cameras provide real-time weather information available over the Internet. The FAA and the State of Alaska are cooperating to equip and train ground personnel in Alaskan airports so they can provide near real-time information directly to pilots by radio. The FAA has fully staffed its Alaska Regional Airport Certification Office, and the FAA and the State of Alaska are cooperating to improve the inspection program for airports in the State, and the FAA implemented a State-wide program to collect and disseminate information about Alaskan airport conditions provided by pilots and unofficial observers through the automated flight service station network.

As you are aware, Public Law 106-69, the Transportation and Related Agencies Appropriations Act for Fiscal Year 2000, directed that an interagency initiative, with the goal of reducing the number of occupational aviation fatalities in Alaska and the number of aviation accidents and resultant deaths in the State, be undertaken. We believe this initiative, which involves the FAA, the NTSB, the National Weather Service, and the National Institutes for Occupational Safety and Health, or NIOSH, is a good step toward improving aviation safety in Alaska. You may be assured that the safety board will cooperate in every way possible with this effort to its completion.

Mr. Chairman, it should be noted that over 90 percent of the accidents that occur in the State are attributable to human factors and operational errors. The ultimate responsibility for any flight lies with the pilot and a good educational program will go far to eliminating unwarranted risk-taking and human errors.

Most commercial operators are dedicated to providing the traveling public with the highest level of safety, but our accident investigations show that there is often inadequate pilot training for the environment in which they fly, less than adequate management oversight, and a less than aggressive safety program, or no safety program at all. To decrease the 90 percent human error figure, these issues must be addressed by the Alaska aviation industry.

PREPARED STATEMENT

Mr. Chairman, that completes my prepared remarks, and I would be happy to respond to any questions you have.

[The statement follows:]

PREPARED STATEMENT OF JAMES LABELLE

Good morning Mr. Chairman and members of the Delegation. It is a pleasure to represent the National Transportation Safety Board before you today regarding aviation safety in Alaska.

Between 1990 and 1998, there were 1,510 aviation accidents, an average of one accident every 2 days, that took the lives of 355 people. The commercial aviation accident rate in Alaska is three to four times greater than that of the other 49 States. Indeed, we were saddened to learn of the most recent commuter airline accident that occurred just last Tuesday 50 miles from Bethel, Alaska. That accident took the lives of 6 people. It is also significant to note that aircraft accidents are the leading cause of occupational fatalities in Alaska.

Flight operations in Alaska are diverse, with a challenging environment, such as rough terrain, adverse weather, and unique air transportation requirements. Due to the large geographic area and lack of other forms of transportation, aviation is often the only way to traverse much of the State. These challenges increase the risks to safe flight operations.

Because of Alaska's unique aviation needs and diverse challenges, the National Transportation Safety Board has had a longstanding interest in aviation safety in Alaska. In 1980, the Safety Board published a special study on the air taxi industry in Alaska. As a result of that study, the Board issued 10 safety recommendations to the Federal Aviation Administration (FAA) and the State concerning the planning and development of Alaska's aviation system and infrastructure, weather observation and dissemination of weather information, regulatory surveillance and operator safety oversight. As a result of those recommendations, we have seen many improvements to the safety of the aviation system in Alaska.

Despite these recent improvements, Board accident investigations indicated that the safety issues identified in the 1980 study continued to be of concern. In 1995, the Safety Board published a second study on aviation safety in Alaska. As a result of that study, 23 new safety recommendations were issued to the FAA, the United States Postal Service, the National Weather Service (NWS), and the State of Alaska regarding weather observing and reporting; airport inspections and airport condition reporting; pilot flight, duty, and rest time; visual and instrument flight rules; and the needs of special aviation operations in Alaska. Twenty-one of those recommendations have been classified as acceptable. The Safety Board is encouraged with action taken since publication of our study. For example:

- A demonstration project for satellite-based navigation and traffic surveillance is underway in the Yukon Kuskokwim Region of Alaska, as part of the FAA's Capstone Program;
- The FAA approved the use of single-engine airplanes for commercial passenger-carrying flight operations under instrument flight rules;
- The FAA and the NWS implemented a test program in which remote color video cameras provide real-time weather information, available over the Internet. As of mid-1999, video cameras are providing views of several airport environments and mountain passes within Alaska;
- The FAA and the State of Alaska are cooperating to equip and train ground personnel at Alaskan airports so they can provide near real time information directly to pilots by radio. The State of Alaska implemented a program to equip and train airport maintenance personnel for radio updates;
- The FAA has fully staffed its Alaskan Region airport certification office, and the FAA and the State of Alaska are cooperating to improve the inspection program for airports in the State; and
- The FAA implemented a state-wide program to collect and disseminate information about Alaskan airport conditions provided by pilots and unofficial observers through the automated flight service station network.

Many of these were taken as a result of the efforts of the Alaska Congressional Delegation, and we commend you for your continued work on these matters.

Unfortunately, two of the safety recommendations issued as a result of our 1995 study were closed as unacceptable action. Those recommendations were:

To the Federal Aviation Administration

Ensure, at all automated surface weather observing sites in Alaska for which FAA is responsible, and where currently there are qualified FAA weather observers (including contract weather observers) on site, that (1) operationally significant information, including distant weather 3 information, is manually added to automated weather observations until technological progress eliminates the need; and (2) all such information is combined and disseminated in a single aviation weather report.

To the National Weather Service

Revise current policies to provide mike-in-hand (near real-time) radio service for aviation weather information at locations in Alaska where National Weather Service and surface and contract personnel are sited until automated surface weather observing systems transmit observations of an operationally significant weather phenomena to pilots operating in the terminal area.

We believe the interagency initiative directed in Public Law 106-69, the Transportation and Related Agencies Appropriations, fiscal year 2000, is a good step toward improving aviation safety in Alaska, and we look forward to working on the unacceptable recommendation issues as part of that effort.

As you are aware, the interagency initiative involves four federal agencies—the FAA, the NTSB, the NWS, and the National Institute for Occupational Safety and

Health (NIOSH). This initiative involves five elements: (1) the gathering and analyzing of data; (2) bringing together working groups, including representatives of the aviation industry, the aviation workforce, and the insurance industry; (3) working with local professional groups such as individual pilots and the Alaska Airmen's Association, industry, and educational leadership; (4) evaluating the effectiveness of changes in flight safety practices; and (5) evaluating progress and suggesting additional improvements.

The goal of this three-year joint effort is to reduce the number of occupational aviation fatalities in Alaska by 50 percent for the years 2000 through 2009, and to reduce substantially the number of aviation accidents and resultant deaths in the State. You may be assured that the Safety Board will cooperate in every way possible with this effort to its completion.

Mr. Chairman, these initiatives will go a long way to improving aviation safety in Alaska, but it should be noted that over 90 percent of the accidents that occur in the State are attributable to human factors and operational errors. The ultimate responsibility for any flight Res with the pilot, and a good educational program will go far to eliminating unwarranted risk taking and human errors. Most commercial operators are dedicated to providing the traveling public with the highest level of safety. But our accident investigations show that there is often inadequate pilot training for the environment in which they fly, less than adequate management oversight, and a less than aggressive safety program or no safety program at all. To decrease the 90 percent human error figure, the change must come from within the industry.

Mr. Chairman, that completes my prepared remarks, and I will be happy to respond to any questions you may have.

ALASKA'S UNIQUE NEEDS

Senator STEVENS. Thank you very much.

Pat, as you know, we have written this legislation to direct the FAA administrator to take into account Alaska's size and unique reliance on aviation before imposing new rules. We wonder, is that legislation being followed?

Mr. POE. I cannot cite a single situation in which a rule was totally disregarded regarding the State of Alaska. There are situations, and ongoing ones, where we look at ways to accomplish the intent of the rule in ways that are consistent with the environment that we have here in Alaska. I think those types of balanced approaches serve both causes well.

Senator STEVENS. I have been told there has been some attempt to consolidate this region with the region in Seattle. That would be automatically just putting us in a position where the Alaska region would not be subject to review by people who are familiar with our unique circumstances. Is that being pursued now, do you know?

Mr. POE. To my knowledge, it is not. We had one incident recently, and your office was involved, I believe, looking at the possibility of merging civil aviation security responsibilities between the two regions. That did not go forward, and as we speak I know of no other initiative.

Senator STEVENS. You have been here, as you said, just a little over a year now, and you came very highly recommended by the Administrator, and I would be interested to know if you have reached any conclusions as to what are the significant challenges that the industry faces here that it does not face outside. Too big a thing for 5 minutes?

Mr. POE. The range of issues here in the State of Alaska was something for which I was not fully prepared, to be very candid.

The thing that struck me the most about my time here in Alaska has been the sense of community among the aviators, and the different organizations, whether it is the Alaska Aviation Safety

Foundation, or the carriers, or the Airmen Association, or the Seaplane Association. We come together on an issue, and we come to point on trying to make a difference. That does not mean we always agree, but I think that that is one of the things that sets Alaska apart from any place I have been before.

One other thing is that the FAA people here have been here long enough that they know people who have fallen to the system, and so this is not just a professional responsibility, it is a personal commitment, and it is a great group of people.

Senator STEVENS. I am sure we agree with that.

REVILLA CORRIDOR EXEMPTION

Senator Murkowski has asked me to point out to you that for 20 years VFR traffic has been able to obtain a special VFR clearance exemption through the Revilla Corridor that maintains a steady flow of traffic into Ketchikan, and there is a decision been made not to renew the exemption. He would like to know, in the absence of the exemption, how is FAA going to prevent a backup of VFR traffic in and out of the Ketchikan Harbor during marginal weather conditions, and is FAA delaying a reestablishment of the exemption?

Mr. POE. When we began to evaluate the new routes that were being taken in and out, and we saw this probable conflict in traffic, we began to look to see if the exemption had already expired. It had not, and as a result it remains in effect today. In a way that was good fortune, because that gives us an opportunity to work with all of the community there to try and find a palatable solution. Right now, we think without extraordinary and extra care given to that situation, that it could run a safety risk, and so we want to find a way to remove that, so the work is ongoing.

Senator STEVENS. It is in effect right now?

Mr. POE. The exemption remains in effect I believe through January. Someone can confirm that for me.

Senator STEVENS. All right. I will tell him that.

KETCHIKAN FLIGHT SERVICE STATION

He also noted that in January 1999 there was a notice to the public that the Ketchikan flight service station hours would return to a 24-hour operating schedule following the recruitment of two new employees to fill the staffing losses. He said in February that the FAA reduced that flight service station hours to 14 hours and 15 minutes due to staffing losses, and that the new recruits had not been fully certified. What is going to be the schedule, as we go into the next quarter for the new century, for the flight service station? Will it return to the 24-hour schedule?

Mr. POE. It is our long-range intent that it do so. I do not have the answers to whether it will be effective within the first quarter of the next calendar year.

Part of the problem is the grade structure of that particular facility, and that promotion opportunities come and people leave as a result of that. The other thing is that with minimum staffing, when training and other losses occur, it requires that we adjust the operation not only of that facility, but on occasion others, and we look

for ways to do that that has the minimum impact to the public in terms of timing and in terms of the seasons of the year.

To the best of my knowledge, our intent is to return that to a 24-hour operation.

NEEDED INVESTMENTS AT ANCHORAGE INTERNATIONAL

Senator STEVENS. Mort, just a question or two for you. The transition of the Anchorage airport from an interim stop for passenger refueling to becoming, really one of the world's major cargo air hubs, as I think we have all noted that, and we have every indication that it is going to continue to grow. Are there investments that you think that we should be familiar with, steps we need to take to assure that that growth will be able to continue as scheduled and serve the air cargo and passenger markets? Is there anything further we should do in the Federal level to assist?

Mr. PLUMB. Senator, I think there is a few things we can do on the passenger and the cargo side, as I mentioned a little earlier. I think on the cargo side we need to take a close look at liberalizing the seventh and eighth freedoms, so we could capitalize on this globalization of aviation.

In that regard, I might just give a quick example. Let us just say hypothetical purposes, if we had a package that was on a bill of lading, we would like to have the ability to have that package carried by a carrier such as United Airline from New York to Anchorage and then be put on a carrier such as JAL and go from Anchorage on to Tokyo.

On the passenger side, we would like to see a pilot program that at least would give us an opportunity to show that it should not have any disadvantage in the marketplace, so Alaskans who are currently denied the opportunity to fly between Anchorage and New York could get on an international airline such as Korean Airlines and make that travel from Anchorage to New York as well as from New York back to Anchorage.

With regard to infrastructure, there are some things. We believe we are going to need some new taxiways to reduce airfield delays. There are certain support facilities we are going to need, possibly seamless access between some of the airparks, which would mean a tunnel under some of the runways to get between the north and the west side there. We certainly see a need for an efficient operations center, and emergency operations center, where we could consolidate in case we did have a mishap here.

Just recently we had an opportunity to exercise with the FBI on one of their exercises, and we both concluded that it would be advantageous to have a facility on the airport where we could operate from.

I think that would conclude my comments on that area.

Senator STEVENS. I just have a couple more comments, Don.

Mr. YOUNG. You are the chairman.

CAPSTONE

Senator STEVENS. You have all mentioned Capstone. How is it really coming along? Whoever would like to comment.

Mr. POE. Well, I am sure there are several opinions. Let me offer mine straight away. I think with the help of industry and with

your support, I think it has made remarkable progress, considering that it was almost exactly 12 months and a few days ago that the first appropriation was made, and we have done in-house testing, we have awarded the contract to train new pilots who began the equipage of aircraft that will start in January, we have a listing of 150 airplanes, we have funded the first 132. I think it is moving remarkably well, almost too well. We usually do not get this fortunate to move this fast.

I also think that the user community here is very strongly behind Capstone, and at the end of the day, that is what is going to make it work.

Senator STEVENS. When will we get the report that will indicate how fast we can go forward and make it State-wide?

Mr. POE. The University of Alaska Study is a 3-year study which was looking at the safety aspect of Capstone. In my judgment, the \$6 million appropriation that we received this year, we will use part of that as a scene-setter to move beyond the Yukon delta. Whether that's into Juneau, or whether that is into Fairbanks, or whether that is into Anchorage, but it will be into a different area. I think this will be an incremental process, and it is somewhat dependent on future appropriations.

One of the main issues deals with spectrum, which is frequency. Right now we are using a frequency that belongs to the military and to go State-wide we are going to have to have one that the FAA owns and controls, and we are hoping to see that accomplished by January of next year, not of 2000 but 2001, as a part of the certification process, also as part of looking at ways to use this technology to actually sequence and separate aircraft.

Senator STEVENS. How is it viewed from the State's point of view, Paul?

Mr. BOWERS. The State absolutely supports Capstone, and would very much like to see it implemented State-wide, expanded State-wide. It cannot be soon enough.

NTSB'S VIEW OF SAFETY PROGRESS

Senator STEVENS. Jim, I am not sure everybody knows that you made the basic recommendations for following out so far on the safety process, 15 more closed-circuit weather surveillance cameras. That was one of your recommendations. We have got ten support, I think, for your mike-in-hand proposal so pilots can update runway conditions in flight.

I guess Capstone really was one of your ideas, as a matter of fact. At least my staff tells me they think it was your idea.

Mr. LABELLE. Well, actually it came out of the NTSB Alaska Safety study in 1995.

Senator STEVENS. Did it?

Mr. LABELLE. It was 23 recommendations, and I am pleased to say 21 of those 23 have been acceptable.

Senator STEVENS. What is next?

Mr. LABELLE. Well, we hope with the Alaska safety initiative to make some inroads into some of the issues with human factors, and with the help of my office and the FAA and the National Weather Service, we hope to get a coalition together and hopefully make some progress to perhaps reidentify some old problems and

make some new approaches to those old problems and deal with perhaps more effectively some of the human factors issues in Alaskan aviation, and in particular, pilot decisionmaking, management oversight, training for the Alaskan environment, and dealing with industry.

There has been some resistance. I have sensed, from industry to more regulation, and I concur. This is not a regulatory event, as we see it. Those involved with the Alaska safety initiative. We are looking at a nonregulatory approach, with industry buy-in, and I think it is absolutely crucial that we have their support, hear their views, get their perspective, and act as a facilitator to help them reduce the accident rate in Alaska.

Senator STEVENS. I spent the morning with the tourism industry, and it is really taking off, you know. There is no question about it.

One of the bright spots on our resource utilization screen is the increase in tourism, and substantial commitments there. The one dampener that could slow that down is the continued statistics we have had in recent months on aviation accidents and deaths. I really think the study that is underway is a very important one, to try and secure voluntary compliance with the type of procedures that would bring about the reduction in those statistics.

If we cannot get voluntary compliance, of course, in time your agencies, at least three of the four of you, will be forced to bring about mandatory compliance with procedures. I think we would be anxious to learn any way we can to help bring about that voluntary compliance. I think it will come about sooner, and it will be more effective, if it is voluntary.

Don.

INFRASTRUCTURE NEEDS

Mr. YOUNG. Thank you, Senator. I first want to thank the panel. I notice, Mr. Bowers, that you were making some suggestions and I was trying to write them down as fast as I could, about money could be better used on the runways, et cetera, than be used on another thing that Mr. Poe is proposing, or the FAA is proposing. Would you like to explain that, and what you think should be done?

Mr. BOWERS. It comes back to the infrastructure that we have got in Alaska. We really have an immature infrastructure. We do not have well-developed runways. In the rest of the country, in America, so to speak, we do have a fairly mature infrastructure.

Runways are well-developed, they are lighted, they are paved, taxiways—we are into multiple iterations of improvement at those facilities. The last things we need to do are improve safety areas, and that is, indeed, the national direction. That is the policy that the FAA follows on a Nation-wide basis, and that makes a lot of sense in the rest of the country.

In Alaska, however, any time we do any development on a runway, if we are doing any airfield infrastructure development, the FAA national policy is to marry that with implementing a full safety area at that airport. DOT absolutely supports having safety areas, but only after we have addressed the primary problem area, and that is having a decent runway. It makes no sense to me to

implement a full safety area at some of our airports when most of them are short, unlighted, rough surface.

The priority is, get the runway fixed first. After we have addressed that, then let us go back and do the refinements like improving the safety areas, keeping in mind that every landing and take-off uses the runway, but the safety area is only used if there is a problem, and typically that problem is a direct result of the operation from that rough, short, unlighted runway.

NATIONAL FAA POLICY

Mr. YOUNG. Mr. Poe, this is nothing personal, but are you having to follow the national direction of the FAA, or do you have the latitude to do what Mr. Bowers suggests?

Mr. POE. We have the latitude to work in the concept of a cost-benefit and look at the extent to which safety aprons are needed at airports in Alaska. That provides some flexibility. However, we consider the safety apron part of the airport runway. We consider one, if you will, one formula for safety.

I can understand, when Paul indicates maybe we should pick priorities and surface the runway before we consider the accompanying safety implications.

Mr. YOUNG. Well, I am just going to suggest, Mr. Bowers—I have landed on a lot of those airfields, and I agree with you 100 percent. I do not necessarily agree with you, Mr. Poe. I want you to know that right now.

Mr. POE. I understand that.

Mr. YOUNG. But I am hoping the industry itself will have some comments, and I hope you are not locked into concrete with the idea that you may not be totally right on this issue. There may be another side of the coin to avoid—we are supposed to be here for safety. We are not supposed to be here for turf acquisition. That is what I really want to stress.

HUMAN FACTORS

Mr. LaBelle, you have mentioned that 90 percent of the accidents were related to human factor, and 10 percent were related to aircraft and regulations.

Mr. LABELLE. I am sorry——

Mr. YOUNG. 10 percent would be aircraft, 90 percent——

Mr. LABELLE. Well, the mechanical issues, or environmental issues. Essentially we look at three basic elements in any accident investigation. That is the pilot, the machine, and the environment they fly in.

Mr. YOUNG. So you are finding 90 percent, usually pilot?

Mr. LABELLE. That is correct.

Mr. YOUNG. With all the new ideas and thoughts in weather reporting, automated weather reporting, all the other things that have been recommended by Senator Stevens, we still have that factor of 90 percent, do we not?

Mr. LABELLE. We still have the factor, but a lot of the infrastructure relating to Alaska safety study, the 1995 Alaska safety study, is just now coming to fruition, so hopefully Capstone and other initiatives down the road will have some impact.

But again, the operational issues are still, even Nation-wide outside of Alaska they are still paramount. Those are still the principal precipitators of accident—the human element, and the more we can do, I believe, in Alaska to address the unwarranted risk-taking, the so-called bush pilot syndrome, through training, through awareness, and strong safety programs within the industry, I think we can make an impact on the accidents in Alaska.

Mr. YOUNG. The hand mike, does that basically replace the—you see, I was never a great supporter of the automated weather reporting. You know, I have flown enough in the State to not really believe in it. Now, will that take and make up with the lack of good weather reporting, with the hand mike report?

Mr. LABELLE. I think it will be an adjunct to it. I do not think it is—there is now automated weather reporting sites scattered throughout the State, and there is going to be more. I just had the opportunity to talk to the director of the National Weather Service, Richard Pesotti, and he indicated that they are going to be working with the mike-in-hand and some training for the National Weather Service individuals to help implement that, which is good, which is very proactive.

Mr. YOUNG. Now, I just came from an area that has an automatic weather reporting system. It tracks weather, wind-wise, cloud-wise, wind coverage, et cetera, just very, very good. Why can we not put that in the airplane itself? It is just not practical financially?

Mr. LABELLE. I really cannot respond to that. I suspect it would be financially prohibitive. Perhaps Capstone—the Capstone initiative has some of that inherent in it with the weather display and weather mapping and some other issues, and some of the downlinks that they have from satellite data, so that is coming. That is available at least in part in the Capstone initiative.

OLDER AIRCRAFT

Mr. YOUNG. Mr. Poe, you know I have had some questions—I will not bring them up today—about a couple of other subjects like airplane maintenance and certain things that I do not think are necessary, old planes being proposed in the Lower 48 that now they say are outdated. No plane has been shown where it has collapsed or has had metal fatigue. It is pilot error.

Alaskan industry itself, as you are well aware of, is dependant upon many of our old vintage aircraft. That is what they were built for, and as long as they are inspected, and I think that is your responsibility, and as long as they are, you know, studied for stress, engine maintenance is kept up, and everything is done, there is no reason physically why an aircraft cannot run forever, and one of my proud moments in Alaska is, I see planes flying that I see standing in the Smithsonian Institute, and I have flown on most of those.

So I think there has got to be a working relationship, and I am glad to hear you say that that has occurred, or is occurring. I want to continue that, because as I mentioned in my opening statement, my goal is to make sure it is safe, but make it available, and make sure that the competition exists, and make sure that my consumers are able to get from A to B without having to pay an arm and a

leg. Every time we have to do something within the insurance area, or addition, et cetera, our constituents end up paying for it, and very frankly I do not think it creates that much more safety.

So with that, I want to thank the panel. Mr. Plumb, you have a great operation out there. Keep it going. One of my proud moments, as the Senator has mentioned, is the growth of that international airport, and we just hope that it continues, and we employ people, and we get jobs and get people off the airplane and on the airplane, and achieve the goal of good transportation.

Thank you, Senator.

Senator STEVENS. Thank you. On that aging aircraft issue, I talked to FAA Administrator Garvey on that issue. You may know about that, Pat. She told me she is aware of the legislation I mentioned, specifically the law that requires the FAA to consider Alaska's unique environment and its dependence on aviation before imposing any new rules or regulations, and she assures me that Alaska's concerns would be addressed in the final rule.

That has not been made public yet how it will be done, but we are going to monitor that very closely, Don. I am told now that that will be almost a year before that final rule is published, so we still have time to work on that.

Mr. YOUNG. Which reminds me, Senator, Mr. Poe, on that Ketchikan deal, has there been any problem with the existing exemption, the one that you brought up, of the corridor?

Mr. POE. Yes. The problem is, as traffic has intensified in that area, that we are no longer comfortable with the way the arrangement exists, and so—

Mr. YOUNG. May I ask this question: if you change it, what is the alternative, unless there is just less flights?

Mr. POE. Well, we have people looking into what the best alternative is. Our intent is not to reduce the number of flights. Our intent is to increase the level of safety, and that is what we are studying as we speak.

Senator STEVENS. We do thank you very much for taking the time to be with us. We do, by the way, have staff on the committee representing other Senators here today. That is important impact to have on our committee by the testimony we have, and far greater than if we had waited to have just one of you appear in a hearing in Washington, so I thank you for taking the time.

Our next group is what we call the user group panel. Dick Harding, president of PenAir, representing the Air Carriers Association, Tom Wardleigh, president of the Alaska Aviation Safety Foundation, and ALPA representative Felix Maguire, the president of the Alaska Airmen's Association, and Ken Acton, an aviation consultant.

I have just been informed, to my sadness, that because of a council meeting we must evacuate the building before 4:30, but we still have plenty of time, but I just want people to know there is a time constraint on us in order that the area may be cleaned and made presentable for the assembly.

For no other reason that that is the way it appears on the schedule I was given, why don't we just start with you, Dick.

STATEMENT OF RICHARD HARDING

Mr. HARDING. Good afternoon, Senator Stevens, Congressman Young, members of the committee, members of the public. My name is Richard Harding, and I am speaking to you as past president of the Alaska Air Carriers Association and as general manager of PenAir. I have been a pilot all my life, and I still occasionally fly the line. I will talk about the age 60 rule, but before that I would like to discuss a couple of other aviation safety issues.

The State of Alaska consistently has a significantly higher accident rate than the rest of the country. The Federal Government has invested millions of dollars in the FAA funding through new regulations and other programs. The sad reality is, the FAA has only minimally improved the safety record in Alaska. The accident rate today is the same as it was 15 years ago.

Over the past 15 years, the FAA has implemented major regulatory changes, mandatory installation of GPWS, CVR, drug and alcohol testing, the commuter rule, and they have proposed now new regulations on repair stations and aging aircraft. The cumulative cost to Alaska-based carriers is in the millions of dollars. Despite all of these mandatory regulatory compliance items, the accident record in Alaska has not changed.

PenAir took an inventory of the airports we serve, 2 years ago, and compared the accident and incident data relating to substandard airports. We made a difficult business decision to discontinue operations at several locations. This left a few small communities without options for air transportation. We did it because we realized the risk operating into those unimproved airports was not worth a potential accident.

Recently, the airlines and other user groups met with State and Federal agencies to draft a 5-year plan of infrastructure projects, system changes and recommendations to improve safety in Alaska. Seven major issues were a minimum of 3,300 feet of runway length with lights, and minimum shelter for the passengers, all-weather approach and landing capability, availability of weather information, communication navigation systems, weather cameras, and support of Capstone, and very important, a stable aviation workforce.

The Aging Aircraft Safety Act mandated the FAA to implement rules requiring engineering data that would forecast structural failure in aging aircraft and further apply that data to inspection programs. The Alaska air carriers and PenAir both support the regulations that improve airplane safety. Implementation of this regulation, however, will not provide a level of safety that is measurably better than provided by more feasible means. If the rule becomes regulatory, it will have a devastating effect on aviation infrastructure in Alaska.

AGE 60 RULE

The current proposed legislation by Senator Frank Murkowski to extend the retirement age to 65 is a rule we believe would benefit nearly everyone. The flying public would benefit by the greater experience level on the flight deck, pilots would benefit from their ability to select their time of retirement, airlines would reap bene-

fits of a lower pilot turnover rate, and retention of their most experienced pilots.

This year, PenAir will lose two pilots, including me, directly related to the age 60 rule. Indirectly, our company has an annual turnover rate of about 25 percent within our pilot ranks. However, the loss would be less if the major carriers were not experiencing a rash of vacancies as a result of this forced retirement. The military would also benefit by less pilot turnovers in the airline industry.

Experience is still the most important criteria for hiring pilots at PenAir. We operate in Alaska, and we have no choice but to fly in the most demanding conditions and under onerous geographical challenges.

When I first came to Alaska to fly for PenAir I had 2,000 hours of flight time. All of my previous experience consisted of training. I was either getting trained, or as a flight instructor, training others. I could ace any written test, pass any flight test with ease. However my first year of flying in Alaska was an education in itself. I found myself saying many times, boy, I will never do that again. After hundreds of never-again mental notes, I had a year under my belt, and a little experience.

I have been fortunate enough to have flown in Alaska for 30 years, and accumulated over 30,000 accident-free hours. Many pilots are not as lucky. A study by the State labor economist confirms my personal experience. Her 1997 study confirmed that pilots with less than a year experience contributed the most pilot fatalities on the job.

The general health of Americans has improved over the last 40 years, and most people are working to an older age. The median age of the Nation's workforce has risen from 28 in 1970 to 39 today. Even Social Security is raising the retirement age to 67.

Most people I know would prefer to have a little gray hair in the front seat, particularly when the flying conditions are not ideal. Maybe they say that to spare my feelings, but I do not think so, because I feel the same way.

In conclusion, I sincerely hope the age 60 rule is amended to 65. I fully believe it would be beneficial to everyone, and would help reduce the pilot shortage we face today.

Aviation in Alaska is an integral part of the daily economic and social fabric of our State. Ever more restrictive and expensive operational equipment requirements force carriers to make business decisions that are not market-driven, but are regulatory compliance-based.

The FAA continues to force carriers that have reached a financial and operational threshold of using larger turbine-powered equipment to pay a compliance penalty to operate that equipment. At the same time, operators of smaller, reciprocating engine equipment do not have the same regulatory compliance cost structure. The cumulative effect is to drive operators toward increased utilization of old technology, while exposing the traveling public to a greater risk.

PREPARED STATEMENT

The industry needs relief from well-meaning but misdirected regulatory proposals that accomplish little, or are of substantial cost. We do not expect to undo the mistakes like the commuter rule, but we would like to see one-size-fits-all regulations addressed to meet Alaska needs. You, Senator Stevens, provided the FAA a vehicle with recent regulation that allows the Administrator to consider Alaska's unique requirements. The Administrator still needs your guidance on how to apply this regulation. We also need your help in bringing Alaska into the 21st Century. We will never have the highway system provided to the Americans in the Lower 48, but Alaskans deserve an aviation infrastructure equivalent to that road system, one that provides the same safe, reliable transportation system as our fellow Americans.

And thank you for letting me speak today.

[The statement follows:]

PREPARED STATEMENT OF RICHARD HARDING

ALASKA AVIATION ISSUES FOR THE 21ST CENTURY

Good afternoon Senator Stevens, members of the committee and members of the public. Thank you for providing this opportunity to inform you of critical issues affecting commercial aviation today. My name is Richard Harding and I'm speaking to you as past-president of the Alaska Air Carriers Association (AACA) and as General Manager of PenAir, an Anchorage based company with 45 aircraft, 98 pilots and 425 employees. I have been a pilot all my life and have accumulated 30,000 accident free hours over 30 years in the industry. At times I still fly the line, although my commercial flying will come to an abrupt halt in 5 days because of an unjustified and antiquated rule. The FAA rule does not consider the value of my lifetime experience or good health. I'll talk more about the Age 60 rule in depth later. But, before that, I'd like to discuss aviation safety and Alaska's accident statistics, recent regulatory initiatives, the Commuter Rule, the condition of Alaska's airports and Aging Aircraft.

SAFETY FIRST

First, let's talk safety. The State of Alaska consistently has a significantly higher accident rate than the rest of the country and, anybody remotely involved with aviation in Alaska is acutely aware of that fact. The Federal government has invested millions of dollars into FAA funding through new regulations, increased oversight, and initiatives including a new approach to "dictating" and how the industry will operate "more safely." We've seen times of heavy-handed enforcement practices by the agency and have experienced the pendulum swinging the opposite direction to accommodate and work with carriers. The sad reality is what the FAA has done has only minimally improved the safety record in Alaska; and the safety rate today is the same as it was 15 years ago.

REGULATORY INITIATIVES

Over the past 15 years, the FAA has implemented the following major regulatory changes: (1) mandatory installation of GPWS on turbine-powered aircraft with 10 or more seats; (2) mandatory installation of TCAS on turbine-powered aircraft; (3) elimination of the allowance of 15 minutes flight to VFR conditions; (4) Part 135 flight crewmember training to Part 121 training program standards; (5) drug, and alcohol testing and training for aviation vendors' employees; (6) equipment installation requirements for single-engine IFR operations; (7) "commuter rule" conversion to Part 121 operations for single-engine aircraft with 10 or more passenger seats; (8) NPRM 99-09 Repair Stations, and (9) NPRM 99-02 Aging Aircraft. The cumulative costs to Alaska based air carriers has been in the millions of dollars. Despite all of these mandatory regulatory compliance items, the safety record in Alaska has not changed significantly.

THE COMMUTER RULE

In 1995, we felt the biggest and most onerous rule to ever hit the industry was the “Commuter Rule.” It has been nearly 5 years since its effective date with little or no change in the industry’s safety record—while there has been a documented decline in service in parts of Alaska. Where 10–19 passenger twin turboprops with two pilots in the cockpit were once used, they have now been reduced to 9 passenger seats with a single pilot. The results for those who completed the changeover are higher operating costs, higher ticket fares, and those who didn’t change over have more exposure to risk through increased numbers of takeoffs and landings. Certainly, the move back in time to older, single-engine piston-powered aircraft vs. the more reliable and safer twin and single engine turboprops is not progress.

In 1995, the FAA passed a rule that required Part 135 10–19 seat aircraft to transition into more restrictive and expensive Part 121 operation rules. Only two companies made a successful transition into Part 121, PenAir and Frontier Flying Service. Three others that made the transition, Taquan Air Service (Air One), SouthCentral Air and Yute Air have either gone out of business or into bankruptcy. In effect, the rule took many of the newer, more technically advanced aircraft out of operation and literally set Alaska aviation back 25 years.

FUNDING

We have experienced a slow improvement in runway conditions over the years because of an increased investment of federal dollars. We need to increase the number of dollars to get airports up to minimum service levels. Investments in Alaska’s aviation infrastructure are such a slow and arduous process because of the bureaucratic process of the FAA, the value of much needed improvements isn’t something we can count on in the near future, with the exception of Capstone.

We all understand the different operating culture and infrastructure of Alaska transportation as compared with the Lower 48. Most of the Alaskan commuter fleet is composed of single-engine aircraft flying VFR. Aviation takes the place of a road system infrastructure throughout most of Alaska’s bush, and it always will. The cost of building and maintaining a half-mile of airport is much less expensive than building and maintaining roads between villages.

AIRPORTS

Speaking of airports, two years ago, PenAir took inventory of the airports we served and compared accident and incident data relating to substandard airports. We made a difficult business decision to discontinue operations into several destinations. This left a few small communities without options for air transportation. We did it because we realized the risk operating into those unimproved airports wasn’t worth the potential costs involved with an accident.

The conditions at our rural airports are only one of several topics I would like to discuss today. All of the subjects, however, address safety and offer recommendations for reducing accidents in Alaska.

Recently, the airlines and other user groups met with state and federal agencies to draft a five-year plan of infrastructure projects, system changes and recommendations to improve safety in Alaska. The six major recommendations of the “Alaska Aviation Coordination Council” were; (1) publicly owned airports, a minimum of 3,300 feet in length with runway lights and minimum shelter for passengers; (2) all weather approach and landing capability; (3) availability of weather information; (4) communication and navigation systems; (5) weather cameras; and (6) very importantly, stable aviation work force. The estimated cost to bring Alaska’s airport system up to these minimums statewide was estimated to be \$265 million over the next 5 years.

AGING AIRCRAFT

Congress initiated the Aging Aircraft Safety Act of 1991 (AASA) in reaction to an accident involving an older Boeing 737 in Hawaii. The Act mandated the FAA implement rules requiring engineering data that would forecast structural failure in aging aircraft and further apply that data to inspection programs. The manufacturers of the types of aircraft involved in the accident that precipitated this Act of Congress have already addressed the aging aircraft issue. Of the remaining light twin-engine aircraft used in commuter service, a disproportionate amount of these aircraft are being operated in Alaska.

Operators in Alaska, including PenAir, rely heavily on light twin-engine aircraft to provide the aviation infrastructure necessary to serve Alaska’s small communities that are totally dependent upon air transportation. Implementation of this rule

would eliminate light twins and force carriers (those that survive the economic loss of their light twins) to revert to single-engine aircraft. Most single-engine aircraft in Alaska are older than the light twins, and most cannot fly IFR, which will in turn create a less safe environment for the public. Please note that accident statistics show that in Alaska, single-engines have six times more accidents than twin-engine aircraft.

In Alaska, the light twin engine aircraft we fly are primarily the Piper Navajo, and the Cessna 402. Neither has been manufactured since 1983. It is not practical or economically feasible for the manufacturer to provide the design data necessary for engineers to create the information required to establish damage-tolerance-based inspections and procedures. Under the current NPRM, expanded inspection procedures apply damage-tolerance inspection criteria. Considering that this NPRM is directed toward aircraft designed under FAR 3 and FAR 23, it effectively requires re-engineering of the airframes.

In addition to the lack of design information availability, the National Air Transportation Association (NATA) estimated the cost per air carrier to be approximately one million dollars per aircraft type. The only result of the new regulation will be the elimination of light twin aircraft in Alaska, not increase safety.

The AACA and PenAir both support regulations that improve airplane safety. Implementation of this regulation, however, will not provide a level of safety that is measurably better than provided by other more feasible means. The Aging Aircraft Safety Act of 1991 did not mandate the FAA require operators to re-engineer entire fleets of operational aircraft, and the Act did not mandate the FAA to ground them. There is no mention in the AASA of damage-tolerant inspection criteria. There are other measures available to ensure the continued airworthiness of aging aircraft for the remainder of practical service life, such as implementation of additional age sensitive maintenance procedures requiring progressive inspection programs, tailored to each affected type, and incorporation for planned obsolescence provisions.

Damage tolerance inspection procedures are inappropriate for retrofit inspection programs. There is no need to expand the scope and detail of inspection criteria for PenAir. To place this burden on each air carrier to develop its own program, including damage tolerant inspection criteria for each type of aircraft the air carrier intends to operate in the future, is not practical nor economically viable. The proposed aging aircraft regulations, as currently written, are unnecessary and cumbersome.

If the rule becomes regulatory, it will have a devastating effect on the aviation infrastructure in Alaska. The most critical safety concern with older aircraft fleets, and the most immediate concern, is the individual airplane's history of damage, repair maintenance and alterations. A progressive inspection plan such as Approved Airworthiness Inspection Program, designed by certification engineers and airworthiness inspectors incorporating increasingly stringent requirements as the aircraft ages, would identify fatigue problems before they affect safety.

Grounding fleets of aircraft in Alaska will enhance neither safety nor serve the public interest. The regulation needs to be modified to allow reasonable inspection programs an opportunity to address the aging aircraft issue.

AGE 60 RULE

The Age 60 Rule is not a new idea, as the very first FAA Administrator, Elwood Quesada, introduced it during his term and on March 15, 1950 it took effect requiring mandatory retirement for pilots as they reach age 60 even though neither scientific studies and/or medical documentation ever supported this rule. Overwhelming opposition was presented and only after the rule had taken effect was a study undertaken to examine critical issues. The study was performed by the FAA in the early 60's but later abandoned by the agency before final results were made public. In 1969, an independent report was commissioned and completed, but again results were never made public.

In 1979, a Navy study of pilots and their long-term health histories was performed on one thousand aviators. The FAA reviewed the study but concluded it failed to provide an adequate basis for revising the Age Sixty Rule.

Congress became interested in the issue and directed the National Institute of Health (NIH) to do research on the viability of the rule and they were tasked with substantiating the reasons pilots were retired at sixty. A panel was convened outside the authority of the FAA and that panel "expressed doubts about the need for all pilots to step aside at age sixty." Subsequently, the panel recommended initiation of a comprehensive study focusing on selected captains over sixty.

After reviewing the NIH report, the FAA issued two notices of proposed rule-making (NPRMs). First, the agency suggested extending the Age Sixty Rule to include flight engineers and the second proposed a test program for selected pilots

over sixty. This mirrored exactly what the NIH had suggested. Two years later the furor died down and the FAA quietly dropped the proposal.

The current proposed legislation by Senator Frank Murkowski to extend the retirement age to 65 is a rule we believe would benefit nearly everyone. The flying public would benefit by the greater experience level on the flight deck. Pilots would benefit from their ability to select their time of retirement. The airlines would reap benefits by experiencing a lower pilot turnover rate and retention of the most experienced pilots in the system.

Of course, no issue is without opposition. Those that wouldn't benefit from a rule change are the young pilots on the fast track to the left seat. Certainly the rule would delay them back, which in actuality would provide a quiet benefit by allowing them more time to gain valuable experience.

This year PenAir will lose two pilots, including myself, directly related to the Age Sixty Rule. Indirectly, our company has an annual turnover of about 25 percent within our pilot ranks. However, the loss would be less if the major carrier's weren't experiencing a rash of vacancies as a result of this forced retirement. The military would also benefit by less pilot turnovers in the airline industry.

Last year, for the first time ever, we lost a 48-year old pilot to the majors! And, I'm amazed to hear some carriers are now hiring pilots over 50. On the opposite end of the spectrum some majors are now hiring pilots with less than one thousand hours. In contrast, at PenAir, we won't even consider employing pilots with such a low experience level to fly our five-passenger airplanes. We used to give hiring preference to pilots without a four-year college degree because we knew the airlines weren't interested in them, but that is not true anymore.

Experience is still the most important criteria in hiring pilots at PenAir. We operate in Alaska and have no choice but to fly in the most demanding conditions and onerous geographical challenges. On an average day we have "poor" weather reporting and operate within strict limitations because most airports have only VFR capability and many of the airports we depend upon have sub-standard runways.

When I first came to Alaska to fly for PenAir, I had 2,000 hours listed on my employment application. All of my previous experience consisted of training. I was either getting trained or training others as a flight instructor. I could ace any written test and pass any flight test with ease. However, my first year flying in Alaska was an education in itself. I found myself saying many times, "Boy, I'll never do that again." After hundreds of "I'll never do that again" mental notes, I had a year under my belt and a little experience. I have been fortunate to have flown in Alaska for thirty years and accumulate over 30,000 accident free hours. Many pilots aren't as lucky. A study by state labor economist Taktha Lukshin confirms my personal experience. Her 1997 study confirmed that pilots with less than one year experience contributed to most of the pilot fatalities on the job.

The general health of Americans has improved over the last forty years and most people are working to an older age. The median age of the nation's workforce has risen from 28 in 1970 to 39 today. Even social security is raising the retirement age to 67.

Most people I know would prefer to have a little gray hair in the front seat, particularly when the flying conditions aren't ideal. Maybe they say that to spare my feelings, but I don't think so. I feel the same way.

CONCLUSION

I sincerely hope the Age 60 Rule is amended to Age 65. I fully believe it would be beneficial to everyone, whether they know it or not, and would help reduce the pilot shortage we face today. Aviation in Alaska is an integral part of the daily economic and social fabric of our state. Evermore restrictive and expensive operational and equipment requirements force air carriers to make business decisions that are not market-driven, but are regulatory compliance based. The FAA continues to force air carriers that have reached the financial and operational threshold of using larger, turbine-powered equipment to pay a "compliance penalty" to operate that equipment. At the same time, operators of smaller, reciprocating-engine equipment do not have the same regulatory-compliance cost structure. The cumulative effect is to drive operators toward increased utilization of old technology while exposing the traveling public to greater risk.

The industry needs relief from well meaning but misdirected regulatory proposals that accomplish little or nothing but add substantial costs. We don't expect to undue mistakes like the commuter rule but we would like to see "one size fits all," regulations addressed to meet Alaskan needs. You, Senator Stevens, provided the FAA a vehicle, with recent regulation, that allows the Administrator to consider Alaska's

unique requirements. The Administrator still needs your guidance on how to apply this regulation.

We also need your help to bring Alaska aviation into the 21st century. We will never have the highway system provided to Americans in the lower 48; but, Alaskans deserve an aviation infrastructure equivalent to that road system that provides the same safe, reliable transportation as their fellow Americans.

Senator STEVENS. Thank you very much. We appreciate it, Dick. Tom.

STATEMENT OF TOM WARDLEIGH

Mr. WARDLEIGH. Thank you, Senator Stevens and Mr. Young. It is a pleasure to greet you here. I just returned from New Zealand. I did not have time to prepare a written dissertation, but the one thing I noticed is that user fees were instituted in New Zealand in 1987, with general aviation exempt from those fees.

However, in January 1999, those user fees were applied to general aviation in that country. It is my personal observation, after visiting several airports there, that Mort Plumb hosts more general aviation at the Lake Hood airstrip than the nation of New Zealand has. I commend you for protecting us so far from user fees and other things that would just put the lid on general aviation.

Addressing safety directly, Alaska has a unique mix of topography and weather that makes it extraordinarily demanding to serve airports like Dutch Harbor and St. George Island, St. Paul Island, Ketchikan, Juneau, Wrangell, Petersburg, and so forth. Retention of experienced pilots is going to be a critical factor in improving any safety record in the Yukon Delta, Kuskokwim area, anywhere that we have been consistently going into the mining business with aluminum bits, which just does not work.

I believe that through your efforts, the University of Alaska has a fine plant facility. They are capable of training resident Alaskans, people born and raised here, people who want to live in the rural communities, and serve those communities. One of our apparent problems is a lack of gainful employment opportunity in the small communities of rural Alaska. Being a professional pilot, even a ticket agent or a dispatcher or a weather observer is certainly an attractive alternative to not doing any of those tasks.

I urge that politically we get together with the Bureau of Indian Affairs, with the unemployment people and the Federal Government, any source of funds that will enable us to bring young people in from graduating in rural high schools, train them to useful careers in aviation at the University of Alaska, perhaps protect them a little bit from the city environment when they first get here, enable them to have a productive life in aviation, and become a PenAir pilot working for Dick, and stay at PenAir, rather than going to the worldwide air carriers or other, more lucrative jobs.

I believe some stability and some lesser accident rate could improve the insurance rates, make the companies more profitable, and make the people in the communities a little bit more comfortable when they ride in a small airplane from place to place, and when their athletic teams go from village to village to just play basketball.

Mort mentioned a problem with seaplane adequacy here in the Anchorage area. There is a possible opportunity for the State, and with some political influence, the railroad. The Alaska railroad had

a large gravel pit at Eklutna, Alaska. One of the local construction firms even created a proposed plan to make a good, safe, seaplane base in that old gravel pit.

Unfortunately, it had just been Eklutna Village Corporation. They had a vote whether to support the accommodation of seaplanes or to keep it as it is, and with the population of 27, the vote was 14 to 13 to not have a seaplane base there.

It is my feeling that if an attractive land exchange program could be created, perhaps those people would exchange that land, where it could become very convenient. It is in a very sheltered wind area, and would in fact make a fine reliever seaplane base for the communities of Eagle River and Palma, and Anchorage.

We are concerned not so much for safety, but for utilization of the air space over national parks, refuges, and other Federal domain in the State of Alaska. We notice, for instance, that the park service employees use gravel bars and rudimentary strips, but they discourage the general public from using them.

At the present time, we have got a tentative agreement with the park service at McKinley to continue the McKinley air strip in service for the foreseeable future, or, quote, until a suitable replacement is identified. That air strip was used recently for medevacs and service to people in need, as well as just the tourist population. We feel that access to that park should not be restricted to just those people who are able to walk and who have the time to walk. There are handicapped folk who can see Mount McKinley in no other way than getting in an airplane and viewing that majestic piece of real estate. We hope that you can intervene with that.

We notice that the insurance availability can be a business deterrent. Right now, there is considerable flux in the availability of commercial insurance for aviation purposes. I do not exactly know how the Congress can fit in that, but hopefully there can be found a way to make affordable insurance available land, of course, the key to that is stop having accidents. The key in my view to stop having accidents is have more proficient, skilled pilots and more conservative management who will tell them, you may not take that flight under certain conditions.

We recognize that the FAA is basically air carrier oriented, because the air carriers serve the huge bulk of the national population, but we urge that it stay close to the administration, to Mrs. Garvey and her successors, so that Alaska's unique needs can be met. One size did not fit Alaska any better than a sharpei dog's coat, and not many of them run in the Iditerod.

I would suggest that our Anchorage population reading the letters to the editor recently has lost sight of the fact that Anchorage International is one of the most unique and beneficial airport sites in the whole world, to my knowledge. We have three flight paths from those runways that go over water. They do not imperil people's houses, residencies. They do not make a lot of noise.

The thought of moving a large airport into the Susitna Valley would preempt a great deal of livable land by virtue of the noise and the approach and departure paths. I believe Mr. Plumb has a tremendous challenge to develop that beautiful airport site successfully and skillfully, and sell it to the population of Anchorage, who

benefit by the fact that 747's full of fuel oil do not fly right over the middle of town on take-off most of the time.

I join you in the issues already mentioned about aging aircraft. We still have a 1929 Traveler in commercial service here in Alaska. It seems to be doing fine. I would hope that the FAA's enforcement program—and be reminded of the original language of the enabling act that said, and to regulate in the interest of safety. We get the feeling that some of the regulation goes on just because the law is the law is the law. We would like to have some direction to their legal department, and to their enforcement people. Focus it on safety. Make the regulation in the interest of safety come to life.

And thank you for this opportunity.

Senator STEVENS. Thanks, Tom. Glad you got back in time.

Felix Maguire.

STATEMENT OF FELIX MAGUIRE

Mr. MAGUIRE. Senator Stevens and Congressman Young, ladies and gentlemen, it is an honor to be able to speak before you this afternoon.

I am president of an association that is a State-wide association that is 1,200 members scattered throughout the State with regional directors in Fairbanks, Juneau, Kenai, and Bethel, so we keep an eye out on most things around the State for general aviation.

Personally, I have been the chief pilot for AT&T ALASCOM for the last 20 years, and I have flown into most villages throughout the State, and I do so on a regular basis, so I am very familiar with the structure of the State.

There are six points I wanted to mention this afternoon. Number 1 is that the 5-year strategic plan that has already been mentioned, we are very supportive of that. It came out of an initiative when people gathered together and had communicated well and shared well their vision and their feelings for the future, and there is a good sense of vision in that strategic plan.

The only thing that I personally would disagree with is that it asked for runways of 3,300 feet, and I think we should go for 4,000. The reason I say that is because, when I started flying here 25 years ago, and in the first 10 years I flew a King Air, and I kind of was the first one to fly a King Air around for a while, and then the King Air started to catch on and we started moving from piston airplanes to turboprops, and by the end of my 10 years of flying that King Air and we sold it and replaced it with a Cessna Citation, we noticed other people flying King Air's, and even the airlines were flying the Beech 1900's, which is the stretch version of the King Air.

I have flown the Citation now into gravel strips all over the State, and even took Citation into Chungnak, which kind of surprised them that a jet would get in there, and the movement is that the older airplanes are not being replaced. They are not making any more Navajos, so gradually we are going to move to turboprops, and then we are going to move to jets down the line, and if we are looking in the next century, then we have to look to providing runways that are capable of taking those airplanes.

I was able to do most of my stuff on the part 91 and land on runways that are 3,000 feet, but if Dick Harding is to use the Citation

in and out of a strip he will have to have 4,000 feet to meet the requirements of part 121.

The next issue I mention is whether we had a system here in Alaska that was working very, very well, called LABS, and the FAA provided that system, and we could get weather on that, and it was available very cheaply on a commercial basis. It was not Y2K-compatible, so it was taken away and replaced with a system called DAWN. The only problem with DAWN is that DAWN is an internal system. The FAA will not let the public use that. They have this tremendous system, but they use it for themselves only, and I do not see the rationale in the FAA gathering information from the National Weather Service and then hoarding it to themselves and not letting it available to the public. If this system could be put on the Internet, then we could all have this information, even if we have to pay for it.

The commercial systems that are out there at the moment are not as good as DAWN. They are not as good as the LABS situation. They do not allow you to have collectives. If you want the weather, if you are going from here to King Salmon, you have to get the weather for Barrow and every other place, so it is a waste of paper and time, and is not as efficient as the LABS system was.

The cameras are a great contribution to the State, and we thank the Senator for his getting the first appropriations to try out the first cameras, and it took us a while to get the FAA to do that, but now that we have got them, everybody sees the advantage of having cameras throughout the State, and we look forward to having a camera in every pass as well as at some of the remote locations where we do not have a human being to report the weather.

Flight service stations are still a concern. You have already mentioned the fact that the flight service station in Ketchikan is short-staffed, and it has to do, at that post has partially to do with the fact that the flight service station personnel are grade 10's. Those at the FASS are grade 12's, and so everybody who is in the flight service station wants to move to an FASS and get extra pay.

In the meantime, with the shortage, an FASS person comes to Ketchikan to fill in. They are not only getting two grades higher in pay, they are also getting per diem, and that destroys the morale of the flight service station, so people want to leave the flight service stations and go away.

There is no training facility in Oklahoma for flight service stations as they are today. The equipment is outmoded, and for some reason the FAA is adamant that training has to take place in Oklahoma and not on-site. If they would train people on-site in Ketchikan and Sitka and Dillingham and Barrow, then we would not have the shortage. We could train local people to do that, and we would be able to employ perhaps the Native residents to work at the flight service stations.

Maintenance is a concern of navigation facilities throughout the State. The FAA in the last month has decided to centralize maintenance in Anchorage, so all the people who maintain things out of Juneau or Ketchikan, Barrow and so forth, are all going to be centralized in Anchorage.

I work for a corporation that tried the same thing. AT&T brought all their technicians in from the bush and put them all here in An-

chorage, and found themselves in a real bind when something went out, such as ADAK went off the air 3 months ago, and the only way to get somebody out there—you cannot fly them out commercially because there is no weather available.

You cannot charter an airplane because the charter cannot go without weather available. The only thing they could do was, they fortunately had a corporate airplane that flew under part 91 that could go out and take a look-see.

The FAA does not have a part 91 airplane in the State of Alaska, and we know how difficult it is to get into Juneau on most days, and if we have to get a technician down to Hoonah or to Haines to fix a beacon, then the difficulty of getting them from here to Juneau is the first step, and then to get them the other way. So I think it would be a retrograde step and a depreciating of service if FAA centralizes the maintenance in Anchorage.

The Capstone project is a great project. We support that, but we see that even though it is a 3-year experiment within 3 years, if it is a total success, it will take at least 20 years before this is implemented Nation-wide. In the meantime, Bethel is a bad spot without radar, and each year we encourage the FAA to put radar in Bethel since 1987.

They have approved it each year, and each time it comes round to appropriations it gets killed, because the appropriation is based on the number of passengers who move through the terminal. The number of passengers moved through Bethel could be all put on one 747, or two 747's, in one day, and that is inadequate to justify the place to have radar.

If we counted airplanes instead of passengers, the movement of aircraft would justify the radar, and I think an exemption should be made on how we justify the radar in Bethel and go ahead and put it in. The radar could be in and up and working in 2 years, whereas the Capstone project equipment will not be working for at least 20.

Senator STEVENS. 20?

Mr. MAGUIRE. I would think, by the time we get around the whole Nation, everything that would have to be done to use this as a national project. This is an experiment that is going on, the Capstone, and it is going to be very successful, but by the time you get every aircraft equipped, and every center equipped with the radar, the ADSB to read this stuff, and you need radars around and facilities to pick up the ADSB, it is going to take a longtime to implement the whole thing as a national program, and the way the FAA works, and the way the appropriations work, it will take time, and that is not hitting them or saying there is anything wrong with them. They are doing the best they can, but they are severely limited by their funding.

Aging aircraft is a problem. It will force us back into single engine airplanes, and single engine airplanes have more accidents than twins, and we know we have not been successful even though we have had single engine IFR approved. Not many are doing it because of the extra equipment they have to carry on the airplane. If we force people out of the aging aircraft, then we are going to force them back into singles.

Generally, airplanes start out in the Lower 48, and in Europe, and they run 10 years, and we see them for the second wind up here in Alaska, so to speak, and then after we are done with them they might end up in some third world country, but we do not get many new airplanes into Alaska, and if they are going to interpret the regulations to deprive us of the use of the current, every 737, every airplane that ERA has over there will go away. They are Conairs, they are twin Mortons, they are all Morton 10 years, 14 years old. They will all disappear. It would be an intolerable situation for the State.

The last thing I would like to mention is the Ketchikan corridor, seeing as how you brought it up. What I was told precipitated the Ketchikan Corridor was a new ILS that was asked for by Alaska Airlines and other airlines, an ILS 2, and it reduced the minimums from 1,000 feet down to 500 feet, and it was the fact that they would come down to 500 feet, that they would be too close to the people going out in the corridors.

I find it hard to believe that after all these years somebody has brought that up as an objection, because even if you fly the normal ILS down to 1,000 feet, at some point you are going to be at that same point of 500 feet as you go in, and you are going to be at that in VFR conditions if you are flying the ILS 1, and people can fly past you.

If it is down to 500 feet, they will not be flying down the corridor, so I do not know why FAA is making this such a big problem. The exemption is good, the separation is sufficient, it has worked well for 20 years, let us keep it going.

Paul Bowers brought up the idea that the FAA is kind of locked into with the airports of improving the safe areas around the airports rather than improving the runway. There is a similar thing happening with PAPI's and VASI's. Those are the lights and the approaches to runways. PAPI's our international standard. It is the IKO standard, and they are warning us to put those in all our runways because it is the IKO international standard.

VASI's work much better in Alaska, because if you come downwind at Fort Yukon and you turn base and you can see the VASI, you know whether you are high or low. You cannot tell on a PAPI until you are lined up straight with the runway whether you are high or low. A VASI is a much better indicator and safety device for Alaskans than a PAPI, and just because it is national policy to go with PAPI's and its IKO does not necessarily mean that we have to go that way in Alaska, and that is one of the problems again.

For your own home town, Congressman Young, from Fort Yukon down to Circle and down to Eagle, you cannot fly a small airplane down there, I discovered to my horror, because the MOA is now down to 100 feet in that area, and we are trying to work with the military so that we can get a corridor between Fort Yukon, Circle, and Eagle, so people can go down there at least to 2,000 feet safe altitude, especially in the summertime when we have people coming visiting Fort Yukon.

But it is an unprecedented time of cooperation that is going on at the moment. We are sitting around tables, we are talking to each other, Tom, from the Safety Foundation, the Air Carriers Association, the military, the FAA, the DOT, and we have been work-

ing so well together in this last year, it has been very refreshing to see that everybody is willing to speak out, and nobody is afraid to say certain things, and yet everybody is cooperating to make things better, and that is part of what led to that 5-year strategic plan.

PREPARED STATEMENT

I congratulate them for doing that. I congratulate both of you for inviting us here this afternoon, for having our say. Thank you very much.

[The statement follows:]

PREPARED STATEMENT OF FELIX MAGUIRE

Good afternoon Senators and members of the committee. Thank you for the opportunity to present some comments on the major issues affecting aviation in Alaska and their impact into the 21st Century. My name is Felix Maguire and I am president of the Alaska Airmen's Association, which is non-profit organization dedicated to the preservation and enhancement of General Aviation through education and safety. The Association has more than 1,200 member Statewide. It has its headquarters in Anchorage and has regional Directors in Fairbanks, Juneau, Kenai and Bethel. We work closely with all other civil aviation organizations, including AOPA, as well as the Military and State and Federal Government Agencies to preserve and enhance general aviation.

MAJOR ISSUES

Five year strategic plan.—We have worked with the above organizations to produce the Five Year Strategic Plan for Alaskan Aviation as proposed by the Ad-hoc Alaska Aviation Advisory Committee. This proposal is the result of all agencies, civil and government, gathering together and communicating openly with concerns for the best interest of aviation in our State. We whole-heartedly endorse its recommendations concerning: (1) The lengthening of runways to a minimum of 3,300 feet and providing safe shelter at every airport; (2) All weather approach and landing capabilities; (3) Availability of weather information; (4) Good communication and navigation facilities; (5) Weather video cameras; (6) A stable aviation work force. This vision for the future will meet many of the safety needs at the airports throughout the State. Our inter-modal transportation system relies heavily on Marine transportation in the SouthEast, Road and Rail in South Central, and totally on Aviation in the North, the West and SouthWest. In a State where the infrastructure is so different from the rest of the United States, we emphasize that Aviation is the lifeline to the outside world for most Alaskan villages.

Weather information.—The installation of AWOS and ASOS has replaced many human observers throughout the State. Weather continues to be a major factor in aviation accidents in Alaska. The introduction of Video Cameras has been the greatest enhancement to weather reporting in the past 15 years. We encourage more use of this technology and greater availability to the public. The availability of weather and NOTAMS through such systems as LABS enabled users to access vital safety information before flight. LABS was discontinued this year as not being Y2K compatible. The replacement system, DAWN, is not available to the public. It is for FAA in-house use only. Other commercial systems are not as good and very costly. Why can't the FAA make DAWN available to the users via the Internet? It does not make sense for the FAA to hoard the information and give it out piece meal by phone or on DUATS. LABS provided for collectives. For example if an aircraft were flying from Fairbanks to Ketchikan, LABS would give weather at the appropriate airports en-route, Anchorage, Cordova, Yakutat, Juneau, Sitka as well as winds aloft and forecast. Using current commercial systems, the pilot gets the weather for every station in Alaska, using more paper and wasting time and energy. The FAA gets good information from the National Weather Service but is not making this available to the general aviation users. Why?

FSS stations.—These are the backbone for distributing information and weather in our State. The specialists at FSS are Grade 10 while their counterparts at AFSS are Grade 12. The AFSS has more sophisticated equipment but the FSS personnel are hard to replace. There is no scheduled training for replacements and after a year at an FSS the specialist inevitably moves on to an AFSS for the higher grade of pay. Ketchikan has been on reduced service for a year now awaiting replace-

ments. Temporary replacements come from the AFSS, get higher pay plus per diem, and this breaks down the moral of the FSS staff. Consequently, we the users suffer from shorter hours of operation; staff with less experience as the longer serving ones leaves. If this continues the FSS will close due to staffing shortages and the users will lose a valuable safety net.

Maintenance of facilities.—The FAA recently proposed to centralize its maintenance for the State in Anchorage. I was Chief Pilot for AT&T Alascom for twenty years here in Alaska and saw that company go through the same cost cutting exercise. There were several instances that will be paralleled by the FAA when trouble hits. The communications earth station at ADAK went off the air three months ago. All scheduled aviation came to a stop, as there was no weather reporting available and no ATC frequencies in operation. The island was isolated. Maintenance could not travel on a Charter, as there was no weather. Fortunately, the company has a corporate aircraft that operates under Part 91. We were able to fly to Dutch Harbor, fill up with fuel and then proceed to Adak for a “look see.” Being part 91 we were able to land and get the maintenance technician to repair the Earth Station. The FAA does not have as part 91 aircraft in Alaska so what will it do if a critical navigation system goes down. We know how difficult it is to get into Juneau some days even with all systems working. We encourage to FAA to rethink this policy as long as there are ground-based facilities. In the middle of the next century, if we have only Satellite based non-ground facilities, then the technicians could be centralized.

Future planning.—I came to Alaska in 1974 as an Air Force Pilot and since then I have noticed the great improvement in many airports and a deterioration service by the FAA. This is in part due to a plan that implemented to replace FSS stations and weather reporting with un-tried automatic equipment. Future plans should not be implemented until the replacement systems are proven to be successful. Our Association fully supports the Capstone project that has so much promise for the future. At the same time we know that it will be some twenty years before it is all refined and ready for operations use everywhere. In the meantime, Bethel needs its radar. The radar has been approved for installation in Bethel every year since 1987 and each year it gets dropped for lack of funding. The measurement used that counts passengers passing through the airport is unsatisfactory. Two B.747's could carry all that travel in one day so the FAA drops the requirement for Radar. If they used the number of aircraft movements, they would find Bethel is a busier airport than of the lower 48 airports. An exemption needs to be made so that Bethel gets the Radar that is necessary to provide more safety. The record of radar being introduced at King Salmon shows that the flow of aircraft increases with the introduction of approach radar.

Aging aircraft.—Twenty years ago I flew the first King Air around the state. Others were flying Navajos, and Cessna 402 as well as a myriad of single engine aircraft. Over the ten years of flying the King Air other started flying similar aircraft. In 1989 we switched to a Cessna Citation V. The runways were improving and the Citation 560 could handle gravel and short runways of 3,000 feet. This is a part 91 operation. To use the aircraft for Part 135 or Part 121, a longer runway would be required. The trend has been from Piston twins to Turboprop, and in the future it will lead to jets. There are no piston twin being made that would replace the aging Navajos and others. In Alaska, we tend to get the second-hand aircraft; those that have been used for ten years in the lower 48 and Europe appear in Alaska. When they finish their time here they go on to Africa and other less developed countries. The new NPRM would kill the aviation business in Alaska. Surely, the intent was to prohibit failures such as the B.737 that came apart in Hawaii. This NPRM will force Alaskans back into single engine aircraft. They have a worse record for safety and mainly fly VFR. The result would be a retrograde step for Aviation.

Better communications, cooperation and interchange of ideas is a necessary ingredient for the future. I thank you for allowing us to express these thoughts and hope that you will be able to consider the special needs of a State that depends so much on aviation.

Senator STEVENS. Thank you.
Ken. Ken Acton.

STATEMENT OF KEN ACTON

Mr. ACTON. Thank you, and good afternoon, Senator Stevens, Congressman Young, and the public. Thank you for holding this hearing in Alaska, and so close to those of us who are directly affected by the issues of commercial aviation.

I would like to address three fundamental issues and two emerging issues for the future. In the same manner that many of the challenges facing Alaskan aviation are not new, I would like to suggest that some of the first issues for the future are not new, either, namely, any future demands and accommodation of Alaska aviation will still include reliance on a handful of fundamental requirements, and they are, available weather information, reliable airport facilities, and consistent FAA oversight and support of the industry.

I believe both the weather and the airport facilities have been addressed prior to my time, so in the interest of time I will not dwell on those. I would like to reinforce the issues that Mr. Bowers brought up and Dick Harding brought up and Felix brought up, all about the Alaska aviation, the 5-year plan and the minimum standards for airports.

I would also like to endorse the comments, the previous comments about alternative and more weather sources. This is the single best way that we can improve aviation safety in Alaska, is the expansion and the increase in the number of weather sources throughout the State.

The third fundamental need that I mentioned was the need for consistent FAA oversight and support of commercial operators. My business allows me to work with several operators and with several FAA representatives, and I have discovered, along with my clients, that there are certain patterns that impede both the FAA and commercial operators from maintaining an open working relationship. The three most common patterns are the lack of accessibility of assigned FAA inspectors for their oversight and support, the instability of inspector assignments, and the inconsistent interpretation of FAR.

I believe these patterns that exist between operators and their assigned inspectors are indicative of a much larger pattern, and Dick Harding mentioned it earlier, specifically the well-intentioned FAA initiatives for safety that we have seen in the last 10 years have not significantly improved the safety record of Alaskan aviation. What we need instead are consistent, stable, and predictable expectations from the FAA that will help create the trust and the cooperation that will strengthen safety, service, and compliance.

Several speakers prior to me have mentioned Capstone, and I, too, would like to endorse Capstone, and mention it as illustrative of the need for these three fundamental issues in the future, namely, when we look at the system, I mean, it is an exciting system, and I cannot think of a better model for the theme of this hearing, you know, the issues of the 21st Century, and when we look at the ingredients of how it works, being able to download weather into the cockpit, being able to tell where you are and have that communicated to the other airplanes, that is all great, but still we understand the importance of the fundamental needs, one, the importance of state-of-the-art weather services, and more of them; second, reliable airport facilities as aircraft operate in an IFR type operation into many of these locations; and third, broad support and participation, which can only occur with an open and trusting relationship between the regulators and the aviation users.

I did mention that I would like to bring up two issues that I see as emerging issues in the future, the first of which is an increased need for responsible risk management on the part of and by the initiative of operators, incumbent on the Alaskan aviation industry and individual operators to create better risk management and safety systems for its operations. Increased market competition and the experience level of the pilots flying in Alaska require this.

Without specifically defining a model, or defining what would be the best program for all, I think the need defies that. Rather, I think we can identify qualities of good risk management that are appropriate to rural Alaskan aviation. Initial and recurrent training programs should include aeronautical decisionmaking not only for pilots, but for management as well.

It is time to recognize and respond to the fact that the corporate culture of operators influences the safety of flight operations, and that this culture can be trained and managed.

The second quality of good risk management is the incorporation of increased two-pilot experience and revenue flight operations. I am not suggesting doing away with single-pilot operations. I am simply suggesting that operators need to pay more attention to the quality control of the pilot in the cockpit. This would include programs that require new-hire pilots to fly in revenue line operations with experienced pilots prior to assignment in single-pilot operations, and especially during marginal and winter operation and flight conditions. This also includes routine company checks of line pilots throughout the year.

The last quality that I would like to identify of good risk management systems in the future are the need to make the go no-go decisions of operators, to define them in procedural terms. I am speaking of the decisions surrounding specific flight assignments and their release for flight. PenAir has demonstrated leadership in this area by developing a model for flight release that is not only participative between management and pilots, but it also is defined in qualitative terms.

The FAA needs to encourage and support the efforts of operators to define appropriate risk management for their operations. I do not believe that the FAA should regulate a one-size-fits-all model for such programs, and I was pleased to hear Mr. LaBelle say that as well. I would agree with what Felix said, that the industry, the operators, general aviation, and the regulators have a relatively good long-range planning atmosphere right now.

What I do believe is that operators are in a better position to create appropriate risk management measures for their own operations, but they need resources, training and support to do so, to design these systems.

The last issue I will address is changing patterns of scheduled air service in Alaska. We are all familiar with the established pattern of large aircraft serving mainline routes to hub cities, and small aircraft serving bush village destinations.

As we experience more competition, improvements to our airway and airport infrastructure, there will be greater pressure to support different types of aircraft and route structures than we have seen in the past. We are already experiencing pressures from the passenger, freight, and mail markets that will blur the line separating

large mainline aircraft on given routes versus small aircraft on other routes. The introduction of the commuter rule in 1995 is one example of regulation that inhibited the improvements to service and safety, and reinforced this two-class system of scheduled air service. I believe our future will include and require the use of more midsize aircraft in the creation of nontraditional route structures. While both small and large aircraft will diminish, they will also still be represented in several markets. In other words, the market will be much more complex, and it will be nice to think that the regulatory environment in the future will not only be flexible enough but also accommodate and support these changing patterns in scheduled service.

In closing, the challenges of maintaining a safe and viable commercial aviation industry I think will depend on improving airway and airport infrastructure, the cooperative efforts between FAA and the industry to address safety and compliance, and the regulatory environment that supports appropriate service to the Alaskan market.

PREPARED STATEMENT

Thank you very much. I will be submitting written comments.
[The statement follows:]

PREPARED STATEMENT OF KEN ACTON

Good afternoon Senator Stevens, Congressman Young, members of the committee, the panel and the public. Thank you for holding this hearing in Alaska and close to those of us who are so directly effected by commercial aviation. I have worked in the Alaskan aviation industry for 21 years in administration and training. In that time, I have worked for Part 121 and part 135 carriers in rural Alaska, have served on the board of the Alaska Air Carriers Association, and been a consultant to the industry. I would like to speak in behalf of the issues of rural Alaska aviation and many of my clients, including the interests of Part 135 operators, both scheduled and on-demand, and the markets they serve including Alaska communities as well as on-demand off-airport flights for the tourism, recreation, and sport fishing and hunting industries.

INDUSTRY CHALLENGES

We all know that aviation is the essential transportation link in rural Alaska, and we also know that rural Alaska is a demanding flight environment. There is a limited airport and airway infrastructure. The weather is harsh and often unpredictable. Most airports consist of small, unpaved runways that are subject to varying year-round maintenance requirements. There are few options for IFR flight. The nature of the market and its economy of scale dictate the use of small aircraft in VFR operations. The flight activity can be intense with the industry currently supporting some 300 certificated operators in the State of Alaska. And finally, because of the nature of the commercial pilot profession, rural Alaska operators attract low time pilots who are unfamiliar with the area and its unique requirements.

RESPONSIVE EFFORTS

Most of these industry challenges are not new, nor have they been ignored. There have been several responsive efforts to the challenges of creating and maintaining a safe and affordable air transportation system in the State. The automated weather reporting systems, both AWOS and ASOS, have been a welcome addition. We have seen a continuing program to upgrade and improve many rural Alaskan runways. The Capstone project is an exciting and promising plan for improving airway capabilities. And the mail transportation policy supports the presence and viability of scheduled air service at reasonable cost.

Indeed, many things are working very well, and we all share a debt of gratitude for the support and leadership of the congressional delegation.

I would like to address 3 fundamental issues and 2 emerging issues for the future.

FUNDAMENTAL NEEDS OF THE FUTURE

In the same manner that many of the challenges facing Alaskan aviation are not new, I would like to suggest that some of the first issues for the future are not new either. Namely, any future demands and accommodation of Alaskan aviation will still include reliance on a handful of fundamental requirements: available weather information, reliable airport facilities, and consistent FAA oversight and support of the industry.

WEATHER INFORMATION

Weather information is essential. Unfortunately, most aviation accidents in the State of Alaska are weather-related. The availability of reliable and more weather information is the single best way to improve the flight environment and it is the most repeated concern of the industry. The automated weather stations, both AWOS and ASOS, have significantly addressed the need for increased weather information. The "mike-in-hand" program and the addition of "flight cam" installations help pilots and operators see an even broader picture of the weather. The industry supports all of these systems. Simply put, the availability of reliable weather reporting systems in multiple locations will remain a fundamental requirement for maintaining a safe flight environment in Alaska's, future. We need more weather reporting locations. We need a variety of source information.

RELIABLE AIRPORT FACILITIES

Maintaining reliable airport facilities is the second fundamental need I would like to highlight. The State of Alaska with FAA capital investment continues to upgrade and improve the runways in rural Alaska. We would all like to see it happen sooner than later.

As we enter the 21st century, most of our runways are still short, unlighted, and unpaved, and are subject to mud, ice, and drifting snow. One of the highest levels of Part 135 flight activity occurs in the Yukon-Kuskokwim delta where 70 percent of the runways are under 2,500 feet in length and many are unlighted. And even though the Alaska Supplement may describe the surface of these runways as gravel, we know that in several locations that means the best fill material which was readily available, which is often a coarse river silt. We need runway improvements to bring our airports up to at least the minimum standards identified by the Alaska Aviation Coordination Council.

We also know that we cannot always rely on future capital funding of runway improvements. In fact, capital funding is a small part of the long-term equation. Runways, nav aids, and automated weather systems come with the price of maintenance. The State of Alaska and the FAA both face budgetary constraints that seem to directly effect the response time of runway and airport facility maintenance. Reports of unreliable or irregular airport facilities are often first reported by users and not by the providers. VFR pilots and operators have learned that you often have to "go see for yourself" because the accuracy of some of the AWOS/ASOS systems and the reliability of some runway maintenance has not been proven. Unfortunately, this puts all of us right where we don't want to be; namely it invites operators and pilots to ignore some of the intended support systems for flight ops decisions. We need definitions and criteria for reporting facility outages and predictable response times for their repair. And we need reliable runway maintenance.

Another part of our airport facilities include the flight service station system. The current flight service station system is still functional, but the regional aspect of the FSS system lacks sensitivity to the local flight environment. This is particularly true in areas that require operations under special VFR flight rules of FAR 91.157. Let me give you a recent example. Class E airspace was recently extended down to the surface area in both Aniak and Saint Marys. This has made for a safer flight environment when the airspace is accommodating both IFR and VFR flight activity simultaneously. However, these flight conditions represent less than 10 percent of the daylight hours and introduces control of a VFR flight environment without any local presence. Prior to these new airspace procedures, all airport traffic participated in the Common Traffic Advisory Frequency (CTAF) procedures. Under the new airspace classification whenever the ceiling is less than 1,000 feet and 3 miles of visibility and regardless of any IFR flight activity, the VFR pilots must obtain special VFR clearance from the Flight Service Station in Kenai to operate into and out of these runways. This includes having to wait for a landing clearance while holding in the vicinity of mountainous terrain in marginal weather, especially in Aniak. The remote control of VFR flight arrivals and departures at these airports does not in-

clude a sensitivity to the flight conditions nor the presence of ATC to encourage broad compliance.

Alternatively, there was a time when both Saint Marys and Aniak had the equivalent type of airspace (a control zone) but it was only activated when an IFR approach was initiated. This seemed appropriate to the level of mixed VFR and IFR flight activity and in lieu of any local ATC personnel in these locations. Outside of the times of active IFR flight activity, the airspace was uncontrolled and the traffic relied on use of the CTAF.

At the end of the day, and on the threshold of the 21st century, we need improved airport facilities and some assurance that these facilities will be reliably maintained and appropriately administered.

FAA OVERSIGHT AND SUPPORT

A third fundamental issue for future operations is the need for consistent FAA oversight and support of commercial operators. My business allows me to work with several operators and with several FAA representatives, and I have discovered along with my clients that there are certain patterns that impede both the FAA and commercial operators from maintaining an open and working relationship. The three most common patterns are (1) The lack of availability of assigned inspectors for oversight and support, (2) the instability of inspector assignments, and (3) the inconsistent interpretation of FAR.

Accessibility of FAA certificate inspectors can be difficult. Operators are sometimes stymied in their efforts to obtain requested Ops Specs changes, required check rides, or simply a request for FAA guidance due to the absence of their inspector. Many inspectors work a 4-day work week, are often assigned to training or other administrative duties, or are simply unavailable for unexplained reasons. In such cases, other inspectors can seldom respond to a specific operator's request and the operator must wait until their assigned inspector becomes available. Commercial operators must necessarily rely on assigned FAA representatives to conduct operations and the operators need to rely on the FAA's availability as well.

There has also been a pattern of apparent random reassignment of inspectors to commercial operators. In the past three years, I have several clients who have had as many as three and four inspectors assigned to their certificate oversight in less than 12 months. In fact some inspectors have been assigned to operators and subsequently reassigned to new operators without any introduction or exchange between the operator and the inspector. This pattern seems to be especially prevalent among the smaller operators.

Any re-assignment of inspectors can quickly reveal a third pattern and that is the inconsistent interpretation of FAR across different inspectors. As a result, regulatory compliance matters rather than safety or service can dominate a commercial operator's management. A lot of my client workload consists of helping operators respond to varying interpretation of FAR due to inspector re-assignments.

These patterns of oversight between operators and inspectors are indicative of a much larger pattern. Specifically, the well-intentioned FAA initiatives for safety that we have seen in the last 10 years have not significantly improved the safety record of Alaskan aviation. Consistent, stable and predictable expectations from the FAA will help create the trust and the cooperation that will strengthen safety, service, and compliance.

CAPSTONE

I would like to briefly mention the Capstone project to illustrate my concern for the first three fundamental issues I have addressed. Capstone offers some real promise for increased aviation safety with 21st century technology and an appropriate governmental response to the theme of this hearing. When we look at the ingredients of its systems and how it will work, we are reminded that our future will still require: (1) state-of the art weather services, (2) reliable airport facilities, and (3) broad support and participation which can only occur with an open and trusting relationship between FAA and the aviation users. Capstone will highlight and increase the demand for these basic Alaskan aviation needs.

INDUSTRY RISK MANAGEMENT ISSUES

There are two more issues for the future that I would like to address. The first of which is an increased need for responsible risk management on the part of operators. It is incumbent on the Alaskan aviation industry and individual operators to create better risk management systems for its operations. Increased market competition and the experience level of pilots flying in Alaska require it. Without spe-

cifically defining these systems, we can identify a few qualities of good risk management that are appropriate to rural Alaskan aviation.

Initial and recurrent training programs should include aeronautical decision making for both pilots and managers. It is time to recognize and respond to the fact that the corporate culture of operators influences the safety of flight operations and that this culture can be trained and managed.

A second quality of good risk management systems is the incorporation of increased 2-pilot experience in revenue flight operations. This includes programs that require new hire pilots to fly in revenue line operations with experienced pilots prior to assignment in single pilot operations, especially during marginal and winter flight conditions. This also includes routine company checks of line pilots throughout the year. I know of several operators who have incorporated these qualities into the training and management of their pilots and have acquired greater confidence in their own flight operations, and have earned the respect of the public, regulators, and their insurance underwriters.

The go/no-go decisions of operators, that is, the decisions surrounding specific flight assignments and their release for flight, need to be defined in procedural terms. Penair has demonstrated leadership in this area by developing a model for flight release that is not only participative between management and pilots, but is also defined in quantitative terms.

The FAA needs to encourage and support the efforts of operators to find appropriate risk management systems for their operations. I do not believe that the FAA should regulate a one-size-fits-all model for such programs. Operators are in a better position to create appropriate risk management measures for their own operations, but they need resources and support to do so.

The interests of the industry and the public will benefit when operators procedurally define risk management systems and make them the priority they deserve in their daily operations.

CHANGING PATTERNS OF SCHEDULED SERVICE

The last issue I will address is changing patterns of scheduled air service in Alaska. We are familiar with the established pattern of large aircraft serving mainline routes to hub cities, and small aircraft serving bush village destinations. As we experience more competition and improvements to our airway and airport infrastructure, there will be greater pressure to support different types of aircraft and route structures than we have seen in the past. We are already experiencing pressures from the passenger, freight and mail markets that will blur the line separating large mainline aircraft on given routes versus small aircraft on different routes. The introduction of the "Commuter Rule" in 1995 is one example of regulation inhibiting improvements to service and safety and reinforcing this two-class system of scheduled air service. I believe our future will include and require the use of more mid-sized aircraft and the creation of non-traditional route structures. While the use of both small and large aircraft will diminish they will also still be represented in several markets. Service and safety will be enhanced if the regulatory environment accommodates the changing patterns of scheduled air service.

SUMMARY

In closing, the challenges of maintaining a safe, viable commercial aviation industry in rural Alaska will depend on improving the airway and airport infrastructure, cooperative efforts between FAA and the industry to address safety and compliance, and a regulatory environment that supports appropriate service to the market. Thank you for the opportunity to express these issues. I will be happy to answer any questions and will be submitting written comments for the record.

SAFETY IMPROVEMENT TREND

Senator STEVENS. Thank you very much. Don, do you want to go first this time?

Mr. YOUNG. Thank you, I want to go back to what I said before about the efforts put forth, especially Mr. Harding and Mr. Wardleigh. You have been around here a long time. The percentage of accidents now, today, with all the advantages we have, was that the percentage improved, or is it about the same as what it was, say, 25 years ago?

Mr. HARDING. One of the things we do not have is an actual accurate number of flight hours for 135 operations. It is not required for people to report that. We do not. We know there is an increase in aviation activity, and we know that the accident rate has been level, so we can say there has been some improvement, but we do not what that number is in actual hours flown in 135 operations.

Mr. YOUNG. This is another thing that I am seeking here, if anything is, you know, we are supposed to be for safety and not for regulation for just regulation's sake, and that is my philosophy and always has been. That is one of my biggest concerns over the years is, we pass regulations because it is the thing to do, but in result we did not become any safer, and you know, I may be incorrect in this, but when I first started flying up here 40 years ago, we had a pretty good safety record. We had a lot of experienced pilots, by the way, even then, and if I go back to the 9010, one of our biggest concerns, and I am glad to hear we are getting more local people into the flying, a lot of the pilots, as you well know, come up here to get their hours in to go back outside. Those first hours, I think you mentioned it, and you mentioned it, you know, those first hours are the period of time we have the most accidents, and I still think that is what we should be addressing, is the pilot involvement in the accidents, more so than anything else. I do not know how we do that. Maybe we are addressing it.

But you talk about gray hair, I can remember one thing, I went to New York about 3 years ago and jumped in a cab, the worst ride and the biggest scare I ever had in my life. The guy was from Russia, had been here 6 months, driving in New York. Now, think about that a moment. Some of the time you get in these airplanes and you see somebody in the airplane that has got nice—he is a young fellow, good guy, wants to do well, find out he has not been flying in Alaska but about 3 weeks. That bothers me.

Now, this is for the industry to think about. I think that is something you have to address.

As far as the 60-year-old, Mr. Harding, I happen to agree with you on this 100 percent. The problem is, you have some people within your industry that are flyers that do not agree with you, that they do want the age of retirement at 60 years old. If we were to change that, I think the only way we could possibly do it would be for Alaska only. I want you to know that there are certain people that are flying within the unions that do not like the idea of changing that retirement age. I like seeing that gray beard and the gray hair to make sure I have got somebody with a little experience in that seat.

So you can comment on that. As far as the air space goes over national parks, we are addressing that issue every day. I am not terribly confident, under this president and administration, that they believe as we do. We think the law is on our side, but it is going to be maybe a big battle. We hope we can win on that one.

DAWN SYSTEM

I want to ask one question, Mr. Maguire, on the DAWN deal. Why can we not use that? I mean, are they saving—

Mr. MAGUIRE. What they say is that if somebody gets into the DAWN system they can get into the FAA's whole system, and then

they might be able to do some damage within the FAA computer system.

Mr. YOUNG. But that information was available under the other system, was it not?

Mr. MAGUIRE. It was available, but you know, in this age of computers, I do not see why a fire wall could not be put in that you can go in and find the weather and not go beyond that. The way it was explained to me was that if you got in that you might be able to alter something, or change something that may be bad for the country.

But at the same time, I can go into the military one and I can get the weather from the military for Elmendorf or even the airports over in Bosnia if I want, and they do not seem to be concerned about the security, but the FAA seems to have tighter security requirements.

Mr. YOUNG. Well, I think that is something the Senator and I can look into, because if the information is there and improves the safety factor, to me it is ridiculous not to have that information available for you. That does not make sense to me.

Mr. MAGUIRE. It does not make sense to us, either.

Mr. YOUNG. Senator.

AGE 60 RULE

Senator STEVENS. Thank you very much. You know, on the age 60 rule. I agree with Don, it is going to be very difficult to deal with. We do need to keep the retirement age in perspective, however, because one of the great problems right now is to attract more people into training, younger people into training, and that is one of the reasons that they say they want the old ones out so that there are opportunities for new ones to come in. It is a very difficult problem.

Mr. YOUNG. Will the Senator yield just for a moment?

Senator STEVENS. Sure.

Mr. YOUNG. I think I am correct, I was flying with a 59-year-old person the other day on a major airline, and he informed me that in 2 years time 60 percent of the existing pilots today will have to retire by the year 2002. Now, who are they going to replace them with? Now, that is something we had better think about.

Senator STEVENS. I was going to get to that. Our statistics show that the demographics of society are such that if the older pilots cannot fly, we will soon not have enough pilots to keep our commercial lines going. It is a very difficult problem to deal with.

OPERATIONAL RISK MANAGEMENT

Dick, my staff tells me you have got this innovative program now, ORM, operational risk management, which the Army started sometime ago. I am told you are the only commercial carrier of any class that has instituted the concept. I think we need to know, for the staff and all of us, what is PenAir's risk management program, and should we try to make it apply outside of Alaska to the aviation industry?

Mr. HARDING. The operational risk management system is something we have developed. We started with doing risk assessment of runways, putting a numerical value on them, and when they got

to a certain risk factor we would quit operating there, and that is how we discontinued serving some of them.

We met with the military, and we were talking to them, and they said, you know, we have this RM program. We had the worst helicopter safety record in the world, and 6 years after adopting this program we went to the best, so that kind of caught my attention, and I plagiarized everything they had, rewrote our program, and we have one now for our 135 and our 141 operation.

Senator STEVENS. Could I interrupt you, please? They have given me an emergency message. If Dr. Robert Alberts is in the audience, would you please step out into the lobby.

Thank you very much, Dick.

Mr. HARDING. Anyway, we have taken the program, and before a pilot leaves the home station he has to fill out a piece of paper, it takes about 15 to 30 seconds to do it, it gives him two things. One is an awareness of the risk involved in that particular flight, and the other one, when it gets to a certain point, it gets management involved, and this is one of the biggest problems we have in Alaska, is getting operational control, getting the managers—I cannot fly with every pilot in Bethel and King Salmon all the time, so I have to rely on them working in that area to make the decisions, and with this operational risk management it gives us an opportunity to, with higher risk flights to get involved in the decision-making of go or no-go, and we have been doing it for about 2 years now and it has been very successful and, of course, the pilots had first fought it because pilots are not paper-oriented people, but after they realized that it has taken some of the responsibility away from them and sharing it with management they endorse it now.

Senator STEVENS. Anyone else talked to you about using the system?

Mr. HARDING. We have had quite a few carriers in Alaska, and I have had several major carriers from outside Alaska that have inquired, and I have sent them a copy of the program also.

Senator STEVENS. Have you shared that with other carriers?

Mr. HARDING. Yes. Any other carrier that is interested in that, we are willing to share it. If we can lower the accident rate of other carriers it is to our advantage, too. We would like to see less accidents in Alaska, and I think this program is probably the most cost-effective accident-reducing program that we could possibly come up with. It does not cost anything. All we have to do is, it takes a little time to fill out a piece of paper.

Mr. YOUNG. Senator, can I ask just one question? When you say accident, are you talking about all accidents, on ground, in the air, landing, take-off and such? You know, maybe a pilot runs into a pylon, or something like that. Is that considered an accident?

Mr. HARDING. An accident has got a very narrow definition in the part 830 of the regulation, and from the time he starts his take-off, taxiing, to the time he pulls to a complete stop and stops the airplane it is considered in-flight, and that is considered an accident at that time, if he does a certain amount of damage.

STATE OF GENERAL AVIATION IN ALASKA

Senator STEVENS. Tom, what is the situation here now in terms of the state of the general aviation community? I have already said my great respect for you as an instructor, because you were able to get me certified after 4 days. That is pretty good. But Young says he is still not going to ride with me unless you are there. But is the state of aviation generally in Alaska healthy? Should we be as concerned as we are about these safety statistics we are hearing?

Mr. WARDLEIGH. Senator, you certainly should be as concerned as you are. In our review of the past 18 years or so of the Safety Foundation's activities, nothing much as changed, and we see the key to reducing accidents as better information and better understanding by the pilot. We endeavor to change that through research and public education.

We are trying to teach, for instance, the basketball teams, do not wear jeans and sneakers if it is 40 below and you are going to ride in a Cessna 206 to play a game. Everyone has to be responsible for their own safety, and that includes the doctors, dentists, lawyers who leave here on Friday afternoon to go catch a trout some place.

They cannot blame the weather service if the weather is different from the forecast. They cannot blame the FAA. The weather that is most important—I was one of the strong supporters of the weather cameras, and of keeping the flight service stations that you facilitated in remote Alaska, but really down to the nitty gritty, the weather that is important to you is what you see through the windshield. It does not matter what the forecast is. When Felix and I are out flying together, if we cannot cope with what we see through the windshield, we had better have an alternative plan to go some place else and do something else.

One of the concerns that I see facing general aviation in Alaska right now is the EPA's mandate that we stop using leaded aviation fuel, 100 low lead. As recently as yesterday I talked to the Shell Oil Company engineer in charge of these projects. They have not yet produced a substitute fuel that is free of lead that will allow us to operate the thousands of aircraft engines in Alaska, the pistons, the old round and flat engines that are so common in our recreational activities and in our air taxi activities.

Right now there is an ethanol fuel that is being assessed, and all you have to do is change the pistons to cam shafts to cam followers in the valve seats in order to make it compatible with your flat engine, and there is no way that those folks with the big round engines, like Northern Air Cargo, can ever realize the service they need from their engine if we must in fact go to unleaded fuel with the present state of research.

Senator STEVENS. Well, back when I was a kid in order to increase the performance of engines we put more lead in it. Can't you add lead to some of these other products?

Mr. WARDLEIGH. Well, you can, but that does not meet the EPA requirement that it be lead-free. At the present time there is only one source of aviation fuel lead. That is a tiny little factory in England that is still making the stuff. There is no other source any more.

Senator STEVENS. What do you think, Mr. Maguire—what do you think about the state of aviation right now, Felix?

Mr. MAGUIRE. I think generally it is fairly healthy. I think there are more people wanting to get back into it. The numbers have gone down. The numbers of pilots qualified have gone down.

I think one of the problems we have—and I hate to say this with Dick sitting here—is what Congressman Young brought up about the young pilots coming up here and getting some experience and leaving, and I think that is partly because we do not pay them very well in Alaska.

Our air carriers are living on the bread line, and because we do not pay them well, they do not stay. They make bigger dollars somewhere else. So that is an industry problem, I think. They have to reconcile, if they pay them more, then how are they going to make enough money off a ticket to pay for that.

LAKE HOOD FLOAT PLANE CAPACITY ISSUES

But the general aviation, I think it is reasonably healthy. There is still 120 people out on the waiting list at Lake Hood to get a float plane spot, and it is still taking 15 or 16 years to get a spot out there, so we do need another facility somewhere to cope with that.

Senator STEVENS. Is there a plan for that?

Mr. MAGUIRE. There is not, no.

Senator STEVENS. Mort, have you gone? Did Mort leave? It is too bad we did not ask Mort that.

Mr. MAGUIRE. One of the problems, there was a plan some years ago to build some more float plane slots at Lake Hood, but the area they picked, unfortunately they found when they did some dredging that all the rest of the water of the rest of the lake would drain out through it and it would go, because it does not have a proper chalk base, so they decided not to touch that.

Senator STEVENS. Well, let me ask all of you, do we need another location in this area? I am told we have about half of the float planes in the United States up here now. Do we need another location away from that general large airport for the float planes?

Mr. MAGUIRE. Well, we feel that we do because of the congestion that is over there. Anchorage International is very congested with Lake Hood traffic, Merrifield traffic, Elmendorf traffic, and Anchorage International traffic altogether.

Another facility would be good. However, everybody likes the fact that it is downtown and it is out there in Lake Hood, and everybody would give that first preference.

Mr. YOUNG. Let us go back to the Clinton project, though. That is not that far away, and if they were willing to sell them for exchange, that might be the most—I would say the most logical area to have one.

Mr. MAGUIRE. There are a limited number of aircraft available, so even if—you know, if somebody wants an airplane they have to probably buy one that is already out there. There is not too many new ones coming into the State.

Mr. YOUNG. Mr. Maguire—can I ask a question, Senator?

Senator STEVENS. Sure.

Mr. YOUNG. Or all of you, and I am saying this because it is important. You say everybody is sitting down and talking and working for a solution. That was your statement. Does that include the FAA?

Mr. MAGUIRE. That does very much include the FAA, but they are hamstrung a little bit, you know. You must realize that the structure of the FAA is such that the local administrator does not have much clout.

Mr. YOUNG. Well, this is what I am—with all due respect, this gentleman has a lot of clout. I like to think I have got a little clout, and I will have a little more if I get where I think I am going to go, and I think it is ridiculous for them to say this is the way we are going to do it, we do not care what the local administrator says, but we are going to do it because we are God.

We are trying to look for safety, and if there is a better way of doing it other than one-shoe-fits-all, I think that ought to be—the reason I asked Mr. Poe is there enough flexibility, if he does not have the flexibility, then I would like to write something to give him the flexibility so we can achieve what we are seeking, that safety, and have our consumers without paying an arm and a leg, get from A to B, and I think that can be done, you know.

Mr. MAGUIRE. Well, my impression is, it is like any major corporation that has a headquarters out of State, and different department members, as willing as they are, they report to somebody in Washington, DC, not to Pat Poe. They report to somebody back there.

Mr. YOUNG. You mean within the Alaska region they do not report to Pat Poe, they report to Washington, DC?

Mr. MAGUIRE. They report to somebody in Washington. I am not FAA, but that is the impression I get from them.

Mr. YOUNG. We have to work that out somehow.

Senator STEVENS. No, it is an administrative management rather than substantive management concept that they have got.

Can I go back now, chief—do you understand what I am saying? They have a substantive line, and the control—I went through that with them once before.

PLANNING FOR ALASKA'S FUTURE

Let me ask you this. This intrigues me to think about trying to find another place that would be equally almost successful to the Lake Hood location, where we might get additional float plane capability. Do you have any suggestions to us? God willing, we hope to outlive Strom Thurmond, you understand that. But we are probably not to do it by too much. We have only just so much time in these positions we have, and God willing, and Alaskans—I am not supposed to say these things, probably, but you know, we have 8 to 10 years where the three of us have positions that Alaska will not see for another 50, at least, probably.

Now, what should we be doing is to try and make sure that when we leave our watch we have the best state-of-the-art system in aviation. What are we missing? What should we be working on to set in motion plans that take 5 or 6 years to come to fruition? Have you given that any thought?

What does general aviation, what does commercial aviation need in Alaska to be really the state-of-the-art, top-drawer transportation system we need for the next century?

Dick, what do you think?

Mr. HARDING. The strategic plan that we put together, that 5-year plan was put together by all of us. We all did get together on that.

Senator STEVENS. Did it think out that far?

Mr. HARDING. Yes. It is 5 years, at least 5 years ahead.

Senator STEVENS. What is missing? What have we not done in it?

Mr. HARDING. Well, we get down to the smaller things, like the float plane, we do need another facility for float planes. As great as Mort Plumb has—the more he does for drawing cargo to International, the more it leans on the general aviation out there and squeezes us out, and it is going to push us further and further away, because they call the shots. The large carriers call the shots at International.

They bring in all the money, so general aviation gets pushed aside a little bit, and we need to protect that, and I think if we could develop a lake out at Birchwood, I think that would be great, as Tom said, the one at Eklutna, if you could use your influence to get that lake for us, that would be great.

Senator STEVENS. Is the summary of the 5-year plan similar? My staff says they have got it. I have not seen it. Okay. Tom, have you got any suggestions?

EKLUTNA FLOAT PLANE FACILITY

Mr. WARDLEIGH. Well, I would like to speak to the Eklutna situation. It is a half-flooded, tidally influenced termination of the Eklutna River, which is a salmon-carrying river, and the plan that we proposed some years ago would put a dike in the form of a wheel strip right at the tide line where the clay breaks into the inlet to protect the float plane pond.

You could then dredge a rather large pond that would accommodate a large number of seaplanes, have an operating strip essentially parallel to the runway, and by lining the pond with gravel you would enhance the salmon-spawning available area and by diking the thing and monitoring the height of it you would inhibit the inflow of the salt water, so you would keep the whole system fresh, it would be noncorrosive to the floats.

And essentially the Birchwood and Eklutna area lies in the eye of the tornado, where the winds come out and spin around Matanuska and the Kenick Glacier and just blow like the dickens across Palma and Wasilla. There is an area of calm winds most of the time at the Birchwood Airport and the Eklutna gravel pit area.

It just is an ideal sanctuary if some agreeable land exchange could be made to get the land made available. I doubt that the intertribal politics of the Eklutna Tribe will ever facilitate that. I do not know, but it is difficult and cumbersome. If the State could own the land, it would facilitate accomplishing what is needed.

Senator STEVENS. Okay. That is a good alternative. Anyone else make any comments?

Mr. ACTON. I would echo Felix's statement about the 5-year plan, too. I mean, that statement about what constitutes needs for the future. That has been a collective effort, anyway, articulated by a collective effort.

The other thing that comes to mind, Senator, is more adherence by the FAA to accommodate the unique needs of Alaskan aviation. When we see new initiatives, new NPRM's, new HBATS, whatever came out from the FAA, it is not always recognizable that there is recognition of some of these unique needs, and more so, I do not think that that necessarily gets communicated down to the level that most directly affects operators, and that is the relationship between an inspector and an operator.

You know, I mentioned in my comments that there is a reassignment of inspectors. That is routine and to be expected, but seemingly in the last few years there has been quite a bit of it, and with some frequency, and many operators will simply get a new set of inspectors assigned to oversight of their operation, and find that everything that they have been doing and have been previously approved is now needing revision. Now, that makes no sense to me.

Mr. YOUNG. What you need is a manual that is consistent.

Mr. ACTON. Consistent, stable, and simple.

Mr. YOUNG. Not changing because the personnel changes.

Mr. ACTON. Correct.

LACK OF TRANSPORTATION ALTERNATIVES

Senator STEVENS. One of the difficulties we have is trying to convince the rest of the country of the fact that we have no highways. Not only do we not have Federal highways, we have very few State highways. We have very few local highways that join communities, and we are dealing with a system that replaces an infrastructure that covers a whole series of areas that are substantially supported by other programs.

The highways funds, the assistance to States, the urban grants, the HUD grants, all of those things that come into play that affect transportation systems in the south, we see very few of those. We are trying our best, I am trying my best to make certain some of that money comes in to us to meet our unique needs, but it is a very difficult thing to organize a transportation system based upon one support group that works out of a fund that is committed and primarily supports the commercial world.

Our general aviation is not looked at the same way as the people who drive—husband and wife each drive a car to work in Washington, DC. If we had a husband and wife flying different planes in Alaska, the difference would—you would see that acutely, because the assistance those two get, highway funds, local funds, police, all types of insurance coverage, et cetera, that is not available to the people flying up here, is just two different worlds, and to find money to finance our world is the problem. I am still working on that, and I think we have got to find some way to do it.

The Postal Service is probably the area where we have the greatest example of the Federal Government trying to meet our needs. They currently lose about \$125 million a year in their operations up here. Everywhere else is operating on a plus basis, because it is a nonprofit, really not federally subsidized system now. But we

have to find some way to get some more money to this stream. I think we are going to keep up the development of this concept, and I would welcome your suggestions along those lines.

Do you have any other comments, my friend?

DISTANCE PLAYS AN IMPORTANT ROLE

Mr. MAGUIRE. Senator, if I might just—one of the thoughts that occurred to me, with the maintenance that I mentioned, that they are going to centralize maintenance in Anchorage, if supposing in Washington, DC, the runway lights go out and they have to bring somebody from as far away as Chicago to fix them, they might get a sense of how far people have to go from here to Ketchikan to fix the lights. They might understand a little bit better, because that is about as far as people will have to go if they centralize all the FAA maintenance in Anchorage.

If a light goes out in Barrow, it is like sending somebody from Wichita all the way over to Florida to fix the lights.

Senator STEVENS. I fought that problem with the Coast Guard once. Do you know they moved all the maintenance systems down to Seattle, and when they started paying overtime to send people out to Cold Bay, they learned, and it has been readjusted. It will not take long for people to understand they cannot finance that system.

Mr. MAGUIRE. But with the limited funds it will be wasted in the meantime.

Senator STEVENS. Yes. Well, let me thank you all for taking the time to come. By the way, Pat, you are still here. Anything we have said that you want to defend yourself on or comment on?

Mr. YOUNG. We have been fairly nice. I can tell you that right now.

MAINTAINING AN ACTIVE DIALOGUE WITH FAA

Mr. POE. No, Senator. I think I agree with a lot of what I heard. I think the only thing I would punctuate is the fact that there is an active dialogue.

Senator STEVENS. Well, it is to your great credit, my friend. I think there is a different attitude here in the FAA, and I can remember coming home and having meetings with the Airmen's Association in which your predecessor was not welcome. Not your successor, but your predecessor was not welcome.

We thank you for what you are doing, and I think that attitude that these people express of having a working relationship is good news as far as we are concerned. It means we can do our job a lot easier in Washington, so thank you very much. I just did want to give you a chance to speak up if you thought there was something that you should comment on.

RECOGNITION OF GUESTS AND APPRECIATION TO PARTICIPANTS

I do not know if you know it, but the staff of the Appropriations Committee for the House Transportation Subcommittee is here in Alaska with us. They have come up to witness some of the challenges and issues we face. I understand they were in rural Alaska

yesterday, and learned how to put on their shoes at 51 below, and other things—was it really that cold?—in Point Hope yesterday.

I do thank them for coming, and I hope that this hearing today has been as meaningful to them as it has to Don and me. We really do thank all of you in the audience for coming and participating, and I thank my good friend the Congressman for all Alaska for honoring us with his presence here today. It was a Senate hearing, but we are pleased to have Congressman Young with us at any time, and I do want to let the audience know if you have any comments or questions about answers that were given here, and you want to pass them on to us, you should write to me at the Senate in Washington, or take your time to talk to these gentlemen right here.

This is my transportation subcommittee clerk, Wally Burnett. I was there when he was born in Fairbanks. He does not like to remember that.

And Dan Elwell, who is what we call an extern on our staff, working with me, who is, by the way, an American Airlines pilot, and has really contributed greatly to our understanding of aviation issues in this last period.

Lisa Sutherland, the vice director, deputy director of the Appropriations full committee staff, is here with us also.

If you want to corral someone who will listen, since we are on our way to another meeting, feel free to trip them so that they do not leave too fast.

ADDITIONAL SUBMITTED STATEMENTS

But we do thank you for your courtesy, and again, if you want to add any comments or ask questions about what you—those comments, if you wish them to go into the record must be in our hands by January 7. We have to file this record on January 7 in the Senate.

PREPARED STATEMENT OF THE PROFESSIONAL AIRWAYS SYSTEMS SPECIALISTS

I represent the Professional Airways Systems Specialists for the North Alaska Systems Maintenance Office. Our area of responsibility extends from Barrow to the north, to Gambell in the west, to Eagle in the east, and as far south as Shemya, this includes all National Airspace equipment in between. Since the beginning of Mr. Al Gore's initiative known as reinvention of government, personnel reform, and now the FAIR Act some very disturbing trends are beginning to emerge. Air safety is being measured in dollars rather than in lives saved and accidents prevented. Here in Alaska an initiative known as Corporate Maintenance Philosophy has been undertaken and has been in effect for about three years. New ways of doing business are being experimented with along with a very serious attempt to change a culture. The program started out with a list of six paths to success and a plan including "the nows" and "the futures". The program progressed pretty well for the first year and a half but began to experience difficulty as staffing and money began to go away. When opportunities existed to make capital gains and reinvestment in the existing infrastructure I believe those funds were squandered and when staffing adjustments were made we wound up with a whole lot of folks in the wrong places and there is no political will or decent leadership willing to make the necessary adjustments. I will attempt to describe some events and projects which I feel have failed and in the process have cost millions of hard to get taxpayer dollars.

1. Staffing of the technical workforce which maintains and repairs National Airspace equipment and infrastructure has dropped to dangerously low levels, despite the fact that our overhead staff in the regional office continues to grow, mostly in higher pay grades such as GS-14 and GS-15 levels. Most of these positions provide no direct support to the NAS or the flying public. We have assistants to assistants to assistants and assistants who supervise assistants. The bureaucracy is so bloated

it is no wonder we cannot manage to field new systems in a timely fashion, we can't get out of our own way.

2. Mean time to restore facilities has been on a steady increase as a result of our new Corporate Maintenance Philosophy. Risk assessments conducted concerning this situation have been ambiguous, depending on who conducts the assessment. The Airways Facilities managers contend this is a normal result of the way we are doing business and the Air Traffic managers are concerned about redundant systems being left to run on half a system while Airways Facilities decides whether or not to respond. Whereas we used to respond to facility outages in 24 hours or less our MTR "mean time to restore" numbers are running at 68 hours and more than likely will continue to increase.

3. Our Emergency Operations Facilities have deteriorated to such a state that if we experienced a national disaster or a serious disruption in our existing communication facilities we would not be able to communicate with the vital EOF sites outlined in our emergency plans. Kenai has no operational facility at all, Fairbanks has one resource with very limited backup, and no control on the floor at the AFSS. Juneau has a similar situation to that of Fairbanks. The EOF facility was to be complete a year ago, but has been in a bureaucratic quagmire since the property disposal that took place in Kenai two years ago. HF communications was a vital aspect of the emergency experienced during the 1964 earthquake, our HF capabilities at this time are in a sad state of affairs.

4. We have installed a government owned and operated satellite telephone system here. Despite the fact that the system circumvents the private sector and costs were on an astronomical scale we did it anyway. Litigation continues to this day over the whole affair and the system now has become one of the most labor intensive and biggest drain on resources in our inventory. Training has been barely adequate and scarce at best, there is no relief in sight, instead we are continuing on with a phase 2 of the system. The facilities are known as ANICS.

5. The Microwave Landing System program purchased 26 MLS systems, Alaska was delivered 14 of the 26. There was to be a five year test program with a clause that if the systems proved to be inadequate, they would be replaced with a system "equal to or better than", what is the question? Each system cost the taxpayers \$750,000, the Alaskan portion of that acquisition was 10.5 million dollars. Well those systems are off the air more than they are on the air. Most all of the MLS systems were installed, flight inspected, and turned off, placed in care taker status with a 72 hour turn up stipulated. Only one real user in the commercial area was using these that was Reeve Aleutian Airway, the aircraft equipment was supplied by the FAA.

6. We are planning the construction and operation of four new Flight Service Stations in our state over the next year or so, they are at Deadhorse (leased from state), McGrath, Iliamna (leased from private vendor), and Northway. I am not privy to the cost of these facilities but I have reviewed the plans during the engineering process.

I was shocked to learn that the plans for these new "state of the art" facilities included at the heart of the voice switching system components developed in the 1970s, not supportable, and antiquated. When the question was posed to the program managers their reply was equally ludicrous. We have been told that STVS and or ICSS voice switch equipment was not available for installation at the new facilities. Because flight service stations no longer exist in the lower 48 states the program managers in Washington made no provision for acquisition of new voice switch equipment. The voice switch equipment in a facility like a flight service station is the heart of the facility, most everything going in or out of that facility goes through that switch. Why would anyone want to build new facilities around an outdated switching system is beyond me!

7. Our latest effort in modernizing the NAS in Alaska is known as CAPSTONE. I have done some research on its history thusfar and find it to be an innovative development in technology, the subsidiary company of United Parcel Service, IlMorrow Inc. makes the equipment being used for the ADS-B Automatic Dependent Surveillance Broadcast, it also requires other facilities to be a complete system in the NAS. Some of the other facilities are AWOS Automated Weather Observation Systems and some lighting aids. My immediate involvement in the 3 year test project has been with the AWOS systems and already I see cost cutting measures being taken that will hamstring the program right from the beginning. We are currently installing and getting ready to turn on four weather systems in St. Michaels, Holy Cross, Scammon Bay, and Mountain Villiage, with six more coming next fiscal year. These weather observation systems are planned to be placed into service with dial up capabilities only, this will inevitably lead to poor service to the flying public and the system will not possess ADAS Aerospace Data Analysis System capabilities which

is used in surface weather analysis. I view the ADAS connection as critical to the success of these facilities. I fear that by the time the FAA can field, test, and finalize a system like CAPSTONE it will be long obsolete and we will have another boat anchor.

Thank you for this opportunity to submit testimony to you regarding air safety and modernization in Alaska. I encourage you to take a more active role in oversight of our government agencies and their operations. I am grateful for the finding you have secured for the state and the aviation community while Chairman on the Senate Appropriations Committee. Some of our government agencies have become self serving and in some cases out of control, I would hope strong leadership from our congressional delegation will make some effort to curtail this trend.

PREPARED STATEMENT OF AERO TWIN, INC.

First, let it be noted that there is a majority opinion held within the repair station industry that modernization of Part 145 is overdue.

While a few of the revisions to Part 145 proposed by this NPRM are welcome changes (provisions for satellite repair stations and Deviation authority, for example), there are many provisions to which Aero Twin, Inc. strongly objects.

Prior to citing individual paragraphs, we will comment on several primary objections to the proposed amendment to Part 145:

1. Aero Twin, Inc. cannot support a revision that mandates the establishment of internal quality assurance processes that are so ill-defined as to potentially mean anything, up to and including the requirement for ISO 9000 certification for every repair station. Such proposals must be rejected out-of-hand until the FAA deigns to provide some definition of what, specifically, is entailed by the proposed quality assurance system. Advisory material published concurrently with the release of the rule is absolutely inadequate. Further, while Aero Twin, Inc. does not object to the concept of self-auditing, we feel performance of such audits must remain elective. The quality control programs and procedures currently mandated by Part 145 are carefully designed to assure airworthiness; FAA surveillance assures adherence to the programs. While the FAA may have data suggesting that implementation of quality assurance systems enhance quality, it is unclear that the conclusion is readily extended to encompass smaller repair stations, where the additional level of internal oversight would be largely symbolic, yet more costly per employee.

2. The proposed revisions to Part 145 include the creation of an Accountable Manager. We are strongly opposed to this provision. We believe it to be a poorly veiled means to assign liability to an individual within a corporation. A Repair Station is an organizational authorization. Responsibility for assuring adherence to the applicable regulations is the joint responsibility of the organization and the FAA. Requiring one individual to assume all of the responsibilities delegated to the proposed Accountable Manager is outside the scope of FAA function. Each organization seeking Repair Station authorization should retain the right to identify which staff members hold particular responsibilities within the organization, subject to meeting basic qualifications. Daily operation of an organization subject to personnel absences due to vacations, sickness, business travel, etc. requires flexibility not afforded in the FAA's proposal. We would support the creation of a 'Primary Point of Contact' as a means to streamline correspondence and interaction with the FAA.

3. The personnel training requirements proposed by the FAA are not well enough defined to allow a reviewer to judge the benefits or the costs involved. While Aero Twin, Inc. does oppose mandated training requirements in principal, specific information regarding these requirements must be provided if this review is to have substantive meaning. Advisory material published concurrently with the release of the rule is absolutely inadequate.

4. In the proposed revision, in addition to the repair station manual, there is a series of documents that must be prepared and maintained by the repair station, and in some cases forwarded to the FAA district office. We recommend adoption of a consistent language in prescribing the requirements for these documents. The documents include:

- The capability list [ref 145.203]
- The personnel roster [ref 145.157]
- A comprehensive facility description [ref 145.207(c)]
- A list of references to manufacturers' inspection standards for particular articles [ref 145.207(d)(2)]
- A forms manual [ref 157.145.207(d)(3)]
- A vendor list [ref 145.207(h)]

We suggest the following apply to each of the listed documents:

- a. These documents should be separate from the repair station manual, included only by reference, and should constitute accepted data, as opposed to approved data.
- b. These documents should be maintained by the repair station and submitted to the district office upon revision within a stated period or time following revision, without affecting the status of repair station compliance.
- c. The form of submission may be an electronic document accompanied by means to access the electronic copy.

These features are already prescribed for certain documents in the proposed rule (refer to 145.205(e)(2), 145.205(f), 145.207(d)(3)). A consistent system of dealing with these documents will clarify the rule and improve compliance. Separation from the approved manual material is imperative.

5. We are unable to accept the FAA's unsubstantiated cost analysis. The cost of establishing and maintaining a quality assurance system cannot be determined until the system is defined in some detail. The cost of establishing and maintaining a personnel training system cannot be determined until the system is defined in some detail. Both systems are mandated by the proposed rule, yet neither is described in detail sufficient with which to estimate costs.

Aero Twin, Inc. comments to specific paragraphs in the proposed rule: Paragraphs of the proposed rule to which Aero Twin Inc. has no specific comments are omitted.

FAA Section 145.3 Definition of terms

(a) Accountable manager means the manager who has the corporate authority for ensuring that all maintenance, preventive maintenance, and alteration is carried out to the standards required by the Administrator.

Aero Twin, Inc. Response: We object to the mandated creation of this titled position for the aforementioned reasons (see opening comments).

(i) Computer system means any electronic or automated system capable of receiving, storing, and processing external data, and transmitting and presenting such data in a usable form for the accomplishment of a specific function.

Aero Twin, Inc. Response: This definition should be clarified to exclude office systems.

(j) Consortium means the holder of a type certificate that forms a combination or group of separate certificated repair stations to perform maintenance, preventative maintenance, or alteration of that type-certificated product and components thereof, and functions under a single unified quality control and quality assurance system.

Aero Twin, Inc. Response: Aero Twin, Inc. does not agree that consortiums, as defined, should be allowed. In the first, place we oppose the requirement for quality assurance systems which negates the primary purpose of a consortium. In the second place, we oppose the granting of relief to a consortium as it unfairly favors type certificate holders entering the repair station industry.

(n) Maintenance release means a repair station document signed by an authorized repair station representative that states that the article worked on is approved for return to service for the maintenance, preventative maintenance, or alterations performed.

Aero Twin, Inc. Response: We believe the exclusive nature of the scope of 'return to service' should be emphasized by the insertion of the word 'only'. 'Approved for return to service only for the maintenance, preventative maintenance, or alterations performed.' The scope of the maintenance release must not be ambiguous in any way.

FAA Section 145.9 Advertising

(b) No certificated repair station may make any statement, either in writing or orally, about itself that is false or is designed to mislead any person.

Aero Twin, Inc. Response: We do not agree that paragraph (b) belongs in the airworthiness regulations. It is offensive that the FAA presumes to mandate fair and honest business practices. Organizations that would intentionally mislead are unlikely to be converted by virtue of this regulation. Other FAA certificate holders are not under similar regulatory restraint.

FAA Section 145.11 Deviation authority

[all]

Aero Twin, Inc. Response: Aero Twin, Inc. agrees with the provisions for Deviation authority. It should remain a part of the final rule.

FAA Section 145.51 Application for certificate

(a)(3) A statement signed by the accountable manager confirming that the procedures described in the repair station manual are in place and meet the requirements of the applicable Federal Aviation Regulations.

Aero Twin, Inc. Response: Aero Twin, Inc. believes this paragraph should be removed. In the first place, we do not agree with the creation of an Accountable Manager; in the second, we see no need for any separate signed statement. The approval of the required manual by both the repair station and the FAA, and FAA inspection, assures compliance with the regulations. This transparent enforcement clause is unwarranted.

(a)(4) An organizational chart of the repair station and a list of the names and titles of managing and supervisory personnel.

Aero Twin, Inc. Response: Aero Twin, Inc. suggests the deletion of all words after 'repair station'. The requirements of 151.51(b) and 151.157 render this paragraph redundant.

(d) An applicant for a repair station certificate operated by a consortium, which functions as a single organization with regard to quality control and quality assurance, holds an approved type certificate, and performs maintenance, preventive maintenance, and alterations of that type certificated product, must have the consortium's quality control and quality assurance systems in place at each of its facilities.

Aero Twin, Inc. Response: Aero Twin, Inc. does not agree with the creation of consortiums, and thus, is opposed to inclusion of this paragraph.

FAA Section 145.59 Ratings and classes

(a) Aircraft ratings. An aircraft rating on a repair station certificate permits that repair station to perform maintenance, preventive maintenance, or alterations on an aircraft, including work on the powerplant(s) of that aircraft up to, but not including, overhaul as that term is defined in See. 145.3 under the following classes:

(1) Class 1: Aircraft (other than rotorcraft and aircraft composed primarily of composite material) of 12,500 pounds maximum certificated takeoff weight or less.

(2) Class 2: Aircraft (other than rotorcraft and aircraft composed primarily of composite material) over 12,500 pounds maximum certificated takeoff weight and up to and including 75,000 pounds maximum certificated takeoff weight.

(3) Class 3: Aircraft (other than rotorcraft and aircraft composed primarily of composite material) over 75,000 pounds maximum certificated takeoff weight.

(4) Class 4: Rotorcraft (other than rotorcraft composed primarily of composite material) of 6,000 pounds maximum certificated takeoff weight or less.

(5) Class 5: Rotorcraft (other than rotorcraft composed primarily of composite material) over 6,000 pounds maximum certificated takeoff weight.

(6) Class 6: Aircraft composed primarily of composite material of 12,500 pounds maximum certificated takeoff weight or less.

(7) Class 6: Aircraft composed primarily of composite material over 12,500 pounds maximum certificated takeoff weight.

Aero Twin, Inc. Response: The definitions of Classes 1 through 7 are completely dependent upon the interpretation of the phrase 'composed primarily of composite material'. The explanation provided in the NPRM sheds some light on the FAA's intent, but the regulation is vague.

Aero Twin, Inc. concurs that repair of advanced composites requires special training and special equipment, but in the case of aircraft with one or several primary structural elements fabricated using advanced composites, there typically remains a large percentage of aircraft structure and systems which may be adequately inspected, maintained, and repaired by non-specialized techniques and equipment.

Maintenance, preventive maintenance, or alterations of advanced composites should be made permissible by a separate and distinct rating, or be considered a specialized service rating under 145.59(i). In either case the rating should be made applicable to components or substructures (not entire aircraft).

This recommendation would involve removal of the composite exception clause in 145.59 (1) through (5), the removal of 145.59 (6) and (7), the addition of an Advanced Composite Rating in 145.59, in appropriate revisions to 145 Appendix A, and definition of the term Advanced Composite.

With regard to the definition advanced composite, we wish to point out the definition would need to exclude room temperature cure, wet-layup, non-vacuum bagged fairings typical on many light aircraft, but might reasonably include any composite primary structure, regardless of fabrication technique.

FAA Section 145.61 Transition to new system of rating

(a) Except as provided in paragraph (b) of this section, a certificated repair station with a certificate issued before [effective date of the final rule], may exercise the privileges of that certificate until [2 years after the date of the final rule].

(b) A certificated repair station with a certificate issued before [effective date of the final rule] that makes an application to change any portion of that certificate

under Sec. 145.57 must meet all the applicable requirements of this part and apply for and receive approval for each rating under which the repair station desires to exercise privileges.

Aero Twin, Inc. Response: Aero Twin, Inc. does not believe that the proposed two-year transition is realistic. We have experienced FAA administrative delays of six months in obtaining approval of minor revisions to our Repair Station Manual. We cannot believe Flight Standards District Offices will be able to support the concentrated workload of training inspectors, processing of major revisions to the manuals of all repair stations, perform the required inspections, all within the allotted period. If the rule passes as written, the FAA will certainly have to spend additional time and effort in providing for inevitable deadline extensions. We propose that 151.61(a) be amended to allow a five year transition period: '. . . may exercise the privileges of that certificate until [5 years after the date of the final rule].' It follows that the requirements of 145.61(b) are also unrealistic, as it is unlikely that an active repair station can operate for even one year without needing minor revisions to its manual. We therefore recommend that for a two year period following adoption of a final rule, minor revisions to Repair Station Manuals may be adopted and approved without meeting all new applicable requirements.

FAA Section 145.103 Facilities and housing requirements.

[all]

Aero Twin, Inc. Response: Aero Twin, Inc. believes the language of the current 145.53 is adequate to address facilities and housing requirements; we recommend retaining existing language.

FAA Section 145.105 Change of location, housing, or facilities

(a) A certificated repair station may not make any change in this location or any change, deletion, or addition to its housing or facilities, whether the change is a new location, is a substantial rearrangement of space within the present location, or involves moving any of the housing or facilities that are required by Sec. 145.103, unless the change is approved by the Administrator.

(b) The Administrator may prescribe the conditions, including any limitations, under which a certificated repair station may operate while it is changing its location, housing, or facilities.

Aero Twin, Inc. Response: We believe the regulations should provide for a grace period of at least 30 days in the reporting and approval of changes within existing facilities, where such changes do not involve reduction or removal of existing capability, space, etc. The requirement to obtain prior approval will discourage improvement and modernization.

FAA Section 145.151 Personnel requirements

(a) Each certificated repair station must: (1) Designate an individual as the accountable manager;

Aero Twin, Inc. Response: We object to the mandated creation of this titled position for the aforementioned reasons.

FAA Section 145.157 Records of management, supervisory, and inspection personnel

(a) Each certificated repair station must maintain the following:

(1) A roster of management and supervisory personnel, including the names of the repair station officials who are responsible for its management and the names of its technical supervisors;

(2) A roster with the names of all inspection personnel, including the chief inspector;

(3) A roster of personnel authorized to sign a maintenance release for approving an altered or repaired article for return to service;

(4) A summary of the employment of each individual whose name is on the management, supervisory, and inspection personnel roster. The summary must contain enough information on each individual listed on the roster to show compliance with the experience requirements of this part including:

i. Present title;

ii. Total years of experience in type of maintenance work;

iii. Past employment record with names of places and periods of employment by month and year;

iv. Scope of present employment; and

v. If applicable, the type of mechanic or repairman certificate held and the ratings on that certificate.

(b) The rosters must be kept current and reflect changes caused by termination, reassignment, change in duties or scope of assignment, or addition of personnel.

Aero Twin, Inc. Response: Aero Twin, Inc. agrees with the provisions of 145.157, with the caveat that the rosters required by this section must be distinct from the FAA Approved Repair Station Manual to ensure that personnel changes do not immediately render the manual itself invalid. The intent of the proposed rule is unclear. We recommend language be added to provide a fixed grace period of 30 days for reporting changes per 145.157(b).

FAA Section 145.159 Training requirements

(a) Each certificated repair station must have an employee training program that consists of initial and recurrent training and is approved by the Administrator.

(b) The training program must ensure that each employee assigned to perform maintenance, preventive maintenance, or alterations, and each employee assigned to perform inspection functions is capable of performing the assigned task.

(c) Each certificated repair station must document in a form acceptable to the Administrator programs pertaining to individual employee training. Individual training records for those employees who require training under the requirements in paragraph (b) of this section must be retained for the duration of each individual's employment.

Aero Twin, Inc. Response: Aero Twin, Inc. agrees that training is of the utmost importance, but we are unable to meaningfully respond to this requirement in light of the lack of detail in the proposal. We therefore oppose this section until the FAA provides draft versions of the advisory material. Refer to our opening comments.

FAA Section 145.201 Quality assurance and quality control systems

(a) Each certificated repair station must: (1) Establish and maintain a quality assurance system acceptable to the Administrator;

Aero Twin, Inc. Response: We oppose the requirement for quality assurance systems for the aforementioned reasons (see opening comments). We recommend the title of section 145.201 be revised to 'Quality control system', and that (a)(1) and (a)(3) be eliminated (the latter being redundant considering 145.207(d)(1)).

FAA Section 145.203 Capability list

(a) Each certificated repair station must prepare and retain a current capability list acceptable to the Administrator. The repair station may not perform maintenance, preventive maintenance, or alterations on an article until the article has been listed on the capability list in accordance with this section and Sec. 145.207(g).

(b) The capability list must identify each article by make and model, part number, or other nomenclature designed by the article's manufacturer.

Aero Twin, Inc. Response: It is burdensome and unnecessary to require listing each article by make, model, and part number. Listing articles by model series should be allowed, where appropriate. For example, the Cessna 150 was produced as models 150, 150A, 150B, 150C, 150D, 150E, 150F, 150G, 150H, 150J, 150K, 150L, and 150M. In this case it would be appropriate for the capability list to include 'Cessna Model 150 Series'. This is even more important in the case of instrument, accessory, and propeller rated repair stations, where the list of specific models and/or part numbers could become extremely long, and constant revision to add new listings would be overly burdensome.

(c) An article may be listed on the capability list only if the article is within the scope of the ratings. And classes of the repair station's certificate, and only after the repair station has performed a self-evaluation in accordance with Sec 145.207(g). The repair station must perform the self-evaluation described in this paragraph to determine that the repair station has all of the facilities, equipment, material, technical data, processes, housing, and trained personnel in place to perform the work on the article as required by Part 145. If the repair station makes that determination, it may list the article on the capability list.

(d) The document of the evaluation described in paragraph (c) of this section must be signed by the accountable manager and must be retained on file by the repair station.

Aero Twin, Inc. Response: We do not accept the creation of an Accountable Manager, therefore we object to paragraph (d). We propose the Repair Station designate staff members with authority to sign capability evaluation reports; that designated authority would be documented as part of the roster required by 145.157. The FAA's review and acceptance of the roster would confer acceptance of the designated signature authority.

FAA Section 145.205 Repair station manual

(a) Each certificated repair station must prepare, keep current, and follow and approved repair station manual for the ratings authorized that is consistent with the size and complexity of the repair station.

- (b) The certificated repair station manual must:
- (1) Set forth the procedures and policies approved by the Administrator for the repair station's operation in accordance with the requirements of this part; and
 - (2) Be followed by the repair station's personnel while conducting station operations.
- (c) Each certificated repair station must maintain at least one copy of its current manual at its facility.
- (d) A copy of the repair station's current manual must be made readily available to repair station personnel required by subpart D of this part.
- (e) The repair station must provide to the certificate holding district office:
- (1) A current paper copy of the repair station manual; or
 - (2) A current electronic copy of the repair station manual that is accompanied by the means to access the electronic copy.
- (f) Except for changes to the capability list, each revision to the repair station manual must be submitted to the Administrator for approval.
- Aero Twin, Inc. Response: We believe the capability list should be separate and distinct from the repair station manual. The proposed rule is clear in its intent that the capability list is not FAA-approved; we suggest that paragraph (f) be revised by striking the words 'Except for changes to the capability list'.

FAA Section 145.207 Repair station manual contents

- Each certificated repair station's manual must include the following:
- (a) An organizational chart containing the name of each management employee who is authorized to act for the repair station, the employee's assigned area of responsibility, and the employee's duties, responsibilities, and authority;
- Aero Twin, Inc. Response: We do not agree that the organizational chart included in the repair station manual should include names of the individuals holding each position. The personnel roster required by 145.157 will include the names of repair station staff members. We suggest replacing the word 'name' with 'title'.
- (c) A description of the certificated repair station's operations, including a description of the facilities, equipment, material, and housing as required by subpart C of this part;
- Aero Twin, Inc. Response: The requirements of subpart C, particularly as written in the proposed rule, are too comprehensive for inclusion in the repair station manual. A facility diagram is sufficient. We suggest that paragraph (c) should read: 'A diagram of the certificated repair station's facilities'. If a comprehensive description of the certificated repair station's operations, including a description of the facilities, equipment, material, and housing as required by subpart C of the proposed rule, is to be required, it should be separate and distinct from the repair station manual (accepted data, not approved data).
- (d) An explanation of the certificated repair station's quality assurance system, including:
- (1) The quality control system;
 - (2) References, where applicable, to the manufacturer's inspection standards for a particular article, including reference to any data specified by that manufacturer;
 - (3) A sample copy of the inspection forms and instructions for completing such forms or a reference to a separate forms manual;
 - (4) Procedures for updating the capability list required by Sec. 145.203, including notification of the certificate holding district office; and
 - (5) Procedures for the implementation of corrective actions for any discrepancies found by the quality assurance system.
- Aero Twin, Inc. Response: We believe paragraph (d) and its sub-paragraphs need substantial revision: We do not agree with the requirement for a quality assurance system (see opening comments) nor do we believe the references of subparagraph (2) should be included in the body of the repair station manual; a list of such references, if required, should be separate from the manual (accepted data, not approved data). We suggest that (d) be revised to read:
- (d) An explanation of the certificated repair station's quality control system, including:
- (1) A sample copy of the inspection forms and instructions for completing such forms or a reference to a separate forms manual;
 - (2) Procedures for updating the capability list required by Sec. 145.203, including notification of the certificate holding district office; and
 - (3) Procedures for the implementation of corrective actions for any discrepancies identified by internal or external review.
- (g) Procedures for self-evaluations, including methods and frequency of such evaluations, and procedures for reporting results to the accountable manager for review and action;

Aero Twin, Inc. Response: We do not agree with the need for a quality assurance system nor with the creation of an Accountable Manager. Absent the requirement for a quality assurance system, we do not oppose the inclusion of self-evaluation procedures; we suggest (e) be revised to read: 'Procedures for self-evaluations, including methods and frequency of such evaluations, and procedures for documenting and reporting results'.

(h) A list of the maintenance functions contracted to an outside facility with: (1) The name of the facility; (2) The type of certificate and ratings, if any, held by such facility; and (3) Procedures for qualifying and surveilling the facility and for accepting maintenance, preventive maintenance, or alterations performed by the facility;

Aero Twin, Inc. Response: This list, which we refer to as a vendor list, should be separate from the repair station manual (accepted data, not approved data). In the case of FAA certificated facilities, subparagraph (3) should not apply, as those facilities are already subject to FAA verification of an approved quality control system.

(k) The repair station's capability list;

Aero Twin, Inc. Response: The capability list should be separate from the approved manual material. We suggest striking this paragraph.

FAA Section 145.211 Inspection of maintenance, preventive maintenance, or alterations performed

(a) A certificated repair station must inspect each aircraft, airframe, aircraft engine, propeller, appliance, component, or part thereof upon which it has performed maintenance, preventive maintenance, or alterations as described in paragraphs (b) and (c) of this section before approving that article for return to service.

(b) Each repair station must certify on an article's maintenance release that the article is airworthy with respect to the maintenance, preventive maintenance, or alterations performed after;

(1) The repair station performs work on the article; and

(2) A qualified inspector inspects the article on which the repair station has performed work and determines it to be airworthy.

Aero Twin, Inc. Response: There must be no ambiguity in this section with regards to the scope of the inspections and maintenance release. The required inspection and maintenance release must apply only to the work performed and this limitation must be very clearly stated in the final rule. We believe this is the intent of the words 'with respect to' in paragraph (b); however, similar wording is omitted in (b)(2), leaving open the interpretation that the qualified inspector must determine airworthiness of the complete article, not limited to the work performed. We suggest that (b)(2) be revised to read 'A qualified inspector inspects the article and determines it to be airworthy with respect to the maintenance, preventive maintenance, or alterations performed'.

FAA Section 145.213 Contract maintenance

(a) A certificated repair station may not contract a job function to another certificated repair station unless:

(1) The contracting repair station meets the quality control and inspection system requirements of 145.201(a)(2) and 145.209(c)(2), and

(2) The contracting repair station's approved repair station manual contains the information and procedures specified in 145.207(h).

Aero Twin, Inc. Response: It is wrong to assume that 'another certificated repair station' may not meet the basic requirements for certification, and that the contracting repair station is responsible for making that determination. The FAA is responsible for making approved determination. All of (a) should be eliminated from the proposed rule.

(b) A certificated repair station may not contract a job function to a noncertificated person unless:

(1) The certificated repair station meets the quality control and inspection system requirements of 145.201(a)(2) and 145.209(c)(2);

(2) The certificated repair station's approved repair station manual contains the information and procedures specified in 145.207(h);

Aero Twin, Inc. Response: It is wrong to assume that a certificated repair station may not meet the basic requirements for certification. Paragraphs (b)(1) and (b)(2) should be eliminated.

FAA Section 145.215 Privileges and limitations of certificate

(a) A certificated repair station may:

(1) Perform maintenance, preventive maintenance, or alterations only on any aircraft, airframe, aircraft engine, propeller, appliance, component, or part thereof for which it is rated;

(2) Arrange for the maintenance, preventive maintenance, or alteration of any article for which it is rated at another organization only if that organization is under the quality control system of the repair station, as prescribed by Sec. 145.201(a); and

Aero Twin, Inc. Response: Paragraph (a)(2) is contrary to the provisions of proposed 145.213. We suggest (a)(2) read: 'Arrange for the maintenance, preventive maintenance, or alteration of an article for which it is rated at another organization under the conditions of 145.213.

FAA Section 145.219 Reports of defects or unairworthy conditions

(b) Each certificated repair station must report the defect or unairworthy condition it discovers to the Administrator on a form and in a manner prescribed by the Administrator. The report must include as much of the following information as is available:

(1) Type, make and model of the aircraft, airframe, aircraft engine, propeller, appliance, or component part;

(2) Name and address of the operator;

Aero Twin, Inc. Response: We believe (b)(2) should be eliminated. Further, we believe compliance with the provisions of 145.219 will be enhanced by this elimination.

Appendix A to Part 145—Job Functions

[all]

Aero Twin, Inc. Response: As previously stated, Aero Twin, Inc. believe that aircraft classes 6 and 7 should be eliminated and a distinct rating for advanced composites be created. This would necessitate appropriate revisions to Appendix A.

End of comments to specific paragraphs of the proposed rule

In summary, Aero Twin, Inc. hopes that the FAA, in quantifying the benefits of this proposal, has considered that, due to increased overhead, many small repair stations will be economically unable to comply with the proposed requirements for extensive new internal processes and record-keeping. The market in general aviation maintenance will swing in favor of individual repairmen; repair stations will surrender certificates to work in that less-overburdened regulatory environment. As a result, a large portion of GA maintenance will move out from under the light of current FAA repair station surveillance and into the darker corners of ramps and tee-hangars nationwide.

PREPARED STATEMENT OF SECURITY AVIATION

It would appear that the tendency of the Anchorage FAA Flight Standards District Office (FSDO) is more of a "we are here to help you" attitude than enforcement. Perhaps the reason is that it is literally impossible for an inspector to one day come in, drink your coffee, maintain a friendly relationship and then the next day objectively investigate a violation or accident of the same operator. The FAA should consider creating enforcement officers, a section completely separate from the regular FSDO inspectors. In addition to investigating and prosecuting pilots and operators these enforcement officers should be in the field making sure that all operators are playing by the same rule book. Eliminate the personal relationships. An FSDO inspector cannot do both.

The FAA continues to allow air charter companies who have had numerous violations, accidents, injuries and fatalities to continue operating. Some of these operators have been banned by the Department of Defense (DOD) who will not allow military or civilian personnel to travel on these carriers. The FAA flight standards district office receives the DOD reports but still allows these operators to continue transporting the general public, who assumes because they are licensed by the FAA they have to be OK. Why is the general public not afforded the same safety standards that a PFC, Colonel or GS-15 civilian is afforded?

Why is the FAA not doing press releases on pilot and operator violations and accidents? Is it true that a journalist or reporter must obtain violation and legal proceedings information from the FAA under the Freedom of Information Act? Very few of the traveling public has access to information that will influence who they fly with. Who you fly with should be just as important as the grocery store, restaurants, or lawyers that you may use, all of whom publicize their inspections or findings.

PREPARED STATEMENT OF THE ALASKA AVIATION COORDINATION COUNCIL

The undersigned members of the Alaskan Aviation Community wish to express our appreciation for the aviation hearings in Anchorage on December 14, 1999. After careful consideration of testimony thus far, we would like to add the following comments and clarifying information to the record.

We believe that Alaska aviation interests share a common vision of Alaska aviation infrastructure needs and that it is clear from existing testimony that Alaska is unique in its reliance on aviation for its most basic transportation needs. Three points of clarification may need to be made regarding testimony given:

First, the need for airport and aviation infrastructure improvements is clear and the cited \$265 million in airport improvements over the next five years is in addition to the historic \$80 million in annual Airport Improvement Program funding that now comes to Alaska.

Second, the cited 20-year window for Capstone avionics to broadly affect aviation safety refers not to the efficacy of Capstone, but rather to the fact that until virtually all aircraft are equipped with 'Capstone' type avionics, Capstone will not be able to provide all the safety benefits it promises to. Obviously, interim, incremental improvements will be most welcome and statewide implementation of Capstone is strongly endorsed.

Third, due to the scope and dynamic nature of aviation and Alaska, more aviation related issues will arise and our concern is that the present nationally driven FAA methodology of addressing these concerns does not serve Alaska aviation safety as well as it should. Alaska is often detrimentally impacted by well meaning federal regulatory reaction, to issues occurring elsewhere, with a "one size fits all" solution. A brief sampling of recent national mandates that have failed or are failing to improve aviation safety in Alaska follow (specifics for which are attached):

- Outdated FAA requirement to re-equip transponder equipped aircraft in Alaska, for which a petition for exemption (FAA Docket 29537) is languishing.
- FAR Part 135 to Pt. 121 transition for commuter carriers, that effectively forced some remote Alaskan markets to smaller, non-pressurized aircraft.
- The Single Engine Instrument Flight Rule (SEIFR) re-write that effectively eliminated SEIFR.
- A historic eastbound departure procedure from Juneau International Airport revised to now uneconomic usage.
- Long standing Ketchikan Revilla corridor flight procedures cancelled.
- Aging Aircraft NPRM 99-02 that will effectively shut down most intra-Alaskan Part 121 and Part 135 scheduled operations.

With national focus programs driven from a remote FAA headquarters in Washington, D.C., policy makers often fail to understand the actual impact of their decisions on basic safety. At other times, locally identified and pursued safety concerns, lacking a national focus, fail to get proper consideration and are either ignored or brushed aside without regard to existing procedure.

For these reasons, we feel it important to fundamentally change the way Alaskan aviation interests and FAA communicate and work together to resolve safety concerns. Toward this end, we would again cite the (attached) Alaska Aviation Coordination Council's Strategic Plan, specifically the recommendation to create a formal "Alaskan Federal Aviation Advisory Council" to the Alaskan Region FAA. This Advisory Council would provide continuous safety and user need assessment to ensure effective planning and development. Presently, no formal communication mechanism exists between the FAA and the aviation community at large to ensure effective feedback and/or advice in planning programs or resolving issues and informal processes lack the structure and authority necessary to ensure follow-up and accountability. Pursuant to this end, we have also asked FAA Administrator Jane Garvey to authorize the FAA Alaska Regional Administrator to address local issues in the best interest of Alaskan aviation safety, including, if need be, authority to waive or modify regulations as necessary to address specific Alaska aviation issues.

Again, we thank you for your tireless pursuit of a safe, efficient, and reliable air transportation system that meets the needs and enhances the health and welfare of all Alaskans.

PAUL BOWERS,
A.E.E., Chair, Alaska Aviation Coordination Council.

JOHN PRATT,
AK Field Representative, Seaplane Pilots Association.

TOM WARDLEIGH,
Chairman, Alaskan Aviation Safety Foundation.

RICHARD HARDING,
Operations, Peninsula Airways.

BOB HAJDUKOVICH,
President, Frontier Flying Service.

GARY BENNETT, JR.,
General Manager, Northern Lights Avionics.

ROBERT JACOBSEN,
President, Wings of Alaska.

JIM HILL,
Pilot, Alaska Airlines.

ARTHUR WARBELOW,
President, Warbelow's Air Ventures, Inc.

FRED H. CIARLO,
General Manager, Tanana Air Service.

RONALD W. HANEY,
Interim Chair, Aviation Technology, UAA.

LEONARD KIRK,
President, Leonard Kirk Aviation Training.

ANECDOTAL EXAMPLES OF FAA NATIONAL DIRECTION THAT DOES NOT SERVE ALASKA AVIATION SAFETY

Alaska is often detrimentally impacted by well meaning federal regulatory reaction, to issues occurring elsewhere, with a "one size fits all" nationally driven FAA solution that do not serve Alaska aviation safety as well as they should. Following is a brief overview sampling of recent national mandates that have failed or are failing to improve aviation safety in Alaska:

- Most transponder equipped aircraft in Alaska have still useful Mode A/C compatible equipment, not thrice as expensive Mode S equipment. Due to nationally proposed infrastructure upgrades, however, FAA national regulations were changed years ago to require air taxi aircraft replacing worn out equipment to do so only with more costly Mode S equipment. The proposed FAA NAS infrastructure upgrades never occurred and are now in doubt, without which there is no benefit to Mode S equipage in small aircraft in Alaska. For this reason, many operators of aircraft with worn out Mode A/C transponders are simply removing them from service rather than replacing with expensive Mode S. Conversely, although Alaska trails the nation in radar coverage, larger aircraft are increasingly equipping with TCAS, which alerts pilots to the presence of any transponder-equipped aircraft, Mode A/C or Mode S. Erosion in the number of transponder equipped aircraft is a safety issue.
- Petitions for exemption (FAA Docket 29537) from this requirement on behalf of all affected Alaskans seems to have been brushed aside without processing per the FAA's own rules (FAR Part 11) and with apparently no understanding of the issues involved.
- The nationwide, congressionally mandated FAR Part 135 to Pt. 121 transition for commuter carriers, that effectively forced smaller operators to revert from pressurized small twin aircraft to nonpressurized single engine aircraft, because the two-pilot and other regulatory burdens of Pt. 121 compliance made the larger aircraft uneconomic in some remote Alaskan markets.
- The Single Engine Instrument Flight Rule (SEIFR) re-write that was intended to enable Alaskan air carriers utilization of IFR capable single engine aircraft, but which rule finally came out effectively making it uneconomic to operate SEIFR and it removed the limited SEIFR procedures previously available to Part 135 operators.
- The long standing, historic east-bound 'Lemon Creek Departure' procedure from Juneau International Airport, developed and safely used without incident by Lockheed Constellations, DC-6s, Boeing 707s, B-720s, B-727s, B-737-100s, 200s, 300s, 400s: all in concert with and fully approved for use by Alaska Region FAA, until a change in FAA staff and national interest review found this long standing local procedure 'unsafe'. Present procedure modifications now impose significant, cost-inefficient load restrictions on Pt 121 operators who opt to use it.
- Ketchikan Revilla corridor flight procedures involving SVFR and IFR coordination, wherein longstanding Air Traffic procedure separating SVFR floatplane operations could be conducted in the channel simultaneously with IFR operations at the airport, with aircraft separation assured by altitude restrictions. With

new Alaska Airlines RNP minimums and availability of approaches to Runway 29, FAA ATC issued notice that simultaneous operations will be cancelled effective 02/28/00.

—Aging Aircraft NPRM 99-02 would mandate a transport category oriented Damage Tolerance (DT) inspection program for all multi-engined 14 years or older aircraft used in Part 121 and Part 135 scheduled operations. This would apply to nearly every intra-state operation in the State of Alaska, affecting over 700 aircraft that were not designed to undergo such inspections, Alaskan operators note this proposal is not only cost prohibitive, but implementing a DT inspection program could in itself make airworthy components or structures un-airworthy. (Multiple requests to have this NPRM rescinded have been submitted by users.)

SUBCOMMITTEE RECESS

Senator STEVENS. So I thank you all for being here and recording our testimony.

Thank you very much.

[Whereupon, at 4:20 p.m., Tuesday, December 14, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENT OF TRANSPORTATION AND RE-
LATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

THURSDAY, FEBRUARY 3, 2000

U.S. SENATE,
COMMITTEE ON THE BUDGET AND COMMITTEE
ON APPROPRIATIONS, SUBCOMMITTEE ON
TRANSPORTATION AND RELATED AGENCIES,
Washington, DC.

The committees met jointly, at 10:08 a.m., in room SD-608, Dirksen Senate Office Building, Hon. Pete V. Domenici (chairman of the Budget Committee) presiding.

Present: Senators Domenici, Shelby, Grassley, Gorton, Snowe, Abraham, Lautenberg, Conrad, and Durbin.

JOINT OVERSIGHT HEARING ON MODERNIZING THE FEDERAL AVIATION ADMINISTRATION: CHALLENGES AND SOLUTIONS

DEPARTMENT OF TRANSPORTATION

FEDERAL AVIATION ADMINISTRATION

**STATEMENT OF JANE F. GARVEY, ADMINISTRATOR
ACCOMPANIED BY JACK BASSO, ASSISTANT SECRETARY FOR BUDGET
AND PROGRAMS**

OFFICE OF INSPECTOR GENERAL

STATEMENT OF KENNETH M. MEAD, INSPECTOR GENERAL

OPENING STATEMENT OF SENATOR SLADE GORTON

Senator GORTON [presiding]. If we can get you seated, we will begin. The meeting will come to order.

In the temporary absence of Senator Domenici, the chairman of the Budget Committee, he has asked me to open. He has an opening statement here that expresses my views exactly and I think outlines what we are about here today. So I will present it, but the record can show that it is his opening statement with which I am associated.

There are two committees that are represented here this morning and two panels of witnesses. There are going to be a lot of questions, so witness time is going to be limited. We will introduce the first panel, and once they have completed their statements and our questioning, we will move immediately to the second panel.

First we will hear from the FAA Administrator, Jane Garvey. She is accompanied by Jack Basso, Assistant Secretary for Budget and Programs and CFO for the Office of the Secretary of Transportation. Following the Administrator's testimony, we will hear from Kenneth Mead, the Department of Transportation's Inspector General.

Madam Administrator—and these are Senator Domenici's words—I know how difficult this week has been for you and your staff. Whatever you want or can say about the Air Alaska tragedy, please feel free to comment this morning. Whatever is said here today, let me be very clear—and this is not a partisan issue—safety should always be priority number one. As you can well imagine, this comes very close to me.

Ms. GARVEY. Yes.

Senator GORTON. Many of my constituents were involved in that tragedy, and I have always had a particular warm spot in my heart for Alaska Airlines. It is a very heart-breaking experience for all of us who are from Seattle.

Let me also say what this hearing is not about. It is not about the President's budget for the FAA next year. We are going to get those numbers on Monday. Should the Administrator want to discuss those numbers, of course, she is free to do so. But that is not a part of our hearing request.

Second, it is not about the current ongoing FAA reauthorization conference. That conference I hope will be completed soon. We want to focus on the future of air transportation in this country. We are all aware of the growth in the number of airline passengers, and we have become increasingly aware of airline delays. One reason often given for these delays and associated costs to the traveling public has been the argument that our air traffic control system is incapable of meeting the new demands due to outdated systems and old technologies. And yet we know that the Federal Government has spent more than \$30 billion for FAA's modernization program since 1983.

This oversight hearing then asks the basic question: With this level of spending and more planned increases, why are we still experiencing problems? We must step back and ask ourselves if the government's organizational structure for our air traffic control system is appropriate for the challenges of the new century. Are there different legislative approaches to funding the air traffic control system apart from the airlines taxes, trust fund, and general fund approach we have used over the past three decades?

Other countries—and we will hear from the Canadian government—have moved toward a more commercial approach to air traffic control. Should we consider that approach and would it even work here in the United States?

These are the kinds of questions that I hope we will deal with today. But I can't avoid on my own adding my compliments to the Administrator. Jane Garvey and I have gotten to know each other quite well since she has taken that position. We flew together on New Year's Eve over the Y2K non-event, very happily, and I have great admiration for the job she has done as Administrator under very real difficulties. She and her agency are, of course, a long way

from being out of the woods, but I do want to compliment her on a job well done so far.

Ms. GARVEY. Thank you.

Senator GORTON. With that, Senator Lautenberg.

OPENING STATEMENT OF SENATOR FRANK R. LAUTENBERG

Senator LAUTENBERG. Thank you very much, Mr. Chairman. It is a pleasure to have you operating in this position, not that I don't miss Senator Domenici, but I think since you and I have some common interests in railroading and other things, life could get easier. But we are pleased to see Jane Garvey and meet Assistant Secretary Basso here this morning.

I came to the Senate with a deep interest in transportation. Though I was running a company in the computer service business, much of my interest emerged in transportation as a result of some public service I was doing as a Commissioner of the Port Authority of New York and New Jersey. The Port Authority is quite an agency. They operate three major airports: Newark, La Guardia, and Kennedy airports in the region. They also have a general aviation airport called Teterboro, which gets a lot of traffic.

And so I was fairly much focused on transportation problems. My company experienced them on the roads, and I had some significant exposure because the Port Authority also owned a railroad called the PATH.

Then, as now, the Port Authority controlled these airports and is responsible for all capital investments in those airports, not to mention investments also in the seaport, and as I indicated, in other services as well, including bridges, tunnels, and you name it in the transportation area.

I became familiar with the critical importance of transportation investments during that period of time, and I also learned that one thing we must do—and the Port Authority was quite an example—is to make investments in a balanced way. As I indicated, we had bridges, tunnels, had an awful lot of automobile traffic, bus terminals, the railroad, and, of course, the airports.

So I came to realize that when funds are not allocated intelligently, more than money is wasted. Time is wasted, critical time during which highways and runways just become more congested.

Mr. Chairman, I believe, like many of our colleagues, that increased investment in aviation is necessary. There is no question about it. But in all our discussions and debates during the last couple of years on how we should provide that increased investment, not enough has been said about how we ensure that these investments are made for the best interests of the traveling public. Not enough has been said how we ensure that other needs of our transportation system are adequately met.

And I am pleased to be here with my friend and colleague of almost all the years that I have been here in the Senate, Senator Shelby. Senator Shelby has my job on the Transportation Subcommittee. He is the chairman. But I have allowed him to take over these years. I am the ranking member, and the chances of a change that I can feel are not very good.

Not enough has been said about whether the current system through which we finance aviation investments is indeed the best system.

As a long-time observer of the spending practices at the FAA, I can tell you that there have been too many instances of time loss and waste. And our current Administrator, FAA Administrator Jane Garvey, deserves a great deal of credit for her efforts at bringing these problems under control.

We must not repeat the mistakes of the past. We must not allow air traffic control procurement programs to be micromanaged or mismanaged. We can't just blindly throw billions of dollars at our Nation's airports and expect the congestion to disappear. We can't just throw billions of dollars at our aviation equipment manufacturers and expect an efficient, state-of-the-art system to emerge at the other end. We need to take aggressive efforts to see that investments are being made intelligently, that money is not being wasted, and that the FAA is being governed by the most modern and sound management practices and the equipment that is consistent with the technological age in which we now live.

Mr. Chairman, over 4 years ago, Chairman Mark Hatfield and I championed a provision that we hoped would go a long way toward reforming the FAA. In a classic case of legislation on an appropriations bill, we provided the Federal Aviation Administration with the broadest and most far-reaching authority to reform its personnel and procurement systems. For years, we had been told that the Federal Government's personnel rules were inconsistent with the flexibility that FAA needed to maximize its potential. And I worked very hard on that, as did Senator Hatfield.

We were also told that the Federal Government's procurement rules were hampering FAA's ability to modernize the Air Traffic Control System in an efficient and affordable manner. So in just a few paragraphs of an appropriations bill, we gave the FAA the widest possible permanent exemption from all these rules. Four years later, however, it appears that these authorities have barely been used.

So when we see an agency that doesn't find a way to fully utilize all the tools at its disposal, we need to question whether the time is right to dramatically increase the level of spending. And this goes with particular criticism directed to Ms. Garvey and her team. It is a big, complicated agency, and it needs incremental steps, as I see it, to get things done. You can't change it overnight.

We also have to consider who will pay for a dramatic new cash infusion into the FAA. I said it earlier: We must maintain an appropriate balance in executing our transportation investments. Current proposals to provide an ironclad guarantee for future aviation spending at levels well beyond the amounts collected into the trust fund will necessarily require funding reductions in other areas of transportation and other areas of the domestic budget.

Since the inception of the Airport and Airways Trust Fund, Congress has appropriated roughly \$65 billion more for aviation than has been collected into the trust fund. I repeat, \$65 billion since the inception of the airport and airways trust fund has been spent on aviation that—or appropriated than has been collected.

So now we are facing proposals to guarantee even larger appropriations of non-trust fund dollars for aviation, general fund dollars that could otherwise be used to fund things like agriculture and education and health research and defense or any other part of the budget.

If the Transportation Subcommittee is going to be required to absorb all of the cuts necessitated by an aviation guarantee, then we will surely be heading toward a transportation bill that is out of balance. And as we review the current situation with the Alaska Airlines crash, it is both tragic and ironic that the two agencies that are engaged in the recovery and the investigation, the people we are looking to for advice and information, the Coast Guard and the National Transportation Safety Board, are two of the agencies that might have to endure severe funding cuts in order to pay for a guaranteed increase in FAA funding.

Now, no one is talking about granting these agencies a funding guarantee. And as I have pointed out many times before, if funding for Amtrak is cut, services in the Northeast corridor are terminated, we will have to add over 10,000 additional DC-9 flights a year between Washington and New York and Boston, and that kind of service will be felt across this country. Whether it is Albuquerque or Los Angeles or what have you, you are going to feel it if we have to add that much extra capacity to the airplanes filling the air lanes. There simply is not the capacity to handle that many flights in what is already the most congested air space in the world.

But, again, its effects are not limited to just that space. So we have got to consider the full ramifications of providing guaranteed increases in aviation spending at levels well beyond those paid into the trust fund, and such a plan that we see overhanging could well produce some grossly inefficient and destructive results.

And I thank you, Mr. Chairman. You have aged since you took this chair a little while ago.

Senator DOMENICI [presiding]. OK. Let me just talk for a minute about how we might proceed. You all know that this is a joint hearing, and we have the chairman of the Appropriations Subcommittee here sitting at my left. The problem is that a joint hearing brings a lot more Senators, and also you have to understand that we have two sets of panels, and nobody wants to be here until 1:00 or 2:00 this afternoon. I hadn't planned to be either. In addition, the leadership has scheduled one vote in the middle of this, but we will try to not close down. So I am going to try to keep the opening statements down in terms of either how long and how many, but I think it is absolutely imperative that I do let the chairman of the subcommittee make an opening statement. Then we will proceed and hear from the witnesses and then we will use our time for opening statements as part of our questioning.

Senator Shelby.

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. Thank you, Mr. Chairman. I will try to be brief, but I think this is a very important hearing, and I commend you for bringing it together.

I would like to thank the panelists for making the time to come testify today before these two committees of the Senate. I know that administration officials and industry representatives do not always relish testifying before either the Budget or the Appropriations Committees because our jobs are sometimes to minimize the amount of the taxpayers' money that must be spent on the functions of government and to make trade-offs among competing programs.

I would also like to thank again the chairman of the Budget Committee, a member of the Transportation Appropriations Subcommittee, which I chair, for scheduling this joint hearing and including my subcommittee. I think this hearing presents a unique opportunity for us to discuss the public's commitment to aviation and the challenges and pitfalls facing the FAA as we continue to modernize the Air Traffic Control System and the National Air Space System and to develop the procedures and the workforce to meet the government's evolving role in aviation.

My hope today is that we can explore two broad but simple questions. One, what are the aviation challenges that must be solved? And, two, what are the potential ways to meet those challenges?

I am mindful of the old axiom that to a hammer every problem looks like a nail, but I have a hard time believing that the solution to every problem at the FAA or in the aviation industry is more money. I know money is important, but it is not the answer to everything.

My research shows that the FAA's appropriation has grown by 230 percent over the last 20 years, while operations handled by the FAA have grown by only 22 percent over the same period. As part of this discussion, I also hope that we can get a better sense of what use the FAA has made of the procurement and personnel reform authority that Congress granted that agency a few years ago. Unless I am mistaken, I believe that the FAA has the greatest flexibility in procurement and personnel of any Federal agency. Yet my sense is that the same problems that plagued the agency 20 years ago and \$28.8 billion of procurement dollars are the same ones that plague them today. I would hope that we could have a very candid—very candid, Ms. Garvey—and focused discussion on whether throwing more money than we already do at the FAA is likely to result in a commensurate improvement in air traffic control efficiency and modernization. To this point, that formula has not worked.

Twelve years ago, the Reagan Commission on Privatization noted, and I quote,

that as airline deregulation moves into its second decade in the United States, the National Air Transportation System faces tremendous challenges. Dissatisfaction over consumer service is apparent in the record number of complaints received by the U.S. Department of Transportation, the flurry of news media attention recently directed toward American aviation, and the voluminous aviation legislation introduced in Congress during 1987.

We only need to change the date to make that an accurate statement for the current state of the Air Transportation System. The concerns expressed in that report in 1987 about the difficulties and deficiencies impairing the efficient operation of the system are as valid today, I believe, as they were in 1988.

Clearly, the problems are persistent and structural. Generally, problems of this nature are not overcome by being overlooked. Insulating FAA funding from competing with other Federal programs will exacerbate the problem rather than remedying the real challenges that must be addressed as we continue to lead the world into the next generation of air navigation, surveillance, and airport and airway safety systems.

Is there a crisis in aviation? If there is, I believe it is the same crisis that we have struggled with for the past 20 years: not enough land-side capacity and how to manage the disruption caused by inclement weather on airport operations that cascade throughout the National Aviation System.

Clearly, there is not enough money in any trust fund, in any agency department or Federal budget to change the weather. The FAA Administrator has explained the relationship between weather—thunderstorms, snowstorms, and their aftermath and delays in the system.

Is capacity a problem? It is not a problem at the vast majority of airports across the country, but it is a problem in some of the airports near major population centers. Unfortunately, aviation projects in those places tend to be some of the most expensive, environmentally contentious, and locally controversial. It is often difficult to convince local communities that longer or more runways, high-speed taxiways, or other aviation investments that will facilitate more aircraft flying above their homes and communities is good for them, even if it is in the national interest.

As a practical matter, I believe that the greatest capacity improvements in the short term are likely to come from improved approaches made possible by GPS technology and better utilization of existing pavement through improved sequencing and coordination of flights. To read some of the recent news accounts, you would think that lavishing more money on the FAA would solve just about every problem that ails us. If you miss a flight, it is because there isn't an aviation firewall. If airports are shut down by a line of thunderheads, it is because there isn't an aviation firewall. If the stock market is off, it is because there isn't an aviation firewall. It goes on and on.

I will state categorically here that recent air tragedies would not have been averted by an aviation firewall. I wish it was that simple. The airlines will continue to cancel flights due to mechanical problems and the scheduling considerations dictated by reduced fleet size even if there is an aviation firewall, and, most importantly, weather disruptions will not go away even if there is an aviation firewall.

I ask that a paper and an update from the Heritage Foundation about budget treatment of aviation accounts be placed in the hearing record at this point, Mr. Chairman.

Senator DOMENICI. Without objection.

[The information follows:]

[From the Heritage Foundation Backgrounder, July 9, 1999]

MOVING AVIATION TRUST FUND “OFF BUDGET” UNDERMINES THE BUDGET PROCESS

(By Ronald D. Utt, Ph.D., and Gregg Van Helmond)

On June 15, 1999, the House passed H.R. 1000 (the Aviation Investment Reform Act for the 21st Century, or AIR 21), to reauthorize the Federal Aviation Administration (FAA) through fiscal year 2004 and to increase significantly federal spending in support of commercial aviation.¹ To make room for this additional spending in a federal budget in which total spending is tightly limited by congressionally approved “caps,” Title IX of AIR 21 would move all spending and revenues of the Airport and Airway Trust Fund “off budget.” As a result of this proposed change, federal aviation spending would be exempt from all congressional budget control mechanisms and would receive a level of protection now provided only to Social Security. Spending control mechanisms that no longer would be applicable to aviation spending if the aviation trust fund were moved off budget include budget caps established by the Balanced Budget Act (BBA) of 1997, pay-as-you-go rules, annual congressional oversight and review, and other statutory budget limitations.

Although the House passed AIR 21 by a veto-proof majority, it is not at all certain that the Senate is prepared to accept aviation spending plans of this magnitude or a change in the budgetary treatment of trust fund spending. Indeed, now under consideration in the Senate is a significantly different proposal to reauthorize the FAA: S. 82, introduced by Senator John McCain (R-AZ), which would authorize much less spending than H.R. 1000, and make no change in aviation’s on-budget status. Because the FAA’s current authorization expires this August, considerable pressure will be placed on the Senate to match the level of spending, and the special off-budget privilege, passed by the House.

Advocates of the proposal to move aviation spending off budget argue that this special privilege would protect the tax revenues generated by the airline industry and airline passengers from being diverted to non-aviation spending, tax relief, or debt reduction. And because none of the existing congressional spending limitation efforts and mechanisms apply to off-budget spending, this privilege also would allow Congress to raise future aviation spending substantially above levels that would be permitted for such other, unprotected programs as national security, health care, and law enforcement. If ultimately adopted by Congress and signed into law, such a change would be a major setback in Congress’s long struggle to control spending, reduce taxes, and balance the budget. It also would be fiscally irresponsible because it would make sound federal financial decisions more difficult, weaken congressional oversight, create a misleading federal budget, and violate the spirit of the BBA. Specifically:

1. *Sound public finance decisions would become more difficult.*—Moving aviation spending off budget would erase any remaining notion of fiscal discipline within Congress. Not only would it remove aviation spending from any measures of budget control, but it would have the further effect of creating opportunities to spend more in other programs. Placing aviation spending off budget without a corresponding decrease in the discretionary spending caps in effect would bust the caps enacted in 1997 by creating a “gap in the cap.” This gap, amounting to \$25.2 billion between 2001 and 2004, would likely be filled with increased spending from a variety of other programs seeking relief from the discipline imposed by the caps. If the caps were adjusted downward to reflect the off-budget move, then an even smaller share of the federal budget (now down to just 34 percent of all federal spending) would have to shoulder the burden of meeting the budgetary targets required by the BBA. Such vital, but unprotected programs as Coast Guard drug interdiction, national defense, the Centers for Disease Control, and many others could become subject to cuts, while federal spending on behalf of commercial airlines and recreational pilots would be increased and protected from congressional oversight.

2. *Congressional and presidential oversight of federal programs would be weakened.*—As the chairman of the Senate Budget Committee, Pete Domenici (R-NM), noted recently,

¹For a more detailed critique of AIR 21, see Ronald D. Utt, Ph.D., “FAA Reauthorization: Time to Chart a Course for Privatizing Airports,” Heritage Foundation Backgrounder No. 1289, June 4, 1999.

“Off-budget gimmicks or “firewalls” reduce management and oversight of the FAA by taking trust fund spending out of the budget process. That’s a bad idea—we should not place the FAA and the trust fund on permanent autopilot.”²

Earlier this year, the General Accounting Office (GAO) testified before the House Transportation Subcommittee that

“When the [transportation] trust funds were created, Congress did not create them as automatic spending trust funds. It chose to retain annual oversight and control of spending from those funds in the appropriations committees.”³

With aviation spending moved off budget, and escalating levels of funding set for the next five years, both Congress and the President would lose what little leverage they have to induce the notoriously troubled FAA to strive for higher standards of performance. Providing such protection to a government department that this year again earned the GAO’s “high-risk” designation—a distinction it shares with the Internal Revenue Service and the Department of Housing and Urban Development—would be irresponsible.⁴

3. *Off-budget protection would diminish opportunity for reform.*—Once a program is moved off budget, and no longer is subject to annual budget review or periodic authorization, Congress has fewer scheduled opportunities to review it and, therefore, fewer opportunities to effect needed reforms. The federal government’s involvement with commercial aviation has changed little since 1971, when the aviation trust fund was created as the primary funding vehicle for FAA programs. But since the 1971 FAA overhaul, there have been many changes in the world of commercial aviation; most of these changes—except for President Jimmy Carter’s airline deregulation in 1978—have taken place abroad. These include the privatization of more than 60 airports in the past two years, the denationalization of many former government-owned airlines, and the privatization/corporatization of air traffic control systems, notably in Canada (1997) and in 16 other countries in recent years. By locking up funding for five years and placing such funding off budget, as H.R. 1000 would do, neither Congress nor the President would have much in the way of opportunity to impose reform, and the status quo would prevail until at least 2005.

4. *The federal budget would be even more misleading than it is today.*—Removing aviation funding from the budget would understate the size of the federal government. In fiscal year 1998, off-budget spending amounted to over \$316 billion. More important, when other non-discretionary (labeled as “mandatory”) spending is taken into account, over 66 percent, or \$1.1 trillion, of the \$1.7 trillion in federal outlays are essentially untouchable for Congress during the annual budget process. Programs not lucky enough to warrant designation as “off budget” or “mandatory,” including national defense, education, and other discretionary line items, bear the brunt of any budget cuts needed to fulfill deficit/surplus targets, repay the national debt, or meet emerging priorities and emergencies.

5. *Supporters of other programs would seek similar protection.*—At present, only Social Security has received “off-budget” protection in recognition of the importance of the program for the well-being of many retirees and the firm, contractual relationship between the taxes paid in and the benefits received. No such significance or relationship applies to the FAA’s spending programs, whose chief beneficiaries are the for-profit airlines, recreational pilots, and weekend hobbyists. All reflect a segment of society with the financial means to bear the risk of future budget restraint and the impact such uncertainty might have on the programs that assist them. Nonetheless, if aviation spending programs were placed off budget, other programs of potentially greater significance to the well-being of the country or to vulnerable constituencies, such as Medicare and national security, would be likely to demand the same protection—and could receive it. As a consequence, what remains “on budget” soon would amount to a minor share of federal spending, and much of the rest—now afforded off-budget status—would be beyond control, oversight, and reform by either the President or Congress.

²Bureau of National Affairs, “House Passage of AIR-21 Stuns Senate; Domenici Mobilizes for Off-Budget Battle,” Daily Report for Executives No. 116, June 17, 1999.

³U.S. House of Representatives, Committee on Appropriations, Department of Transportation and Related Agencies Appropriation Bill fiscal year 2000, Report No. 106-180, June 9, 1999, p. 33.

⁴U.S. General Accounting Office, High Risk Series: An Update, GAO/HR-99-1, January 1999; “The Department of Transportation’s 10 Top Priority Management Issues,” Statement of Kenneth M. Mead, Inspector General, U.S. Department of Transportation, before the Subcommittee on Transportation, Committee of Appropriations, U.S. Senate, 106th Cong., 1st Sess., February 25, 1999.

6. *The spirit of the Balanced Budget Act would be destroyed.*—The BBA was created to keep runaway spending in check, and to date has served as an important source of discipline in slowing the growth of discretionary spending. Although it has not always been honored, and many tricks and gimmicks have been suggested or utilized to sneak extra spending past its controls, the spirit of the BBA has survived and has been more effective than previous congressional budget reforms. AIR 21 could very well end this successful effort. Although not a new ploy, off-budget accounting for the Airport and Airway Trust Fund would exempt billions of dollars from budgetary restraints at the expense of other programs.⁵ By taking the aviation trust fund off budget, Congress would risk setting a dangerous precedent. By undermining the sense of shared sacrifice that has helped many congressional committees to make tough decisions, advocates of other programs could become inclined to resist cuts and seek the same or similar privileges and protections.

CONCLUSION

Although the House voted overwhelmingly to pass AIR 21 (H.R. 1000) and to move aviation trust fund spending off budget, the bill's prospects in the Senate are uncertain, particularly when considering the Senate's record of firm opposition to the sort of budgetary gimmicks included in AIR 21. At present, the Senate's version of legislation to reauthorize the FAA (S. 82) proposes to spend substantially less than AIR 21, and also to leave the trust fund on budget and subject to existing spending limits and caps. As such, S. 82 offers Congress a fiscally responsible choice compared with the irresponsible excess of AIR 21.

[From the Heritage Foundation Executive Memorandum, Feb. 2, 2000]

SENATE SHOULD NOT TAKE FAA SPENDING OFF BUDGET

(By Ronald D. Utt)

In 1999, the U.S. House of Representatives passed H.R. 1000, the Aviation Investment Reform Act for the 21st Century (AIR 21), by a veto-proof majority and sent it to the Senate with the expectation that the upper chamber would support its unprecedented violation of fiscal integrity. Put forth originally by House Transportation and Infrastructure Committee Chairman Bud Shuster (R-PA), AIR 21 would place the Airport and Airway Trust Fund off budget and guarantee federal aviation programs minimum funding levels from general federal revenues over and above revenues derived from dedicated aviation taxes.

Strong Senate opposition to AIR 21—led by Senators Pete Domenici (R-NM), Frank Lautenberg (D-NJ), Richard Shelby (R-AL), and Ted Stevens (R-AK)—is based on concerns that the bill's proposals are fiscally irresponsible and would establish a precedent that other federal programs could use to avoid the discipline of the congressional budget process. The Senate has passed its own bill, the Air Transportation Improvement Act (S. 82), sponsored by Senator John McCain (R-AZ), which would authorize less spending than AIR 21 and make no change in the budgetary status of the Federal Aviation Administration (FAA). Achievement of a House-Senate compromise remains elusive, since the Senate refuses to accept AIR 21's budget-busting provisions, and authorization for FAA's Airport Improvement Programs has expired.

If AIR 21 were enacted and the aviation trust fund were placed off budget, federal aviation spending would be exempt from all congressional budget control mechanisms and afforded a level of protection now provided only to Social Security. Spending control mechanisms that no longer would apply include budget caps established by the Balanced Budget Act (BBA) of 1997, pay-as-you-go rules, annual congressional oversight and review, and other statutory budget limitations.

Advocates of AIR 21 argue that the off-budget privilege would prevent the diversion of tax revenues generated by the airline industry and its passengers to non-aviation spending, tax relief, or debt reduction. But if FAA spending were redefined as off budget, future aviation spending could be increased at rates above those permitted for such other unprotected programs as national defense, education, and law enforcement.

If AIR 21 were adopted by Congress and signed into law, its provisions would mark a major setback in Washington's long struggle to control spending, reduce taxes, and pay down the debt. Specifically:

⁵The House Transportation Committee attempted to take the Highway Trust Fund off budget last year.

- Responsible public finance decisionmaking would be more difficult, because one program would be given more protection and privileges than the rest. Moving aviation spending off budget would undermine any remaining notion of fiscal discipline in Congress. Moreover, giving the FAA guaranteed minimum levels of funding out of general revenues would provide it with an added—and costly—privilege.
- Congressional and presidential oversight of federal programs would be weakened. As Senate Budget Committee Chairman Pete Domenici has observed, “Off-budget gimmicks or ‘firewalls’ reduce management and oversight of the FAA by taking trust fund spending out of the budget process. That’s a bad idea—we should not place the FAA and the trust fund on permanent autopilot.” Moving aviation spending off budget would deprive Congress and the President of what little leverage they have to induce the notoriously troubled FAA to achieve higher standards of performance. Diminishing oversight of a federal department that earned a “high risk” designation by the U.S. General Accounting Office would be irresponsible.
- Off-budget protection would diminish opportunities for reform. Once a program is moved off budget, it is no longer subject to annual budget review, appropriations, or periodic authorization. As a result, Congress would have fewer opportunities to review the FAA or encourage it to adopt fundamental reforms that today are sweeping commercial aviation, especially abroad. These include privatization of more than 60 airports in the past three years, outsourcing of various component activities, and privatization-corporatization of the air traffic control systems in Canada and more than a dozen other countries. By locking up the program for five years and placing its funding off budget, AIR 21 would ensure that the earliest reform opportunity could not occur until 2005.
- The federal budget would be even more misleading than it is today. Removing aviation funding from the budget would understate the size of the federal government by excluding a multibillion-dollar program. In fiscal year 1999, off-budget spending amounted to \$321 billion; when other non-discretionary (“mandatory”) spending is added to this amount, over 66 percent—or \$1.2 trillion of the \$1.7 trillion in federal outlays—is essentially untouchable in the annual budget process. Programs not lucky enough to warrant “off budget” or “mandatory” designations, including defense, public health, criminal justice, and education, bear the brunt of any budget restraint necessary to meet overall fiscal objectives.
- Supporters of other programs would seek similar protection. At present, only Social Security receives off-budget protection in recognition of its extreme political sensitivity and the essential benefits it provides to a large and vulnerable portion of the population. No such significance applies to the FAA’s spending programs, the chief beneficiaries of which are for-profit airlines, recreational pilots, and weekend hobbyists. If programs that benefit commercial aviation are placed off budget, other federal programs of potentially greater significance to vulnerable constituencies or the nation’s well-being would be likely to demand, and perhaps receive, the same protection.

Although the House voted overwhelmingly to pass AIR 21 and move aviation spending off budget, the bill’s prospects are uncertain because of the Senate’s record of firm opposition to the sort of budget gimmicks included in this bill. At present, the Senate-passed alternative (S. 82) proposes spending less than AIR 21, offers no minimum guarantees from general revenues, and would keep the trust fund on budget where it belongs. As such, it offers Washington a fiscally responsible alternative to AIR 21’s fiscal excess.

Senator SHELBY. In short, the paper makes the points that: one, effective oversight would be reduced; reform of the agency would be more difficult; and, three, special budget treatment, as we all know, is a slippery slope. Special budget treatment is a code for reduced accountability and oversight. If the FAA were an agency that could be put on autopilot, then accountability and oversight might not be so important. But, unfortunately, the FAA is an agency with enormous challenges that require increased accountability and oversight, as pointed out in every study, review, or assessment of the agency in the last 20 years, most recently, in the 1997 Coopers & Lybrand independent financial assessment. Clearly, changing budget treatment is no substitute for responsible policy oversight.

I would note that a month ago we invited almost all the airline CEOs to be here this morning to share their views with us on these issues. Unfortunately, to my knowledge, none were able to join us today. I think they miss an opportunity to talk with two committees of the Senate directly involved in aviation spending issues. With all the meetings they have been having around the Hill on this issue, I would have thought they would have jumped at the opportunity to be here today. I will give some of those CEOs another opportunity to testify before my Subcommittee on Appropriations later this year about some of the issues my constituents have been giving me an earful about. Funny to me, my constituents don't seem to care about FAA's funding levels or delays as much as they do about the airlines living up to commonly expected levels of customer service and the implicit promise made by advertised air fare prices.

Mr. Chairman, I know I have taken too much time, and I really am more interested in what the witnesses have to say here. Thank you for your indulgence.

Senator DOMENICI. Senators, do I understand that it is acceptable to everyone that we proceed? I think we ought to hear from the witnesses.

Thank you very much for taking over, Senator Gorton, Senator Lautenberg, in my absence.

Let me just say in addition to the statement which was read on my behalf, this is part of our oversight responsibility, ongoing oversight that we will do for the next couple of weeks in various parts of our government, and it was thought to be rather important to get a better understanding of the needs in this area because we have not yet resolved the multi-year bill for FAA that is in conference. But, in addition, believe it or not, we have not resolved how much appropriations money there will be available for the entirety of government. We are still negotiating and we still have to have meetings on that. And it is relevant how much, in addition to any guarantee of trust funds which is given in our conference, how much additional money might be needed because we don't have a very large pot of non-discretionary money to spend on all of government.

So I hope everybody understands. We don't hold this to become technical experts on the subject matter but, rather, the broader picture that has been presented in my opening remarks and by the distinguished chairman and ranking member.

Now, the Honorable Jane Garvey, Administrator of the Federal Aviation Administration, whomever you have accompanying you, they are welcome to speak if you want them to. Their presence is noted, and their names. Let me say it has been a pleasure to know you for a number of years. I think you have taken a challenge here that is very difficult, and to my knowledge, thus far, what I know about it, I commend you for very, very serious efforts to fix some things that need fixing. Would you proceed, please?

STATEMENT OF JANE F. GARVEY

Ms. GARVEY. Thank you very much, Mr. Chairman. It is a pleasure to be here and to be with members of the committee.

If I could begin by first of all expressing our sympathy to the families who experienced really an irreplaceable loss this week with Alaska Airline Flight 261, and we are very much aware of the ties of Senator Gorton and Chairman Stevens, too, as well, to those communities.

We do have an extraordinary aviation system in this country. We serve 600 million passengers a year. But as Secretary Slater commented yesterday, in somber moments like these, I think it really underscores the importance of the work that we do. And I would only add that it also serves to encourage us to redouble our commitments to doing absolutely the best job that we possibly can. And I know I am speaking particularly for the men and women who have joined the NTSB in investigating this accident in great detail.

Mr. Chairman, again, thank you very much for having us here today. And if I could—and I will do this as briefly as I possibly can, but I would like to try to answer, if I could, two fundamental questions this morning. The first is: How are we managing, how are we at the FAA managing this enormous challenge of modernizing the Air Traffic Control System? And I think inherent in that is the question: Are we up to the task?

Second, I would like to touch on what we see as some of our major challenges. First of all, the management approach we are taking I think can be summed up in one phrase that I am sure many of you have heard by now, and that is, evolution not revolution.

Historically, I think the FAA—and, in fact, government in general—takes on projects that are often too massive, too ambitious, large, complex projects that never seem to get done. So instead of the big bang approach, we are moving incrementally, step by step, reducing the potential for cost overruns and delays. And we have done this by listening to the users of the systems, the airlines who have to use the system, and by establishing unprecedented agreements, both with industry and with our labor unions. I wanted to underscore that because really it is something we will accomplish only if we are working together on this issue.

We think the approach is paying off, and it is paying off in three important elements of modernization, again, very briefly. First of all, sustaining the system. There are thousands of pieces of equipment in the system, and we often focus on the very sort of visible projects. But in 1999, for example, we replaced over 750 major pieces of equipment in the system. We replaced 30-year-old equipment in all of our centers, and that is the equipment that is used to manage the Air Traffic Control System. HOST was completed and replaced in December. DSR will be replaced in all of the centers by May 2000. We are very happy to say that last week we initiated STARS in Syracuse, and El Paso went online 2 or 3 weeks ago.

So those, again, provide the platforms for the future capability. So in terms of sustaining the system, we are doing a great deal to replenish the system that is out there. And we have done all of this while managing the once-in-a-century problem, Y2K.

The second element of modernization is the whole issue of safety enhancements, and that really speaks directly to our mission of aviation safety. I think some of the members touched on that, the

whole issue of weather, and included in our modernization effort is a whole series of weather initiatives that gives us much more accuracy in producing the weather information. Our goal here is to really have in place in all of our facilities common weather information, the most state-of-the-art information. So both in terms of sustaining the system and safety enhancements, we are doing it incrementally, and we are doing it in a block-by-block fashion.

The third element for modernization is improving the whole system efficiency. Free Flight Phase One really is the cornerstone, and I think some of you have heard me speak about this before. Again, it could be a very ambitious massive project, and what we have said is let's identify a series of automation tools which give us increased efficiency and increased capability. This has been accomplished. It has been accomplished with an unprecedented agreement with industry and an unprecedented agreement with our own unions. I am delighted to see Bob Baker here, who has been helping us in the whole effort with Free Flight.

We have a very simple, straightforward contract with industry. It is, we deploy the technology; and industry helps us measure the results. So block by block, step by step, incrementally, we are getting modernization done. I think in particular, look at some of the investments that Congress—or some of the money that Congress has given us in the past 2 years: HOST, \$164 million, and we got it done ahead of schedule. I am delighted with that.

Free Flight is on schedule. We will have those technologies deployed to selected sites by the end of 2002, and we are moving very aggressively in that area. So the incremental approach is important.

Second, I think there are other ways that we are managing differently. Historically, the FAA has taken a stovepipe approach to solving problems. We tend to be rather layered and hierarchical. The decisionmaking is often diffused in the agency. What we are doing now is taking every major initiative, organizing it with one point of accountability, and organizing it across the lines of business. Y2K I think gives us a great model. Free Flight Phase One gives us another model where we are pulling these programs together under one point of accountability.

I think another issue that has been very important to us and something we have learned well in the last couple of years, and that is the importance of human factors. Technology is only one part of the challenge. Human factors is another part. Getting our controllers and the users involved early on in the deployment of these technologies is really key. If you look at the Free Flight office or you look at the efforts in STARS right now, you will see the controllers working side-by-side with the managers. I think that is critical as well.

Senator Lautenberg spoke of two very, important tools that we received from Congress. We are absolutely indebted forever for both personnel reform and acquisition reform.

Personnel reform has already allowed us to streamline the recruiting of top people. We have been able to actually recruit some people into the agency from industry. I think we would not have been able to do that 5 or 10 years ago. We are on the right track with personnel reform. We had a terrific pilot program last year

that really taught us a great deal, and we are getting ready to move out on implementing the performance based compensation plan for the entire agency in the spring of this year.

Acquisition reform, 50 percent reduction in time, great value-added. We are seeing, again, I think some real improvements. Now, let me just say that there is more we can do. We should be doing more and we are doing more. We have had independent reviews from the IG, from Booz Allen, from NAPA. All of them have given us some very specific suggestions which we are taking and implementing.

Finally, the issue of cost accounting. In some ways, I think that holds the greatest promise for us in the future. We are well on our way with cost accounting. I will tell you we have had to slow down a bit because of some of the budget constraints, but, again, in the area of air traffic control, we are well on our way to seeing cost accounting in place.

Let me just finally mention some of the challenges that we have ahead. I think when we look at the large technology, we are always going to have issues in managing those large, complex projects. I think we need to constantly ask ourselves: Have we set the right deadlines? Do we have the right milestones? Are we asking the right questions? But we are prepared to do that, and I think we are, again, well on the way incrementally to getting those projects done.

I think another great challenge for us is the whole issue of delays, and you spoke about that in your testimony, a number of you. We are very focused with industry on a Spring-Summer Plan that is really going to change the way we approach some of the issues of managing the Air Traffic Control, and that in the short term is going to give us some very positive benefits. Again, that is something we are just about ready to announce, we hope by the end of February.

We will continue to have challenges in personnel reform, in acquisition reform, in cost accounting. But the greatest challenge is going to be to keep focused on those elements, do the best job we can at implementing, and then using those tools as flexibly as we possibly can.

One last word, though, if I could, on reauthorization. From our perspective, we see this as one of the great short-term challenges. I do want to underscore what Secretary Slater said to you, Mr. Chairman, just the other day when he thanked you and this committee for your efforts on completing the action on the Reauthorization Bill. We are very much aware of some of the very difficult issues associated with that bill, particularly in the area of funding. We do appreciate your willingness to tackle those very tough questions with us.

The other day I spoke with Don McCarty, the head of American Airlines, and he made a statement that has really stayed with me. He said that it would be so good to get that behind us so that we can continue to focus like a laser on some of the issues that really are so challenging to us. I think the issue of further reforms is part of that, and we look forward to, not only hearing from some of the other witnesses today about some of their experiences, but also, we

look forward to working with this committee in the future on additional reforms that we could possibly put in place.

PREPARED STATEMENT

We do believe that passing the Reauthorization Bill is one step in taking the debate and the dialogue to another level, and we absolutely look forward to working with members of this committee to seeing it through.

Thank you very much.

Senator DOMENICI. Thank you very much.

[The statement follows:]

PREPARED STATEMENT OF JANE F. GARVEY

Chairmen Domenici, Shelby, and members of the committee and subcommittee: Thank you for the opportunity to appear before you this morning to discuss the Federal Aviation Administration's progress in modernizing the National Airspace System (NAS). I am pleased to report that in the past 2 years, the FAA's restructured approach for modernization has produced promising results—specifically in the creation of a manageable short and long-term strategy to modernization and in the form of positive responses from our partners in the aviation community.

The FAA is a 24 hour/7 days a week service delivery organization. The FAA controls approximately 200,000 takeoffs and landings per day and moves over 600 million passengers per year. This latter number is expected to reach 1 billion within a decade. Our customers depend on the safe and efficient operation of the NAS. Maintaining this system in a safe and efficient manner, while providing for the anticipated growth in the use of NAS, is the FAA's top priority.

Our Nation's decade-long economic expansion has produced a sustained increase in demand for air traffic control (ATC) services. Traffic has grown about 4 percent a year and some locations have seen 20 percent increases during a year as new flights are added into highly competitive airline links. As this economic growth and increase in demand for our services continues, increasing pressures will be placed on aviation resources.

The world looks to the FAA for guidance and support not only for air traffic control, but for all aviation activities, including security and certification. The standards we set will guide international aviation for years to come.

MANAGING DIFFERENTLY

Our management approach can be summed up in a phrase that I am sure many of you have heard by now: evolution, not revolution. Instead of taking a "big bang" approach to modernization, we are moving incrementally, building upon each step that we have taken, reducing the potential for cost overruns and schedule delays. In addition, the FAA has established a strong partnership with the aviation industry and labor unions. As a result, the FAA has focused resources on areas important to industry and has taken steps to coordinate with the appropriate labor groups.

This management approach to NAS modernization is the right one to take, given the tight budget constraints in which all Federal agencies must operate. As a Federal entity, the FAA must also meet its annual performance goals. Our annual performance is also tied to how effectively the FAA manages the resources Congress provides. Our NAS modernization efforts, built upon incremental steps, is best suited for the task of managing the dollars your committees provide to the FAA.

As I mentioned, the FAA has structured our approach to modernization with a particular emphasis on air traffic control modernization, the cornerstone of the NAS. We have defined three elements to air traffic control modernization: first, sustaining our current system and renewing the infrastructure; second, adding safety feature, (safety, of course, being the FAA's primary mission); and third, improving the system to increase capacity and efficiency.

OUR ACHIEVEMENTS

When it comes to NAS sustainment, I'm sure each member of both committees is well aware of our largest and most recent sustainment project—Y2K compliance. The FAA had to assess and certify 628 different systems and programs—a daunting task to say the least. Whether you were traveling at 35,000 feet as Senator Gorton and I were at year-end, or following worldwide festivities on television, you never

heard anything alarming or threatening about our transition. It was the dedication, time, sufficient funding, and effort of hundreds of FAA employees that made our Y2K transition such a success.

In order to sustain our current systems and renew our aviation infrastructure, we have incorporated both major and minor changes to the air traffic control system. Thus far, we have installed and integrated more than 750 major systems and pieces of equipment into the NAS. These efforts to sustain our system produce immediate paybacks. For instance, last year the FAA replaced the HOST and oceanic computer system equipment used to control air traffic at the 20 en route and 3 oceanic centers. We are also replacing the associated radar display systems at the 20 en route centers, with 12 systems fully operational last year.

Many of our NAS sustainment projects are nearly complete, while others are beginning to bear fruit. For example, this coming May we will dedicate the last of the Display System Replacements (DSR), replacing 30-year old display equipment in the en route centers, and completely modernizing controller workstations. DSR provides controllers with new hardware and software display systems, and provides a platform for future enhancements. We are in the process of replacing one system per month, center by center, at all 20 centers.

In December, I had the pleasure of traveling to El Paso, Texas, to see the first use of our new air traffic control automation system in the terminal environment with STARS, the Standard Terminal Automation Replacement System. STARS is the equivalent of DSR in the terminal environment, the most intricate environment in the NAS. Although the FAA has faced a number of difficulties with the development of STARS, controllers, technicians, and management are working side by side to resolve open issues and problems. With the first version of STARS now running in both El Paso and in Syracuse, New York, our efforts are beginning to pay off in this critical area.

One of the best examples of how the FAA is managing differently is the work of the Human Factors Working Group, a group that grew out of our development efforts in STARS. The working group, comprised of representatives from the FAA, our labor union leadership, and industry, developed a process to identify, monitor, and resolve human factors issues throughout the entire acquisition process so that these issues do not arise unexpectedly and too late in a program. Since air traffic controllers play such a crucial role in the FAA's safety mission, the Human Factors Working Group makes sure that they have an early and continuing voice in the acquisition of systems that affect the job that they are so committed to doing.

We are also currently testing the Wide Area Augmentation System (WAAS). WAAS works with the satellite-based Global Position System (GPS). The GPS signal that is available for civil use is accurate but requires augmentation for aviation use. The GPS signal by itself does not fully satisfy civil aviation navigation requirements. WAAS would correct the signal to provide the safety, integrity, and accuracy to satisfy civil aviation navigation requirements.

The FAA and Raytheon's latest testing of WAAS indicates that the accuracy of the system exceeds our requirements. However the performance to date of the safety monitor function that provides system integrity has not yet met requirements. WAAS integrity is an essential element in the program. In order to ensure the system meets essential safety requirements, the FAA is currently assessing how much work will be required.

Our second element of NAS modernization, adding safety features, is an effort that speaks directly to the FAA's primary mission of ensuring aviation safety. Our additional safety features include advanced weather information systems. These enhancements will provide us with more precise, more accurate, and timelier weather information. In our modernization blueprint, we have included many weather initiatives, such as the Integrated Terminal Weather System and the Weather and Radar Processor. These provide increased accuracy in terminal area and en route weather information, as well as Terminal Doppler Weather Radar for major airports where windshear and microbursts are safety issues.

WHAT WE ARE FOCUSED ON

The third element of modernization, improving the capacity and efficiency of the system, means fewer delays, lower costs, and better service. The crux of this third element is Free Flight Phase One. Free Flight Phase One is the first step to an innovative approach to air traffic control, moving from "control" to air traffic "management." Free Flight Phase One is designed to move the NAS from a centralized command-and-control system between pilots and air traffic controllers to a distributed system that allows pilots, wherever practical, to choose their own route and file a flight plan that follows the most efficient and economical route. The overall benefit

of these programs is to enable our air traffic control system to accommodate the future increase in flights and provide more optimum routings for aircraft in the Nation's airspace.

Free Flight Phase One represents an historic point in the FAA's history. Under this program, we have reached a consensus with industry that is virtually unprecedented: an agreement from all sectors of the aviation community. Our agreement with the industry is simple: we deploy the systems and the remainder of the community measures the results and tells us how they are working. After receiving this feedback, we will decide upon our next steps. Maintaining this consensus is an enormous challenge for the FAA, particularly in an industry where competition is the guiding principle.

Moreover, Free Flight Phase One is a perfect example of the benefits of the FAA's "evolution, not revolution" approach to NAS modernization. Under this building block approach, we not only reduce the risks of cost overruns and schedule delays; we take into account the changing nature of emerging technology. The FAA's NAS modernization plan is a forward-looking approach that is scheduled to take place over the next 15 years. With our new incremental, evolutionary approach, we will be able to accommodate changes in technology and incorporate them into the NAS in a managed fashion.

AIR TRAFFIC CONTROL REFORM

Finally, I would like to discuss air traffic control reform. At this crucial time, when Congress is in conference on important FAA reauthorization legislation, I would like to emphasize the Administration's commitment to meaningful and necessary air traffic control reform, a much needed long term solution. Fundamental reform of air traffic control has been an Administration priority for 6 years. The goal is to make our air traffic control system as efficient as it is safe, a goal we share with this committee. Through the expanded capacity that greater efficiency would provide, we can reduce delays, better serve under-served communities, and accommodate the enormous growth projected for this vibrant industry.

Although the Administration has proposed different organizational structures at different times, our three principles for ATC reform—business-like management, cost-based pricing, and budget reform—have remained the same. They have been endorsed by three blue-ribbon commissions; most recently the 1997 congressionally mandated National Civil Aviation Review Commission (NCARC). Both the House and the Senate recognize the importance of reform to the future of air traffic control, and both have some elements of reform in FAA reauthorization legislation that is now in conference. The Administration wants to be part of the dialogue on the important issue of reform. We believe our three principles provide the basis for sound, responsible, achievable reform.

First, the FAA needs to be able to operate the air traffic control system more like a business. The Administration is fully supportive of the NCARC recommendation that FAA management must become performance based. Congress has already given us key elements of management reform in the form of streamlined personnel and procurement authority. A key reform still needed is the establishment of a chief operating officer (COO) whose salary and tenure are linked to concrete performance measures. We recognize and appreciate that both the House and Senate bills would create a COO.

Second, the FAA's ATC revenue stream must become cost-based. The Administration believes that Congress should replace the current financing mechanism, an excise tax on airline passengers, with a system in which the actual commercial users of air traffic control services pay for them based on the cost of those services. (Like NCARC, the Administration agrees that general aviation should continue to pay a fuel tax.) As stated in the NCARC report, "A cost-based system of charges will change the way the government, as the provider of ATC services, and the aviation industry, as the user of ATC services, develop their respective policy and management decisions. Using such a system, in and of itself, will bring about a very significant management improvement." In other words, cost-based pricing is necessary to drive management reform.

Third, in exchange for pricing reform, Congress should ensure that the resulting cost-based revenue from air traffic control users is spent *exclusively* on air traffic control. Such a guarantee will make it easier for the FAA and its customers to meet operational and capital spending needs for ATC.

Air travel is a critical engine of economic growth, whether it is the leisure travelers who fuel tourism or the many business travelers who depend on reliable, convenient air service. If we do not reform ATC to enable it to accommodate the antici-

pated growth of air travel, we will be making a fundamental decision to limit our Nation's economic growth during the 21st century.

SUMMARY

As for our next steps in modernization, we are currently exploring several possibilities. Here, we strive to strike the right balance between looking towards the future and not biting off more than we can—or should—chew. As we modernize the NAS, we continue to anticipate future needs, assessing how viable various options are.

FAA's future actions must be to look at improving our management tools. Our initiatives in cost accounting, personnel and acquisition reform, and our strong partnership with industry will enable us to effectively manage our current resources and future demands placed on the NAS.

The challenge facing the FAA is to finance the capital investments that will allow the agency to make key safety improvements, keep up with growing air travel demand, and improve efficiency of aircraft operations. This requires a level of funding that will allow new initiatives as well as provide stable funding for existing projects. The FAA currently makes choices among several valuable projects, all of which can provide significant benefits to aviation.

Making choices is not unique to the FAA, but the aviation industry senses that valuable new initiatives are vital to improving aviation efficiency. We are working to address these in the fiscal year 2001 budget, while sustaining the levels of capital investment sufficient to make solid progress towards modernizing the NAS.

Modernization and maintenance of the NAS is a significant challenge for the FAA. Congress has supported the FAA in its efforts toward modernization and reform, and I look forward to continuing that working relationship with you, Mr. Chairmen, and the members of both committees.

Thank you for the opportunity to appear before you this morning. That concludes my prepared remarks and I would be pleased to answer any questions you may have.

Senator DOMENICI. Senators I received a note from Senator Grassley that he is on a very short time frame. He would like to make a brief opening statement.

OPENING STATEMENT OF SENATOR CHARLES E. GRASSLEY

Senator GRASSLEY. Yes; It will be very brief. The reason I am doing it, for the benefit of my colleagues, is because I have a constituent before the Finance Committee at 11 o'clock. This statement is in regard to the funding for the FAA.

I sent you a letter, Mr. Chairman, that asked that minimum funding be made available to meet the President's fiscal year 2001 FAA budget request. Maximum funding for the amount fully authorized by law would be the ideal that I support.

I should further explain that I do not include in my request any of the reported fees that the President may be asking for in his budget request. To the extent necessary, FAA funding should come from the general fund.

All of this should be done through the regular budget and appropriations process. There should not be a firewall or other mechanisms to segregate these funds. I believe that this request is within the position which you, Mr. Chairman, have so clearly stated many times of late, and I hope it will be possible for you to accommodate the request.

My letter states satisfactory resolution of air transportation problems will take more than increased Federal funding. I agree with what Senator Shelby has said in his statement today. I believe that these efforts will take more than a massive infusion of public funds. It will take structural and cultural changes within the agency. I will note that the FAA has received increased Federal funds

in the past, and there is some question as to how wisely those funds have been spent.

I thank all my colleagues for accommodating me.

Senator DOMENICI. I wanted to thank you for your comments and thank you for the support for the position we have taken in conference, which is precisely what you have said. And you are aware of what has been offered, and you are aware of what hangs us up. And I don't know when it will be completed, but we surely want to finish it. And you are urging us to finish it, but obviously you are urging us to finish it on the grounds that you consider sensible. And I thank you for them, and they will be used by me. When people ask about what other Senators think, I will be able to quote someone that knows precisely the problem, as you have stated.

Senator GRASSLEY. Thank you, Mr. Chairman.

Senator DOMENICI. Let's now move to the Inspector General, the Honorable Ken Mead, Department of Transportation.

STATEMENT OF KENNETH M. MEAD

Mr. MEAD. Thank you, Mr. Chairman. I want to express our appreciation for your having this hearing today. I think the hearing is a statement not just about the need for adequate investment, which we all want in our aviation system. This hearing is also about accountability and oversight for money the FAA already receives, as well as any plus-ups that may come along.

I think it is important to outline the context here. FAA oversees the largest, busiest, safest air transportation system in the world. Until Monday night, we had a remarkable safety record going for 2 years. I think that was a real credit to FAA and the airlines as well.

I would like to focus, though, on three issues: restructuring the FAA, progress with acquisition and personnel reforms, and a word or two about FAA financing. All of these issues were mentioned in the committee's invite letter.

On restructuring, there are a number of proposals being discussed that suggest FAA ought to operate more like a business. Some of these proposals suggest a corporation and some suggest privatization. There is a variety.

I want to make clear that I don't envision any circumstances where DOT's role in safety oversight ought to be transferred outside of the Federal government. I think it ought to be taken off the table. Further any proposal to restructure FAA or have air traffic control spun off and run by a commercial type of organization ought to be carefully examined.

I think the experiences of other countries that have done this are instructive, such as NAV Canada. But it is difficult to use them as a conclusive frame of reference because our air traffic control system is so much larger, more diverse, and more complex. Just a number as a point of reference here. The United States handled nearly 44 million aircraft in the en route environment in 1998, and that is compared to about 5 million for Canada. This doesn't mean that we should avoid inquiry into new ways of doing business and how to be more efficient and effective.

Now, if the Congress should choose to make major changes to FAA's structure or commercialize air traffic control services, I urge

great caution. We already have a safe system, despite all the bumps, warts, needs for improvement, and so forth. And I don't think there is any substitute for firsthand experience in a limited air traffic control environment.

Before you consider expansive changes or wholesale changes to our entire system, the oceanic air traffic control environment might provide an area that could be explored in that regard. While exploring oceanic air traffic control would be very cautious and conservative approach, it would give us all a much surer footing on which to proceed in the future.

Why oceanic? There are a number of reasons. Oceanic services are operationally distinct from domestic air traffic control. The oceanic environment is a growth market in need of modernization. The United States is behind, and changes in this area would affect only 300 of FAA's 15,000 controllers. Also it would have very limited impact on most airports, small carriers, general aviation, and air taxis. I am not making a recommendation here, but just putting on the table an issue that the Congress may wish to explore.

I would like to make some comments on acquisition and personnel reform. It was in late 1995 that Congress provided the FAA with the tools to operate in a more businesslike manner. Essentially, Congress exempted FAA from the procurement and personnel rules. There has been some progress—I don't want to deny that at all—but there has been limited impact on bottom-line results.

To its credit, FAA has adopted a "build a little, test a little" approach to some acquisitions and has made progress in reducing the time to award contracts and the time to amend contracts. And some systems have been deployed on time. At the same time, however, problems persist with technologically challenging systems like STARS, which would replace computers in the terminal environment, a system called WAAS, which pertains to satellite navigation, and AMASS, which would help prevent runway incursions, which is a very important area of safety risk. These systems have a cumulative value of over \$4 billion, and they are experiencing severe cost and schedule problems.

The problems with these acquisitions, Mr. Chairman, are unambiguously not related to a lack of funding or the result of burdensome procurement or personnel rules. The common thread of the problems with these acquisitions are problems in developing software-intensive computer systems and addressing human-computer interface issues.

In the case of STARS that I mentioned, the human factor issues were identified much too late in the process. So, regardless of the amount of money that FAA gets, the agency needs to do more to protect the government's investment, make contractors more accountable, and address human factor issues earlier in the development process. It is very costly to address human factors at the 11th hour and doing so can lead to major design changes. I believe the Administration is moving to address this problem.

Personnel reform. FAA has had some success with personnel reform, but by far the most visible result of personnel reform has been the new compensation agreement with the controllers. This agreement has markedly improved relationships between FAA

management and the union, the controllers. But it comes at a price. The new agreement will require nearly \$1 billion in additional funding over the life of the agreement, and it has led to sharp increases in the agency's operations costs.

What I want to illustrate with this chart—and it is also in the testimony—is that for fiscal years 1998 through 2004 there has been sharp increases in the agency's cost of operations, which are principally salaries. Operations is the blue line. As you can see, the cost of operations constrains the dollars available for modernization, which is the yellow line, and dollars for airports, which is the green line.

It is a fact, Mr. Chairman, that the United States invested more in fiscal year 1992 in modernization than it will in fiscal year 2000. But it is also true that at the same time operations costs increased about 40 percent, from \$4 billion to \$6 billion.

Finally, on financing FAA, I know there are various proposals, but they all have one common thread: to increase the amount of funds available to the agency.

This other chart shows the FAA budget by program for fiscal years 1988, 1994, 2000 and 2001. While FAA's overall budget has grown, funding for airports and capital improvements have remained relatively steady. Because operations costs have increased, FAA faces significant risk in meeting its operation costs without crowding out capital investments.

FAA's Budget by Program (FY 1988-2001)

I also want to point out that on the trust fund issue, the actual receipts received by that trust fund from taxes aren't enough to finance all of FAA. It is about \$700 million short. That doesn't include the interest earned.

I would like to close with a word about FAA's cost accounting system. The cost accounting system was first required of FAA in 1996. It had been talked about for many years before. A cost accounting system would help the agency keep track of its costs. Most businesses would go into bankruptcy if they didn't have one. FAA recently deferred its implementation date for a cost accounting system to 2002. I think that decision ought to be reversed, and it ought to be done sooner rather than later. If you can't track where your money is going, like in your checkbook, how much money you are getting, and what you are spending it for, it is very difficult to make a persuasive case as to where you place additional investment and what you are going to get out of that investment.

PREPARED STATEMENT

So I would urge the FAA and the Department to get on with that cost accounting system, and I think that would put them in a better position to frame the case for additional investment.

That concludes my statement.

[The statement follows:]

PREPARED STATEMENT OF KENNETH M. MEAD

MODERNIZING THE FEDERAL AVIATION ADMINISTRATION: CHALLENGES AND SOLUTIONS

Mr. Chairmen and members of the full committee and subcommittee: We appreciate the opportunity to discuss "Modernizing the Federal Aviation Administration: Challenges and Solutions."

FAA oversees the largest, busiest and safest air transportation system in the world. FAA also is responsible for operating air traffic control, which is the nerve center of the Nation's air transportation system. Until Monday night, the safety record for the last 2 years was remarkable. This is a credit to FAA and all segments of the aviation community. At the same time, FAA and the aviation community are facing a number of challenges. The demand for air travel has doubled since 1980 and is expected to continue to grow through 2015. Unfortunately, with the growth in demand has come growth in delays, and consumer dissatisfaction with airline service is high. In the last 5 years, delays have increased by over 50 percent.

Against this backdrop, FAA's air traffic control modernization efforts and airport capacity have not kept pace with the demand for air travel. These are legitimate concerns and they are not new. Congressional hearings dating back to the mid-1980's focused on the same subjects. As there were then, there are now proposals to restructure FAA's air traffic functions to perform more like a commercial business and to provide additional funding for air traffic control modernization and airport improvement programs.

Today, I would like to make three points.

First, there is no air traffic system in the world as large and complex as that of the United States. It is safe, but actions are needed to make it more efficient. Any proposal to restructure FAA or have air traffic control run by a commercial type organization must be carefully examined. Furthermore, the oversight of aviation safety should not be transferred outside the Department of Transportation. This is an inherently governmental function for which the traveling public deserves the highest level of independent scrutiny and assurances.

If the Congress should choose to make any major changes to FAA's structure or commercialize air traffic control services, we would urge great caution. Having first-hand experience in a limited air traffic control environment is essential before any expansive changes are considered. FAA's oceanic air traffic control could provide this experience. Oceanic services are operationally distinct from domestic services and there would be limited impact on small carriers, general aviation, and air taxis. It is an area where the United States could solicit lessons learned from other countries that have already taken steps to commercialize air traffic control operations.

Second, Congress has already provided FAA with the tools necessary to modernize the National Airspace System and obtain the necessary skills to operate effectively.

In 1995, Congress exempted FAA from Federal procurement and personnel rules. After 4 years, there has been some progress, but overall, these reforms have had limited impact on bottom line results.

To its credit, FAA has adopted a "build a little, test a little" approach to its acquisitions and has made progress in reducing the time to award contracts under acquisition reform. In addition, FAA has deployed systems such as the Display System Replacement (new color displays for en route controllers) on time and within budget. However, cost and schedule problems persist with key modernization projects, such as efforts to install new computer systems in the terminal environment and move toward satellite-based navigation.

FAA has also had some success with personnel reform in that managers have been able to hire qualified candidates faster than under the Federal Personnel System. By far, however, the most visible result of personnel reform to date has been the new compensation agreement with its controllers, which has improved management-labor relations. However, this agreement also has led to sharp increases in the agency's operations costs, principally salaries, which now constrain funding for air traffic control modernization and airport development. It is a fact that the United States invested more in fiscal year 1992 in modernization than it will in fiscal year 2000. But at the same time, operations costs increased almost 40 percent from \$4.4 billion to an estimated \$6.0 billion.

Exemptions from Federal rules may facilitate success, but management accountability, strong contractor oversight, effective cost controls, and a sound cost accounting system are the essential ingredients to modernize and effectively manage the air traffic control system.

Finally, several proposals have surfaced over the past year to finance FAA, all of which had one common thread—to increase the amount of funds available for FAA operations and air traffic control modernization efforts. Based on FAA's estimates, by 2004 its total budget requirements will be over \$12 billion or 20 percent greater than in fiscal year 2000. FAA faces significant risks in meeting its operations costs (primarily salaries) without crowding out capital investments. The means for financing these requirements is a major issue that the Department, Congress, and aviation users continue to debate.

There are investment opportunities that will significantly decrease airline costs, provide better and safer service to the flying public, and reduce FAA's operating

costs. These include data link communications, collaborative decision-making systems, and efforts to reduce runway incursions, a major area of safety risk, but additional funding alone will not get the desired results. For example, FAA must control its operating costs, do a better job of negotiating contracts for large software-intensive efforts that include appropriate measures to withhold payments if progress is not satisfactory, and implement a sound cost accounting system.

FAA originally planned for its cost accounting system to be fully implemented by October 1, 1998, but has yet to implement the system. FAA recently delayed the completion schedule until some time in fiscal year 2002 because of Operations funding constraints. This decision should be reversed. FAA needs a reliable cost accounting system sooner, not later. Any business that fails to track and control its costs would most likely go into bankruptcy.

In addition to implementing a cost accounting system, FAA needs to develop a strategic business plan—a key tool for any successful business. The plan should provide key corporate strategies and operating plans over the next several years, and describe the timing and impact of those strategies. The plan should outline agency strategies for investing in future technologies, as well as how the agency will control the rising costs of operations and bring about productivity enhancements.

RESTRUCTURING FAA

There are a number of proposals under discussion regarding restructuring FAA to operate and perform more like a business. However, we want to make clear that there are no circumstances we can envision in which the Department of Transportation's role in oversight of aviation safety should be transferred outside the Federal Government. Safety oversight is an inherently governmental function for which the citizens of the country expect and deserve the highest level of independent scrutiny and assurances. But this does not mean we should not try to find ways to deliver air traffic control services and implement new technologies more efficiently and effectively. However, in light of the size, complexity, and safety record of FAA, any proposal to restructure or have air traffic control run by a commercial type organization must be very carefully examined.

There are primarily three concerns with proposals that would spin off air traffic control (ATC), air traffic controllers, and ATC infrastructure development and investment to a commercial enterprise, while simultaneously retaining safety oversight within FAA. These concerns include: (1) how a commercial enterprise would balance safety against costs and ensure that decisions come down on the side of safety; (2) whether a commercial enterprise would have the incentive to initiate research and development in cutting-edge technologies; and (3) whether a commercial operation could adequately protect and respond to the needs of all stakeholders, including passengers, in our diverse aviation system. FAA's stakeholders include over 194,000 general aviation aircraft, more than 5,000 public use airports, and over 12,000 small carriers and air taxis.

Numerous other countries, including Canada, Germany, Australia, and New Zealand, have assigned their ATC System, once provided by government to entities having administrative and often financial autonomy. Canada transferred its civil air navigation services to NAV Canada in November 1996, and some have cited it as a role model for FAA to follow. We greatly appreciate the information NAV Canada has shared with us on their experiences in commercializing air traffic services. The experiences of NAV Canada and other countries are instructive, but it is difficult to use their experiences as a conclusive point of reference because our air traffic control system is so much larger, diverse, and complex. Several differences are shown on the following chart.

**Comparison of Attributes for FAA Air Traffic Services
and NAV CANADA**

| Attributes | FAA Air Traffic Services | NAV CANADA | Percent of NAV CANADA to FAA Air Traffic Services |
|---|--------------------------------|---------------|---|
| 1998 Traffic Activity (En route) ¹ | 43,700,000 | 3,600,000 | 8% |
| 1998 Traffic Activity (Towers) ² | 53,800,000 | 5,300,000 | 10% |
| Domestic Customers ³ | 6,651 | 1,300 | 20% |
| Air Traffic Facilities ⁴ | 575 | 190 | 33% |
| Public Airports | 5,324 | 1,254 | 24% |
| General Aviation Aircraft | 194,800 | 15,000 | 8% |
| Staffing | 36,400 | 5,200 | 14% |
| FY 1999 Funding ⁵ | \$6.4 billion | \$568 million | 9% |

Notes:

1. En route traffic activity includes all aircraft handled by Center controllers.
2. Tower traffic activity includes take-offs and landings.
3. Domestic Customers include commercial air carriers, commuters, air taxis, and flight schools.
4. Air traffic facilities include Centers, Towers, Contract Towers, Flight Service Stations, and Approach Control Facilities.
5. Figures in U.S. Dollars. Fiscal Year 1999 figures for FAA Air Traffic Services include Air Traffic Services' Operations, FAA's Facilities & Equipment, and FAA's Research & Acquisitions' Operations. This excludes funding for other FAA lines of business such as aviation regulation and certification, and aviation security.

In the area of research and development, NAV Canada officials told us that they avoid large research and development initiatives in favor of acquisitions that can return their investment in a shorter period of time. NAV Canada is relying on FAA for key emerging technologies, including satellite-based navigation systems and a new automated controller tool called the Center TRACON Automation System that provides controllers with sequences for landing aircraft.

Although relatively small in comparison to FAA, NAV Canada has made progress in developing new technologies for oceanic air traffic and eliminating the use of paper flight strips for controlling aircraft at some domestic facilities. NAV Canada's oceanic development efforts include aircraft surveillance and data link communications that are planned to be in use this fall. A similar effort for oceanic air traffic control in the United States—the Oceanic System Development and Support contract—was significantly reduced, largely due to technical and contractor performance issues, not a lack of funding. With regard to paper flight strips, FAA was unable to eliminate them in its domestic airspace because of controller concerns.

Because there is no frame of reference or experience base comparable to our ATC System that we can rely on for guidance, we urge great caution before proposing a major restructuring of what is already a very safe system, but a system also in need of improvement. In our opinion, the first course of action would be to implement a sound cost accounting system and effectively utilize the procurement and personnel reforms Congress has already given FAA. Second, if Congress decides to move toward commercialization, it must be done gradually in order to gain first-hand experience, and in a limited ATC environment, such as oceanic air traffic control in the Atlantic and the Pacific Oceans. The traffic load and mix handled by the United States oceanic environment is comparable in some important respects to that handled by some commercialized ATC enterprises, such as NAV Canada and Airservices Australia.

By proceeding in this manner, Congress and the aviation community would be able to judge what works well and what does not, identify refinements that need to be made, and assess whether a commercialized ATC organization should or should not be considered for broader application in the United States.

Oceanic Air Traffic Control

The International Civil Aviation Organization (ICAO) delegated to the United States responsibility for providing ATC services in over 80 percent of the world's

controlled oceanic airspace. There are labor, governance, financing, and transition issues that would have to be addressed if our oceanic ATC were to be operated by a commercial organization, but these issues are easier to resolve because the oceanic ATC environment is limited in scope. The commercialization of oceanic ATC would not be free from controversy; however, the issues involved are not nearly as complex or contentious as would be the case in the domestic ATC environment.

ATTRIBUTES OF FAA'S OCEANIC AIR TRAFFIC CONTROL

Mostly affects the large carriers who are suggesting commercializing or privatizing ATC.

Operationally distinct from domestic ATC services.

Major ATC modernization and avionics standardization opportunities—FAA's schedules have slipped, modernization solution is not settled, and financing decisions have not been made.

Oceanic ATC operations projected to increase 5.4 percent annually.

Greater acceptance of user fees—Congress has already approved the collection of overflight fees, and other countries already collect fees for oceanic services.

Limited impact on controllers and labor agreements—only 300 of FAA's 14,900 controllers provide oceanic services.

Little impact on private (non-business) general aviation, small carriers, regional airlines, and air taxis.

ACQUISITION AND PERSONNEL REFORMS

In October 1995, Congress exempted FAA from the Federal procurement and personnel rules that FAA said hindered its ability to effectively modernize the Air Traffic System and acquire the staff and skills it needed to operate effectively. After 4 years, there has been some progress and FAA learned valuable lessons from its experience with the Advanced Automation System (the centerpiece of FAA modernization efforts in the late 1980's and early 1990's), but overall, these reforms have had limited impact on bottom line results.

At about the time these reforms were enacted, the Office of Inspector General, the General Accounting Office and others cautioned that neither procurement and personnel rules nor lack of funding were the source of the problems FAA was experiencing with its ATC modernization initiatives. Exemptions from Federal rules may facilitate success, but exemptions and additional funding are not substitutes for strong management including oversight of contractors, effective cost controls, and a sound cost accounting system. We find that FAA still has much work to do in these management areas, so we reiterate these cautionary notes today.

Acquisition Reform

The driving forces behind granting FAA relief from acquisition rules and regulations were escalating costs and schedule slips with FAA's air traffic control modernization efforts. Between 1992 and 1994 alone, the overall estimated costs of the modernization effort increased annually by about \$1.2 billion due in large part to problems with key projects. For example, the expected cost of FAA's Advanced Automation System (AAS) had increased from \$4.8 billion to over \$7 billion with key segments behind schedule by more than 8 years. Of the \$2.6 billion spent on AAS before it was restructured in 1994, about \$1.5 billion could not be salvaged for use in other modernization projects.

Since the advent of acquisition reform, problems with major acquisitions have been less severe, but major benefits have yet to be realized. To its credit FAA has adopted a "build a little, test a little" approach to its acquisitions and has made progress in reducing the time to award contracts. FAA has deployed systems, such as the Display System Replacement (new en route controller displays) and the HOST (computers that receive, process, and track aircraft movement throughout the domestic en route and oceanic airspace), on time and within budget. Also, long-range surveillance radars, as well as Terminal Doppler Weather Radar that detects hazardous weather around airports, have been fielded. In the past these systems experienced significant cost and schedule problems.

However, problems persist with technologically challenging systems, such as the Wide Area Augmentation System (WAAS), Standard Terminal Automation Replacement System (STARS), and Airport Movement Area Safety System (AMASS). WAAS is a satellite-based navigation system; STARS is a replacement that will provide

new color displays, processors, and computer software for terminal facilities; and AMASS is a key safety technology designed to help controllers prevent accidents on airport runways. These three systems alone have cumulative program costs of over \$4 billion, and are experiencing cost and schedule difficulties.

**Cost and Schedule Variances
in Key FAA Modernization Programs**

| Program | Estimated Total Program Cost | | Scheduled Operations* | |
|---------|------------------------------|--------------------------|-----------------------|---------|
| | Original (in Millions) | Current (in Millions) | Original | Current |
| WAAS | \$892.4 | \$2,900.0 | 1998 | 2000 |
| STARS | \$940.2 | \$1,400.0 | 1998 | 2002 |
| AMASS | \$59.8 | \$151.8 | 1996 | 2002 |

*Note: The scheduled operation date for WAAS represents Phase-1 Initial Operating Capability, for STARS represents first full service Operational Readiness Demonstration, and for AMASS represents last System Operational Readiness Demonstration.

The problems with these acquisitions are not the result of a lack of funding or the result of burdensome procurement and personnel rules. What all these systems have in common are difficulties with software development and human factors. For example, WAAS has experienced development difficulty in a critical software safety package that, among other things, determines the effects of the ionosphere on the WAAS signal and the validity of the WAAS message. The STARS schedule has been impacted by the software development needed to resolve computer-human interface issues and other new requirements. As a result of these problems, schedules have proven to be unrealistic and costs have increased.

FAA has taken steps to address problems with WAAS, STARS, and AMASS but only after major problems have surfaced. FAA can do more to protect the Government, make contractors more accountable, and address human factors issues earlier in the development and acquisition processes.

Our recent work on Free Flight Phase I—an initiative to introduce new automated controller tools and new information systems for FAA and airlines—shows the need to enhance contractor accountability and institute cost control mechanisms for software-intensive contracts. For example, two contracts for a software-intensive controller tool are time and material contracts. With these types of contracts, there is little positive incentive for cost control or labor efficiency—all risk is with the Government. FAA should negotiate contracts for software development with appropriate measures (cost ceilings, incentives, and earned value management techniques¹) as well as methods for withholding payment if progress is not satisfactory.

In addition, FAA needs to identify and resolve human factors concerns early in the acquisition process to avoid cost overruns and schedule delays. The need for human factors work extends beyond the traditional computer-human interface issues for FAA systems, such as STARS, and has important safety and workforce implications. Key issues that require FAA's attention include the impacts on the selection and training of controllers as a result of new automated controller tools as well as the impacts on pilots from new data link communications and cockpit display technologies.

Key emerging technologies, such as data link communications for controllers and pilots, new automated controller tools, and new cockpit display technologies have far-reaching human factors implications. In addition to resolving these issues, a key management issue for FAA is to know when "enough is enough" with respect to human factors. FAA cannot satisfy everyone, and exit criteria is needed to make the tough decisions. In our opinion, without exit criteria, FAA's costs to resolve human factors issues in the STARS Program will continue to increase.

¹ Earned Value Management is a widely recognized way to measure technical progress with large scale, software intensive acquisitions. This management tool forecasts how much a program will cost and when it will be delivered.

In fairness to FAA, we must recognize that the development of new technologies, particularly those involving complex software and new aircraft avionics, involve research and development risks for which the United States bears much of the cost. Many of the firms developing these systems for FAA rank among the most technologically sophisticated in the world. Once developed, this technology is considered “off the shelf” and can be sold at a fraction of the costs to other ATC providers.

Personnel Reform

Personnel reform was designed to provide greater flexibility in hiring, training, compensating, and placing employees. FAA has had some success in that managers have been able to hire qualified candidates faster than they could under the Federal Personnel System. But, by far, the most visible result of personnel reform to date is a 5-year collective bargaining and compensation agreement reached with the controllers in 1998.

This agreement has markedly improved management-labor relations with the controllers, contains assurances of productivity gains in the future, and establishes a ceiling of 15,000 air traffic controllers. However, the price tag for this agreement is large, resulting in a sharp increase in the agency’s costs of operations. FAA now faces significant risks in funding the new controller pay system while, at the same time, meeting other critical agency requirements funded by the Operations Account, such as hiring safety inspectors and developing a cost accounting system. These risks are compounded as FAA negotiates new wage agreements with its other workforces, such as maintenance technicians, who want similar treatment.

The costs associated with the new system are consequential from several points of view—the impact on a controller’s wages; continued increases in the portion of the agency’s total budget that goes to the Operations Account, comprised mostly of salaries; and the effects of the agreement on FAA’s capacity to increase investment in ATC modernization.

First, to illustrate the effect on an individual controller’s wages, we looked at controller compensation before and after the agreement. Prior to October 1, 1998, the effective date of the new compensation package, air traffic controllers in the busiest facilities earned a base salary of up to \$86,000. With the new compensation system, these controllers received a pay increase as high as 20 percent in base pay distributed over 3 years plus the annual Government cost of living increases. Currently, those air traffic controllers assigned to FAA’s busiest air traffic facilities can earn about \$111,000 before any premium pay is earned. When premium pay such as holiday, locality, and overtime are added, some of these controllers earn over \$142,000 annually. By October of this year, they will earn over \$147,000.

FAA estimates that its new compensation system will require nearly \$1 billion in additional funding over the 5-year life of the new agreement. This additional cost takes into account anticipated savings from a gradual reduction in the number of air traffic supervisors.

Second, to illustrate the effect of the agreement on operations costs and capital investments in modernization, it is important to recognize that FAA’s operations costs have been rising since 1992, with significant increases in the last 3 years. In fact, the United States invested more in fiscal year 1992 in modernization than it did in fiscal year 2000 (\$2.4 billion in 1992 vs. \$2.1 billion in 2000). But at the same time, the United States spent \$4.4 billion on operations (mostly salaries) in fiscal year 1992, compared to an estimated \$6.0 billion in fiscal year 2000. This trend shows no sign of abating.

The chart below illustrates increases in the cost of FAA operations, principally salaries, and the increasing disparity between the cost of operations (blue line) and the dollars available for modernization (yellow line). The chart shows why the increasing costs of FAA’s operations must be contained.

**FAA's Budget by Program
(FY 1988-2004)**

FAA believes this problem will be partially mitigated by offsetting productivity gains, such as freezing the staffing level of 15,000 air traffic controllers for 3 years, eliminating 4-day work weeks at 24-hour facilities, and the performance of collateral duties by air traffic controllers. However, over a year after signing the agreement FAA is still trying to identify and quantify productivity gains.

Last year, we recommended that FAA project the productivity offsets over the life of the agreement to better manage its future funding requirements. FAA did not agree, stating that a 5-year estimate would be speculative at best, relying too much on estimates regarding future aviation activity. In our opinion, it is not unreasonable to expect FAA to anticipate and plan for the costs associated with multi-year commitments. FAA needs to forecast and monitor projected revenues, savings, and productivity gains.

FINANCING FAA

Several proposals have surfaced over the past several years to finance FAA, all of which had one common thread—to increase the amount of funds available for FAA operations and air traffic control modernization efforts. While there are investment opportunities, additional funding alone will not improve FAA. There is a need for strong management controls, greater risk sharing with contractors, and a cost accounting system.

FAA's budget has increased nearly 73 percent from fiscal year 1988 to fiscal year 2000. Based on FAA's estimates, by 2004 its total budget requirements will be over \$12 billion or 20 percent greater than fiscal year 2000. The means for financing these requirements is a major issue that the Department, Congress, and aviation users continue to debate.

**FAA's Budget by Program
(FY 1988-2001)**

FAA faces significant risks in meeting its operations cost increases without crowding out capital investments. As shown in the above chart, growth in the operations portion of FAA's total budget has constrained the funding available for modernization and airports. This occurs in an environment in which FAA's overall budget has continued to increase. Congress will need assurances that any additional funding for FAA will actually translate into capital investment and not be absorbed by FAA's operations.

For fiscal year 2000, FAA was financed entirely from the Aviation Trust Fund. However, this is only a short-term measure because FAA's projected expenditures exceed revenues generated through excise taxes. For example, this year, projected expenditures exceed revenue from taxes by over \$700 million—this does not include interest earned.

Alternative methods or a mix of methods will therefore be needed to meet all of FAA's requirements. Suggestions include raising aviation taxes so that the trust fund receives an adequate infusion of receipts to cover the aviation budget; establishing user fees—an approach proposed by the Administration; tapping the general fund, which relies largely on Federal income taxes; and creating a general fund entitlement for FAA.

The method of financing FAA and the level of increased funding is a policy matter that ultimately is a judgment for the Congress. There are investment opportunities with data link communications, collaborative decision-making systems, and efforts to reduce runway incursions. It would be a disappointment for all if additional funds went to cover cost growth in existing acquisitions or if capital investments could not be made because they were crowded out by the increasing costs of salaries and related expenses. FAA should address three key fiscal issues in managing its current budget as well as any increases it may receive.

First, FAA's operations costs must be contained.—FAA's budget requirements continue to increase largely due to the rising costs in FAA's Operations Account. This account represents 60 percent of FAA's fiscal year 2000 budget and is expected to grow to nearly \$7.6 billion or about 62 percent of FAA's budget by fiscal year 2004.

Second, risks with FAA's modernization efforts need to be shared.—Contractors share risks with FAA but more can be done, particularly with software intensive acquisitions. This becomes increasingly important as FAA moves forward with several major software-intensive acquisitions, such as WAAS and Free Flight Phase 1 automated controller tools. As we noted earlier, FAA should negotiate contracts with

appropriate controls to require contractors to share risks as well as provisions for withholding payments if progress is not satisfactory.

Third, a reliable cost accounting system must be in place.—FAA needs a cost accounting system to make sound financial and managerial decisions and support user fees. A cost accounting system helps an organization to accurately track and control its costs, which results in better decisions. However, the basic financial data have to be accurate and reliable. In past years, FAA's financial data were not reliable, which is why we have been unable to render a "clean" audit opinion on its financial statements. During fiscal year 1999, FAA made an extraordinary and labor-intensive effort to produce better financial data. We are currently auditing these data.

FAA is making progress in the development of its cost accounting system. FAA is currently developing the costs for providing its Oceanic and En Route services. FAA also intends to develop user fees, using its cost accounting system, to charge customers for the various services it provides. For example, FAA is currently developing user fees for flights that fly over the United States, but do not take off or land in the United States.

FAA originally planned for its cost accounting system to be fully implemented by October 1, 1998, but implementation is not complete. Earlier this year, FAA estimated its system would be fully implemented by September 30, 2001. However, FAA recently delayed the completion schedule until sometime in fiscal year 2002 because of funding constraints. FAA needs a reliable cost accounting system sooner, not later. FAA should reverse its decision and accelerate the implementation schedule for its cost accounting system.

In addition to implementing a cost accounting system, FAA needs to develop a strategic business plan—a key tool for any successful business. The plan should provide key corporate strategies and operating plans over the next several years, and describe the timing and impact of those strategies. The plan should outline agency strategies for investing in future technologies, as well as how the agency will control the rising costs of operations and bring about productivity enhancements.

Mr. Chairmen, this concludes our statement. I would be pleased to answer any questions.

Senator LAUTENBERG. We are interested but we are voting, and so please hold our interest in check and we will be back.

Senator DURBIN. Thank you, Senator Lautenberg. I have spoken to Senator Domenici, who will be returning shortly. I voted and came back to ask a few questions.

I thank you for your testimony today and for your service to our Nation in one of the most important agencies of the Federal Government. And I want to just say to Ms. Garvey that I have appreciated the contribution that you have made, and I have enjoyed working with you.

I hope that this Congress really establishes as its first priority the passing of the FAA Reauthorization Bill. There is so much at stake in this bill, beyond the obvious, construction at airports, safety modernization, and so many other issues.

In my home State of Illinois, we are watching closely because many downstate communities are unserved or underserved, and the slot rule at O'Hare is really the nexus of this debate. So we are hoping to see that resolved quickly.

I have three or four specific safety issues that I would like to get into. First I would like to discuss at this meeting what we have discussed privately. That is my suggestion that we consider adding new technology to the cockpits of our airplanes, and perhaps in other parts of the airplane, specifically, we are talking about video cameras in the cockpits.

Some 30 years ago, Congress, working with the airlines and the pilots, decided that in order to have valid investigation of accidents, audio recording and data flight recorders would provide the kind of information that might lead to a higher level of safety and fewer crashes. I think that they have served us well.

There was a compromise made at the time in the legislation, a 30-minute loop on the voice recorder. As it stands, I think it has served us well.

In 30 years, technology has changed dramatically. We are now facing video cameras when we go to ATM machines and convenience stores. We put them on school buses, in virtually every office building. They are ubiquitous. And we have to, I think, acknowledge that they have some value.

Certainly in the EgyptAir crash and other, more recent crashes, they might have provided information to resolve some very fundamental questions. What happened in that cockpit before that plane crashed? What can we do in the future to make it safer?

I have spoken to you about this and spoken to others, and I would like to ask you, Ms. Garvey: What is your position on this technology in the cockpit? If you believe that it could make our flights safer for American passengers and those from other countries who use our airlines, what can we do to implement this technology as quickly as possible?

Ms. GARVEY. Thank you very much, Senator. First of all, we think it holds great potential and should be looked at very, very seriously. Subsequent to our conversation, I met with Chairman Jim Hall from the National Transportation Safety Board, and he is in agreement. We are chairing together a group headed by John O'Brien from the Airline Pilot Association and also a government official. They are looking at all of the additional technologies, including the video cameras, that could be used to gather more information. And that is really what we are all about, trying to gather as much accurate information as we can. So that is very high on their list of issues to be considered.

We are expecting a report back from that committee later this spring or into the month of June, but we are very encouraged. We have talked with them and met with them a couple of times. I know they are taking this technology very seriously. I also would not be surprised to see even a more formal recommendation coming from the NTSB, but I think the chairman is also interested in seeing some additional recommendations that may come out of that group.

Senator DURBIN. And how soon can we expect a response, positive or negative, on this issue?

Ms. GARVEY. Well, I really think this summer, and perhaps we can even get it before then, but I know this summer is when they are presenting the formal report back to the chairman and to myself. So we will certainly have it by that time. But we will certainly talk with the committee members and see if there may be a couple of issues that they might want to advance, and that might be one. I will speak with Chairman Hall about that as well.

Senator DURBIN. I am not pushing for any particular technology or company, but I have met with some that are exploring this, and they have convinced me that these cameras, the lenses, can be unobtrusive and no obstacle to the orderly operation of an aircraft. They have also suggested that the video might be put in the cargo hold and some other places on the airplane that could be beneficial to determine the cause of accidents or perhaps even for insurance purposes to monitor whether or not—this is a problem, unfortu-

nately, but to monitor whether or not there are people smuggling on contraband, drugs and the like. This sort of thing might have many benefits beyond accident investigation, and I hope that that will be viewed seriously.

May I ask two or three other questions? When I get on an airplane and am urged by the flight attendants to put down my newspaper and listen to their instructions. One of the things that they focus on is the evacuation of an airplane—lighting along the aisles and where the exits are located and the like.

I would like to ask you a few questions about how much the FAA knows about the evacuation of airplanes. Someone told me recently they had flown in a Canadian airplane and found something very interesting. They don't put any seats in front of their exit rows. And, in fact, in the rows nearby, instead of three seats abreast, there are only two.

Yet if you get on an American plane—and not using American Airlines, but one in our country—that is regulated by our FAA, I think you would find it very difficult many times to get to that exit row. It is a very tiny passage, small passage for a lot of people who are supposed to evacuate in a short period of time.

What does the FAA do to establish whether or not you can evacuate a plane with 400 passengers? What kind of time frame do you have in place? What kind of decisions have you made about clearing that exit row that obviously the Canadians see a lot differently than we do?

Ms. GARVEY. Well, let me speak to that issue. We do a lot of testing in our offices in Oklahoma City, the Civil Aeromedical Institute (CAMI), which is—our research group does an enormous amount of testing, real-life testing, to see—

Senator DURBIN. With real people on airplanes coming off?

Ms. GARVEY. Yes, absolutely.

Senator DURBIN. How frequent? Has that been done on a regular basis?

Ms. GARVEY. It is on a pretty regular basis. I would have to get back to you with the most recent one.

Senator DURBIN. Well, I will tell you what I am told. I am told that that was done in years gone by, and now instead they are using computer models and theories. And I am just curious as to whether that is a fact.

Ms. GARVEY. Right. We are using some computer models, but we are also still doing the live testing at CAMI, and I can get the most recent.

But I can also tell you that we work very closely with a woman by the name of Helen Murrer, who is in Europe and who is one of the premier experts in this area, and have worked very, very closely both using our computer models and also having her review the kinds of evacuation testing that we are doing. She is recognized internationally. I have had the pleasure of meeting and talking with her. But I do think that is an issue you have to constantly look at. There are changes sometimes to the airplanes that make it worth re-examining.

[The information follows:]

The regulations (14 CFR 25.803 and Appendix J, Part 25) require that transport airplanes with more than 44 passengers be able to be evacuated in less than 90 sec-

onds, under prescribed conditions. The regulations permit actual tests, or a combination of tests and analysis. We believe our certification regulations ensure a safe evacuation given U.S. airlines' current passenger-seating configurations. For brand new airplane types, actual demonstrations with full passenger loads are almost exclusively required. Derivative, or follow-on, models are often substantiated with a combination of tests and analysis. Since all U.S. transport airplanes meet this 90-second evacuation requirement, we see no reason to require specific exit-row seating configurations. At this time, there is no computer model approved that would replace a full-scale demonstration, although this is an active area of research and development.

The FAA continues to conduct live evacuation testing at the Civil Aeromedical Institute (CAMI) in Oklahoma City. Testing is conducted on a regular basis of 3 to 4 times annually. Computer models are in development, however, those models have not proven effective to date. In May of 1999, CAMI published a research paper entitled "Passenger Management Strategies for Emergency Egress through Airliner Over Wing Exit". This paper was presented at the 1999 Airspace Medical Association meeting. CAMI is currently building a wide-body evacuation facility. Live testing will continue to be conducted and CAMI will also use the live testing to develop the parameter data for more reliable computer models.

Senator DURBIN. Are you under pressure from the manufacturers of airplanes or the airlines to keep those seats in the exit row so that they can have more revenue?

Ms. GARVEY. No, not at all, and I need to check—in fact, I am glad John is here. I will ask John Crichton a little bit later. But I need to check with what the Canadian experience is and why that is. I am just not familiar enough with it. But we are not under any—I mean, our issue is safety, and it has to be safety. So making sure there is an appropriate time for evacuation is absolutely critical.

There may be some point of differences with some of the flight attendants about whether or not we should use the computer models. We are pretty comfortable with the ones we have used. We have checked them out with international experts. But we are, again, continuing the real-life testing of CAMI as well.

[The information follows:]

The FAA has conducted extensive research to establish the minimum required passageway dimensions to Type III over-wing exits. The airlines have stated recently that they will provide additional leg room, which has prompted interest in the space provided at exits. The FAA has also begun the harmonization process with the European Joint Aviation Authorities to arrive at a common standard. There is a perception that airlines are willing to provide leg room to capture market share.

Senator DURBIN. May I ask one last question? I see my time is running out. A few years ago, I introduced a bill that banned smoking on airplane.

Ms. GARVEY. Thank you.

Senator DURBIN. You are welcome. And I took after the Canadian model. Again, they were ahead of us on this issue, and I give them credit. Northwest Airlines was the first domestic carrier to do this voluntarily, to ban smoking on airplanes, and now it is universal on our domestic flights. I hope that we can extend it in some fashion to international flights.

But let me ask you a question about air quality in general. I am told that not that long ago the transfer of air within a cabin of the aircraft used to occur every 3 or 4 minutes and that we have been degrading that standard to now 15 minutes for the transfer of air in a cabin because of some efforts to have fuel economy.

Now, I understand the airlines' problem. The cost of fuel has gone up some 25 percent. They have to deal with that as one of their costs of operation.

Can you tell me whether or not you have established a standard for air transfer in the cabins of aircraft and what it might be and whether it has changed?

Ms. GARVEY. Well, it is interesting that you raise this issue because I saw Senator Feinstein this morning, and she—

Senator DURBIN. She feels very strongly about this, too.

Ms. GARVEY. She spoke with me about that as well. Our medical unit within the FAA has been looking at this issue. I know we are working closely with the flight attendants on this issue. In fact, the Senator and I were speaking about it this morning. The most recent study that we are all familiar with I think has a standard that is a little lower than we are used to, and she raised some questions that we really, need to go back and take another look at that.

Senator DURBIN. Well, I wish you would.

Ms. GARVEY. We will do that for you.

Senator DURBIN. I think it goes beyond the obvious, stale air, the health aspects of it. Flight attendants, unlike those of us sitting in seats being waited on, are up and around and moving, and if they do not have a regular transfer of air and fresh air, it could impede their judgment or their ability to perform their jobs. And I hope that the FAA will look at that aspect of it.

Ms. GARVEY. We will get back to you both with the most recent studies and where we are going from here.

Senator DURBIN. OK. Thank you very much.

Ms. GARVEY. Thank you.

[The information follows:]

On July 5, 1996, Amendment 25-87, "Ventilation," to Title 14 of the Code of Federal Regulations, Part 25.831, became effective. This amendment introduced a requirement for new aircraft ventilation systems which states: "For normal operating conditions, the ventilation system must be designed to provide each occupant with an airflow containing at least 0.55 pounds of fresh air per minute." This is equivalent to 10 cubic feet per minute (cfm) for each occupant, which, prior to this amendment, was required only for crewmembers. It also ensures a more effective distribution of the air inside the aircraft cabin by providing each occupant, regardless of seating, with a minimum of 10 cfm of fresh air. While this requirement does not apply to existing aircraft, all newly certificated transport category aircraft are required to meet this new standard.

On September 9, 1994, an existing interagency agreement between the National Institute for Occupational Safety and Health (NIOSH), the Center for Disease Control and Prevention, and the FAA was amended to include a plan to determine the feasibility of designing and conducting a study of the chemical, physical, and microbiological aspects of aircraft cabin air quality. The research program implementation plans were included in a July 1995 initial report to Congress (attached).

The FAA continues to submit an annual report to Congress delineating the plans and actions the FAA has taken. The report also describes the participation of other groups interested in this FAA-NIOSH project. The fourth annual report will be sent to Congress at the end of March 2000.

U.S. DEPARTMENT OF TRANSPORTATION,
FEDERAL AVIATION ADMINISTRATION,
Washington, DC, December 29, 1998.

The Honorable ALBERT GORE, JR.,
President of the Senate,
Washington, DC.

DEAR MR. PRESIDENT: This is the third annual report of actions the Federal Aviation Administration (FAA) has taken in response to Section 304 of the Federal Aviation Administration Authorization Act of 1994, Public Law 103-305. Section 304 requires the FAA to conduct cabin air quality research and report to Congress annually on the progress. The FAA was also directed to contract with the Centers for Disease Control and Prevention and other appropriate agencies to carry out any studies necessary to meet the goals of the research program and to invite representatives of manufacturers, airlines, employee organizations, passengers, and academia to participate in the research program.

The third annual report contains information on the plans and actions the FAA has undertaken to study aircraft cabin air conditions, including aircraft cabin exposure assessments, cosmic radiation exposures, biological contaminant characterization, and in-flight disease transmission and symptomology research. Most of the research effort is being conducted by the FAA in collaboration with the National Institute for Occupational Safety and Health (NIOSH). The report also describes the participation of other groups interested in this FAA-NIOSH project.

An identical letter has been sent to the Speaker of the House of Representatives.
Sincerely,

JANE F. GARVEY,
Administrator.

U.S. DEPARTMENT OF TRANSPORTATION,
FEDERAL AVIATION ADMINISTRATION,
Washington, DC, December 29, 1998.

The Honorable NEWT GINGRICH,
Speaker of the House of Representatives,
Washington, DC.

DEAR MR. SPEAKER: This is the third annual report of actions the Federal Aviation Administration (FAA) has taken in response to Section 304 of the Federal Aviation Administration Authorization Act of 1994, Public Law 103-305. Section 304 requires the FAA to conduct cabin air quality research and report to Congress annually on the progress. The FAA was also directed to contract with the Centers for Disease Control and Prevention and other appropriate agencies to carry out any studies necessary to meet the goals of the research program and to invite representatives of manufacturers, airlines, employee organizations, passengers, and academia to participate in the research program.

The third annual report contains information on the plans and actions the FAA has undertaken to study aircraft cabin air conditions, including aircraft cabin exposure assessments, cosmic radiation exposures, biological contaminant characterization, and in flight disease transmission and symptomology research. Most of the research effort is being conducted by the FAA in collaboration with the National Institute for Occupational Safety and Health (NIOSH). The report also describes the participation of other groups interested in this FAA-NIOSH project.

An identical letter has been sent to the President of the Senate.
Sincerely,

JANE F. GARVEY,
Administrator.

FEDERAL AVIATION ADMINISTRATION REPORT TO CONGRESS ON AIRCRAFT CABIN AIR
QUALITY RESEARCH PROGRAM

EXECUTIVE SUMMARY

Section 304 of the Federal Aviation Administration Authorization Act of 1994, Public Law 103-305, requires the Federal Aviation Administration (FAA) to establish a research program and to report to Congress annually on its findings in aircraft cabin air quality research. This is the third annual report. On September 9, 1994, an existing Interagency Agreement between the National Institute for Occupational Safety and Health (NIOSH), Centers for Disease Control and Prevention, and

the FAA, was amended to include a plan to determine the feasibility of designing and conducting a study of the chemical, physical, and microbiological aspects of aircraft cabin air quality. The research program implementation plans were included in a July 1995 initial report to Congress. This report updates the status of the research program and details our future research plans.

BACKGROUND

In 1993 and 1994, Congress held hearings to address complaints from flight attendants and passengers regarding aircraft cabin air quality. Those individuals stated their belief that there is less fresh air in aircraft because air is recirculated to conserve fuel. Concerns were also expressed about a possible relationship between cabin air quality and the contraction (transmission) of infectious diseases and causation of other medical symptoms.

On July 5, 1996, an amendment to the Code of Federal Regulations, 14 CFR 25.831, Amendment 25-87, entitled "Ventilation," became effective. This amendment introduced a requirement for new aircraft ventilation systems that reads as follows: "For normal operating conditions, the ventilation system must be designed to provide each occupant with an airflow containing at least 0.55 pounds of fresh air per minute." This is equivalent to 10 cubic feet per minute per occupant, which, prior to this amendment, was required only for crewmembers. While the new requirement does not apply to existing aircraft, all newly certificated transport category aircraft are required to meet this standard.

Transport category aircraft are pressurized by introducing fresh air through the aircraft's air conditioning system and into the cabin and cockpit of the aircraft. The pressure altitude inside the aircraft is maintained by electronically controlling the exit of air from the fuselage through an outlet valve. For crew and passenger comfort and safety, the regulations for certification of transport category aircraft require that the cabin pressure altitude be maintained at no higher than 8,000 feet, when the aircraft is at its maximum altitude. The original aircraft design, established at the time of certification, dictates the minimum fresh airflow rate that must be supplied to meet certification requirements. The flightcrew has the flexibility to vary the amount of fresh air introduced into the aircraft while still meeting the required minimum dictated by the aircraft design. The certification requirements addressing limits on carbon dioxide, carbon monoxide, and ozone concentrations in the aircraft cabin, however, must still be met.

While certain measures may be taken by an air carrier to conserve fuel, these measures must not result in a violation of the regulations or create unacceptable or hazardous cabin air conditions for aircraft occupants. Past studies that have included measurements of cabin air quality conditions during aircraft flights have focused on gaseous components, and have revealed that cabin air quality was within acceptable and safe limits. However, the new FAA-NIOSH research has also incorporated analysis of bioaerosols, cosmic radiation, circadian shifts, and ergonomic factors to address remaining health concerns.

The FAA issued a notice of proposed rulemaking (NPRM), "Allowable Carbon Dioxide Concentration in Transport Category Airplane Cabins," which was published in the Federal Register on May 2, 1994. This notice proposed revisions to the standards for maximum allowable carbon dioxide concentration by reducing the allowable maximum concentration from 3 percent to 0.5 percent in occupied areas of transport category aircraft. A final rule became effective on January 2, 1997.

ACTIONS TO IMPROVE CABIN AIR QUALITY

The existing Interagency Agreement between NIOSH and the FAA, as amended on September 9, 1994, authorized efforts to design and conduct studies of chemical, physical, and microbiological aspects of aircraft cabin air quality. An additional Interagency Agreement was signed in January 1997. This agreement incorporates two new studies providing indirect approaches to the understanding of possible disease transmission within the aircraft cabin, in-flight symptoms, and other health effects that may result from changes in cabin air quality (GAO) or other environmental factors. Systematic epidemiological studies of broad categories of disease transmission in the aircraft cabin environment were not considered feasible with available technology. Additionally, appropriate biomarkers for transmission of upper respiratory diseases and microbiological detection methodologies were not considered adequately developed to support direct field study designs. In addition to the CAQ activities described in this report, FAA and NIOSH investigators agreed that during fiscal year 98-99 they would revisit and update their understanding of the technical issues concerning the study of in-flight disease transmission.

ORIGINAL FAA-NIOSH AIRCRAFT CABIN EXPOSURE ASSESSMENT STUDY

During 1995, the Cabin Exposure Assessment Study plan was drafted after a thorough assessment of the methods and instrumentation for evaluating cabin air quality, including exhaustive performance tests in standard laboratory and in hypobaric atmospheres. The objectives of the continuing 1996-1999 Exposure Assessment Study are to: (1) characterize cabin air quality parameters and cosmic radiation exposures onboard commercial aircraft for a variety of flight routes, duration of flight time, and aircraft types, and (2) provide exposure data for the epidemiological study of reproductive health in female flight attendants. The dual objectives of characterizing cosmic radiation exposures (which depend heavily on altitude and proximity to geomagnetic poles) and aircraft cabin air quality require a study design with flights stratified across different routes, latitudes, aircraft types, and flight durations. Short (<2 hours), medium (2-8 hours), and long (>8 hours) flights were planned over north-south routes and east-west routes including equatorial and near-polar flights. Eleven of the most common aircraft types, as identified in Air Transport Association (ATA) U.S. fleet demographics, were included. Measurements of cabin air quality and cosmic radiation data were collected on commercial flights of four airline companies. Indoor air quality parameters monitored on each flight include carbon dioxide, carbon monoxide, nitrogen oxides, environmental tobacco smoke (as nicotine), ozone, volatile organic hydrocarbons, temperature, humidity, relative pressure, airborne total particulate mass, and inhalable particulate mass. A combination of validated active sampling methods and direct-reading data-logging instruments were used for continuous cabin environment data collection during each flight.

Data collection on eight flights was completed in 1996 on two airlines as part of a feasibility study. After scientific peer review of the protocol in 1996, exposure monitoring on an additional 25 flight segments commenced in April 1997 and was completed in June 1998. Laboratory analyses of samples was completed in October 1998. Data analyses will be completed by summer of 1999.

Data and results from the full complement of 33 flights will be presented in the FAA's 1999 annual report to Congress. A preliminary review of some of the cabin air quality data has shown that 1-minute average concentration ranges were: carbon dioxide 540-2879 ppm; ozone <0.01-0.47 ppm; carbon monoxide <1.0-4.4 ppm; nitrogen oxides <0.3-0.7 ppm; and total particulates <0.02-0.04 mg/m³. Carbon dioxide exposures were highest during periods of passenger activity and varied among different aircraft models. Once all results are available for analysis, the relationships between contaminant levels and aircraft type, passenger load, flight length, and other factors can be explored.

COSMIC RADIATION EXPOSURES

In the Cabin Exposure Assessment study, characterization of cosmic radiation exposure is accomplished using two portable tissue equivalent proportional counters (TEPC). The TEPC instruments, built by Battelle Pacific Northwest Laboratory under contract to the FAA, are capable of recording the energy deposition spectra from the TEPC into 256 channels of data. The instrument fits within the confines of a carry-on suitcase. The instruments are placed near each other in the overhead bins of the aircraft to provide a measure of reproducibility and precision in cosmic radiation dose. The TEPC is considered the best instrument for measuring biological harm in the cosmic radiation environment.

The epidemiology study requires estimates of cosmic radiation exposure for many thousands of flights. The best available method for estimating these exposures is a program developed at the Civil Aeromedical Institute. Calculations to date, with the latest version of the program, are within +9 to -32 percent of TEPC measurements. However, the program calculates effective dose, whereas the instruments measure dose equivalent. Effective dose is the preferred quantity for radiation protection purposes. Although dose equivalent and effective dose are both estimates of biological harm, the quantitative relationship between the two is unknown (and will be investigated). No instrument currently available measures effective dose. Considering the uncertainties in the measurements and calculations, the use of two independent methods of estimating biological harm was considered desirable. Comparisons between the two methods indicate they are in reasonably close agreement.

Average TEPC dose equivalent measurements for the first 17 flight segments (conducted during 1997-1998) ranged from 0.64 to 57.7 microsieverts. Dose equivalent rates based on block hours ranged from 0.91 microsieverts/hour (Kotzebue, Alaska, to Nome, Alaska) to 6 microsieverts/hour (Seattle to Miami). Based on these data, annual radiation dose equivalents for a flight attendant flying 900 block hours per year would range from 0.819 to 5.4 millisieverts, well below the occupational

limit of 20 millisieverts/year (5 year average) recommended by the International Commission on Radiological Protection and the FAA.

BIOLOGICAL CONTAMINANT CHARACTERIZATION

Endotoxins were selected from the broad class of biocontaminants for monitoring aboard aircraft on four flights. Endotoxins are a component of the membrane of gram-negative bacteria (GNB) and are composed of lipopolysaccharide (LPS). Upon inhalation, endotoxins may induce intracellular changes in inflammatory and immune system cells through macrophage activation. Several studies have investigated the relationship between endotoxin and health effects or symptoms in indoor environments. In a study of 19 Dutch office buildings, a dose-response relationship was found between airborne endotoxin levels and building-related (including respiratory) symptoms, with air concentrations six times higher in high symptom prevalence buildings compared to low symptom prevalence buildings. A study of 12 Danish town halls found the prevalence of GNB in floor dust was significantly correlated to general symptoms and to mucous membrane symptoms. A Swedish study of endotoxin levels in air and dust from homes showed a dose-response relationship for airborne endotoxin and cough, breathing difficulties, itchy eyes, and tiredness. Although studies of endotoxin levels in homes, office buildings, and other indoor environments have been conducted, no data are available for commercial aircraft cabins.

Although endotoxin bioactivity quantitation via the standard *Limulus* bioassay has been applied in many environments, an emerging chemical assay for endotoxin via 3-hydroxy-fatty acid (3-OHFA) quantitation provides additional information about possible bacterial sources of LPS. Three-OHFA's are characteristic for endotoxin-associated LPS, and the relative distributions of individual 3-OHFA's differ among species of GNB. This chemical assay shows promise as a more stable method than the *Limulus* assay. Analyses of 3-OHFA's may lead to a better understanding of the health implications of the endotoxin-associated dust since the ratio of endotoxin activity to total 3-OHFA is an indication of the potency of the dust sampled, which may differ by environment.

Air and dust samples were collected during four flights on commercial aircraft in June 1998. Air samples were collected in coach class at 4 locations per flight with 2 replicates per location (32 total on 4 flights). Surface sampling of dust was performed on both seats and carpet. Eight seats and 8 carpet locations were sampled per flight (32 total seats and 32 total carpet samples). Analyses will be completed by October 1998. The results should permit comparisons of endotoxin activity and 3-OHFA's in aircraft cabins to other indoor environments where dose-response relationships between endotoxin levels and building-related symptoms have been demonstrated.

IN-FLIGHT DISEASE TRANSMISSION AND SYMPTOMATOLOGY RESEARCH

With the signing of the January 1997 Interagency Agreement between the FAA and NIOSH, work began on in-flight disease transmission and symptomatology research. In a related effort, the FAA Office of Aviation Medicine worked closely with the Centers for Disease Control and Prevention and the Air Transport Association on the issue of transmission of tuberculosis in aircraft.

A 5-year FAA-NIOSH research program to address broader disease transmission issues has been developed for the fiscal year 1997-fiscal year 2002 timeframe. Two studies have been proposed to evaluate the possibility of disease transmission, symptoms, and health effects from changes in cabin air quality or other factors.

The first disease transmission study incorporates a respiratory symptomatology assessment into ongoing FAA-NIOSH research. The original research, in partnership with the Department of Defense (DOD) Women's Health Research Program, was primarily focused on reproductive health issues of female flight attendants. As part of this program, in fiscal year 1998, approximately 7,000 women (flight attendants and teachers) were asked in a 1-hour telephone interview to answer a reproductive history questionnaire to examine past reproductive outcomes. The teachers serve as a comparison population for the study. Precise work history and personnel data are being collected from three airlines and corresponding teacher unions. Data analyses will begin in early fiscal year 1999.

The reproductive history questionnaire, referenced in the previous section, now contains a panel of respiratory symptomatology questions excerpted from national surveys, including the National Health Interview Survey (NHIS). These questions address respiratory symptomatology (of both infectious and noninfectious etiology) for current and last-year time periods. In the context of complete work (flight) history data and lifestyle factor data, these symptoms can be analyzed in depth, evalu-

ating the relationship between flight activity and symptomatology and controlling for lifestyle factors. In addition to the predominantly nonflying comparison group of teachers, a second large comparison population is available from the NHIS questionnaire data. It is unlikely that a respiratory system symptom survey of this depth or quality could be independently conducted outside the ongoing study, since concurrent collection and analysis of detailed work history data is rarely conducted outside NIOSH. Additionally, this would be prohibitively expensive if structured as a free-standing effort.

The second disease transmission study in fiscal year 1997 through fiscal year 2002 utilizes cabin air exposure modeling. Very little information regarding infectious diseases in the cabin air environment and their potential for person-to-person transmission is available. The number and size of occupant-generated bioaerosols and their dispersal and removal from the aircraft cabin are not known. This project evaluates the dispersal and removal of bioaerosols generated by aircraft cabin occupants in order to answer two important questions: (1) What are the major factors that determine the spread of human bioaerosols in the cabin air environment? and (2) How can this information be used to improve new aircraft design or to retrofit existing equipment?

Experimental methodology from current NIOSH projects can be appropriately modified to determine the factors that may affect the transmission and level of bioaerosols in an aircraft cabin. These factors may include airflow patterns, ventilation characteristics, the number of particles in expired air, humidity, filter efficiencies, and breathing patterns. Software is under development to control simultaneously multiple aerosol measuring devices while video recording human activities responsible for bioaerosol generation. The system is capable of activities for the upcoming fiscal year include conducting the adapted tracer gas tests to measure the age of air in aircraft that are on the ground with their ventilation systems operating. CFD modeling of cabin airflows will begin. Also, experimental work to evaluate aircraft cabin airflows using a variety of techniques will begin in cabin mockups. The results of the biological literature and methods survey will be available. These results will be used to formulate a sampling plan for bioaerosols on commercial aircraft.

PARTICIPATION OF OTHER GROUPS IN THE FAA-NIOSH PROJECT

The FAA Office of Aviation Medicine (AAM) also continued collaborating on aircraft cabin environmental quality issues. AAM participates in the Aviation Subcommittee of the ASHRAE Technical Committee (TC 9.3) and, as a nonvoting member of the ASHRAE Standards Committee, SPC 161, Air Quality Within Commercial Aircraft. In June 1997, the ASHRAE Aviation Subcommittee contracted for a cabin air quality study (\$150,000), which is designed to complement the FAA-NIOSH research. Through FAA's interaction with ASHRAE, FAA's Civil Aeromedical Institute provided valuable guidance and assurance that products from the ASHRAE research contract would be integrated into the ongoing FAA-NIOSH study. As specific examples, the FAA member recommended that air contaminant samples be collected in the breathing zone of aircraft occupants; that samples be analyzed by the same method that is used by the organization that promulgated the standard; and that occupant exposures be evaluated on a time-weighted average basis from closing the cabin door—throughout the flight—to opening the cabin door. The FAA member also recommended the minimum ventilation requirements (cubic feet per minute per occupant) to ensure that maximum sustained levels of carbon dioxide exposure and cabin air changes per hour meet the requirements of FAR 25.831, "Ventilation."

The airline trade associations and unions have been supportive of this project, encouraging their members to participate in critical retrievals of work history and in questionnaire participation. Much of this support was garnered through the "trust building activity" of NIOSH personnel supporting this project.

The FAA will continue to conduct a cabin air quality research program and report to Congress annually on its findings.

U.S. DEPARTMENT OF TRANSPORTATION,
FEDERAL AVIATION ADMINISTRATION,
Washington, DC, July 24, 1995.

The Honorable ALBERT GORE, JR.,
President of the Senate, Washington, DC.

DEAR MR. PRESIDENT: This is the initial report of actions the Federal Aviation Administration (FAA) has taken in response to Section 304 of the Federal Aviation Authorization Act of 1994, Public Law 103-305. Section 304 requires FAA to conduct

cabin air quality research and report to Congress annually on the progress made. The FAA was also directed to contract with the Centers for Disease Control and Prevention to carry out any studies necessary to meet the goals of the research program and invite representatives of manufacturers, airlines, employee organizations, passengers, and academia to participate in the research program.

The initial report contains information on the plans and actions FAA has undertaken to study certain factors related to cabin air conditions, including pressure altitude systems, temperature, air circulation rates, and potential health impacts. The first annual report will be provided to Congress in August 1996.

An identical letter has been sent to the Speaker of the House of Representatives.

Sincerely,

DAVID R. HINSON,
Administrator.

U.S. DEPARTMENT OF TRANSPORTATION,
FEDERAL AVIATION ADMINISTRATION,
Washington, DC, July 24, 1995.

The Honorable NEWT GINGRICH,
Speaker of the House of Representatives, Washington, DC.

DEAR MR. SPEAKER: This is the initial report of actions the Federal Aviation Administration (FAA) has taken in response to Section 304 of the Federal Aviation Authorization Act of 1994, Public Law 103-305. Section 304 requires FAA to conduct cabin air quality research and report to Congress annually on the progress made. The FAA was also directed to contract with the Centers for Disease Control and Prevention to carry out any studies necessary to meet the goals of the research program and invite representatives of manufacturers, airlines, employee organizations, passengers, and academia to participate in the research program.

The initial report contains information on the plans and actions FAA has undertaken to study certain factors related to cabin air conditions, including pressure altitude systems, temperature, air circulation rates, and potential health impacts. The first annual report will be provided to Congress in August 1996.

An identical letter has been sent to the President of the Senate.

Sincerely,

DAVID R. HINSON,
Administrator.

REPORT TO CONGRESS ON THE FEDERAL AVIATION ADMINISTRATION'S ACTIONS ON
AIRCRAFT CABIN AIR QUALITY RESEARCH PROGRAM

REPORT OF THE FEDERAL AVIATION ADMINISTRATION TO THE UNITED STATES CONGRESS
PURSUANT TO PUBLIC LAW 103-305, SECTION 304 OF THE FEDERAL AVIATION ADMINISTRATION AUTHORIZATION

EXECUTIVE SUMMARY

Section 304 of the Federal Aviation Administration Authorization Act of 1994, Public Law 103-305, requires the Federal Aviation Administration (FAA) to establish a research program and report to Congress annually on the actions it is taking to conduct aircraft cabin air quality research. FAA was also directed to provide Congress with an initial plan to implement the program. This report contains information on the program actions FAA has taken to comply with these directions and with the requirement to contract with the Centers for Disease Control and Prevention to conduct this study.

BACKGROUND

In 1993 and 1994, Congress held hearings to address complaints from flight attendants and passengers regarding air carrier cabin air quality. These individuals expressed concern about cabin air quality and stated their belief that there is a reduction of fresh air in aircraft because air is recirculated to conserve fuel. Other concerns were raised about the possible relationship between cabin air quality and occupant symptoms, as well as the contracting of infectious diseases.

Currently, the language in 14 CFR 25.831, "Ventilation," states that each passenger and crew compartment must be ventilated, and each crew compartment must have enough fresh air (but not less than 10 cu. ft. per minute per crewmember) to enable crewmembers to perform their duties without undue discomfort or fatigue.

Transport aircraft are pressurized by introducing fresh air through the aircraft air conditioning system and into the cabin and cockpit of the airplane. The "altitude" inside the aircraft is controlled by allowing air to exit the fuselage through an electronically controlled valve. The regulations which are used to certify transport category aircraft require that the cabin altitude be maintained at not more than 8,000 feet, when the aircraft is at its maximum altitude, for crew and passenger comfort and safety. The original aircraft design, established at the time of certification, dictates the minimum fresh airflow rate that must be, supplied to meet certification requirements, but there is some flexibility allowed in meeting these requirements. The flightcrew can vary the amount of fresh air introduced into the aircraft while still meeting the required minimum dictated by the aircraft design. The certification requirements addressing limits on carbon dioxide, carbon monoxide, and ozone concentrations in the aircraft cabin, however, must still be met.

While certain measures may be taken by an air carrier to conserve fuel, these measures are not expected to result in a violation of the regulations or unacceptable or hazardous cabin air conditions for aircraft occupants. Studies have been conducted in the past to measure conditions of cabin air quality on airline flights. These studies have shown that the cabin air quality was within acceptable and safe limits.

ACTIONS TO IMPROVE CABIN AIR QUALITY

In November 1989, Notice 89-31, Standards for Approval for High Altitude Operation of Subsonic Transport Airplanes, was published in the Federal Register. The intent was to incorporate the requirements in the FAR for a number of special conditions that had been issued for operation of several (mostly small) jet transports to enable operation above 41,000 feet up to and including 51,000 feet. The current Part 25 requirements do not cover such high altitude operations.

One of the proposals in Notice 89-31 was to revise section 25.831(a) of the FAR to require that each occupant be supplied with 0.6 pounds of fresh air per minute, which is approximately 10 cubic feet per minute (CFM). The current rule requires 10 CFM per crewmember. With this higher airflow, using accepted analysis methods, the carbon dioxide level in the passenger cabin would be 0.125 percent. The proposed new rule would apply to all new airplanes in the certification process. The final rule is now in coordination and is expected to be issued in 1995.

The FAA issued a notice of proposed rulemaking (NPRM) which was published in the Federal Register on May 2, 1994, titled "Allowable Carbon Dioxide Concentration in Transport Category Airplane Cabins." This notice proposed revisions to the standards for maximum allowable carbon dioxide concentration by reducing the allowable maximum concentration from 3 percent to 0.5 percent in occupied areas of transport category airplanes. Such modifications could reduce the complaints of poor air quality and the sense or perception of "stuffiness," associated with higher concentrations of carbon dioxide. Comments on the NPRM have been received and are under review. A final rule is anticipated in 1995.

RESEARCH PROGRAM IMPLEMENTATION PLANS

FAA's plan to perform aircraft cabin air quality research contains a number of elements. These include modifying, by amendment, the formal agreement with the National Institute for Occupational Safety and Health (NIOSH), Centers for Disease Control and Prevention, to conduct an epidemiological study and undertake other study activities; establishing research protocols, including survey flights and sampling; and initiating liaison with both Government and non-Government organizations to assist in this study, develop test protocols, and provide peer review. These program plans are described below.

The statute directing FAA to conduct a research program on cabin air quality, including pressure altitude systems, calls for an examination of conditions that could be harmful to the health of airline passengers and crew, as well as the risk of airline passengers and crew for contracting infectious diseases during flight.

On September 9, 1994, an existing Interagency Agreement between NIOSH, Centers for Disease Control and Prevention, and the FAA, was amended to include a plan to determine the feasibility of designing and conducting a study of chemical, physical, and microbiological aspects of cabin air quality. NIOSH has initiated a literature review of cabin air quality studies and, in addition, sampling methods for the analysis of all relevant aircraft cabin contaminants are being evaluated to establish the most efficient and meaningful research protocol.

FAA has established liaison with appropriate technical specialists at the National Aeronautics and Space Administration, Boeing, and other organizations to assist the agency in development of the optimal testing protocols and to obtain peer review for the cabin air quality research. Special relationships have also been established

with the American Society of Heating, Refrigeration, and Air-Conditioning Engineers Aviation Subcommittee. This group has undertaken an initiative to establish consensus standards for minimum fresh air ventilation rates in the air carrier aircraft cabin environment.

The FAA is proposing that NIOSH undertake a 5-year epidemiological study to address disease transmission in the cabin environment.

In fiscal year 1995, approximately six to eight survey flights will be conducted to develop protocols for the collection of chemical and physical air quality data and to test instrumentation to be used in the data collection. A proposed total of 22 to 24 survey flights will be conducted and are scheduled to be completed in fiscal year 1996. Flights will be chosen depending on aircraft model and flight duration, taking into account other factors which impact aircraft cabin air quality, such as passenger load, smoking exposure, and filter efficiency.

Demographics of the major U.S. airlines will be used to determine which aircraft types should be evaluated in the study. For example, the six aircraft types most prevalent in U.S. operating airline fleets are the B727, B737, MD80, DC9, B757, and DC10. A key component of the new study will be the selection of optimal measurements to determine microbial loads onboard aircraft. These measurements will be critical to the related study that addresses the relationships between aircraft cabin environmental conditions and occupant symptomatology and the risk of contracting infectious diseases.

The FAA/NIOSH Research Program has been designed to meet the goals stated in Section 304 of Public Law 103-305. This research program will specifically determine what, if any, aircraft cabin air conditions, including pressure altitude systems on flights within the United States, are harmful to the health of airline passengers and crew, as indicated by physical symptoms such as headaches, nausea, fatigue, and lightheadedness. It will also assess the risk of airline passengers and crew contracting infectious diseases during flight.

Senator CONRAD. Thank you for being here today, and I want to thank, in absentia, Chairman Domenici for holding this hearing and Chairman Shelby for being here as well. I think this is critically important.

I am on the FAA reauthorization conference committee as a member of the Budget Committee, and I would like to share a somewhat different perspective than we have heard, at least while I was here this morning before I had to leave for the vote. We heard a lot of talk about money not being able to solve problems. That is certainly the case. Money doesn't solve all problems. But an absence of money, when there is real need, creates its own problem. And I want to say I believe we need more money for airport expansion or airport modernization for FAA, and the need is just as clear as it can be.

We have 600 million air passengers a year now. We are being told it will be a billion passengers within the next decade.

Now, you are not going to service those passengers. You are not going to be able to deal with the capacity needs of the airports of this country. You are not going to be able to prevent enormous gridlock in the Air Transportation System of the United States without substantial increases in funding. And anybody that has worked with me over the 14 years I have served in the United States Senate knows that I am a deficit hawk, that I have been relentless in wanting to eliminate the deficits, and we are at that day, thank goodness. We are able to balance our budget without counting Social Security, which is a dramatic improvement over where we were just 8 years ago.

But as a deficit hawk, I also recognize there are other needs in this country as well. And unless we address this one, we are going to hamper the economic efficiency of this economy because transportation is right at the heart of an effective economic system in

America. And I defy anybody to explain to me how you go from 600 million air passengers a year to a billion and not spend more money to deal with the challenges.

Those of us who fly frequently know what is happening. Delays of more than 15 minutes are up 20 percent—something over 20 percent. I tell you, I am experiencing it. This last weekend I was flying home to North Dakota, got up at 5 o'clock in the morning for a 6 o'clock flight, and, you know, we all get on the plane, and then they come with their announcement that I have had many, many times: We have a mechanical problem; it will be 15 minutes to an hour and 15 minutes, and we will have it fixed. We all get off the plane. After 45 minutes, they come on and say: It will be 15 minutes to an hour and 15 minutes before we are able to leave. You know, then they get into it and they find there is more problems than they anticipated, and it is 3½ hours before you leave.

Now, that meant that I missed a series of commitments, and it meant all the other folks in that plane probably missed commitments. That has a real effect on the efficient functioning of our economy. And the fact is reliability is declining, and we are going to have to put more money into this system. That doesn't mean you just throw money at the system. It does have to be done in a way that people are held accountable.

I want to salute you for the work that was done to avoid the Y2K problems that all of us were anticipating. Goodness, what a remarkable event that turned out to be. We all woke up, virtually no problems. And I salute you for the excellent work that you did. I know enormous time and energy was spent on making certain that the air transportation system in this country was safe and functioned without problem. And I think you deserve public credit.

There are three matters that I would like to raise with you that affect my State. First of all, I want to thank you for dealing with the air traffic control situation that affects Minot Air Force Base in Minot, North Dakota. You acted, and acted properly, I believe, to leave that matter of air traffic control with the Minot Air Force Base because of the nuclear deterrence responsibilities of that Air Force base. And I very much appreciate the way you responded to that need. And I can tell you that the commander of that Air Force base and the head of the Air Force appreciates the cooperative spirit of the FAA in resolving that matter.

Second, on essential air service, we have four North Dakota communities that are covered by the EAS Program, but we are having very significant problems with respect to the reliability of that service in North Dakota, especially with respect to Great Lakes aviation: repeated cancellation of flights, repeated failure to provide service, and problems really that need to be addressed during.

During consideration of FAA reauthorization, I got an amendment passed that requires DOT and FAA to come up with a plan to make EAS more sustainable, more reliable, and I would just encourage you, even though that bill is still in conference, to proceed to review those issues.

Is that something that you could do pending the completion of FAA reauthorization?

Ms. GARVEY. Senator, certainly we can review them. Those are really understand the jurisdiction of the Secretary's office, the De-

partment of Transportation, but both Assistant Secretary Basso and I will make sure that gets back to the right office and make sure that that review takes place. We are very much aware of those issues, as you were describing them, and the criticality of having that kind of service for communities really is—essential air service is exactly the right name for it.

So we appreciate those issues, and we will respond and deal with them.

Senator CONRAD. Well, we do have serious problems.

On a final note, I want to also thank you for dealing with the question of the width of the runway at Minot Airport.

Ms. GARVEY. Yes.

Senator CONRAD. FAA had been indicating they would only fund a 100-foot-wide runway, and when we were able to get written confirmation from Northwest Airlines that they intended to serve that market with Airbus A320 aircraft that required a 150-foot runway, FAA responded and indicated that they would fund a 150-foot-wide runway. And I would just like to confirm that again here this morning.

Ms. GARVEY. That is correct. Yes, exactly right, Senator.

Senator CONRAD. Well, I appreciate that.

Ms. GARVEY. Thank you.

Senator CONRAD. I would just like to add a final if I could on the point that Senator Durbin made.

Senator DOMENICI. It is your time.

Senator CONRAD. This air recirculation question I think is an important question. I have constituents that mention this to me, and I believe it is a problem. I would very much hope that the FAA would go back and revisit the question of what the requirements are and that we have a recirculation more frequently of air in these aircraft.

I have had doctors tell me that there is an epidemic of illness as a result of the close confines of aircraft. In fact, the Capitol physician has told us that they are seeing just an epidemic of communicable illnesses being spread in aircraft and that part of the reason is that we are not recirculating the air frequently enough. And I very much hope that that would be investigated.

Thank you, Mr. Chairman.

Senator DOMENICI. Let me apologize for my absence. I hope—in fact, I know matters were handled very well in my absence, and nobody went to war, nobody got mad at each other. Isn't that nice?

I want to just suggest that one of the reasons that I have undertaken oversight hearings this year—and I am sorry that I don't have 3 months instead of one to do some oversight hearings—is not because we have authority to write laws in these areas. Everyone here knows we don't. But I have been part of producing a budget and 13 appropriation bills for 25 of the 27 years I have served here. And I have come to the conclusion that our procedures do not allow enough time for authorizing committees to have hearings about the matters within their jurisdiction and to actually find out whether the programs they are funding and that they have authorized sometimes 50 years ago, 30, 20, whether they are still worthwhile.

Well, I am pleased to announce that in the United States House they are way beyond a majority of members who have joined in a

resolution saying let's have appropriations and budgeting every 2 years, and thus, that would leave some time for something else, like oversight.

I submit, however, that from your standpoint, as being on the executive side—and I would ask if I am correct—if you didn't have to submit a budget every year, it would permit you a great deal more time to oversight the department that you run.

I just got a note yesterday that a little tiny funding in one of my bills, Corps of Engineers at \$3.7 billion a year, they must do a budget every year. The budget is eight volumes long. Eight volumes, 20,000 pages, for \$3.7 billion, one small department of the government every year, every year. Then they must do hearings on appropriations, then appropriating, then we all go back and have a Christmas sleep. And guess what? Budget appropriation again.

I think a lot of the problems that are falling in your laps are your own problems of not managing correctly, and you have been one very willing to tell us where things must be improved. But I think part of the problem is a 1-year cycle for producing budgets for appropriations.

Could you comment? That is a question I did not tell you I was going to ask you, but could you comment on it if you have anything relevant?

Ms. GARVEY. And I may ask Mr. Basso if he would like to comment from the Department's perspective. But I would say certainly from a programmatic perspective, a multi-year predictable stream of funding is certainly something that we would find extraordinarily helpful to give us that kind of flexibility.

Mr. BASSO. Mr. Chairman, just speaking for myself as opposed to the Administration, I have had 35 years to observe this process, and one thing I am sure of is every year the cycle gets longer and more continuous. So I would have to agree with you, that having more time, more oversight, more deliberation, couldn't help but deal with a \$1 trillion issue. And certainly I agree with you from my perspective on that.

Senator DOMENICI. Senator Gorton, did you get to ask questions?

Senator GORTON. No, I did not.

Senator DOMENICI. Please do so.

Senator GORTON. I have only a couple.

Ms. Garvey, what is the status of the Wide Area Augmentation System Program? And are the recent delays part of any larger structural challenge?

Ms. GARVEY. WAAS is definitely one of the most complex and most challenging projects we have. We did a series of testing, or actually, Raytheon, our contractor, did some testing for us in the fall and into the early winter months. Two issues or two elements, two factors arose. One is—and this is the good news—there is much greater accuracy with WAAS than we had anticipated. So the accuracy is even greater than what we had expected. That is the good news.

The part that is not so good is the whole issue of our safety monitoring, and it is very critical and very important for us to have the highest levels of safety as we are looking at this kind of equipment. We have no room for any mistakes in that area, so we have very high standards in the safety arena.

The testing is showing that WAAS is not able to meet those standards at this point, so we have that challenge for us. And, quite honestly, if it means a schedule slip or compromising the safety, we would obviously take the schedule slip. But we have scheduled next week, for 3 days, a technical review committee. It is made up of a contractor, FAA officials, and I was just mentioning to Mr. Mead earlier that we are inviting people from outside to help participate in this, to really identify a path for success here. How do we deal with this issue? How serious is it, and how do we deal with it? So we will have more to report on this after that group meets.

But good news on the accuracy. The safety standards, and it really involves the alarms going off more frequently than they should. We have to deal with that before we can move ahead.

Mr. MEAD. I would like to just say a word about WAAS from our work. As you know, we are independent of FAA. This is one of the programs that is having problems. This program started out with a program cost estimate of \$893 million. We are now looking at about \$3 billion.

This is also one of those programs experiencing schedule slippages. WAAS started out in 1996. In 1998 we were supposed to start deploying it now, it is going to be 2000 or later.

I have noticed some real improvements in FAA's oversight of the WAAS contractor here. This is one procurement where a lot of risk sharing is going to be needed because it is a very expensive contract. I think the contractor bears now a responsibility here, just like FAA.

WAAS is also a very important program in terms of technology development and in terms of transitioning to satellite navigation.

Senator GORTON. Thank you.

Another subject, Ms. Garvey. The recent contract with the controllers, is it affecting your ability to meet budgetary targets? Is it going to tighten your ability to do other things at a time of rather constrained budgets?

Ms. GARVEY. Well, thank you very much for asking that question. If you will bear with me—because this is an important issue to me. I think it—it is something I get asked very frequently.

First of all, we did have a 12 percent increase in our operations budget, but I think we need to say that there also was over 8 percent increase in mandatory spending. The controller contract is less than one-quarter of that, so I don't want to say it doesn't have an impact, but I also want to point out that it is a very small impact overall.

And I want to take a step back for a minute because we had some very important goals when we went into the controller contract negotiations. One was that we wanted to get some productivity gains. That was very critical to us. And I am happy to say that for the first time we have a contract that does include some cost savings and cost avoidance. We have never had that before. That is significant.

Second—and I think that some of the speakers earlier referred to this—we have not always had the best relationship with the controllers. Management and union have not been always in sync at the FAA. I think this contract has established an atmosphere for

us in the FAA where the labor-management relationship has never been better. They are full partners as we are moving ahead on modernization, absolutely full partners. And from my perspective, that is critical. We don't need to look far to see other places where the labor-management relationship is such that it really does sort of poison the well, if you will.

So we wanted productivity gains, and we wanted full buy-in for modernization. We wanted to take a look at some ways that we might be able to give up alternate work weeks and so forth. That is very tough for a 24-hour-a-day operation. We have been able to achieve those. And so I think it is extraordinarily positive.

We also wanted to be able to classify our facilities in different ways. We wanted to be able to say that San Francisco, Chicago, New York, those are very busy, and the controllers there ought to be paid in relationship to the number of operations that they had to control. So I think the contract is a solid, good document, and I think it will allow us to move ahead in a way that we probably could not but for a contract.

Senator GORTON. Thanks. Thank you, Mr. Chairman.

Ms. GARVEY. Thank you.

Senator DOMENICI. For your information, Senator, you were not present when the Inspector General put up a rather significant chart with three lines on it. One of them had to do with the increased costs attributable to the contract of employment versus the growth in other accounts because of it. I am not suggesting that the chart attempted to say we were harming one part because we have a good labor contract, but it did show that it is a very big part of expenditures that we are now online to keep giving for quite some time. If it works out that there is a much better relationship with employees and if it turns out to have added productivity, I think that would be exciting, and I congratulate you for it.

I have just two questions. I happened, just by coincidence, to have located in the city of Albuquerque one of your aging aircraft centers wherein the scientists at Sandia National Laboratory work with the private sector in determining the significance of aging on certain components of American conventional, ordinary airplanes that we have in our stockpile that we are using. I have asked them for some evaluations in the past. Clearly, even though we are building more new airplanes, we are also living on a stockpile of airplanes that are getting very old as people are flying around in rather old airplanes. And we need to know more about what that means.

Could you just talk to the record on that?

Ms. GARVEY. Senator, that is an absolutely significant issue. You are absolutely right that as our aircraft ages, that whole issue becomes even more paramount. We have worked very closely with the NTSB around the whole issue of aging aircraft, and we have a very aggressive program underway. Again, we have brought in some wonderful experts.

I am not as familiar with the Sandia Lab's efforts in this area. I am very familiar from my highway days of wonderful work that they have done, and I think it would be good for us to follow up and perhaps see if there is a way to include some of their information in what we are doing.

Senator DOMENICI. I believe there are two similar ones. I think there is one in the State of Iowa, if I am not mistaken. But, in any event, they are now pursuing some very exciting work on some of the very modern airplanes and testing just individual parts for their longevity, their strength. After 30 years, what is happening to them? And I think you have to be a big player in that.

Ms. GARVEY. Absolutely.

Senator DOMENICI. Because you have to tell the American people the planes are safe. It is not going to be so easy to keep doing that with planes that are growing older and older if you don't know the answer. Right?

Ms. GARVEY. Absolutely. An important issue for us.

[The information follows:]

Since the Aloha 737 accident in May 1988, the FAA has worked with the transport airplane manufacturers and airlines to improve the technology of inspecting for corrosion and fatigue damage, developed improved structural inspection requirements, and issued many airworthiness directives to correct aging problems on various types of aircraft. This continuous improvement in aging aircraft safety will be expanded by rulemaking that will require older airplanes to be evaluated, and monitored in service, for the development of any new sources of widespread fatigue damage (the type of damage that caused the Aloha accident).

The FAA continues to work aging aircraft problems through the Airworthiness Assurance Center of Excellence (AACE), through which Sandia National Laboratories plays a key role. In the AACE the FAA has set up a partnership that brings leading talent in government, academia, and industry to focus on maintaining the high level of safety in the aging fleet (along with other airworthiness problems).

At the Sandia National Laboratories, the FAA has set up an inspection system Validation Center. Sandia's group of samples with known flaws provides real aircraft structures to test new laboratory developed inspection methods. This provides the FAA with a way to ensure that newly proposed methods will meet their expected levels of performance in practice. This philosophy of validation is already working well in the area of airframe inspection. It has also been applied to engine inspection technologies, and will be used on the aging systems program that the FAA now has underway.

The research work at the AACE and, in particular at the Validation Center, is crucial to supporting the FAA's core capabilities and ensuring that the latest technology is correctly applied to maintaining the aging fleet.

Iowa State University is the co-leader with Ohio University of Airworthiness Assurance Center of Excellence and through their Center for Aviation Safety Reliability (CASR), they are working with the FAA's William J. Hughes Technical Center primarily on the development of new inspection methods for aircraft structures.

The effectiveness of the Center for Aviation Systems Reliability (CASR) and the Airworthiness Assurance NDT Validation Center (AANC) is intertwined with the certification, operational and maintenance requirements for aircraft structures. Non-destructive Inspection (NDI) technology has improved our ability to detect structural flaws and corrosion. The probability of detection establishes the inspection intervals for operators. Safe operation of aircraft beyond the design service goal is predicated on detection and modification of aircraft structure due to fatigue and corrosion. The real benefit of improved NDI is that of increased reliability of detecting flaws before the residual strength of the structure degrades to an unsafe level. We are able to extend the life of structures and repair or replace them within a safe time frame as a direct result of NDI advancements.

Senator DOMENICI. One of our Senators—I think Senator Conrad—made an issue of airplanes not being on time and the kind of problems people are having. I just want to clarify: Is that attributable to the fact that we don't have enough money, or is that attributable to something else?

Ms. GARVEY. Well, I would certainly say that—and let me step back for a minute. I think there were really three critical areas. Last summer we saw a 20 percent increase in delays, and there were, I think, three significant reasons for that. One is, as Don

McCarty said this morning, we all experienced some significant weather last year, and that was an issue. Second, the transition to modern equipment—we moved into DSR last year, and that created some problems for us as well. And, third, there were a number of significant runway projects that were taking place throughout the country that also had an impact, particularly at those critical centers.

I think the efforts that have been underway have been significant. We have been working closely with the airlines every single week in coming up with a Spring-Summer Plan for this year. We don't want to have the same repeat of what we experienced last year. We have come up with a very significant plan around procedures, around ways to manage the air traffic much differently, and that is going to be announced at the end of this year.

I can tell you some elements include giving our command center in Herndon more control—they know the whole system—and looking at a number of procedures as well. I will say that is the short-term fix. We still believe that the long-term fix is the long-term modernization efforts that we are also committed to. So that clearly is the long-term answer as we move forward.

Senator LAUTENBERG. If I might, Mr. Chairman, how about just the general increase in the flying public?

Ms. GARVEY. Absolutely.

Senator LAUTENBERG. Airplanes are filling and they are busy and slots are blocked and the gates are unavailable.

Ms. GARVEY. We are seeing that particularly at some of the hubs, as you know, at some of the airports near and dear to your heart, Senator. So we are seeing that as well, the growth in traffic.

Mr. MEAD. We don't have two things in this country pertaining to the delay issue that are very important, particularly as you are considering FAA's reauthorization. First, we do not have a common definition of what a delay is. Second, we do not analyze the causes of delays in a systematic way. This is irony of Shakespearean proportions, almost. Did you know that you are considered departing "on time" if that plane backs away from the gate within 15 minutes of its scheduled departure? But if you sit on that runway for 2 additional hours, even though you have pulled away, you are still leaving "on time".

Now, the person in that plane doesn't think they are leaving on time, but the Federal Government counts, and it shows up in USA Today and everywhere else as a departure on time. I think that ought to be changed.

Senator DOMENICI. Well, we thank you for that observation. I was wondering why they did that to us, why they didn't bring us back, since we were going to be there 2 hours, why they didn't turn us free. But obviously it would be a late departure.

Mr. MEAD. That is another issue.

Senator DOMENICI. It could be that is the reason they do it. They don't do it as much anymore, though, which is very interesting to me. Something has happened in the meantime. Planes are not pulling out as many times and them telling you as soon as you get away from the gate, well, we are going to be here for an hour before we take off. I haven't heard that as much lately. Have you?

Senator LAUTENBERG. Well, I got on an airplane the other day despite the precaution that said, look, we are going to get you on the airplane, we are going to close the door, but I can tell you now it is 55 minutes before we are going to be given clearance to take off. And it was excessive traffic going into the New York region.

So delays are alive and well, Mr. Chairman.

Senator DOMENICI. At least that one they told you clearly in advance, and I think they are doing a better job at that.

Senator LAUTENBERG. Yes.

Senator DOMENICI. I have no further questions. I guess I would like—do you want to go another round?

Senator LAUTENBERG. I haven't asked any questions.

Senator DOMENICI. Oh, I am sorry. I thought you asked them while I was gone. I am going to yield in one moment.

I wonder if you would mind, Administrator Garvey, responding to the last comments made by Mr. Mead with reference to the commonality that he suggested we don't have in some of these areas. Can you address that for the record?

Ms. GARVEY. Do you mean in terms of the delay issue?

Senator DOMENICI. Yes, where he just described the things that he recommended?

Ms. GARVEY. I think one of the issues that Mr. Mead has referred to is the common definition of delays and so forth.

Senator DOMENICI. Correct.

Ms. GARVEY. One very good and interesting result of the work that we are doing with the airlines right now, is we have sort of put some of that aside, and we have said, "Let us take a new look at this, and let us measure how the system is doing. Let us agree upon an established set of metrics." We have done that, and actually, they are pretty straightforward and pretty simple, and we now have sort of a common definition between the two of us.

We still have, as Mr. Mead suggested, the issue about DOT's definition of it. I think that is something we still need to work on, but we have agreed on the common definition with the airlines about how we are going to measure how well we do this summer, so we will be able to do that together.

Senator DOMENICI. Now, Madam Administrator, the Inspector General explained at length one of the major projects you have going, procurement contracts for new equipment, and I understand from my friends who know, that that is a very, very important new part of modernizing the system. He explained its original bid price and how much it ended up costing, and its original committed delivery date and how long it took. Now, I am not surprised. Believe it or not, we funded the Internal Revenue Service for new equipment for all America, only to find that they could not get it done. If ever I was frustrated as an appropriator in those days was to say, "OK, we just put up \$4 billion. We can now tell our citizens we are going to have a modern system at the IRS." IRS wondered for a few years why Congress defunded them in certain areas, and I can tell you it was because of what I just described. Now, thank God, it looks like that is over, but there are similar stories in Social Security and other areas, where there are big machines, and modernizing has been attempted in huge jumps, not just little incremental steps. But I guess it would be important to at least know,

since the subject came up, whether the FAA has analyzed this and if you know why that happened and can tell us that it will not happen again?

Ms. GARVEY. Mr. Chairman, I think the approach that we are taking on these big projects incrementally, step by step, is in large part the answer. I think that is absolutely critical as we are moving forward. Mr. Mead and I have talked a great deal about that, and I think that is a very positive step forward.

Second, I think that the whole issue of procurement reform, I want to stress again it has allowed us to make changes and made some differences to us. We are able to get contracts on board in 50 percent less time. The other—and Mr. Mead is absolutely right, there are about 5 projects at the FAA that are very big projects and need to be watched very carefully. He mentioned a couple, WAAS, STARS, OASIS and so forth. There are 5 of them.

But I also want to put that in perspective. We have a \$2 billion budget in F&E. Those 5 projects make up about 15 percent, so there is still a large number of projects being done. And I think in those areas in particular, procurement reform has been beneficial. Having said that, I want to give you my absolute commitment that those 5 problem projects, if you will, are being watched very carefully. They are being managed differently with clear points of accountability. There are absolute deadlines that we have to meet, and we are doing that.

I think we need to do a better job in terms of procurement reform of building in life cycle cost, and that is something we have talked with Chairman Shelby's committee about as well. We need to bring that in, and that is one of the suggestions we have got, and we are doing that as well.

Senator DOMENICI. All right.

Ms. GARVEY. Thank you, Mr. Chairman.

Senator DOMENICI. Mr. Lautenberg, excuse me for not—assuming. I thought you might have—

Senator LAUTENBERG. Not at all. Our schedule has been mixed up, and I apologize for having to run off for a couple minutes.

Senator Shelby, do you want to—

Senator SHELBY. No, go ahead. I defer to you.

PREPARED STATEMENTS

Senator LAUTENBERG. Mr. Chairman, I have three statements that—one by Senator Hollings, one by Richard Durbin, one by Senator Johnson—that we would like to have inserted in the record.

Senator DOMENICI. They will be inserted and at this time, I would like to insert a statement from Senator Snowe.

Senator LAUTENBERG. Thank you.

[The statements follow:]

PREPARED STATEMENT OF SENATOR ERNEST F. HOLLINGS

Good morning and welcome to our distinguished guests, Administrator Garvey, Inspector General Mead and Mr. Crichton. I am very pleased that you are able to appear at this joint hearing before the Budget and Appropriations Committee. "Modernizing the Federal Aviation Administration: Challenges and Solutions" is the title of today's hearing, an apt and timely one at that. As many of you know, we have been conferencing on the FAA bill since fall and funding has lapsed on the Airport Improvement Program portion of the FAA's budget. Spring—the beginning

of the construction season is almost here and we seem to be headed no where soon on this issue.

We may pose theoretical questions concerning privatization and the role of government. What we cannot do, however, is dispute the duties incumbent upon us at this moment: properly funding the FAA so that it can carry out its primary mission of ensuring safety, and properly funding our Nation's aviation infrastructure. Few will dispute the role of transportation in commerce. Admittedly, shipping and rail initially were responsible for building our Nation's wealth and shaping its cities; however, with the past century, aviation has become the primary and most important means for moving people. In fact, it has revolutionized the way we do business. In 1998, U.S. air carriers enplaned 607 million passengers. According to the FAA, this number will grow to an estimated 1 billion passengers in 2010. This explosive growth does not even include cargo flights.

Congestion in the skies and on the ground at our Nation's airports is also increasing exponentially. According to the Air Transport Association, delays were up by 36 percent this summer. The prediction of gridlock as was noted in the National Civil Aviation Review Commission's 1997 Report seemed to be coming to early fruition. While it is fortunate that we have Canada's system as an example of privatized air traffic control, the United States' airspace has dramatically more complicated flight paths, in addition to a more diverse body of users. Deregulation of the airlines industry left many winners and losers. We have planes flying all over the place, including a large number that are classified as general aviation. Our population is greater and extends throughout our borders. We have 86 commercial air carriers compared to Canada's one. And with the exception of a few, the majority of U.S. carrier operations use the hub and spoke system, allowing them to serve a larger number of passengers. We can not afford to have another set of winners and losers by turning air traffic control over to the private sector.

Although it is important that we engage in discussion on ways to facilitate modernization of the FAA, it is imperative we do not trade academic discussions for action. We must step up to the plate and do our duty—pass the FAA bill.

PREPARED STATEMENT OF SENATOR RICHARD J. DURBIN

Chairmen Domenici and Shelby, thank you for calling this important hearing on Federal Aviation Administration (FAA) modernization. Obviously, the State of Illinois, home to one the world's busiest airports, has a great interest in achieving the most efficient and safest air traffic control system possible. I thank Administrator Garvey for joining us today.

I also want to mention my strong desire to see the conferees on the FAA Reauthorization Bill finish their work as soon as possible. In downstate Illinois, we're facing an air service crisis. The High Density Rule at Chicago's O'Hare International Airport is jeopardizing service to smaller communities. It is my hope that the conference report will bring some relief to these communities who desperately need access to the Chicago market for economic development and tourism.

I'd like to use my time this morning to talk about an important, commonsense safety and accident prevention issue—video cameras in airplane cockpits.

The tragic and mysterious crash of EgyptAir 990 in November and the recent crashes of Kenya Airways and Alaska Airlines give us a solemn reminder that air travel can never be made too safe. As crash investigators attempt to sort out the circumstances surrounding these accidents, the Federal Government continues to look for new and innovative ways to enhance air safety and prevent future accidents.

Cockpit voice recorders help us understand the causes of many crashes. But sometimes they still leave us mystified. I believe the missing link to a clearer and fuller understanding of why airplanes crash is video camera technology in the cockpits and on planes.

In an era where video cameras are commonplace in grocery stores, office buildings, public buses, and at ATMs, it is time to modernize the tools of air safety. The voice recorder was once state of the art, and it still can be an important tool for investigating accidents. However, a video camera could provide invaluable information for analyzing accidents and creating a safer environment for airline passengers. Visual recordings could also shorten the length of an investigation at a time when the public is anxious and eager to understand what happened.

The crash of EgyptAir flight 990 unfortunately illustrates the need to improve flight recording devices. Although the audio record provided the National Transportation Safety Board (NTSB) with some important clues about what might have occurred just before the crash, the recording appears to raise many more questions

than it answers. Visual recording equipment could provide more practical information in such circumstances.

I understand the concerns raised by the opponents. Video recordings should and must be treated in the same manner as cockpit voice recordings. Privacy concerns and compassion for victims' families must be appropriately addressed.

This week, I met with the chairmen of both American and United Airlines. They're open to the concept. I've had the opportunity to meet with and raise this subject with today's witness, FAA Administrator Garvey, and with NTSB Chairman Jim Hall. Both are interested.

In fact, Chairman Hall wrote, "The Safety Board shares your belief that a video recording could provide invaluable information for analyzing accidents and creating a safer environment for airline passengers." NTSB's Office of Research and Engineering is currently looking into this matter.

Mr. Chairman, the Federal Government, specifically the FAA, must lead the way. I am asking Administrator Garvey to continue to push the agency to consider this concept and the latest available technology.

However, Congress has a role as well. We should ensure that both the FAA and NTSB Reauthorization Bills include language that prepares the way for the possibility of video cameras and recordings. We should not wait for another accident.

I thank the Budget Committee and the Transportation Appropriations Subcommittee for holding this important hearing. I look forward to working with my colleagues as well as with the FAA and NTSB to advance this commonsense concept.

Thank you.

PREPARED STATEMENT OF SENATOR TIM JOHNSON

Thank you, Mr. Chairman. I appreciate your holding this hearing and thank the witnesses for being here this morning. I want to take a moment to express my concerns regarding the status of the Federal Aviation Administration (FAA) reauthorization. As we all know, the authorization lapsed last fall and consequently, our airports currently are operating with some uncertainty about the future.

Several of South Dakota's airports receive funding through the Airport Improvement Program (AIP), which funds a variety of critical projects across the country including safety, security, capacity, and noise projects. In recent years, AIP funds were used for a number of important projects, including the rehabilitation and lighting of a runway in Pierre and runway rehabilitation projects in Watertown, Sioux Falls, Rapid City, Mitchell, Huron, Brookings, Aberdeen, Redfield, Flandreau, Custer County, and Platte. Many critically important projects are slated for construction when the funds are made available and I hope that a resolution to the conference is found in a timely manner so that our entire construction season, which is often fairly short because of the harsh midwestern winters, can be utilized.

Essential Air Service (EAS) also is a critical program for South Dakota. Yankton's airport depends on EAS for air transportation, and the cities of Brookings and Mitchell also are served by this program. EAS has proved to be crucial to ensuring that rural America remains economically viable, by allowing scheduled air service to exist at many rural airports across the Nation that otherwise could not support commercial air service. If funding for EAS lapses, South Dakota's rural airports, and the communities they serve, will be adversely affected.

Finally, regarding the controversial issue of how to best ensure airports receive adequate, reliable funding in the future, I support using all revenues generated by aviation taxes for aviation needs. Using all aviation trust fund monies to meet the unmet needs in our aviation infrastructure and the growing needs of the flying public makes common sense. I want to commend Chairman Domenici for attempting to find a compromise on the complex issue of aviation funding. I hope that the conference can resolve this complex issue as soon as possible, and, again, I appreciate the Chairman's efforts to find a compromise.

I hope the FAA reauthorization conference will be able to resolve the extremely complex and critically important issues involved in the FAA reauthorization conference so that our airport managers will no longer be held hostage by congressional inaction. Thank you, Mr. Chairman.

PREPARED STATEMENT OF SENATOR OLYMPIA J. SNOWE

Thank you, Mr. Chairman. I would like to express my appreciation to you for scheduling this hearing. This is a very important issue.

As a member of the Senate Commerce Committee and Aviation Subcommittee, which has jurisdiction over the Federal Aviation Administration, I recognize the extraordinary importance of the FAA reform and modernization issue.

Just last month, a relatively minor computer glitch in the Air Traffic Control System virtually halted air travel in the East. This past summer, flight delays were at an all time high. This is our wake-up call. Modernization is critical. After all, by some estimates, air traffic congestion is expected to grow by upwards of 50 percent through 2008. I do not believe that we are currently prepared to handle growth of this magnitude.

Of course, some of the problems in the Air Traffic System are caused by factors beyond our control, such as weather. However, other factors, including over-scheduling, antiquated technology, and bureaucratic management can and must be addressed.

To this end, the FAA has in recent decades developed modernization initiatives to improve its programs and upgrade its systems. However, these efforts have been plagued by chronic cost and schedule overruns, due at least in part to what many believe was an overly ambitious strategy. The GAO, for example, identified the FAA's failure to follow a "phased" versus an "incremental" approach to modernization. While the FAA has taken steps to address some of these criticisms—adopting short- and long-term modernization goals and working toward those goals through incremental change, for example—I am not sure that all of the outstanding issues have been addressed.

A key issue, of course, is air traffic control modernization. The FAA has outlined three components to its air traffic control modernization strategy: (1) maintaining current systems and upgrading infrastructure; (2) enhancing safety; and (3) developing new mechanisms to increase capacity and efficiency in the system.

These are fundamental themes, and I strongly believe that we need to focus our attention and follow through before it's too late. I look forward to what I hope will be a frank and constructive exchange of ideas on how to confront the FAA's challenges through adoption of new technologies, better management practices, and perhaps restructuring.

I am interested in hearing from the FAA on what the costs and long-term outlook for modernization are, what efforts the agency has made to counter criticism from the GAO and others, and what affect all of these changes will have on consumers.

The FAA certainly faces enormous challenges as it attempts to keep pace with the rapid changes taking place in aviation.

Once again, I would like to express my appreciation to the Chairman and my thanks to the witnesses for sharing their insights.

Thank you, Mr. Chairman.

Senator LAUTENBERG. Ms. Garvey, one of the things that I was kind of curious about, and including the discussion—included in the discussion of delays was some concern about the lack of clear definition what constitutes delays, and I think that would be very helpful to the passenger market, because they just do not get it. They know when they are late, and they know what the OAG or they were told when they called to make their reservation, and if it is not there, it is late. It does not need more defining than that. But how much—and you have identified weather as a significant factor. We ought to be able to identify how much delays cost by weather, and I think that would be a good thing to do. It does not mean we can throw up our hands and ignore it. The fact of the matter is there is better and better weather equipment out there. We do not want airplanes flying in risky conditions, but if the public knew that, they would say, "Boy, that is a good idea that they delayed that."

You were talking about procurement, and you know, Senator Hatfield and I and others worked hard at getting the procurement process reform, and yet, things are not in place, and you had a discussion just now, Senator Domenici, and are there any legal obstacles there that you have, any regulatory problems that you have in implementing the procurement process as we like to see it?

Ms. GARVEY. Senator, I am not aware of any, and again, I actually think we have made some very good progress in it. The recent review that we had by Booz-Allen—it was an independent review—made 18 suggestions to us, including, by the way, getting the life cycle costing included. They essentially said, “Look, you are on track. You are doing the right stuff.”

Senator LAUTENBERG. Well, I think our friend, Ken Mead, may differ with you a little bit on that.

Ms. GARVEY. I am not sure.

Senator LAUTENBERG. Is there a difference in view?

Mr. MEAD. No; I was musing that in our observations of procurement reform, it is interesting that people sometimes do not know what to do with freedom when they get it. When Congress gave FAA freedom, there was a period of time, it seems to me—I was at GAO for part of this time—now being at the Department where the agency did not know what to do with this newfound freedom. FAA is still struggling with it to this day. I hear from Mr. Belger and others about this but I see improvements on the innovations. I really do. I am not sure FAA really believed it when they had freedom from Federal acquisition and personnel rules.

Ms. GARVEY. If I could just mention I was at Highways then. And I do not want to leave the impression that there is not more we can do. I think we have to constantly ask ourselves: are we using it as flexibly as we can, and can we push the envelope a little bit more? So we need to constantly do that. Mr. Mead’s staff is terrific about working with us and making some suggestions. I think for the most part we have implemented just about all of those or well on the way to.

Senator LAUTENBERG. Well, some aviation observers have complained that the Appropriations Committee has not granted FAA enough procurement funding. Now, my experience has been that when the Appropriations Committee reduces funding for a particular procurement, it is based on FAA’s testimony indicating that a project has been delayed or is otherwise put on a different track. Do you believe that granting FAA an unlimited pot of procurement funds is going to put an end to your contracting problems in a hurry?

Ms. GARVEY. I would agree with the statements that were made earlier. I do not think money is the only answer. I will say that I think this year in 2000 we have had some real shortfalls. We are looking at some programs that may be slowed up a bit, but I would certainly agree with the earlier comments, it is not the only answer. I hope we can get what the President asked for this year, but—

Senator LAUTENBERG. Is any part of the problem inability for suppliers to deliver product, whether it be software, hardware, otherwise?

Ms. GARVEY. That is a very good question. I am not sure I know the answer to that. I am not aware of any, but I will check with people. There may be some cases where that is an issue. I will tell you one area I have been a little concerned about. The kind of freedom we have had and flexibility we have had has created some problems for some small businesses, and that is an issue we have been wrestling with lately, whether or not our sort of eagerness to

get some contracts out, whether we may have inadvertently not been quite as fair to some of the small businesses as we should be. So that is something we are looking carefully at and dealing with as well.

[The information follows:]

No. We are not aware of any inability on the part of our supplier to deliver products.

Mr. MEAD. I recall, Mr. Lautenberg, you were on the committee at the time and saw firsthand what happened to the Advance Automation System. AAS was the centerpiece of FAA's air traffic control effort in the late 1980's and early 1990's. And I recall in appropriations hearings that year that FAA came up and asked you for money. Actually, I think the committee largely funded that request, only to have, the plug pulled on the entire program 11 months later as a result of an intensive study by Deputy Administrator Daschle and Administrator Hinson. And going back further to the Microwave Landing System, which was a multi-billion dollar program, which was also terminated. The Micro Wave Landing System was terminated because of pressure from the airline industry.

Senator LAUTENBERG. Well, it is interesting, because, Ms. Garvey, you have the unique experience of serving both as a Deputy Highway Administrator as well as the FAA Administrator. And in the procurement process I saw something unique happen in New Jersey last year. When we gave a contract for a major interchange—perhaps you remember, major 417—and I think Secretary Basso was there to celebrate the completion a year early, a year early, and essentially under budget for the work that was done, because we gave a contract out there, we gave the contractor a lot of headway, and there was a bonus promise, and the bonus promise that we had to pay—I think it was about \$3 million—was insignificant compared to the pre-Christmas rush that was taking place on these highways and a lot of retail shopping. And I think we begin to learn things, and I have seen it also on a light-rail system that is being now done in New Jersey, in North Jersey, where the contract is fairly open-ended—not without all the audit trails that one would expect—but the fact of the matter is that if we kind of got out of the way, we found out that if we had reliable contractors, we could get the job done, and there is a tendency among all of us here to micro-manage at times, because we get frustrated at the lack of completion of things.

Now, do you think that our interstate highway system provides the kind of benefits to our economy that perhaps investments in FAA might provide? Is it appropriate for FAA to get guaranteed amounts of general funding when the Federal Highway Administration receives no general funding whatsoever? The point I make, I assume, is obvious at this juncture, and that is, what about this concept of assuring FAA that it gets whatever funds it needs, and jeopardizing investments in highway or rail or other parts of the transportation system, or accounts way beyond that?

Ms. GARVEY. This is where I turn over to Dr. Basso.

Dr. BASSO. Senator, it is a very good question. First just briefly on the Interstate Highway System, I think it has been unprecedented what the system has done for the country, and in par-

ticular, I enjoyed being with you in New Jersey a few weeks ago when we had a chance to see all of that firsthand, very important.

On the question of guaranteed funding, I think clearly the Administration has not called for guaranteed general funding for the FAA. The other point that I think I should make is that clearly the trust fund alone, with the receipts that are coming in now, do not or would not just simply meet our budget needs, and when I am able to talk more about this on Monday, I can be more specific about our approaches to how we would meet those needs.

Senator LAUTENBERG. Mr. Mead, your testimony includes some sobering data regarding the cost growth and three of FAA's major procurements. Do you think that there is a risk that dramatically increased appropriations to the FAA Facilities and Equipment budget will cause the cost of these programs to grow even more? Does it suggest that it will increase the appetite for spending with some less control involved?

Mr. MEAD. If the Congress is going to give FAA more money, I would suggest that you put in some controls to ensure that additional funds are not absorbed by salaries and related expenses and cost growth. I think we would all come away from the table a bit disappointed if additional funds intended for modernization went to cover cost growth in other areas.

I do think that in tandem with the FAA reauthorization and appropriation process, there should be a very explicit linkage to a cost accounting system. If someone comes and asks you or me for money, you probably like to say, "Well, what exactly would you use it for and what will you get out of it?" To arrive at the answers to those questions, you need a cost accounting system. Most businesses have them. While it is fairly unusual in the Federal Government, businesses have them, FAA, in many respects, is a 365 day a year business. And we are talking about a lot of money. So I think there are investment opportunities—I can rattle off a whole list of them—but it would be very important that the money be spent wisely.

Senator LAUTENBERG. What do you think, Ms. Garvey?

Ms. GARVEY. Well, first of all, I could not agree more on the cost accounting system. In fact, I think that holds, as I mentioned, the most promise for helping us control our costs, because we have accounting like every government agency right now, but it is not to the level that we need it. It is not in the same way that business has it.

Senator LAUTENBERG. But inhibits the development or the influence—

Ms. GARVEY. We actually are well on the way. I will tell you that this year we did—and Mr. Mead referred to that—we did delay implementation for everything other than the Air Traffic Control System, and that was because of the budget constraints. We worked very hard though to make sure that the air traffic control piece, which is in our view the most critical piece, that we are on track with that. We have a framework in place. We are already beginning to collect data for both the en route and the oceanic domains. The flight services stations will be later this year. So we are beginning to collect that data now. We have tested with industry. That is, are we headed in the right direction? We have got extraor-

dinarily complimentary comments from industry. One representative from American Airlines said that it ought to be a model to be used internationally. It is that level of detail. So do I wish it were in place today? Absolutely. But are we on the right track? Yes, we are, and I think it holds great promise for us.

Senator LAUTENBERG. Thank you.

Mr. Chairman, I think it is fair to say that the thinking necessary to correct some of the problem there is in place, so we encourage you to move forward with these changes, and speak emphatically about them when you meet with the committees of the Congress, and make sure that they understand where you are going and what the mission is.

Thank you very much.

Senator DOMENICI. Thank you, Senator.

Senator Shelby.

Senator SHELBY. Thank you.

Ms. Garvey, you have been at the FAA long enough now to have a pretty good sense of the challenges that have to be addressed to make that organization more efficient, more accountable and responsive to its customers. I believe you received good marks from insiders at the FAA, from most industry experts, and generally a good reception here on the Hill, including from my committee.

Ms. GARVEY. Thank you.

Senator SHELBY. Some claim that you are the best administrator that the agency has ever had. Yet, the FAA of 2000 has many, if not all of the problems I mentioned earlier, that have plagued it for the past 20 years.

Basically, is this too big a job for any one person? Is the air traffic control function a task that would be better executed by non-governmental management structure, or are all the naysayers out there predicting gridlock and doom wrong?

Ms. GARVEY. Well, thank you first of all for the kind comments.

I will tell you, by the way, that I am reaching my midpoint of the 5-year term tomorrow.

Senator SHELBY. Congratulations.

Ms. GARVEY. Thank you, thank you. And I expect to see it through.

I think the whole issue about whether or not there ought to be a different structure is absolutely the right kind of debate to have in this Congress, absolutely the right kind of debate. The Administration has proposed, as we know, in 1995, a corporation, a performance-based organization, but there are lots of ideas out there, and to have them debated is appropriate. But I do want to say—and I hope you will bear with me—but I really do think we have made some progress. It is difficult to change a 47,000-people agency, but I think we have made some enormous strides forward. I really do not want to go home today without saying that I think the work that is being done at the FAA and the kind of decisions that people make on a daily basis have not produced some positive changes in the last 2 years. We are doing things differently, and I think we are getting some very significant work done.

Senator SHELBY. BNA reported just this morning that the President's budget request for FAA operations is \$6.6 billion. That is in excess of what is currently being contemplated in the FAA reau-

thorization conference. Is that correct? And if that is correct, is the reauthorization inadequate or is the President's budget request bloated?

Mr. BASSO. Mr. Chairman, let me just answer by saying I am not in a position to confirm the number today. I will be on Monday and——

Senator SHELBY. Are the numbers in the ball park?

Mr. BASSO. They are clearly in the ball park, Mr. Chairman.

Senator SHELBY. Good.

Mr. BASSO. I think I have to give you that, and I would like to promptly on Monday advise you——

Senator SHELBY. Will you get back with us on that?

Mr. BASSO. Sir?

Senator SHELBY. Will you get back with us on that?

Mr. BASSO. Absolutely. I will call you Monday morning first thing.

Senator SHELBY. What is the status of the contract tower plan that Congress has requested the FAA? Ken, do you want to comment on that?

Mr. MEAD. I think there is kind of an odd issue that has come up on this Contract Tower Program. We have reviewed it. We found that these low-level towers, the program was essentially sound for low-level towers. We did find that FAA has to stay on top of the contractors to make sure that they come through and live up to their staffing obligations. Safety did not seem to be affected.

Now, your committee, the House, the Conference Committee, directed FAA to do a study of whether that Contract Tower Program could be expanded to further towers. FAA's study was not done properly, in my view. And you turned around and directed us to do it, in the Inspector General's Office. We are in the process of doing it.

One issue that has come up is that the controller agreement establishes 15,000 controllers, either as a ceiling or a floor or both. We were told that, "Well, if FAA were to contract out any more towers, that is, privatize them, well then, you would be abrogating the controller agreement because some of the controllers would have to come from these towers." I am not so sure that that is a correct analysis, because those controllers could go to some other tower, or they could leave. FAA could hire more controllers and put them where they are needed most—at the busier facilities. This is a very controversial issue.

I think that Contract Tower Program at low-level facilities, where they are not getting a lot of traffic, is a sound program, and deserves support.

Senator SHELBY. Mr. Mead, would you be concerned that the necessary FAA reform would be less likely if an aviation firewall was erected?

Mr. MEAD. I do not see the issue as a firewall, and with all respect.

Senator SHELBY. What do you see as being the issue?

Mr. MEAD. Because if you gave FAA all the money that comes in every year from the trust fund, they would be getting less money now than you have appropriated. I think they would get about

\$700 million less, unless you took all the interest. So I think the real issue here is whether general income taxes from the general fund ought to be going to FAA as an entitlement. I know that is a policy judgment for the Congress. Over the years I think that the appropriators have done a good job at exercising oversight, I cannot point to a lack of money as being the problem with major systems that have had problems. But again, I know there are additional investment opportunities out there.

Senator SHELBY. Your statement indicated that in 1995 the GAO and the Office of Inspector General cautioned that neither procurement or personnel rules, nor lack of funding were the source of the problems the FAA was experiencing with this ATC modernization. Is that still true?

Mr. MEAD. Yes, it is largely still true, sir.

Senator SHELBY. OK. Your statement also indicates that the FAA originally planned its cost accounting system to be fully implemented by October the 1st, 1998, but that the FAA has yet to implement this system. Why is a cost accounting system so critical to the effective management of the agency and for making responsible modernization decisions? Should the FAA request supplemental funding or reprogramming to complete the development and implementation of a cost accounting system?

Mr. MEAD. Part one of your question, a cost accounting system is important, because it tells you how much you are spending for what—

Senator SHELBY. It is accountability, is it not?

Mr. MEAD. As its name would suggest, yes, sir.

Senator SHELBY. Accountability.

Mr. MEAD. And if you do not have one, and you get more and more money, what is the real incentive for having a cost accounting system?

Senator SHELBY. I agree with you.

Mr. MEAD. So I think—as Ms. Garvey was saying, you have to keep the accelerator to the floor on that.

And as to your second part of your question, FAA has a roughly \$10 billion a year budget, and it is difficult for me to believe that out of that large sum of money the extra \$2 million that would be required to do something that is so fundamental, that even a company in bankruptcy must have, that FAA could find that money. Now, maybe they do need the supplemental, but I do think it is very important for work on a cost accounting system to go on.

Senator SHELBY. Thank you, Mr. Chairman.

Senator DOMENICI. All right. If there are any other questions, Senators can submit them, and we would ask you to answer the questions as quickly as you can, because we are on about a 2½ week deadline.

Before you leave, Madam Administrator, I wanted to compliment you on your personal hiring practices. A year ago your director of the budget was sitting there behind you—

Ms. GARVEY. Wonderful job.

Senator DOMENICI. Mr. Riley was sitting back here giving us advice, and you actually found somebody very, very good. We are very sorry that we lost him, but it is your gain and obviously our loss.

Ms. GARVEY. It is our gain.

ADDITIONAL COMMITTEE QUESTIONS

Senator DOMENICI. And we wish him well as he attempts to help you do your job.

Ms. GARVEY. Thank you very much.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED TO MS. GARVEY

QUESTIONS SUBMITTED BY SENATOR PETE V. DOMENICI

TECHNOLOGY AND FUTURE OF AVIATION

Question. The world is changing. Technological advances have transformed our lives and provided benefits to the aviation community. Does the current structure of FAA allow it to fully harness technological advances and adequately respond to changes?

Answer. As the experience of the private sector shows, there is no one best structure to advance technology and respond to technological change. The FAA has had good success in breaking up large, technically challenging changes into manageable pieces so as to “build a little, test a little, change a little” in what is called spiral development. This is the approach for Free Flight Phase 1 (FFP1). We are partnering with the airlines and the Europeans on development of data link. Through our involvement with the International Civil Aviation Organization and RTCA Incorporated, formerly Radio Technical Commission for Aeronautics, and in partnership with our aviation industry, we are setting standards for use of new technology. In our Safe Flight 21 initiative, the FAA and the aviation community are developing the aircraft avionics for the future. The FAA has placed a heavy emphasis in its acquisitions to buy commercial off-the-shelf products, shifting the risk for development to industry. This causes the FAA to plan and implement technological refresh cycles with our systems with greater frequency than in the past.

While development is on the cutting edge, implementation takes more time, The National Airspace System (NAS) must evolve, not change in a revolutionary way. The users must have time to transition and make their capital investments. The transition must be safe, and we must have experience with the new technology before we phase out the old. This contributes to increased operations and maintenance costs that are not seen in other industry segments when they retool or replace automation with much shorter life cycles.

FAA'S MODERNIZATION PROGRAM

Question. In the early 1980's the Administration began a modernization program to upgrade the antiquated Air Traffic Control System. Historically modernization projects have experienced significant cost over-runs and schedule delays. What mistakes were made during FAA's modernization efforts of the past? How have these lessons been applied to today and future efforts?

Answer. The FAA has learned that large projects must be broken down into manageable implementation steps. We have demonstrated this with FFP1 and spiral development. Each step must produce measurable benefits, either to the users or the FAA or both.

Data link has been broken down into a series of discrete steps and the airlines are participating in early phases of development and implementation. We have started with four common message sets. We will expand to 18, and then add additional messages based on joint data link trials that are underway with Eurocontrol.

We must adequately sustain our current infrastructure while we continue to modernize. To jump start modernization and to reach consensus that formed the basis of FFP1, we had to make a number of investments at the expense of our infrastructure. This was necessary to reach consensus on modernization and formed the basis of FFP1. We are now increasing our investments in critical infrastructure to produce a more balanced portfolio. This investment includes funding power system upgrades, facility improvements, communications improvements, physical security, and information security.

Close collaboration with our user community is essential. We must do better mid-range (3 to 5 years) planning for modernization. We value our continuing collaboration with the users on the NAS architecture. We have been dealing with urgent

problems first. Priorities such as Year 2000 fixes and increased security at our Nation's airports (\$100 million per year) have drawn funding away from modernization activities.

Question. What management reforms have been instituted within the FAA to prevent FAA's current modernization efforts from being over budget and delayed? Are there other actions you are now considering?

Answer. The FAA initiated several different reform efforts aimed at improving the operational environment within the Agency and programmatic performance.

Performance plans are linked to specific modernization goals and monitored on a quarterly basis. The FAA took an important step in support of culture change and improved performance by developing annual outcome-based, mission-focused performance goals and indicators in line of business performance plans.

The Integrated Product Development System establishes cross-functional teams throughout each FAA line of business to produce effective and efficient products and services that satisfy customer/user needs.

The FAA Integrated Capability Maturity Model integrates a unified approach for evaluating FAA's processes and improving them. Early in the implementation process, we expect results to contribute to increased efficiency and higher quality products and services.

The requirement process re-engineered and established a single organizational entity to better manage system requirements and ensure improved collaboration with the teams.

Acquisition reform established corporate-level decision making for FAA needs and investments and substantially streamlined procurement processes. It created an improved structure and process for defining FAA needs and investments.

The portfolio management aggregates investment candidates into funding categories to facilitate managing the capital investment portfolio as a whole. It increases benefits and helps manage risks.

Two examples of programmatic success working within this changing operational environment include the Display System Replacement (DSR) and the Host and Oceanic Computer System Replacement (HOCSR) Programs. These two programs successfully delivered their products within their acquisition program baselines. Among some of the benefits they derived from reform initiatives were:

- Stable requirements.
- Hiring new personnel faster.
- Attracting new staff using the new flexible compensation system.
- Using cross-functional team concepts to improve teamwork and communications.
- Using Acquisition Management System (AMS) to talk with industry more openly, involve industry in their acquisition process, and engage in teaming with industry.

Question. What are your goals and vision for FAA modernization over the next 5 to 10 years?

Answer. Two documents used to describe the FAA's vision for NAS modernization, both long and short term, are the NAS Architecture and the Capital Investment Plan (CIP).

The NAS Architecture, released in January 1999, is the United States aviation community's comprehensive, long-term plan for improving the NAS. The NAS Architecture is based on the joint FAA and industry operational concept for planning and conducting flight operations. Our shared goal is to increase safety, security, and efficiency of the NAS.

The CIP is an overview of FAA's NAS Architecture. It summarizes the FAA's capital resource expenditure plans for fiscal year 2001 through fiscal year 2005 and is based on the Office of Management and Budget's 5-year estimates. The plan shows the extent to which the Agency expects to modernize for the next 5 years. Our modernization goals are described as follows:

- Upgrade our infrastructure to add new safety and security capabilities, and to add new efficiency capabilities. System outages have the potential to erase the benefits derived from new capabilities as evidenced by our recent outage at Leesburg Air Route Traffic Control Center.
- In addition to new capabilities, we must continuously improve the services we provide to the Nation. We must also expand on how we deliver these services to gain user benefits. Benefits are realized through increased safety, delay reduction, improved access to the airspace by all users, increased predictability in delivery of our services, improved flexibility to the users in planning and flying through the NAS; and more return on investment to gain efficiency.
- Assuming funding levels close to the President's budget and outyear projections, over the next 5 years, we can accomplish many of the modernization activities

that will improve the safety, security, and efficiency of the NAS. Some of these are as follows:

- Be well on our way to the implementation of satellite navigation;
- FFP1 will have been completed in fiscal year 2002 and by fiscal year 2005 these automation tools will have expanded to other locations in the NAS;
- Additional surface movement radars will have been deployed at airports having high numbers of runway incursions starting with contract award this year;
- Initial controller-pilot data link services will commence in fiscal year 2003 and be expanded to a larger message set by fiscal year 2005;
- Most terminal radars and secondary surveillance beacons will be replaced by fiscal year 2005;
- Modernized oceanic services will begin operations in fiscal year 2002 and be fully updated by fiscal year 2006;
- Critical en route infrastructure (Direct Access Radar Channel/DARC and Peripheral Adapter Module Replacement Item/PAMRI) will be replaced by fiscal year 2004 and after a significant development investment, the en route software will be replaced by fiscal year 2007;
- We have turned the corner with Standard Terminal Automation Replacement System (STARS);
- We will have approximately one-half of all terminal facilities deployed and operational by fiscal year 2005; and
- Our infrastructure investments in power systems and facility upgrades will keep pace with service demands to reduce outage related delay.

RECENT AIR TRAFFIC CONTROL OUTAGES

Question. On January 6, FAA's air traffic control equipment at the Leesburg, VA, location failed, causing hundreds of flights all over the East Coast to be delayed. On December 19, 1999, the primary FAA radar system in Palm Springs, CA was declared unusable. Please describe the recent outages of air traffic control equipment in Leesburg and Palm Springs. What caused these outages?

Answer. The daily certification of the HOST System was performed at Washington Center in Leesburg. A manual refresh of the HOST System was initiated; however, the refresh interrupted the computer processing and created the subsequent outage. The HOST Computer Program remained locked up and extended the outage. The flight plan table overloaded and service degraded on January 6, 2000. Washington Center transitioned to an independent backup system and resumed normal operations.

The radar at Palm Springs, CA was declared unusable on December 19, 1999 due to equipment deterioration and environmental conditions. FAA provided interim service using military radar. Airway Facilities optimized the Palm Springs radar performance and replaced the Air Traffic Control Beacon Interrogator (ATCBI)-4 with an ATCBI-5. Information from the ATCBI-5 and surveillance radar is now fed directly into the terminal radar. Normal operations resumed at the Palm Springs radar on February 21, 2000.

Question. How quickly were the problems fixed?

Answer. At Washington Center, normal operations resumed after 3 hours and 34 minutes, At Palm Springs, Airways Facilities used 80 hours to optimize performance of the radar.

Question. How are you ensuring that this will not occur in the future?

Answer. A software fix was developed and installed at Washington Center to prevent this problem from recurring. The software fix is being distributed to all en route centers.

At Palm Springs, the installed systems have been optimized and are operating within design parameters. The FAA will continue to review the complex local environmental issues at Palm Springs. These include unusual atmospheric conditions, local topography, and a number of electricity-generating windmills that create a unique environment. An Airport Surveillance Radar-11 is scheduled for installation in fiscal year 2005. The FAA is developing a transition plan to further improve radar service at Palm Springs.

Question. Do you agree with the statement that additional funding or enactment of a specific bill would have prevented this?

Answer. No; outages occur for a variety of reasons. Additional funding would neither prevent these events from occurring nor can the events be tied to insufficient funding.

RESULTS OF PERSONNEL AND PROCUREMENT REFORMS

Question. In 1996, Congress provided FAA the ability to develop and implement acquisition and personnel reforms to address the unique demand on, as well as the needs of, the agency. What flexibility did these reforms provide the FAA?

Answer. Acquisition and personnel reform have been very beneficial to the FAA. Under personnel reform, we have designed and implemented a new human resource system. Initial efforts focused on “quick hit” changes to policies and processes such as delegating authority for personnel decisions to line organizations and managers, and offering additional flexibility in filling positions. We have developed a comprehensive compensation framework, which establishes the overall objectives and tenets of FAA’s compensation programs. We have designed an evaluation plan to assess progress in meeting the objectives of personnel reform, and we have developed proposals for more comprehensive long-term program changes. These improvements represent the first steps in moving from decades-old personnel programs to a new system.

Acquisition reform has provided the FAA the following:

- Flexible policy and guidance;
- Reasonable competition among two or more sources is the preferred method of source selection;
- Single source method is still an option when it makes good business sense to do so;
- Best value method is used as the basis of award for most contracts;
- Any method of cost or price analysis may be used to determine fair and reasonable prices with price analysis being the preferred method for evaluating competitive proposals;
- Policy does not require Cost Accounting Standards on contracts for commercial items;
- Protests and disputes are decided within FAA’s Office of Dispute Resolution;
- The Administrator has final decision authority; and
- Direct access to the small business community, i.e., the Small Business Administration is not involved in the contracting process.

Question. It has been 4 years since Congress passed the provision. What tangible results has the FAA achieved directly related to these reforms?

Answer. Personnel Reform.—Since 1996, FAA has made many improvements that represent the first steps in moving from the decades-old personnel program to a new system. Reform has enabled us to accomplish the following:

- Reduce the time it takes to fill positions and effect personnel actions. The average time to hire a new employee has been cut from 6 months to 6 weeks.
- Establish an automated system that reduces the time to classify a position from a previous average of three weeks to a current average of 1 day.
- Streamline establishment and recruitment for senior leadership position (e.g., hired 70 executives, 17 percent of whom came from outside of government; hired 17 world-class experts in critical scientific and technology positions through use of streamlined executive staffing procedures).
- Use more innovative recruitment methods to attract better candidates.
- Design and pilot a new performance-based compensation plan for employees and executives, which include:
 - A 5-year contract with controllers union and implementation of a new pay plan.
 - Increased emphasis on performance management and recognition of contributions.
 - Implemented a new agency training policy, which provides more efficient and effective training by increasing flexibility in training design and delivery and by delegating decisions about training to lines of business.
 - Began implementation of a new job evaluation system that eliminates thousands of pages of job grading standards and position descriptions, and replaces them with concise definitions tailored to FAA work.
 - Replaced 150 separate Federal classification guides and instructions (over 11,000 pages) with 50 pages of FAA-specific criteria.
 - Simplified temporary travel and permanent move policies, which provide equitable reimbursement to employees.
 - Reduced administrative requirements and costs for travel and relocation.
 - Communicated personnel reform changes to managers and employees, so that they fully understand changes and how to take advantage of personnel reform flexibility.

Acquisition Reform.—Acquisition reform has helped simplify, integrate, and unify elements of the life cycle acquisition management into a more effective system. For

example, now all acquisition policy is located in one streamlined policy document located on the Internet with automated tools and guidance. Acquisition reform has shifted focus to life cycle management of programs, created an improved structure and process for defining FAA needs and investments. It has established corporate-level decision making for FAA needs and investments, and increased involvement of stakeholders in decisions.

Two examples of programmatic success working within this changing operational environment include the DSR and the HOCSR Programs. These two programs successfully delivered their products within their acquisition program baselines. Among some of the benefits they derived from reform initiatives were:

- stable requirements;
- hiring new personnel faster;
- attracting new staff using the new flexible compensation system;
- using cross-functional team concepts to improve team work and communications;
- using AMS to talk with industry more openly, involving industry in their acquisition process; and
- engaging in teaming with industry.

Substantially streamlined procurement processes produced a 50 percent reduction in the time to award contracts and has increased the percentage of contracts awarded competitively. Based on best value, it has improved communications with FAA vendors and has made significant improvement to the contract protest and dispute resolution process. Award time and vendor's bid and proposal costs have been reduced through the use of qualified vendor's list for repetitive and simplified requirements. Some examples of procurements that gained from this streamlined process are:

- Transient Voltage Surge Arrestors.*—This acquisition was announced and awarded in a 3-day period instead of the 180 days under the old system. Public announcement time was one day versus 51 days. A purchase order was used instead of a formal Request for Proposal (RFP) award document, which saved both the FAA and contractor time and resources.
- Low Level Windshear Alert System.*—A sub team evaluated offers and recommended a vendor within 2 weeks instead of at least 6 weeks under the old process.

On a commercial buy of very high frequency omni-directional range items, FAA achieved a 42-day savings in total processing time by issuing a Screening Information Request (SIR) on the Internet (rather than going the Commence Business Daily process) and using the streamlined selection and award process.

Continued implementation of these reform efforts is necessary to realize their full impact on improving operations and delivery of products and services. In addition, full and stable funding for the entire lifecycle of FAA programs is critical to NAS modernization efforts.

Question. Does the FAA need additional reforms or flexibility to manage efficiently?

Answer. The FAA reauthorization proposals submitted to Congress in 1998 and 1999 contained requests for both financial and managerial reforms. While the agency is grateful for both personnel and procurement reform, these are but two elements necessary to elevate the FAA to the level that will be required by both the aviation industry and the flying public in the 21st Century. Study after study, report after report has shown that the FAA must become more business-like in its approach to operations, capital investment, and research and development. This covers all aspects of the day-to-day activities of the FAA. If the FAA is to be more efficient, financial and managerial reforms are necessary. Specifically, three changes are key.

1. *Management reform.*—Congress needs to provide for a chief operating office and other organization changes to allow the Air Traffic Control System to operate more like a business—that is, performance-based and customer-oriented.

2. *Pricing reform.*—Congress needs to replace the current excise tax on airline passengers with cost-based charges on commercial users of air traffic control. This will provide the FAA with the information necessary to respond to its customers, which result in, faster adoption of capacity-enhancing technology and expansion of services in response to market demand. It will also create an incentive for more efficient operation and use of the Air Traffic Control System.

3. *Congressional Mandates.*—Congress needs to put in place an appropriate financial mechanism to ensure that cost-based receipts from air traffic control users are spent exclusively on air traffic control.

AIR TRAFFIC CONTROLLERS PAY INCREASES

Question. On September 15, 1998, FAA agreed to a 5-year labor agreement that promised the United States air traffic controllers substantial raises as well as established a ceiling of 15,000 air traffic controllers. The agreement, which expires in 2002, is estimated to have a net cost of \$1.0 billion. How would you describe FAA's relationship with its unionized work forces?

Answer. The relationship with the National Air Traffic Controllers Association (NATCA) is better today than it has been for many years. We are working issues in partnership with the bargaining unit to address and resolve issues in a collaborative manner. This approach has enabled us to work smarter and more efficiently toward our goals. For example, we have been able to move ahead with modernization. We have turned the corner on the STARS Program by fielding the first two systems at El Paso and Syracuse. We continue to work together on developing the advanced versions of this system for future deployment. Another excellent example is the manner in which the NATCA and the FAA worked together to solve issues in the DSR deployment, which will be completed in May 2000. In many facilities, we were able to transition to the new system well ahead of schedule.

Question. Is the 15,000 a floor or ceiling for the number of air traffic controllers?

Answer. The contract says we maintain staffing levels at 15,000 for the first 3 years, with growth limited to 2 percent annually for the last 2 years of the contract. The 15,000 is considered a floor on controller staffing.

Question. How has this contract affected your budget?

Answer. The fiscal year 2001 budget requests an increase of \$73 million for pay raises associated with the NATCA contract. Any additional costs will be funded from within Operations.

During the first part of fiscal year 1999, the FAA and NATCA worked to finalize the rules associated with the various productivity articles of the contract and the rules for the new pay system. A metrics team was established to identify and track measurable results of implementing the contract. Early indications from this effort are showing some positive trends, and the FAA will continue to refine and analyze this data to provide additional information to Congress on the results of this effort.

Question. Were there any benefits the agency received as a part of this agreement?

Answer. During the first part of fiscal year 1999, the FAA and NATCA worked to finalize the rules associated with the various productivity articles of the contract and the rules for the new pay system. A metrics team was established to identify and track measurable results of implementing the contract. Early indications from this effort are showing some positive trends, and the FAA will continue to refine and analyze this data to provide additional information to Congress on the results of this contract.

There are many indirect results of the contract with NATCA, including an improved and more productive working relationship between FAA management and NATCA in modernizing the aviation system. An example of this partnership is the manner in which DSR has been fielded throughout the country, resulting in FAA completing many facilities well ahead of schedule. Another example is the STARS Program. The FAA has fielded the first segment of STARS at El Paso and Syracuse, and is working on the advanced configurations of that program.

Question. Does the agreement prevent FAA from implementing action that would make it more efficient?

Answer. By its very nature, any collective bargaining agreement imposes constraints on the agency's ability to take unilateral action to improve efficiency. However, FAA and NATCA are working closely together to identify efficiencies and track measurable results of implementing the contract.

The agency continues to move forward toward full implementation of the collective bargaining agreement, including those initiatives intended to improve efficiency. FAA and NATCA have reached final agreements on accelerated grievance resolution, assignment of staff functions to bargaining unit employees, expanded responsibility and accountability for controller-in-charge, and revised procedures for relocating bargaining unit employees.

A joint FAA/NATCA metrics team was established to identify potential cost savings and/or productivity improvements, and to develop measurement systems for tracking the impact of the collective bargaining agreement and the compensation agreement. To date, the metrics team has determined the contract articles projected to have measurable impact, identified data sources for measuring cost and/or productivity, and validated the reports to be provided to agency managers. The final product of the metrics team will be completed by early summer fiscal year 2000.

FAA PROGRAM PRIORITY

Question. FAA has four main appropriations—Operations, Facilities and Equipment (F&E), Research and Development, and the Airport Improvement Program (AIP). Of these programs, please list in order of priority, which one(s) are the most critical to the agency?

Answer. All four appropriations are critical to the mission of the agency and support the Administrator's goals of safety, security, and system efficiency. The President's budget provides for balanced investment among these programs, and the requests would allow the FAA to improve aviation safety and security by hiring new safety and security inspectors. These requests will also improve efficiency by modernizing equipment and researching new technologies.

For example, the F&E budget cannot be substantially raised without an increase in the Operations budget. F&E modernization equipment cannot be turned over to the Operations budget for acceptance into the NAS without the required funding for staffing, operations and maintenance. Furthermore, this modernization equipment could not have been developed without a strong research and development budget nor could safety be maintained at America's largest airports without funding for improved facilities through the AIP.

Question. Does the FAA have the ability to manage increases in any of these areas?

Answer. Yes; the President's budget request for the FAA contains manageable funding increases for all four of these programs.

FAA'S POSITION ON AIR TRAFFIC CONTROL RESTRUCTURING

Question. In the United States, Congress, the Administration and interest groups have discussed different approaches to restructure and reform of the Air Traffic Control (ATC) System. These have included intergovernmental reforms, making air traffic control a performance-based organization, creating a government corporation, and creating a private corporation. Do you believe that structural air traffic control reform is needed rather than peripheral measures?

Answer. Yes; we believe that structural ATC is needed. To that end, the President recently directed the FAA to come back to him in 45 days with options for achieving broader reform of the ATC System.

Question. What is the prospect of following the Canadian model in the United States?

Answer. The President recently directed the FAA to come back to him in 45 days with a plan for achieving broader reform of the ATC System. We will consider the Canadian model during our deliberations.

Question. If it is your opinion that we cannot copy the Canadian model, what lessons or scales of efficiency can be taken from the model?

Answer. The President recently directed the FAA to come back to him in 45 days with a plan for achieving broader reform of the ATC System. We will consider the Canadian model during our deliberations.

USER FEE PROPOSAL AND COST-BASED ACCOUNTING SYSTEM

Question. For the last several years, the FAA's budget submission has included a user fee proposal. The first step in implementing and gaining acceptance of any user fee is the development of a cost-based accounting system. When did FAA begin working on the development of a cost-based accounting system, what is the current status, and when is it expected to be completed?

Answer. The FAA began its cost accounting initiative in fiscal year 1996. Information and status on this initiative follows:

- FAA's primary focus in cost accounting has been on the Air Traffic Services (ATS) line of business; to include full cost distribution for Air Traffic, Airway Facilities, and all other components of the organization. For cost accounting purposes, ATS has defined four core services they provide to the aviation community: en route, oceanic, flight service stations, and terminal/tower.
- The FAA has successfully identified the fiscal year 1998 costs for en route and oceanic services. For the first time, the FAA knows the "full" cost—direct and indirect—of two of these key air traffic services (en route and oceanic). ATS management has already begun to evaluate benchmarking opportunities using this cost data.
- In March 2000, the FAA will have validated actual en route and oceanic cost for fiscal year 1999. This data will be used as the basis for overflight fees, to be established in the latter half of fiscal year 2000.

- The remainder of fiscal year 2000 will focus on completing the ATS implementation for Flight Service Stations in April 2000 and terminal and tower services in fiscal year 2001.
- Due to fiscal year 2000 funding priorities, the implementation for all remaining FAA lines of businesses has been delayed until fiscal year 2001 and fiscal year 2002. The fiscal year 2001 budget requests \$7 million in fiscal year 2001, and the total cost to completion is \$14 million. This work will include tracking the “full” cost of NAS modernization projects, the airport capital grant program, the certification and regulation of the airline industry, aviation security services, and other mission support functions.
- An updated implementation schedule is being prepared for review by FAA management, and will be available by April 2000.

QUESTIONS SUBMITTED BY SENATOR FRANK R. LAUTENBERG

DELAYED EFFORTS TO MINIMIZE RUNWAY INCURSIONS

Question. Ms. Garvey, as you know, a great deal of attention has been paid to the growing problem of runway incursions the potentially deadly mistake when an aircraft mistakenly enters a busy runway or taxiway. We are now told that your proposed solution to this problem, the Airport Movement Area Safety System (AMASS), will be delayed at least another 2 years. The Appropriations Subcommittee has never limited the amount of funding for this program. Some years, we actually provided more than you requested. Please explain why this program is being further delayed.

Answer. The single answer is a combination of difficult technical and management issues have produced the delay. Let me explain more fully. The implementation of AMASS at the Nations 34 busiest airports, which is a modification to the Airport Surface Detection Equipment Model 3 (ASDE-3) radar, represents only a portion of the agency’s runway incursion strategy. The Agency has established a higher level of FAA executive oversight and has appointed a Director of Runway Safety. This Director serves as the Agency’s focal point for the coordination and integration of runway safety activities, within FAA and within industry. The Director is now implementing and executing runway safety initiatives that include education, training, and awareness activities.

The AMASS Program underwent an in-depth review and restructure during the late summer and early fall of 1999. The previous schedule that the agency was attempting to meet had been based on a FAA commitment to the National Transportation Safety Board (NTSB) to have 38 AMASS systems operational at the 34 airports by October 2000. To meet this date, the Agency implemented a very high-risk acquisition strategy and schedule that included concurrent development and production phases. In April 1999, new program requirements were added that related to human factor evaluations. At that point, program management recognized that the development effort required to meet user requirements was far more extensive than envisioned and the October 2000 commitment to NTSB could not be achieved. We also identified additional human factor issues and critical operational issues that required resolution prior to commissioning. The required second level engineering and logistics support functions necessary to implement new equipment into the FAA’s NAS had not been adequately planned for, funded, and implemented due to our decision to undertake the high risk acquisition strategy. These operational support issues require additional funding and time to implement. The fiscal year 2000 appropriation and the fiscal year 2001 request for AMASS reflect the cost and schedule changes for those years as a result of the program restructure. Additional funds will be required in future years to continue the implementation and commissioning efforts as well as the implementation of preplanned product improvements validated in the operational requirements document.

Subsequent to the restructure, we are meeting or exceeding planned milestones such as completion of the initial human factors modifications required for commissioning and the installation, testing and acceptance of 20 of the 40 total AMASS systems in the procurement. The operational test and evaluation (OT&E) critical issues have been identified and are being resolved. Factory testing of the majority of these modifications is complete. This testing is in preparation for the OT&E field regression to validate corrections, scheduled for June 2000.

The restructuring of the program was accomplished with the cooperation of all relevant FAA lines of business, and with representation from an AMASS air traffic workgroup, which included NATCA and Airway Facilities technician representatives. In addition, program management personnel changes on both the government

and contractor's part in 1999 have contributed to an improved working relationship and better productivity. Because the restructure effort included extensive risk identification and risk mitigation measures, we are optimistic that program goals will be met. This includes an August 2000 initial operating capability (IOC), an Independent Operational Test and Evaluation starting in September 2000, and commissioning of all systems by the end of December 2002. We have already seen evidence that the previous contractor performance problems have been reduced and that the overall life-cycle supportability of the system within the national airspace will be increased.

AIRPORT MOVEMENT AREA SAFETY SYSTEM (AMASS)

Question. Is this problem really a technical problem, a management problem, or a funding problem?

Answer. The delays associated with the AMASS Program can be attributed to a combination of technical and management issues that are described below. Previous funding for the program is not a contributing factor to the program delay. Let me explain more fully.

The implementation of AMASS at the Nations 34 busiest airports, which is a modification to the ASDE-3 radar, represents only a portion of the agency's runway incursions strategy. AMASS will not reduce runway incursions, but will help prevent accidents if an incursion occurs. We have focused significant efforts on education and training, improved procedures and guidelines, as well as improvements in airport lighting, signage, and surface markings. Only the combination of these efforts and technical solutions like AMASS will have the greatest effect on reducing the problem of runway incursions.

The previous schedule included acquisition strategy and a schedule that depended on concurrent development and production phases. We subsequently recognized that the development effort required to meet user requirements was far more extensive than originally envisioned. We also identified additional human factor issues and critical operational issues that required resolution prior to commissioning. The required second level engineering and logistics support functions necessary to implement new equipment into the FAA's NAS had not been completely planned for, funded, and implemented due to the schedule associated with the high risk acquisition strategy.

The AMASS Program underwent an in-depth review and restructure during the late summer and early fall of 1999. All of the areas identified above were reviewed in-depth during the program restructure process, which included revalidated requirements, risks and mitigation actions identified, schedules developed, and costs to implement estimated. All relevant FAA lines of business and key union representatives participated in the process.

Subsequent to the restructure, we are meeting or exceeding planned milestones such as completion of the initial human factors modifications required for commissioning and the installation, testing and acceptance of 20 of the 40 total AMASS systems. The OT&E critical issues that have been identified are being resolved. Factory testing of the majority of these modifications is complete in preparation for the OT&E field regression testing to validate the corrections, scheduled for June 2000.

In addition, program management personnel changes on both the government and contractor's part in 1999 have contributed to an improved working relationship and better productivity. Because of this participation and the success to date in meeting milestones in the restructured schedule, we are optimistic that we will meet the program goals.

WHY DOES AVIATION DESERVE A GENERAL FUND GUARANTEE WHILE HIGHWAYS DOES NOT

Question. Ms. Garvey, you have had the unique experience of serving both as the Deputy Highway Administrator, and as the FAA Administrator. We have been told by some Members of the House that the FAA must receive a guaranteed amount of non-trust fund dollars to compensate for the overall benefits that our economy receives from our aviation system. Doesn't our interstate highway system also provide extraordinary benefits to our economy?

Answer. The Administration has consistently proposed the elimination of the general fund contribution for aviation programs. We agree that the Interstate Highway System provides many benefits to our economy, and note that under TEA-21, highway users pay for 100 percent of the highway program's infrastructure and operating costs plus 80 percent of transit costs (because highway users benefit from the congestion reduction transit produces). In contrast, aviation users do not fully support their own services, let alone any related services.

Question. Do you believe it is appropriate policy for the FAA to receive guaranteed amounts of general funding when the Federal Highway Administration receives no general funding whatsoever?

Answer. No; the Administration has consistently proposed to eliminate the general fund contribution for aviation programs. Under TEA-31, highway users pay for 100 percent of the highway program's infrastructure and operating costs plus 80 percent of transit costs (because highway users benefit from the congestion reduction transit produces). In contrast, aviation users do not fully support their own services, let alone any related services.

Question. Do you believe there is a reason why FAA's Safety Inspectors should be paid from general funds, while Federal Highway's Motor Carrier Inspectors should be paid from trust funds?

Answer. No; the Administration has consistently proposed to eliminate the general fund contribution for aviation programs. The Administration's proposal is to fund the entire FAA through a combination of excise taxes and new cost-based fees.

QUESTIONS SUBMITTED BY SENATOR CHARLES E. GRASSLEY

USER FEE PROPOSAL

Question. At what point in time is the fine line crossed where the fees that are charged an industry in order to pay for services become fees that hinder growth of that industry?

Answer. Ideally, fees should be set equal to the cost of the services that the industry consumes. Therefore, the budget proposes to collect in aviation taxes and user fees only the amount needed to fund the FAA in the subsequent year. Although we phase this policy in over 2 years, financing the FAA through a combination of aviation taxes and dedicated user fees would promote a more business-like and efficient FAA while ensuring that all aviation revenues are spent for aviation purposes. In addition, charging customers the cost of services received provides a market signal to the FAA as to which services are needed and an incentive for air carriers to use those services efficiently.

ROLE OF THE NATIONAL ECONOMIC COUNCIL IN FAA POLICY

Question. Mrs. Garvey, I would like you to talk to us about the role the National Economic Council (NEC) is playing in developing FAA policy. It is our understanding the NEC has held a number of meetings with the FAA and the aviation community on privatization. Can you tell us the results of those meetings? Will any NEC developed proposals be included in next week's budget submission?

Answer. The NEC provides economic guidance to all areas of the executive branch, which includes the FAA. There have been a number of meetings between the NEC and the aviation community with occasional FAA participation, to discuss various options to organize FAA ATC services in a more business-like fashion.

Question. Mrs. Garvey, for several years the Appropriations Committee has included a provision in its annual funding of the Department of Transportation prohibiting taxpayer funds from being used to develop unauthorized user fees. To your knowledge is the NEC developing a FAA user fee system?

Answer. Both the 1998 and 1999 FAA Reauthorization legislative proposal contained language developing cost-based user fees for air traffic services. The user fees proposed in the President's fiscal year 2001 Budget are based on that proposal, but we won't develop the fees until they are authorized by Congress. To my knowledge, the NEC is not developing any new FAA user fee system.

QUESTIONS SUBMITTED BY SENATOR BOB SMITH

PROJECT DELAYS

Question. Has it been your experience that some FAA projects are delayed due to unanticipated technical or environmental problems and as a result, FAA is then able to advance other projects more quickly to prevent any lapsing of available funds?

Answer. Inevitably, some programs are delayed because of technical or environmental problems. However, this situation is fairly uncommon. When it has occurred, we have generally been able to reprogram either within a program or to other high priority projects. For example, a specific location scheduled for building construction may run into an environmental situation that would delay the project. To maximize the use of the funds, we would reprogram them to another location that is ready

for construction. The FAA generally lapses less than one-half of 1 percent of the funds available, which is considered a prudent business practice.

Question. If so, what criteria does your agency use to advance projects which have been approved for later funding cycles but are ready to get funded now?

Answer. In those situations where funds are available for redistribution or reprogramming to other programs, the criteria for reallocation of funds has generally been based on accelerating those programs with significant near term benefits to NAS safety and efficiency.

QUESTIONS SUBMITTED TO MR. MEAD

QUESTIONS SUBMITTED BY SENATOR PETE V. DOMENICI

FUNDING FOR MODERNIZATION

Question. Mr. Mead, from your years of aviation experience both as DOT Inspector General and the director of Transportation Affairs for the General Accounting Office, you have witnessed the problems FAA has experienced with its modernization program. Incorrectly in my view, there are some who believe the solution to air traffic control modernization is simply to throw more money at the problem.

Do you agree with me that providing more and more funding for modernization is not the correct prescription for air traffic control modernization?

Answer. More funding alone is not the answer. While there are investment opportunities, the key is better management. FAA needs to hold management accountable, oversee contractors more effectively, establish effective cost controls, and expedite the completion of its cost accounting system. In addition, FAA needs a strategic business plan to outline its strategy for future investments, control the rising costs of operations, and bring about productivity enhancements. If FAA does not take these steps, Congress will find that additional funding will only go to cost overruns and increased salaries.

Question. If so, why is it that more funding for air traffic control modernization has not and will not translate into meaningful modernization of our system?

Answer. More funding has not translated into meaningful modernization of our system because FAA has not been able to control costs and meet schedules for technologically challenging systems such as WAAS, STARS, and AMASS. The common threads of these systems is that they involve extensive software development, which FAA has difficulties with, and human factors issues, which are not resolved early enough in the acquisition process. Further, FAA does not hold contractors accountable. As I stated in the testimony, the two Free Flight contracts for a software-intensive controller tool are time and material contracts. All risks are with the Government—there is little incentive for cost control and labor efficiency.

Question. In your opinion, do you believe that the FAA should undergo fundamental structural change or does the agency require additional management reforms similar to the personnel and procurement reforms of 1996?

Answer. I would exercise caution in making major structural changes given the excellent safety record in aviation. Any proposal to restructure FAA, particularly any proposal to spin-off air traffic control to a commercial enterprise, must be carefully examined. There are no circumstances where safety oversight can be transferred outside of the Federal Government—this should not even be considered an option because safety oversight is an inherently governmental function.

Far too often, FAA points to external factors as causes of their problems. In 1995, Congress exempted FAA from Federal procurement and personnel rules that FAA said hindered its ability to effectively modernize the Air Traffic Control System. These reforms have had little impact to date. FAA needs to make the reforms they already have more effective by controlling its operating costs, better managing acquisitions, and making sound investment decisions.

ABILITY TO KEEP PACE WITH TECHNOLOGY

Question. Mr. Mead, I understand oceanic air traffic control is one of the fastest growing segments of air traffic. I also understand that oceanic capabilities of the United States are not as advanced as those of NAV Canada.

What contributes to NAV Canada's success in keeping up with rapidly changing technology?

Answer. NAV Canada responds to changing demands by acquiring commercial-off-the-shelf technology. It relies on research and development efforts of the United States and other countries to eliminate high-risk projects. Quite simply, being a commercial enterprise, NAV Canada seeks a rapid return on capital investments,

which results in quicker benefits to the users. In addition, Canada has always used an incremental approach in fielding new technologies. For example, the Gander Automated Air Traffic System (GAATS), which handles over 1,000 flights bound for or arriving from Europe, was developed incrementally and began long before NAV Canada took over control of Canada's air navigation system. The incremental approach increases the likelihood of user acceptance and minimizes the problems associated with implementation of new technology.

Question. Does the structure of NAV Canada contribute to its technological successes?

Answer. NAV Canada must make wise business decisions in spending funds it receives from user fees for new technologies since it no longer receives government subsidy. This structure contributes to managing low risk technology initiatives by using commercial-off-the-shelf technology and relying on others to undertake investment in new cutting edge technology.

AIR TRAFFIC CONTROL PAY INCREASES

Question. Mr. Mead, operation costs will continue to increase as a result of a new pay system for air traffic controllers, which became effective in 1999. This will require approximately \$1 billion in net additional funding over the 5-year life of the agreement.

In fiscal year 1999, FAA experienced a \$284 million shortfall in its Operation's budget that required reduction in planned safety inspector training and travel. I also understand that FAA will be sending a supplemental request for 2000 operations.

Question. Were the shortfall in funding for 1999 and the supplemental request a result of the new pay system for controllers?

Answer. The majority of the \$284 million shortfall in FAA's 1999 Operations budget was in Air Traffic Services (\$204 million). This was a direct result of the new controller pay system that FAA did not budget for as well as increases in NAS Handoff costs (costs of maintaining newly commissioned systems that can no longer be funded using appropriated Facilities and Equipment funds). FAA needed the supplemental request due to a shortfall in Operations funds, caused largely by the pay increases for controllers.

Question. How will this agreement with the controllers affect the agency? What effect does the increase in operating costs have on other critical agency requirements, such as modernizing the Air Traffic Control System?

Answer. FAA said the pay increases associated with this agreement would be budget neutral due to productivity enhancements. FAA's commitment has not yet been fulfilled since most productivity enhancements, such as increased use of controller-in-charge positions, have not yet been put in place. FAA now faces significant risks in funding the new controller pay system while, at the same time, meeting other critical agency requirements funded by the Operations account, such as hiring safety inspectors and developing a cost accounting system. These risks are compounded as FAA negotiates new wage agreements with its other workforces, such as maintenance technicians who want similar treatment.

FAA's unconstrained Operations costs have, in the past, had the effect of crowding out other critical agency functions such as modernizing the Air Traffic Control System. However, provisions of FAA's Reauthorization Bill essentially commit funding from the Trust Fund for Facilities and Equipment and the Airport Improvement Program. The issue now is to what extent Congress is willing to provide general fund contributions to fund FAA's Operations.

IG'S OPINION ON RESTRUCTURING

Question. Mr. Mead, the increasing funding requirements for the Operations Program and the risk of this account crowding out other requirements including modernizing the Air Traffic Control System seem to support the idea of restructuring the FAA.

In your opinion, is restructuring or reform needed to ensure the Air Traffic Control System is managed effectively?

Answer. No; FAA does not need to restructure or have additional reforms beyond what they have today. However, it should be managed more effectively and run more like a business. FAA needs to hold management accountable, oversee contractors more effectively, establish effective cost controls, and expedite the completion of its cost accounting system. In addition, FAA needs a strategic business plan to outline its strategy for future investments, control the rising costs of operations, and bring about productivity enhancements.

Question. If you were in our shoes, what actions would you take to modernize and more efficiently manage air traffic control in this country?

Answer. First, FAA must complete its cost accounting system so it can accurately track and control costs and make effective management decisions. Second, FAA should ensure that contracts are written with appropriate controls to protect the Government's interest, shift some of the risks, and hold contractors accountable for satisfactory progress. Finally, FAA must establish a strategic business plan to outline strategies for future investment based upon projected funding, and for controlling rising operations costs. Congress should use FAA's success in meeting these strategies as a gauge for future funding.

RESULTS OF PERSONNEL AND PROCUREMENT REFORMS

Question. Mr. Mead, in 1996, Congress provided FAA the ability to develop and implement acquisition and personnel reforms to address the unique demand on, as well as the needs of, the agency.

It has been 4 years since Congress passed the provision, what tangible results has the FAA achieved directly related to these reforms?

Answer. Under acquisition reform, FAA has been able to award contracts faster under the Acquisition Management System (AMS). Also, FAA has been obtaining more input from contractors, which helps refine requirements before awarding contracts. FAA has deployed systems, such as the Display System Replacement (new en route controller displays) and the HOST (computers that receive, process, and track aircraft movement through the domestic enroute and oceanic airspace), on time and within budget. However, AMS has had little impact in improving the quality, cost-effectiveness, and timeliness of technologically challenging systems, such as the Wide Area Augmentation System (WAAS), Standard Terminal Automation Replacement System (STARS), and the Airport Movement Area Safety System (AMASS).

Under Personnel Reform, FAA can point to a few successes, such as fielding a pilot program of its proposed agencywide compensation plan in the Research and Acquisitions line of business. We have not yet validated the results of this pilot program. The most significant result of Personnel Reform has been the collective bargaining and compensation agreements signed with FAA's air traffic controllers. However, as previously discussed, the price tag for this agreement is large. Overall, much remains to be done under Personnel Reform to achieve an agencywide personnel system that provides for greater flexibility in hiring, training, and placing FAA's workforce to meet the agency's unique needs. In fact, consistent with our findings on Personnel Reform, the National Academy of Public Administration stated in its August 1999 report on FAA's Personnel Reform that "the efforts of the past 3 years have not yet shown results in terms of mission impact and return-on-investment".

Question. Have the reforms made any measurable impact on the major modernization programs?

Answer. The reforms have not had the bottom line impacts on the major modernization programs that were expected. The purpose of acquisition reform was to grant FAA relief from acquisition rules and regulations which FAA claimed was preventing them from completing major modernization programs within cost and on schedule. FAA has made progress in reducing the time to award contracts, but major programs such as WAAS, STARS, and AMASS continue to have significant cost growth and schedule delays. Problems with these three programs are attributable to unrealistic milestones and problems in developing complex software and resolving human factors issues.

NONDEPARTMENTAL WITNESSES

STATEMENT OF JOHN CRICHTON, PRESIDENT AND CHIEF EXECUTIVE OFFICER, NAV CANADA

Senator DOMENICI. Senators, thank you and thank you, and let us go to the next group of witnesses.

All right. Our second panel of experts will now present their testimony. First, John Crichton, President and CEO of NAV Canada; second, Dr. Robert Poole of the Reason Public Policy Institute in Los Angeles, California; and third, Robert Baker, Vice Chairman of American Airlines.

We had hoped for a panel of airline CEOs, but conflicting schedules precluded this, and it was probably more than we ought to expect that we could get them all to come. Enough said.

Let us proceed. In the order that I identified you, would you each note right now that your entire statement—if you have statements—are going to be made part of the record as if you read them?

Mr. CRICHTON. Yes.

Mr. POOLE. Yes.

Mr. BAKER. Yes.

Senator DOMENICI. And then if you could proceed as quickly as possible so there would be time for a few questions. Mr. Crichton.

Mr. CRICHTON. Thank you, Mr. Chairman. My name is John Crichton. I am the President and CEO of NAV Canada.

What is NAV Canada? It is a private, non-share capital corporation which owns and operates the Canadian Civil Air Navigation System. It was incorporated in 1995. It purchased the entire system from the Canadian Federal government for \$1.5 billion, and began operations November 1, 1996.

We employed 6,300 people at takeover. That staffing level is now 5,200.

Full scope of operations: air traffic control, and advisory service, flight information services, aviation weather services, and we provide service throughout all of Canada, obviously, but also the northwest Atlantic Ocean, parts of Greenland and the Arctic Ocean.

What is a non-share capital corporation? It is a private company that operates just like any other business corporation, except there are no shareholders. These types of businesses are often referred to as non-profits. That is somewhat misleading because NAV Canada does earn profits and it can earn profits. But what the lack of shareholders means is that the profits are recycled within the business, either to pay down debt, to finance capital expenditures, or to reduce service fees.

We have four members who act as surrogate shareholders in that they appoint the Board of Directors, they can approve corporate by-law changes and appoint auditors. Our four members are the Air

Transport Association of Canada, representing the commercial airlines, the Federal Government, our union associations and a business aircraft association. These groups appoint 10 of the 15 members of the Board, and this is one of the—I think keys to success of our company, is that we have those key stakeholders on the Board, and in particular, the customers.

There is no share equity, there are no shares, so our capitalization is in the form of debt, but we are rated double-A by all the major rating agencies in the United States and Canada, and in fact, we—I believe we would probably have the lowest cost of corporate capital in North America.

There is no government involvement of any kind and no financial guarantees from the government at all. We are on our own and operate that way.

Why did Canada choose to privatize the system and to pick this non-share capital model? And I filed with the committee—it was interesting to hear people talk about what has happened in years gone by—but I filed with the committee, and I am sure all of the Senators have—is an excerpt from a testimony given at a parliamentary hearing in Ottawa in 1996, and this is a document that was in fact produced by Transport Canada, who was then operating the system, and it sets out the rationale for the decision to privatize in terms of delays, service problems and so on, and costs, and I think that that rationale is still well-supported today.

Our non-share capital model, it has a lot of advantages for this type of a business. It removes any perceived conflict between personal profits and safety with there not being shareholders. The money, as I say, recycles within the system. It allows for that key stakeholder representation on the Board of Directors. The nature of air traffic control is a natural monopoly, and it is an essential service, but that makes it readily financeable in the capital markets. The customers on the Board in our case, they act as a replacement for the profit motive. They are interested in safe service. They are interested in efficient service and at a reasonable cost. With a corporate structure like this, we become effectively self-regulating from an economic point of view.

PREPARED STATEMENT

Just some highlights of—we are almost 3½ years since we started—just some highlights in terms of system performance. Management and administrative structures have been streamlined 1,100 fewer people or about 17½ percent reduction in the work force. Most of that was done on the administrative side. We are in fact expanding on the operation side. We reduced the capital spending by about 40 percent from what was being spent annually in the government, but we are getting much more product, and our focus now is on truly deliverable projects with proven customer or safety benefits. Our charges for service have reduced by over 30 percent from those amounts of money that were being raised through the Air Transportation Tax, which was repealed. We have also paid our controllers a lot more money; at the same time we got about a 20 percent increase in productivity along with that contract. Our major automation project, the CAATS, which was in serious trouble at the time we took over the system, is now on time and on budget

and will be delivered later this year. We have reduced the rate of operating irregularities in the system from the safety measurement point of view, fielding some very advanced systems, oceanic systems and so on, dealt with about a 15 to 20 percent increase in traffic over the last 3 years, and we are reducing the number of ATC delays that are brought about through things under our control.

Thank you.

Senator LAUTENBERG. Thanks very much.

[The statement follows:]

PREPARED STATEMENT OF JOHN W. CRICHTON

WHAT IS NAV CANADA?

A private, non-share capital corporation which owns and operates the Canadian Civil Air Navigation System.

Incorporated in May 1995.

Purchased the ANS from the Canadian Federal Government for \$1.5 billion and began operations on November 1, 1996.

Employed 6,300 people on takeover, current staff level is 5,200.

Corporate headquarters in Ottawa.

Scope of operations:

- Air traffic control
- Airport advisory services
- Flight information services
- Aviation weather services

From—

- 7 area control centers (ACC)
- 43 control towers
- 80 flight service stations (FSS)
- 1,400 Nav aids
- 43 radar sites
- Serves all of Canada including a large part of north west Atlantic Ocean, southern Greenland and a portion of the Arctic ocean.

WHAT IS A NON-SHARE CAPITAL CORPORATION?

A private company that operates like any other business corporation except there are no shareholders.

Often called a “non-profit” company but this is misleading as NAV Canada can and does earn profits.

The lack of shareholders means that profits are recycled to (a) pay debt, (b) finance capital expenditures, or (c) reduce service fees.

Four “members” act as surrogate shareholders in that they appoint the Board of Directors, approve corporate By-law changes and appoint auditors.

NAV Canada’s four members are:

- Air Transport Association of Canada—4 Board appointees
- Federal Government—3 Board appointees
- ANS Union Association—2 Board appointees
- Business Aircraft Association—1 Board appointee
- Total 10

Board appoints four unrelated Directors plus the CEO for a total Board of 15.

No share equity means all capitalization is in the form of debt.

NAV Canada is rated “AA” by U.S. and Canadian rating agencies, and has so far issued \$1.750 billion in revenue bonds.

No government involvement or financial guarantees of any kind.

WHY DID CANADA CHOOSE TO PRIVATIZE AND TO PICK THE NON-SHARE CAPITAL MODEL?

In 1994 Transport Canada addressed this question before a parliamentary committee and an excerpt from their Testimony is attached.

Rationale then still applies today.

The non-share capital model, as developed for NAV Canada, has the following advantages:

- No perceived conflict between personal profits and safety.
- Allows for key stakeholder representation on the Board

- Air Carriers—Who need and pay 100 percent of the cost of service.
- Government—Custodian of the public interest.
- ANS Unions—Represent 90 percent of employees.
- Business Aircraft—Represent GA customers
- Natural monopoly and nature of essential service makes it readily financeable at low cost.
- High credit ratings provide for a lower cost of capital than equity.
- Customers on Board replaces profit motive as an efficiency driver.
- Economically self-regulating.
- Government is still safety regulator.
- Government personnel and procurement policies dropped.
- Directors and Officers are subject to the common law obligation as fiduciaries to act in good faith and in the best interests of the corporation.
- Conflicts avoided in that Board appointees cannot be:
 - Employees, officers or directors of significant customers or suppliers.
 - Elected officials or employees of Federal, provincial or territorial governments.
 - Union officers.

WHAT IMPROVEMENTS IN SYSTEM PERFORMANCE HAVE BEEN ACHIEVED TO DATE BY NAV CANADA?

Management and administrative structures have been streamlined, 1,100 or 17.5 percent reduction in staffing.
 Capital spending reduced by 40 percent—focus now on “deliverable” projects with proven customer and/or safety benefits.
 Service charges reduced by over 30 percent from equivalent amount formerly charged to passengers (tax was totally repealed in November 1998).
 Air traffic controller productivity increased by about 20 percent with wages increased an average 33 percent (all after a 7 year wage freeze).
 Major automation project “CAATS”. Now on time and on budget—final delivery in Fall 2000.
 World’s first “glass” tower opened in Toronto in November 1998.
 Reduced rate of operating irregularities.
 Introducing most advanced oceanic system in the world in mid 2000 (GAATS—Version 21).
 Successfully coped with a 15 percent increase in traffic over last 3 years.
 Incidence of ATC induced delays on decline.

CANADIAN AIR NAVIGATION SYSTEM
 MODERNIZATION AND COMMERCIALIZATION

A briefing to the Standing Committee on Transportation, October 1994, Transport Canada Aviation.

FEDERAL BUDGET—1994

Transport Canada Initiative.—In order to improve efficiency and achieve long-term savings, TC will review the potential for commercialization of a number of its major activities (such as the air navigation system) in close consultation with affected parties.

RATIONALE

User concerns on quality of service provided and the cost of delays.
 Recommendation by associations, airlines, business aircraft operators, airline pilots and air traffic controllers.
 Recommendations of reports, studies and Royal Commission.
 International experience.

ANS Expenditures vs Traffic

CHARACTERISTICS OF A COMMERCIAL ANS

A commercialized ANS should be:

- free to manage resources and people
- responsive to user needs
- able to procure on commercial principles
- funded by those who use the service
- operated in a business-like way
- accountable to owners and customers

PRINCIPLES

Safety must not be compromised.
There should not be a negative impact on the current structure of commercial and recreational aviation in Canada.

PUBLIC INTEREST

Public interest requires that ANS:

- exists
 - is safe
 - contributes to national transportation efficiency
- ANS provides equitable access to all users.
Remote communities receive appropriate services.
International communities receive appropriate services.
Sovereignty and security needs are met.
There is no abuse of monopoly position.
ANS remains Canadian owned and controlled.

**STATEMENT OF ROBERT W. POOLE, JR., PRESIDENT AND DIRECTOR,
TRANSPORTATION STUDIES, REASON PUBLIC POLICY INSTI-
TUTE, LOS ANGELES, CA**

Senator LAUTENBERG. Mr. Poole, go ahead.

Mr. POOLE. Thank you. I am Robert Poole, Director of Transportation Studies at the Reason Public Policy Institute.

I have been involved with this issue of air traffic control reform since 1981, and it is striking to me how much the debate has changed since then. Today it is pretty widely accepted that air traffic control is basically a commercial service, while air safety regulation is inherently governmental. It is also accepted that FAA's management and corporate culture are really—realistically poorly suited to operating and modernizing a high-tech service business. And it is generally accepted that air traffic control funding should be driven by the growth in aviation activity, not by the constraints of the Federal budget process.

Now, who agrees with these points? The National Airline Commission in 1993, the National Partnership for Reinventing government since 1994, DOT's Executive Oversight Committee, which proposed the USATS Corporation in 1994–95, and the National Civil Aviation Review Commission in 1997.

Now, of course, we heard this morning, and we all know about the big increase in delays last year when growing air traffic bumped right up against the limits of a system that is still technologically and organizationally obsolete. As a result of that, we have had a number of calls from airline CEOs for commercializing or corporatizing the air traffic control system. We now today have 13 years of experience with corporatized air traffic control in 16 countries including Australia, Canada, Germany, New Zealand, South Africa, Switzerland and the United Kingdom. There are a number of common elements that emerge from all of this experience. First, governments have spun off the air traffic control service provider, but not safety—they have kept safety regulation as inherently governmental in-house, and put it at arm's length from the service provider.

Second, the air traffic control corporations are generally operated on a not-for-profit basis as Mr. Crichton said, because it is a monopoly. Excess revenues are recycled back into the system or used to lower charges in the following year.

Third, the air traffic control corporations are funded directly by their users through fees and charges, and this makes the company accountable to the customers. As they say in Canada, user pay means user say.

Fourth, the companies fund modernization by issuing long-term revenue bonds based on a predictable revenue stream, and this gives them much greater ability to plan and manage.

We can also see now that air traffic control commercialization works. It solves the problems that are plaguing government-run air traffic control in country after country. The unit costs of providing service go down, modernization moves more quickly, and flight delays are reduced, and in no country has there been any problem or reduction in air safety from doing this.

So how can we apply this experience to the United States? My organization, Reason Public Policy Institute, is working on a de-

tailed proposal for a U.S. air traffic control corporation. We are seeking input from the entire aviation community. This is a work-in-progress, so I cannot give you the final result, because we are not finished yet, but I can give you some things that are emerging out of our work.

First we think that the stakeholder controlled not-for-profit corporation is probably the best model for this country. It is working very well in Canada, and it harkens back to the original days of air traffic control by ARINC in this country. The kind of corporation we are working on would provide all civilian air traffic control services in the United States and oceanic, would hire a top management team to run the company, but would take over nearly all the current staff of FAA's air traffic services, and all of FAA's current air traffic control facilities, would keep its books using Generally Accepted Accounting Principles, naturally, would pay market-based compensation to all of its employees to insure the best possible talent for every position, and would be free to define and purchase new technology just the way a private business does.

The most crucial element of this reform in our view would be direct user payment by the users to the corporation. The reason for this is that it is so important to develop a corporate culture that takes the customer seriously and gives them what they want, and does not try to foist on them things like microwave landing systems that they do not want. And that will happen only if the company gets its revenue by satisfying its customers. Developing fair and simple air traffic control fees is no easy task, and we have not completed our proposal on that yet, but we do expect to recommend that the current FAA user taxes be abolished and replaced by fees and charges that will be charged only for services rendered. In other words, a private plane using an airport without a tower would not be paying anything under the kind of reform we are looking at, but all of the stakeholders, including private pilots who do use the system, would have representation on the board of the corporation, as is the case with NAV Canada. The overseas experience shows that these kinds of corporations can be self-supporting, they can get investment-grade ratings, and they can easily fund modernization by issuing long-term revenue bonds.

For regulatory purposes, clearly, the FAA would need to be a strong safety regulator, exercising arm's-length oversight, just as it does today with regard to the airlines, pilots, mechanics and manufacturers. All are regulated at arm's-length by the FAA. Congress, of course, will continue to have the responsibility to fund the slimmed-down FAA and DOT and their needed oversight functions including the operation of air traffic control by the corporation.

Finally, just one more thought. I really want to stress the urgency of structural reform along these lines. The current system is not keeping pace with the growth. It is failing to modernize in a cost-effective fashion. If we are going to avoid gridlock in the skies and on runways, we have to develop a modern satellite-based system based on GPS and data links, and we believe that a user-driven customer responsive corporation is really the best way to get there.

PREPARED STATEMENT

I'll be happy to answer questions when the time comes.
 Senator DOMENICI. Thank you, Mr. Poole.
 [The statement follows:]

PREPARED STATEMENT OF ROBERT W. POOLE, JR.

SHIFTING AIR TRAFFIC CONTROL TO A USER-FUNDED CORPORATION

My name is Robert W. Poole, Jr. I am the director of transportation studies at the Reason Public Policy Institute in Los Angeles. As a former aerospace engineer, I have been studying transportation issues for more than 20 years and have advised the U.S. Department of Transportation and various congressional committees on a number of occasions. In 1997 we were asked to advise the National Civil Aviation Review Commission, as it assessed the problems of the Nation's Air Traffic Control System.

I have been involved with ATC reform since the days of the PATCO strike in 1981. I'm impressed by how much the debate has changed over the years. There is a broad consensus within aviation policy circles on many issues that used to be very contentious. It is now widely accepted that ATC is an essentially commercial service, and that it is separate from air-safety regulation, which is inherently governmental. It is also increasingly accepted that the FAA's management and corporate culture are poorly suited to operating and modernizing a high-tech service business—and have not been significantly improved by the modest 1996 reforms of procurement and personnel systems. And it is also widely accepted that ATC funding should be driven by the growth of aviation activity—and not by the ups and downs of the Federal budget process.

These conclusions are reflected in the work of the Administration's National Partnership for Reinventing Government. The same conclusions inspired the DOT's U.S. Air Traffic Services Corporation proposal in 1994–95. They underlie the strongly worded findings of the National Civil Aviation Review Commission in 1997. And they are backed up by nearly two decades of GAO reports and think tank studies. Last year—just as NCARC warned—growing air traffic bumped up against the limits of our creaking, obsolescent ATC System, resulting in record levels of airline delays, costing airlines and their passengers billions of dollars in extra costs and wasted time. That experience has led to a growing chorus from airline CEOs calling for removing the ATC System from the FAA and setting it up as a user-funded business. The bible of the industry, *Aviation Week*, has editorially endorsed that approach for several years.

One factor that has helped to shape this growing consensus is the actual experience of commercializing air traffic control around the world. Twenty years ago, when I first began working on this concept, there were no commercial ATC corporations to be found. The few that had been started—as non-profit airline cooperative efforts, in the United States in the 1930's by ARINC, and in Cuba and Mexico—had all been taken over by their respective governments.

But beginning in the late 1980's, the same problems that plague our ATC System—inadequate or uncertain financial resources, poor cost-accounting, crippling bureaucratic rules on personnel and procurement, etc.—led to a growing wave of reform. One after another, starting with New Zealand, ATC operations were restructured as commercial corporations, either wholly owned by government or as non-profits controlled by the various aviation stakeholders. Among those taking this path are Australia, Canada, Germany, South Africa, Switzerland, and the United Kingdom. ATC restructuring has been brought about by governments of both left and right, including Labor governments in New Zealand and the United Kingdom and a center-right government in Germany. You have heard this morning of the success of ATC commercialization in Canada.

Four common elements emerge from these various ATC reforms:

- First, in virtually every case, governments have spun off the ATC service provider but have kept safety regulation as part of the government's transportation agency. Putting safety regulation at arms-length from service delivery is seen, correctly, as a way to improve air safety.
- Second, in every case but one, these ATC corporations are operated on a not-for-profit basis. (That one exception is the United Kingdom Labor government's current proposal to sell 51 percent of the National Air Traffic Service to private investors.) Because ATC is one of those rare cases of natural monopoly, it makes sense to operate it in this way, with any excess revenues either re-in-

vested back in the corporation or used to reduce the following year's fees and charges.

- Third, nearly every one of these ATC corporations is funded directly and completely by its users. Fees and charges are the prices of the company's services; they do not get sent to the government, to be appropriated (or held in a trust fund). They are paid directly by the customers to the service provider (as with electricity charges by TVA and postal charges by USPS). And that makes the company accountable directly to its customers. As they say in Canada, "user pay means user say."
- Fourth, these ATC companies are able to fund modernization by issuing long-term revenue bonds, based on their predictable stream of revenue from fees and charges. Indeed, NAV Canada's bonds had no trouble receiving investment-grade ratings. The financial community loves this kind of investment.

In addition to these common features of commercialized ATC corporations, we also find a common pattern in their experience. To put it simply, ATC commercialization works. By that I mean: it solves the problems that have plagued government-run air traffic control in country after country. Following commercialization, we typically find that the unit cost of providing ATC services goes down, modernization proceeds more quickly and smoothly, and flight delays are therefore reduced. In no country has there been any reduction in air safety, and most observers believe safety levels have increased.

In short, compared to 20 years ago when ATC commercialization was mostly theory, today we can draw on a wealth of experience from around the world. All of it points to the conclusion that moving ATC out of a government bureaucracy, converting it into a commercial corporate form, charging users directly for services and making it directly accountable to those users for its performance, and regulating it at arms-length for safety—this kind of fundamental reform works.

The logical next question is: How can we apply this experience to the United States? That is the question that my organization is currently addressing. Our three-member project team is developing a detailed proposal for an Airways Corporation that could take over ATC functions from the FAA and operate in a commercialized manner. We are seeking input as we go along from the entire aviation community—major airlines, low-fare airlines, cargo carriers, air-taxi operators, business aircraft owners, recreational flyers, air traffic controllers, and others. Since this is a work in progress, I cannot give you definitive results just yet. As you can imagine, this is a very complex project, and different stakeholders have somewhat different interests that must be taken into account in coming up with a workable plan. But I can give you some broad outlines of where we think we are heading.

First, having reviewed the global ATC reform experience, we believe that the stakeholder-controlled not-for-profit corporation is probably the best model for the United States. It is working very well in Canada, with which we share a major border and have extensive air commerce. And it harkens back to the origins of U.S. air traffic control, which was begun on exactly this basis by Aeronautical Radio, Inc. (ARINC) in the 1930's. So we are defining a non-profit ATC corporation with a stakeholder-controlled board of directors.

The Airways Corporation would provide all civilian ATC services in the United States and in the oceanic regions for which this country is responsible. It would hire a top management team to run the company, but would take over essentially all of the current FAA staff in Air Traffic Services and all current FAA ATC facilities. It would keep its books using generally accepted accounting principles (GAAP) like a normal company. And it would be free to pay market-based compensation to all its employees—both management and non-management—so as to ensure the best possible talent for each position. It would be free to define and purchase new technology in the same way as any private business.

We believe the most crucial element of this reform is direct user payment to the corporation for ATC services. It is absolutely crucial to develop a corporate culture that is driven by and responsive to customer needs. That will only happen if the company must derive its revenues by meeting their needs. This process is what drives the remarkable productivity of the entire U.S. economy. And we can now see that it works in air traffic control, as well. To repeat the *leitmotif* of Canadian ATC reform, "user pay means user say."

To be sure, we recognize that developing the specifics of ATC fees and charges is no easy task. We are devoting considerable effort to coming up with a pricing proposal that is both simple and fair to all aviation users. Until we've done a lot more work, and gotten a lot more private feedback from user groups, I don't want to go into more specifics on this issue. But because we all know that private pilot groups have great concerns about this issue, let me say just a few words on that score.

We anticipate that our plan will propose that current Federal aviation user taxes be abolished, as part of the transition to the new, commercialized system. The underlying principle is that the new ATC fees and charges will apply only where users make actual use of ATC services. A private plane shooting touch-and-go landings at a non-towered airport is not using the system and should not be charged by the system—or by the Federal Government. But those who do use ATC services should pay for the use of those services—again, in as fair and simple a manner as possible. And as stakeholders in the system, they should be represented on its board. This includes military and civilian government users, whose budgets should include the cost of using ATC services, just as it includes buying fuel for their aircraft.

Next, let me address funding for the remaining FAA functions. Without its ATC operations, the remaining FAA would have two main programs: safety regulation and airport grants. We believe that safety regulation is inherently governmental. The one difficult area is AIP grants for airports. We all know that this country is short of airport capacity, but that expanding existing airports and building new ones in places where they are needed are both very difficult. The problem seems to be less one of funding than of overcoming local opposition to noise and traffic. We do not yet have a specific proposal on how best to pay for airport improvements—but we are working on it.

Getting back to the Airways Corporation itself, the overseas experience demonstrates that it can easily be self-funding. Like any other utility business providing a vital public service (e.g., electricity or water) by investing in long-lived infrastructure, the most appropriate way to pay for such infrastructure is via long-term revenue bonds. With a robust stream of revenue from fees and charges, such bonds could easily earn investment-grade ratings. Wall Street will be only too happy to arrange these bond issues. Hence, we strongly recommend that the corporation not be allowed to borrow from the Treasury. Since one of the key objectives of this reform is to develop a user-responsive corporate culture—i.e., one that will choose wise and cost-effective investments, rather than white elephants such as the now abandoned Microwave Landing System—is important that all such investment plans be required to pass the market-testing of the financial markets.

Finally, let me address the question of regulation. There are two potential types of regulation involved: safety and economic. In terms of safety regulation, the FAA will become the arms-length regulator of the new corporation. That will put air traffic control on the same basis as all the other participants in the aviation system: airlines, private plane owner/operators, airframe and engine producers, airports, pilots, and mechanics. All are regulated at arms-length by the aviation safety regulator. It will be no different in the case of the ATC service provider. Most countries that have commercialized ATC consider this separation of regulation from operations to be a significant strengthening of air safety.

When it comes to economic regulation, I noted previously that the Airways Corporation will be a natural monopoly. The corporate structure we propose is a not-for-profit corporation with a stakeholder board—essentially, a user cooperative. In theory, such a structure should represent the interests of its customers and not require the usual kind of public utility regulation (whose purpose it is to look out for the interests of its customers). However, we all know that the interests of business-jet operators and those of cargo carriers and those of major airlines are not identical. We believe there will still be a need for external review and appeal of the corporation's decisions on such things as fees and charges and of changes in levels of service. At this point, we think such review and appeal is best carried out by the DOT, just as appeals from rail shippers can be taken to the DOT's Surface Transportation Board.

Congress will, of course, continue to have the responsibility to fund the FAA and DOT, and to exercise the needed oversight of all of their operations, including their regulatory responsibilities with respect to air traffic control.

In closing, I would like to stress the urgency of this kind of fundamental, structural reform of the way we provide and pay for air traffic control in this country. The current system has failed to bring about modernization of the ATC System—modernization that is essential if we are not to succumb to gridlock and far worse delays than were experienced last spring and summer. The shift from ground-based to space-based ATC, based on GPS and data link, promises a huge increase in both en-route and runway capacity. But the FAA has been institutionally incapable of delivering this modernization, wasting billions on such fiascos as the Advanced Automation System and the Microwave Landing System.

There are several reasons for this structural failure. One is the FAA's cumbersome procurement process. When a new generation of computer electronics comes along every 18 months and it takes the FAA 5 to 8 years to procure a new system, you have a recipe for getting further and further behind the state of the art. This

is due in part to the FAA's proclivity for defining everything to death in-house, rather than making creative use of off-the-shelf systems where feasible. A commercial ATC corporation will be able to upgrade its technology as quickly and efficiently as other high-tech businesses.

Another structural problem is uncertain funding. The vitally needed controller-to-pilot data link is a key element in free flight, but is being delayed by stop-and-go FAA funding. Implementing data link requires synchronized schedules involving airlines, avionics makers, and ATC facilities on the ground—but FAA budget problems play havoc with this synchronization. An ATC corporation would have assured funding for such modernization programs via its revenue bonds.

But the most important structural failing is this: the FAA is not customer-driven. Regarding free flight, WAAS, data link, and other key technologies, there is no urgency or sense of commitment to meeting users' needs as soon as possible. This is a basic problem of corporate culture. And it will only be solved when the ATC organization is paid directly by its customers and held accountable for results by those customers.

This concludes my presentation today. As I said previously, my comments are based on our work-in-progress on defining a plan for ATC commercialization that can gain widespread support within the aviation community. We are not there yet, but we are making good progress. I should have a lot more to report several months from now.

Senator DOMENICI. Mr. Baker from American Airlines, we would be pleased to hear your statement.

Senator LAUTENBERG. Before Mr. Baker makes his statement, Mr. Chairman, I was at a presentation made by American Airlines this morning, and it knocked the socks off people that were sitting there, because they were going to give us more room in the seats, Mr. Chairman, and I had a legislative redress that was stopped en route, because we could not get enough activity within the Senate. But that was a very positive thing, and I hope that it sets an example for all the airlines to accommodate the comfort and the ease of travel for passengers throughout. And I am not endorsing American Airlines, but I do like the idea.

Chairman DOMENICI. You liked what they said.

Senator LAUTENBERG. I do love it, Mr. Chairman.

STATEMENT OF ROBERT W. BAKER, VICE CHAIRMAN, AMERICAN AIRLINES, INC.

Mr. BAKER. Thank you, Senator. I will have just a few words about that in my remarks.

I am Bob Baker. I am Vice Chairman of American Airlines, and I want to start by expressing my appreciation to the leadership and members of the Senate Budget and Appropriations Committees for the opportunity to testify about the serious challenges facing the air traffic control system in our country.

But before I turn to that subject, I want to take this opportunity to tell the members of these committees about an important announcement that we made earlier today. Last year the airline industry received very harsh criticism from many quarters for failing to provide the kind of high-quality customer service that the public has every right to expect. Many Members of Congress joined the critics, either responding to the complaints of their constituents or based on their own dissatisfaction.

In response, the individual carriers have pledged to new customer service plans, addressing everything from baggage handling to ticket refunds and prompt accurate information about delays and cancellations. Accurate information is certainly a hallmark of aviation and customer service. Compliance with these plans will be

reviewed on an ongoing basis by the Inspector General of the Department of Transportation.

This morning American Airlines took passenger service to a new level. Just across town our Chairman and CEO, Mr. Don Carty, announced that as part of a \$400 million program to refurbish the interiors of our entire fleet, American Airlines will give our passengers more of what they really want, more space. By removing two rows of seats from every aircraft and reconfiguring the coach cabin, we will increase seat pitch and provide more space for every passenger, not just a few rows in first class. Mr. Carty regrets very much that he is unable to be here today because of the long-planned event surrounding this ground-breaking announcement.

And now I will return to the purpose of this hearing, the issues surrounding air traffic control. As we enter the year 2000, the air traffic statistics for 1999 show trends that raise concerns about the upcoming summer traffic season and the years beyond. An efficient and safe system for ATC is the basic foundation, the bedrock upon which we strive to provide a safe, predictable, and quality service to our customers. When we implemented our customer service plan late last year, we discovered a lot of ways in which we could improve our service. At the same time, we realized our most important basic customer service, on-time performance, is fundamentally dependent on air traffic control.

And while the aviation industry can improve some elements of customer service, we cannot unilaterally address the challenge posed by an outdated air traffic control system. For that we need the help of Congress, the FAA, the air traffic controllers, and many, many others.

In order to understand the present challenge to the Air Traffic Control System, we must address three questions: When do we need to start? What do we need to do? And how do we get it done?

In the case of air traffic improvements "when" is a critical question. We all want to avoid gridlock, but there are long lead times, starting with capital investment and proceeding through the development, testing and training that must precede the implementation of new systems. Most of you know that we completed a study in 1997 and were alarmed to discover that we are already approaching the point at which the air traffic system becomes overloaded.

Our 1999 operating results at American confirm that the trend in the U.S. air traffic control delay situation continues to escalate, with the total number of delays up 36 percent, and the total minutes of delay up 34 percent over the corresponding 1998 figures. This is an alarming increase as compared to our 1998 operating results, where the total number in minutes of air traffic delay were up only 5 percent and 9 percent respectively. Our 1999 operating delays coupled with a dramatic increase in customer complaints related to delays and cancellations serve as an urgent wake-up call to the approaching chaos that our study predicts will exist by 2005. Five years, mind you, is the most optimistic projection for implementation, and given the size and complexity of the air traffic control system, 5 years is really just around the corner.

Which brings us to the next question: What do we need to do to modernize and which things do we do first? Using the results of our own study and other research en route and terminal airspace

are the first targets, because changes in these areas require new aircraft and air traffic capabilities that will take many years to develop, install and train our pilots and controllers to use. At the same time we look to new technologies and innovative management to improve efficiency in the air. Airport facilities and ground infrastructure must be developed as well. In the final analysis, successful modernization will require that all elements of our system receive much needed improvements. That is where the Free Flight Program comes in. With the guidance and leadership of Administrator Garvey, this unprecedented collaborative process represents important industry and government consensus for determining the path to modernization. Although this consensus has already achieved some important milestones in the development of Free Flight technology and processes, without continued leadership and support from Members of Congress and the Administration, we are unlikely to reach our goal in time.

A comprehensive approach to air traffic modernization must address the three fundamental components of the system: communications, navigation and surveillance. The first, communications, connects the people who are making and coordinating the operation decisions in our system. This includes people in the command center, controllers in our air traffic control centers, people in our airline operations control centers, and finally, the pilots who fly the aircraft. Communications modernization means insuring that these important participants have the tools, resources and training necessary, not only to increase the capacity of our current systems, but also to increase the already high level of safety we have achieved. Sufficient radio band width or spectrum, for example, is absolutely essential if we are to eliminate the traditional voice-only bottleneck that characterizes pilot control or communications today. New operating capabilities and airspace capacity with improve safety can be realized by upgrading the old analog voice and teletype systems to new digital voice and data link communication systems.

A modern air traffic system must also include satellite-based navigation capabilities. Currently, airspace capacity is constrained by our traditional ground-based radio navigation facilities, which have significant location and range limitations. Satellite-based navigation systems will enable us to redesign our airspace, to increase the throughput of both the en route and terminal airspace. This increased accuracy, enabled by satellite augmentation systems such as the Wide Area or Local Area programs, will allow us to design new airport approach and departure procedures, dramatically improving safety, efficiency and an environmental impact that will certainly be positive.

The final component is surveillance, which most of us think of as radar. By augmenting radar using aircraft transmitted data, we can unlock new applications that can improve our ability to better manage air traffic by detecting traffic conflicts earlier, both in the air and on the ground. This promises to be an important part of addressing the growing problem of airport runway incursions.

Once we know what to do, we have to address the most difficult question of how do we get it done? If we are to avoid rapidly approaching gridlock, we must, starting now, insure the commitment to pay for modernization and infrastructure development, not just

this year, but on an ongoing multi-year basis. Such consistent funding is a key cornerstone to managing any investment risk. Unfortunately, the needed funding must pay the escalating cost of operating, maintaining and staffing the current ATC System, while also making the investments in the improvements necessary to insure our future. Because of the urgent need to get started on the programs, infrastructure and reforms necessary to guarantee aviation's future, I urge you to find a way to resolve whatever remaining issues are preventing passage of the FAA Reauthorization Bill.

PREPARED STATEMENT

In conclusion, I believe that the safety and efficiency of the air traffic control system can be improved simultaneously. Thanks to the leadership of Administrator Garvey, we have a plan. Short-term improvements may buy us some time while we pursue the development and implementation of real solutions, but we cannot hesitate much longer. We must begin modernizing our systems and operating structures today if we want to avoid the gridlock in the skies tomorrow. We need your support to get an FAA Reauthorization Bill passed to insure the funding and management reforms that will put us on the right path.

Thank you very much.

Senator DOMENICI. Thank you.

[The statement follows:]

PREPARED STATEMENT OF ROBERT W. BAKER

Thank you, Mr. Chairman and members of the committees: My name is Robert Baker, and as the vice-chairman of American Airlines, it is an honor to have the opportunity to present American's views on the need to modernize our air traffic control system.

As we enter 2000, the air traffic statistics for 1999 show trends that raise concern about the upcoming summer traffic season and the years beyond. An efficient and safe ATC System is the basic foundation, the bedrock, upon which we strive to provide a safe, predictable, and quality service to our customers. When we implemented our customer service plan last year, we discovered a lot of ways in which we could improve our service. At the same time, we realize our most important, basic customer service—on time performance—is fundamentally dependent on air traffic control. And while the aviation industry can improve some elements of customer service, we cannot unilaterally address the challenge posed by an outdated ATC System. For that, we need the help of Congress, the FAA, the air traffic controllers and others.

In order to understand the present challenge to the ATC System, we must address three basic questions: When do we need to start? What do we need to do? How do we get it done?

In the case of ATC improvements, "When?" is a critical question. We all want to avoid gridlock. But there are long lead-times, starting with capital investment and proceeding through the development, testing and training that must precede the implementation of new systems. Most of you know that we completed a study in 1997 and were alarmed to discover that we are already approaching the point at which the Air Traffic System becomes overloaded. Our 1999 operating results confirm that the trend in U.S. ATC delay continues to escalate, with the total number of delays up 36 percent and total minutes of delay up 34 percent over 1998 figures. This is an alarming increase as compared to our 1998 operating results, where the total number and minutes of air traffic delay were up 5 percent and 9 percent respectively. Our 1999 operating delays, coupled with the dramatic increase in customer complaints related to delays and cancellations, serve as an urgent wake-up call to the approaching chaos that our study predicts will exist by 2005. Five years, mind you, is the most optimistic projection for implementation. And, given the size and complexity of the ATC System, 5 years is just around the corner.

Which brings us to the next question, "What do we need to modernize and what do we do first?" Using the results of our own study and other research, enroute and

terminal airspace are the first targets, because changes in these areas require new aircraft and air traffic capabilities that will take many years to develop, install, and train our pilots and controllers to use. At the same time we look to new technologies and innovative management to improve efficiency in the air, airport facilities and ground infrastructure must be developed as well. In the final analysis, successful modernization will require that all elements of our system receive much-needed improvements.

That's where the free flight program comes in. With the guidance and leadership of Administrator Garvey, this unprecedented collaborative process represents important industry and government consensus for determining the path to modernization. Although this consensus has already achieved some important milestones in the development of free flight technology and processes without continued leadership and support from Members of Congress and the Administration, we are unlikely to reach our goal in time.

A comprehensive approach to ATC modernization must address the three fundamental components of the system: communications, navigation and surveillance. The first, communications, connects the people who are making and coordinating the operating decisions in our system. This includes people in the FAA command center, controllers in our air traffic control centers, people in our airline operations control centers, and pilots who fly the aircraft. Communications modernization means ensuring that these important participants have the tools, resources and training necessary not only to increase the capacity of our current systems, but also to increase the already high level of safety we have achieved. Sufficient radio bandwidth, or spectrum, for example, is absolutely essential if we are to eliminate the traditional voice-only bottleneck that characterizes pilot-controller communication today. New operating capabilities and airspace capacity with improved safety can be realized by upgrading the old analog voice and teletype systems to new digital voice and data communication systems.

A modern ATC System must also include satellite-based navigation capabilities. Currently, airspace capacity is constrained by our traditional ground-based radio-navigation facilities, which have significant location and range limitations. Satellite-based navigation systems will enable us to re-design our airspace to increase the throughput of both enroute and terminal airspace. The increased accuracy enabled by satellite augmentation systems, such as the wide-area (WAAS) or local-area (LAAS) programs, will allow us to design new airport approach and departure procedures, dramatically improving the safety, efficiency, and environmental impact of take-off and landing patterns.

The final component is "surveillance," which most of us think of as radar. By augmenting radar using aircraft-transmitted data, we can unlock new applications that can improve our ability to better manage air traffic by detecting traffic conflicts earlier, both in the air and on the ground. This promises to be an important part of addressing the growing problem of airport runway incursions.

Once we know what to do, we have to address the most difficult question of "how" to get it done. If we are to avoid rapidly approaching gridlock, we must, starting now, ensure the commitment to pay for modernization and infrastructure development, not just this year, but on an ongoing, multi-year basis. Such consistent funding is a key cornerstone to managing any investment risk. Unfortunately, the needed funding must pay the escalating costs of operating maintaining and staffing the current ATC System, while also making the investments in the improvements necessary to ensure our future. Because of the urgent need to get started on the programs, infrastructure and reforms necessary to guarantee aviation's future, I urge you to find a way to resolve whatever remaining issues are preventing passage of the FAA reauthorization bill.

In conclusion, I believe that the safety and efficiency of the ATC System can be improved simultaneously. Thanks to the leadership of Administrator Garvey, we have a plan. Short-term improvements may buy us some time while we pursue the development and implementation of real solutions. But we cannot hesitate much longer. We must begin modernizing our systems and operating structures today, if we want to avoid gridlock in the skies tomorrow. We need your support to get a FAA reauthorization bill passed to ensure the funding and management reforms that will put us on the right path.

Thank you.

Senator DOMENICI. I just have three questions, one for each of you, and I will take you first, Mr. Baker, and then I am going to yield to Senator Lautenberg, who will close the meeting down.

So I do not forget, I want to thank all three of you. I think the testimony, not only your oral testimony, but your entire testimony, will be of relevance, and certainly an eye-opener to a number of people who want to read and try to see what is going on elsewhere in the world.

In reading your testimony, Mr. Baker, I noted that you mention airport facilities and ground infrastructure sort of in passing, and you do not highlight it as a problem to be addressed in the, quote, "What do we need to modernize and what do we need to do first" section. Should we take that to mean that the Airport Improvement Program funding or passenger facility charges are not a priority for your airline?

Mr. BAKER. No; I think the proper structure would be a balanced approach of en route improvements, terminal area improvements, which are basically air traffic control, coupled with an ongoing process of improving facilities, both runways, taxi-ways, as well as terminal facilities, to meet the demand on these facilities. I think they all have to go on simultaneously, and they are all equally important to the overall capacity of aviation.

Senator DOMENICI. Thank you.

Mr. Crichton, Mr. Mead's statement indicated that NAV Canada is relying on the FAA for key emergency technologies. In turn, your material indicates that NAV Canada will introduce the, quote, "most advanced oceanic system in the world this year." Is there an opportunity for cooperation or more cooperation between the FAA and NAV Canada in the development and fielding of new air traffic control technology?

Mr. CRICHTON. Thank you, Mr. Chairman.

There is significant potential, and in fact, some of it is being realized. I think historically there has been a participation back and forth across the border. For instance, we are involved in the WAAS Program with the FAA, in a small way in assisting in that. The FAA has developed some tools that we find very interesting. Our oceanic system, actually, we are in discussions with the FAA to possibly make that available as part of their procurement process as well, so I think there is a tremendous scope for sharing between ANSS, and certainly there is a longstanding cooperative working relationship between NAV Canada and the FAA.

Senator DOMENICI. Just my wrap up question to both you, Mr. Poole, and yours might have to be theoretical and yours, Mr. Crichton, can be practical based on what exists. But obviously there is a tremendous opposition to privatization here from those who work for the FAA and from the unions that are part of it. They have their reasons for being against it. I just have a question. From the standpoint of pay and the non-profit corporation, what has resulted from that in terms of comparable pay before and after the institutional change, and perhaps comparable pay with U.S.A. comparable jobs?

Mr. CRICHTON. Mr. Chairman, with respect to the air traffic controller portion of the work force, the contract that we entered into last summer with them, saw an average increase of 33 percent in their pay, and that varied depending on location of the controller and their grade, and some of them were actually 40 percent, and

some, obviously, a bit less than the 33 percent, and that was for a 39-month contract, just a little over 3 years.

Now, we bargained in return and got demonstrable productivity improvements in work rules of at least 20 percent, and that was unique, because historically, I think the bargaining process, particularly with government, has been more of a one-way street, where the process would see concessions given or raises or so on, and very little coming the other way, so that was quite unique, and it at times was traumatic to negotiate it, but we got it done.

Mr. POOLE. Senator, I would like to say that I am not here advocating privatization of air traffic control in the sense that it is often meant. The word around the world usually means turning something over to a for-profit company with shareholders.

Senator DOMENICI. I understand.

Mr. POOLE. I am using the term "corporatization" or "commercialization" to mean creating something much more like NAV Canada, which is a direct user-serving organization, and—

Senator DOMENICI. If I used the word "privatization", I mean—

Mr. POOLE. I appreciate it, but I think it is an important semantic distinction.

Senator DOMENICI. I am trying to use the word that Mr. Crichton described as to what they have done in Canada.

Mr. POOLE. But this is relevant in terms—the unions, including the current controllers' union in the United States, has consistently spoken out against privatization, and they include in that the Contract Tower Program which is run by for-profit companies. On the other hand, they are on record in 1994, 1995, as endorsing the Administration's USATS corporation concept, and they recently have reaffirmed that support. So I mean I think there is definitely room there to talk with them seriously about an air traffic control corporation that is outside of the structure of the FAA, that is funded by the users, that meets the needs of users and is free to borrow in the capital market and so forth, as long as you adequately protect pension benefits, insure market-based compensation and so forth. I do not see this as a huge—I mean it is an issue definitely, but it is not an insuperable stumbling block as it might be if we were talking about turning it into a for-profit company.

Senator DOMENICI. Well, let me make sure the record is correct in terms of my use of words. There is opposition to privatization, as privatization is conventionally used, and I have been told there is not as much opposition, perhaps even some favor, shown towards the kind of entity that you are describing, Mr. Poole, and maybe that Mr. Crichton has explained with reference to Canada.

If our air traffic control system is commercialized, how would you insure that large carriers do not overshadow other smaller stakeholders such as General Aviation, General Aviation pilots, small carriers and smaller airports? How are you doing that, or is that not a problem in Canada?

Mr. CRICHTON. No, we are doing it. And it is a combination of the provisions that were set out in our enabling legislation to enable a transaction. There are certain provisions there regarding level of service requirements, charging principles, and also within our own corporate governance documents in terms of our corporate by-laws, there is a balance to approach. The air carrier representa-

tives on the board do not constitute a majority, number one, but GA does have a seat on the board as well. So it is the combined effect of all of those issues looks after that concern, and it has not been a concern for us.

Senator DOMENICI. Thank you very much.

Senator Lautenberg.

Senator LAUTENBERG. I will just be here a couple of minutes, Mr. Chairman. That is my intent anyway.

I wanted to just get something kind of clear, because the non-profit—you describe as non-shareholder, Mr. Crichton, that NAV Canada has—and I wonder, what is the incentive to keep going and to keep this business intact? There is some ownership someplace here. Who owns the NAV Canada?

Mr. CRICHTON. Quite frankly, if you are thinking of ownership in a traditional sense, Senator, nobody.

Senator LAUTENBERG. Well, I mean in—

Mr. CRICHTON. There are not any shares in that sense. The four members, as I described them earlier, are, I suppose, the surrogate shareholders, but the incentive is largely in the fact that the customers who are paying all the bills have a significant role in the governance of the company in terms of sitting on the board, and that provides the incentive to be efficient, and to produce a good product, to be safe and so on.

Senator LAUTENBERG. They pay competitive executive wages?

Mr. CRICHTON. Yes.

Senator LAUTENBERG. So these are careers that people want to pursue, and will, I guess, be held to a standard of efficiency, productivity results that we would normally see in the corporate world?

Mr. CRICHTON. Absolutely.

Senator LAUTENBERG. And so it is, if not directly customer-held shares, customer owned, they are a large part of the council, the board, whatever, and they are the ones who set the need, and is it the board that finally judges whether or not this particular program, this particular investment is going to be put in place?

Mr. CRICHTON. Yes, they do, although I must say that when it comes to the establishment of user fees, when it comes to major capital programs or system improvements, that the directors on the board tend to defer quite a bit to the airline or the GA people, the people in terms of their judgment, and I think that is quite normal.

Senator LAUTENBERG. You have to get a consensus of course.

Mr. CRICHTON. Yes; and we certainly, when we are doing any kinds of program, we consult with our customers constantly, including with respect to capital programs, and we have found that that pays off, because quite frequently they will point out some programs that they see very little value added to them, but they have other ones that they think would help them a lot, and a lot of our time is spent, in fact, in trying to figure out how to save the airlines' money from an operating cost point of view.

Senator LAUTENBERG. Do you hear from the customers' customers?

Mr. CRICHTON. Not a lot.

Senator LAUTENBERG. Well, who does?

Mr. CRICHTON. The airlines certainly do.

Senator LAUTENBERG. And you are assured that they pass those criticisms along to you?

Mr. CRICHTON. The—I think the average passenger, at least in Canada, does not really notice the air traffic control system.

Senator LAUTENBERG. Well, you are talking about the management of the system programs to be put in place. Does it substitute for the structure that we might have here, except for the safety side of things? Does your structure substitute for that?

Mr. CRICHTON. We provide the entire air navigation service, which includes, obviously, the air traffic control portion.

Senator LAUTENBERG. Right. But if there are delays, do you hear it from the airlines? Does anybody collect passenger opinion?

Mr. CRICHTON. The whole issue of delays becomes a technical one and a complex one of trying to establish in any given circumstance what induced the delays. Certainly if you are looking at it from a passenger's point of view, unless they were told specifically, they would not know the delay was an ATC-induced delay, and I have heard pilots get on the PA and announce delays into Toronto or something due to ATC problems, when in fact the reason the delays were there was there was a huge thunderstorm right over the airport. So we have to get clear on the terms on what really caused the delay. We do cause some delays. We are not perfect. Most of them have been due to a staffing problem. We are fixing that. But in Canada at least, the ATC-induced delays are relatively small.

Senator LAUTENBERG. Well, I am curious about what influence NAV Canada has on passenger questions. Is your activity focused exclusively on the navigation and the controller side of things?

Mr. CRICHTON. Yes, sir. Unlike the FAA, we have no role in air safety, other than our obligation to run the ANS. So that is still—Transport Canada does all of that, looks after the regulation of us, of the airlines, and certification of aeronautical products and so on.

Senator LAUTENBERG. So it is specifically parceled out.

Mr. CRICHTON. Yes.

Senator LAUTENBERG. I am curious as to how you were able to drop your service charges to users by over 30 percent. What did you find—you, Mr. Poole, what do you find is the hindrance to shrinking down costs? I mean our people work very hard. There is a lot of stress. There is overtime required, and I talk to controllers regularly. I go up in the towers and sometimes I sit in the second seat in a small airplane. And I go up and I ask them what their attitude is and see how they operate. I almost fainted when I first went up there and I saw that they had little paper slips that they were passing back and forth. And it is incredible to me, and I must say, whether it is Canada or the United States, how well the system operates. When you look at the number of movements that take place every day, Mr. Baker, the number of people that are carried, and thank the Lord so few incidents that have the kind of tragic result we have just witnessed, so few compared to the amount of effort and the amount of activity that takes place. I think it is miraculous and I think it is a real testimonial not only to the equipment, but rather to the personnel that man it. They do one terrific job. And, yes, when mistakes are made, they are often

caught and there is backup redundancy that takes care of the fact that we do not have a major collapse in the system.

But how do you get these costs down like that? I come out of the corporate world. I ran a big and very efficient company I think, yes. The stockholders always thought so. What is it that—what is the factor or couple of factors that—it has to be some single thing, it cannot be a whole series of little things; it has to be a major, major thing.

Mr. CRICHTON. Well, just briefly, Senator, in our case it was the application of normal commercial business practices to the system, and as I said in my remarks, we reduced the work force by nearly 20 percent, and that was almost exclusively in the administrative and overhead area, and we found the system, when we took it over, was fairly bureaucratic, was—there was a great deal of redundancy in the system in terms of people in different regional offices, for instance, throughout the country, where really a business would centralize a lot of those functions and so on. So we spent a lot of time on that, and also in terms of—just bringing into play normal commercial practices with respect to purchasing and so on and so forth. So that is how we have done it, and we baselined those costs and got it down.

Mr. BAKER. I think in our experience, looking at air traffic control corporations in a number of countries, two things seemed to stand out. One is the kind of administrative streamlining that Mr. Crichton just talked about, of really making an organization with fewer layers, and in very few cases are there reductions in number of actual controllers or technicians. It is much more the administrative overhead that can be cut significantly.

Second is a less complex procurement process with a greater willingness in selected cases of adapting off-the-shelf equipment and systems, rather than in-house doing a great deal of what you might call over-specifying to come up with unique products specifically for this job. Sometimes that is necessary, but not always, apparently, not to the degree that it is common within the FAA today.

Senator LAUTENBERG. Mr. Baker, your company is one of the bigger and better companies in the aviation business. You know that your operation is very much dependent on the effective use of a national resource, whether that is airspace, whether it is airports, the infrastructure that goes along with it, even things like transportation to and from the airports, all of these things have an effect on the way your business operates.

Now, one of the things that I am sure you have heard talked about a lot recently is the unlocking, so to speak, of the trust funds. Now, do air carriers believe that they have not gotten their money back from their contributions to the trust fund?

Mr. BAKER. I think the airlines are less able to have a view, and my company, in particular, as to how to fund what needs to be done, but we clearly can articulate what needs to be done and how that has to proceed. The trust fund is one of several alternative vehicles that can bring the money to the people who have to do the work. The airlines' view has consistently been that we need to get on with it, and that it is expensive, but we do not see many alternative approaches to solving the problem. Clearly the trust fund is another way in which money comes from our customers' pockets

into the process. If airlines, for instance, were charged on some kind of a user fee or direct basis, that is an indirect way of getting money from the ultimate passenger, because that would be reflected in our fares. So how we choose to do that process, the airlines have less of a concern than the fact that we eventually show up with the right amount of money at the right time to get the job done.

Senator LAUTENBERG. Now, because I pointed out in my opening statement that we appropriated roughly \$65 billion more for aviation since the development of the Airport Airways Trust Fund than has been collected into the trust fund, \$65 billion more. So it is a condition that looks like it has been well handled. I think hearing what we have heard today, both from Administrator Garvey, from the Inspector General, and our friends at the table with you now, that things are improving, and it has been catch-up. Believe me, when I came down here in 1982, I came out of the computer business. I ran a big company. It has 35,000—37,000 employees today, and it is a company I started with two other people, computer business. We celebrated our 50th anniversary last year and I was the oldest of the three, and I hope that my condition suggests that I have been able to work all of those years without showing excessive wear and tear.

But the fact of the matter is, that equipment that we abandoned way before I got here was the principal equipment used by the FAA. I was frightened by it, to see that we are so antiquated in a place that has such a hold or a control on safety, on scheduling, et cetera, but we have worked our way through getting better. The pace is slower than we would like to see. Very frankly, I speak for myself, and I think probably the airlines feel that way. Certainly Mr. Mead is still here, and I know that he has expressed interest in moving the process. That is what we would like to do.

Mr. BAKER. Senator, I would offer one comment, that when the Administrator flew on New Year's Eve—on American, I might add—through Dallas/Ft. Worth to San Francisco, I remarked to her, when she arrived in Dallas/Ft. Worth, that it is very interesting to note that when there is an immovable deadline, as a country we get things done.

Senator LAUTENBERG. Well, when it looks like the world is going to come apart if you do not, it sure does get finished.

Mr. BAKER. And the same thing happens in the corporate world. You cannot take slippages when you cannot move the deadline, and the same thing applies in public or the private sector.

Senator LAUTENBERG. We do have movable goal posts here, and it happens because—one of the reasons, I think, is because of the erratic nature of the funding mechanism, but that does not mean that we can just go ahead and put everything that we have in aviation—you folks could not handle it if we suddenly shut down the railroads or what-have-you. Imagine 10,000 more flights a year from Boston to down here, the northeast corridor, if we shut down Amtrak. It would—it is a shot that would be heard around the world. And we cannot afford to do that. And I just want to make sure that it is clearly understood that we appropriate a heck of a lot more into the fund, and we do it on a need basis. We do not do it on a mandatory basis, because there are favorites that various

chairmen might have, and you would see something come out of an area, a modular area in an efficient transportation system that could triple one area at the expense of another, and that just would not do us any good. You could not fly all the places where people need them.

So the—I am reminded of a question, Mr. Baker, about the airlines and how they feel about Air 21. Are you folks endorsing the Air 21 concept that has been—

Mr. BAKER. I think we endorse it as one possible way to deal with the problem, but not the only, and we urge that all of the respective views on how to do it come together quickly, and we get on with the funding.

Senator LAUTENBERG. Yes; I think you run a risk here, and that is, though you suggest that you are really are kind of flexible and do not have much of an opinion, an endorsement of that proposition is one that is going to, I think, meet an enormous amount of tension here, because that little exercise I just went through, if you take it to the planes and you leave out the trains, or you leave out the cars, I think you would see us one lopsided nation with lots of people not being able to get where they want to go, and one does not have to live in Washington, DC to know that the highways are crowded beyond their capacity to handle them. We have to have high-speed rail. We have to have things that will permit aviation to become even more efficient than it has incredibly been.

ADDITIONAL COMMITTEE QUESTIONS

Listen, thank you all for your testimony. We will take the opportunity to submit questions in writing, would ask for a prompt response, and Mr. Crichton, Mr. Poole, Mr. Baker, thank you very much.

[The following questions were not asked at the hearing, but were submitted to the nondepartmental witnesses for response subsequent to the hearing:]

QUESTIONS SUBMITTED TO MR. POOLE

QUESTIONS SUBMITTED BY SENATOR PETE V. DOMENICI

TECHNOLOGY, CURRENT SYSTEM, AND WORLD TREND

Question. Mr. Poole, you have been involved in transportation studies for a long time and particularly have focused on the U.S. Air Traffic Control System.

Do you believe the United States current Air Traffic Control System structure is sufficiently agile to keep pace with rapidly changing technology and sufficiently responsive to customer needs to ensure a modernized system?

Answer. No, the present U.S. ATC System is falling further and further behind today's rapidly moving electronics, computer, and satellite technology. It is also not, in actual practice, a customer-driven organization. Otherwise (for example), it would not have wasted a billion dollars on the now-abandoned Microwave Landing System that its users did not want. I do not believe the ATC System will be customer-driven until the customers are directly paying its bills—by means of payments for ATC services paid directly to the provider organization.

Question. In terms of global trends, would you say that our Air Traffic Control System is out-of-step with the direction many other countries seem to be taking to enhance system efficiency while preserving the highest level of safety?

Answer. Yes, the United States is definitely behind the curve. There are now at least 16 countries with a commercialized corporate organization for air traffic control, with direct user charges providing all or nearly all of these corporations' revenue. Such countries include Australia, Britain, Canada, Germany, New Zealand, Switzerland, and South Africa. These countries are modernizing more quickly and

at lower cost, their airline delays are being reduced (while ours are increasing), and their unit costs of providing ATC services are also coming down, resulting in lower fees to the users. Ten years ago this was mostly a matter of theory; today, it is a matter of fact.

BEST STRUCTURE FOR THE UNITED STATES

Question. Mr. Poole, you have done a tremendous amount of work and have studied how other countries have responded the similar problems in their Air Traffic Control System and modernization programs.

Of the structures you have studied, which one would be the best “fit” for the United States?

Answer. Our assessment is that the model adopted by Canada—of a not-for-profit corporation, funded by user fees and charges, and controlled by a board representing all principal stakeholders—is the best model to adapt for the United States.

Question. What are the major barriers to a structural change that you propose?

Answer. There is understandable attachment to the status quo by those operating the present system within the FAA and those in Congress responsible for oversight of its operations. Based on the overseas experience, we think ATC commercialization can be a positive change for most of the current staff, who should be considered part of the team that works out the details of the new system. And Congress will still have important oversight functions vis-a-vis DOT and FAA, especially regarding safety regulation of the new system.

The other main concerns arise from some segments of the airline industry and from much of the general aviation community. Both fear serious economic harm if they are faced with user fees that are significantly higher than what they currently pay in aviation user taxes. These concerns must be taken very seriously in developing the principles for ATC fees and charges—and are being given detailed attention in the work that my organization is currently carrying out.

COMPARISON OF AVIATION IN THE UNITED STATES AND CANADA

Question. Mr. Poole, some have argued that too many differences exist between the U.S. Air System and the Canadian Air System. They have stated that because of these differences, commercialization is not the best “fit” for the United States and would not translate into the same success as was experienced in Canada. I understand that the Canadian System is between one-fifth and one-eighth as large as the U.S. Air Traffic Control System.

Please compare the systems. What are the major differences between the United States and Canada?

Answer. The United States has 5 times as many aircraft movements, 3.2 times as many commercial aircraft, and 8.4 times as many general aviation aircraft as Canada. The countries are approximately equal in area, but most of Canada’s population is in its major cities, near its southern border with the United States, while the U.S. population and its major cities are far more geographically dispersed.

Question. Given these differences, how do you respond to those who make this argument?

Answer. The larger overall amounts of U.S. aviation activity would, of course, make this the largest ATC commercialization ever undertaken. But mere size does not argue against the idea’s feasibility. The satellite-based Future Air Navigation System (FANS) technology—based on GPS plus airborne data-link plus space and ground-based augmentation (such as LAAS and WAAS)—will provide huge increases in ATC capacity. The transition to this new technology is likely to be much smoother and done more cost-effectively by a customer-responsive organization of the kind we are proposing than by the FAA in its current form.

In terms of managing complex air space, what counts is not the overall numbers but the density and complexity of air traffic. Germany (whose system has been corporatized for 7 years) has some of the world’s most dense air traffic—yet its ATC corporation is handling it better than the former government agency did.

The most relevant difference between the United States and Canada is the much larger size of general aviation here, as a proportion of total aviation activity. Clearly, a commercialized system must deal realistically with this large and important set of players. Our ATC corporation proposal will present what we believe to be a fair deal for general aviation.

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

Question. Mr. Poole, you are an advocate of privatization. In your opinion, what are the major areas that we need to be concerned with if Congress decides to privatize the Air Traffic Control System?

Answer. Actually, when it comes to air traffic control, what I'm recommending is better described as corporatization or commercialization, since I do not think the system should be sold to or operated by a for-profit company. Rather, I recommend that we follow Canada's example and create a not-for-profit stakeholder-controlled corporation, funded directly by fees and charges paid by aviation users.

In that context, it is vital to structure the corporation so that all stakeholders are fairly represented in the decision-making, especially regarding fees and charges. It is also very important to make clear to the public that air safety will be strengthened, by putting the ATC provider (the new corporation) at arms-length from the safety regulator (the FAA), just as the airlines, general aviation, and the airframe manufacturers are all at arms-length from the safety regulator. This is seen as one of the important benefits of ATC corporatization in other countries.

Question. Mr. Poole, what are the major arguments for and against commercializing the Air Traffic Control System?

Answer. The major arguments in favor of commercialization are as follows:

1. To change the corporate culture of the ATC provider to one that is highly motivated to respond to user needs, because it is paid directly by its users for services provided.

2. To provide a dependable source of funding for both operations and ongoing modernization, via fees and charges that can support the issuance of revenue bonds.

3. To free the corporation from the remaining constraints of Federal personnel and procurement regulations, so that it is free to operate like other high-tech service businesses.

4. To remove the conflict of interest inherent in the FAA's current dual role as both ATC service provider and aviation safety regulator—thereby enhancing aviation safety.

The major arguments against appear to be:

1. The system should be run as a public service, not to make a profit. (But this objection is not relevant to a not-for-profit corporation like NAV Canada, which is what I am recommending.)

2. A commercialized system might pay less and employ fewer controllers. (In fact, the evidence suggests that corporatized systems tend to pay more (they pay whatever they need to, to obtain the best people for each position, especially for top management). On the other hand, it is likely that advanced technology will inevitably make ATC less labor-intensive, so the work force will shrink over time whether or not ATC is commercialized.)

3. A commercialized system might be dominated by the interests of major airlines, putting low-fare carriers and general aviation at risk. (This is why a stakeholder board governance structure is so critical to the design of the new system; it must serve the interests of all stakeholders.)

4. A commercialized system might jeopardize air safety. (I believe this to be the weakest argument against ATC commercialization. This change should strengthen air safety for three reasons: (1) It puts the safety regulator at arms-length from the service provider, ending today's inherent conflict-of-interest, (2) It facilitates a more-rapid shift to newer and better technology, which will make operations safer, and (3) The private liability insurers of the ATC corporation will provide an additional layer of safety oversight, besides that provided by the FAA.)

Question. Mr. Poole, if our Air Traffic Control System is commercialized, how would you ensure that large commercial air carriers do not over-shadow other smaller stakeholders, such as general aviation pilots, small carriers, and smaller airports?

Answer. The key ingredient is a carefully balanced stakeholder board, analogous to the board now governing NAV Canada. Our current draft proposal calls for a 15-member board, with 4 seats for various airline interests, 2 seats for general aviation interests, one representing airports, one representing ATC employees, and 2 representing the Federal Government (DOD and DOT). These 10 would select the CEO, and those 11 would select four independent, at-large directors.

Question. Mr. Poole, privatization is difficult to forward as an alternative management structure if we wait for all the interested parties: the Administration, the controllers, the airlines, General Aviation, Congress, and the flying public to agree on the specific details of the structure, isn't it?

Answer. Is it better to try to incrementally privatize like Mr. Mead suggests or to follow the United Kingdom's model where the decision is made to privatize, consistent with broad principles, and let the interested parties hammer out the details?

ATC commercialization was a user-led reform in Canada. I think we are moving toward airline-industry consensus on the general approach, and there seems to be parallel interest within the Administration (at least to the extent of something like their 1994–95 USATS Federal corporation proposal). Once a serious proposal is on the table with strong industry support, I believe that other stakeholders (primarily general aviation groups and employees) will be willing to negotiate what they consider to be a reasonable deal that protects their interests within that framework. But I agree that it is not necessary for Congress to decide on all the details. Better to enact a good, solid framework of principles and let the stakeholders work out the details.

QUESTIONS SUBMITTED TO MR. CRICHTON

QUESTIONS SUBMITTED BY SENATOR PETE V. DOMENICI

SAFETY

Question. Mr. Crichton, some have expressed concern about commercializing air traffic control primarily because they fear that safety would be compromised.

Based on your experience at NAV Canada, has safety increased, decreased, or remained the same since NAV Canada was established?

Answer. We believe the level of safety has increased. One measure is the significant reduction in the rate of operating irregularities per 100,000 flights that we have achieved.

In addition, the privatization has separated the service provider (NAV Canada) from the safety regulator (Transport Canada), whereas previously the service provider and the safety regulator were the same entity. An inherent structural conflict of interest has been removed and Transport Canada now conducts a robust safety oversight role to a degree which they never did before.

In addition, management at all levels in NAV Canada have a portion of their compensation linked to maintaining and enhancing safety levels.

NAV CANADA USER FEES STRUCTURE

Question. Mr. Crichton, some air traffic control users and stakeholders groups in the United States are wary of user charges. I understand that Canada's major aviation stakeholder groups were able to agree on a user fee structure.

Please describe NAV Canada's user fee structure. On what basis are they charged?

Answer. Large commercial air carriers pay movement based fees related to aircraft weight and distance flown. Smaller commercial air carriers have a choice of paying movement based fees or daily charges which have a cap. Small general aviation aircraft usually pay a flat annual fee related to the weight of the aircraft.

There are numerous categories and details too numerous to list here, but which can be accessed on our web site at www.navcanada.ca or through our Customer Guide to Charges which is being sent to you via courier.

Question. Who pays user fees and are any users exempted from charges, such as the military?

Answer. Some exemptions from air navigation services charges are provided for certain categories of flights. These are listed below:

- Gliders, ultralights and balloons;
- All aircraft weighing less than 600 kg (1,323 pounds);
- Aircraft or flights dedicated to search and rescue operated under the direction of police or the Department of National Defense;
- Aircraft or flights dedicated to firefighting and related operational training;
- Domestic U.S. flights which over fly Canadian airspace;
- Aircraft or flights dedicated to air ambulance operations paid by government;
- Test flights performed exclusively for the following purposes: Testing aircraft following overhauls, modifications, repairs and inspections for which a certificate of compliance is to be given; or Enabling aircraft to qualify for the issue or renewal of a certificate of airworthiness;
- Flights aborted (not reaching their next destination and returning to the point of flight departure) due to weather conditions;
- Flights taking part in air shows;
- Flights operated exclusively for a registered charity as defined in the Income Tax Act (Canada) or equivalent foreign statute;
- State aircraft of a foreign country, unless charging has been authorized by an Order-in-Council; and

—Aircraft or flights operated under the authority of the Minister of National Defense.

Question. What kind of appeal process exists regarding Nav Canada's fees and charges?

Answer. Fees and charges may be appealed by a user to the Canadian Transportation Agency if a user believes the fees and charges violate one or more of the charging principles set out in the Civil Air Navigation Services Commercialization Act or on the grounds that NAV Canada failed to abide by the notice provisions in the Act. The relevant sections of the Act are 32 through 54 inclusive. We will forward to you by courier a copy of the Act.

Question. Did Canada eliminate specific taxes to compensate for the new user fees?

Answer. Yes; while in government, the ANS was largely financed through the proceeds of the Air Transportation Tax on tickets issued to passengers for flights which originated or terminated in Canada. This tax had a maximum cap of \$55 per ticket and was repealed in two stages as NAV Canada phased in its user fees. This tax was totally repealed in November 1998.

SUCSESSES OF NAV CANADA

Question. Mr. Crichton, I understand that NAV Canada has improved air traffic control efficiently, developed cutting edge technological solutions to air traffic control challenges, increased controller productivity and lowered the cost to system users by more than 30 percent.

In your opinion, would this impressive set of accomplishments be possible if the government were directly involved in the day-to-day operation of NAV Canada?

Answer. No, most of these achievements would not have been possible and the government recognized this as one of their motivating factors in pursuing the privatization. The government realized that its structure related to personnel policies, procurement, capital program management and customer responsiveness was ill suited to what amounted to the provision of a complex commercial service in a fast paced, commercial market place.

PROSPECT OF THE NAV CANADA MODEL IN THE UNITED STATES

Question. Mr. Crichton, NAV Canada clearly has impressive results. Your organization has lowered capital expenditures while improving efficiency and air side capacity.

In your opinion, would the NAV Canada model be successful in the United States?

Answer. In my opinion it would be. The NAV Canada model elegantly balances the vital interests of all ANS stakeholders.

Question. The government retains its main public interest preoccupation to oversee safety while at the same time receiving a substantial sum of money for the assets while shedding any ongoing financial liability. The commercial airlines obtain a low cost, customer driven private sector corporation in which they participate at the Board of Directors level. General Aviation obtains service guarantees, reasonable costs and a seat at the Board table. The ANS unions also receive Board representation and formal recognition of their vital role.

What are the main difference between the United States and Canada that would make it more difficult to adopt a model like NAV Canada?

Answer. I believe the main differences, between the United States and Canadian ANS's are quantitative rather than qualitative. The United States is the largest ANS in the world and Canada is number two. Proper commercial management principles will work in both cases. Some other differences are the attitude of general aviation and organized labour. However, I think their concerns are capable of being addressed as we did in Canada provided the political will is there along with some industry leadership.

ACCESS TO SMALL AND RURAL COMMUNITIES

Question. Mr. Crichton, as you know, New Mexico has many small and rural communities. Air service is very important to these communities, and contributes to their economic well-being.

Do any protections exist either in the NAV Canada legislation or operating procedures pertaining to air access to small or rural communities? If so, please describe the protections.

Answer. Yes; the legislation contains specific protections for northern and remote communities. These protections are contained in sections 18 through 22. In effect these communities are given a veto over reductions in service levels which can only be overridden by the Federal Minister of Transport.

Question. Has NAV Canada identified any air traffic services where the costs far exceed the returns?

Yes; and they generally fall into the category of services provided to remote communities and general aviation. However, these tradeoffs have been accepted by most stakeholders as reasonable in the context of operating a national ANS in a country as large and diverse as Canada.

Question. Has NAV Canada discontinued air service in a rural community?

Answer. No; we have, however, adjusted the method of service delivery in some communities without materially affecting the level of service.

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

Question. Mr. Crichton, the FAA has had difficulty increasing air traffic controller productivity, yet NAV Canada has increased productivity by about 20 percent. Why have you been so successful in this area while FAA has had so much difficulty?

Answer. I cannot comment on the FAA situation as I am not familiar with their specific issues. NAV Canada's approach with our controllers' union was to offer significant wage increases provided there were substantial quid pro quo's in work rule changes to enhance productivity in a real and measurable sense. These goals were attained through long, intensive, hard bargaining. It was not easy and management had to stand its ground in spite of intense pressure—in this we had the full support of our Board of Directors and ultimately the Federal Government, who was prepared to intervene in the event of a strike.

Question. Mr. Crichton, recent concerns about increases in delays and cancellations and customer dissatisfaction with airline service in the United States has fueled debate about the need to restructure or commercialize its air traffic control system. What impact has privatization had on airline delays and safety in Canada?

Answer. Since NAV Canada took over, delays attributable to ATC have been gradually reduced. This has been accomplished through a variety of means:

- Increased controller staffing levels to fill chronic shortages inherited from government;
- Increased customer collaboration in decision making;
- Increased focus on quickly introducing proven, automated systems and procedures that expedite traffic flows; and
- Enhancement of Safety under NAV Canada.

QUESTION SUBMITTED BY SENATOR CHARLES E. GRASSLEY

Question. Mr. Crichton, I understand that each Federal employee working for NAV Canada received a one-time payment of approximately \$14,000 U.S. dollars. Who bore the cost of that payment, NAV Canada or the government? Do you feel such separation pay was critical to the success of NAV Canada?

Answer. The background behind this payment is that it was a contractual obligation of the Federal Government to its employees. Many years ago the Federal Government agreed to a severance arrangement whereby if any Federal employee ceased to be a Federal public servant, they would be paid a one-time severance equal to 1 week's salary for each year of service up to a maximum number of weeks.

This was simply a contractual obligation that was triggered by the privatization. There were two choices. The government could pay the employees directly in cash on transfer to NAV Canada, or pay the accrued liability to NAV Canada as a closing adjustment with NAV Canada becoming liable to make the payment to individuals when they eventually left NAV Canada. It was the preference of employees to receive the money in cash when they transferred over and the government agreed to this.

I do not believe that this situation had any effect on NAV Canada, as it was a longstanding legal obligation pertaining to the government to which NAV Canada was not a party and it was seen as such. On the other hand, if the Federal Government had tried to back away from this obligation, the employees would have no doubt sought legal redress and this would have adversely affected morale. Happily, this did not happen.

SUBCOMMITTEE RECESS

Senator DOMENICI. We stand in recess.

[Whereupon, at 12:56 p.m., Thursday, February 3, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENT OF TRANSPORTATION AND RE-
LATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

THURSDAY, FEBRUARY 10, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:08 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Specter, Bond, Bennett, Campbell, Stevens, Lautenberg, Byrd, Kohl, and Murray.

DEPARTMENT OF TRANSPORTATION

OFFICE OF THE SECRETARY

STATEMENT OF RODNEY E. SLATER, SECRETARY OF TRANSPORTATION

OPENING REMARKS

Senator SHELBY. The committee will come to order.

Mr. Secretary, we welcome you, again, to the committee.

Secretary SLATER. Thank you, Mr. Chairman.

Senator SHELBY. You have been here many times. We have worked with you on many, many issues.

My colleague, Senator Lautenberg, who is the ranking Democrat on the Budget Committee, has to go to the budget hearings. And I am going to defer to him at this time for the first opening statement, and then I will pick it up.

Senator LAUTENBERG. Okay.

Senator SHELBY. Senator Lautenberg.

STATEMENT OF SENATOR FRANK LAUTENBERG

Senator LAUTENBERG. That is very kind, Mr. Chairman. I thank my colleagues, as well, for indulging me for just these few minutes.

I wanted to be here to welcome Secretary Slater and his staff to our hearing this morning as we review the President's budget request for the Department of Transportation for fiscal 2001.

With this budget, the Administration has shown that transportation should be and will be a priority, even as overall Federal spending is held down to reasonable limits. The President's request for the DOT of just under \$55 billion represents a 9.4 percent increase above the level enacted for the current fiscal year.

And I think it is important to point out that if we are successful in matching the Administration's request in the 2001 appropriations bill, overall Department of Transportation funding will have risen more than \$12.4 billion or almost 30 percent since my friend, Senator Shelby, took the reins of this subcommittee.

Last week, during our joint hearing with the Budget Committee on the topic of aviation finance, I emphasized that an appropriate balance must be maintained when we invest in improvements to our national transportation enterprise.

The Administration's budget for the fiscal year 2001, I believe, reflects that balance. And I am very pleased to see the sizable increases requested for both the FAA and the Coast Guard's operating budget. Both of these agencies have been stretched to the max. The FAA has some new equipment coming online that must be installed and maintained.

The Coast Guard, according to the Commandant, Admiral Loy, has exhausted itself fighting the war on drugs in the Caribbean, interrupting illegal immigration, addressing the critical domestic missions here at home. I had the opportunity, over these past few weeks, to be down at the South Pole and to watch one of our Coast Guard icebreakers do its job; monotonous and exhausting, hard, but it is essential. Wherever you see the hand of the United States extended, it always seems to carry a Coast Guard implication with it.

So, I am pleased to see these rather healthy increases that will allow these agencies to operate at full capacity and at full effectiveness.

MASS TRANSIT

And as we turn our attention to the infrastructure programs, here, again, the Administration has maintained its commitment as to balance between all modes of transportation. The Federal Transit Administration is slated to receive a 9 percent increase. It is welcome news, frankly, to a Senator from the most densely populated state in the nation.

Specifically, in my State, they have requested \$121 million for the Hudson-Bergen light rail system and \$10 million for the Newark-Elizabeth rail link. And perhaps, most importantly, this budget also formerly signals the Administration's intention to sign a full funding grant agreement for Phase II of the Hudson-Bergen light rail system. Once completed, Phase II of the system will realize a long-awaited goal; giving 100,000 riders a day improved access between our major cities in northern New Jersey and ultimately to the marketplace in New York City.

While I know that some of the funding sources for the Administration's new initiatives might be controversial, I want to commend the Administration's drive to get more productivity out of our transportation system. In this day and age, we must carefully consider the environmental impacts of our transportation improvements, and we must also face the fact that we are constrained, not only in the availability of unused right-of-way, but also the availability of funds.

We must make aggressive efforts to get more out of our existing transportation infrastructure. That means getting more produc-

tivity out of our highway system. And the President's proposed \$140 million increase in the Intelligent Transportation Systems, a boost of 143 percent, is intended to do just that. So is the President's proposal to use \$468 million for a new high-speed rail initiative.

HIGH-SPEED RAIL

I am pleased that we are finally making some progress on the issue of high-speed rail. Our transportation infrastructure is bursting at the seams from overuse. And our ability to build new roads and airports is limited. We just don't have the space in many of the areas of the country.

At the same time, our rail infrastructure suffers from serious under investment and remains a largely untapped resource. While we have almost tripled our Federal investment in highways and aviation, over the past 20 years, investment in our national passenger rail system is actually 50 percent lower than it was 20 years ago.

If we are to maintain a balanced transportation system capable of dealing with increasing travel demands, then we must reverse this trend and begin matching our investments in highways and aviation with serious investments in our rail infrastructure.

That is why I introduced the High-Speed Rail Investment Act last fall. This legislation uses innovative financing to provide \$10 billion in capital funds for the development of high-speed rail corridors across the nation over the next 10 years. We currently have a bipartisan group of 32 cosponsors in the Senate, and companion House legislation will be introduced by a bipartisan group led by Congressman Oberstar and Congressman Houghton.

Mr. Secretary, I hope that we will be able to work together to provide a secure and long-term funding source for the development of high-speed rail corridors across the country.

AMTRAK

On the subject of passenger rail, Mr. Chairman, I have got to express my concern over the fact that our current hearing schedule allows no opportunity for Amtrak to testify before the subcommittee this year. When you add together the Administration's high-speed rail initiative and Amtrak's core budget request, we have a pending budget request before the subcommittee for intercity passenger rail of almost \$1 billion.

Now, I think we have a responsibility to hear from Amtrak on this request. And I would hope that we could find time on the schedule to do that. I note that on March 2, you have scheduled a hearing on the implementation of the Driver's Privacy Protection Act, and I am pleased that we are going to have that hearing, but I believe that if we are going to set aside a spot to have a hearing that is authorizing in nature, we ought to also take the time to have a hearing on Amtrak, Mr. Chairman. I hope that we will be able to do that.

I want to thank you for the courtesy extended. And once again, I thank the Secretary and this whole team. They work hard at the job. We do not always give them the resources that are necessary

to do the job, but they do very well with what they get. And I hope that we will continue to be able to support them, as needed.

Thank you.

OPENING STATEMENT OF SENATOR RICHARD SHELBY

Senator SHELBY. Thank you. Mr. Secretary, I will try to be as brief as I can. We have a lot of people here today.

I must admit, however, that this is the most creative budget that I have seen since becoming chairman of the subcommittee. At first blush, it appears that the President's budget increases Federal spending on transportation by nearly \$5 billion, but on a closer inspection of this budget, the Administration clearly is taking credit for numbers that were set by TEA-21, additional funds which became available because of higher than anticipated gas tax revenues, and spending financed by new user tax increases that the Congress has already rejected. In the end, this is barely a current services budget.

USER FEES

Mr. Secretary, the President's budget request is not only misleading, I think it is dangerous. It assumes that new user fees for aviation, rail safety inspections, marine navigation aids, and hazardous materials will offset \$1.3 billion of this budget's costs. The proposals have been submitted to Congress each year that I have been chairman of the subcommittee, and each year, Mr. Secretary, I have told you that Congress is not interested in enacting new user taxes increases on the transportation community. Perhaps it is time to adopt, Mr. Secretary, a "three-strikes-and-you're-out" law for budget gimmicks.

REVENUE ALIGNED BUDGET AUTHORITY

Also, this budget includes proposals to divert highway gas tax revenues to other activities, such as passenger rail, highway safety programs, and motor carrier inspections. These may be popular programs which merit our consideration for funding, but I can assure you that proposals to fund these types of programs with gas tax revenues are as dead on arrival in the Senate as new user fees.

The widespread practice of transferring funds in this budget is largely the result of the budgetary firewalls on certain transportation accounts. Considering the excessive movement of funds, I fail to understand, Mr. Secretary, why I would read press reports indicating that you are willing to support an aviation firewall.

This would only exacerbate the conditions that forced you to resort to gimmicks in the first place and would further tie your hands in managing all the transportation programs for which you, as Secretary, have the responsibility.

The President's budget request is not only misleading, it is irresponsible. It raises expectations of various user groups and interested parties, while both of us know that neither you nor I can deliver on the empty promises it makes to diverting highway dollars to non-highway accounts or activities offset by new user tax fees.

I think we may need to look for a mechanism that requires the Department to present a budget that internally offsets any spend-

ing which requires shifting resources out of a protected budgetary account to a non-eligible transportation account or which is funded by new user fees that the Department doesn't even have the cost accounting system in place to implement.

Other than that, Mr. Secretary, it is great to see you. You are always welcome here. I have certainly enjoyed working with you. And once we get past this, we will get down to other things.

Secretary SLATER. Thank you, sir.

Senator SHELBY. Senator Byrd.

STATEMENT OF SENATOR ROBERT C. BYRD

Senator BYRD. Mr. Chairman, thank you.

TEA-21

A healthy national transportation system is a vital component of a prosperous future. TEA-21, as it is known, was a great legislative accomplishment of the last Congress, and one in which I was deeply involved, as the Secretary is well aware.

A key feature of TEA-21 is that it placed into law a mechanism to ensure that all funds deposited into the highway account of our Highway Trust Fund will be spent on the purposes for which they are collected; namely, the construction and restoration of our nation's highways. In doing so, TEA-21 re-established the trust in the Highway Trust Fund.

TEA-21, like any major piece of legislation, represented a compromise between many different regional interests and differing policy positions held by members of the House of Representatives, the Senate, and the Administration.

I do not attend many signing ceremonies, but I did attend the signing ceremony for TEA-21. It was the only signing ceremony I have attended, I suppose, in many years. And I can tell you that on that day, there were not any "nay sayers" to be found in this town to tell the President that he should not sign it. Everybody had already made their compromise. That is grammatically incorrect. Everyone had already made his or her compromise. Everyone had something to be proud of in that bill.

EMERGENCY RELIEF

Even so, the Administration is now proposing a number of major changes to TEA-21. Perhaps the most destructive of these proposals is the Administration's plan to take a portion of the highway funding provided in TEA-21 away from all 50 States, in order to address a backlog of emergency relief applications.

Every year, in the past, when the cost of these applications has exceeded the funds available, Administrations—be they Republican or Democratic—have submitted requests for emergency appropriations. Without exception, Congress has always provided the necessary emergency relief appropriations. But, in the last 2 years, a new pattern has emerged.

This Administration has knowingly allowed the amount of unfunded applications for emergency relief to grow to more than \$600 million. And now, rather than request these funds as an emergency supplemental appropriation, the Administration, instead, is pro-

posing to address the bulk of the backlog by diverting some \$400 million from the highway funding allocated to the States under TEA-21.

This new approach is particularly perplexing when one looks at the fiscal year 2000 emergency appropriations the Administration is requesting. Among them, the almost \$1 billion requested to assist Colombia in its drug war.

Appropriately, roughly \$250 million in emergency assistance is being requested for victims of Hurricanes Floyd and Dennis, and the forest fires in the west. But these same disasters caused destruction to our Federal highways. And yet, the Administration is saying that highway damages caused by natural disasters are not emergencies; that instead, we should take highway funds from all 50 States to cover those costs.

REDIRECTING HIGHWAY FUNDING

I am also concerned by another proposal of the Administration; namely, to divert another \$600 million in funds that were guaranteed for highway construction under TEA-21 and use them for purposes completely outside of the Federal Highway Administration.

This is the second year in a row that the Administration has made a proposal of this kind; and frankly, I believe it represents a gross abuse of the trust that we established with the American people in TEA-21. The amounts that were guaranteed for highway spending under TEA-21 should be spent on highways.

This Administration is, instead, proposing once again to rewrite TEA-21 to send needed highway funds to programs, such as new high-speed rail initiatives, highway research efforts, and welfare-to-work programs in the Federal Transit Administration.

I want to emphasize that I am not, necessarily, opposed to any of these initiatives, but they should be justified on their own merits. I am very much opposed to deriving their funding by redirecting funds that were guaranteed for highway construction under TEA-21.

And finally, I am disturbed by the Administration's proposal to rewrite TEA-21 in a manner that chooses a new set of winners and losers within the Federal-aid Highway Program. Under the President's proposed budget, certain authorized programs would receive increases in both contract authority and obligational authority, well above the levels called for in TEA-21.

Most of these selected programs would be effectively guaranteed 100 cents on the dollar of their proposed increase. Since the total amount of spending is set in TEA-21, the Administration is required to cut the amount of obligational authority that will be available to all other programs in order to pay for their proposed increases.

Let me state that more clearly: When the Administration proposes to fund certain programs at levels above the authorizations in TEA-21, those dollars must come out of someone else's allocation.

When one reviews the details of the Administration's proposal, it is clear that the biggest loser in the Administration's sweepstakes is the formula funding provided to the States. Formula funding to all 50 States would be cut by more than \$1.2 billion in obligational

authority below the levels called for under TEA-21. Within that amount, funds available for the Appalachian Development Highway System would be reduced by almost \$10 million.

Mr. Chairman, when we have the opportunity to question the Secretary about the details of his budget proposal, I look forward to inquiring as to the rationale behind some of the winners and losers that have been chosen in developing this budget.

MISSISSIPPI DELTA AND APPALACHIA

I do not agree that this is the time or the place to rewrite TEA-21. And, I most certainly do not agree that funding for the Appalachian Highway System should take a cut in order to fund any other program in TEA-21 that the Administration has decided is more important.

It is ironic, in the extreme, Mr. Chairman, that one of the new initiatives for which the Administration is seeking funding is an effort to reduce poverty in the Mississippi Delta through increased road construction. The mission of this initiative is identical to that of the Appalachian Development Highway System. Yet, this budget proposes to fund the—and I am not against funding it—but proposes to fund this new Mississippi Delta program at the same time that the Administration is proposing to cut funding for the Appalachian Development Highway System, in connection with which, the people of Appalachia were promised a highway system in 1964 or 1965—35 years ago. It is not complete, yet.

I shall not support that approach. And, I trust that this subcommittee will not support it either.

Now, despite my concerns with the budget, I, along with others, certainly welcome the Secretary here this morning. We have worked well together in the past. He is a skilled and knowledgeable Cabinet officer. We do not always agree, but, so what?

He has always been honest—and my statement says here “and forthright” with me. I think, last year, we had a little problem understanding just what kind of a curve ball he was trying to throw the subcommittee. But, he is a gentleman and a scholar. And, I look forward to hearing his testimony this morning.

Senator SHELBY. Senator Campbell.

STATEMENT OF SENATOR BEN NIGHTHORSE CAMPBELL

Senator CAMPBELL. Thank you, Mr. Chairman. I appreciate the time. I understand we have a vote in about 20 minutes. So, I am going to try and make my statement brief. But I also welcome Mr. Secretary—

Secretary SLATER. Thank you, Senator.

Senator CAMPBELL [continuing]. And also thank you for being accessible. We haven't always agreed, but you have been there and willing to discuss our differences. And I appreciate that.

GAS TAX REVENUES

I want to just maybe make a couple of comments alluding to what my friends have already spoken to. I, also, am very concerned about the President's budget, because as I understand it, these increases are going to have to come from fuel taxes—increased fuel

taxes. And I do not know if you have purchased gas in the last few days, but I have, and it is already just literally out of sight. We get calls in our office all the time wondering why Congress is not doing something to keep the price of gasoline at the pumps down.

And I am also concerned that the President's plan wants to redirect that money to pay for trains and transit programs. Senator Byrd spoke to that. Senator Shelby did, too. But TEA-21 contained provisions that all of the gas tax revenues would go toward transportation improvements, and any surplus would be divided among the States.

And as Senator Byrd has said, there are going to be some winners and loser under the President's budget, but I can tell you, as I see the numbers, Colorado is clearly going to be a loser. Under TEA-21, we should receive \$308,110,281 in gas tax surplus. In the President's budget, we are going to lose over \$15 million and would actually only receive just a little over \$292 million.

We have the fourth fastest growing State, as you know. And we are going to have to fight for every dollar. So, from my perspective, that simply will not fly with the people of Colorado; the fact that we are going to actually lose money, when we need so much help in a fast-growing State.

NUCLEAR WASTE

Let me also just mention one other thing. This is not really in your purview or jurisdiction, but as of 11 o'clock, it very well may be, if the Nuclear Waste Bill passes.

Many of us are very divided on that. I have spoken to my Department of Transportation, yesterday, in Colorado, and a number of very interested parties, like Colorado Ski Country, which is one of our biggest employers—it is the backbone of our tourist industry, as you probably know. If this bill passes, the transportation of nuclear waste—I assume that the routes are going to be set by the Department of Transportation.

We do not have very many options, because the main corridors for both rail and highways go through our metropolitan areas of Denver, as you probably know. Many people are still gun-shy out there, if I can use that word, from less than two decades ago, when a truckload of torpedoes turned over right in the main intersection in the middle of Denver—what was called the Mousetrap.

It was days before they could get that cleaned up, because nobody knew if they were armed or if they were dangerous and a number of other things.

I can tell you that there are places that you have traveled in our State, where the rails go by—in Glenwood Canyon, as an example—1,000 feet straight down to rivers down below. And accidents regularly happen; not so much with trains, but certainly on the trucks.

We have 6 and 7 percent grades going over the Rocky Mountains; in fact, more than our neighbor to the north, Wyoming and Montana, and more than our neighbor to the south, New Mexico. And it simply could be just a devastating thing in our State if there was some kind of a wreck, an accident.

Now, I understand the thinking. Everybody wants to get rid of that stuff. I liken it sometimes to the guy that builds a nice home,

but he wants to put the septic system on his neighbor's land. Everybody wants the jobs, the economic opportunity, and so on, from those wonderful union jobs that are paid at these plants, but they do not want the waste in their State.

They want to dump it in somebody else's. And the fact of the matter is, we have got a couple of places like that, and Colorado would probably like to get rid of it, but you think of the danger of transporting it.

I was going to ask you, if we have the time, if you have given any thought about alternative routes; about where the State would come in; who would have the final jurisdiction if the State disagrees with the route, other than the Federal Government; and would we have some of those routes just literally foisted upon us, when we think it could be terrifically dangerous?

So, I will stop with that comment, Mr. Chairman, and hope we have some time to get into some questions before we vote.

Senator SHELBY. Senator Bond.

STATEMENT OF SENATOR CHRISTOPHER BOND

Senator BOND. Thank you very much, Mr. Chairman. Mr. Secretary, it is good to see you again and to have the opportunity to talk with you. Obviously, we have some warm issues that we need to discuss.

I express my personal appreciation to you for your understanding of the needs that we have in Missouri. Being right at the heart of the nation, we are the crossroads, the cross-section for all kinds of transportation. And you have helped us with bridges and with highways. And you know the importance of rail and air transport to our State.

HIGHWAY TRUST FUND

I will submit a much longer statement for the record, because, like many of the other members of the committee, I have two other hearings that I have to attend right now, but I do want to follow-up on the comments that have been made about the President's proposed robbing of the Highway Trust Fund. There is very little I could say that could improve upon the statements of Senator Byrd, Chairman Shelby.

I think gross abuse of trust is probably a good way to phrase the raid that has been proposed on TEA-21. We worked TEA-21 out as a long, hard compromise. You may remember that that compromise was one that I joined with our dear late friend Senator John Chafee, to fashion. We worked with people on all sides—on this committee, on the budget committee—and we achieved what we think is a compromise. Nobody got everything they wanted, but that is why it is called compromise. That is why it is called legislation. Back in Missouri, they call it the Bond-Chafee Plan.

Now, it is possible to run over me on this, but I think I have got a lot of friends. And my guess is that this dog is not going to hunt. And I would hope that you would not bother wasting our time trying to pursue something that is so outrageous and such a flagrant violation of the spirit of compromise that was accomplished in TEA-21.

AVIATION SAFETY

Let me touch briefly on a couple of other things. I hope that you will talk about the Open Skies Agreements which are necessary to facilitate increased global trade.

The International Civil Aviation Organization performed an audit of the FAA to determine if it met international standards, and it did. And I also would be interested in knowing to what extent you are providing assistance to other countries to meet the terms of the ICAO audit.

Finally, and very important to me, as one who flies often and who was stopped by a television reporter in Miami on Sunday to ask if I dared get onto an MD-80 aircraft after the tragedy of the Alaskan Airlines flight.

I join with my colleagues in extending our deepest sympathy to the families and friends of the victims of that flight. But we also need to know, going forward, whether the outstanding safety record of the MD-80 is in place. We want to be assured, as the traveling public wants to know, what steps are being taken to assure the safety of the MD-80 and others.

I indicated on that unexpected interview that we were going to be on the FAA like a dog on a bone, if they did not assure the safety for the traveling public of that and the other airplanes. I believe that assuring the safety is something that all of us demand from the FAA. And we urge your priority attention to this matter.

Again, my apologies for having to leave, but I will submit this, Mr. Chairman, and look forward to reading the record and following the discussions in this committee.

Senator SHELBY. Senator Kohl.

STATEMENT OF SENATOR HERB KOHL

Senator KOHL. Thank you, Mr. Chairman, and welcome, Mr. Slater.

Secretary SLATER. Thank you, Senator.

Senator KOHL. We appreciate your coming before us today to discuss the Department of Transportation budget for fiscal year 2001.

I need to be at another hearing in a few minutes, but I want to point out a few concerns this morning. We look forward to working with you as the appropriations process continues.

HIGHWAY TAX SHIFT

The transportation budget you have put forward for fiscal year 2001 continues our strong investment in highways and transit to areas in which we have made great progress. But your budget also presents some false choices on other issues.

For example, you suggest shifting \$468 million in highway dollars to a new high-speed rail capital account. Now, we share the same goals, Mr. Secretary. The Midwestern States are energized about high-speed rail and would clearly benefit from this funding, but it is unfair to condition that support on a choice between highways and rail.

So, while the overture of Federal support is greatly appreciated, it is my hope that you will also help with more clear-cut solutions,

such as Senator Lautenberg's legislation to establish a high-speed rail tax credit.

LORAN-C RADIO NAVIGATION

Mr. Secretary, this budget provides \$20 million for LORAN-C radio navigation upgrades, an account that your department had long ignored in previous budget requests.

We thank you for coming around to our consistent support for this vital safety and navigation aid, but as you know, we have now been in policy limbo on LORAN for over 6 years, and you have failed to deliver the promised announcement on LORAN's continuation.

The Administration's handling of this issue has reached a point of embarrassment. Now that you have delivered the dollars to LORAN, you need to work much harder at delivering policy direction and leadership.

GREAT LAKES ICEBREAKER

On a separate subject, and on behalf of the Great Lakes, let me commend you for providing \$110 million for the Mackinaw icebreaker replacement vessel. The productive life is nearing an end, so this funding is a major priority for the Midwestern region.

We are also encouraged by your funding for three more Coast Guard buoy tenders for construction at Wisconsin's Marinette Marine.

AIRLINE COMPETITION

Lastly, Mr. Slater, we continue to be concerned about the state of airline competition. Travelers in Wisconsin and many other smaller and medium-sized markets continue to have few alternatives to the large incumbent carriers on many routes. As a result, only some of the benefits promised during the airline deregulation have been realized. Fares continue to be high on many routes and choice of services limited.

Moreover, startup carriers face serious obstacles in establishing competing service to the incumbent carriers. These include arguably predatory conduct by the incumbents, designed to drive their competitors out of the market. And for their part, the established large airlines seem to be content to divide the country into separate fiefdoms defended by fortress hubs, avoiding competing with each other, and thereby ensuring high fares and high profits.

In my opinion, the large airlines' behavior may not, in many instances, be unlawful under the prevailing anti-trust laws; however, it is clear that abuses exist in the airline industry and that the competitive conditions are far, far from ideal.

It is time, Mr. Secretary, for serious efforts at promoting airline competition and preventing the abuses which continue to occur.

Again, I need to move on this morning, but thank you for coming before us, Mr. Secretary. And you can expect to continue our discussions and exchanges on these important issues.

Thank you, Mr. Chairman.

Senator SHELBY. Senator Bennett.

STATEMENT OF SENATOR ROBERT BENNETT

Senator BENNETT. Thank you very much, Mr. Chairman.
Mr. Secretary, welcome.

Secretary SLATER. Thank you, Senator.

Senator BENNETT. I am interested in your opening statement, that you quote my old boss, John Volpe, and remind me once again that I sat at that same table at Mr. Volpe's side before this subcommittee. I do not know whether Senator Byrd was on it at the time, but I rather suspect he probably was, back in 1969 and 1970. The problems John Volpe addressed, to which you refer, are still with you, and they still will be.

Being Secretary of Transportation is like being Sisyphus. You keep pushing that rock up the hill and it keeps rolling back down. So, I congratulate you on your determination to keep pushing it forward and deal with this. And I will not visit all of the other issues that my colleagues have visited, because I think you have gotten the message rather strongly from them. And I will not pile on.

I-15 DESIGN-BUILD PROJECT

I do want to do some parochial things and extend my congratulations and gratitude to you and to the Department—your predecessors at the Department—for the way you have worked with us in Utah on the I-15 Design-Build Project.

If I might boast a little for my colleagues, this is a major redesign-rebuild of a critical highway section in the heart of the population core of the State of Utah, which, under normal circumstances, would take 9 years. It is being done in four-and-a-half, in a design-build project that is kind of a model project that the Department of Transportation is watching.

And at the moment, it is ahead of schedule and under budget. It is the flexibility that the Secretary has shown, the application of discretionary funds, in a logical way that has made it possible. We are very grateful to you for your willingness to do that. We think we will become a model for other projects around the country that will show acceleration of time and an impact on the budget.

I would be remiss if I did not recognize Jack Basso, who is here with you, Mr. Secretary, who has been extremely helpful in the pressure-cooker that we have of the Olympics. Nothing would be worse for us in Utah, or I think more embarrassing for Americans, to have the Olympics come to Utah and have the television cameras show nothing but orange cones and traffic jams getting to and from the Olympics.

Mr. Basso, working with the Utah Transit Authority and the Salt Lake Olympic Committee, as well as the members of the Congress, both here and in the House, if I may—the members of the other body have been a little bit more difficult to deal with than Mr. Basso has, but I think it is a tribute to you, Mr. Secretary, that you are surrounded by people of quality, who have the attitude of "Let's get it done," rather than the attitude of "Gee. What are the previous regulations and here are the reasons why we can't get it done."

We, in Utah, are very grateful to this Secretary and to this Department for the work you have done.

UTAH VALLEY RADAR COVERAGE

I still have an item that I would like to discuss with Jane Garvey. I understand she is not scheduled to appear before the subcommittee. She will not be surprised to hear me raise it once again—the need for additional radar coverage for the approach over Utah Valley for airliners coming into Salt Lake.

The FAA now tells us they intend to place a temporary ASR-9 or ASR-11 radar unit in that position for the period of the Olympic games. We continue to be perplexed why this installation is not permanent.

As I say, Administrator Garvey will not be surprised, because I have raised this with her before, but at least we now have the temporary placement of a radar coverage there. That, at least, is some kind of recognition of the fact that there is a problem. Anything that you might do to inquire into what would be necessary to make that permanent, would be much appreciated.

Thank you.

Senator SHELBY. Senator Murray.

STATEMENT OF SENATOR PATTY MURRAY

Senator MURRAY. Thank you, Mr. Chairman. And thank you, Mr. Secretary, for coming up to the Hill today to discuss your budget.

On a personal note, I just want to express my appreciation to you and your staff for the tremendous amount of work they had done and help they have provided in Washington State. We have dealt with a lot of difficult issues out there, from rescue tugs to pipelines to freight mobility. Your staff has always been great to work with, and you have, as well. And I just want to express my appreciation.

I have had a chance to look at your budget. I think it is one that the members of this committee can work with. I think you have done a good job. It moves us toward our common goals of improving safety and mobility, economic growth, and environmental protection. And I am especially pleased with your increased investments in FTA and RSPA. I really think you have done a good job with it.

PUGET SOUND

I have a couple of things I want to mention, since I do not think we are going to get back around to questioning. I have some comments on your request for new start transit projects and full funding agreements. That is a very important issue to the Puget Sound area. We were ranked second worst traffic in the nation last year. It is not a title we are proud of. This is very important to our voters. It is strongly supported at home. Hopefully, we can get your commitment to work with us to get a full funding grant agreement this year, so we can move that project forward.

CORRIDORS AND BORDERS

Second, I wanted to mention the Border and Trade Corridor Program. You are more than doubling the funds for that. This is an

essential program. We have a lot of trade that goes back and forth between Canada and Washington. The State of Washington is the most trade-dependent State in the nation.

With the recent incident of suspected terrorism at the border, there is a new energy to this, because we want to make sure that those who are not supposed to get across the border, do not. But we also have a lot of economic activity. One of our projects assists in these border activities.

We also need to move containers quickly, efficiently, and safely with our Fast Corridor Project. So, that is extremely important to our State as well. Overall, we urge you to look at awarding projects to those who have the best policies and momentum in place, because that is very important to us.

PIPELINE SAFETY

Finally, an issue you and I have talked a lot about since last June 10, is the issue of pipeline safety. A number of my colleagues that I have talked to have heard me talk about this issue. We had a pipeline accident in the State of Washington last June 10, where three young children were killed and 270,000 gallons of gasoline were dumped into a creek bed that is now an environmental disaster.

There have been more than 5,500 accidents since 1984. I have a bill on pipeline safety that I hope we can move through. I think your office is going to have one, as well. We hope that you get that over to Congress soon.

I do appreciate your including a \$10 million increase for the Office of Pipeline Safety, but I think we also have to raise the national standard, so that these pipes that were put in the ground 25 or 30 years ago are inspected more than just the first time they're laid.

There was also an accident in Pennsylvania over the weekend. It's time to have good, strong national standards, so that the people who live on these pipelines, live next to them, have their schools next to them, their businesses next to them, are assured that, as a national goal, we are making sure that these pipelines are operated safely. That is an important issue to my State and many others, as well.

We look forward to working with you to move your proposals through Congress this year and I hope we get the appropriations so the Office of Pipeline Safety has the personnel to inspect these pipes.

Thank you.

Senator SHELBY. Thank you, Senator.

Senator Stevens.

STATEMENT OF SENATOR TED STEVENS

Senator STEVENS. Mr. Secretary, I was pleased to see you in Los Angeles. It meant a great deal to the survivors of the victims of Flight 261 that you were there and so many people were there to help them with their grief.

FAA PROFESSIONALISM

While I was there, I met with the FAA. And I met with the NTSB, and the Coast Guard, and the Navy, and the FBI, and the whole group. But I was particularly impressed with the air controllers in Los Angeles. And if you have not had a chance to listen to that last recorded exchange between the air controllers and the pilots, I would recommend you do it, because I think it was an insight into the pilots and the controllers and the professionalism of those who operate our airline system. It certainly was enlightening to me.

I have been a pilot for 60 years, you know, and I really think that I have never heard such professionalism. Most people do not know that that pilot had the authority to land in L.A., and he decided to go out over the Bay to make sure he had control before he approached that airport. That is something I think the public ought to know more about. That was a decision, I think, that probably saved a great many lives at L.A. Airport.

But beyond that, I do thank you—I note, in your statement, you make a point about the role of the FAA and that tragic crash.

VOLCANO MONITORING

I only have one comment to make about the budget. And I do not know whether I will get back later to talk about it, but once again, the budget does not contain the money for the volcano monitoring activity in Alaska. I think that is unfortunate. I really think, Mr. Chairman, the Administration sort of thinks that is an Alaskan item. And I have got to put it back in, if they take it out, which is probably true, but it really is not an Alaska item. That is for the international flights that fly over our State, that are affected by the plumes that come from the volcanoes along the Aleutian chain. And they are very dangerous.

This observatory has the capability, now, to monitor those and to give warnings to the international flights, and tell them where to fly to avoid hitting the plume that comes out of the volcanoes. I do think it ought to be a total U.S. obligation to the flights that we invite from foreign countries to come into our airspace to give them warning of hazards within our airspace.

But in any event, I would hope that funding, one of these days, will be generated from the President's budget and not be something that I have to ask the chairman to reinstate in this budget.

But it is nice to see you, Mr. Secretary. And again, I commend you for the very, very calming words that you delivered to the families of the victims of Flight 261. I think it was a very significant thing for all of us. I had a great many friends on that flight. And it meant a great deal to all of us.

Thank you very much.

Senator SHELBY. Senator Stevens, we will put that funding in the budget for you and for the American people and the other people who fly over Alaska. It would be easier, though.

Senator Specter.

STATEMENT OF SENATOR ARLEN SPECTER

Senator SPECTER. Thank you very much, Mr. Chairman.

Secretary Slater, we are going to be voting in a few minutes, as it has already been announced. And it will be difficult to come back, so I would like to raise a number of issues with you. And perhaps, you could supply us some responses for the record.

Secretary SLATER. Yes.

RADAR OUTAGES

Senator SPECTER. We had some radar outages last May in Philadelphia. And I took a look at the radar system and the equipment which is being used there, and it is in urgent need of upgrading and correcting.

It is amazing to me to go into the radar rooms and see what they are doing on monitoring the flights which come in. And it has made me apprehensive every time I have been in an airplane, since, coming into the Philadelphia Airport or other airports.

There is hardly anything more important than being able to trace the airplanes, and to see how they work in those dark rooms, with so many dots on the screen containing hundreds of people, it is really a terrifying matter, which I think has to be addressed. If additional funding is necessary, I think you will find response by the Congress on a life and death matter like that.

PENNSYLVANIA PROJECTS

A second matter that is of great priority in my State involves the light rail system, which is coming into the construction of two new stadiums in Pittsburgh; one for the Steelers and one for the Pirates. We are putting about \$600 million into those stadiums in a situation which raises a real question in my mind about the kind of extortion which is being practiced by major sporting teams, but that is being done.

To make it work, we are going to have to have the Federal Government come in on the transportation system. We are going to be presenting to this committee and to the chairman, Senator Shelby, some large figures this year. But without transportation, these projects do not work, which are indispensable for the life of the community.

I note that the Administration has provided only \$25 million for Maglev this year; a much lower figure than the \$950 million, total, which was authorized on TEA-21, and the \$200 million authorized for fiscal year 2001. Maglev has the potential for enormous advances in transportation.

We could run a line from Philadelphia to Pittsburgh in 2 hours and 7 minutes, with intermediate stops in Lancaster and Harrisburg and Altoona, Johnstown, and Greensburg, and have enormous benefits for the economy of the State. I was distressed to see, with the change of governments in Germany, that they are abandoning their Hamburg to Berlin line. But we have a great capitalistic system, here.

We are now in the 21st century—Senator Byrd, I know, disagrees with that. We are now almost in the 21st century. We are pikers, compared to what they did in the 19th century, building railroads across America. We just have to provide that kind of capitalization.

Two other matters, very briefly. I know you have been involved in the U.S. Airways Pittsburgh to London negotiations. We need to

apply a little bit of pressure, because that area is being under served. And I am going to try to help you find money for the FAA Engineering Center, so we can bring that to Pittsburgh, as well.

That is a very brief synopsis of a long laundry list, Mr. Chairman.

Thank you.

Secretary SLATER. Thank you.

Senator SHELBY. Thank you, Senator Specter.

There are no other opening statements. Your full statement will be made part of the record, Mr. Secretary.

You may proceed, as you wish.

STATEMENT OF SECRETARY SLATER

Secretary SLATER. Okay. Mr. Chairman, Senator Lautenberg, members of the subcommittee, it is a pleasure to, once again, come before you. And as you noted at the outset, Mr. Chairman, I have had the good fortune and pleasure of coming to this committee on a number of occasions.

Senator Bennett made reference to Mr. Basso. Let me also mention Linda Darr and Beverly Pheto, who are here with Mr. Basso, who have done just a wonderful job working with our team on this budget.

I would like to also mention Mike Frazier, who is our Assistant Secretary for Governmental Affairs, who works very closely with all of you.

Many of you have made reference to my team, and I am fortunate to have a group of visionary and vigilant DOT professionals, who enjoy, as do I, the opportunity to work with all of you.

Let me also thank you for the opportunity to bring what we believe to be a very visionary and vigilant, and yes, creative budget, as relates to transportation, on behalf of President Clinton and Vice President Gore. It represents fiscal discipline and strategic investment.

At this time, I would like to just make a few brief comments about it, and also submit my written statement for the record.

I have often said, and I think all of you have heard me say this from time to time, that as I view it, transportation is about more than concrete, asphalt and steel. At its core, it is about people and it is about enabling them to lead safer and better and more fulfilling lives.

Mr. Chairman and members of the committee, when I look at transportation, I see opportunity, and I see freedom—what this country represents, at its core, as well. That is why I speak so passionately about the importance of transportation. I think, too, that is why we have had such a wonderful working relationship, because all of you view it in that light.

So, again, we thank you for this wonderful experience that we are having, where our work is truly viewed as a joy and not a job.

FISCAL YEAR 2001 BUDGET

The record \$54.9 billion budget that we have proposed for fiscal year 2001 does represent, as has been noted, a 9 percent increase over last year's budget, which was also a record. It will continue to help us advance safety, efficiency and improve the condition and

performance of our transportation system. Working especially with this Congress and with our State and local partners and with the private sector, over the past 7 years, we have made transportation safer and more efficient. We have also made our communities more livable. We appreciate that opportunity to work with you. And I repeat it, yet again.

We gather today because we all understand that we must not rest, but build on the great work that we have already done, and develop and also inspire in developing, not only a quality transportation system for the 21st century, but also ensure the development of the visionary and vigilant workforce that will help us design and operate, maintain and manage that system.

TRANSPORTATION SYSTEMS OF THE 21ST CENTURY

The transportation system of the new century and the millennium must be safe and sustainable, to be sure, but we would also ask that we have a discussion about the fact that we, too, believe that it has to be international in its reach and intermodal in its form, intelligent in its character, and inclusive in its service. Adequate resources and nurturing a climate of transportation innovation are essential to bringing that kind of system into being.

Almost 3 years ago, on my first occasion to come before you, this distinguished subcommittee on transportation, I said that the Department of Transportation must set high goals, and that we must be architects of change if we are to build a new balanced relationship with the committee and with our partners at the State and local level.

Well, we have tried to do just that. And here, briefly, I would like to just mention what we have done and also what we have yet to do.

This is probably my last appearance before the committee. You have got a difficult schedule. And I want to, again, report to you, briefly, what we have done, what we have yet to do, and how this Administration's proposed budget and clearly what you will do with it, as we seek to have that record level number at the end of the day, how that will support our efforts.

With the enactment of TEA-21, we have provided substantial, really record-level funding for many, many priorities; the Appalachian Development Highway System, Senator; also, Congestion Mitigation and Air Quality Improvement; record-level investment for transit and highways. And we have been able to move forward in using those resources to make a difference—a difference in the long-term.

We have also used a One DOT management strategy, where we have tried to work better as a Department as a whole. In some instances, we actually have our offices together across the country, to build and improve upon our relationships with you and with our local and State partners.

Our best-in-government strategic and performance plans, I believe, have shown that we are an organization of vision and vigilance. And our budget reflects that.

Again, \$55 billion, a 9 percent increase over last year, to help us build the system of our dreams and support the kind of development we need for our workforce.

Let me just mention, briefly, how we have record-level investment in the areas that matter; the areas that are identified in our strategic plan—safety, mobility, economic growth, environmental protection, and national security. All of you, in one form or another, have raised these issues during your comments.

SAFETY

We would improve safety with a record \$4 billion, up 13 percent from last year. This includes a 21 percent or more increase for highway safety strategies that work; getting dangerous truck drivers off the road, reducing drunk driving, and increasing the use of seatbelts and child safety seats.

The budget also provides \$1.1 billion for aviation safety. Senator Stevens noted that we were just in L.A. last week with the family members and with the friends of those who died in the tragedy—the tragic Alaska Airlines crash just a few weeks ago. Clearly, we wish, today, to express, yet again, our sympathy for the families and the friends, but we also wish to do our duty.

And so, we are pleased that Boeing and also Alaska Airlines and many of the other airlines that use the MD-80s have followed our advice. We have developed this partnership, that they actually check all of those planes to ensure that they are operating safely. That is the least we can do. And it is very, very important that we do it.

We will also continue to work with the industry to strengthen our commitment to safety. All of you know that we join the industry in setting as a goal an 80 percent reduction in U.S. commercial aviation crashes involving fatalities over a decade—by 2007. We have seen significant progress as we have worked in that regard, but we do have to deal with this issue involving Alaska Airlines and the crash and the MD-80s, and we are doing that.

MOBILITY

We will also enhance mobility with a record \$39 billion in infrastructure investment, 86 percent more than the previous Administration's 1990–1993 average. This includes \$30 billion for highways and for intermodal connections, record transit funding, funding to improve airports, and continued support for Amtrak, helping them to become self-sufficient. It also includes a \$468 million request for a new program to upgrade passenger rail service and to make improvements necessary to accommodate high-speed rail.

I know that we have some disagreements about how we get this done. You have our proposal. I hope at the end of the day, we can provide these resources, figuring out a way to do it.

Let me also say that to pass TEA-21 was a significant compromise. And all of you should know—and I do believe you know this—that the President was there every step of the way with you. At the end of the day, the President actually had to give up about \$30 billion in offsets to make it all happen, as we wanted it all to happen.

And so, when the President makes a proposal that seeks to deal with our assessment of the spirit of it in some unique way, know that we do it in the same spirit that we came forward with the additional resources to provide for record-level investment and the

highest surface transportation bill to ever pass in the history of the country.

I think it is worthy to note that we did this at a time when we were also trying to balance a budget and to deal with the economic and fiscal needs of our country.

ECONOMIC GROWTH

We would also promote economic growth by answering the President's call for advanced transportation systems with a record \$1.28 billion for innovation and technology, up 37 percent from last year's level.

Through our partners, we are facilitating a climate of innovation in areas such as telecommunications and nano-technology. These areas hold enormous potential for transportation. And by the way, many of your institutions of higher education are working with us in partnership in these areas.

We would also invest nearly \$1 billion to support the President's New Markets Initiative, helping welfare recipients move from the dependence of welfare to the independence of work, and improving transportation in areas like the Mississippi Delta and also on Native American reservations.

Senator Byrd, I can assure you that there is no intent in any way to minimize our commitment to Appalachia. If anything, we are trying to model these efforts after the success that we have enjoyed as it relates to Appalachia.

ENVIRONMENT

Also, we would propose a record \$3.8 billion to protect our environment. One of the most significant provisions, as it relates to TEA-21, is that not only could we declare it as a record-level transportation bill, but it was also the most significant environmental bill to pass during that session of the Congress, and one of the most significant to ever pass.

And so, we are pleased to include significant funding for CMAQ and for what we call the Clinton-Gore Livable Communities Initiative.

NATIONAL SECURITY

We, also, would safeguard travelers with \$1.6 billion for national security, including drug interdiction and anti-terrorism efforts. Many of you have commended the Coast Guard. Last year, the Coast Guard had a record drug interdiction effort, confiscating some 51 tons of cocaine. That effort continues and these resources will help them in that regard.

I firmly believe that our goals as a free people, served by a strong economy, in a climate of peace, can only be achieved in this coming century of the global economy, by making sure that our transportation system remains safe and sustainable, and that it does take on these characteristics that I have mentioned, as relates to the system of the 21st century.

We, at the Department of Transportation, believe that our budget will help us in that regard. The budget will improve transportation safety, maintain and expand the transportation infrastruc-

ture enterprise, reduce environmental degradation, and provide more opportunities for our citizens to pursue happiness.

I, and the members of our DOT family, look forward to working with the committee and with the entire Congress to pass a budget; hopefully, this one. We know we can work together and get things done, with a good budget that will allow us to build the system of our dreams, and also continue to develop the kind of workforce that we will need to operate and manage and maintain that system.

With that, Mr. Chairman and members of the committee, again, thank you for the opportunity to come before you. And I look forward to responding to specific questions that you may have.

[Statement follows:]

PREPARED STATEMENT OF RODNEY E. SLATER

Mr. Chairman, Members of the Subcommittee. I thank you for the opportunity to testify today in support of President Clinton and Vice President Gore's fiscal year 2001 transportation budget.

OVERVIEW

The record \$54.9 billion budget we propose for fiscal year 2001, nine percent more than this year—also a record, will continue to advance the safety, efficiency and conditions and performance of our transportation system. Working especially with the Congress, our state and local partners and the private sector over the past seven years, we have made transportation safer and more efficient and our communities more livable. We must not rest on this success, but build upon it to create the transportation system of the 21st century and develop and inspire a visionary and vigilant workforce to design, operate, maintain and manage it. The transportation system of the new century and the new millennium must be safe and sustainable, to be sure, but also international in reach, intermodal in form, intelligent in character, and inclusive in service. Adequate resources and the nurturing of a climate of transportation innovation are essential to bringing this type of system into being.

Over the last three years, we at the Department have worked diligently to become an ever visionary and vigilant organization that pursues excellence in its service to the American people and casts its sights far into the future.

Almost three years ago at my first hearing before this distinguished Subcommittee as Secretary of Transportation, I said that the Department of Transportation must set high goals and be architects of change, that we must build a new balance in our relations with state and local governments, and that we must look for, not always the quick solutions, but the solutions that will make a difference in the long run. Now, in likely my last appearance before this Subcommittee, I would like to report briefly on how we have done, what we have yet to do, and how the Administration's budget will support our efforts. With enactment of TEA-21, and its substantial funding for priorities like the Appalachian Development Highway System, the Congestion Mitigation and Air Quality Improvement Program and transit, we were able to secure a solution that will make a difference in the long run. With our ONE DOT management strategy, where the modes work in coordination, and in some locations in the same offices, we are able to build new and improved relations with our state and local partners. And our best-in-government strategic and performance plans show that through vision we are willing to set high goals and through vigilance we are willing to commit the resources and time to follow through on these plans.

A TRANSPORTATION SYSTEM THAT MEETS THE CHALLENGES OF THE 21ST CENTURY

The fiscal year 2001 budget continues our effort to set the course for transportation investment that will help achieve our hopes, dreams and needs for this new century. It is a budget not just about funding concrete, asphalt, and steel, but about people. We know that our mission must be to be good stewards of the transportation enterprise so as to help people live safer, better, more fulfilling lives. Here, again, the fundamental challenge is to envision and build the transportation system of the 21st century—and to develop and inspire an ever visionary and vigilant workforce to operate, maintain and manage it.

The budget provides funding increases in the areas that matter most, those that reflect the goals in our best-in-government strategic plan—safety, mobility, economic growth, protection for the human and natural environment, and national security.

As President Clinton said in his State of the Union address, “Never before have we had such a blessed opportunity . . . to build the more perfect union of our founders’ dreams.”

In the 20th century we saw the building of a transportation system that allowed unprecedented new opportunities to arise and our country to achieve unheard of levels of prosperity. Our transportation system, which has responded to consumer demands, now allows just-in-time delivery, overnight packages and e-commerce. These innovations changed the way people lived in the 20th century and will significantly impact the way people live in the 21st century.

As our transportation system has grown and changed, so have the unintended consequences of that system, such as transportation-related fatalities and environmental impacts. The Federal Government must continue to show leadership in trying to alleviate these harmful unintended consequences and the fiscal year 2001 budget requests additional funding to expand this leadership role.

BUILDING UPON OUR TRANSPORTATION SAFETY RECORD

Safety is our top strategic goal, and President Clinton and Vice President Gore’s top transportation priority. We at DOT have said that safety is our North Star by which we are guided and by which we are willing to be judged. Our transportation system’s performance reflects the strength of this commitment. Today, 4,300 fewer people die on our roads than in 1993 and alcohol-related fatalities are at all time lows. However, over 41,000 lives are claimed on our highways every year and more Americans need to buckle-up, even though our seat belt use rate is at an all-time high. As motor carrier traffic has increased, fatalities related to motor carrier accidents have remained too high. These challenges must be successfully met and we are committed to leading the way in doing so.

The President wants to build on the safety progress we have made even as our economy expands and travel grows. We propose a 13 percent increase in transportation safety funding, to \$4 billion in fiscal year 2001. This will allow us to improve highway, aviation, rail and pipeline safety.

Since transportation deaths occur mostly on our roads, we must continue making our roads safer. That is why we want to increase safety funding for the new Federal Motor Carrier Safety Administration, NHTSA, and FHWA. We are extremely troubled by the fact that 63 percent of the motor vehicle occupants who died in traffic crashes last year were not wearing seat belts and almost 60 percent of the small children who died in traffic crashes in 1997 were not in safety seats. Unquestionably, the best way to save lives and prevent injuries on the road is for each and every one of us to use a seat belt and to protect our children by properly securing them in safety seats and keeping them in the backseats. To do this, we must constantly repeat the two words “buckle up.” Changing human behavior is our most difficult challenge. That is why we propose to increase NHTSA operations and research spending by 79 percent to \$286 million in fiscal year 2001.

Ensuring safe motor carrier transportation is a critical part of our overall efforts to improve highway safety. Healthy economic growth and logistical innovations like “just in time” delivery have spurred significant increases in truck travel and have been a boom for the trucking industry. But while the motor carrier fatality rate has decreased significantly, from 3.0 per 100 million vehicle miles traveled in 1993 to 2.7 in 1998, the actual number of large truck crash fatalities has increased from 4,849 in 1993 to 5,374 in 1998. This is unacceptable and we are making the changes necessary to reduce these deaths. Federal motor carrier safety programs must channel resources to strategies that give us the highest payoff in reducing crashes, injuries and fatalities. We must have better focus on high-risk behavior, increase our enforcement efforts, put more investigators in the field and at our borders to enforce truck safety laws, and promote enhanced education and training programs. And that is what we propose to do more of in the fiscal year 2001 budget by increasing funding for the new Federal Motor Carrier Safety Administration by 54 percent to \$279 million.

In order to increase state enforcement efforts and improve the commercial drivers licensing information, we propose to raise motor carrier safety grant funding by 78 percent to \$187 million. To increase Federal border inspection efforts, increase the number of inspectors, and improve data and data analysis, we propose to increase the Federal Motor Carrier Safety Administration’s operating and research funds by 21 percent to \$92 million. These substantial funding increases should allow us to

aggressively reduce motor carrier fatalities and accidents and achieve our “stretch goal” of a 50 percent reduction in motor-carrier related fatalities by 2009.

Equally important is the \$1.1 billion we request for our aviation safety programs, six percent above this year’s level. This will help us move towards our “stretch goal” of an 80 percent reduction in the rate of fatal aviation crashes by 2007. Under this initiative, special teams of technical experts will zero in on the leading causes of crashes, fatalities and injuries so we can prevent them before they happen. The tragic Alaska Airlines Flight 261 crash reminds us of the importance of our commitment to making our skies—the safest in the world—ever safer.

Finally, let me add that as Congress acts on this budget, I hope it also acts expeditiously to pass legislation to reauthorize the FAA’s programs. This is our number one legislative priority as this is the third year that we have not had a reauthorized aviation program. We need to give the FAA the management tools and the financial structure it needs to do its job.

Our railroad safety vigilance and our cooperative relationship with the railroad industry in identifying and ameliorating the root causes of rail safety challenges have paid substantial dividends over the past few years. Railroad accidents and fatalities are down eleven and twenty-nine percent, respectively, since 1993. A total \$117 million, six percent above this year, is proposed to continue and expand upon our rail safety research and programmatic efforts, bringing together rail labor, management and DOT. In addition, we request \$18.7 million for the Nationwide Differential Global Positioning System, within the surface transportation budget. Together with \$10 million for train control projects, this gives us the foundation for safety assurance in our rail system.

Safety on our seas is also a critical component of overall transportation safety, as the Coast Guard saves one life every two hours. The fiscal year 2001 budget includes close to \$1 billion, six percent above this year, for the Coast Guard to continue and expand its search and rescue capability by being better able to detect, locate and assist those in distress. As part of this effort, the Coast Guard is seeking to increase safety among the nation’s commercial fishing fleet, traditionally among the most hazardous occupations in the United States. Modernization of the national distress and response system will contribute to the safety of professional mariners and recreational boaters alike on America’s waters.

BUILDING INNOVATIVE MOBILITY SOLUTIONS

Mobility is about helping people get to where they want to go. It is about strengthening families, linking communities and supporting businesses. Today, roads and bridges are in better condition, Amtrak ridership is increasing, and transit ridership has seen double-digit growth since President Clinton and Vice President Gore took office—thanks to smart investment in our nation’s transit systems. The number of airline passengers has grown 36 percent in seven years. We have made a great deal of progress during the past seven years and we must build on this progress and continue to advance innovative, intelligent solutions to the mobility challenges that we face.

John Volpe, our second Secretary of Transportation, anticipated our current interest in intermodalism 30 years ago, when he said that “No one mode of transportation will ever solve all of our transportation problems.” Recently, the *Journal of Commerce* said that the United States “has by far the best intermodal transportation network in the world.” But we must build from strength to strength so as to ensure that our transportation system can continue to meet the ever-increasing demands and remain the best in the world.

That is why we are engaged with our partners in a 2025 visioning process that will help us complete the task of crafting a new transportation policy architecture for a new century and a new millennium. That is also why we will be hosting an international transportation symposium to share our best practices and listen to and learn from our international partners about how can work better together to build the transportation system of our dreams.

The first crucial piece in keeping our transportation network in good shape is good sound strategic investment. Investment in transportation infrastructure proposed in 2001 exceeds the average annual investment in 1990–93 by 86 percent. The fiscal year 2001 budget includes a record \$30 billion for Federal-aid Highways, a record \$6.3 billion for transit, \$521 million to continue Amtrak’s rebuilding, \$468 million to expand capital investment in intercity passenger rail service and \$1.9 billion for airports.

Transit investment has become an increasingly important part of the mobility mix. The \$6.3 billion requested for transit programs in fiscal year 2001 reflects our commitment to transit programs across the nation, while maintaining a balance of

funding between highways and transit. We have requested funding for 12 new full funding grant agreements.

The \$1.9 billion requested for airport grants, when coupled with our proposal to permit airports to raise additional funding through airport passenger facility charges and combined with other sources available to airports, provides record level funding to meet airport infrastructure investment needs. To continue the modernization of our air traffic control system, \$2.5 billion is proposed, 22 percent more than current levels. This funding will be used to further reduce the number of outages and delays and to maximize the use of our airspace.

In order to continue its capital modernization efforts, we request \$520 million, 34 percent above this year, for Coast Guard assets. This includes \$42 million to continue the deepwater recapitalization analysis begun last year, so that Coast Guard can modernize its aging deepwater assets in the most efficient and least costly manner.

The marine transportation system is a key element of the national transportation system, serving as a primary link between all modes of surface transportation and facilitating global commerce. It contributes more than \$720 billion to the U.S. Gross Domestic Product and creates employment for more than 13 million Americans. The maritime transportation system will realize increased mobility through this budget with the acquisition of the Great Lakes icebreaker replacement, three new seagoing buoy tenders, and ongoing ports and waterways system analyses.

In addition, the budget includes a total of \$47 million, \$27 million in the Coast Guard and \$20 million in the FAA, to operate and maintain the Loran-C navigation system. This request is 28 percent more than this year's funding level. After careful consideration, the Administration has decided to operate and maintain Loran-C in the short-term while continuing to evaluate the long-term need for the system.

A second critical ingredient for keeping our transportation network working effectively is smart investment. We must build upon the solutions that have served us well in the past, in a manner that is less damaging to our communities and our environment. Our transportation system should be managed better, so that we can make more efficient use of our existing system. The budget includes \$338 million for Intelligent Transportation Systems, to improve—among other things—traffic signal control, freeway and transit management and regional multi-modal traveler information.

Smart investment includes investment in transportation solutions for the future. Last year Amtrak ridership increased substantially. This shows that many Americans continue to want intercity passenger rail transportation. The fiscal year 2001 budget proposes a substantial investment in passenger rail service, building on the growth in ridership and ability to cover operating costs that our Northeast Corridor investment has supported. Many state governments have invested in passenger rail service, including high speed rail, and Federal funding will provide the foundation for it to be a significant transportation solution for the future. We propose \$468 million for this new program, in addition to continued Amtrak capital funding.

All of our goals, including our mobility goal, will be further enhanced by our budget proposal to increase technology and innovation by 37 percent to \$1.28 billion. The Administration is committed to innovation for good reason: innovation has proven to be an indispensable ingredient in the longest economic expansion in American history. This budget moves our commitment to innovation to higher heights than ever before. The budget includes a nearly 80 percent increase for NHTSA—administered safety programs—a more than 80 percent increase for Intelligent Transportation Systems—and a greater than 50 percent increase for surface transportation research. Our ITS programs are demonstrating real world effects. For example, a joint General Motors-DOT partnership is demonstrating state-of-the-art rear end collision warning systems. Additionally, it measures performance and effectiveness with real drivers on public roads, not in an artificial test situation.

The funding will be utilized according to our four innovation strategies—to build partnerships, increase investment in innovation, reduce barriers and provide incentives to innovation, and support of education and training to develop the next generation of inventors.

Support for training also extends to the DOT workforce because we must invest in our own workforce to achieve the best performance. That is why the budget includes training funds across-the-board in DOT equal to at least two percent of payroll. FAA and Coast Guard will exceed this standard, as they have more unique training needs.

BUILDING THE FOUNDATION FOR ECONOMIC GROWTH

Our great economy provides better jobs and a higher standard of living for all Americans. An economy that works for all Americans depends on a transportation system that is safe and that serves all Americans. If transportation connections are not available, or not offered at a time when we need them, our work, education and overall "pursuit of happiness" are limited and sometimes impossible. Transportation accessibility has grown considerably in the past seven years, but there are still areas of this country, such as the Delta region, Native American lands, Appalachia, and some inner cities and isolated rural areas where accessibility is limited or non-existent.

The fiscal year 2001 budget includes more than \$1.2 billion, 44 percent over 2000, for programs that contribute to the nation's economic growth and increase transportation accessibility. The funding proposed to support these efforts will provide all Americans with better access to work, educational opportunities, and commercial markets. The resulting enhanced economic and community development will improve the quality of life for our nation's citizens.

The budget includes strategic investments in critical transportation links that will provide greater economic opportunities for Native Americans, the Mississippi Delta region, isolated urban and rural residents, and former welfare recipients. We propose to double the 2000 level for the Job Access and Reverse Commute Program, to \$150 million, to provide essential support for the Administration's welfare-to-work goals and economic growth in our low-income workforce.

The vast rural areas and small towns of the Mississippi Delta region suffer from disproportionate isolation and diminished opportunities for access to the daily activities of life. Many Delta residents have substantial difficulties in accessing employment opportunities and related activities such as training, education, and childcare. We propose a new \$69 million initiative to expand the access to opportunity to those who call the region home.

Transportation services available to Native Americans also fall below those for the rest of the nation. A total of \$358 million, 50 percent above 2000, is proposed to begin to correct this imbalance. Most of this funding will be used to help meet the more than \$4 billion needed to improve the condition and performance of Indian Reservation roads.

We also propose to double funding, to \$280 million, for the Corridors and Borders Program. This will improve the movement of freight that is so crucial to our global economic competitiveness. Demand for this program is substantial. In fact, this year we have 150 requests totaling close to \$2.2 billion for the limited funding that we can award at our discretion.

And here in the Washington metropolitan area, the President committed \$25 million towards a new Metro station to promote economic development along New York Avenue. We also are providing a Full Funding Grant Agreement for the Largo extension and propose \$600 million to complete the federal investment in the replacement of the Woodrow Wilson Bridge.

BUILDING AN ENVIRONMENT FOR OUR CHILDREN

In his State of the Union address, President Clinton reminded us that we have "put to rest the bogus idea that you cannot grow the economy and protect and enhance the environment at the same time." This Administration has committed itself to protecting our environment. Our air is cleaner and our water is purer today than seven years ago, even as we enjoy the longest economic expansion in our nation's history. Our commitment to protecting our nation's environment continues in this budget, with a total of \$3.8 billion, almost five percent above this year for DOT's environmental programs.

To aggressively implement the Administration's livability and environmental agenda, a record \$6.3 billion, as already mentioned, is proposed for transit programs and a record \$1.6 billion is proposed for the Congestion Mitigation and Air Quality Improvement (CMAQ) Program. Support needs to be continued and replicated across the country for increased use of alternative transportation systems providing access to and within national parks and other public lands, such as the new propane fuel bus system inaugurated last summer to serve Arcadia National Park and surrounding communities in Maine.

Our budget increases by almost fifty percent the funding provided to the Transportation and Community and System Preservation Pilot Program. This will aid communities in developing smart-growth plans to combat congestion and sprawl, and ensure in the words of Vice President Gore, "that communities are not only better off, but better." There is tremendous demand for these programs, as communities desperately want to tackle livability issues.

Additional funding is also requested for the Advanced Vehicle Program, DOT's contribution to the effort to develop clean, fuel-efficient vehicles for the new century. Programs like these are crucial to building a transportation system that meets the needs of future generations. The Detroit International Auto Show recently spotlighted the clean car developed through the Partnership for a New Generation of Vehicles. Our Advanced Vehicle Program, with \$20 million in new funding, will apply similar technologies to produce clean trucks and buses.

KEEPING OUR NATION SECURE

DOT plays a critical role in ensuring that the transportation system is secure, that U.S. borders are safe from illegal intrusion, and that the transportation system can meet national defense needs in times of emergency. In addition, the Coast Guard and the Maritime Administration continue to perform several specific national security functions in support of the Department of Defense. A total of \$1.6 billion, eight percent above this year, is proposed for DOT national security programs.

This includes \$617 million, eight percent above this year, to fulfill the Department's commitment to conduct drug law enforcement operations. This funding will enable the Coast Guard to maintain an effective presence in the transit and arrival zones by mounting strong and agile interdiction operations. And it will build on the record interdiction effort of last year, with 70 tons of drugs confiscated.

It also includes \$99 million for the Maritime Security Program, so that we can ensure that vessels will be available to carry military cargo during war or national emergencies.

CONCLUSION

I firmly believe that our goals as a free people, served by a strong economy and a climate of peace, can only be achieved in this century of the global economy by making sure our transportation system remains safe and sustainable, and becomes over time international in reach, intermodal in form, intelligent in character and inclusive in service. We at DOT, ever visionary and vigilant, are committed to building this type of system. The fiscal year 2001 budget reflects the Clinton-Gore Administration's commitment to the future of this country and the recognition of the importance of transportation to enjoying sustained growth and an improved quality of life.

Our proposed budget helps to ensure that transportation remains the tie that binds us together as a people—and the foundation of our prosperity as a nation. The budget will improve transportation safety, maintain and expand the transportation infrastructure, reduce environmental degradation, and provide more opportunities for our citizens in their "pursuit of happiness."

I, and the members of the DOT family, look forward to working with this Subcommittee, and the entire Senate and House, to pass a budget that will aid us in building the transportation system of our dreams and the ever visionary and vigilant workforce we need to meet the challenges and embrace the limitless opportunities of the 21st century and the new millennium.

Senator SHELBY. Mr. Secretary, we have 3 or 4 minutes to get to our vote. So we will recess, and we will come back.

Secretary SLATER. Okay.

Senator SHELBY. Thank you.

Mr. Secretary, thank you for your indulgence.

Secretary SLATER. Thank you, Mr. Chairman.

Senator SHELBY. You are always a gentleman.

Secretary SLATER. Thank you.

DISCRETIONARY PROJECTS

Senator SHELBY. Mr. Secretary, in the transportation appropriations bill and the accompanying conference report, a number of discretionary projects are identified that are important to members of Congress. As the various agencies of your department administer the programs under which these projects are funded, I think it is important that the lines of communication between your office and the appropriations committee be open. They have been—

Secretary SLATER. Yes.

Senator SHELBY [continuing]. In the past. And that we be kept informed of any problems that you would encounter as you administer those projects.

Having said that, can I have your assurance, on behalf of the committee, here, that your office will fully brief the subcommittee staff, both majority and minority, before you sign off on any final disposition of any discretionary grant programs that Congress provided direction on in the conference report this past fall? Is that possible?

Secretary SLATER. It is possible, sir. You have our commitment.

Senator SHELBY. Okay.

Secretary SLATER. Thank you.

Senator SHELBY. Mr. Secretary, there are several programs under which the year 2000 transportation appropriations bills identified specific projects. And some of these programs have not yet made grant release announcements.

Secretary SLATER. Yes.

Senator SHELBY. Can you tell us when to expect grant announcements for the Transportation and Community System Preservation Program, the Job Access and Reverse Commute Grant Program, the National Corridor Planning and Development Program, the Intelligence Transportation Systems Program, and for the remainder of the grants under the Federal Lands Program and the Ferry Boats and Facilities Program? Can you get with me on this, or do you want—

Secretary SLATER. Yes.

Senator SHELBY. Yes. I am on it, now.

Secretary SLATER. What I would like to do, Mr. Chairman, is to follow-up with more specific dates. We are working on all of these discretionary grant programs. And we are hopeful that we will be able to move on most of them during the spring.

Senator SHELBY. Okay.

Secretary SLATER. But you may have some that will come a little later in the year. Our objective is to move on this as quickly as possible.

USER FEES

Senator SHELBY. A total of \$1.3 billion in new user fees is included in this budget, as we talked about.

Secretary SLATER. Yes.

Senator SHELBY. Mr. Secretary, is there any reason for the second kick of a mule? I think that this is actually the third or fourth kick on these user fee taxes. Do you think it would drive home the lesson more effectively if we reduce the appropriations for the Office of the Secretary by the same percentage of proposed user fees that get authorized and enacted each year?

Secretary SLATER. Well—

Senator SHELBY. That is probably not a fair question.

Secretary SLATER. Well, I have some people back here who definitely want to know what my answer is. But I would say, Mr. Chairman—

Senator SHELBY. Do you want to furnish the answer for the record, later?

Secretary SLATER. I can furnish an answer for the record, in more detail.

[The information follows:]

The fiscal year 2001 budget proposes \$1.3 billion in new user fees for aviation, rail safety, marine safety, hazardous materials safety, and the economic regulation of surface transportation. The Administration policy is to introduce user fee funding where appropriate. Users generally are more willing to pay fees when such fees are dedicated to improving the quality of the programs that affect them directly.

Within the FAA, \$965 million is included to establish cost-based user fees for air traffic services. Under this proposal, the collections each year from the new cost-based user fees and existing excise taxes combined would be equal to the total budget resources requested for FAA in each succeeding year. For FRA \$103 million will be collected from railroad carriers to offset the costs of the rail safety program—including safety and operations, and safety-related research. Within the Coast Guard \$212 million will be collected to recover a portion of the Coast Guard costs for navigation services, to be paid by U.S. and foreign commercial cargo carriers. Fishing and recreational vessels would be exempt. New RSPA user fees total \$5 million for increased hazardous materials registration fees, to be paid by shippers and carriers of hazardous materials. User fees totaling \$17 million will be used to completely offset the expenses of the Surface Transportation Board. The fees would be collected from those who benefit from the continuation of STB functions, i.e., railroads and shippers.

Senator SHELBY. Or on a telephone call.

Secretary SLATER. I can, but let me just say for the record and the public debate of it all, that it is the policy belief of this Administration that there are certain benefits that a defined group of either businesses or individuals enjoy, and that those activities would be appropriate for user fee consideration. That is why we continue to come back. We do have some programs that actually rely, to some extent, on user fees. So, it is not—

Senator SHELBY. But you do have to consider the political climate in anything.

Secretary SLATER. Definitely.

Senator SHELBY. You understand it better than I do.

Secretary SLATER. We understand that, but in an effort not to second-guess the Congress, we just want to keep it before you and would hope that at some point, you would find it acceptable.

FUNDING FIREWALLS

Senator SHELBY. Can we talk about firewalls for just a minute?

Secretary SLATER. Yes.

Senator SHELBY. In conversations with me and also Chairman Stevens, you have made clear that you oppose the creation of a firewall for the aviation account, and would recommend a veto of a bill that created a firewall or other special budgetary treatment—

Secretary SLATER. Right.

Senator SHELBY [continuing]. That was not offset or paid for by other spending cuts. I assume that must be, in part, because of the difficulty you are experiencing managing all—and I mean all the transportation programs in the context of the highway firewall.

Secretary SLATER. That is right.

Senator SHELBY. Would you affirm your opposition to special budgetary treatment today, or would you explain the absolute inconsistency of proposing changes to the highway budget firewall, while not opposing the creation of another firewall that would only create increased pressure on the accounts that your budget, Mr. Secretary proposes to increase by abrogating the highway firewall?

Secretary SLATER. Sure.

Senator SHELBY. It seems like a little paradox, here.

Secretary SLATER. It is difficult. I thought, when the question was asked or you alluded to it during your comments, that it was a good question, and I hoped that I would have the opportunity to respond to it.

Clearly, in TEA-21, at the end of the day, a number of compromises were made in order to bring trust back into the effort, to spend growing balances in the trust fund, but to do it in a way that was fiscally responsible. As I noted earlier, at the end of the day, because of the quality of the bill and the desired financial commitment, the President actually had to give up about \$30 billion in offsets that he had suggested for other purposes. So, there was, definitely, the compromise.

Senator SHELBY. But there always is, is there not?

Secretary SLATER. There always is. As it relates to FAA, we have been clear in saying—as we said as relates to surface transportation, “no off-budget.” We have been very clear in that regard.

We have also expressed our non-support for firewalls for the very reasons that you have noted. They present very difficult situations for—

Senator SHELBY. They cause you trouble in your Department.

Secretary SLATER. It does, anytime you are trying to balance. And in that sense, I find myself in the same position that the committee finds itself in, when you have to make choices.

We have used the word “balance” a couple of times over the course of the hearing. I think that in TEA-21 we were able to capture a pretty good balance in the way we gave emphasis to certain programs; highways; transit; a focus on safety; a focus on the environment; those kinds of things. I think if we can do the same thing as relates to the FAA, and figure out how you might unlock the trust fund, dealing with receipts and interest, then I think that at the end of the day that might carry the day.

Now, we still have some delta, even if you are able to get a commitment among the parties to go with receipts and interest. You still have about a \$1 billion annual deficit, and we have to figure out how you come up with that amount, as well.

Our proposal is to do it through user fees, but there are some other options on the table. Again, at the end of the day, we will be against taking the trust funds off-budget. We will be against providing any kind of guarantee as relates to the general fund, but it would not necessarily be against unlocking the trust fund and providing for receipts and interest from the Aviation Trust Fund.

TRANSIT FULL FUNDING GRANT AGREEMENTS

Senator SHELBY. On Transit New Starts, Mr. Secretary, it is my understanding that TEA-21 authorized a total of \$8.4 billion commitment authority in guaranteed funds for new starts.

Secretary SLATER. Yes.

Senator SHELBY. Our staffs have informed me that after the enactment of the fiscal year 2000 appropriations bill, \$2.8 billion was left uncommitted for the rest of the authorization cycle; that is, through fiscal year 2003.

And finally, if all the transit projects that are included in the Administration's request do sign full funding grant agreements with the Federal Transit Administration during the fiscal year 2001, all the commitment authority that was authorized in TEA-21, will be committed, leaving no uncommitted funds available for new funding grant agreements before 2003.

Is that an accurate description of the current status of the new starts pipeline? And what would happen under the proposed budget request?

Secretary SLATER. I believe it actually is. We have a number of full funding grant agreements that we are already providing support for. I think that number is 14. We have about three that are pending, and we have this new round of 12 new full funding grant agreements.

And you are correct. After all of those run their cycle, we will have used up the amount authorized for this purpose in TEA-21.

Senator SHELBY. Mr. Secretary, it is also our understanding that some, if not most, of the projects proposed for new full funding grant agreements in the budget have not yet completed the NEPA process or have records of decisions filed, which means that they are not yet ready to move from the preliminary engineering to the final design stage of the project. Is that right?

Secretary SLATER. Well, I would have to look at the individual projects.

Senator SHELBY. Do you want to get back to us on that?

Secretary SLATER. That is correct. I will get back with you.

[The information follows:]

The requirements of the National Environmental Policy Act of 1969 (NEPA) are met when a Record of Decision (ROD) or a Finding of No Significant Impact (FONSI) is issued. Six of the twelve proposed FFGAs have RODs: Hudson-Bergen MOS-2; Portland-Interstate MAX LRT; Seattle-Central Link LRT; Pittsburgh-Stage II LRT; Salt Lake City-CBD to University LRT; and Washington DC/MD-Largo Extension. The remaining six projects are on track and will be issued a ROD or FONSI by June 30, 2000.

Secretary SLATER. I will say this, Mr. Chairman, that we do have a criteria for making these kinds of judgments. The projects that meet that criteria, are in the development stage, but they are far enough along for us to make a judgment about local commitment. We have a general sense about the scope of the project. These are the kinds of things that we take into account before entering into full funding grant negotiations.

You are correct in noting that at the end of the day, we may or may not have all of these projects meet all of the requirements and move forward.

Now, Senator Lautenberg mentioned the Hudson-Bergen project earlier. And by the way, Mr. Lautenberg—Senator, thank you for your leadership on that project and promoting it. This is actually a project that is rather unique in that the request has been to provide the full funding grant agreement, but there is no request for money right now. They are requesting money a little later on.

So, there is a difference in the stage of development of all of the projects, but all of them have met our criteria for full funding grant agreement negotiations.

FISCAL YEAR 2000 FULL FUNDING GRANT AGREEMENTS

Senator SHELBY. Mr. Secretary, I believe last year's budget request included seven proposed full funding grant agreement projects, which you expected to approve before the end of the fiscal year 2000. We are halfway through that 2000 year. How many of those projects have actually received an FFGA? It is my understanding it is only one; the Dallas-North Central LRT.

Secretary SLATER. Let me check that, Mr. Chairman. I do not have the information at my fingertips. But I will say this, that if they do not meet their commitment to have their work done within the prescribed period of time, then we will deal with that situation.

So, if we have time within the cycle, then they still have time to get their work done. But without knowing where we are, exactly, with each project, I would like to get back to you with specifics on that.

[The information follows:]

FTA entered into a FFGA with Dallas on the construction of the North Corridor LRT project on October 6, 1999. The proposed FFGA's for San Diego/Mission Valley East and Fort Lauderdale/Tri-Rail Commuter Rail have been forwarded to Congress for approval; and the Newark/Newark Rail Link (MOS-1) project is under development within the Department. The Memphis Medical Center extension underwent significant scope changes and funding increases; thus was rerated and is now proposed for FFGA in fiscal year 2001. The Salt Lake City Downtown segment has been withdrawn and an extension of the North South LRT to the University is proposed in the fiscal year 2001 budget. The Orlando I-4 Central Florida LRT project was also withdrawn from consideration because of loss of local financial support.

Senator SHELBY. Okay. How do you think that the other 70 or so authorized new start projects that are currently in alternative analysis or preliminary engineering are going to react to a budget proposal that completely cuts them out of the running for full funding grant agreements before the year 2004?

Secretary SLATER. I think that they would want to know that we are already beginning the process of preparing for the next re-authorization cycle of what would be TEA-21+. And many of these projects really take time for development. I still think that there will be opportunity to be responsive to those projects, over time.

Senator SHELBY. Okay.

Secretary SLATER. I think that there may be things that we can do in the interim that really keep that process going. We would look forward to working with those individual States and locales.

Senator SHELBY. We hear from everybody up here, as you know.

Secretary SLATER. Oh. We do, too.

Senator SHELBY. I know.

Secretary SLATER. Yes, sir.

Senator SHELBY. Both of us. Same day, probably.

Secretary SLATER. Right.

LOS ANGELES MTA

Senator SHELBY. The budget includes a request for \$50 million for the L.A. MTA to buy new buses in order to implement the bus consent decree ordered by the Special Master.

Secretary SLATER. Right.

Senator SHELBY. The judicial process associated with the consent decree litigation is ongoing and it is very complex.

Secretary SLATER. That is right.

Senator SHELBY. It is my understanding that a stay has been granted by the 9th Circuit Court of Appeals, while an MTA appeal of the decree is pending. Does not a Federal budget request for funding to implement the bus consent decree prejudice the results of this ongoing judicial process? In other words, that is not finished, yet. Or are we getting a little ahead of ourselves?

Secretary SLATER. We may be, but it has always been our hope that the parties would figure out a way to resolve this matter without taking it to the term of a court decision. And if that, in fact, occurs, we would need to be in a position to respond positively to that kind of potentiality.

But you are right in noting that we are making the funds available, while you actually have a matter before the courts. But we also have an opinion that we have expressed in this matter, as well.

To provide this money at this time is consistent with how we have viewed the facts of the situation. But again, we are not moving forward until there is a court decision or until the matter is resolved in some way short of a court decision.

COAST GUARD OPERATIONAL READINESS

Senator SHELBY. The Coast Guard has expressed concern that operational readiness is eroding. In fact, in a recent speech at the Center for Naval Analysis, the Commandant focused on the reduced availability of C-130s and the lack of spare parts needed to keep them flying to illustrate the readiness challenges the Coast Guard is facing.

Secretary SLATER. Right.

Senator SHELBY. I have asked the committee staff to look into it and have been informed that even though Congress fully funded the aircraft maintenance line into the 2000 appropriations bill, the Coast Guard reprogrammed funds below the notification threshold from the Aircraft Maintenance Account to pay for recruitment activities.

Will you look into this and provide a response for the record, why the Coast Guard is citing the lack of readiness in an account that they dun for another activity?

Secretary SLATER. Okay. I will look into it, but if I may, Mr. Chairman, I would like to note, as relates to the reprogramming, it is an amount that is below what would be the general threshold of concern over which we would never go beyond.

And so, while we definitely would want to talk this through, we did make a reasonable judgment that we were acting within the parameters of our ongoing agreements and relationships.

The other point I would like to make is that I think Admiral Loy and our Coast Guard have really faced quite a difficult challenge. As you know, they are having to take on additional responsibilities in the drug interdiction effort and migrant interdiction effort. We really have had considerable difficulties in our recruitment efforts, much like the Armed Services, as a whole.

We are now working with Secretary Cohen and the Joint Chiefs of Staff and the National Security Council with Sandy Berger and the President to figure out how we address this. But in the short

term, we did need to have some reprogramming to beef up our efforts in this area. I am pleased to report that we are actually on track to do better this year, as relates to recruitment.

Also, the place where we have been hurt has been having the kinds of people that really have the skills, frankly, to do a lot of the maintenance work that you have raised. Also, the Department of Defense, because of a contracting relationship change that they have undertaken, now actually contracts out much of their work as relates to this question.

We, then, do not have the benefit of being able to look to the pool when it comes to getting some of the spare parts that we need for this purpose. It is a difficult situation. It is a challenging situation. What we were trying to do here was to do something in the short-term that would help us bide our time until we could work with the committee, with the Congress, and with the Administration, to deal with this over the long-term.

PASSENGER RAIL

Senator SHELBY. Okay. Expanded inner city rail capital. I will try to be brief.

Secretary SLATER. Okay.

Senator SHELBY. The budget proposes to transfer \$468 million from the Revenue Aligned Budget Authority for the purposes of making grants to Amtrak or to a single State or consortium of states to improve passenger rail service. These funds are in addition to the \$521 million for Amtrak capital grants consistent with the glide path to operational self-sufficiency by 2003—

Secretary SLATER. Right.

Senator SHELBY [continuing]. Which both Amtrak and the Administration have committed to. One of the things that strikes me as a little odd, Mr. Secretary, about this new program, in addition to being funded out of the highway gas tax receipts, is that a 50 percent match is required if the grant is made to a State or consortium of States, but no match is required if the grant is made directly to Amtrak. Is that understanding not correct?

Secretary SLATER. Your point is well taken. Amtrak, frankly, because of its limited and tight budgetary environment, is not required to match, but because we are trying to generate more commitment from other sources—the States, in this instance, are required to meet this opportunity with a 50/50 match.

If I may, also, Mr. Chairman, I know that this issue has been a matter of concern to you, because you have expressed, as I have, in many instances, agreed, that when it comes to rural America, the presence of Amtrak is not as we would desire it.

What we have sought to do in the short-term is to deal with the financial viability of Amtrak. And I am pleased that we have made considerable progress, in that regard.

It is really hard to imagine that from 1997 to this point in time, Amtrak has experienced three consecutive years of ridership increases; about 10 percent over that period of time. They have also had a 16 percent increase in revenues. The service has improved. They have done a better job.

And we are going to have high-speed rail in the northeast corridor by the summer. We have the regional service that we just un-

veiled from New York to Boston, dealing with the non-electrification of the track. And then we will have the Acela Express Service in the summer.

ACELA RAIL SERVICE

Senator SHELBY. What will be the time from Washington to Boston, after that?

Secretary SLATER. From Washington to Boston, I think we are going to cut about two-and-a-half hours off of that trip.

Senator SHELBY. I need to ride that with Senator Lautenberg, do I not?

Senator LAUTENBERG. I would like to have you on that train. Mr. Chairman, I have a special catering order from off the train, but we will be able to eat—

Senator SHELBY. A glass of water, I hope.

Secretary SLATER. You know they said that time really passes fast when you are having fun. So, the two of you together, talking about transportation matters, that time would go pretty quickly.

Senator SHELBY. Well, we would not want to do that unless you joined us in the—

Secretary SLATER. Now, I would love that.

Senator SHELBY. And we would have to have our senior advisor here, Senator Byrd.

Secretary SLATER. Oh. Yes.

Senator SHELBY. He knows more about all of this than all of us, basically.

Secretary SLATER. Okay. Well, let me say this: I do believe that because of the leadership of this committee, when we unveil that Acela service, it would be really quite a joy and an honor for all of us to experience that together, because I can tell you, in 1997, Amtrak was on its back. It was really the Senate, first, and then the entire Congress and the Administration, all of us working together, to get that creative budgeting there early on, and then to provide the plan to get them to self-sufficiency over a 5-year period. They have done a really good job.

The Amtrak Board of Directors, now, is totally in place. Governor Tommy Thompson is doing a great job as the chair; and Governor Dukakis, as the vice chair, a great job; also, Mayor Smith, working with the mayors has done a super job; and Governor Holton, formerly of Virginia, is on the board. It is a great board. They are doing a good job.

Senator SHELBY. That is good.

Secretary SLATER. We believe, though, that the \$468 million would be helpful, not so much in the northeast corridor, but to ensure that as we celebrate that service, that we can also hold out promise for Alabama and the Gulf Coast region.

Senator SHELBY. Louisiana.

Secretary SLATER. That is right. Louisiana. Mississippi.

Senator SHELBY. Georgia.

Secretary SLATER. The north—

Senator SHELBY. The deep south.

Secretary SLATER. The deep south.

Senator SHELBY. North Alabama.

Secretary SLATER. So, that is why we have this proposal; to give us an opportunity to engage States and other interested parties in looking at a broader vision for high-speed rail.

Senator SHELBY. Senator Lautenberg, thank you for your indulgence.

Senator LAUTENBERG. Thanks very much. Mr. Chairman, it is a pleasure, again, to have our Secretary with us. He has done a good job. The people who work with and for him have carried their share of the responsibilities very efficiently.

We had Mr. Basso, up in New Jersey, and he helped us in the review of what is taking place in the light rail service. He understood our needs and where we have to go, even though the budget, Mr. Chairman, is large—\$55 billion, roughly. But the need is even larger than that. For us to have the kind of transportation systems that a nation like ours, with the size of our economy and the size of our country, and the interest of our people.

They are just sitting in airports. And I see more people having lunch on the floor at Newark or wherever you go the places are crowded. The schedules are jammed. They are often late.

When we talk about rail or we talk about other modes, we are talking about a necessity to make sure that everything works as efficiently as it can. When service is held up in Newark, believe me, you feel it in Alabama, and you feel it in Louisiana. The system is a totally integrated system.

And so, it was exciting to be on the regional Acela. It is a door-opener. I was reminded by Governor Dukakis that the speed that we have now, in this regional thing, is only a catch-back; not a catch-up, but a catch-back. Because in 1959, they had the same 4-hour speed. And it disintegrated over the years, as the equipment and the facilities disintegrated. But now—

Senator SHELBY. In 1959, they had a—

Senator LAUTENBERG. They had a 4-hour speed. But we are going to be down to 3 hours, shortly, there. And I must point out, and I had the staff get this right away, the Acela regional train showed a 45 percent boost in ridership over the trains they replaced—45 percent. I think, when did we start, 2 weeks ago—that—to open that service?

And I thank you, Mr. Chairman, for your help in getting that investment made. It makes it so easy for my three grandchildren, who live in Boston, and their mother and their father, to come down to visit me. I know that was a nickel-and-some factor.

We can do better, I hope, than the \$468 million in the President's budget.

Mr. Secretary, do you think the Administration is going to be soon in a position to endorse my legislation or expand the use of capital, here, with the \$10 billion bond support?

That would have a substantially lower cost than what we have to do now, in order to get funding into the railroad. That \$10 billion of financing would, over the 10-year period, cost about \$2 billion. Is that—\$2.3 billion. You get leverage four times out, as a result of that. I hope that we will get an enthusiastic endorsement from the Administration very soon.

Secretary SLATER. Thank you, Senator.

BLOOD ALCOHOL CONTENT (BAC)

Senator LAUTENBERG. You know, we are still working on reducing the blood-alcohol content while driving. I know that both Senator Shelby and Senator Byrd share my view that we have to be more diligent about reducing those fatalities. And it has come down. And it is good to see it.

The last 2 years, only one State out of 34 has adopted a .08 BAC. It is a poor record, considering all the States, except Kentucky, has a chance to pass it and get the funding.

Does the President support the .08 BAC?

Secretary SLATER. He does. And Senator, I would note that for the first time in 1998, we actually had the percentage of alcohol-related highway fatalities to fall below 39 percent. It is actually 38 percent.

Senator LAUTENBERG. For fatalities or—

Secretary SLATER. That is right. Thirty-eight percent of all fatal crashes involving alcohol. At one time, it was actually 55 percent; years ago. So, we have significantly brought that figure down. It stabilized at around 41 percent for many years of this Administration, but now we are below 40, and at 38, which is quite an improvement.

Senator LAUTENBERG. And you know, it says one thing, Mr. Secretary, and I would appreciate your comment. Does the incentive program go far enough to induce these States to move to improve the safety record, vis a vis, driving while under the influence?

Secretary SLATER. It does not go far enough. As you know, the Administration joined you and others, Congresswoman Lowey, in proposing a national standard of .08 BAC. We were not successful in that effort, but one of the good provisions of TEA-21 does provide an incentive program. So, it does not go far enough, but it has been helpful. Hopefully, though, we can win the battle and get .08 BAC as the law of the land.

Senator LAUTENBERG. I think, Mr. Secretary, and for the record, I think that it needs more than an incentive, which has, thus far, not really induced much support. We found out when we raised the drinking age to 21, and there, I am told by the safety agencies, Senator Byrd, it saved 15,000 families from having to mourn the loss of their child in these last 14 years.

If I feel proud of one thing that I have done, I must tell you, it is that. We can bring that terrible record down even further, if we would just get on this with seriousness. There were incentives out there for years to bring the drinking age up to 21, and not much happened.

When we said, "Okay. We are going to reduce your highway funds," even that was a drag, but finally everybody understood that Lautenberg was serious and the Senate agreed, and we got it done.

AIR CARRIER ACCESS TO HEATHROW

I want to talk for a minute about air carrier access to Heathrow Airport. Now, you have been in negotiation with the UK for some time regarding a new bilateral aviation deal. And I, along with many of my colleagues and the Administration, have been insisting

that any new aviation deal with the UK include access for new U.S. carriers to Heathrow.

I have been to Gatwick. And I have been to Heathrow. And I will tell you, Heathrow is the difference between a more timely arrival to your destination by a significant measure. I think I paid \$100 cab fare from Gatwick to London. In my view, this is not the way things ought to happen.

Is there any possibility that you would agree to a new deal with the UK that would not include access for new U.S. carriers to Heathrow? I hope not.

Secretary SLATER. No, Senator, that has been one of the conditions of our negotiations. Those conditions have also grown to include restoration of the service from Pittsburgh to London, as well as a new designation of U.S. carrier to Heathrow.

Senator LAUTENBERG. Well, it is nice to have Pittsburgh-London service, but we need it in the New York/New Jersey area, where so much traffic occurs. I hope that we would not fall prey to a mini-deal that would allow British Airways and American Airlines code sharing without guaranteeing access for U.S. carriers to Heathrow.

Secretary SLATER. You should know, Senator, that we have already requested additional information on the British Airways-American Airlines issue. There is no intent, on our part, to address that until we have a greater sense of equity as relates to the U.S.-UK aviation relations.

COAST GUARD CUTTERS

Senator LAUTENBERG. Last month a new Coast Guard cutter went into service, patrolling the Atlantic seaboard from New Jersey to South Carolina, after three boats sank off the coast of New Jersey, this last winter. This is welcome news, however. And something that the Chairman raised and you talked about a moment ago, the cutter patrols a very large area. More ships could be added, and over the next few years, the Coast Guard is expected to add new vessels—

Secretary SLATER. Yes.

COAST GUARD MISSIONS

Senator LAUTENBERG [continuing]. But for drug interdiction duties, not search and rescue and some of the other responsibility they have, what is DOT's plan to ensure that all Coast Guard missions, not just the drug interdiction duties, are able to be carried out fully? Because it is my understanding that the Coast Guard is short 1,200 people and retains only 50 percent of its pilots. And boy, they do one load of work, I will tell you.

Secretary SLATER. They do.

Senator LAUTENBERG. We squeeze them constantly; give them more assignments. We see what happens with illegal immigration. We see what happens with pollution control. We see what happens with navigation aids. And the Coast Guard is there when we have these terrible tragedies; whether it is an airplane going down or a boat sinking. The Coast Guard is there in terrible weather, very difficult assignments.

Secretary SLATER. You are right.

Senator LAUTENBERG. So—

CHALLENGES FACING THE COAST GUARD

Secretary SLATER. Senator, your point is well taken. You know, the motto of the Coast Guard is "Semper Paratus"—"Always ready". The Coast Guard actually saves a life every 2 hours. During the Hurricane Floyd experience, they actually saved 500 lives over a period of time. It is a remarkable organization. It has been very much at the forefront in a lot of the streamlining and reinventing effort of this Administration over the past 7 years.

We have gotten to a time, now, where we really are starting to look at the long-term challenges facing the Coast Guard; their readiness and their deepwater equipment needs and the like. We are starting to really address those concerns.

Let me just mention one or two things in that regard. First of all, I should say, that even as the Coast Guard has done some re-programming of late, and I go back to the Chairman's question in this regard, they have not, in any way, stepped back from their safety responsibility, which they consider primary—search and rescue. Their ability to perform there is consistent with where they have been.

Over time, we would hope to increase the ability to perform at that level, in this respect and across the board, with our deepwater initiative, which is a major, multi-billion dollar acquisition program need that we have.

We have recently gone through a process where we have basically put together a plan for this purpose. The President's budget includes \$42 million to begin the process of moving forward on this initiative. But we will have to come to the Congress in years to come with a request for much, much more. We are putting together a program and a process for doing that in a way that is thoughtful and that evidences reason and reflection.

We have also engaged in a roles and mission effort as relates to the Coast Guard. This is sort of a companion effort with the Deepwater Initiative. It is to re-examine the roles and the missions of the Coast Guard in this new environment.

And there, again, I think we have had considerable success and would welcome an opportunity to report to you and other members of the committee and your staffs about our progress in that regard. We are looking at the long-term needs and the long-term view of the Coast Guard. And we appreciate your comments in that regard.

I think Admiral Loy and Admiral Card, the Commandant and Vice Commandant, have done a great job. If I may, I would like to mention Admiral Naccara, who headed our Y2K initiative within the Coast Guard. Super job working with IMO and putting together a code of best practices that became, really, the standard for the nations of the world. The Coast Guard is a fine organization. We appreciate your support and your expressions of concern regarding some of the challenges faced by the Coast Guard.

Senator LAUTENBERG. Thank you very much. Thanks, Mr. Chairman.

Senator SHELBY. Senator Byrd.

Senator BYRD. Thank you, Mr. Chairman. And thank you, Mr. Secretary.

Secretary SLATER. Thank you.

REDISTRIBUTION OF HIGHWAY FUNDING

Senator BYRD. Your budget proposes many changes in the treatment of the programs under TEA-21. These proposals have the result that there are some big winners and some big losers in the distribution of the total amount mandated for highway funding under TEA-21. Your formal testimony makes mention of some of the big winners under your budget.

I think it is also important that we have a discussion about the losers under your budget. These are the programs that would have to have their obligation and limitations cut in order to pay for the increases that are being proposed elsewhere.

The biggest loser is the formula fund provided to the States. As you may recall, I offered an amendment. It was co-sponsored by Senator Phil Gramm, Senator John Warner, and Senator Max Baucus, at the time we had the TEA-21 legislation before the Senate.

In the first place, we had to fight like the dickens to get it up before the Senate. Then, they had a strong battle over the amendment itself. But, it was adopted. The result was somewhere between \$26 billion and \$28 billion—not million—but billion went to all of the States; raising all the boats, because the tide was raised. If you have an infusion of somewhere between \$26 billion and \$28 billion, that raises the tide.

Now, part of the reason that we provided highway funding guarantees in TEA-21 was to give the States a predictable flow of money from the trust fund. And now it is being proposed to upset this predictability by taking more than \$1.3 billion—that sounds like about \$1.30 for every minute since Jesus Christ was born—\$1.3 billion that the States are expecting to send to other priority initiatives.

How do you explain this proposal, Mr. Secretary? With all due respect to you, and I love you, how do you explain this proposal to the nation's governors and the nation's highways commissioners?

Secretary SLATER. Well, Senator, you have actually come back to really what has been a matter of concern voiced by many of your colleagues. And as I recall, you actually led in putting the issue on the table, and appropriately so, because, as you have noted, you were really, along with your colleagues, a principal player in bringing the balance to the measure that passed—TEA-21. It was quite a historic piece of legislation.

We would argue that the predictability is still there; that our focus is primarily on that amount that comes in, in excess of projections. Although there was language in TEA-21 to address that possibility, that is where the focus is.

This year it is projected to be about \$3 billion, let me just say that. Last year, it was a considerable amount. This year, about \$3 billion.

Last year, we actually proposed using it in many different ways, and using much, much more of it. In this instance, we are really focusing on about a third of it, maybe even a little less. I think our total number is about \$741 million.

So, we have really tried to take into account the sensitive nature of what we are proposing, and also the fact that there was that delicate balance that we participated in. We recognize that and

commend it and support it. But again, we are talking about that which is in excess of the projection. And this year we are talking about a much smaller amount of that.

As we propose using the \$741 million in a certain way, the ways that we are suggesting are consistent, pretty much, with the themes of TEA-21. The only area where there is probably sort of a hard departure, would be as relates to high-speed rail, because, there we tried to make it eligible as an item for funding under TEA-21, giving the States the ability to do that. We did not carry the day on that point. So, we acknowledge that.

But that is probably the most significant departure from what was proposed in TEA-21. Everything else pretty much matches what was proposed in TEA-21. TEA-21 dealt with economic development.

Our belief is that the Delta Regional Program that we are proposing, about \$69 million, and the Native American Lands Program that we are proposing, are consistent with the spirit of TEA-21; especially when you consider that it deals with hard-pressed regions of the country, much like Appalachia.

Senator BYRD. But you're cutting Appalachia. That is not consistent with—is it, with the policy is it?

Secretary SLATER. Well, again, we are dealing with the excess that goes beyond the projection. But I think you make a good point, Senator. And as we go forward, I think we need to really address that particular of the question. So, I think you make a very good point, there.

The other areas deal with increases in safety. It is really trying to add more to certain categories. That is right. But those categories are categories that are reflected in TEA-21.

And the only area where you may have a major departure would be with our desire to ensure that once we unveil high-speed rail in the northeast corridor, that we have a foundation for a similar corridor or a similar series of corridors around the country. That is probably the area where we have the sharpest departure from the specific items mentioned in TEA-21.

MISSISSIPPI DELTA AND APPALACHIA

Senator BYRD. Mr. Secretary, I support the Mississippi Delta Program. I do not see why we need to cut back on Appalachia. Why can we not move forward on both?

Secretary SLATER. That is a good—

Senator BYRD. If we want to improve safety, then let us finish those Appalachian corridors. Instead of having two-lane corridors, which are a sure prescription for accidents and fatalities, we need to have four-lane divided highways.

Secretary SLATER. Right.

Senator BYRD. That includes a very important safety project.

Secretary SLATER. Well, Senator Byrd, we are in agreement there. I remember, in 1995, when we were dealing with the designation of the National Highway System, with your support, we actually got a much stronger commitment to complete the job of the Appalachian Highway System. And I think we are making considerable progress. That is why I am so sensitive, frankly, to the point that you raise.

Why, if the focus for the Delta Program and the program for Native American lands, if the objective there is to do as we are doing with the Appalachian region, why would you take from that region to do this? I think that is a very good point. We should figure out how we address it, as we go forward.

Senator BYRD. Well, you are not just proposing to reallocate the \$3 billion in excess projections. You are proposing to reallocate funds within the core highway program. Actually, you are proposing to change TEA-21.

Secretary SLATER. That is a good argument. But we would argue that what we are proposing is still consistent with TEA-21. We have tried to cut it back to make it less onerous, burdensome for some, but our focus, again, is on \$741 million; the remainder, roughly \$2.3 billion, that would continue to flow through the formulas as prescribed in TEA-21. And that, then, goes to, primarily, highways, some transit, but it flows through the formula.

Senator BYRD. I consider Amtrak an important national asset for our transportation system.

I am not persuaded by your argument.

Secretary SLATER. Yes, sir.

Senator BYRD. But, my time is limited. And I am going to shift, now.

Secretary SLATER. Okay.

Senator BYRD. I respect you for your argument, but you really have to argue the President's case for him. I understand that. I know your heart is not there in the coffin with Caesar. Your heart is with me. You really want to build that Appalachian System, but I understand the constraints that you have to live under. I respect you for that.

AMTRAK

I consider Amtrak an important national asset. The cost of traveling on the Cardinal is considerably cheaper than the airfares available to my constituents.

Secretary SLATER. Right.

Senator BYRD. The airfare cost is about \$659 for a round-trip to West Virginia; perhaps, above \$700. I suppose you can go to London and back for much less, but you can certainly ride Amtrak for much less.

Secretary SLATER. Right.

Senator BYRD. Yet, you can go from here to White Sulphur Springs for less than \$90; maybe just a little over \$90, on Amtrak, but it is \$600-plus to go by plane.

You noted that the Amtrak ridership increased substantially the last year.

Secretary SLATER. Right.

Senator BYRD. You are requesting funds for new high-speed rail corridors around the country. Are you concerned that Amtrak will struggle to absorb this \$50 million reduction in direct support this coming fiscal year?

Secretary SLATER. No. We believe that they can—that what we have proposed for Amtrak is sufficient. I think the amount of \$521 million, plus the expanded program dealing with high-speed rail of about \$468 million is sufficient.

It is our belief we have provided an amount that is consistent with the 5-year plan that Amtrak put together towards self-sufficiency. We feel comfortable that they can manage with the amount that we proposed.

Senator BYRD. I understand there has been a delay in the delivery of Amtrak's new high-speed train sets.

Secretary SLATER. That is right.

Senator BYRD. These new trains are supposed to be used in the northeast corridor. Amtrak is depending on these new trains to generate substantial revenue next year. If the high-speed trains continue to be delayed, is it possible that the Administration will have to revisit its budget request of \$521 million in direct support for Amtrak?

Secretary SLATER. We probably would not revisit that question in this round, but clearly, we are concerned about the Acela Express Service coming online as soon as possible. Our highest concern is that of safety. And that has been the real issue here.

As things stand, currently, the delay has not adversely impacted—or irreversibly—let me say it that way—impacted Amtrak to such an extent that we would have to make a request of that type at this time. We still feel good about the request of \$521 million.

We are hopeful, as relates to the request, for high-speed rail support around the country through our expanded request of \$468 million, but we continue to monitor the situation with the Acela Service very closely. And we do not want to go through the complete year without the benefit of that service.

I thought Senator Lautenberg—I made a note of his comment that they have already seen a 45 percent increase in ridership with the Acela Regional Service. And that does not even get to the 150 miles-per-hour service that we are looking forward to.

So, there is that desire out there. We can tap it, but you have to have the service online to do so.

REROUTING TRAIN SERVICE

Senator BYRD. Mr. Secretary, the Cardinal has had a very difficult time with its on-time performance over the last several months.

Secretary SLATER. Right.

Senator BYRD. One solution that has been proposed is to reroute the train around Chicago to avoid areas of congestion with freight traffic. This proposal would require the cooperation of many of the impacted freight railroads. Will you look into that situation?

Secretary SLATER. I will.

Senator BYRD. Could your office, perhaps, play a role in working with the freight railroads to allow this rerouting proposal to go forward?

Secretary SLATER. Yes. Senator, I will look into it. And we will respond to you regarding the results of our inquiry.

TIMELY RAIL SERVICE

Senator BYRD. The Norfolk Southern and CSX Railroads took over Conrail this past summer.

Secretary SLATER. Right.

Senator BYRD. And since that time, we have experienced an increased number of delays in the MARC Commuter Rail Service, along the Brunswick line, between Martinsburg and Washington, DC.

In my office, there is a young lady who commutes from Shepherdstown, WV, over to Washington, DC, and she is here every day.

Secretary SLATER. Is that right?

Senator BYRD. She gets off the train down at the station, here; walks to the office. Every afternoon, at 5 o'clock, she leaves the office to catch the train that goes back to WV. She picks up her automobile at Brunswick, MD or one of the WV stops. And she has been doing this for 8 years. And I will put her absentee record against almost anybody else's. She is there all the time; very dedicated.

But I hear about this problem she has. Along with that, I hear from other constituents. The inclement weather over the last few months has, of course, been a factor.

Secretary SLATER. Right.

RAIL MERGERS

Senator BYRD. These delays have impacted a considerable number of West Virginia residents who live in the panhandle of West Virginia and commute to Washington, D.C., daily.

Now, would you please comment on the dislocations that were created by that merger, and what the department has done to try to minimize them?

Secretary SLATER. Well, Senator, first of all, quality transportation services is nothing, if it is not on time. We are really working to address that issue of efficiency and timeliness across the transportation spectrum—aviation, clearly. We talk about Amtrak here, but even Metro service. And we are actually using technology to help us in that regard.

Having said that, let me say that, more and more, we are finding that there is the challenge of providing timely commuter service, passenger service, and timely freight service when they have to share, in many respects, the same track.

But this is something that we can address, and address effectively; and I think, address to the satisfaction of all concerned. Because, again, at the core of quality transportation is that issue of safety, but it is also timeliness and service. And so, you have to have that addressed, and addressed effectively.

We are working on that. What we would like to do, maybe, in that regard, since this is clearly an issue of concern to the committee, is to continue to keep you informed as we work on this question.

As relates to the broader issue that you raised regarding the Norfolk Southern and CSX merger and the acquisition of Conrail, let me say, in dealing with that question more specifically, that we have really seen a total transformation of the rail industry during these mergers and reconfigurations, over the last decade or so. I mean, it has really been remarkable.

I remember when I talked to Secretary Peña, early on, about key issues that I should be mindful of and issues that he had wrestled

with and knew that were still there to be dealt with; this was the number one issue that he raised.

Senator BYRD. Mr. Secretary, you would make a great Senator. You would be excellent in the case of a filibuster.

Secretary SLATER. A filibuster. All right. Thank you.

Senator BYRD. You really have not answered my question. I am going to go on to——

Secretary SLATER. Let me—what were the specifics of—I was about to get to it, I thought.

Senator BYRD. My time is running out. One other question.

Secretary SLATER. We are talking about time, too. My apologies.

Senator BYRD. One brief question, here.

Secretary SLATER. Okay.

Senator BYRD. But you did fine. I will give you a 100 percent on the effort.

Secretary SLATER. Okay. Thank you.

Senator BYRD. But I am a careful listener. I know when my question is not being answered. We had a discussion about that last year, did we not?

Secretary SLATER. Yes, we did.

RAIL SIGNALING SYSTEMS

Senator BYRD. I am told that there may be an opportunity to improve the signaling system between Martinsburg and the Maryland State line, in order to minimize the conflicts between freight trains and commuter trains along the Brunswick line.

Secretary SLATER. Right.

Senator BYRD. I would appreciate it if your experts at the Federal Railroad Administration and the Federal Transit Administration could look into this proposal.

Secretary SLATER. We will do that.

Senator BYRD. Would you?

Secretary SLATER. It would be a good thing to do, sir.

Senator BYRD. I hoped we could count on your assistance for that review.

Secretary SLATER. Okay. Thank you.

Senator BYRD. Now, Mr. Chairman, I thank you for your patience.

Senator SHELBY. Sure.

Senator BYRD. If I have further questions, I will submit them for the record.

And thank you, again, Mr. Secretary.

Secretary SLATER. Thank you, sir.

Senator SHELBY. Thank you, Senator Byrd.

Mr. Secretary, I want to touch on a couple of more things——

Secretary SLATER. Okay.

EMERGENCY RELIEF

Senator SHELBY [continuing]. On something Senator Byrd mentioned in his opening statement. I find it interesting that you propose to increase the Emergency Relief Highway Program from the TEA-21 firewall amount of \$100 million to \$498 million, we have been told, to address the emergency highway backlog. While I

think that more emergency money should have been provided in TEA-21, I agree with you on that.

I question how equitable it is to take the firewall account, which already requires a 12.9 percent reduction, because the TEA-21 authorization did not deliver on what it authorized, and reduce the amounts that will go to every State further, in order to fund an emergency program that any observer should have known was undercapitalized in the authorization.

My question is: Why did you not pay for the increase in Emergency Relief Highway Program out of the general funds, out of RABA, or submit a supplemental request? What are the options, there?

Secretary SLATER. Well, I think we have actually had the \$100 million amount pool since fiscal year 1973 or so. It is clear that that amount is not sufficient. We always have to come back either for supplementals or do something, as we are proposing now; figure out some way to make it a part of a budget request where we seek the resources.

What we are trying to do here, ultimately, is to take care of a backlog, but also deal with what I think we agree is a problem, and that is the limitation that we all face of having just \$100 million in that fund on an annual basis.

That is what we are really trying to do in the long-term, here; figure out some way of providing a bigger pool of resources, so that we can deal with these challenges as they come up, over time.

FAA RECEIPTS AND INTEREST

Senator SHELBY. I understand. Mr. Secretary, wouldn't your budget request for the FAA be more than funded by the receipt and interest in your user fee proposals than from the Airport and Airways Trust Fund?

Secretary SLATER. Do you mean, based on our proposal—

Senator SHELBY. Yes.

Secretary SLATER [continuing]. Would we actually be collecting more than we need?

Senator SHELBY. Yes. Would not your budget request for the FAA be more than funded by the receipt and interest in your user fee proposal than from the Airport—

Secretary SLATER. We do not think so.

Senator SHELBY. Why? You mention \$300 million more that would be necessary to meet the budget. Is that about right?

Secretary SLATER. Well, we do not think so.

Senator SHELBY. You do not think so.

Secretary SLATER. We do not think so. Now, having said that, we do know that we have the challenge before us of coming up with a cost accounting system.

Senator SHELBY. Do you want to check the figures?

Secretary SLATER. Yes. We can do that.

Senator SHELBY. That would be good.

Secretary SLATER. All right.

Senator SHELBY. Because, sometimes, you might be right and you might be wrong. And I do not know.

Secretary SLATER. Okay. Well, we can—

Senator SHELBY. We have some problems.

Secretary SLATER. Okay. We will look into it.

Senator SHELBY. And provide it for the record.

[The information follows:]

If we are considering existing taxes and interest, those sources of income total \$10.456B and are \$766M below our request of \$11.222B for FAA programs in fiscal year 2001. If we include the new user fees (with a related minor decrease in interest), the total income is \$11.410B, which is \$188M above our request of \$11.222B in fiscal year 2001.

Secretary SLATER. Yes. And Senator, if I may say, for the record, that we do understand the challenge we face when it comes to putting together a cost accounting system to really deal with the kind of credibility you have to have when you institute a user fee program. Administrator Garvey is doing a good job in that regard. And I think we have enjoyed some success, but we have some ways to go.

Senator SHELBY. Mr. Secretary, as usual, you have been very receptive to us, and you know how to work with us, and we have worked with you on a lot.

Secretary SLATER. Yes.

Senator SHELBY. So, I do not want you to think that we have exhausted all the questions. I know Senator Byrd has probably got some, and Senator Lautenberg, and Senator Stevens, and other members, we have about the budget submission.

Secretary SLATER. I understand.

Senator SHELBY. But we will save the technical and budget questions for the record. We want to thank you for your time today; for your patience.

Secretary SLATER. Thank you.

CLOSING REMARKS

Senator SHELBY. And having said that, this subcommittee will now be in recess until Thursday, February 24, at 10 a.m., right here in this room, where we will discuss Department of Transportation Safety Initiatives.

Secretary SLATER. Okay. Mr. Chairman—

Senator SHELBY. Yes.

Secretary SLATER [continuing]. Can I do one thing before we close the budget—

Senator SHELBY. Go right ahead.

Secretary SLATER. Senator Stevens asked a question that was specific; I think, in some way, related to a question that you had an interest in. It deals with the issue of providing resources for the monitoring of the Alaska—

Senator SHELBY. Right.

Secretary SLATER [continuing]. Volcano issue. I have a specific answer. One reason we did not put it in our budget is that it is our understanding that the U.S. Geological Survey has budgeted \$3.5 million for sustaining this operation in their fiscal year 2001 budget.

If that amount is insufficient for this year's costs, then we commit to work with the committee to resolve this question. I actually saw it while I was on a trip to Alaska with the Senator. So, I know about it. It is a matter that we are interested in. But it is our un-

derstanding that the U.S. Geological Survey has actually made the budgetary request to address it.

Senator SHELBY. But, basically, we will work it out either way—

Secretary SLATER. We will work it out.

Senator SHELBY [continuing]. Our both ways.

Secretary SLATER. That is right. We will work it out.

Senator SHELBY. Thank you. Thank you.

Secretary SLATER. We will work it out.

ADDITIONAL COMMITTEE QUESTIONS

Senator SHELBY. Senator Byrd will have some other questions.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

DISCRETIONARY PROJECT EARMARKS

Question. There are several programs under which the fiscal year 2000 transportation appropriations bill identified specific projects, and some of these programs have not yet made grant release announcements. When can the Congress expect Department of Transportation grant announcements for the remainder of the discretionary grants under the Federal Lands program and the Ferry Boats and Facilities program, and for the Transportation and Community and System Preservation program, Job Access and Reverse Commute Grant program, National Corridor Planning and Development program, and Intelligent Transportation Systems program?

Answer. There were 17 Public Lands Highways and 6 Ferry Boat earmarked projects for which the States had not submitted applications. By law, FHWA cannot allocate funds for these programs unless they have an application from the State. FHWA has now received most of the applications from the States for those projects; allocations will be announced shortly.

For the Transportation and Community and System Preservation Pilot Program, the selections have been made, and were announced on March 18. The announcements for the National Corridor Planning and Development Program will be made in March or April.

The fiscal year 2000 appropriations act designated 75 locations, 17 States, and 58 local jurisdictions to receive funding under the Intelligent Transportation Systems Deployment programs. Guidance for developing project proposals was released to local jurisdictions on November 17, 1999 and to State Offices on February 25, 2000. The project proposals will be reviewed by the Department to ensure that they meet the project selection requirements contained in the TEA-21 program authorization. The grant release announcements are expected beginning in May.

For the Job Access and Reverse Commute Program, the Federal Transit Administration issued its solicitation for fiscal year 2000 projects on March 10, 2000. The notice calls for projects specifically designated by Congress to be submitted no later than 60 days following the announcement, and projects for competitive selection to be submitted no later than 90 days. Congressionally designated projects may be announced as soon as FTA reviews the application and determines compliance with all standard grant requirements and conformance to the Congressionally mandated criteria for the program. FTA expects to announce the competitively selected projects before the end of the fiscal year.

DISCRETIONARY BRIDGE

Question. Please provide a list of all bridges eligible for discretionary bridge funding for which the agency has (or expects within the next fiscal year) an application. Please indicate whether such bridge is eligible for discretionary bridge funding or any other discretionary programs administered or funded by the Department of Transportation.

Answer. The following table lists bridge candidate projects that were considered for fiscal year 2000 funding under the Discretionary Bridge Program. The table indicates which projects were funded. Bridge projects on the Interstate system costing over \$10 million and ready for construction within one year of the allocation would

also be eligible for Interstate Maintenance discretionary funds. The table also indicates which projects satisfy these conditions. The States' applications do not include enough information to determine those projects that may also be eligible for Public Lands or Borders and Corridors funding.

CANDIDATES FOR THE DISCRETIONARY BRIDGE PROGRAM

[Fiscal year 2000]

| State | Project | Comments |
|---|------------------------------|--|
| Seismic Retrofit Candidates: | | |
| California | Golden Gate Bridge | Eligible—funded with fiscal year 2000 DBP funds. |
| Tennessee and Arkansas | Hernando Desoto Bridge | Eligible—funded with fiscal year 2000 DBP funds. |
| Washington | Spokane Street Over-crossing | Meets rating factor criteria (40.7), but did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until the 4th quarter). |
| Nonseismic Candidates: | | |
| Continuing projects (Partially funded in previous years): | | |
| Michigan | Dequindre Yard | Eligible—funded with fiscal year 2000 DBP funds. Also eligible for IM discretionary. |
| Missouri | Chouteau Bridge | Eligible—funded with fiscal year 2000 DBP funds. |
| Tennessee | Loudon City Memorial | Eligible—funded with fiscal year 2000 DBP funds. |
| Washington | Snohomish River Br. | Eligible—funded with fiscal year 2000 DBP funds. |
| South Carolina | Grace Memorial Bridge | Not Funded in fiscal year 2000—Did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until the 4th quarter). |
| Olympic Cities Projects: | | |
| Utah | Kimballs Jct. Bridge | Eligible—not funded in fiscal year 2000—unfavorable rate factor of 59.5. Also eligible for IM discretionary. |
| Utah | Silver Creek Jct. | Bridge Eligible—not funded in fiscal year 2000—unfavorable rating factor of 59.7. Also eligible for IM discretionary. |
| Other Non-seismic Projects: | | |
| New Mexico | I-25 /I-40 Interchange | Eligible—funded with fiscal year 2000 DBP funds. Also eligible for IM discretionary. |
| Illinois | Wacker Drive Viaduct | Eligible—funded with fiscal year 2000 DBP funds. |
| Kansas | Turner Diagonal Bridge | Eligible—earmarked in H.R. 2084 Conference Report and funded with fiscal year 2000 DBP funds. |
| West Virginia | Williamstown-Marietta Bridge | Eligible—earmarked in H.R. 2084 Conference Report and funded with fiscal year 2000 DBP funds. Also eligible for IM discretionary. |
| New York | North Grand Island Bridge | Eligible-not funded. ¹ |
| Minnesota | Ford Bridge | Eligible-not funded. ¹ |
| New York | Stutson Street Bridge | Eligible-not funded. ¹ |
| Michigan | Grand Rapids (R07) | Eligible-not funded. ¹ |

CANDIDATES FOR THE DISCRETIONARY BRIDGE PROGRAM—Continued

[Fiscal year 2000]

| State | Project | Comments |
|---|---|---|
| New Hampshire and Vermont | Rt. 9 over Connecticut River | Eligible-not funded. ¹ |
| Rhode Island | Washington Br. Over Seekonk River | Eligible-not funded. ¹ Also eligible for IM discretionary. |
| Michigan | Grand Rapids (R06-1) | Eligible-not funded. ¹ |
| Michigan | Grand Rapids (R06-2) | Eligible-not funded. ¹ |
| Texas | Sabine River Bridge | Eligible-not funded. ¹ Also eligible for IM discretionary. |
| New York | Ridge Road over Railroads | Eligible-not funded. ¹ |
| Mississippi | Jourdan River Bridge | Eligible-not funded. ¹ Also eligible for IM discretionary. |
| Massachusetts | Hadley Bridge (Calvin Coolidge Mem. Bridge) | Eligible-not funded. ¹ |
| West Virginia | Star City Bridge | Eligible-not funded. ¹ |
| Massachusetts | Fall River Bridge | Eligible-not funded. ¹ |
| New York | Marcy Ave. Ramp | Eligible-not funded. ¹ |
| New York | Manhattan Bridge | Eligible-not funded. ¹ |
| Mississippi | Pascagoula River Bridge | Eligible-not funded. ¹ |
| Missouri | Lexington-Missouri River Bridge | Eligible-not funded. ¹ |
| Massachusetts | Fitchburg Bridge | Eligible-not funded. ¹ |
| Alaska | Kenai River Bridge | Eligible-not funded. ¹ |
| Texas | Trinity River Bridge | Eligible-not funded. ¹ |
| Alabama | Clement C. Clay | Did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until the 4th quarter). |
| Florida | Royal Park Bridge | Did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until the 4th quarter). |
| Kentucky | Burnside-Monticello Bridge | Did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until the 4th quarter). |
| Maryland | Woodrow Wilson Bridge | Did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until the 4th quarter). |
| Projects Earmarked in Fiscal Year 2000 Conference Report, House Report 106-355: | | |
| Florida | Florida Memorial Bridge | Did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until 2004 or later). |

| | | |
|--------------------------|--|--|
| New Jersey | Witt-Penn Bridge | Did not meet eligibility criteria for funding in fiscal year 2000 (would not begin construction until 2004). |
| Arizona and Nevada | Hoover Dam | Not eligible—not a bridge replacement project (it is a bypass around the Dam). |
| Alabama | Naheola Bridge | Not eligible—not a highway bridge. |
| Vermont | Union Village/Cambridge Junction Bridges | Not eligible—project cost less than \$10 million. |
| Mississippi | US82 Mississippi River Bridge | Not eligible—bridge rating factor greater than 100. |
| Texas | Paso Del Norte International Bridge | Not eligible—project cost less than \$10 million. |
| Kansas | Turner Diagonal Bridge | Eligible—funded with fiscal year 2000 DBP funds. |
| West Virginia | Williamston-Marietta Bridge | Eligible—funded with fiscal year 2000 DBP funds. |

¹ These projects were eligible for funding, but because of the limited amount of discretionary bridge program funds available for non-seismic projects (\$65 million), they were not selected for funding.

Note: Only two candidates who submitted applications for fiscal year 2000 funds were well qualified according to the eligibility criteria. The Golden Gate Bridge and the Hernando Desoto Bridge are continuing projects and have received seismic retrofit discretionary funds in previous years. The Hernando Desoto Bridge is in the New Madrid Fault region.

EMERGENCY RELIEF HIGHWAYS

Question. The budget proposes an increase in the Emergency Relief highway program from the TEA-21 firewall amount of \$100 million to \$498 million to address the emergency highway backlog. While I think that more emergency money should have been provided in TEA-21, I question how equitable it is to take the firewalled account—which already requires a 12.9 percent reduction because the TEA-21 authorization didn't deliver on what it authorized—and reduce the amounts that will go to every state further, in order to fund an emergency program that any observer should have known was undercapitalized in the authorization.

Why didn't you pay for the increase in the Emergency Relief highway program out of General Funds, out of RABA, or submit a supplemental request? Were these alternatives considered as the Department put together its budget? Please provide a short analysis of each of these alternatives, as well as an other alternatives considered by the Department and Office of Management and Budget as you considered how to address the Emergency Relief highways funding shortfall.

Answer. The Department reviewed a number of options for addressing the backlog of emergency relief needs, including a request from the General Fund, RABA, or supplemental appropriations. Although these methods would provide funding to meet the most immediate needs for emergency relief, they do not address the underlying cause of this crisis. The \$100 million in emergency relief provided each year since fiscal year 1973 is clearly not sufficient for the level of need. The Emergency Relief Reserve Fund will provide a long-term solution, and FHWA believes will prevent another crisis from developing. The \$398 million of additional contract authority reflects the ten-year average of Emergency Relief supplementals, excluding Loma Prieta, plus sufficient funds to pay off the current balance over three years.

FAA CONTRACT TOWERS

Question. It is the Committee's understanding that DOT may propose to cut off funding for nearly half the contract towers across the country in a couple of months. The contract tower program is very important from an aviation safety perspective, and it's providing significant air traffic control cost savings. In fact, audits by the DOT Inspector General validate the important benefits of the program and suggest it might make sense to expand it.

Why is the Department even considering a funding reduction for the contract tower program? Please explain why DOT may propose action that could adversely affect aviation safety and will penalize a program that is solidly justified from a cost/benefit standpoint?

Answer. The FAA is facing a shortfall in its operating budget this year. That is why the Administration has proposed fiscal year 2000 supplementals with the fiscal year 2001 budget; the supplementals would allow the shifting of some costs currently being borne by the Operations appropriation.

No decisions have been made yet on the canceling of contract tower services. Obviously, DOT does not want to reduce funding for this program and hopes that Congress will provide the supplemental funding to ensure continued operations. The contract tower program is assumed fully funded in the FAA budget request for fiscal year 2001.

FAA PERSONNEL AND PROCUREMENT FLEXIBILITY

Question. A few years back, the Congress granted the Federal Aviation Administration substantial latitude in personnel and procurement matters. Is it your understanding that the personnel authority that Congress granted the FAA has limited that agency in any way in enacting any operational or management reforms?

Answer. On the contrary, the personnel reform authority has played a key role in supporting a variety of management reform efforts within FAA aimed at improving how the agency operates in a more business-like fashion. For example, the new compensation programs being piloted in FAA link pay adjustments to organizational and individual performance, which directly supports FAA's establishment and measurement of annual outcome-based, mission-focused performance goals and indicators. A fundamental objective of FAA personnel management changes, particularly in relation to compensation programs, is an increased emphasis on improvements in organizational performance and increased efficiency of operations.

TRANSIT NEW STARTS

Question. The fiscal year 2000 budget request included seven "proposed" full funding grant agreement (FFGA) projects, which you expected to approve before the end

of fiscal year 2000. We are halfway through fiscal year 2000—how many of those projects have actually received an FFGA?

Answer. FTA entered into a FFGA with Dallas for construction of the North Corridor LTRT project on October 6, 1999. Three projects, Fort Lauderdale, San Diego Mission Valley East and Newark Elizabeth MOS-1 are ready to be executed and will be submitted to the Congress for 60-day review very shortly. The Memphis Medical Center Extension underwent significant scope changes and funding increases. Thus, it was re-rated and is now proposed for an FFGA in fiscal year 2001. The Salt Lake City Downtown segment has been withdrawn and an extension of the North South LRT to the University is proposed in the fiscal year 2001 budget. The Orlando I-4 Central Florida LRT Project was also withdrawn from consideration because of loss of local financial support.

Question. Why is the Department constricting the new starts pipeline with projects that are not yet ready to move forward to a full funding grant agreement?

Answer. The projects proposed for full funding grant agreements in the President's budget will all be ready to enter into FFGAs by the end of fiscal year 2001 and in fact several could move ahead much faster. If these projects have no outstanding issues, FTA should be able to approve the entry of these projects into final design by the summer of 2000. This is a stricter test than was applied in the proposals made for fiscal year 2000, which were based on projects which were expected to have completed a record of decision by September 30, 1999 (and thus to be in final design by December 31, 1999). FTA is applying a stricter test this year to assure that no project issues are outstanding which could delay the project further or cause major changes in project cost, such as engineering concerns, right of way issues, project management planning concerns, environmental issues, or permitting issues.

Question. The demand for new starts funds is extraordinarily high, and transit agencies around the country are in varying stages of development, working toward securing that magic piece of paper, a full funding grant agreement, which most projects need in order to secure financing for the substantial capital investments that are required to build or expand a transit system. You have requested funding for 15 new proposed full funding grant agreements, which you expect to enter into in fiscal year 2001. Please prepare a table addressing the following questions. How much commitment authority over the life of the authorization was included in the TEA-21 firewall? How much of this commitment authority was "pre-committed" to existing FFGAs at the time TEA-21 was passed? How much of that commitment authority has been committed to projects since the enactment of TEA-21 through the present (middle of fiscal year 2000)?

Answer.

Federal Transit Administration TEA-21 Authorization Table

[In millions]

| | |
|---|------------|
| Available TEA-21 Authority-Guaranteed Level [\$6,092.40] + Contingent Commitment [\$2,350.80] | \$8,443.20 |
| Existing commitments: | |
| Remaining ISTEAF FFGA Commitments [Fiscal year 1998-Post 2003] | 3,787.50 |
| PMO takedown [Fiscal year 1998-2003] | 42.28 |
| Alaska and/or Hawaii Ferry Boat set-aside [Fiscal year 1998-2003] | 51.48 |
| Other appropriations [Fiscal year 1998-2000] | 860.49 |
| Other than final design & construction [8 percent—fiscal year 2001-2003] | 272.73 |
| TEA-21 commitments | 296.45 |
| Total | 5,310.93 |
| Remaining Commitment Authority | 3,132.27 |

Question. Is it correct that, were all the new start transit projects that are included in the budget request to enter into FFGAs with the FTA during fiscal year 2001, all the commitment authority that was authorized in TEA-21 would be committed, leaving no uncommitted funds available for new full funding grant agreements before the end of fiscal year 2003?

Answer. Yes. The FTA expects that the FFGAs proposed would consume all of the commitment authority available under TEA-21. New funding commitments could be made only if non-guaranteed funds were appropriated under the authorizations provided by 53 USC § 5338(h) or if additional commitment authority were authorized.

Question. How do you think the other 70 or so authorized new start projects that are currently in alternatives analysis or preliminary engineering are going to react

to a budget proposal that completely cuts them out of the running for a full funding grant agreement before fiscal year 2004?

Answer. Some of the project sponsors would be disappointed that commitments could not be made until later. However, other sources of funding are available such as formula funds, flexible funds available from the Federal Highway Administration, and loans or loan guarantees under the Transportation Infrastructure Finance and Innovation Act (TIFIA) provisions of TEA-21. The projects proposed in the fiscal year 2001 budget are those which will be ready in fiscal year 2001 for an FFGA. The Department believes it is better to allow the worthy projects among those which are ready to proceed now, with a federal commitment, than to wait for other projects to develop further.

LOS ANGELES BUS REQUEST

Question. The budget includes a request for \$50 million for Los Angeles County MTA to buy new buses, in order to implement the bus consent decree ordered by the Special Master. The judicial process associated with the consent decree litigation is ongoing and complex. It is my understanding that a stay has been granted by the Ninth Circuit Court of Appeals, while an MTA appeal of the decree is pending. Doesn't a federal budget request for funding to implement the bus consent decree pre-judge the results of this ongoing judicial process?

Answer. Los Angeles MTA Accelerated Bus Procurement Program established new bus quantities through fiscal year 2004 of 2,095 new buses. For fiscal year 2001 their program assumes purchase of 400 new buses. However, the Special Master requested that Los Angeles MTA procure 297 additional new buses beyond the Accelerated Bus Program with delivery as soon as possible and at least 88 additional vehicles in service by January 3, 2000.

In late November 1999, the U.S. Ninth Circuit Court of Appeals issued an order, granting MTA's request for a temporary stay of the court order. The Appeals Court set an expedited schedule for filing of legal briefs in December and January, but no date was set for oral arguments on MTA's appeal. MTA believes that the accelerated bus procurement program to buy 2,095 new buses by 2004 will be sufficient to meet the agreed load factors. Even with the recent stay of the court order, the MTA is addressing the possible purchase of the additional 297 buses through current bid procurements and flexible options.

FTA believes that MTA's general need to purchase buses to relieve overcrowding and expand service is a legitimate expenditure of federal funds. Regardless of the ultimate resolution of the appeal, Los Angeles MTA will still need to aggressively purchase a significant number of buses in order to relieve any disparity in the level of services provided throughout the community.

Question. Did Los Angeles MTA request this level of federal bus funding? Do you know whether the MTA has included funding in its 2001 operating budget for the required 20 percent match for these funds?

Answer. In discussions last year with Los Angeles MTA over plans to replace its bus fleet of aging vehicles, to provide reliable transit service, and to meet the pending requirements of the Special Master's Decision, FTA committed to seek up to \$50 million in fiscal year 2001 to assist MTA in meeting these goals. Los Angeles MTA advises that the matching funds are included in their 2001 operating budget.

Question. What does the Los Angeles MTA expanded bus procurement plan assume for capital bus purchases in fiscal year 2001? What does the consent decree, if implemented as it is currently fashioned, require that LA MTA spend on bus purchases in fiscal year 2001? What are the operating cost requirements for both these levels of capital commitment?

Answer. The Accelerated Bus Procurement Program assumed the purchase of 400 new buses in fiscal year 2001 at a cost of almost \$157 million. However, the Federal District Court order further accelerated the bus purchases for additional 297 buses at a cost of almost \$116 million. This is currently pending before the Federal Ninth Circuit Court of Appeals which has stayed the orders of the District Court and the decisions of the Special Master.

The projected operating cost of the Consent Decree for fiscal year 2001 is over \$81 million. This cost does not include any implementation changes that the Special Master's decision may mandate through the current legal proceedings. Should the MTA not prevail in the current legal proceedings, an additional \$17 million for bus operations will be necessary to implement the Special Master's requirement for the 88 additional buses.

Question. Can Los Angeles MTA, or any other transit provider, use Section 5309 bus capital funds for "expanded capital" activities that were traditionally considered

operating activities? What are these eligible activities? Are there any restrictions on this expanded use?

Answer. Yes, Los Angeles MTA can use any bus capital funding they receive under section 5309 for preventive maintenance activities as redefined in the fiscal year 1998 Appropriations Act and subsequently in TEA-21. TEA-21 redefined "Capital" to include preventive maintenance activities to more closely align with the definition of capital expenditures allowed under the Federal Highway Administration programs and to help preserve the Federally funded assets.

Bus Capital expenditures can include acquisition or preventive maintenance of buses, maintenance facilities, bus malls, transportation centers, park-and-ride facilities, bus rebuild, bus preventive maintenance, passenger amenities (i.e., passenger shelters), bus stop signs, and miscellaneous equipment. These funds can not be used for typical operating costs such as driver's salaries and fuel.

EXPANDED INTERCITY RAIL CAPITAL

Question. The budget proposes to transfer \$468 million from Revenue Aligned Budget Authority for the purposes of making grants to Amtrak, or to a single state or consortium of states, to improve passenger rail service. These funds are in addition to the \$521 million for Amtrak capital grants, consistent with the "glide path" to operating self-sufficiency by 2003, which both Amtrak and the administration have committed to. What is the rationale for requiring a 50 percent match if the grant is made to a state or consortium of states, but not requiring any matching funds if the grant is made directly to Amtrak?

Answer. The Administration does not propose to treat Amtrak and States differently under its proposed Expanded Intercity Rail Passenger Fund. The Administration intends to encourage joint applications between Amtrak and a State or consortium of States for funding under this program. Eligible projects must generate a positive financial contribution for Amtrak and positive net benefits for the public. The funding, by law, can only be used to pay for up to 50 percent of a project's total cost. This provision would apply equally to Amtrak or a State grantee. In the case of a grant to Amtrak, the additional funding could come from other company revenues, or a State or consortium of States with which it is partnering.

HAZARDOUS MATERIALS REGISTRATION FEES

Question. On November 4, 1999, Chairman Wolf and I wrote to GAO Comptroller General Walker, requesting that the General Accounting Office perform an evaluation of the Hazardous Materials Emergency Preparedness grants program, which is paid for by registration fees charged to hazardous materials shippers and carriers. Concerns have been raised by some members of the hazmat carriers industry that the same shippers and carriers who pay for the HMEP grants program through their user fees also participate in and pay for well established emergency planning training programs in the private sector. We asked GAO to determine whether the HMEP grants program goals are being met by existing private sector initiatives to identify any duplication of services.

In light of the ongoing GAO study, why has RSPA promulgated a final rulemaking on the hazardous materials registration fee increase (February 14, 2000 Federal Register)? Don't you think it was premature for RSPA to move forward with the assessment of a fee increase when the need for such an increase has not yet been reviewed by an impartial party? Why did the Department make the decision to proceed on this rulemaking while the GAO review is ongoing?

Answer. The increased funding will enhance safety by ensuring that a larger segment of the response community will receive critical initial and recurrent training at all levels, enhancing the extent and quality of planning tools, and improving safety at a level consistent with congressional intent. The ultimate objective of this program is to protect on-scene emergency response personnel at hazmat incidents, and to enable them to more effectively protect lives and property endangered by hazmat accidents. The funds paid through this rule will go directly to fund state Hazmat safety programs, providing increased performance to various response groups—from volunteer fire departments to emergency medical responders and others who may be involved in hazmat response efforts.

A Notice of Proposed Rulemaking was published on April 15, 1999, and public hearings were held in Washington, DC on May 25, 1999 and in Des Moines, IA on June 22, 1999. In written comments and oral presentations. Several industry organizations and associations expressed support for fully funding the HMEP Grants program, although some differed in their preferred approach to achieve full funding.

In the fiscal year 1999 budget submission, the Administration informed Congress of its intent to propose rulemaking to change the annual level of funding for the

Hazardous Materials Emergency Preparedness (HMEP) Grants Program by raising the registration fee and broadening the base of registrants to achieve a more equitable program geared to the risk and amount of hazardous materials being shipped. The final rule was published on February 14, 2000 to ensure adequate time for communicating new requirements to registrants before the new registration cycle begins in July 2000.

COAST GUARD C-130 SPARES

Question. The Coast Guard has expressed concern that operational readiness is eroding. In fact, in a recent speech at the Center for Naval Analysis, the Commandant focused on the reduced availability of C-130s and the lack of spare parts needed to keep them flying to illustrate the readiness challenges the Coast Guard is facing. I asked my staff to look into it, and have been informed that even though Congress fully funded the aircraft maintenance line in the fiscal year 2000 appropriations bill, the Coast Guard reprogrammed funds below the notification threshold from the aircraft maintenance account to pay for "recruitment" activities. Why is the Coast Guard citing lack of readiness in an account that they have dunned in order to pay for another activity?

Answer. The Coast Guard decided that its mission needs can be best met in 2000 by allocating \$43 million to hire several hundred additional active duty Coast Guard personnel above the levels originally requested in the President's fiscal year 2000 budget or funded in the fiscal year 2000 appropriation. The realignment of funds improves Coast Guard fiscal year 2000 readiness by addressing shortfalls in military technicians and maintenance personnel. The fiscal year 2001 budget further improves readiness and operational capabilities. No additional funds are requested in 2000 to backfill for spare parts or other activities the Coast Guard deemed to be lower priorities.

Question. Further, would you respond for the record on whether additional internal reprogramming controls should be established for the Department for instances such as this, or whether we need to revise the congressional reprogramming guidelines to keep the modal administrations from reprogramming below threshold from safety and readiness accounts to fund administrative or "recruiting" activities?

Answer. The Department does not believe that more stringent reprogramming controls are warranted. The reprogramming was not aimed at an "administrative" activity; it was aimed at a root problem affecting the Coast Guard readiness posture.

QUESTIONS SUBMITTED BY SENATOR PETE V. DOMENICI

NATIVE AMERICAN INITIATIVE

Question. Senator Slater, I applaud the Administration's Native American initiative. As you know, one of the more important highway programs for my home state of New Mexico is the Indian Reservation Roads program. Of the approximately 22,000 miles of Bureau of Indian Affairs road serving tribal lands, only 11 percent of the paved roads are rated as being in good condition. Funds for Indian Reservation Roads funds are critical to improving transportation for Native Americans.

Please describe the Department's Native American initiative. How much funding is being provided as part of this initiative, and what is included in the Department's budget?

Answer. The Department's budget proposal dedicates \$358 million to address the needs of Native Americans. Of this total, \$350 million will be used for the FHWA Indian Reservation Roads (IRR) program, including the authorized level of \$275 million plus \$75 million of Revenue Aligned Budget Authority. The increased funding for IRR will begin to address the backlog of needs, estimated at about \$4 billion nationally. The Department's initiative also dedicates \$1.2 million from FHWA's On-the-Job Training (OJT) program and another \$5 million from FTA's Job Access and Reverse Commute program for projects which benefit Native Americans and Native American Tribes. These programs help connect people to opportunity by providing job skills and critical transportation services. The budget proposes to provide both IRR and OJT with 100 percent obligation authority so that all of the funds will be made available for use.

Finally, the initiative includes \$2 million for NHTSA activities which benefit Native Americans. These activities will include improving EMS services on Indian lands, developing safety materials and media campaigns tailored to the Native American community, increasing the number of health and safety professionals who

receive injury prevention training, and providing training and support for local traffic law enforcement on Indian lands.

Question. How will the available funds be distributed?

Answer. Indian Reservation Roads funds are distributed by the Bureau of Indian Affairs (BIA) to their regional offices. BIA distributes funds according to a formula based on relative need which was implemented in 1993. TEA-21 requires the Secretary of the Interior to develop a new formula for fiscal year 2000. However, that process is still under way; and implementation of the new formula is expected in fiscal year 2001.

Tribal governments will be able to apply for the Job Access funds, and FTA will base its decisions on the merit-based criteria described in TEA-21. The Administration has also proposed legislative language that would make it easier for tribal governments to compete for funding by allowing them to apply directly to FTA without having to be selected first by a state.

NONDESTRUCTIVE EVALUATION AND TESTING

Question. Secretary Slater, the Administration continues to put an emphasis on the use of technology in transportation. You know of my interest in the work that is being done by the Aging Aircraft Nondestructive Evaluation Center (AANC), which is supported by the Federal Aviation Administration, and is now a partner in the Center of Excellence for Airworthiness Assurance. This collaboration has been very successful and continues to make progress to ensure greater safety in the civilian aviation fleet.

Mr. Secretary, I remain extremely interested in the work of the Aging Aircraft Nondestructive Evaluation Center in Albuquerque, and for the various components of the Center of Excellence for Airworthiness Assurance program. AANC in Albuquerque has been funded at \$3 million per year. I believe the FAA intends to continue this level of support in fiscal year 2001. Is that the case?

Answer. FAA support of the AANC has been \$3 million annually. In fiscal year 2001, FAA is requesting a significant increase in the Research, Engineering & Development (R,E,&D) budget that would increase funding for AANC to \$5 million. The \$2 million increase above previous year's funding would be for research of Aircraft Non-structural Systems (wiring, subsystems, etc).

Question. What is the total budget request for the AANC and the program elements associated with the Center of Excellence in the fiscal year 2001 budget, and how does this compare to the proposed plan for fiscal year 2000?

Answer. AANC's fiscal year 2000 and fiscal year 2001 budgets are \$3 million and \$5 million respectively. Though AANC is a core member of the Airworthiness Assurance Center of Excellence, it receives funding directly through an interagency agreement between the FAA and the Department of Energy.

Question. Is the request sufficient to support ongoing work? What are the program goals for fiscal year 2000 and fiscal year 2001 under the FAA's plan?

Answer. The fiscal year 2001 budget request of \$5 million will support planned research in both structural inspection and nonstructural systems. This level of funding will support the initiatives described below.

The AANC will be maintained as an independent and highly capable inspection validation center that fully supports the needs of the FAA's National Aging Aircraft Research Program and the FAA field offices. In fiscal year 2000, specific structural programs include the completion of a field reliability study of industry procedures for finding subsurface cracks in B-727/B-737 transport aircraft; completion of a validation effort of a safer inspection for commuter aircraft (Metro 226/227 aircraft); and development of an industry accepted set of calibration standards for consistent honeycomb inspections. Planned accomplishments for the Nonstructural Systems Research program include technical support for the Aging Transport Systems Rule-making Advisory Committee's Intrusive Inspection Project, and completion of circuit breaker testing.

In fiscal year 2001, structural program goals include completion of a validation activity to apply composite patches to metal aircraft (DC-10/MD-11); completion of a corrosion detection experiment focused on B-727/B-737 lap splice joints; completion of a visual inspection experiment to determine the affect of job card instructions on inspection performance. Nonstructural Systems Research will include both aging electrical systems research (degradation assessment of aircraft wire, visual inspection follow-on studies, and validation of wire testing systems) and aging mechanical systems research (destructive testing of flight control linkages, characterization of the 747 testbed aircraft, and assessment of maintenance practices).

Question. The AANC and the Center of Excellence have focused their research and technology development efforts largely on structural aging in view of the cur-

rent fleet of commercial aircraft. The FAA has recognized the nonstructural aging issues as needing to be addressed, for example, the wiring issue. Has the FAA committed any resources to nonstructural work through the Center this year?

Answer. The FAA will be committing \$550 thousand to AANC in fiscal year 2000 for Aging Electrical Systems Research.

Question. Can you please tell the Subcommittee what the current nonstructural aging program expects to accomplish in 2000 and how much the FAA intends to commit to this area of research under the fiscal year 2001 budget request?

Answer. The fiscal year 2000 funding will support the Aging Transport Systems Rulemaking Advisory Committee's Intrusive Inspection Project and completion of aircraft circuit breaker testing. In fiscal year 2001, FAA has requested \$2 million for nonstructural aging research.

FAA COST-BASED ACCOUNTING SYSTEM

Question. Secretary Slater, during a hearing just one week ago today on modernizing the FAA, both the Inspector General and the FAA Administrator stated that the cost-based accounting system would not be completed until 2002. A cost-based accounting system is the critical element in the development of fees. Why do you assume the collection of new user fees in 2001, when the cost-based accounting system will not be complete?

Answer. The FAA's cost accounting system is being implemented in phases. The first phase, currently underway, is to implement the Air Traffic Services line of business, which accounts for the majority of FAA costs. Other lines of business will be implemented in fiscal year 2001 through fiscal year 2002. FAA has completed work on enroute and oceanic portions of Air Traffic Services, comprising approximately \$2.5 billion of fiscal year 1998 costs. Identification of the fiscal year 1999 costs of these services will be completed in March 2000. FAA will also complete work on the cost of Flight Service Stations this fiscal year. In total, all of these services will account for approximately \$4.9 billion in agency costs. Since the FAA has valid cost data now for enroute and oceanic services, that information would be available for the establishment of cost-based user fees in fiscal year 2001 for these services.

FAA EXCISE TAXES AND USER FEES

Question. Secretary Slater, the President's budget proposes a new user fee within the Federal Aviation Administration and assumes collection of \$965 million in 2001. In 2005, the President's budgetary receipt projections show the proposed fees increasing to \$2 billion. The budget specifically states that current aviation excise taxes will be reduced over time as more efficient, service-based charges are phased in. However, your projections do not show a reduction in excise taxes in the out-years. Can you explain this apparent inconsistency?

Answer. Beginning in fiscal year 2002, the budget proposes to set total aviation excise taxes and new user fees equal to the expected FAA operational and capital needs in the subsequent year. The proposed fees increase from \$965 million in 2001 to \$2 billion in 2005 to reflect phasing in the fees over 2 years. The Budget reflects the total revenues proposed to be collected from the aviation community. This total is not affected by the conversion from taxes to fees.

FISCAL YEAR 2000 ACROSS-THE-BOARD REDUCTION

Question. Secretary Slater, in last year's Consolidated Appropriations Act for fiscal year 2000 (Public Law 106-113), the President and the Congress agreed to an across-the-board reduction of 0.38 percent in discretionary programs as part of an effort to ensure that spending in fiscal year 2000 did not dip into the Social Security surplus. We were successful in that effort, but in the process the Department of Transportation had to reduce the program spending by \$179.6 million in fiscal year 2000.

First reports had the Department targeting FAA's Airport Improvement program for the entire reduction, but according to the budget documents that did not occur. Rather, each office and agency took a part of the reduction with most coming from the Federal-aid highway program (-\$105.3 million) and the FAA Grants-in-Aid for Airports program (-\$54.4 million).

Mr. Secretary, would you please provide the Subcommittee with the program, project, and activity details underlying the across-the-board reductions for each agency?

Answer. The program, project, and activity details follow.

FEDERAL-AID HIGHWAY PROGRAM—TREATMENT OF 0.38 REDUCTION UNDER THE FISCAL YEAR 2000 OMNIBUS APPROPRIATIONS ACT

BACKGROUND

The fiscal year 2000 Omnibus Appropriations Act contains a government-wide rescission in the amount of 0.38 percent of the discretionary budget authority provided (or obligation limitation imposed) for fiscal year 2000 for each agency of the Federal government. For the Federal-aid highway program, it has been interpreted that this reduction applies to the Federal-aid obligation limitation.

The Act further provides some discretion in administering the rescission, except that no program, project, or activity of any agency may be reduced by more than 15 percent. The reduction determined for the Federal-aid highway program is \$105,260,000, which equates to a 0.38 reduction in the \$27.7 billion fiscal year 2000 Federal-aid obligation limitation, i.e., the Federal-aid highway program did not absorb a disproportionate share of the reduction under the broad authority provided.

ADMINISTRATION OF THE 0.38 REDUCTION WITHIN THE FEDERAL-AID OBLIGATION
LIMITATION

The Federal-aid obligation limitation is divided among programs and the States based on a multi-step process provided in TEA-21 and slightly modified in section 310 of the fiscal year 2000 DOT Appropriations Act. Under this process, limitation is first reserved, or set-aside, for administrative expenses and programs funded from the administrative takedown authorized by section 104(a) of Title 23, the Bureau of Transportation Statistics, the Highway Use Tax Evasion program, funds provided through Revenue Aligned Budget Authority, and carryover balances for allocated programs from previous years.

The limitation remaining after these initial set-asides is then compared to the total remaining new authorizations of contract authority subject to the limitation for the year. This ratio of total limitation to total authorization (the "limitation ratio") is used in the remaining steps of the distribution to determine how much limitation each program or State receives. For fiscal year 2000, this ratio was determined to be 87.1 percent.

Next, the limitation ratio is used to calculate how much limitation is set-aside for three specially designated programs—High Priority Projects, the Woodrow Wilson Memorial Bridge, and the Appalachian Development Highway System program. Limitation setaside for these programs is available until used. Similarly, \$2 billion in limitation is setaside for the Minimum Guarantee program and this limitation is available until used; that is, it is "no-year" limitation.

Again using the limitation ratio, limitation is then set-aside for allocated (not apportioned to the States) programs, except for those discussed above. The amount of limitation each allocated program receives is calculated by multiplying the new authorization for the fiscal year by the limitation ratio. For example, an allocated program authorized at \$100 million receives \$87.1 million in fiscal year 2000. Discretionary programs such as the Bridge Discretionary program, Transportation and Community and System Preservation program, and Public Lands Discretionary program, are subject to this provision. For fiscal year 2000, Congressional earmarks of discretionary programs contained in the DOT Appropriations Act were reduced by the same ratio as the overall category, i.e., they were funded at 87.1 percent of the earmarked amount. In fiscal year 1999, earmarks in the ITS deployment program, which was fully earmarked, were proportionately reduced. Those in the only other earmarked discretionary category, public lands, were not.

Finally, after these aforementioned set-asides are made, the balance of the limitation is then distributed among the States, with each State's portion of the limitation based on its relative share of apportioned funds for the fiscal year. This "formula" limitation, which amounted to \$20.896 billion in fiscal year 2000 prior to the 0.38 percent reduction, is available only until the end of the fiscal year. The \$105.260 million reduction for the Federal-aid highway program is being taken from this portion of the obligation limitation, thereby very modestly reducing each State's available limitation used to obligate funds for major Federal-aid programs.

| Total Earmarks | 26,600,000 | 243,396 | 26,356,614 |

Question. Did DOT follow the provisions of the Consolidated Appropriations Act that no program, project, or activity could be reduced by more than 15 percent? Did DOT follow the guidance of OMB that: reductions should be taken from the least critical funding available to the agency; reductions should be considered from funding above the President's request; no reductions should be taken that would require reductions-in-force (RIFs); and agencies should make targeted recommendations rather than across-the-board funding cuts?

Answer. The Department complied with the law that no program, project, or activity could be reduced by more than 15 percent; and the Department followed the OMB guidance on how to apply the reduction. Specifically, the Department allocated the reduction so that operating programs affecting life and safety, such as Motor Carriers, National Highway Traffic Safety, FAA operations and capital, and Coast Guard operations were not reduced. The reductions to the remaining programs were focused, to the extent possible, on Congressional earmarks that were not Adminis-

tration priorities, and accounts that were funded at higher levels than requested by the Administration. The Department's appropriations bill contained close to 600 funding earmarks. These earmarks were a logical place to absorb part of the reduction. For FAA's airport grant program, the reduction of \$54.4 million was taken in this account since Congress enacted an obligation limitation substantially above the Administration's request.

BORDERS AND CORRIDORS PROGRAM

Question. In last year's Transportation Appropriations bill signed by the President, Congress earmarked several projects in the Section 1118–1119 Borders and Corridors program. One of those earmarks was a small, but much-needed \$1 million project to realign the road serving the United States port-of-entry at Columbus, New Mexico. I understand that the State of New Mexico Highway and Transportation Department has chosen not to apply for these earmarked funds from the Federal Highway Administration out of fear that such an application would jeopardize the state's ability to receive funding for other projects for which it has applied in the 1118–1119 program. It certainly was not my intention in earmarking funds for such a small project to prejudice New Mexico's ability to receive funding for other critical border-related projects in the state.

Does the Department of Transportation consider whether a state has received earmarked funds for a Section 1118–1119 project when deciding whether to award funds to the same state for other discretionary projects in the Section 1118–1119 program? In other words, are states penalized or prejudiced if they receive a congressional earmark, or does the Department review each state's projects on their merits and with regard to available funds, without considering these earmarks?

Answer. The Department expects to make the final decisions for fiscal year 2000 Borders and Corridors awards in March. Because of the limited amount of funding available for this program, the Department will base its decisions only on the merit of each project.

Competition for fiscal year 2000 funds is especially fierce because the Department has received requests for far more funding than is available. The Department has received approximately 150 applications totaling over \$2 billion. The fiscal year 2000 budget provides \$122 million for the Borders and Corridors, but congressional earmarking has limited the amount of truly discretionary funding to about half of the total program. For fiscal year 2001, the Administration has requested to double the funding for this program.

QUESTIONS SUBMITTED BY SENATOR CHRISTOPHER S. BOND

REVENUE ALIGNED BUDGET AUTHORITY

Question. Mr. Secretary, let me bring up a budget specific item. You might refer to it as the Revenue Aligned Budget Authority or RABA—I call it Bond/Chafee. This provision included in TEA–21 is very specific. It says that increased revenue to the Highway Trust Fund would be distributed equally across all Federal-Aid highway programs and recognized that the dedicated tax would be spent for its dedicated purposes. Last year your budget proposed diverting some of these revenues to other items and Congress rejected it. This year you propose to do something similar again. I will tell you now that I will work to make certain that diversion of funds from the Bond/Chafee fund do not occur.

But I have to ask you, do you disagree with me on the tremendous highway infrastructure improvement needs that exist? I know that some of the programs your budget would divert Bond/Chafee funding to already receive Highway Trust Fund support. TEA–21 was clear in what received funding from the Highway Trust Fund that is supported by gas taxes. If these additional items are of such high priority why not propose to fund them in a straightforward manner with offsets?

Answer. The Administration has proposed that a portion of the Revenue Aligned Budget Authority be dedicated to programs such as the Commercial Drivers License program, expanded passenger rail and the Job Access program in order to improve safety, mobility, and economic development—all priorities established in TEA–21. DOT agrees with the need for highway infrastructure investment, but there is also a need to view and invest in all parts of the surface transportation system.

AVIATION SAFETY

Question. Now, let me switch topics briefly. I commend the good work of the Department of Transportation where under your leadership the Department is aggressively pursuing open skies agreements to facilitate increased global trade and U.S.

jobs. As you have often stated, the first priority in transportation is safety, and all of us here support you on this.

Last year, the International Civil Aviation Organization (ICAO) performed an audit of the FAA to determine if they met international standards. It is my understanding that the FAA did very well, and I commend you and Administrator Garvey for that. I also understand that ICAO is auditing every member country, 185 in total, against these same international standards and that some of the countries are not doing as well as the FAA.

Can you please provide for the record how the Department of Transportation provides technical regulatory assistance to other countries that do not do as well as the FAA in these ICAO audits? I am especially interested in countries where we have bilateral airspace agreements and how important the Department of Transportation's assistance is to ensuring that passengers and goods being transported to and from the United States are afforded the same level of safety regardless of the air carrier?

Answer. Since the ICAO Universal Safety Oversight Audit Program got underway last March, we have not received results from many of the 185 audits. However, when appropriate in the aftermath of these audits, ICAO makes available the services of its Technical Cooperation Bureau (TCB) to assist nations in developing and implementing plans to remedy identified deficiencies to ensure that these nations provide the level of safety oversight required by ICAO standards.

FAA supports TCB efforts and has made significant contributions in this arena. In June 1999, FAA completed development of a "model aviation document," i.e. a model aviation law, aviation regulations, and implementing standards for flight operations and continuing airworthiness of aircraft. As a follow-on to this effort, FAA and ICAO, in the context of the ICAO TRAINAIR program, will soon complete development of inspector and instructor training courses that are based on the model aviation document. The model aviation document has been made available to ICAO and any ICAO Contracting State that makes a request. The courses will be available at the FAA Academy and any other ICAO-sanctioned training center. FAA is also involved in several collective safety oversight-related assistance projects, in collaboration with ICAO, in South America and Asia.

Resources permitting, FAA also engages, on bilateral bases, in cooperative assistance work with individual civil aviation authorities. Examples include Venezuela and the People's Republic of China. While FAA is interested in raising the safety bar globally, it is particularly important that FAA efforts be focused on States that either have operators that operate to the U.S. or engage in code-share arrangements with U.S. air carriers.

Question. Last item, also related to aviation safety. I would like to inquire about Alaska Airlines Flight 261, but first I would like to offer my condolences to the families and friends of the 88 people who perished in this tragic accident. This accident involving an MD-80 series aircraft is very troubling. I've read that the MD-80 has an outstanding safety record, in fact one of the best in the industry. It has the reputation as a safe, reliable aircraft, and there are more than 1,000 of the aircraft being used by 69 airlines around the world. Alaska Airlines, which, as I understand it, has a good safety record, has pledged its support to the families and friends of those who lost their lives on Flight 261. It is my understanding that NTSB, FAA, Alaska Airlines, Boeing, pilots and many others are cooperating in the investigation, all with the same goal, namely to determine the cause of this tragic accident so that it can be prevented in the future. I was wondering if you could briefly comment on the MD-80, the Department's commitment to safety, and cooperation in accident investigations?

Answer. The DC-9/MD 80 fleet of some 2,300 aircraft worldwide does indeed have an excellent safety record. Alaska Airlines has been flying since 1932 and its record has also been excellent.

The Department is committed to providing full support to the NTSB's investigation. The investigation team has made remarkable progress in quickly finding the recorders and recovering critical pieces of the aircraft's flight control system. The cooperation among all parties involved in the investigation has been outstanding, and the Department is confident that the Safety Board will determine the probable cause.

The Department will react quickly to the safety lessons learned during the investigation and will take action to assure that this tragic event will not be repeated.

QUESTIONS SUBMITTED BY SENATOR SLADE GORTON

EUROPEAN UNION'S HUSHKIT REGULATION

Question. Last year the European Union (EU) adopted a regulation banning certain aircraft meeting the highest internationally recognized noise standards from flying into Europe after 2002. At that time, I strongly objected to the so-called hushkit regulation, arguing that it undermined the integrity of the current and future international noise standards and had a discriminatory impact on U.S. carriers and equipment manufacturers.

During the appropriations process, I spearheaded a Sense of the Senate Resolution encouraging the U.S. Government to take all reasonable means to ensure that the regulation was repealed and to file an Article 84 action within the International Civil Aviation (ICAO) if repeal was not achieved. More than six months have passed, and I understand the EU is no closer to repealing the rule. When will you be filing the Article 84 action? I am told that such an action is underway but has not yet been finalized. Can you give me a date certain by which the action will be filed?

Answer. Led by the State Department's Legal Advisor's office, counsel and experts from several agencies collaborated on the United States' submission (the "Memorial") to ICAO. The action was filed on March 14, 2000.

SOUND TRANSIT

Question. What is the current status of negotiations between the Federal Transit Administration and Sound Transit regarding a Full Funding Grant Agreement? Due to the fact that Sound Transit has been rated as one of the top projects in the country, do you see any obstacles to a Full Funding Grant Agreement being awarded this year?

Answer. Federal Transit Administration (FTA) is working to accommodate Sound Transit's aggressive time frame established for the Link Light Rail design-build effort. In January 2000, Sound Transit submitted a request for FTA approval of entry of Minimum Operable Segment (MOS-1) into Final Design. Approval of Final Design was granted on February 15, 2000. FTA and Sound Transit have begun discussions regarding a Full Funding Grant Agreement (FFGA) for MOS-1. The fiscal year 2001 budget recommends Sound Transit for an FFGA at the \$35 million level.

The Fiscal Year 2000 Department of Transportation and Related Agencies Appropriations Act Conference Report directs FTA to enter into FFGAs only when there are no outstanding issues which would have a material effect on the estimated cost of the project or on the local financial commitment to complete the project under the terms of the agreement. To this end, FTA is currently reviewing the technical and financial capacity and project cost estimate, and other issues, which could potentially affect the timing of an FFGA.

FAA CONTRACT TOWERS

Question. It has come to my attention that the FAA has threatened to cut funding to the Contract Tower Program on April 1. As you know, I have been a consistent supporter of this program. Cuts would adversely affect airports from Olympia to Walla Walla in Washington State. What is the current status of this proposal, and what is the justification?

Answer. The FAA is facing a shortfall in its operating budget this year. That is why the Administration has proposed fiscal year 2000 supplementals with the fiscal year 2001 budget; the supplementals would allow the shifting of some costs currently being borne by the Operations appropriation. No decisions have been made yet on the canceling of contract tower services. Obviously, DOT does not want to reduce funding for this program and hopes that Congress will provide the supplemental funding to ensure continued operations. The contract tower program is assumed to be fully funded in the FAA budget request for fiscal year 2001.

QUESTIONS SUBMITTED BY SENATOR BEN NIGHTHORSE CAMPBELL

IMPROVEMENTS FOR SMALL COLORADO AIRPORTS

Question. Mr. Secretary, in different parts of Colorado, there are airports which have peaks and valleys as far as passenger enplanements go. I am concerned because they are usually smaller airports, compared to Denver and Colorado Springs, and they may be in need of some modernization. Can you tell me what sort of sched-

ule some of the smaller airports in Colorado are on for receiving more modern facilities, and whether the budget you are proposing will trickle down to these airports?

Answer. All of the airports in Colorado that have commercial service are included in the FAA's National Plan of Integrated Airport Systems (NPIAS). This makes them eligible for funding from the Airport Improvement Program (AIP). The FAA works with each airport in the NPIAS to develop an airport capital improvement plan that describes the projects that should compete for AIP funds in a three- to five-year time frame. Therefore, FAA is aware of the needs and priorities at these airports.

If the airports have 10,000 or more annual enplanements, they receive AIP entitlement funds. Otherwise, the airports compete for discretionary funds with other airports of the same size. The AIP has a "small airport" set aside. Funding will depend on availability of funds and priorities. The fiscal year 2001 budget, along with the increased cap on passenger facility charges, will create a record level of federally approved funds for airport development.

COLORADO CIVIL AIR PATROL

Question. I would like to take a second to recognize the Colorado Civil Air Patrol. They do a wonderful job locating lost aircraft and rescuing some people in very challenging situations. I know that they are more of a Department of Defense budget item, but do you think more funding should be made available to them, and the other Civil Air Patrol offices?

Answer. The Civil Air Patrol provides a valuable service. You are correct that it is the Defense Department, and not the Department of Transportation, that provides funding for civil air patrols and can more appropriately address the issue of funding.

NUCLEAR WASTE TRANSPORTATION

Question. We have been debating the Nuclear Waste bill on the Senate floor all week long. I have frequently stated that I am concerned about the ability of our mountain railroads and highways to safely handle the transportation of this high-level nuclear waste to the proposed Yucca Mountain site. What are your thoughts on the proposed transportation of high-level nuclear waste, and what steps does the Department plan to take, should this bill become law, to ensure the safety of those sharing the roads with these shipments?

Answer. The Department is doing everything it can to ensure the continued safe transportation of radioactive materials, including high-level nuclear waste. It should be noted that the Department of Energy is the Federal agency with the lead responsibility in this area.

RAIL TRANSPORTATION OF NUCLEAR WASTE

Question. Under the current bill pending on the Senate floor, the Department of Transportation is in charge of the route in which nuclear waste is taken to Yucca Mountain. What precautions are going to be taken to ensure that railway transportation of nuclear waste is going to be safe, since currently there are no restrictions on railway transportation? What types of precautions will be taken on steep grades, bridges, tunnels, etc.? If an accident does occur on a railway passage, do you think there is sufficient infrastructure to cope with the emergency situation?

Answer. The Department of Energy (DOE) is the Federal agency with the lead responsibility in this area, including both the safe transportation and storage of nuclear waste. Since the Federal Railroad Administration (FRA) has regulatory oversight for the safety of railroad operations within the United States, FRA contributes to the safe transportation of Spent Nuclear Fuel (SNF)¹ and High-Level Radioactive Waste (HLRW)². These materials have been transported safely by rail in the United States for more than 40 years. In the mid-1980s, partly as a result of the rail shipments from the Three Mile Island Nuclear Power Plant, FRA implemented its High-

¹The Nuclear Waste Policy Act of 1982 (NWPA) defines "spent nuclear fuel" as "fuel that has been withdrawn from a nuclear reactor following irradiation, the constituent elements of which have not been separated by reprocessing."

²NWPA defines "high-level radioactive waste" as "(A) the highly radioactive material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and (B) other highly radioactive material that the Commission, consistent with existing law, determines by rule requires permanent isolation." The term "Commission" as used in the definition means the Nuclear Regulatory Commission.

Level Nuclear Waste Rail Transportation Inspection Policy³ for all known rail shipments of SNF and HLRW. Under FRA Inspection Policy, there has never been a rail accident or incident involving the transportation of SNF or HLRW that has resulted in a release of the material from the packaging. Furthermore, there has never been a single death or injury resulting from a rail shipment of radioactive material.

Working with the Department of Energy (DOE), the Association of American Railroads (AAR), railroad labor organizations, and representatives of affected States, FRA developed the Safety Compliance Oversight Plan for Transportation of High-Level Radioactive Waste and Spent Nuclear Fuel. It must be emphasized that the SCOP is a living document that has evolved from 40 years of accumulated experience regarding the safe movement of nuclear materials by rail. FRA will continue to work in partnership with the rail community to periodically review, evaluate and update the SCOP to keep pace with the latest developments and technologies involving the safe transportation of nuclear materials. A sound and meaningful safety partnership involving all elements of the railroad community is absolutely essential for maintaining the highest degree of safety for railroad shipments of SNF and HLRW and for maintaining public confidence in our nation's nuclear materials transportation program.

In developing the SCOP, FRA has revised its previous policy to include the following safety enhancements in planning, inspection, training, and oversight activity areas:

Planning

FRA, DOE, the offeror or agent, and the rail carriers will consider track classification in the route selection process to ensure that the highest-rated track is utilized.

FRA will prepare an accident prediction model for the highway-rail grade crossings along the route. FRA will assist DOE in coordinating with appropriate state, local, and tribal agencies in route planning activities, using this model.

The Department of Transportation's (DOT) Office of Intelligence and Security will assist FRA in coordinating safety precautions, such as the identification of "safe havens," with the offeror, law enforcement officers, and intelligence communities.

Inspections

FRA will arrange for a track geometry car to operate over designated routes.

FRA will conduct visual inspections of bridges along the designated routes and review railroads' bridge inspection programs to ascertain structural integrity.

FRA will review the rail carrier's rail flaw detection vehicle data to ensure that a rail flaw detection vehicle has been operated over the designated route, and necessary rail repairs are made prior to shipments.

The SCOP requires that every train involved in the transportation of SNF and HLRW be equipped with a 2-way End-of-Train (EOT) braking device, regardless of train length. Prior to each shipment, and during each crew change point along the route, FRA will endeavor to inspect trains to ascertain that EOTs are operational.

Along a designated route, FRA will inspect all automated warning devices, at highway-rail grade crossings along the route, to ascertain that they are operational.

Training/Oversight

FRA will assist DOE, and the offeror or agent, in the development of Emergency Response training and safety briefings. FRA will liaison with the rail industry to verify that requisite training and briefings have been performed.

Prior to the first shipment, and at least annually for subsequent shipments, FRA will review emergency response plans for designated routes and recommend modifications, if necessary.

Prior to the first shipment, and at least annually for subsequent shipments, FRA will conduct the necessary reviews to ensure that train crews are properly certified, trained, and experienced in operating over the designated routes.

FRA will place Operating Practices personnel in the rail carriers' dispatching centers for the first shipment on designated routes, and will review dispatching procedures periodically for subsequent shipments.

Prior to the first shipment, and for subsequent shipments, as appropriate, FRA will focus on Operation Lifesaver training in communities along designated routes.

FRA will continue to prioritize complaints regarding designated routes, and will continue to expedite the investigation and resolution of these complaints.

³ See Appendix A "Federal Railroad Administration High-Level Nuclear Waste Rail Transportation Inspection Policy".

FRA will ensure that train crew personnel and carrier's emergency response personnel receive specific training or briefing concerning the nature of the shipment.

FRA will review the appropriate emergency response plans (offerer, carrier and DOE) to ensure that they adequately address the actions to be taken in the unlikely event of an accident or incident involving the train.

Railroads are equipped to handle heavy pieces of equipment, such as locomotives and other freight cars. Their "wrecking equipment" is mobile and can be dispatched to a derailment site within a matter of hours. It is FRA's position that the railroads have the infrastructure to handle a derailment involving a nuclear cask.

DENVER—SOUTHEAST CORRIDOR LRT

Question. In the President's budget for fiscal year 2001, the Administration states its intention to enter into a Full Funding Grant Agreement (FFGA) for the Southeast Corridor in the Denver metropolitan area in the next year. Based upon what you know in regards to the schedule of the project at this time, when would the negotiations on the FFGA begin?

Answer. The Department expects the Record of Decision for this project to be issued in March 2000. Also in March, the grantee plans to request FTA approval for entry into Final Design. Following this, FTA will begin negotiations on the FFGA. This is expected to begin in the early spring of 2000.

Question. I understand that your people at the Federal Transit Administration (FTA) have been persistent in pressing for a reliable capital cost estimate for the Southeast Corridor project. That is a good and prudent thing to do. However, with the state and local match in place, the project can spend \$63 million in federal dollars in fiscal year 2001, but the Administration requested \$20 million. Such a deferral of federal funding will only delay the project, increase interest costs, and ultimately increase construction costs. Could you look through the New Starts program and determine whether there could be other funds committed to Denver's Southeast Corridor project in fiscal year 2001 that could be spent in fiscal year 2001?

Answer. When developing the recommended fiscal year 2001 budget, FTA first recommended funding for the 14 existing FFGAs in accordance with the Federal commitment schedule. When developing the recommended fiscal year 2001 budget for the new FFGAs, FTA recognized that most, if not all properties, would not receive the amount of funds they desired or would be optimum for the project in fiscal year 2001. With the commitment of fourteen existing FFGAs, there was only \$211.7 million available in fiscal year 2001 for other projects in the pipeline. In fiscal year 2001 seven of the existing FFGAs should be completed freeing up more funds for the new FFGAs in fiscal year 2002 and beyond. FTA is not aware of any other New Starts funds available for Denver for fiscal year 2001.

Question. Last November, voters in Colorado overwhelmingly supported a referendum to financially support the Southeast Corridor and other projects. How does this strong showing of support translate into making this project more competitive in relation to other projects? Also, were there any other cities that have passed a similar referendum in the past?

Answer. Prior to the November referendum, the Regional Transit District (RTD) and Colorado Department of Transportation did not have a committed source of local funding for the Southeast Corridor project. The commercial paper bond revenues authorized by the vote are expected to generate \$320 million, or over 90 percent of the local funding required to implement the project. This new committed funding source improved the projects capital plan rating from Low-Medium (reflected in the fiscal year 2000 Report on New Starts) to Medium-High. This rating is consistent with other projects which are in the latter end of the preliminary engineering stage of development and which have a significant amount of local funding commitments.

A few other areas have passed referendums, which provide for dedicated and stable revenue sources for fixed guideway transit systems, including Seattle (in 1996), San Diego (1987), and Orange County, CA (1985).

QUESTION SUBMITTED BY SENATOR FRANK R. LAUTENBERG

CIVIL AVIATION—ARGENTINA

Question. As you know, Newark International Airport has become a major international hub to Europe and Latin America. However, New Jersey does not have service to a major South American country—Argentina. It is critically important that New Jersey get access to Argentina this year. I know that you have an Argentina route case pending before the Department so I will not ask you to predict which

carrier will get the first frequency. However, I am concerned about reports that the government of Argentina may withdraw the new frequencies that are currently the subject of your route case because of the deteriorating condition of Aerolineas, the Argentine national airline. Could you please comment on this issue?

Answer. The new government is reviewing the open-skies agreement with the United States and has indicated that they would like to come to Washington in March to hold informal discussions. The Department is not prepared to reopen the deal. The Department understands the importance to Newark of securing nonstop service to Argentina.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

EMERGENCY RELIEF

Question. Mr. Secretary, you are very familiar with the Emergency Relief program from your experience as Federal Highway Administrator. You have flown into many disaster-torn areas to assure the citizens that their bridges will be rebuilt and their roads will be repaired. In years past, whenever the requirement for emergency relief exceeded \$100 million per year, the Administration proposed an emergency supplemental to pay for these grants. This year, you are proposing that almost \$400 million of these costs be absorbed by the core highway program. This proposal will result in large amounts of funding being drained away from those states that have not had substantial natural disasters in order to pay off the applications of those states that have, like California, and others. What explains this change in policy on the part of the Administration?

Answer. For any given year, it would be appropriate to request a supplemental appropriation when emergency relief needs exceed the \$100 million included in TEA-21. However, what FHWA has seen is that emergency relief needs have consistently outpaced the authorized funding level. The \$398 million of additional contract authority reflects the ten-year average of Emergency Relief supplementals, excluding Loma Prieta, plus sufficient funds to pay off the current balance over three years. The Department reviewed several options for addressing the backlog of emergency relief needs, but did not address the underlying cause of this crisis. The \$100 million authorized for emergency relief is clearly not sufficient for the level of need. The Emergency Relief Reserve Fund will provide a more long-term solution, and will prevent another crisis from developing.

Question. Aren't many of your pending emergency relief applications a result of Hurricane Floyd and Hurricane Dennis? Why is the Administration requesting emergency supplemental appropriations in other agencies for these disasters but not in your agency?

Answer. The Department estimates that only about 14 percent of the emergency relief backlog can be attributed to Hurricanes Floyd and Dennis. It is clear that even if these two events did not occur, there would still be a substantial backlog of unmet needs. Although a supplemental request would address the immediate needs following these two hurricanes, the Department has proposed creating a new Emergency Relief Reserve Fund in order to address the long-term emergency relief needs of the country.

Question. Mr. Secretary, the balance of unfunded applications for emergency relief has been growing for several years, and the Administration has balked at requesting an emergency supplemental appropriation to cover them. Can you explain the Administration's rationale behind requesting almost \$1 billion for assistance to Colombia, while leaving the nation's highway emergency needs in the cold?

Answer. The Administration's budget request is not leaving the nation's highway emergency needs in the cold. The Department has requested \$398 million in additional contract authority above and beyond the \$100 million authorized funding level each year. This funding level would be sufficient to cover the current backlog over the next three years, and prevent another backlog from developing.

QUESTION SUBMITTED BY SENATOR CHARLES E. GRASSLEY

Question. As you know, over the past several years, we have been working closely with the state attorneys general, led by Tom Miller, to address factors that are limiting increased airline competition in various parts of the country, including Iowa. We have talked about the issues impacting the future of competition. As you have recognized, in some cases large air carriers utilize anti-competitive behavior to drive new entrants out of the markets.

Last spring, Mike Hatch, the state attorney general for the state of Minnesota, asked the Department of Transportation to investigate actions taken by Northwest Airlines to drive Sun Country out of its market. In November of last year at a Congressional hearing, Nancy McFadden, DOT's General Counsel stated: "We are concerned about anti-competitive behavior. Currently, we have two preliminary investigations underway brought by AirTran and Sun Country."

Unfortunately, DOT has yet to take any action in response to either complaint. Please provide this committee with an update on the complaints of anti-competitive behavior filed last year by Minnesota Attorney General Mike Hatch and AirTran Airways. Also, when will formal action be taken on these complaints?

Answer. Regarding AirTran's complaint, the Department continues to conduct extensive analyses of the information AirTran and Delta report to the Department, and the Department is considering whether to request additional information from Delta.

Regarding Attorney General Mike Hatch's complaint about how Northwest Airlines has responded to Sun Country's entry into several Twin Cities markets, the Department requested Northwest's comments on his complaint. The comments received from Northwest did not address all of the Department's concerns, and the Department has therefore continued the informal investigation into the matter. DOT will soon have access to information that can be used to further assess Northwest's capacity and fare responses to Sun Country. This is detailed information that the airlines are required to file with the Department, and Sun Country's first report has just become available for review.

SUBCOMMITTEE RECESS

Senator SHELBY. Thank you. The subcommittee stands in recess.
[Whereupon, at 12:40 p.m., Thursday, February 10, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENT OF TRANSPORTATION AND RE-
LATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

THURSDAY, FEBRUARY 24, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:05 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Lautenberg, and Murray.

**DEPARTMENT OF TRANSPORTATION SAFETY INITIATIVES—
FISCAL YEAR 2001**

DEPARTMENT OF TRANSPORTATION

U.S. COAST GUARD

STATEMENT OF VICE ADMIRAL JAMES C. CARD, VICE COMMANDANT

NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION

STATEMENT OF ROSALYN G. MILLMAN, ACTING ADMINISTRATOR

RESEARCH AND SPECIAL PROGRAMS ADMINISTRATION

STATEMENT OF KELLEY S. COYNER, ADMINISTRATOR

FEDERAL RAILROAD ADMINISTRATION

STATEMENT OF JOLENE MOLITORIS, ADMINISTRATOR

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. The committee will come to order. Good morning. The Committee on Transportation will meet today.

Of the oversight responsibilities that we have on this subcommittee, none is more important than safety. Generally, we tend to incorporate our safety concerns into program oversight and into our review of the Department's management and funding issues.

However, I believe it is very useful, every once in a while, to focus exclusively on safety issues as a way to get a better sense of what safety considerations are of paramount concern to individual safety agencies and to my colleagues on this committee.

I will take this opportunity to express my concern about the impact of the proposed aviation firewall on safety programs at the Department of Transportation.

Three of the agencies appearing before us today, the Coast Guard, the Federal Railroad Administration, and the Research and Special Programs Administration, are funded entirely from non-firewall discretionary dollars, and more than half of the funding for the National Highway Safety Administration, or NHTSA, is non-firewall general funds as well. So, each of these witnesses has a very real stake in ensuring that discretionary funds are kept exactly that way, discretionary. Only by maintaining this discretion and flexibility can we respond to the priorities expressed in your budget request and through those expressed by Congress.

We have stacked votes starting at 11:30, so I will submit the remainder of my statement for the record in order to maximize the time we have to discuss the issues with our panel.

Today we have as witnesses Vice Admiral James C. Card, Vice Commandant of the U.S. Coast Guard; Ms. Rosalyn Millman, Acting Administrator of the National Highway Traffic Safety Administration; Ms. Kelley Coyner, Administrator, Research and Special Programs Administration; and Ms. Jolene—is it Molitoris?

Ms. MOLITORIS. Yes, it is.

Senator SHELBY. Molitoris, Administrator of the Federal Railroad Administration.

They will discuss various safety programs and related initiatives in each of the agencies' budget requests. Because we have a very limited amount of time and four very different agencies represented today, I will ask all the witnesses to keep your statements extremely brief. I will put your written statement in the record for the staff and other members to read and this Senator especially. They will be submitted for the record without objection.

Senator Lautenberg.

STATEMENT OF SENATOR FRANK R. LAUTENBERG

Senator LAUTENBERG. Thanks, Mr. Chairman. As usual, they say you are on the money when you talk about firewalls, segregating some and not others. It would be awfully tough to work that way.

If you will indulge me, Mr. Chairman, I do not think I am going to be as brief as you would like me to be because I have, as you do I know, two other hearings this day. So, I am going to give my statement and I will hop around and I will be back to make sure that I support my chairman, my good friend.

I will miss him when I am not here, as well as all of you. This is kind of Lautenberg's last stand at the semi-helm anyway.

Senator SHELBY. His last stand. He is heavily armed, though.

Senator LAUTENBERG. Working with the Coast Guard, I am going to single the Coast Guard out and I hope that none of the other agencies represented here will feel slighted. I feel just as strongly about you, but the Coast Guard has one that has gotten a lot of attention lately and I want to focus on that. Working with the Coast Guard has been one of the very unique privileges of serving in the leadership of this subcommittee.

While I never failed to be impressed by the heroism and the hard work of the people in the Coast Guard, I must admit that I am

greatly disturbed by what I have been recently reading regarding the service's declining state of readiness. Those of you who are associated with the Coast Guard, Admiral Card and the others, know very well that I have been a strong supporter and I continue to be. I respect so much what you do. I often mention the array of assignments that you are given without the resources in many cases to do them, and you manage to get most of them done well.

But the focus is directed, as this body here requests—and I am talking about the U.S. Senate all together. I commend you and Admiral Loy, our Commandant, for the very direct and frank statements that he has made in recent months regarding the unavailability of rescue craft, the severe shortage that he faces in adequately trained people, and the great stress this situation places on the work force.

These problems should trouble all of us, but I find them especially troubling when I review the causes behind them. One of those causes is the very rapid change in the operational priority within the Coast Guard, if I may say, directed by the Government. And it appears that there are those within the Administration, the Congress, the Coast Guard itself that are determined to beef up the Coast Guard's role in the war on drugs at any cost, even at the cost of the Coast Guard's ability to safely execute its most fundamental missions here at home.

Mr. Chairman, at every hearing we have held this year, I have emphasized the need for balance when looking at our Nation's transportation needs, and nowhere is the need for balance more apparent than within the Coast Guard's budget.

Now, I am not opposed to anything that the Coast Guard is doing in the area of drug interdiction. I stand behind each and every Coast Guard person who is currently fighting the war on drugs in the Caribbean. But I would like to share some figures regarding this war on drugs and the toll that it is taking on the rest of the Coast Guard. These are not my numbers, Mr. Chairman. They come directly from the Coast Guard.

Beginning in 1995, the year after the huge migration of Haitian and Cuban migrants, drug interdiction activities began growing at a phenomenal rate. Indeed, since 1995, total spending of operational dollars just for drug interdiction has increased by over a quarter of a billion dollars, or 89.3 percent. Cutter hours devoted to drug interdiction have risen 85 percent, while aircraft hours have increased over 100 percent. And over the same 5-year period, the Coast Guard's operating budget has grown by only 15 percent.

So, the increased level of effort on drugs had to come from somewhere. One critical area that absorbed the cuts was the end strength in the Coast Guard. Even as its missions have expanded, total employment in the Coast Guard dropped by more than 7 percent over this period. Another area that paid the price is fisheries enforcement. Funding for fisheries enforcement actually declined more than 12 percent over this period. Cutter hours dropped 13 percent, while aircraft hours fell by more than a third.

Now, on the subject of aircraft hours, the Commandant's recent statements have been so forthright, and I respect him for it. Candor, I think, is the best way to approach problems. He has only so

many aircraft and too many of them are not usable because they have been cannibalized for spare parts.

In a speech this past December, Admiral Loy shared with us the unfortunate story about a boater that died in a storm off the California coast. When the distress call went in to the Coast Guard's air station in Sacramento, they only had one aircraft that was ready to deploy. Usually there would be at least one backup available to relieve it when it ran short of fuel. That station has four C-130 aircraft, but on that day, one of them was undergoing maintenance. And where were the other two? Well, one had not flown for more than 6 months because it had been cannibalized for parts. And what about the fourth? Well, it was out of the country doing drug patrols. In this case, the only available aircraft circled the distressed sailor who was alive but struggling in the terrible weather. The outcome was horrible. The sailor was never seen after that, and after a 6-day search, all they found was the debris.

Now, Mr. Chairman, the Coast Guard does wondrous things. We all admire the courage and the skill of the people who are out there in the worst of weather. In the 16 years that I have served on this committee, I have never seen the Coast Guard priorities get so out of balance. The situation is simply unacceptable, and as I look at the Coast Guard budget request for fiscal year 2001, I am not at all encouraged. It is true that there are some resources included in this budget to improve the deteriorated readiness of the Coast Guard. But the largest requested growth items in the budget are still for expanded and expensive drug interdiction activities.

I think we have to conduct this fight against drugs. I believe that it is a terrible blight on our constituents and our communities. But we have to make sure that we have a balance in what we are doing.

The largest increase is to deploy eight additional helicopters to the Caribbean exclusively for the drug war with specially mounted guns and specially trained crews. And they are good at what they do and I am glad that they are there for us. But we cannot afford to neglect the other responsibilities that we have given to the Coast Guard.

Mr. Chairman, the senior leadership of Congress, this subcommittee, the DOT, and the Coast Guard need to rethink the way we are allocating our resources. I support spending resources on drug interdiction, but we must first make sure that the Coast Guard can fully fund and execute its core missions here at home. It is not sufficient to ignore our activities here at home on a shoestring just so that we can expand our activities in the drug war. It is not fair to our recreational, commercial boaters, this maritime system that we have created in this country which is second to none. It has created this whole, gigantic marine industry as a result of the Coast Guard's imprint on how we navigate and how we rescue and how we signal. It is a wonderful thing. I know I am a miscreant sailor and I can tell you. It is not fair to the members of the Coast Guard who are charged with rescue.

Mr. Chairman, the Vice Commandant is here with us today because the Commandant is participating in the announcement of the findings of the President's Council on Coast Guard Roles and Missions. That council has taken a comprehensive look at the Coast

Guard's current roles and missions and concluded there are not any major Coast Guard missions we can do without. Not one of them. The committee, like Congress, does not want the Coast Guard to lessen its level of effort in any area. We want you to be magicians. That is what it is. If that is the case, then we need to think in terms of funding all of the Coast Guard's missions adequately. It is simply not acceptable to take from one to pay for another.

Now, in focusing my statement on the Coast Guard this morning, I do not want to diminish in any way the important contributions made by the other agencies represented here. So, forgive me if this was the focus. The work all of you do is very important, as well as the people with whom you work. So, I welcome all the witnesses here this morning.

Mr. Chairman, I apologize for taking so long but appreciate this opportunity to blow off some steam.

Senator SHELBY. Thank you.

Vice Admiral Card.

STATEMENT OF JAMES C. CARD

Admiral CARD. Good morning, Mr. Chairman and distinguished members of the subcommittee. I am Vice Admiral Jim Card, Vice Commandant of the Coast Guard, and it is my pleasure to appear before you today to discuss the Coast Guard's maritime safety mission.

I want to take a second to thank Senator Lautenberg for his support over the years. He has been a great supporter of the Coast Guard. He really understands us very well, as we could tell from your statement.

Ensuring the safety of mariners and passengers has always been a mainstay mission of the Coast Guard. We are widely recognized as an international leader in marine safety and search and rescue, and certainly while we have evolved to a highly effective multimission service, we have maintained our leadership in excellence in the safety arena. For us safety is job one.

Our safety aim is to eliminate deaths, injuries, and property damage associated with marine transportation, fishing, and recreational boating. We do so by balancing prevention programs, response capability, and investigation services. Prevention is the key to improving safety in the marine world. We focus our activities on areas of greatest risk.

Because most maritime accidents are the result of human error, the Coast Guard is increasingly focused on efforts to improve human performance. Our overarching strategy to do so is the "Prevention Through People" program whose vision is to achieve the world's safest, most environmentally sound, and cost-effective marine operations by emphasizing the role of people in preventing casualties and pollution. Key to this is knowing more about how people operate and what causes problems.

Our 2001 budget requests a modest \$400,000 to institute a program to capture near-miss and accident data. The system is called the International Maritime Information Safety System, IMISS, and it holds much promise.

Another important and successful prevention program put together over the past several years has been our Port State Control program. We have seen in the last 2 years a great reduction in the number of foreign vessels which do not pass our Port State Control examination entering our country.

But when prevention efforts all fail, the Coast Guard responds with boats and cutters and aircraft. These search and rescue efforts are our most well-known capability, and like calling 911, Americans expect someone to respond to their distress calls when on the water, and we do so with pride. In an average year, the Coast Guard responds to more than 40,000 emergency calls, saving about 4,000 lives and assisting 80,000 mariners in need of non-emergency assistance. Often we work in partnership with other Government agencies, State and local officials, to get this job done.

In the 2001 budget submission, there are several initiatives aimed at restoring our readiness and improving maritime safety, prevention, and response capabilities for the future. Probably the most important is the Deepwater Capability Replacement Project. It is vitally important.

Our National Distress and Response System Modernization Project will improve our ability to quickly find those in distress and be able to respond. Ports and Waterways Safety Assessments will greatly assist vessel traffic in sorting that out. Providing personal protective gear for our crews who are on the front line. Focusing on commercial vessel safety. Having more people in those surf stations with breaking bars.

And probably on the operations side, most important is the personnel support initiatives to help us restore and maintain our work force.

There are, however, safety challenges we have. Passenger vessel safety as it relates to vessel size and speed for commuter vessels. And the numbers increase. We always have to focus on prevention and response.

Commercial fishing vessel safety, while we have improved in the last 5 years with a 30-percent reduction in deaths, is still one of the Nation's most hazardous occupations and one that the Coast Guard has little regulatory control over. We have to focus on human error, dockside examinations. We have operations on each coast, *Safe Catch* and *Safe Return*.

The Marine Transportation System initiative, which we put together. Volume will double in this country in marine transport in the next 20 years. We have to make sure we are ready to take all the safety precautions that we need in that area.

Probably our biggest challenge and the one that the Senator has outlined is our people. We have to make sure we have the right people, the right training, and the right equipment to carry out all these important missions.

Today, Coast Guard men and women will save 11 lives and prevent countless marine accidents. They are dedicated and professional and very proud to serve their country. I am honored to be one of their leaders. I asked you to honor them by fully supporting the President's 2001 budget.

PREPARED STATEMENT

Thank you for this opportunity to discuss this important issue with you, and I will be happy to answer your questions.

Senator SHELBY. Thank you.

[The statement follows:]

PREPARED STATEMENT OF JAMES C. CARD

Good morning, Mr. Chairman and distinguished members of the Subcommittee. I am Vice Admiral James Card, Vice Commandant of the United States Coast Guard. It is a pleasure to appear before you today to discuss the Coast Guard's maritime safety mission and related initiatives. Safety permeates most Coast Guard activities, and the President's fiscal year 2001 budget requests \$973 million, a 6-percent increase over fiscal year 2000, for Coast Guard safety programs. This testimony, however, focuses on specific safety projects and initiatives designed to enhance safety.

COAST GUARD STRATEGIC GOAL: MARITIME SAFETY

The Coast Guard adheres to five strategic goals in providing service to the American people: Maritime Safety, Maritime Security, Protection of Natural Resources, Maritime Mobility, and National Defense. Today, we are here to discuss the Coast Guard's role in Maritime Safety as it relates to the bigger scheme of Transportation Safety. Specifically, our safety aim is to "eliminate deaths, injuries, and property damage associated with maritime transportation, fishing, and recreational boating." Ensuring the safety of mariners has always been a mainstay mission of the Coast Guard. America depends on the Coast Guard to provide safe, efficient, and environmentally sound waterways for a myriad of commercial and recreational users. Competing demands on America's waterways—commerce, national security, public health and safety, environmental concerns, recreation, fisheries, and more—must be balanced. However, safety is integrally linked to all these concerns. Our efforts to achieve the Maritime Safety strategic goal are manifested through a systematic, risk-based approach that looks at the relative degree of probability versus consequences. This systematic approach consists of:

- Prevention—minimizing the likelihood of a casualty;
- Response—minimizing the consequences of a casualty; and
- Investigation—which links lessons learned back to future prevention efforts.

Our most complex safety challenge is preparing for the low probability but very high consequence event.

PREVENTION

Our prevention activities focus on areas of greatest risk, which consider both the probability of an incident occurring and the resultant consequences. To better assess and respond to risk, we look at it through different lenses, such as type of maritime activity or type of causal factor. Regardless of activity type, most maritime incidents resulting in death, injury, or property damage are the result of human error; therefore, Coast Guard efforts will continue to support the "Prevention Through People" concept.

The Coast Guard's Prevention Through People (PTP) program is an outstanding example of government working with industry to make transportation safer. The concept is simple: working together we can change the corporate culture and address the majority of accidents, which are rooted in human performance. Implementation is not so simple, but by working with industry and labor leaders the culture change is occurring, both domestically and internationally. To encourage this concept, the Coast Guard has entered several partnerships with the different segments of the maritime industry.

Recreational Boating Safety

Recreational boating is second only to highway travel in U.S. transportation fatalities. The recreational boating population continues to grow rapidly. While recreational boating fatalities have decreased over the last three decades, the number of deaths has leveled (roughly 800 annually) over the last several years. Again, human error is the most common cause of fatal accidents, and failure to use life jackets is the most common cause of death following these incidents. The Coast Guard coordinates a Federal-State recreational boating partnership, consisting largely of administering a Boating Safety Grant program. Although recreational boating safety (RBS) is largely a state responsibility, failure in RBS directly impacts

the Coast Guard: 70 percent of the Coast Guard's search and rescue (SAR) case load results from recreational boating incidents.

The Coast Guard has three primary initiatives in the area of recreational boating safety: enforcement, response, and education. To enforce compliance with laws designed to minimize accidents on the water, we conduct about 50,000 boardings of recreational boats each year. When things do go wrong, we respond to about 40,000 search and rescue cases each year. Our major thrust, though, is in the area of prevention. To that end, through the dedicated efforts of our Auxiliary volunteers, we conduct 150,000 Courtesy Marine Examinations of recreational boats each year. Also, we teach boating safety to 250,000 people each year in formal classes, give over 2,800 safety lectures, and operate safety information booths over 6,500 days annually. In 2000, we are expanding our Courtesy Marine Examination program by authorizing members of the United States Power Squadrons to conduct these exams under the direction of the Auxiliary, and in the near future we will similarly involve some States in this program, in coordination with the National Association of State Boating Law Administrators. As you can see by these numbers, our civilian volunteers play a substantial and vitally important role in enhancing the safety of their fellow boaters.

Commercial Vessel Safety

The largest percentage of maritime worker fatalities occurs in commercial fishing, one of the nation's most hazardous occupations and an industry over which the Coast Guard has little regulatory authority. The Coast Guard is focusing on reducing human error, along with enforcement of safety regulations, to reduce accidents in the commercial fishing industry.

In the short term, we will increase our presence on fishing docks with the goal of greater interaction on common safety goals of fishermen and the Coast Guard. The Coast Guard conducts voluntary dockside examinations of commercial fishing vessels in order to ensure that all required safety equipment is on board and maintained properly. These voluntary exams have proven to be an effective tool in reducing risk and loss of life. Our fiscal year 2001 budget requests \$0.6 million to enable us to work with the fishing industry to increase the number of fishermen who participate in these safety examinations.

Other short-term plans will increase local outreach through the sharing of best practices and lessons learned from accident investigation reports, as well as regional media campaigns designed to improve overall community awareness of the causes of vessel losses, ways to increase the fishermen's chances of survival, and the positive impact of dockside examinations on safety.

While other commercial vessels (i.e., tankers, freighters, towboats) have lower fatality rates than the fishing industry, the Coast Guard is working to improve safety aboard these vessels as well.

Our passenger vessel safety program is carried out through a regime of international and domestic safety standards. Compliance programs ensure that vessels meet these standards. Development of standards began back in the mid-1800s and continues today. It is a continuous improvement process of incorporating new technology, lessons learned, and knowledge gained from casualty investigations, practical experience, and research and development projects. Much of the history of the regulation of maritime safety has been reactive: disasters followed by legislation. Maritime safety has transitioned from the historical "reactive" approach to today's proactive, systematic, risk-based approach, exemplified by the Passenger Vessel Safety Act of 1993, which focused on passenger vessels evading inspection through charter arrangements. The risk posed by these vessels was recognized before casualties occurred, and action was taken to prevent casualties.

Our standards address both variables in the risk equation: the probability that something will go wrong and the resulting consequences should it occur. Our approach is to reduce the probability of an accident through prevention programs and continual improvement of our response capability.

We are continuing our leadership and participation with the International Maritime Organization (IMO) to improve international safety standards, especially efforts to increase flag state compliance and accountability. Our Port State Control (PSC) initiative has been successful in improving compliance and consistency by PSC authorities around the world. Of the 7880 foreign-flag ships that arrived in the U.S. in 1998, 373 were detained because of their substandard condition. In 1999, only 260 foreign flag ships were detained, a 30 percent decrease from 1998, and a 52 percent reduction in the last two years, representing an increased level of safety in the foreign fleet visiting our ports. The number of arriving vessels has remained consistent, and we examined a similar number of vessels. Our risk-based matrix ap-

pears to be successful in screening all arriving vessels to ensure that the highest risk vessels are boarded.

Other Prevention Initiatives

In addition to maintaining about 50,000 aids to navigation on U.S. waterways, the Coast Guard also operates Vessel Traffic Services in major U.S. ports. The Ports and Waterways Safety Assessment (PAWSA) is a formal risk assessment process that employs an open dialogue with port users in order to identify minimum user requirements and candidate ports for Vessel Traffic Services (VTSs). It is a risk-based decision making process that relies on user consultation to determine the risk drivers and appropriate vessel traffic management measures for mitigating that risk. The process requires the participation of professional mariners with local expertise in navigation, mobility, and port safety, as well as port stakeholders with a vested interest in the environmental, public safety, and economic consequences of marine activity. Ten ports have completed the PAWSA process. In each case, it has been well received by the port community and the agencies that regulate the port. From these sessions, we have provided the local port with a baseline of risk from which periodic reassessments can be conducted, and we have identified safety concerns that need to be addressed. Using information gathered during these efforts, we can conduct comparative and cost benefit analyses to evaluate solutions that meet the needs of the waterway users and are cost effective. As we gain more experience in the process, and as supporting guidance and other tools evolve, we believe PAWSA will improve to the point where it will be usable by any field unit without extensive outside support.

We see many opportunities to employ new technologies to improve safety such as those employed in intelligent transportation systems. For example, the Coast Guard and various sectors of the shipping and carrier industry are working to finish development of a new navigation safety tool called AIS, or Automatic Identification System. AIS will give mariners the ability to integrate several different technologies to improve their own navigation and their knowledge of other vessels around them. AIS incorporates electronic chart systems; the Department of Defense's Global Positioning System (GPS); differential GPS, a Coast Guard-operated high-precision local correction system for GPS; and a radio communications package linking AIS-equipped vessels. AIS will significantly improve navigation safety and collision avoidance, saving lives and preventing property loss, as well as significantly enhancing the protection of the marine environment. Through systems like AIS, we can provide the mariner with an array of integrated, accurate, and real-time information necessary for safe navigation of America's ports and waterways.

The International Maritime Information Safety System (IMISS) initiative is focused on the reduction of marine accidents through a voluntary reporting system that captures causal information, and lessons learned on maritime near-accident (near-miss) events (e.g., near collision situations, near-pollution events, etc.) modeled after the Aviation Safety Reporting System (ASRS). The Coast Guard, Maritime Administration, maritime industry, and recently the National Aeronautics and Space Administration (NASA) have been working together to put IMISS into place. It is also intended to capture related precursor events (hazardous situations) and lessons learned (e.g., crew fatigue issues, equipment maintenance issues, communication issues, etc.) that, but for some corrective action in the chain of events, did not result in the occurrence of an accident. The cost savings by preventing just one major accident involving a large loss of life or damage to the marine environment could be billions of dollars. Additionally, if we take this concept and apply it across all of the transportation modes and other applicable service industry segments, both the physical savings (lives and property saved and reduced damage to the environment) and the fiscal savings (private and public dollars saved) are higher still. We have an industry-based working group under the Society of Naval Architects and Marine Engineers (SNAME) with commitments from over 500 individuals and organizations to help us with the project. Our fiscal year 2001 budget request includes \$0.4 million to continue development of this project.

RESPONSE

When prevention efforts fail, the Coast Guard responds with an appropriate combination of boats, cutters, and aircraft in order to mitigate injuries, property damage, and environmental damage. In order for response to work effectively, we must be promptly notified. Therefore, we not only focus on improving our search and rescue response, but also on increasing the ability of mariners in distress to notify us in time to permit a successful response.

Like calling 911, Americans expect the Coast Guard to respond to their calls for help at sea. Our responses include providing some form of emergency assistance to

approximately 80,000 people, saving approximately 4,000 lives from imminent danger. While most maritime casualties occur in near-coastal waters, it is certainly not true in every case.

In 1980, the Coast Guard coordinated the rescue of 519 passengers and crew from the passenger vessel PRINSENDAM 330 miles from Valdez, Alaska. In November 1998, after refueling both in Bermuda and at sea aboard a U.S. Navy destroyer, a Coast Guard helicopter crew from Elizabeth City, North Carolina, rescued all four crewmembers from the 42-foot sailboat KAMPESKA in 30-knot winds and 20-foot seas, approximately 400 nautical miles off the North Carolina coast.

In April 1999, crews aboard Coast Guard fixed and rotary wing aircraft risked winds up to 50 knots and seas as high as 30 feet to rescue two survivors, both experienced ocean sailors, from the overturned catamaran ACAPELLA approximately 800 nautical miles east-northeast of New York. These and other offshore cases are clear indicators of the need for a deepwater search and rescue capability. Our search and rescue efforts also transcend the bounds of the high seas and coastal waters.

The citizens of Grand Forks, North Dakota may never have considered how the Coast Guard touched their lives, but when the swollen Red River flooded their city, the Coast Guard was there to assist. And very recently, Coast Guard air and boat crews tirelessly rescued over 500 people, from New Jersey to North Carolina, stranded by devastating floods left by Hurricane Floyd. The dedicated professionals of the Coast Guard place themselves in harm's way every day while selflessly rendering assistance to others in distress.

Increased expectations not only come from the American public, but also from the international maritime community that looks to the Coast Guard as a world leader in the international field of search and rescue. Maritime commerce and travel are global activities that require a global safety system, and a vital aspect of that safety system is an effective global search and rescue response capability. The Coast Guard, along with some of our international partners in the SAR community, are recognized as leaders in developing a family of international treaties, such as the International Convention on Maritime SAR and the International Convention for the Safety of Life at Sea (SOLAS), which help provide a global maritime search and rescue capability.

We are also leaders in helping the IMO establish global SAR plans, procedures, techniques, and training. Our efforts are aimed at integrating SAR Regions (SRRs) encompassing the globe by working with individual countries responsible for their assigned regions. The SRR for which the U.S. Coast Guard is responsible encompasses about 50 percent of the North Atlantic Ocean and over 75 percent of the North Pacific Ocean, an area in excess of 28 million square nautical miles. Based on this framework, we have established bilateral agreements with various countries including Russia, China, Japan, and Mexico. We have also recently concluded a trilateral agreement among the United States, Canada, and the United Kingdom.

We have had some particularly noteworthy accomplishments in supporting the global SAR system. One of the jewels of our International SAR system is the Automated Mutual-assistance Vessel Rescue System (AMVER), which in 1998 celebrated 40 years of being a vital, real-world, real-time segment of the maritime safety system. Endorsed by the IMO, AMVER is a global ship reporting system with 12,000 ships participating from 143 nations, which constitutes 40 percent of the world's merchant fleet. On an average day, over 2,700 ships are on the AMVER "plot" that is maintained by the Coast Guard and are available to effect any necessary rescue or assistance in their transit area. AMVER has established an impressive lifesaving track record considering that more than 1,400 lives were saved between 1993 and 1998. In just one case in 1994, six AMVER ships successfully rescued 504 passengers from the Italian cruise liner ACHILLE LAURO, ablaze off the coast of Somalia. Though AMVER is administered and maintained by the United States Coast Guard, it is indeed a global system available as a very powerful and effective lifesaving tool to rescue organizations throughout the world. It is an extremely valuable component of the overall SAR response posture.

The Coast Guard is also a primary supporter and the world's largest user of the multinational Cospas-Sarsat system. This satellite-based system is an extensive network that provides global satellite coverage for the detection of distress beacons on land or at sea, detecting Emergency Position Indicating Radio Beacons (EPIRBs) from ships and Emergency Locator Transmitters (ELTs) from aircraft.

Moreover, the Coast Guard was instrumental in contributing to a new International Aeronautical and Maritime Search and Rescue (IAMSAR) Manual that was recently developed and published by both IMO and the International Civil Aviation Organization (ICAO). For the first time, this three-volume set provides consolidated guidance to nations on the administration, organization, and execution of search and rescue. It is being heralded as a landmark document of international coopera-

tion. We are, in fact, adopting the IAMSAR Manual as the National Search and Rescue Manual of the United States. Additionally, our personnel are working closely with developing nations to help them model their maritime services after the U.S. Coast Guard, since their missions are more akin to ours than they are to those of a blue water navy.

Several other initiatives have been undertaken to "raise the safety bar." Our fiscal year 2001 budget requests \$3.1 million to continue worldwide implementation of the Global Maritime Distress and Safety System (GMDSS), which will significantly enhance maritime communications and maritime safety. We can, for example, for the first time broadcast urgent marine information broadcasts, including weather warnings, and ensure that every GMDSS ship in our areas of responsibility immediately gets the information we broadcast. GMDSS includes a redundant capability to ensure that if one device becomes inoperable, another component can be used to send a distress alert or communicate distress information. Finally, the system is designed to include location and identification information in every distress alert. Some segments of GMDSS pay very big dividends: in 1997 alone, over 540 lives were saved through the use of EPIRBs.

Another critical safety enhancement is our initiative to re-capitalize the National Distress and Response System Modernization Project (NDRSMP). The Coast Guard is recognized as a world-class rescue organization, but we can only be as effective as the system we use to monitor distress calls. As proposed, NDRSMP will improve Federal, State, and local command and control communications within port areas during emergency situations by providing complete VHF radio coverage of coastal areas and navigable waterways where commercial and recreational traffic exists. The new system will also automatically record and play back distress calls, and allow Coast Guard watchstanders to slow them down and adjust the quality until the message can be understood. It will also determine and preserve an electronic fix when a distress signal is received. NDRSMP is a national priority and is an absolute must to ensure America's waterways remain safe.

INVESTIGATION

The marine community is incredibly diverse, with a wide array of vessel types, sizes, and equipment that varies across a broad range of commercial and recreational activities. The Coast Guard is both a seagoing Service with substantial experience operating its own vessels as well as the primary regulator of the marine industry. Each year, the Coast Guard investigates approximately 5,000 marine casualties. Coast Guard inspectors and investigators are unmatched in their expertise, gained through thousands of daily interactions on the waterfront and the ocean with the full spectrum of vessels and marine facilities. This expertise gives the Coast Guard a unique ability to focus quickly and accurately on the most likely causes of a marine casualty.

Investigations of casualties provide critical information about the safety risks of specific vessel types and operating conditions that help the Coast Guard to better target its prevention efforts. The Coast Guard has broad and robust technical expertise in naval architecture, marine engineering, and salvage, as well as a strong seagoing expertise by the very nature of the service. That expertise is necessary to focus quickly on potential causal factors which can be extraordinarily complex in marine systems. The current process allows the Coast Guard to take the lead in investigations it deems most vital in refocusing prevention programs. By virtue of its extensive experience with the maritime community and its regulatory role, the Coast Guard is the agency best able to focus the investigation quickly and efficiently and then implement any needed changes to immediately improve marine safety. In cases in which an investigation uncovers safety issues that appear urgent, the Coast Guard is able to issue safety alerts quickly and commence regulatory program changes based on compelling interim findings. For example, following the sinking of the amphibious passenger vessel *MISS MAJESTIC* at Hot Springs, Arkansas, in May 1999, the first safety alert was issued 5 days after the incident, the second 13 days after the first alert.

CONCLUSION

In many cases, it is not the breadth but the pace of change that challenges us. The growth of international maritime trade will inevitably jump sharply in the next twenty years. Some estimates place the increase between 200 and 300 percent of current levels. The number of U.S. passengers has been steadily increasing over the past decade due, in part, to the increased use of high-speed commuter ferries traveling at over 40 knots and new passenger ships designed to carry 5,000 people. This contributes significantly to increased waterways use, congestion, and risk. However,

we recognize this trend and are working to offset the increased risk through our prevention, response, and investigative efforts, both internationally and domestically.

To ensure the viability of a Coast Guard that will meet the nation's safety needs in the future, we request your support of our fiscal year 2001 budget request, which provides the necessary resources to support our work force adequately, especially in light of the stark competition to attract and retain quality people in today's economy. Coast Guard men and women carry out their duties in a harsh and dangerous environment on a daily basis. To ensure the safety of our people, we must continue to provide them with modern tools and properly maintained equipment so they can carry out their duties in the most efficient manner possible.

Toward that end, the Deepwater project will begin the recapitalization of our aging fleet of vessels, aircraft, and C4ISR (command, control, communications, computers, intelligence, sensors, and reconnaissance) assets with an integrated system that will not only fill capability, technology, and logistics gaps, but will also enable us to meet the maritime challenges we foresee in the 21st century. The Coast Guard's fiscal year 2001 budget requests \$42.3 million to complete planning and design work prior to initiation of specific construction projects.

Thank you for the opportunity to discuss this important issue with you today. I will be happy to answer any questions you may have.

STATEMENT OF ROSALYN G. MILLMAN

Senator SHELBY. Ms. Millman.

Ms. MILLMAN. Mr. Chairman, I appreciate the opportunity to make my first appearance before the subcommittee and discuss critical highway safety issues.

I also want to express my pleasure at appearing today with my colleagues testifying in the one DOT way that we approach transportation safety.

SAFETY MISSION REQUIRES INNOVATION STRATEGY

The fiscal year 2001 budget estimate for the National Highway Traffic Safety Administration reflects President Clinton's and Secretary Slater's highest transportation priority: safety. Motor vehicle crashes are the leading cause of death for Americans between 5 and 29 years old and account for more than 90 percent of all transportation fatalities.

Secretary Slater's goal is to reduce by 20 percent the number of traffic deaths and injuries from 1996 to 2008. Success will have far-reaching national implications in terms of lives saved, injuries avoided, and families kept intact.

NHTSA's missions are to reduce the number, rate, and severity of motor vehicle crashes and to enable States and local communities to solve their unique traffic safety problems. Our safety strategy will succeed or fail, depending on our ability to embrace innovation. Business-as-usual approaches will not accelerate our drive for safer vehicles and roadways. Accomplishing these objectives demands attention to both crash avoidance, such as reducing alcohol impaired driving and decreasing rollover propensity; and crash worthiness—better head protection and increased child safety seat usage, for example.

The fiscal year 2001 budget estimate provides the resources, more than \$499 million, an increase of \$133 million over the fiscal year 2000 level, for an ambitious program to foster a climate of safety innovation through regulatory and non-regulatory approaches, new ways of doing business, and supporting research and development.

FOUR PROGRAM COMPONENTS

Our successful programs generally have four components: partnerships, strong laws, vigorous enforcement, and public information and education. Mr. Chairman, my written statement provides more details about NHTSA's highway safety improvement approach.

FISCAL YEAR 2001 INITIATIVES

In the time remaining, I would like to highlight a few of NHTSA's fiscal year 2001 initiatives.

NHTSA proposes a concerted research program on crash protection for older occupants, a supporting research and development effort that will provide important information for the future of highway safety. Elderly people are much more likely to die than younger people in comparable motor vehicle crashes. The proposed research, through our National Transportation Biomechanics Research Center, will yield more accurate injury measurements and thresholds and alternative occupant restraint systems that improve protection and survivability.

NATIONAL ADVANCED DRIVING SIMULATOR

Also under the umbrella of supporting research and development, NHTSA proposes studies using the soon-to-be-completed National Advanced Driving Simulator. This state-of-the-art facility with the University of Iowa will enable us to examine under controlled conditions such driving behavior scenarios as driver fatigue and inattention, skill degradation among older drivers, and distraction from the driving task that new in-vehicle technologies, such as wireless telephones, may cause. Mr. Chairman, completion of NADS would not have been possible without the very strong support from this subcommittee. We thank you.

SAFE PASSAGES FOR YOUTH

The fiscal year 2001 budget estimates include about \$11 million for NHTSA's proposed initiative, Safe Passages for Youth. The 16- and 17-year-olds have the highest rates of fatal crash involvement per vehicle mile traveled. New strategies are essential helping our young people save their own lives. A program using each of the four parts, partnerships with organizations that work specifically with teenagers, strong laws such as zero tolerance and graduated driver's licenses, vigorous enforcement, and public information and education, have the best potential for increasing seat belt use, reducing under-age drinking and driving and encouraging compliance with posted speed limits and discouraging aggressive driving behavior.

MINORITIES AND RURAL POPULATIONS

Highway safety in America has improved but not uniformly across the country. Minorities, including African Americans and Hispanics, and rural populations are over-represented in highway crash and injury statistics. Rural residents are about 25 percent of the U.S. population, but motor vehicle crashes in rural areas account for 60 percent of all fatalities.

Senator SHELBY. How do you define rural resident? How is that defined?

Ms. MILLMAN. We use the Census definition.

Our fiscal year 2001 budget contains a new initiative, Target Populations, to help NHTSA hone its traffic safety information and education methods to communicate more effectively with these groups.

ADVANCED AIR BAGS

No traffic safety issue during my tenure is likely to receive more public attention than advanced air bags. Since NHTSA announced its November 1996 strategy to improve air bag safety, the agency has conducted investigations, issued safety advisories to the public, researched injury patterns, and consulted with numerous organizations, such as safety advocates and manufacturers. The final rule will greatly benefit from these activities, and we are committed to issuing the rule in accordance with the TEA-21 schedule.

CONCLUSION

Road safety in America has improved greatly since the Federal program began in the 1960's. The fiscal year 2001 budget estimate now before your subcommittee seeks to build on our past successes and develop new knowledge and methods to overcome the remaining obstacles to the highest level of safety.

PREPARED STATEMENT

Thank you, Mr. Chairman, and I would be pleased to answer any questions.

Senator SHELBY. Thank you.

[The statement follows:]

PREPARED STATEMENT OF ROSALYN G. MILLMAN

Mr. Chairman, it is a pleasure to appear before the subcommittee, along with my colleagues, to discuss important transportation safety issues. Testifying together today symbolizes the ONE DOT strategy we follow in working together to improve overall transportation safety. I am especially pleased to have the opportunity to thank the subcommittee for its past support of the National Highway Traffic Safety Administration's (NHTSA) programs and efforts to provide innovative approaches to reducing the number of traffic fatalities and injuries, and the costly human and economic consequences of motor vehicle crashes. I look forward to working closely with the subcommittee in continuing to develop a successful national highway safety program.

HIGHWAY FATALITY TRENDS

Transportation safety is one of this Administration's top priorities as we enter the 21st Century. The mandates of the Transportation Equity Act for the 21st Century (TEA-21) clearly place NHTSA in the forefront of national highway safety leadership in developing and implementing innovative programs. The fiscal year 2001 budget request of \$499.5 million will enable us to meet the greater challenges of this role and to build on our solid record of success. We are witnessing impressive inroads in solving highway-related fatality and injury problems, coming ever closer to our 2008 goal to reduce highway-related fatalities and injuries by 20 percent. Our unflagging leadership has resulted in the lowest highway traffic fatality rate on record, a low of 1.6 fatalities per 100 million vehicle miles traveled. In 1998, traffic injuries were down by 156,000 from 1997. Alcohol-related highway deaths are at a historic low of 38 percent. Seat belt use is at an all-time high of 70 percent. And, Mr. Chairman, from 1975 to 1998, NHTSA programs related to restraint use, motor-

cycle helmet use and underage drinking laws have accounted for 155,000 lives saved.

Yet, much remains to be done. Reaching our 2008 goals requires more creative approaches to on-going and newly identified traffic safety problems, resulting from new technologies, expanding demographics, and changing driving behavioral patterns. To meet these increasing challenges, we plan to more creatively design integrated approaches to traffic safety issues and introduce several innovative programs, developed to address some of the most conspicuous and critical highway safety issues.

CRASH AVOIDANCE

Improving crash avoidance capabilities of motor vehicles is paramount in reducing vehicle-related injuries and deaths. Our Crash Avoidance and Driver Vehicle Performance initiative will study the underlying principles of crash prevention; examine advanced technologies to improve vehicle handling and stability; and conduct laboratory testing to assess vehicle rollover potential, especially that of sport utility and other high center of gravity vehicles. In addition, these crash avoidance activities will address questions concerning driver inattention and distraction; elderly driver safety, mobility, and driving challenges; and the tradeoffs between fitness to drive and mobility.

New technologies such as Automatic Collision Notification (ACN) systems have already been the subject of NHTSA operational field testing, through the Intelligent Vehicle Initiative program. This cross-cutting initiative involves other research programs as well, coordinating our efforts to obtain the best results for our investment. We are proposing to link the Special Crash Investigations program with an industry partner to perform in-depth investigations of crashes involving vehicles with ACN systems. Our program is also developing improved research methods for injury-prediction algorithms to enhance emergency medical system capabilities, thus enhancing ACN system value. We will complete research and development of an easily installed ACN system and evaluate the system cost in relation to its effectiveness in saving lives and in reducing time for rehabilitation and recovery.

HEAVY VEHICLE SAFETY

The Secretary of Transportation has placed a great deal of emphasis on improving heavy truck safety and has set an aggressive goal of reducing the number of truck-related fatalities by 50 percent in 10 years. Meeting this goal will require a concerted, multi-disciplinary effort by many parts of the Department. In support of that goal, NHTSA is proposing several initiatives for research to improve braking performance, use of disc brakes on tractors and trailers, use of adaptive suspensions to counteract incipient rollover and Event Data Recorder (EDR) research to capture information prior to and during crashes. This research will provide us with a clear understanding of crash causation and help to develop suitable countermeasures.

IMPAIRED DRIVING PROGRAMS

Although alcohol-related highway fatality statistics have been notably reduced, dropping to a record low of 38 percent in 1998, more effort is required to reach our goal of 30 percent, or 11,000 by 2005. Our programs propose more aggressive use of NHTSA partnerships and the strategies identified through the Partners in Progress: An Impaired Driving Guide for Action program. Our focus is on developing, testing, and evaluating messages in a new major public education program aimed at the three highest risk groups: 21–34 year-olds; repeat and high blood alcohol content (BAC) offenders; and underage drinkers, including college students. Notable examples are: (1) the fiscal year 1999 five-year campaign, You Drink & Drive. You Lose. program which focuses on re-energizing state and community efforts to deter impaired driving; promoting public information and education; media campaigns; technical program support; new research; and community support; (2) the Drugs, Driving and Youth program, involving judges, prosecutors, and law enforcement, with a new emphasis to include juvenile judges at the community level; and (3) the new fiscal year 2001 initiative, Safe Passages for Youth, targeting teens and youth, using science curriculum, teen courts, peer-to-peer programs, parent and teen outreach, and public service announcements. State and local enforcement agencies will be awarded grants to increase youth compliance with underage drinking, zero tolerance, seat belt use, and speeding/aggressive driving laws.

Innovative research programs are designed to provide direct support in reaching our goals to reduce alcohol-impaired casualties. When the National Advanced Driving Simulator (NADS) becomes operational this summer, we will for the first time, be able to replicate and study the relationship between BAC and the likelihood of

crash involvement under demanding driving conditions without putting drivers at undue risk. The results of these studies will have a profound effect in promoting alcohol and drug safety initiatives, including supporting research findings to strengthen drunk driving legislation and providing compelling educational materials to youth groups.

Our strong support of the Presidential Initiative for Making .08 BAC the National Legal Limit continues, substantiated by studies clearly showing that virtually all drivers are impaired at .08 BAC in such critical driving tasks as braking, steering, inattention, and judgment. Moreover, the risk of being involved in a single vehicle crash increases substantially at the .08 BAC level. The startling findings of one study show this risk is 11 times greater for a driver at the .08 BAC level than for a driver who is sober.

SPEED AND AGGRESSIVE DRIVING

NHTSA is responding to increasing public demand for measures to deter aggressive driving. Judges, prosecutors, attorneys, and law enforcement officers have joined with us to develop a National Action Plan on enforcement strategies, prosecutorial options, and sentencing considerations. Several projects using advanced technologies are underway. The new fiscal year 2001 initiative, Safe Roads America: An Initiative to Reduce High Risk and Aggressive Driving, is part of a ONE DOT intermodal initiative that provides statewide enforcement demonstration grants that target selected high risk driving behaviors, such as unsafe lane changes, red light running, unsafe railroad crossings, and passing school buses. This initiative will be combined with a high profile media and educational campaign, focusing on high crash risk behavior.

AIR BAG INITIATIVES

Since 1986, air bags have saved over 5,000 lives. To meet increasing highway safety challenges, we are committed to improving air bag safety as part of a strong occupant protection program. Air bag issues have crosscutting program implications throughout the agency. As a means to improve air bag effectiveness and safety, we are working toward issuing a final rule on air bag safety by March 1, 2000, the date specified by TEA-21. In response to public concerns, our staff is compiling information received through the Rulemaking process and has met with consumer protection and various traffic safety interest groups, including those from the insurance, automobile, and air bag manufacturing industries, to gain their perspective on this critical safety issue. We have also conducted nearly fifty crash tests of passenger vehicles at our Vehicle Research and Test Center, to research air bag safety issues. The goal of the process is to enhance the benefits and minimize the risks of air bags. In support of air bag initiatives, we will be purchasing a new family of adult and child crash test dummies for use in Vehicle Safety Compliance testing for the enhanced dynamic performance requirements of advanced air bags. These dummies will be used for applying the new injury criteria for occupant protection and developing compliance test procedures.

NHTSA's research program is investing in innovative advanced air bag safety research. The Crashworthiness Safety Systems program will use EDR research to collect air bag deployment data from crash sensing and recording devices installed in crashed vehicles. Likewise, we will conduct research on adaptive air bags and sensing devices that could be used to provide pre-crash information to tailor the inflation level of air bags to provide optimal protection. The Special Crash Investigations program will investigate the performance of new air bag systems as they emerge in crashes. Our National Transportation Biomechanics Research Center is involved in research to address pediatric and small female injury criteria associated with interaction of air bags with out of position occupants, and is accelerating its efforts to understand complex injuries resulting from multi-directional air bag deployment. The National Automotive Sampling System (NASS) is investing in new initiatives which will include data collection on side and frontal advanced air bag performance and automatic air bag shut off systems, providing detailed information on real world crashes. In addition, we are developing expanded programs on air bag education to promote awareness of air bag issues. As with all other aspects of motor vehicle manufacturing, design and performance, the agency will continue to aggressively pursue enforcement actions against those manufacturers whose air bags do not conform to the agency's safety standards or contain a safety-related defect.

SEAT BELTS

This year, 33 states, the District of Columbia, and Puerto Rico qualified for a share of \$54.6 million in incentive grants for increased levels of seat belt use. Much

of the credit for these successes is due to our Buckle-Up America Campaign, an inter-modal undertaking supporting the Presidential Initiative for Increasing Safety Belt Use Nationwide. Emphasis is on enhanced public education programs; high visibility enforcement; building public partnerships; and encouraging states to enact strong occupant protection legislation. We are increasing national support through such programs as the Operation ABC Mobilization: America Buckles-up Children and our partnership with the Air Bag and Seat Belt Safety Campaign.

In support of these programs, NASS is launching a three-year child safety seat study initiative to develop new estimates of the real world effectiveness of child safety seats in reducing and preventing child injuries in crashes. Researchers will monitor police and other emergency frequencies to allow them immediate response to the crash and the opportunity for gathering the highly perishable data on-scene. In addition, our Crashworthiness program is investigating occupant compartment safety improvements, including inflatable seat belt systems, and the National Transportation Biomechanics Research Center is proposing new initiatives for investigating the redesign of restraints to more realistically accommodate the needs of elderly drivers and passengers.

TARGET POPULATIONS

A fiscal year 2001 comprehensive Target Populations initiative will be implemented to develop innovative, culturally and linguistically appropriate materials; conduct culturally relevant media campaigns on occupant safety and impaired driving, and enlist national minority and rural organization partnerships. Our fiscal year 2001 program will continue to focus on those hard to reach African American and Hispanic populations. The program will develop additional creative approaches to include Native American, Asian-Pacific Islanders, and rural populations. Creative approaches to supporting the Secretary's diversity program are expected to bolster data collection, research, and evaluation to determine the reasons for, and develop and evaluate innovative methods to combat the over representation of minority groups in traffic crashes and its casualties. Supporting this initiative, the President has directed special funding toward developing, improving, and implementing traffic safety programs in Indian Country.

CRASHWORTHINESS

We are initiating efforts to improve occupant protection through using advanced vehicle technology to improve vehicle compatibility and develop crash testing methodologies. These efforts will focus on ways to enhance occupant protection through providing vehicle structure and interior compartment design improvements, combined with improved occupant restraint systems. Obtaining the desired results requires research and analysis of real world crash experience; development of crash test procedures that reproduce the crash event; evaluation of the likelihood of injury from crash test measurements; development and evaluation of vehicle countermeasures and their costs; and estimates of safety benefits achieved. The program is actively seeking methods for international harmonization in frontal offset and side impact crashes, vehicle compatibility, intelligent technologies, biomechanics and pedestrian research. Combining research efforts on advanced restraint systems with research on pre-crash radar and other sensing technologies to determine crash severities could be used to tailor air bag deployment to safely cushion vehicle occupants in crashes.

Advanced technology research will be conducted on deployable energy absorbing structures; changing geometries of light trucks and vans (LTVs) through dynamic suspension systems to lower ride height; and advanced materials to minimize weight difference between LTVs and passenger cars. While this research is proceeding, we will continue to conduct extensive compliance testing to assure compliance of existing vehicles with our crashworthiness standards.

NATIONAL TRANSPORTATION BIOMECHANICS RESEARCH CENTER

The National Transportation Biomechanics Research Center continues innovative crash test dummy research development activities. These activities will provide enhanced test devices and support efforts to develop dummies for regulatory purposes. Specific emphasis is on expanding and extending the technology developed for the advanced frontal 50th percentile male dummy to sizes from the 12-month-old child through the 3- and 6-year-old child, to the 5th percentile female and 95th percentile male, to support our crashworthiness programs. We will continue our efforts to simulate the human as realistically as possible in the automotive crash environment in order to mathematically predict occupant-vehicle interaction and the resulting injuries, and how to reduce that potential with automotive restraints and structures.

Study emphasis is placed on high risk anatomy such as the skull, brain, neck, chest, and legs. We plan to actively participate in the International Harmonized Research Agenda efforts to generalize global understanding of biomechanics and to seek a unified technical opinion on dummy technology and crash injury measures and associated injury risk. NHTSA continues to promote university-based impact injury research involving the combined talents of physicians, engineers, and anatomists to develop definitive injury criteria for major body regions that are vulnerable to crashes. We are expanding our Crash Injury Research and Engineering Network (CIREN) to eight trauma centers and are continuing hospital-based, multi-disciplinary, crash injury studies that identify and analyze critical safety issues and accelerate identification of emerging crash safety issues. Additionally, we support efforts to develop and enhance understanding of complex injury mechanisms associated with air bag deployments and the technologies to improve them.

Special emphasis will be placed on crash protection for the elderly. The need for this research has been reinforced by findings from the CIREN program, indicating that crash injuries sustained by the elderly are more severe, lead more often to long hospital stays, and result in higher mortality rates than identical injuries sustained by younger crash victims. Injury threshold levels for protection of various body parts will be developed, and measures to achieve crash protection for those levels will be developed and evaluated, using advanced dummy test devices. This research will allow designers to create restraint systems that distribute loading in ways that enhance safety. The proposed comprehensive research initiative will also result in augmenting biomechanical knowledge of all sizes of the human body.

NATIONAL CENTER FOR STATISTICS AND ANALYSIS

In fiscal year 2001, the National Center for Statistics and Analysis will expand its special crash investigations, especially those involving air bag-related child and adult fatalities. NASS will undertake new initiatives to increase crash investigations of vehicles that incorporate side and frontal advanced air bags, advanced sensing systems, automatic air bag shut-off systems, and automatic crash data collection systems. Research will include light truck aggressivity studies; a 3-year, on-scene, child safety seat study; and new field data collection technologies. We will decrease the time lapse between case investigation and public availability of data. Moreover, we propose to increase crash investigation data quality and completeness, promote improved collection and use of data from on-board crash event data recorders, and continue planning, researching, developing, and testing of new field data collection technology. Data are integral to state and local efforts in improving highway traffic safety. We will continue to expand, obtain, document, and make state crash data files available for analysis. The Fatality Analysis Reporting System (FARS) will broaden information availability through electronic media such as the Internet and CD ROM; link the FARS data with other national data bases and with state data files; and establish electronic links between FARS analysts and their sources, such as hospitals, coroners, medical examiners, and police jurisdictions, to increase the quantity and enhance the quality of drug and alcohol-related information.

NATIONAL ADVANCED DRIVING SIMULATOR (NADS)

The National Advanced Driving Simulator (NADS) is a world-class driving research tool that will provide a safe method for conducting research on driver performance and behavior during precrash events. It allows safe development of effective countermeasures to driver error. NADS is scheduled to be operational this summer. This technology will provide us with a real world view of driving, including driver response in normal and emergency situations, and it will provide essential information on driver reaction and error in driving situations, alcohol- and drug-influenced driving behavior, effects of aging on driving capability, and how roadway designs affect driver performance.

NEW CAR ASSESSMENT PROGRAM (NCAP)

The New Car Assessment Program (NCAP) is dedicated to providing new car buyers with crash test information in an easily understandable format. NHTSA is expanding this program to give the public more meaningful and accessible information on vehicle safety. These initiatives not only involve determining how well a vehicle performs to avoid crashes, but also its performance during a crash. Our plan is to test enough vehicles to be able to provide frontal and side impact information on 80–90 percent of new vehicles. We will also conduct approximately 10–15 tests with the small stature dummy in the driver and passenger seating positions to assess the safety potential of vehicles for the small stature segment of the population. These results will be used to provide information to small stature adults who are at great-

er risk in high speed frontal crashes. To provide more information to consumers to help make informed purchasing decisions, we will also provide stopping distance and headlighting information on an array of NCAP vehicles.

SAFE/LIVABLE COMMUNITIES

The Safe/Livable Communities initiative seeks to improve the quality of community life through integrating enhanced safety, mobility, and access to services into the transportation programs of all modes. Currently, 11 community outreach forums are being conducted across the country. As a follow-up to these Forums, and building upon our experience with over 750 existing community programs, this new initiative will provide coordinated multi-modal technical assistance and materials. NHTSA will catalog all multi-agency community-based initiatives; provide community-based training programs; develop and distribute ONE DOT materials; and expand partnerships to include non-traditional, multi-cultural partners. It will provide the Department with a single-point coordinator for meeting its safety, mobility, and environmental performance goals, including reducing highway-related fatalities; reducing the rate of rail-grade crossing crashes and railway trespass-related injuries; enhancing boat safety; protecting vulnerable groups, such as the disabled, the elderly, and children; reducing traffic congestion; and increasing transit, pedestrian, and bicycle travel.

SAFE MOBILITY FOR AN AGING AMERICA

This is a new research and educational program that directly addresses the nation's rapidly changing driver demographics. It examines an aging driver population; conducts research into crashes involving older drivers; and develops and tests an older driver communications strategy through campaign materials and training. The program focuses on the significant knowledge gaps in developing strategies for creating and providing educational materials. This is a ONE DOT effort, with NHTSA collaborating with FHWA in developing electronically-based training courses for engineers to implement roadway designs that will accommodate older driver's needs. The program will concentrate on researching licensing and regulatory actions, assessment tools, effects and limits of rehabilitation programs, the impact of specific age-related diseases, existing geometric design guidelines, and crash protection for the elderly.

HIGHWAY TRAFFIC SAFETY GRANTS

The Highway Traffic Safety Grants program includes Section 402 State and Community Grants to support performance-based highway safety programs in every state, territory, and the Indian Nations for the purpose of reducing highway crashes, deaths, and injuries. The program supports national priority programs such as encouraging proper use of occupant protection devices, reducing alcohol and drug-impaired driving, reducing motorcycle crashes, and improving emergency medical services and trauma care systems. This program is a major influence in meeting the Secretary's goals of 90 percent safety belt use by 2005 and reducing alcohol-related fatalities to 11,000 by 2005, as well as reducing traffic fatalities and injuries. The Section 405 Occupant Protection and Incentive Grant Program provides grants that will encourage states to pass stronger laws and implement effective measures to increase safety belt and child safety seat use. The Section 2003 (b) Child Passenger Protection Education Grant Program encourages states to implement child passenger protection programs designed to prevent deaths and injuries to children, educate the public and train safety professionals on the proper use of child restraints. The Section 410 Alcohol-Impaired Driving Countermeasures Incentive Grant Program encourages states to pass stronger laws and implement effective measures to reduce safety problems stemming from driving while impaired by alcohol. This supports the Secretary's Partners In Progress Initiative to reduce alcohol-impaired driving fatalities to 11,000 by the year 2005. The Section 411 State Highway Safety Data Improvement Incentive Grant Program encourages states to implement effective programs to improve state data that is needed to identify priorities for national, state, and local highway safety programs, including a traffic records coordinating committee and a strategic plan.

CONCLUSION

Mr. Chairman, we are optimistic about the future impact of our programs, and the dedicated partnerships we have made in promoting safety for all who travel on the nation's highways. Our fiscal year 2001 program reflects our commitment to cre-

ative and innovative strategies for reducing the tragic toll of highway crashes and their related social and economic costs.

STATEMENT OF KELLEY S. COYNER

Senator SHELBY. Ms. Coyner.

Ms. COYNER. Thank you, Chairman Shelby, Senator Lautenberg, and Senator Murray, for the opportunity to appear before your committee to address our key commitment: safety. My name is Kelley Coyner. I am the Administrator of the Research and Special Programs Administration.

RSPA is requesting \$99 million in fiscal year 2001 for our programs which have the key objective of preventing harm to human life and the environment. These activities focus on three principal areas: pipeline safety, hazardous materials safety, and research and technology programs.

We were reminded in the past year of the importance of pipeline safety when a pipeline explosion in Bellingham, Washington resulted in the deaths of three children and changed that small community forever. This incident has given added emphasis to our efforts to create and enforce regulations, to secure the safe operation of pipelines, with a particular emphasis on the four major causes of pipeline failure. We are actively addressing each of these causes: outside force damage, corrosion, human error, and material defects. We have requested a total of \$47 million, more than a 28-percent increase over this year's level for pipeline safety.

In particular, we have requested \$5 million, the amount authorized by Congress in TEA-21, for damage prevention grants. Outside force damage continues to be the leading cause of disruption to pipelines and other underground utilities.

We have a research effort underway to improve internal inspection technology to locate existing mechanical damage and detect this damage as it occurs.

Another leading cause of pipeline failure is corrosion. We have a rulemaking designed to make our current regulations clearer and more effective. Over the course of the next several months, we will publish proposed regulations to strengthen these standards, and we will also require periodic testing of these lines.

To address human error, another cause of pipeline failure, we have begun working with operators individually and in workshops to implement our new operator qualification rule, and we are checking on their progress through our standard inspections.

Finally, to address material defects, we have a research effort underway to analyze plastic pipe performance and the adequacy of our regulations in this area.

For fiscal year 2001, we are also requesting \$23.6 million for pipeline safety grants. This funding is necessary to strengthen our State partners' abilities to carry out their responsibilities to the fullest and to meet the increasing demand for inspection activities and to improve our research and development efforts.

In the United States, more than 3 billion tons of regulated hazardous materials are transported each year, and over 800,000 shipments of hazardous materials are handled daily, a dramatic increase over past levels of transportation in the hazardous materials area.

In order to improve safety and better protect people and the environment, RSPA has published a rule to revise the registration fee structure to support the hazardous materials emergency preparedness grants program. State and local governments use these grants to conduct emergency response planning and training activities to protect communities in the event of a hazardous materials incident. This increased funding, supplied by the registration fee structure, will ensure that a larger segment of the response community will receive critical initial and recurrent training at all levels and will enable them to more effectively protect people and property that could be endangered by accidents involving hazardous materials.

In addition to the pipeline safety programs and the hazardous materials programs, our research and technology program is important to safety as well. This year the Department has requested \$3 million in its budget to allow RSPA to begin a DOT-wide initiative that will allow all modes of transportation to better combat human error caused by fatigue. The goal of this effort will develop the knowledge base, strategy, tools and technologies to forecast and detect fatigue-compromised operators and to proactively manage fatigue. Our goal is to restore alertness and safety and to train operators to recognize and respond to potential hazards in this area.

PREPARED STATEMENT

President Clinton and Secretary Slater have made transportation safety their highest priority, and RSPA is committed to protecting and increasing the safety of people and the environment in relation to our areas of responsibility. By working together with State partners, industry, local communities, emergency responders, and the technology community, we can continue to make our Nation's communities safe and liveable.

Thank you, and I would be pleased to answer any questions you may have.

Senator SHELBY. Thank you.
[The statement follows:]

PREPARED STATEMENT OF KELLEY S. COYNER

Good morning Mr. Chairman and members of the subcommittee. My name is Kelley Coyner, and I am the Administrator for the Research and Special Programs Administration (RSPA). I appreciate the opportunity to speak to the Subcommittee on our efforts to address our number one-priority—safety.

To support our enhanced programs and new initiatives RSPA is requesting \$99 million in fiscal year 2001, an increase of \$16 million over fiscal year 2000. These investments are necessary to protect lives, to create a well-educated population and workforce, and to strengthen partnerships among government, industry and academia to meet our challenges today and our goals for the future.

As communities have expanded and populations have grown, so has the risk of transportation-related incidents. To combat this risk, last year, the Vice President launched a new effort to make communities more livable. We have been especially challenged with keeping our communities and families safe from the unintentional release of hazardous materials from pipelines and other modes of transportation and directing the safe transportation of relief efforts into areas struck by natural disasters.

PIPELINE SAFETY

The challenge of maintaining the safety of pipelines grows each day as our nation's economic prosperity increases and an increase in new construction in our communities brings pipelines and people closer together. There are four major causes of pipeline failure, and we are actively addressing each of them: (1) outside force

damage, (2) corrosion, (3) human error, and (4) material defects. We have underway important initiatives to protect people and the environment and, in the event of a failure, accelerate response to minimize damage. We have requested a total of \$47 million, more than 28 percent above this year's level, for the pipeline safety program.

OUTSIDE FORCE DAMAGE

Most American's homes are connected to the vast underground web of pipes and wires. State-based one-call systems, which enable contractors to obtain information about where pipelines exist and avoid them while digging or excavating, have been effective in avoiding outside force damage. However, this damage continues to be the leading cause of disruption of pipelines and other underground utilities.

The Secretary has challenged RSPA, the private sector and local communities to collectively reduce excavation-related pipeline incidents by 25 percent over the next three years. To reach this goal, we have received \$1 million in fiscal year 2000 and requested \$5 million in fiscal year 2001, the amount authorized by Congress in the Transportation Equity Act of the 21st Century (TEA-21), for damage prevention grants. We have a research effort underway to improve internal pipeline inspection technology to locate existing mechanical damage and to detect this damage as it occurs. We also are requiring pipeline companies to have public education programs in place to ensure that people are aware of the pipelines in their communities and have information about pipeline companies' safety records. We also are identifying what should be included in these communications plans and assessing their effectiveness.

PREVENTING CORROSION

The other leading cause of pipeline failure is corrosion. While statistical analyses indicate the rate of incidents may be beginning to decline, we think the record warrants attention and indicates reasons to improve our corrosion control standards. We are especially interested in evaluating the best long-term corrosion control measures to determine if there are better means of further reducing corrosion. We have begun a rulemaking designed to make our current regulations clearer, more effective, and compatible with new technology.

ADDRESSING HUMAN ERROR

A qualified workforce will help reduce the likelihood and consequence of incidents caused by human error—another important and preventable cause of pipeline failure. Last year we published a comprehensive rule requiring pipeline operators to develop and maintain a written qualification program that assesses the ability of each worker. We have begun working with operators individually and in workshops to implement our new operator qualification rule, and we are checking on their progress during our standard inspections.

Considering material defects

The last of the four leading causes of pipeline failure is material defects. We plan to continue to investigate pipe strength for opportunities to learn and improve in this area. On gas distribution systems, we will focus on the strength of the plastic pipe, which could be susceptible to fractures as it ages. We have a research effort underway to analyze plastic pipe performance and the adequacy of our regulations in this area.

State safety grants

We oversee and share responsibility with state governments to protect more than 2 million miles of pipelines. For fiscal year 2001 we are requesting \$17.6 million for State Safety Grants. This \$4.5 million increase over fiscal year 2000, is necessary to strengthen our state pipeline safety partner's abilities to fully carry out their responsibilities to meet the increasing demands for inspection activities. This amount does not include \$5 million for damage prevention grants.

More than 75 percent of incidents involving fatalities occur in densely populated areas on intrastate distribution pipelines. Because of this, the oversight activities at the state level have become of critical importance. To assist states we are requesting a 50 percent increase in funding to provide for additional inspection activities. We support the states through a wide variety of actions such as pipeline safety grants, regulatory training, and funding to facilitate their participation in RSPA initiatives.

We have taken aggressive strides to address the causes of pipeline failure through regulatory action, investigation of new technology, and improved state programs. We have forged partnerships with local, state and federal agencies, public interest and environmental organizations to help share responsibility for pipeline safety. By working together, we can make it easier for people to live safely with the pipelines in their communities.

HAZARDOUS MATERIALS

In the United States, more than 3 billion tons of regulated hazardous materials are transported each year, and over 800,000 shipments of hazardous materials are handled daily. RSPA's Office of Hazardous Materials Safety has built a hazardous materials safety program that protects the public through strong safety standards, ensures that people know how to comply with those standards, and responds through strong enforcement to curtail illegal shipments and activities. In order to improve safety and better protect people and the environment, RSPA is committed to working with all segments of the hazardous materials community, including state and local officials and the public.

To do this, RSPA has published a rule to revise the registration program fee structure to support the Hazardous Materials Emergency Preparedness grants program. State and local governments use these grants to enhance emergency response planning and training activities to protect communities in the event of a hazardous materials incident.

The increased funding supplied by the registration program fee structure will ensure that a larger segment of the response community will receive critical initial and recurrent training at all levels and will enable them to more effectively protect people and property that could be endangered by accidents involving hazardous materials.

RESEARCH—HUMAN ERROR: FATIGUE

The Department has requested \$3 million in its fiscal year 2001 budget to provide continuing support of a One DOT initiative that will allow all modes of transportation to address two critical areas to combat human error. The first is to focus on developing and implementing technologies and methods for Operator Fatigue Management (OFM). The second is to develop and implement Advanced Instructional Technology (AIT) for operators with a special focus on recognizing and responding to imminent crash threats. This new DOT initiative will develop the knowledge base, strategies, tools and technologies to forecast and detect fatigue-compromised operators and to proactively manage fatigue to restore alertness and safety and train operators to recognize and respond to potential incidents.

CONCLUSION

President Clinton's and Secretary Slater's highest transportation priority is safety, and RSPA is committed to protecting and increasing the safety of people, property and the environment with regard to transportation. By working together with our state partners, our stakeholders, and local communities, we can continue to make our nation's communities safe and livable.

Thank you, and I am pleased to answer any questions you might have.

STATEMENT OF JOLENE M. MOLITORIS

Senator SHELBY. Ms. Molitoris.

Ms. MOLITORIS. Thank you, Mr. Chairman, Senator Murray.

I am very pleased to be here this morning, Mr. Chairman, because your support of our budgets in the past has contributed to an increase in rail safety that is really unprecedented. We can continue to increase the saving of lives and reducing of injuries with your support.

SAFETY STATISTICS

If you look at the chart, you will see the numbers really speak for themselves. Since 1993, injuries and deaths of employees have been reduced 43 percent. The train accident rate is down 9 percent; crossing collisions are down 27 percent; fatalities are down 34 per-

cent; injuries are down 22 percent. These are dramatic, and have occurred while ton-miles are up 17 percent during the same period.

The real reason that this has happened is because people have been working together in partnerships in new ways with Operation Lifesaver, with rail labor and management and many other groups. It is the partnerships that are making it work. But if we have one death or one injury, it is too much, and so we have much more to do.

Our written statement gives you a lot of information about many of our safety programs, positive train control, fatigue mitigation, train switching accidents—which actually account for 45 percent of the fatalities of employees—many, many rulemakings, and our effort to enhance the safety culture on railroads.

Today I am going to focus on crossing safety and other safety initiatives, grade crossing and trespasser issues in particular.

In 1999, crossing collisions and fatalities went down by 7 percent and trespasser fatalities went down by 14 percent. These preventable tragedies still represent 96 percent of the fatalities in the railroad industry. Overall, between 1993 and 1999, the reduction has been 30 percent, significant but just not enough.

GRADE CROSSING SAFETY MANAGERS

One of the things that this committee did in approving our budget some years ago was to establish grade crossing safety managers, which has been tremendously effective. For example, in the 5-year period after their establishment, fatalities decreased 31 percent at grade crossings. So, their work is a very, very important threshold and it is very good. They focus on engineering, enforcement, and awareness programs. Our big partners in awareness and education are Operation Lifesaver and the railroads themselves.

OPERATION LIFESAVER

A few of the highlights of our work with Operation Lifesaver might be interesting to you. For example, next month FRA will be releasing a videotape to truckers focusing on crossings and what they need to do to maintain their own safety and the safety of others.

Senator Murray, in partnership with Washington State Operation Lifesaver and Operation Lifesaver, Inc., FRA developed a law enforcement roll call video to encourage enforcement of State laws on crossings, and 1,000 of these have been distributed to enforcement agencies.

In the West, we partnered with Operation Lifesaver committees from Arizona, New Mexico, and Utah to develop crossing protection prevention programs with Native American communities.

Just this past winter in Pennsylvania, at the Pennsylvania Farm Show, FRA unveiled a field-to-field grade crossing safety program focused on farm crossings. These private crossings can be very dangerous.

We worked very hard with NHTSA, the Federal Highway Administration, and Operation Lifesaver on 70,000 trucker alerts. New public service announcements also will be aired this spring. We have reached about 3 million people directly through our media

advisories, including 60,000 school bus drivers and our PSA's are heard by millions. But there is much more to do.

LOCOMOTIVE HORN RULING

One more very highly visible event occurred recently. FRA, at the mandate of Congress, released a proposed rule on the sounding of horns at crossings. We think this rule can be a win-win rule because it can increase safety, and still provide ways to maintain quiet zones that many communities want. FRA is holding eight public hearings around the country and a long comment period which will end May 26. So, we think it is an opportunity for the citizens to get the answers that they need.

It was interesting, because I had an opportunity recently to speak at the National Conference of Mayors. The mayors are really worried about this, and I am sure you have had a lot of discussion even in your area. We were able to explain what the rule says, let them know it is not going to happen overnight, and let them know we are going to work with them to find the funding in existing sources, and to help them get the job done.

That sums up what we do. Safety is our first and most important job.

PREPARED STATEMENT

I appreciate the opportunity to discuss these things today and to answer your further questions and these of the committee.

[The statement follows:]

PREPARED STATEMENT OF JOLENE M. MOLITORIS

Mr. Chairman and Members of the Committee, I am pleased to appear before you today with my Department of Transportation (DOT) colleagues to discuss surface transportation safety programs, starting with our primary responsibility for railroad safety. During the past seven years, we have participated in an evolution in railroad safety that is unprecedented in the history of this industry. Last month, President Clinton said that the State of the Union is the best in history. In a similar vein, I can say that this industry has a safety achievement record that is better than ever before. This achievement can be credited to the formation of partnerships within DOT, between the Federal and State governments, and between FRA and stakeholders within the railroad industry, such as labor organizations, railroads, and suppliers.

For example, from 1993 to October of last year, rail-related fatality rate was down 38 percent, and injury rates declined 49 percent. The train-related accident rate is down 11 percent for the same period of time. Highway-rail crossing incidents were down 37 percent from 1993—a dramatic improvement. Yet, we know we can do much better, working toward our ultimate goal of zero fatalities and zero injuries. With continued participation from all of our partners and the continued support of the Congress, we will continue to make measurable progress toward reaching our goal. (Attached to this presentation is a table showing our future goals under the Government Performance and Results Act of 1993.)

We believe that continued strong investment in our safety programs can produce even more dramatic results. The President's Budget for fiscal year 2001 requests \$103 million for safety and operations, up more than 9 percent from the fiscal year 2000. This funding will support ten additional safety-field positions, outreach programs for grade crossing and fatigue countermeasures, program evaluations on Safety projects and other projects that will enhance Safety regulatory and enforcement work and the collection and dissemination of Safety data. We have also requested 19 percent increase in research and development (to \$27 million), 95 percent of which is directed at improvements in safety.

Major priorities for FRA over the balance of this year and next include—

—Working with Operation Lifesaver, Inc. to launch a new crossing safety public awareness campaign;

- Finalizing and implementing a Trespass Prevention Action Plan;
- Completing the locomotive horn rulemaking;
- Finalizing the Freight Power Brake rule;
- Hastening the implementation of Positive Train Control Systems by issuing flexible performance standards for new technology and by advancing the National Joint PTC Program; and
- Working with railroads and employee organizations, through the Safety Assurance and Compliance Program on each railroad, to implement system-wide safety procedures that will prevent employee fatalities involved in switching operations.

GRADE CROSSING SAFETY AND TRESPASS PREVENTION

In recent years, approximately 95 percent of all rail-related fatalities have resulted from highway-rail grade crossing collisions and illegal trespassing. So I want to open this morning by providing you with an overview of the ongoing education, engineering and enforcement activities the Federal Railroad Administration (FRA) is undertaking to improve crossing safety, working in concert with other DOT agencies, States, local communities, and the private sector. This work goes hand-in-glove with our efforts to prevent trespassing on railroad rights-of-way. (Attached is a table showing the status of each of the initiatives under DOT's 1994 multi-modal Rail-Highway Crossing Safety Action Plan.)

Education and Awareness.—In order to drive down risk at crossings, we must raise awareness of that risk among drivers and pedestrians. FRA is a founding sponsor of Operation Lifesaver, Inc. (OLI), and we maintain a strong involvement in OLI outreach efforts nationwide. (FRA's budget request for fiscal year 2001 includes \$600,000 for OLI.)

Early in this Administration, we recognized that the traditional, targeted outreach that Operation Lifesaver had made so effective needed to be supplemented through the mass media. FRA's "Always Expect A Train" public education campaign has sought to raise awareness about the deadly consequences of trying to beat a train to a crossing or trespassing on railroad property. This campaign reached citizens in all 50 States via more than 270 television and cable markets, 673 radio markets and 200 publications. Recognizing the merits of mass media strategies, OLI reinforced this message with a hard-hitting series of messages under the theme "Highways or Dieways."

FRA and OLI recognize that these efforts are due for renewal, and we need to ensure that our message is efficiently and effectively delivered. We are currently working closely with Operation Lifesaver to develop new public service announcements which will be introduced this spring. Our budget request includes an additional \$500,000 to take this important message into the homes of more Americans through a unified approach.

We must also reach specific audiences that play key roles in crossing safety. In the aftermath of the tragic collision between a school bus and a commuter train at a crossing in Fox River Grove, Illinois in October 1995, FRA, our "ONEDOT" partners, and Operation Lifesaver have developed a school bus driver training education program called The Responsibility is Ours. The program was distributed during 1997 to all State departments of education and transportation. This program is continually monitored and updated. In 1999, FRA developed a School Bus Driver Safety Alert for distribution directly to bus drivers themselves. In the same spirit, working with the Federal Highway Administration (FHWA), we issued a Commercial Truck Driver Safety Alert. Both alerts are available on FRA's website (<http://www.fra.dot.gov>). We are also working with Operation Lifesaver to develop and distribute in the next few months a video intended to raise awareness about crossing safety within the motor carrier community.

Enforcement.—Crossing safety and the success of passenger and freight rail service are directly related. Collisions at Portage, Indiana and Bourbonnais, Illinois, dramatically brought home the exposure of train crews and passengers to the tragic consequences of train collisions with large motor vehicles. The Department of Transportation is working across a broad front to address this need. For example, the FHWA recently issued a regulation that would penalize commercial drivers who disobey crossing warning devices. Of course, the FHWA rule will be effective only if State and local governments follow through with needed enforcement. That is why FRA is devoting significant resources to elevate crossing enforcement on the agenda of law enforcement agencies through training programs and direct contacts with law enforcement officers.

Engineering.—Since 1974, the "section 130" program has funded safety improvements at highway-rail crossings, including the installation of automated warning de-

vices. This effort has been crucial to our success in reducing crossing deaths. Nevertheless, a majority of crossings continue to have only passive signs such as the basic "crossbuck."

By closing redundant and inherently unsafe crossings, we can reserve section 130 funds for improvements at the crossings that remain. In 1991, FRA established a goal to close 25 percent of the Nation's crossings by 2004. By the end of 1999, a total of 35,123, or 12 percent of all public and private highway-rail grade crossings had been closed by States and localities in cooperation with the railroads. This effort must be continued as we seek corridor-based solutions to the crossing challenge. FRA and FHWA continue to work with State and local community officials to raise awareness that the safest and most efficient way to reduce crossing collisions is to eliminate or consolidate highway-rail crossings. One successful example of this initiative entailed FRA and FHWA partnering with the Western Governors' Association to improve rail safety throughout Western communities by working to eliminate redundant crossings. FRA provided crucial information for development of a reference guide on traffic safety and transportation efficiency that is used by local communities in the western United States.

The future of engineering improvements at highway-rail crossings will be what we make it. DOT agencies sponsored a wide range of demonstration programs during the 1990's indicating that safer crossings can be achieved by using tools that are well proven and currently at our disposal. For instance, the State of North Carolina and the Norfolk Southern Railway, supported by FRA's high-speed rail program funding provided by this Subcommittee, developed the "sealed corridor" initiative to take crossing safety beyond conventional flashing lights and gates. Now is the time to apply lessons learned on a larger scale.

Working with the Office of the Secretary of Transportation, the FHWA, the Federal Transit Administration (FTA), and the National Highway Traffic Safety Administration (NHTSA), FRA has contributed to the establishment of the DOT Leadership Conference Technical Working Group, which now includes participation by the new Motor Carrier Safety Administration (FMCSA). This broad-based intermodal group is examining, from the ground up, what we need to do to take crossing safety to the next level by taking a risk-based approach and using the new tools at our disposal.

Congress has certainly recognized the importance of identifying and prioritizing the risks at grade crossings. Last year, the appropriations committees instructed FRA to identify the ten most hazardous crossings in each state; that project should be completed by this summer. We fully support Congress's intention and believe that risk identification and prioritization should become institutionalized in the crossing safety program. FRA has developed the analytical tools to do the job, but we lack the necessary data collection capacity. A provision in our rail safety bill would remedy that situation by requiring States and railroads to periodically update their grade crossing inventory so that crossing safety funds may be targeted first and foremost at the most dangerous crossings.

Looking ahead still further, FRA has initiated the process of developing standards for Intelligent Transportation Systems (ITS) at grade crossings. Working with the ITS Joint Program Office, we are sponsoring the development of a strategic plan and standards for the ITS Highway-Rail Intersection User Service. Coupled with emerging Positive Train Control Systems, ITS technologies at crossings and in vehicles will one day support dramatic improvements in crossing safety, as well as enhanced traffic management in communities with heavy motor vehicle and train traffic.

Railroad trespassing is especially problematic because too many people do not understand that it is not only dangerous, but illegal since railroad property is private property. Preliminary data indicate that, again in 1999, over 50 percent of all rail-related deaths involved trespassing on railroad property. We know that railroad police cannot deal with this situation on their own. In an effort to increase enforcement of existing laws and encourage adoption of more stringent trespass laws, the FRA developed and disseminated model State trespass and vandalism prevention legislation in 1997 to all 50 governors and State secretaries of transportation, law enforcement agencies and transportation-related associations. Currently, only one State, Iowa, has enacted the model law, but public education efforts promise an increasing awareness of the need for effective enforcement. During the current year, we will work with our DOT partners to finalize a new Trespass Prevention Action Plan. While Federal involvement alone cannot solve this problem, the growing casualties from railroad trespassing will not be reduced if we fail to provide national leadership.

RULEMAKING FOR CROSSING SAFETY

Over the past several years, FRA has put in place requirements for inspection and testing of automated warning devices at crossings and has mandated alerting lights—often called “ditch lights”—to make trains more conspicuous. Within the next few months, we will complete a preliminary cost-benefit analysis and decide whether to propose reflectorization of rail rolling stock to deal with a small, but unusual set of nighttime crashes where motor vehicles actually run into the sides of long trains.

Another significant safety action is our pending proposed rule to require Use of Locomotive Horns at Highway-Rail Crossings. This proposal is mandated by 1994 legislation, which was reconsidered and amended by the Congress in 1996. It is supported by FRA research that shows collisions increase by 62 percent at crossings with flashing lights and gates when train horns are silenced by local “whistle bans.” (Very significant effects were also found at crossings with only flashing lights or with only passive signs such as “crossbucks.”)

The proposal is controversial due to the potential noise impacts in the more than 275 communities across the Nation that have local whistle bans and because it follows the dictates of the law by placing the burden of implementing alternatives to the locomotive horn on local traffic control authorities or law enforcement authorities. (The law contains no authorization for Federal funding.)

After extensive outreach and study during the period 1995–1999, we have tried to fashion a proposal that provides the most flexible menu of options to communities that wish to establish “quiet zones” by compensating for the loss of the train horn. Presently, our regional grade crossing managers are conducting additional outreach sessions to explain the proposal and encourage comments. There are pages on FRA’s web site to provide an in-depth background on this issue. In general, we find that the better the proposal is understood, the more receptive communities are to pursuing a reasoned dialogue on the subject; and we are convinced that we will have a better final rule if we all approach the challenge with that attitude.

FRA will be holding eight public hearings on this proposal, starting with a Washington hearing on March 6. The public comment period will be open through May 26. As this process goes forward, we are committed to working in partnership with communities to advance safety and freedom from excessive train horn noise.

OTHER SAFETY RULEMAKING AND TECHNOLOGY DEVELOPMENT

FRA’s rulemaking program and related technology development activities rely heavily on active and broad-based partnerships. It is hard to believe that FRA’s Railroad Safety Advisory Committee (RSAC) is less than four years old, given that we have done so much through the collaborative rulemaking process. The RSAC has given us revised Track Safety Standards, Railroad Communications rules, Locomotive Engineer Certification procedures and Steam Locomotive Safety Standards. In addition, Roadway Worker Protection rules, Passenger Equipment Safety Standards, and Passenger Train Emergency Preparedness requirements, were all developed through heavy reliance on a similar collaborative process. I am particularly pleased that our work in support of passenger safety has prompted the American Public Transit Association to develop detailed passenger safety standards to help implement and to complement the Federal rules. FRA will be working with its partners to launch a second phase of passenger rulemaking this year, incorporating the lessons from ongoing research and testing, including results of the full-scale crash testing program that is now underway at the Transportation Technology Center near Pueblo, Colorado.

This past September, the RSAC issued a landmark report, Implementation of Positive Train Control Systems, which points the way toward advances in collision avoidance, speed control and more secure protection of roadway workers. In addition, the North American Joint Positive Train Control (PTC) Project is well underway. The project team has just issued a Request for Proposals for a system developer and integrator with proposals due March 24th. This project must succeed if we are to bring about greater safety improvements in the railroad industry in this new century.

Let’s remember that PTC has the potential to greatly increase not only the safety of railroad operations, but service, efficiency and long-term business performance as well. Railroads and their suppliers are working toward more effective traffic planning, but precise and secure execution of those plans will likely require implementation of new train control technology. Moving increasing passenger and freight traffic on the same rail network safely and on time will require train control systems that are highly capable. As the North American PTC project develops the technology, the RSAC PTC Working Group is developing proposed safety standards for train control systems that will be performance-based and flexible.

Meanwhile, FRA is working with the United States Coast Guard, FHWA, and FTA on the deployment of Nationwide Differential GPS. We are requesting \$18.7 million through the FHWA research and development account for this program. This highly accurate augmentation to the Global Positioning System will support our PTC initiatives as well as providing greater safety on highways and transit systems. This is part of a comprehensive set of DOT requests in support of modernization and augmentation of GPS, which will improve both the safety and the efficiency of transportation systems.

The Administration directed the DOT to serve as the lead agency within the U.S. Government for all Federal Civil GPS matters. In support of this important role, GPS is ranked as the Department's second most important "Flagship" initiative. We have other important rulemakings still pending before RSAC. We are in the home stretch on proposed rules for an enhanced Locomotive Crashworthiness standard and improved Cab Sanitation. Additional proposals RSAC is working on will address Cab Noise Exposure, Next-Generation Locomotive Event Recorders, and Roadway Maintenance Machines; and we will have a final rule amendment shortly on use of Gage Restraint Measurement Systems to evaluate railroad tie conditions.

Not every cooperative venture has a happy ending, of course. FRA will be issuing a final rule on Freight Power Brakes this year without the benefit of an RSAC consensus, but with a better understanding of the issue than would have been possible without collaboration.

Safety Assurance and Compliance Partnerships

The success of our rulemaking efforts can be attributed to the willingness of the participants to listen to each other, set aside traditional differences, and act in the collective interest of safety.

This same approach is necessary for our other safety work, as well. The Safety Assurance and Compliance Program (SACP) targets the root causes of systemic safety problems, thereby utilizing our limited inspector resources to their greatest advantage. Bringing together labor and management not only enhances communication and helps leverage our compliance resources, but also opens the door to more fundamental changes in the safety culture of the railroads.

Over the past two years, in particular, we have begun to see a thaw in the rigid culture of punitive discipline, mutual distrust and limited communication that stood as a barrier to further safety improvements in the railroad industry. Modest experiments in cooperation have led to bolder action, and new possibilities have emerged, both on individual railroad properties and at the national level.

One of the fruits of this new-found confidence is the report of our joint task force on Switching Operations Fatality Analysis or "SOFA," which was presented by labor, carrier, and FRA representatives at the RSAC meeting of January 28. Railroad classification yards and switching operations are the most deadly working environment for railroad workers. Most of the solutions to this involve common sense, not high technology. The SOFA group has examined the underlying causes of these preventable accidents and has agreed on several steps that employees and railroads can take to reduce this loss of life. We want the railroads to send employees home uninjured each day to their families. When I hear of rail workers being impaled between two cars, I am angry and sad. I don't enjoy writing sympathy letters—they are so dreadfully inadequate. It is also disheartening to me that every death or injury that has occurred during the last 7 years has occurred on my watch. All of us at FRA feel the same sense of loss each time a rail-related casualty occurs.

Last month, I spoke before the North American Rail Alertness Partnership (NARAP). Within the DOT, the Secretary has identified fatigue countermeasures as a ONEDOT Flagship Initiative. The railroad industry is already leading the way for its employees and serves as the model for the other surface transportation modes to follow in this important safety area. Our proposed safety reauthorization legislation would seek to ensure that comprehensive fatigue management plans are in place on every major railroad. Our budget request includes \$300,000 to help implement, evaluate and disseminate information concerning fatigue management strategies.

To build on these gains, our safety reauthorization bill seeks Congressional endorsement of this cooperative approach for an improved safety culture in the railroad industry. We request Congressional acknowledgment of efforts in that direction, especially with regard to the use of alternatives to formal discipline in appropriate cases, on certain leading railroads. For those railroad employees who are still not fortunate enough to work in a positive safety culture, our legislation proposes to strengthen existing whistle blower protections in order to deter future discrimination. Enactment of these provisions will foster the trust that has developed and help it grow.

FUTURE CHALLENGES

Light rail.—In past years, it was often possible to establish new light rail service to relieve urban congestion by using abandoned rail rights-of-way. Today, a much leaner and very active freight railroad industry is heavily utilizing its main lines, and still seeking to provide freight service to customers located on secondary lines. The result is heavy pressure for intermingling of light rail and conventional rail service, or for use of existing rail rights-of-way for parallel light rail and conventional rail service. The Transportation Equity Act for the 21st Century (TEA-21) has spawned a significant number of new starts for which shared use of track or construction in a common corridor is attractive or even essential if public transportation needs are to be met at an affordable cost. The FTA and FRA have recognized this issue and have issued a proposed Joint Policy Statement focusing on shared use of track. The most important safety issues related to shared use include: (1) the potential for a catastrophic collision between light rail and conventional equipment; (2) shared use of highway-rail grade crossings and infrastructure and (3) employee safety. The proposed policy seeks to promote time-separated operations, apply FRA regulations only as necessary to address common hazards, and defer to FTA's new State Safety Oversight program with respect to strictly light rail aspects of the operation. Meanwhile, FRA and FTA are coordinating at the regional level to evaluate safety challenges associated with parallel operations in the same corridor, including detection of freight-related hazards and adequate provision for highway-rail crossing safety.

Intermodal safety.—The intermodal dimensions of transportation continue to grow with every passing year. To meet these challenges, FRA works closely with the Research and Special Programs Administration and the U.S. Coast Guard, among other agencies, to ensure that hazardous materials are properly packaged and documented for transportation. Increasingly, we are becoming aware that we can be more effective in addressing public safety needs across a broad front by partnering with NHTSA, the FHWA, FMCSA, FTA, and many industry and advocacy organizations in promoting crossing safety and trespass prevention. FRA's participation in promoting the "Safe Communities," "Buckle-Up America," "Moving Kids Safely," "Garret A. Morgan Transportation Futures Program," "Aggressive Driving Team" and other DOT initiatives gives us access to new audiences while allowing us to contribute to the Department's larger mission. As the past chair of the DOT Safety Council, I am an enthusiastic supporter of "ONEDOT" efforts that seek to instill the message of safety in our communities.

Spent fuel.—To meet the needs of the future, our partnerships will need to be inter- as well as intra-departmental. The Department of Energy (DOE) and the Nuclear Regulatory Commission are anticipating a large increase in the rail transportation of High-level Radioactive Waste (HLRW) and Spent Nuclear Fuel (SNF) to long-term storage facilities. Nearly 90 percent of these shipments are intended to move by rail. Spent nuclear fuel rail shipments have doubled in just the last few years from 20 to 40 shipments per year. This figure will climb to over 400 once long-term or interim nuclear fuel storage sites are established, which could occur in the next several years. To accommodate these important national and international goals, FRA will help ensure the safe transportation of nuclear hazardous materials by positioning specialized teams of inspectors that will oversee every nuclear material train movement from beginning to end and conduct a detailed, comprehensive inspection of the track, signal and grade crossing systems. (Attached to this presentation is a table outlining projected movements of HLRW and SNF.)

During the last decade of the 20th Century, we began to find new ways of achieving progress through partnerships. As we stand at the threshold of a new century, we need continued commitment, courage and hard work from our partners to keep this process moving forward. The only way we can continue this momentum is to continue talking at the table and putting our agreements to work through partnerships within DOT, with States and local communities, and with all parts of the transportation industry. I appreciate very much the support of this Subcommittee for our efforts, and we promise you that we will do everything we can to utilize the resources you provide to FRA to achieve the maximum safety impact.

SAFETY PERFORMANCE GOALS

| | Calendar year | | | | | | | |
|--|------------------------|-------------------------------------|----------------------|-------------------------------------|----------------------|----------------------|----------------------|----------------------|
| | 1998 rate actual | 1998 rate actual ¹ | 1999 rate goal | 1999 rate actual ² | 2000 rate goal | 2001 rate goal | 2002 rate goal | 2003 rate goal |
| Rail-related fatalities rate | 2.08 | 1.48 | 1.38 | 1.30 | 1.30 | 1.23 | 1.16 | 1.10 |
| Rail-related injuries rate | 31.14 | 16.78 | 14.40 | 15.99 | 12.90 | 11.60 | 10.40 | 9.38 |
| Grade crossing accidents rate | 3.47 | 1.98 | 1.77 | 2.00 | 1.57 | 1.39 | 1.23 | 1.09 |
| Train accidents rate (including grade- crossings) | 4.25 | 3.77 | 3.47 | 3.79 | 3.38 | 3.29 | 3.21 | 3.12 |
| Hazardous-materials releases rate | 16.70 | 11.90 | 11.30 | (³) | 10.70 | 10.20 | 9.64 | 9.14 |

¹1998 was used as the base year for developing goals for years 1999-2003.

²1999 data are preliminary and cover the period January-October 1999.

³Data is not available at this time.

STATUS OF RAIL-HIGHWAY CROSSING SAFETY ACTION PLAN SUPPORT PROPOSALS

The Rail-Highway Crossing Safety Action Plan was issued by the Department of Transportation in June, 1994. The Action Plan contains 55 specific items concerning enforcement, engineering, education, research, promotional and legislative actions that can be taken to improve highway- rail grade crossing safety. The following is an update on each of the 55 items detailed in the Action Plan.

Increased Enforcement of Traffic Laws at Crossings:

1. *Section 402 Funds.*—NHTSA and FHWA continue to promote state funding for targeted public education, and law enforcement initiatives. In fiscal year 1999, 13 states dedicated \$523,500 towards these efforts. Status: Ongoing

2. *Law Enforcement Liaison Program.*—The FRA employs a full-time law enforcement liaison (currently the 5th officer to work at the FRA) who conducts extensive outreach activities to both the law enforcement and judicial communities. Regional programs are being established in which eight additional Officers will work part-time with FRA across the nation. In coordination with Operation Lifesaver, FRA has distributed over 1000 copies of a new professional education video entitled "Roll Call" to law enforcement entities across the U.S. Status: Ongoing.

3. *Outreach to Judiciary.*—Articles have been published in the National Traffic Law Center (NTLC) newsletter. Outreach presentation has been made to Traffic Court Judges Seminar. FRA has published and distributed the "Partnering in Safety: Judicial Outreach" brochure. Status: Ongoing

4. *Rules of Evidence.*—TRB researched state laws and published the article, "Photographic Traffic Law Enforcement," in the December 1996 National Cooperative Highway Research Program (NCHRP) Legal Research Digest. Status: Complete.

5. *Commercial Driver's License.*—FHWA and the American Association of Motor Vehicle Administrators (AAMVA) sought to elevate crossing violations to "serious" for commercial drivers license (CDL) holders as required by 1995 legislation. The Final Rule was issued on September 2, 1999. Status: Complete.

6. *Compilation of State Laws and Regulations on Highway-Rail Crossing.*—The second edition (published in August 1995) has been updated and will be published in early 2000. The greatly expanded new edition will be available on the FRA website. Status: In progress.

7. *Safety Inquiry.*—The FRA will hold an informal safety inquiry about standing rail equipment near grade crossings. Inspection, testing and maintenance (ITM) regulations prescribed best practices where signals exist. Status: In progress.

Rail Corridor Crossing Safety Improvement Reviews:

8. *Principal Railroad Lines (PRLs).*—FRA defined a national system of principal rail lines, developed maps and encouraged reviews of PRLs. Status: Complete.

9. *The National Highway System (NHS).*—FHWA has encouraged states to include upgrades or elimination of crossings on the NHS in their state planning processes. The OST Strategic Assessment Plan includes "continued safety improvements." Status: Ongoing.

10. *Upgrade Signing and Marking.*—FHWA has sought to improve conspicuity of signs and markings at crossings. FHWA issued a memo in December 1994 to encourage use of higher-quality material. Status: Ongoing.

11. *Responsibilities for Selection and Installation.*—FRA and FHWA have sought to clarify project responsibilities between highway and railroad authorities. Regulatory action was terminated in August 1997. DOT Committee is considering standardized national guidelines. Status: In progress.

12. *STOP Signs*.—FHWA and FRA have sought to promote STOP signs as a traffic control device alternative as detailed in July 1993 memo issued to FRA and FHWA field offices. An NTSB recommendation has been issued. Status: Ongoing.

13. *Incentives for Crossing Consolidation- Cash Payments*.—Under legislation requested by DOT, direct cash payments of STP funds are available to communities for crossing closures. Status: Complete.

14. *Incentives for Crossing Consolidation- Eligibility for 100 Percent Federal Funding*.—Under legislation requested by DOT closure projects are eligible for 100 percent Federal funding. Included in DOT's fiscal year 1997 Appropriations Bill. Status: Complete.

15. *Crossing Consolidation and Closure Case Studies*.—FRA set forth guidelines and strategies based upon case studies in July 1994 publication, "Highway-Rail Grade Crossing. A Guide to Consolidation and Closure." American Association of State Highway Transportation Officials (AASHTO) published a report in March 1995. Status: In progress.

16. *Integrated Intermodal Transportation Planning*.—FRA and FHWA conducted nine outreach meetings with MPO's and railroads (held in TX, CO, PA, MO, MA, WA, CA, GA & IL). Status: Complete.

17. *Check List*.—FHWA and FRA developed a detailed procedure for performing corridor reviews. Provided to FRA and FHWA field offices in May 1995. Status: Complete.

18. *Highway-Rail Crossing Handbook*.—FHWA is updating the 1986 version. Preliminary draft material has been received. Target completion date is September 2000. Status: In progress.

19. *Vegetation Clearance*.—FHWA encourages states to clear vegetation. Status: Ongoing.

20. *Corridor Review Participation*.—DOT proposed to establish an STP incentive program for corridor reviews. DOT bill offered, but was not considered. Status: No further action.

21. *Distribution of Funds*.—FHWA and FRA through the DOT proposed to revise the distribution formula for section 130 funds under NEXTEA. Status: Not considered. No further action.

Increased Public Education and Operation Lifesaver:

22. *Marketing Materials Plan*.—FRA developed the Always Expect A Train public awareness campaign on highway-rail grade crossing safety and railroad trespassing. The multi media campaign was distributed to and disseminated in most media markets across the U.S. FRA is working with Operation Lifesaver to continue the success of the Always Expect A Train campaign by developing new video and audio public service advertisements (PSAs) to be released in May 2000. Status: Ongoing.

23. *Driver Training Materials*.—NHTSA and AAMVA have developed a new model drivers' license manual published with a section on grade crossings. Status: Complete.

24. *National and Community Service*.—FRA sought to support Operation Lifesaver State Coordinators through the Service Trust Act of 1993. Americorps funding was not sufficient to include this program. Status: No further action.

25. *Truck and Bus Involved Accidents-On-Guard Notice*.—FHWA published a notice about highway-rail grade crossing safety in February 1994. Another notice on high profile crossings was issued in February 1996. Status: Complete.

26. *Truck and Bus Involved Accidents-Advisory Bulletin*.—FHWA sent a bulletin to trade press about grade crossing safety in February 1994. Status: Complete.

27. *Truck and Bus Involved Accidents-Public Service Print Advertisements*.—FHWA developed print PSAs and distributed to trade press in January 1994. Status: Complete.

28. *Truck and Bus Involved Accidents-Trucker on the Train*.—FHWA, FRA, ATA and OLI hosted trucking executives on locomotives. Kick-off event was in November 1994. Future joint rail-truck industry meetings and events under consideration. Status: Ongoing.

29. *Truck and Bus Involved Accidents-Operation Lifesaver*.—FHWA has facilitated meetings between Operation Lifesaver and trucking companies. FRA developed and distributed 74,000 copies of its Trucker Safety Alert and 14,000 copies of the School Bus Driver Safety Alert. Both FRA fact sheets are available on the agency's website. Status: Ongoing.

30. *Truck and Bus Involved Accidents-National Safety Organizations*.—FHWA has communicated about grade crossing safety to industry and law enforcement officials. Pamphlets have been published by National Safety Council (NSC) in March 1995 and September 1997. OLI produced training and awareness video in 1996. In July

1999, FRA participated in the Secretary of Transportation's ONEDOT Commercial Motor Vehicle Safety Workshop. Status: Ongoing.

31. *Truck and Bus Involved Accidents-On-Site Compliance Reviews.*—FHWA has reminded motor carriers about the risks at highway-rail crossings during oversight reviews. A December 1994 memo encourages discussion and distribution of materials. Status: Ongoing.

32. *Operation Lifesaver Matching Funds.*—DOT proposed increased funds to Operation Lifesaver with non-public match required. The 1994 DOT bill was not considered. The FRA's fiscal year 2000 grant to OLI totals \$950,000, \$350,000 of which will be used for the development of new public service advertisements, as directed. In addition, TEA-21 provides \$500,000 to OLI annually from FHWA. Status: No further action.

Safely at Private Crossings:

33. *Define Categories.*—FRA is defining categories and minimum standards for private crossings. Statistics and comments from previous safety inquiries are being reviewed. Status: In progress.

34. *Safety Inquiry.*—FRA will hold an informal safety inquiry about standards for certain private crossings. Status: In progress.

35. *Locked gate at Private Crossings.*—FRA and FHWA will jointly demonstrate gates with controlled locks at private highway-rail crossings. Demonstrations are planned in New York and which has received a \$275K grant and Oregon which has selected a demonstration site. Status: In progress.

Data and Research:

36. *Research Workshops.*—Volpe held a workshop in April 1995 to discuss current and projected research needs. Report issued. Status: Complete.

37. *Host Research Roundtables/Workshops-Defense Conversion Fair.*—As part of the DOT Technology Fair, the FRA hosted an exchange program to familiarize Defense firms with industry needs. A Broad Area Announcement (BAA) sought proposals. Status: Complete.

38. *Demographics.*—NHTSA published a study of fatal casualty statistics in November 1994. Status: Complete.

39. *Accident Severity.*—NHTSA completed a study on accident severity statistics in February 1995. Unpublished memo report. Status: Complete.

40. *Signs, Signals, Lights and Markings—Signs and Signals.*—FHWA is researching new traffic control and warning devices. Final Report was issued July 1999. Status: Complete.

41. *Signs, Signals, Lights and Markings—Train Horns.*—FRA published a report in April 1995 on the impact of whistle bans nationwide. Analysis of Wayside Horns published in June 1998. NPRM on the Use of Locomotive Horns at Highway-Rail Crossings was issued on January 13, 2000. The comment period for the NPRM and related Draft Environmental Impact Statement (DEIS) closes on May 26, 2000. Status: In progress.

42. *Signs, Signals, Lights and Markings—Light Rail Crossing Gates for Left Turn Lanes.*—FTA is investigating alternatives for left turn lanes with parallel tracks. Los Angeles County Metropolitan Transportation Authority (LACMTA) demonstration of 4 quadrant gates is progressing. Status: In progress. 43. *Signs, Signals, Lights and Markings- Locomotive Conspicuity.* FRA developed standards and rules for alerting lights on locomotives. Regulations' require that all locomotives be equipped as of December 1997. Status: Complete.

44. *Signs, Signals, Lights and Markings—Manual on Uniform Traffic Control Devices.*—FRA and FTA sought to amend the MUTCD to address such issues as high-speed rail, temporary closure, multi-track signs, and work zones. Notice was published in the Federal Register in June 1995. Proposed amendments were published in the Federal Register on December 21, 1999. Status: In progress.

45. *Innovative Technology—Automated Video Image Analysis.*—FRA is investigating the potential for live video monitoring of crossings. Tests will be conducted in NY and CA. Proposals are being solicited through the Ideas Deserving Exploratory Analysis (IDEA) program. Status: In progress.

46. *Innovative Technology—Radar Activation System.*—FTA sought to evaluate and demonstrate the feasibility of a radar-based system to detect trains and approach speed. Interminable administrative and contract problems delayed demonstration. Status: Terminated initiative. A substitute project is assessing 4-quadrant gates using video on MBTA's new Old Colony Line.

47. *1-800 Computer Answering System.*—All Class I railroad currently have operable 1-800 systems in place. FRA is working with the American Shortline and Regional Railroad Association (ASLRRRA) to develop 1-800 emergency notification sys-

tems. Software is being developed for small and medium-sized railroads to enable 1–800 notification and signs are now posted at most crossings with active warning systems. The State of Texas has been provided with software as part of a two state pilot project. Status: In progress.

48. *Light-Rail Accident Statistics*.—FTA is broadened the Safety Management Information System (SAMIS) system to identify crossing accidents. New data was first published in the 1995 SAMIS Annual Report. Process is under review. Status: Ongoing.

49. *Resource Allocation Procedure*.—FRA proposed to recalculate the accident prediction formulas and rebuild the accident prediction model. During peer review of proposed new procedure, it was decided to retain the original. The current formulas are being updated. Status: In progress.

50. *The Highway-Rail Crossing Inventory*.—FRA and FHWA have promoted voluntary updating by states. FHWA issued a memo on the subject. The Update Manual was published in December 1996. The FRA introduced new data and Y2K format in 1998 and has proposed mandatory updating by states and railroads in the Rail Safety Reauthorization Act 1999. Status: In Progress. A safety inquiry about the display of crossing identification numbers will be held in the future.

Trespass Prevention:

51. *Demographic Study*.—FRA is reviewing its trespass fatality statistics to focus on remedial efforts. Zip code maps are available. 1997 and 1998 bulletins include new data. A data workshop was held in April 1998 and in May 2000, FRA, Operation Lifesaver and the Class I railroads have committed to a meeting at which a consensus agreement will be sought over how to create a snap-shot demographic portrait of trespassers. Status: In progress.

52. *Trespasser Casualty Reporting*.—FRA successfully proposed collecting additional data on trespass casualties. New reporting requirement took effect in January 1997. Data is now available on the FRA website. Status: Complete.

53. *Workshop on Trespass Prevention*.—FRA held a National Workshop on Trespass Prevention in November 1995 in Atlanta. Five Regional Workshops were held in 1996. Status: Complete.

54. *Regional Campaigns*.—FRA developed a low-cost Public Service Announcement to increase trespass awareness. Always Expect A Train campaign introduced in Summer 1996. Status: Complete. Ongoing public outreach efforts continue.

55. *Model Trespass Prevention Code*.—FRA developed, and distributed to each state, Model Trespass legislation in April 1997. Status: Complete. Available via the FRA website.

Status Key

Ongoing.—An initiative which has become a routine or continuing effort.

In progress.—An initiative which is still being developed and implemented.

Complete.—An initiative for which a specific action has been taken or a product has been disseminated.

Not Considered/No Further Action.—Insufficient authority or funding to pursue an initiative.

ESTIMATED RAIL SHIPMENTS OF HIGH-LEVEL RADIOACTIVE WASTE AND SPENT NUCLEAR FUEL

BIOGRAPHICAL SKETCH OF JOLENE M. MOLITORIS

Appointed by President Clinton in April 1993 and confirmed by the Senate, Jolene M. Molitoris is the first woman Administrator of the Federal Railroad Administrator (FRA) in its 34 year history. The FRA is an agency of the U.S. Department of Transportation with responsibility for the safety of all rail freight and passenger service in the United States. During her tenure, Administrator Molitoris has become the champion for rail safety in the U.S. and around the world, establishing zero tolerance for any safety hazard as the industry standard, creating safety partnerships with rail labor and management and achieving historic increases in all safety categories as a result.

Under Molitoris' leadership, the FRA began its transformation from a traditional regulatory agency into a result and customer focused organization. The FRA safety program adopted a systems approach, identifying root causes for safety hazards and system wide solutions that have become "best practices" in the industry. New partnership approaches to "growing" safety and rules development are now institutionalized in the Safety Assurance and Compliance Program (SACP) and the Rail Safety Advisory Committee (RSAC). For the first time, labor, management and other constituents are at the table from the beginning, not at the end of the rulemaking process, resulting in 1998's distinction as the most productive year for significant rule-making in FRA's history. Most importantly, the period 1993—1999 was the safest seven year period in U.S. railroading history, with a 43 percent reduction in employee injuries and fatalities and 30 percent reductions in grade crossing injury and death. Other safety results include: reductions in complaints to regional offices by as much as 86 percent; use of statistics to spot and stop dangerous trends; and cutting edge initiatives attacking such intrinsic industry issues as fatigue by establishing the North American Rail Alertness Partnership (NARAP).

Amtrak, high speed rail and technology have also been at the forefront of FRA's efforts during Molitoris' tenure. The new high speed trains debuting in 2000 can be called the safest trains in the world because of FRA's specifications. And the first non-electric high speed locomotive, a public/private partnership between FRA and Bombardier, will be demonstrated in the U.S. during 2000. Molitoris' focus on positive train control (PTC) has been the catalyst that has resulted in an industry-wide investment for the first time, with American Association of Railroad members committing over \$20.M to a PTC project in Illinois. Also from 1993—1998, FRA re-

sponded to more mega-mergers and acquisitions than ever in history and created a Safety Implementation Plan strategy to assure that safety would not be compromised in the process. Administrator Molitoris is the recipient of many honors. She was the 1989 and 1992 recipient of High Speed Rail/Maglev Association President's Award for Outstanding Achievement. In 1995 Women's Transportation Seminar (WTS), Washington, D.C. Chapter named Molitoris their woman of the year and in 1996 the WTS of the U.S. named her National WTS Woman of the year. Also in 1996, the Cooperstown Conference awarded Administrator Molitoris its Lawmaker/Federal Service Award. In 1999, Administrator Molitoris received three awards: the Indiana High Speed Rail Association created the Jolene M. Molitoris Golden Spike Award; the National Ethnic Coalition of Organizations Foundation, Inc. awarded her the 1999 Ellis Island Medal of Honor; and in its December 1999 publication, Railway Age Magazine named Administrator Molitoris one of the 12 great railroaders of the century.

Administrator Molitoris holds a B.A. from Catholic University of American and a M.A. from Case Western Reserve.

Senator SHELBY. Senator Lautenberg, do you want to start the questions? I know you have got to do some other things

Senator LAUTENBERG. That is very nice, Mr. Chairman. I appreciate it.

I wanted to focus a little bit on the Coast Guard.

Mr. Chairman, I would ask that other questions that I will have for each of the witnesses be submitted in writing and would ask for a prompt response.

Admiral Card, I want to give you an opportunity to comment on my remarks, and you did say that and confirm the readiness question. It is one that has to be focused on and dealt with.

Last year the committee fully funded the budget request for operations, but the Commandant has said publicly the Coast Guard readiness continues its decline: aircraft availability at unacceptable rates and people overworked.

Now, since we did fund the operations request last year, how did we get into this situation?

Admiral CARD. A couple of things I will say, sir. One is that, if you remember also, there was a readiness discussion last year, the Kosovo supplemental, and the Coast Guard identified \$200 million for readiness concerns. But most of that was carried forward to this year's budget. So, of that \$200 million, we were able to spend \$40 million last year, of which \$23 million was just paying some medical bills. So, we really were not able to pay attention to some of those things we even focused on last year.

Second, you brought up an issue earlier. We went through, in our great effort to help balance the budget, we streamlined the Coast Guard, doing what we thought was our part, and we probably went too far, took too many people out of our overhead and out of our systems. And what is more, we got below our numbers. We reduced the number of people in the Coast Guard, and we went more than 1,000 people below that. It has taken a lot of effort to get the people back. We will hopefully have it back by the end of the year. It has also taken a lot of money out of other things to be able to put into that work force restoration.

Senator LAUTENBERG. The question about further increases for the drug war effort looms large when our resources to support a fully effective—and I use the word balanced—Coast Guard platform is being ignored. How does that strike you?

Let me not put you on too tough a spot because one of the things that I have seen with the Coast Guard and now in the way you

were almost too responsive because the one thing that I believe happens around this place is that very often there are serious attempts to respond to cutbacks and things of that nature. But the Coast Guard took their mission very seriously, as they do with all of their missions, and I think you depleted your resources to a point where it hurt the operations.

So, how do we justify, if we must, expanded functioning for the drug effort and still take care of our other missions?

Admiral CARD. Senator, this year's budget, the 2001 budget, goes a long way to helping us restore the work force readiness concerns. There is money in there for that. There is money also in there for maintenance.

There is also money in there for the use of force from helicopters, which we think is very important. Right now, that will probably be the biggest single force multiplier that we have in the drug war.

So, we would like to think it is a balanced approach and there is money in there for both things in the 2001 budget. That is why I asked that you would support that. We worked very hard with the Administration, with OMB, to get the monies in there. We think this is a start of being able to do that.

Senator LAUTENBERG. You commented on the fact that the fishing industry is one of the most hazardous occupations that we know, and that is certainly true. The three of us sitting here all come from coastal States, and we know the risks that our fishermen run when they are out there.

How do we maintain our compliance levels for inspection when we are so shorthanded? How about our boardings and things? Can you conduct those with the same staffing that you have got and conduct them as efficiently as you feel is necessary?

Admiral CARD. Sir, there is a modest increase for a number of people to do fishing vessel safety examinations also in the budget. We have recognized the need for that, and we are trying to emphasize more the dockside examinations to get people ready to go to sea from a preventive perspective.

The other thing we have done is by some of the recapitalization with moving the coastal patrol boats further up north, we are not going to be taking those down south as we would the 110-foot patrol boats.

But in all budget requests, it is a balance. And if you are asking me in the process would we do more if we had more, of course, we would. But we understand the balance in this whole process of bringing forth the budget to the Congress.

This past year both Area Commanders have spent particular focus on fishing vessel safety: *SAFE CATCH* on the east coast with Admiral Shkor and *SAFE RETURN* on the west coast with Admiral Collins. We are starting to see some positive returns in those efforts. They do focus on a risk management basis on the most high-risk fishing vessels that we see.

Senator LAUTENBERG. As I see it, you will be able to put on about 24 additional inspectors. Is that going to give you the numbers of people to really improve compliance within the fishing industry?

Admiral CARD. It is a step in the right direction, sir.

Senator LAUTENBERG. If it is a one-step platform that you are reaching for, that is not bad, but if it is a 10- or 20-step rise that you have to hit, why, that does not sound like it is really enough.

I was at the South Pole just a few weeks ago, and I had the opportunity to board the icebreaker and meet the crew and the captain of the ship. I want to tell you that is not easy duty, especially when it takes such a long haul to do. But I thought the spirit and the willingness to just drone on and do a very important job was remarkable. The one thing that we want to make sure of is that they feel like they are getting the resources they need to do the job effectively.

Mr. Chairman, I am going to submit the rest of my questions.

Senator SHELBY. Without objection.

Senator LAUTENBERG. Thank you very much.

Senator SHELBY. Senator Murray?

Senator MURRAY. Thank you very much, Mr. Chairman, for having this very important hearing on safety. I would like to submit my full statement for the record, and just focus on the questions that I have.

PREPARED STATEMENT

Senator SHELBY. Without objection.

[The statement follows:]

PREPARED STATEMENT OF SENATOR PATTY MURRAY

Thank you Mr. Chairman. I would like to start by thanking all of you for coming up to the Hill today to discuss your safety initiatives in the fiscal year 2001 Transportation budget.

As I told Secretary Slater when he came before the subcommittee two weeks ago, I believe this budget is one that I—and the members of this committee—can work with. It continues our common goals of improving safety, mobility, economic growth, and environmental protection.

Safety has always been my number one priority in transportation and I know this administration shares my beliefs. This budget is evidence of that.

It does a great job of helping to make all our modes of transportation safer. NHTSA receives a 36 percent increase in the budget; there are new initiatives about drunk driving; new enforcement tools to help get other dangerous drivers off the road; and strong initiatives for transit and rail safety. FRA receives a 9 percent increase for safety and operations, and the Coast Guard gets \$64 million in the President's budget for boat safety. I support all of these initiatives and will fight for these levels of funding.

I am also pleased to see that RSPA gets a \$10 million increase from last year's enacted level for the Office of Pipeline Safety to a proposed \$47 million. As you well know, pipelines are not as safe as they can be in this nation. It took an accident that killed three young people and caused much environmental damage in my state 8 months ago to bring that fact to light.

At the on-set I would like to point out that transporting hazardous liquids and gas through pipelines is the safest method possible. We won't improve safety by putting more of these products in barges and on trucks. However, many of these pipelines are getting old, and we are starting to see problems with them. Aside from the people in my state—who won't let the pipeline reopen at all without adequate assurances it is safe—there have been recent releases in places like Pennsylvania and Louisiana. In addition, many new pipes are being laid in places like New Jersey, Maine and Montana. We need to ensure the public that these pipelines are as safe as they can be, and we need common sense changes to make sure that happens.

I would also like to start off by thanking Kelly Conner, the Administrator of RSPA, and her staff who have worked very hard to help the people of my state deal with this horrible tragedy. I also want to illustrate my appreciation for all the work she has done to educate me and my staff so we can better understand how pipeline safety is regulated in our country.

As I mentioned two weeks ago in this subcommittee, I've introduced legislation this session that would reauthorize the Office of Pipeline Safety, S. 2004, the Pipeline Safety Act of 2000, and Senator Lautenberg on this subcommittee has agreed to be a co-sponsor. I've been meeting with many of my colleagues on this issue. And for those of my colleagues that I haven't met with yet, I encourage you to look at my bill. It requires periodic inspection, requires individual government certification of pipeline operators, establishes a "public right to know" about problems with pipelines, and invests and encourages R&D so we can better inspect and test these pipelines. My bill also encourages your Department to develop strong and substantive partnerships with states if these state have the ability and resources to regulate pipelines.

My colleagues in the House—led by Representative Jack Metcalf—have introduced a similar bill.

Your "Budget in Brief" says, "RSPA will expand and strengthen its partnership with the states". I think you should be expanding and strengthening these partnerships.

In contrast, I understand that you've informed the states that are currently participating in a joint state/federal pipeline safety program that you intend to phase out state participation.

As you know, my state and others like Virginia are very interested in becoming interstate agents. In fact, the proposed National Governor's Association Policy on Natural Gas Pipeline Safety, ". . . urges Congress to direct OPS to reverse its existing policy of declining to grant any additional state interstate agent status for interstate pipelines."

I strongly believe that states can be good partners in pipeline safety if they can prove they have the resources and expertise to handle the job.

Would you please elaborate on this statement from your booklet and explain what you mean when you say you want to expand and strengthen partnerships with states? Could you explain in what areas you would be comfortable seeing states have regulatory authority over interstate pipelines if they prove they have the money and expertise to do so?

My second questions involves your rule on the Qualification of Pipeline Personnel that became effective on October 26 of last year.

As you know, the NTSB first requested a rule on operator qualification back in 1987. Following some very bad accidents in 1996—one that killed 33 people and injured 69 others—you published a Notice of Proposed Rulemaking (NPRM) to require pipeline operators to develop a written qualification program for individuals operating pipelines.

I am concerned that the rule your agency has implemented does not establish specific training requirements for personnel and allows companies to evaluate an individual's ability to perform tasks using such things as simple oral examinations, with little or no check by your agency as to the adequacy of such procedures.

My question is why don't you think it is feasible to have individual federal certification of operators? It is feasible in the airline industry where the FAA determines the capabilities of individual employees who work on aircraft.

I just have a few more questions.

I know you are issuing a rule for comment next month on the testing of pipelines. I understand this is in lieu of the fact that you've been required since 1996 to implement a rule that would require regular inspection of pipelines in high risk areas.

As you know, my bill and the House bill would require periodic inspections every 5 years. Will your rule require mandatory periodic inspections? If not, what mechanisms will be in place to ensure that we are relying on more than the industry's own self-interest?

My next question concerns inspection technology, something I've learned a lot about in the past few months. I've learned about devices called "smart pigs", which run internally in a pipe to detect anomalies and corrosion. Unfortunately, only about 20 percent of the pipes in this country are equipped to handle these devices and their reliability is often questioned. I've learned about another type of testing—hydrostatic testing—where rushing water down the pipe to find leaks and cracks. But this type of testing can cause long-term damage. Obviously, the current inspection methods are not perfect, and it will take more research to give us the tools to ensure that pipelines are safe. My question is what types of research and development is OPS undertaking to better the level of inspection technologies?

You know I and others are eager to see your pipeline reauthorization bill so we can make progress on this important issue in this short legislative year. So my final question is when do you plan on sending the Administration's pipeline safety reauthorization bill to Congress?

Thank you.

Senator MURRAY. Ms. Coyner in her presentation mentioned an accident on pipelines that occurred in my State last June 10 where a pipeline exploded and three young children were killed. I, like most citizens in the State, really did not pay attention to the pipelines that went under our communities and by our schools and places of work until that occurred. I have spent a great deal of time since then looking at the whole issue surrounding pipeline safety. I want to thank Kelley Coyner and her staff for working with the people in my State as we resolve this problem and helping educate me and my office about how we regulate pipelines.

As a result of what I have learned, I have introduced legislation on the reauthorization of pipeline safety that does a number of things, including requiring periodic inspection, which is not required right now; and requiring individual government certification of pipeline operators, which is not required now; establishing a public right to know so that people who live on or near these pipelines know of any problems that have occurred and know when inspections have been completed; and encouraging and investing in more research and development so we can better inspect these thousands of miles of pipes that are aging in our country today.

Finally, my bill encourages your Department, Ms. Coyner, to develop strong and substantive partnerships with States if the States have the ability and resources to regulate the pipelines in their State.

Your budget in brief actually says, "RSPA will expand and strengthen its partnership with the States." And I think we should be expanding and strengthening those partnerships. But in contrast, I understand that you have informed the States that are currently participating in some of these joint Federal/State pipeline safety programs that you are going to phase out of that State participation.

Can you tell me exactly what you mean when you say you want to expand and strengthen these partnerships with the States and maybe what you feel comfortable with in States having regulatory authority over these pipelines?

Ms. COYNER. The President's budget request asks for what we would consider full funding of the State partnership grant program included in the current Pipeline Safety Act, and that is up to 50 percent of the expense of the program. It is critical, as you know, to have the technical resources and the inspection resources at the State level in order for them to be effective regulators and enforcers of the statute.

The issue you referred to has to do with a fairly narrow issue in terms of what we call interstate agency status. This has to do with a particular way we engage with the States on looking at interstate pipelines.

Senator MURRAY. Inter or intra?

Ms. COYNER. Inter, lines that run between States. I know that one is a hard one to enunciate well.

This has been part of a 6-year effort to change the direction of that program to focus on high risk areas and to better coordinate our inspection activities. It is not an effort to eliminate our partnership activities, but instead to focus really on two things. One is to make sure that we are getting the local resources adequately fo-

cused on intrastate lines, including local distribution systems where we have the highest rate of fatalities, and the second is to better coordinate our activities on interstate lines.

Senator MURRAY. Very good.

My second question has to do on your rule on qualification of pipeline personnel that became effective, I believe it was, last October. As you know, the NTSB actually requested a rule on operator qualification back in 1987, and following some bad accidents in 1996, one that killed 33 people and injured 69 others, you did publish a notice of proposed rulemaking that will require pipeline operators to develop a written qualification program for individuals that operate these pipelines.

I am concerned that the rule your agency has implemented does not establish a specific training requirement for personnel and actually allows companies to evaluate an individual's ability to perform tasks using things like an oral examination with little or no check by your agency as to the adequacy of those kinds of procedures.

My question to you on this is why you do not think it is feasible to have individual Federal certification and training of these operators who are many times looking at a computer screen to determine whether or not pressures have changed and whether or not any action needs to be taken. It is feasible in the airline industry where the FAA determines the capabilities of individual employees who work on aircraft. So, why can we not employ the same model for pipeline operators?

Ms. COYNER. There are two specific issues, and I think when you described your legislation, you hit on probably the most important technical reason. We do not have the authority to implement a certification program. It was actually taken out of our statute.

But I think that what is important, in terms of looking at safety, is that the operator qualification rule, which was implemented last summer, is not a laissez-faire regulation. It does not allow companies to do whatever they want. Instead it looks at the broadest range of pipeline employees, rather than just focusing on, say, the person who is at the control panel. I think that is something that distinguishes us from what the FAA regulations look at.

And it is our expectation that the person who sits at the control panel would be appropriately certified, that the welder who works on the line would also be appropriately certified, and that as we have begun checking on the implementation of that effort, we are looking for those kinds of things in the plans, and we will look at that when we do the enforcement once the rule becomes fully effective.

Senator MURRAY. I think the expectation is not being met. So, I think that is something we do need to authorize.

On another area, the testing of pipelines which had considerable discussion in my State—actually, you have been required since 1992 to implement a rule that would require regular inspection of these pipelines. My bill and the House bill requires periodic inspections at least every 5 years, depending on the geography of the area.

Is your rule going to require mandatory inspections? And if not, what mechanisms are in place to ensure that we are relying on

more than just the industry's own self-interests in terms of inspection?

Ms. COYNER. In terms of the periodic inspection, I believe you are referring to the use of what we call smart pigs, internal inspection devices. Our expectation is that we will have a proposed rule out in the next several weeks requiring periodic testing of liquid lines, and that will be followed by a proposal concerning natural gas lines.

There are two other issues which I think are important to note. One is that internal inspections are not the only way that we require companies to inspect their lines. There are a number of other techniques available to us such as leak detection surveys, aerial surveys that we conduct, and looking at what is going on with valves.

But we believe, as I know that you do, that this is not going to get us where we need to be, and that part of the critical success here is that we develop new ways to inspect pipelines that cannot be inspected by these existing internal inspection devices. The budget request includes money for research and technology that would help us push further in that direction, and I know that your bill includes that as well.

Senator MURRAY. Right. My bill also includes research and development.

I have actually been surprised to find out how little we know about inspections and how best to do it. The so-called smart pigs can only test about 20 percent of the pipes out there right now is my understanding. An 80 percent of the pipeline that is currently laid cannot be inspected by that. As I said, these pipelines are getting older, 25, 30, 35 years old now. As they age, there are going to be problems.

For the chairman's knowledge, when this occurred in my State I thought it was a unique accident. I was quite surprised, in doing my research, to find out there have been over 5,500 accidents in this country since 1992, with I believe over 300 deaths and many millions of dollars in damage done, both environmentally and in a lot of other areas.

So, it is an issue that is of great concern to me. It should be of great concern to this entire country, and it is going to continue to be a problem until we find better ways to inspect these pipes, require routine inspection of them, and make sure that the people who are operating these pipelines have been correctly certified and trained.

So, I am going to continue to push my legislation and talk to anybody who will listen to me about this. I do not want any more kids or families to go through what happened in my State. And I know that without us really pushing on this, it will occur again.

So, Ms. Coyner, I really wanted to know as well when the administration is going to send over their reauthorization bill to Congress.

Ms. COYNER. I expect that it will be transmitted very soon.

Senator MURRAY. Because we expect to have a hearing very shortly on this.

Again, Mr. Chairman, I thank you for your indulgence on focusing on this one area, but it is a very critical one and I think one

that this Congress needs to take note of. Thank you, Mr. Chairman.

Senator SHELBY. Thank you, Senator.

IMPACT OF AVIATION FIREWALL

Admiral Loy, the Commandant of the Coast Guard, testified that an aviation firewall with a guaranteed general fund subsidy would "bring this organization to its knees." I assure you that the detrimental impact on the Coast Guard of an aviation firewall is more dire today than it was last March. Would you agree with that?

Admiral CARD. Sir, I have already said how important every dollar we have is in the budget. Anything that would take those dollars away would be very detrimental to the Coast Guard.

Senator SHELBY. You are on thin ice to begin with, are you not?

Admiral CARD. Yes, sir.

Senator SHELBY. If legislation is enacted that guarantees a certain level of general funds on top of the airport and airways trust fund receipts and interest for the aviation accounts and navigational user fees are not enacted, what type of impact do you think that will have on the Coast Guard's search and rescue operations that we have been talking about?

Admiral CARD. Well, Mr. Chairman, earlier I said that safety is job one. I suspect that many other things would be cut back quite a bit. But anything that is going to cut back all those things and cut back our people will impact search and rescue operations as well. We think we are finely tuned, and we scrap for every dollar we get. What we do not get, you can see some of the results in the readiness concerns we have had.

Senator SHELBY. You do a good job, an excellent job, with what you have, but you are stretched. Are you not, sir?

Admiral CARD. We have been, and this budget will help us get better. But there are still, as I mentioned, readiness concerns.

HIGH PRIORITY INITIATIVES

Senator SHELBY. Ms. Millman, the President's budget requests an increase of \$126 million above last year's appropriation to bolster the core research program and launch several so-called flagship initiatives regarding aggressive drivers, aging drivers, and younger drivers. Two weeks ago at a hearing on the Department of Transportation management challenges, however, I stated that the subcommittee would not support the diversion of highway funds for non-highway purposes. Considering that last year Congress rejected a similar approach, I would have thought that the administration would have proposed general funds to finance your increases. Unfortunately, for both of us, budget gimmicks have consequences.

Keeping in mind that it is highly improbable that Congress can find the general funds to fully fund your budget request, which of these initiatives or others that I have not named would you consider of the highest priority for funding this year and what would you defer?

Well, you know, you have got to make choices. If you do not make choices, we make choices for you but would rather you make choices.

Ms. MILLMAN. Right.

Senator SHELBY. Well, let me add this before you answer. Which priority programs would bring the greatest safety benefits to the driving public? Is that fair?

Ms. MILLMAN. Yes, and that is the basis on which we would make the determination which programs—

Senator SHELBY. Which ones would they be?

Ms. MILLMAN. Most important is seat belts.

Senator SHELBY. I know they all contribute, but just name some priorities.

Ms. MILLMAN. Seat belts are the most effective safety device that we have. Depending on the type of vehicle, they can increase the chance of surviving a crash by 50 to 80 percent. So, increasing seat belt use will always be one of our highest priorities.

That is a crash worthiness type of technology. If you are in a crash, how can you protect yourself?

Senator SHELBY. We saw an instance of that recently in Kansas City, did we not?

Ms. MILLMAN. Yes.

Senator SHELBY. Where out of three, two did not have their seat belts on. One did and one walks away. Two are killed. One killed. One later dies.

Ms. MILLMAN. That is right.

Senator SHELBY. Right?

Ms. MILLMAN. Yes.

Senator SHELBY. And if the seat belts were on, all three may have walked away or at least been survivors.

Ms. MILLMAN. Looking at the accident, that was our analysis.

But something we can do to avoid crashes in the first place is continuing to focus on alcohol-impaired driving.

Senator SHELBY. Absolutely. We have come a long way there, have we not?

Ms. MILLMAN. We certainly have. We were around 25,000 deaths per year in alcohol involved crashes. Now we are about 16,000, but 16,000 a year is still way too high.

Senator SHELBY. How many of those are younger people? Do you have a breakdown on the accidents related to alcohol?

Ms. MILLMAN. I can get you those numbers. But we know that teenagers tend to have a high use of alcohol when they are in fatal crashes.

Senator SHELBY. Can you furnish that for the record?

Ms. MILLMAN. Yes, certainly.

[The information follows:]

| Persons Killed, by Age and Highest Blood Alcohol Concentration (BAC) in the Crash | | | | | | | | | | |
|---|----------------------|-----------|--------------|----------|----------------|-----------|-----------------|-----------|---------------|------------|
| Age (Years) | Highest BAC in Crash | | | | | | | | Total | |
| | 0.00 | | 0.01-0.09 | | 0.10 or Higher | | 0.01 and Higher | | | |
| | Number | Percent | Number | Percent | Number | Percent | Number | Percent | Number | Percent |
| <5 | 599 | 79 | 55 | 7 | 103 | 14 | 158 | 21 | 757 | 100 |
| 5-9 | 637 | 80 | 53 | 7 | 105 | 13 | 159 | 20 | 796 | 100 |
| 10-15 | 1,128 | 78 | 114 | 8 | 195 | 14 | 309 | 22 | 1,437 | 100 |
| 16-20 | 3,623 | 63 | 605 | 11 | 1,500 | 26 | 2,104 | 37 | 5,727 | 100 |
| 21-24 | 1,643 | 44 | 413 | 11 | 1,713 | 45 | 2,126 | 56 | 3,769 | 100 |
| 25-34 | 3,224 | 47 | 663 | 10 | 3,041 | 44 | 3,704 | 53 | 6,928 | 100 |
| 35-44 | 3,266 | 49 | 592 | 9 | 2,838 | 42 | 3,430 | 51 | 6,696 | 100 |
| 45-54 | 2,833 | 59 | 375 | 8 | 1,577 | 33 | 1,952 | 41 | 4,785 | 100 |
| 55-64 | 2,298 | 72 | 220 | 7 | 883 | 21 | 904 | 28 | 3,202 | 100 |
| 65-74 | 2,565 | 82 | 177 | 8 | 390 | 12 | 567 | 18 | 3,132 | 100 |
| >74 | 3,664 | 89 | 204 | 5 | 269 | 7 | 473 | 11 | 4,137 | 100 |
| Unknown | 56 | 54 | 7 | 6 | 42 | 40 | 49 | 46 | 105 | 100 |
| Total | 25,536 | 62 | 3,479 | 8 | 12,466 | 30 | 15,935 | 38 | 41,471 | 100 |

Note: NHTSA estimates alcohol involvement when alcohol test results are unknown.

Senator SHELBY. It will be very interesting.

HAZARDOUS MATERIALS TRANSPORTATION REGISTRATION FEES

Ms. Coyner, on November 4, 1999, Chairman Wolf and I requested that the General Accounting Office perform an evaluation of the hazardous materials emergency preparedness grants program, which is paid for by registration fees charged to hazardous materials shippers and carriers.

Concerns have been raised by some members of the HAZMAT carriers industry that the same shippers and carriers who pay for the HMEP grants program through their user fees also participate in and pay for well-established emergency planning and training programs in the private sector.

We asked GAO to determine whether the grants program goals are being met by existing private sector initiatives and to identify any duplication of services.

Last week RSPA promulgated a final rulemaking on the hazardous materials registration fee increase. I believe it was February 14 in the Federal Register. Do you think it was premature for RSPA to move forward with the assessment of a fee increase when the need for such an increase has not yet been reviewed by an impartial party such as the GAO?

Ms. COYNER. We have been engaged in an effort for a number of years now with respect to the hazardous materials emergency grants program in terms of looking at what the total authorized levels have been and the unmet needs in terms of training individuals and being prepared. Our view is that one of the most important things we can do to impact what happens if there is a haz-

ardous materials incident is to have trained responders, and that we are severely under-resourced in that particular effort.

The rulemaking went through the usual process of notice and public comment, as well as a number of informal workshops.

We have worked closely with the GAO on their study and review of this particular aspect of emergency preparedness, and we will continue to do so and will take into account their recommendations when they move forward on that particular study.

Senator SHELBY. Can I have your personal commitment that should—should because we do not know—GAO determine that there is a duplication of services among the private sector initiatives, other Federal emergency response programs, and your agency's emergency preparedness programs, that you would revisit the rulemaking in some way?

Ms. COYNER. You can have my commitment that I would be glad to discuss with you the outcome of the GAO study and to take into account implications of it. But I do not want to prejudge the outcome of their study in terms of what their conclusions might be.

Senator SHELBY. Sure, I understand.

GRADE CROSSING COLLISIONS

Mrs. Molitoris, according to the Federal Railroad Administration's hearing record last year, my State of Alabama had the fourth highest, as you know, number of grade crossing collisions in 1998, a total of—think of this—146 accidents in my State of 4.5 million people. Only Texas, much larger, Louisiana, about the same size, and California, the largest State, had more crossing collisions in that year.

I have a fair amount of interest in seeing that the grade crossing safety is improved nationwide, but my State, the fourth largest, and that the number of accidents and deaths at crossings decrease.

It is often said that only truly safe grade crossing is no crossing at all. How are crossing separations such as bridges and flyovers funded?

Ms. MOLITORIS. Would you repeat that last thing? I am sorry. How are what?

Senator SHELBY. How are crossing separations such as bridges and flyovers funded?

Ms. MOLITORIS. It depends, of course, on the particular—

Senator SHELBY. Is it not with Federal highway section 130 funds, which you have no control over?

Ms. MOLITORIS. FRA and FHWA work together. Section 130 money can be used for hazard elimination. That is what it is called. It can be used for warning devices, closings or bridges. It is important to note that annual section 130 funds provided to a State usually are not sufficient to cover the cost of constructing a single bridge. You will find that most States will use other Highway Trust Fund sources for major infrastructure investments such as bridges.

One of the things that we are encouraging from TEA-21 is a corridor approach, Mr. Chairman. That would be to look at a long distance, several miles or 20 miles, and examine what are the most appropriate and safe installations.

Senator SHELBY. Well, what we are interested in for railroads, trucks, cars, and planes is saving lives. Safety.

Ms. MOLITORIS. Yes.

ACCIDENT AND FATALITY DATABASE

Senator SHELBY. Your agency collects data on grade crossing accidents and trespassing fatalities on the general railway system from every State and territory in the United States. However, your accident and fatalities database does not include rail transit grade crossing and trespassing incidents. Is that correct?

Ms. MOLITORIS. The entire database, Mr. Chairman—we have asked in our safety bill to have it increased so that the required information is—

Senator SHELBY. But to have an accurate database, should not all rail crossings and trespassing accidents and fatalities be part of the database?

Ms. MOLITORIS. That would be the most opportune. Yes, it would.

NATIONAL DISTRESS AND RESPONSE SYSTEM

Senator SHELBY. Admiral Card, there have been a number of maritime accidents over the past few years in which the failure of the Coast Guard—we know you do a lot of work, good work, and we are big supporters, as you know, but there are failures. The failure of the Coast Guard to identify a distress call and initiate a search and rescue response in sufficient time has been a contributing factor to the loss of life. These tragedies highlight the need to modernize the National Distress and Response System and upgrade the capabilities of a system that was built nearly 30 years ago.

Staff informs me that the acquisition strategy for this important modernization program is following the model used for the Deep Water Replacement Project. I am concerned that the Coast Guard would choose a complex, unproven acquisition approach for a system that is fundamental to the safety of recreational and commercial boaters.

Now, what is the status of the National Distress and Response System modernization project? Where are we?

Admiral CARD. Mr. Chairman, the request for proposal was on the street and we have had responses back to the request for proposal. It is a two-phased approach to buy this. The first phase enables us to figure out what the design should be and put it in place, and the second phase will allow us to buy all the systems. So, we expect that by 2005 or 2006, it will all be in place. The first phase will be completed about 2001 or 2002.

This is a combination of an information technology system, as well as a distress system. We are concerned and we want to make sure we get it right. We think that the strategy we put together will do that for us.

Senator SHELBY. If Congress provided additional funds for this project to the budget request, would the Coast Guard be able to accelerate the completion of the upgraded system, or is it just going to take some time?

Admiral CARD. It would be able to accelerate the phase two portion of buying it once we have figured out what it is, but the figuring out what it is in the first part will take as long as it will take

to get that right. We are going as quickly as we can with that to make sure it is the right system.

Senator SHELBY. One of the shortcomings, as I understand it, of the current system is that it is dependent upon line of sight communications. In areas where coverage from a line of sight system is poor, such as most of the coastline of Alaska and other States, how will the modernized system improve the ability of the Coast Guard to detect boaters in distress?

Admiral CARD. Well, we will go to other communications technologies. As we are all aware, this sort of technology is increasing greatly. And we will make sure that we cover all the areas for which we are responsible in the new system.

In the meantime, we have tried to do some short-term fixes. We have put a couple of dollars into some DF systems and some better recordings of the messages when they come in so you can understand. We have had some garbled calls. We did not have the right kind of equipment to be able to unscramble those and really hear those very clearly. So, we have done that sort of a short-term fix.

But the real answer is the long-term solution which we are proposing and for which we have money in this year's budget.

Senator SHELBY. Admiral Card, it is my understanding that since the sinking of the recreation vessel *MORNING DEW*, the Coast Guard has initiated several interim measures to improve its search and rescue capability and the national distress system until the modernization project is completed, as you said, in 2005.

What have been the interim measures that have been taken to avoid the recurrence of another accident like *MORNING DEW*?

Admiral CARD. First, and probably the quickest one, was to review all our policies, change those where needed, and make sure that our people understood very clearly what their responsibilities were. And we did that right away.

As I have mentioned, we looked at those opportunities where we could put direction-finding equipment in so that you could tell, when someone was calling, what the line of direction might be. We did not have that. We have that in several places.

We have also, again, bought these recorders and upgraded those.

One thing that *MORNING DEW* did for us is, while we do very well, as you mentioned, you have to examine yourself and say where can we do better. It allowed us to be able to take a hard look at ourselves and improve our performance.

ADVANCED AIR BAG RULE

Senator SHELBY. Ms. Millman, there has been a lot of public attention recently regarding the advanced air bag rule, which is statutorily mandated to be published by March 1, which is just a few days from now.

Although there is widespread agreement with most aspects of the proposed rule, the proposal to return to a 30-mile-per-hour, rigid barrier, unbelted occupant test has created a formidable coalition of opponents that includes air bag suppliers, automobile manufacturers, the National Transportation Safety Board, and a number of respected safety organizations such as the Insurance Institute for Highway Safety, the National Safety Council, AAA, the National Association of Governors' Highway Safety Representatives, and the

American Trauma Society. They strongly oppose this test because it would lead to the installation of high-powered air bags that have caused the deaths of dozens of infants, children, and small adults.

I, as well as other members of this committee, are concerned that the credibility of Federal safety standards are at stake, if that is mandated. This proposed rule could conceivably lead to the use of certain air bags that are once again linked to the death of people who should have survived otherwise, with even the slightest possibility that a return to 30-mile-per-hour test has a potential to result in air bag-induced deaths.

Is there anything to prevent NHTSA from publishing a rule that meets the TEA-21 deadline but doesn't mandate the unbelted rigid barrier tests until the issues are further considered and better information is obtained? I know that is a mouthful.

Ms. MILLMAN. There was a lot in that question.

Senator SHELBY. But you are very familiar with this.

Ms. MILLMAN. I am.

Let me preface my answer with a couple of—

Senator SHELBY. You are aware of all this, but I wanted to put it on the record.

Ms. MILLMAN. Yes.

Senator SHELBY. All these concerns by some blue ribbon groups.

Ms. MILLMAN. Yes.

Air bags, since their introduction in about 1986, have saved over 5,000 people. So, we consider them a very effective occupant-protection technology.

Senator SHELBY. I personally like them. It might save my life, but I am not a small person and I am not an infant. I would like to be smaller, but—

Ms. MILLMAN. Over 5,000 saved, but yes, about 150 killed by air bag-induced injuries.

This is a technology that we have been studying for almost 30 years, and we are certainly doing everything we can in our rule-making process to analyze the concerns that the auto manufacturers have raised about the speed for the unbelted test.

AIR BAG-RELATED ADULT FATALITIES

Senator SHELBY. Have you conducted or sponsored any research in which actual crash data suggests that adults have died in high-speed crashes because an air bag did not inflate with sufficient force?

Ms. MILLMAN. Yes. In 1997, we changed our rules to allow the manufacturers to use a sled test rather than a full vehicle test, and that is when a lot of the manufacturers made significant design changes to their bags. It would be in vehicles that are model year 1998 or later that would have the redesigned bags. So, there are very few of those vehicles in the fleet right now, and we have not been able to identify any crashes that involved the scenario that you described where an adult would be going through the air bag. But we still have that concern because there are so few of these vehicles in the fleet.

LIFE SAFETY IMPROVEMENTS

Senator SHELBY. Ms. Molitoris, Amtrak recently released a report to Congress on the planned infrastructure improvements to the south end of its northeast corridor, Washington, DC, to New York City. Life safety improvements to the tunnels below Pennsylvania Station in New York City are estimated to cost more than \$300 million over the next 10 years. In the FRA's budget, \$20 million is requested and was already funded as an advance appropriation in the year 2000 for the Penn Station redevelopment project. Will any of the \$20 million in the administration's budget for Penn Station be used for life safety improvements to the tunnels?

Ms. MOLITORIS. Mr. Chairman, Amtrak's planning includes some funds for the life safety development plans, but as you said, to actually fix them is a much larger investment.

Senator SHELBY. But this \$20 million I understand is all for construction dollars, which will be at the Amtrak station.

Ms. MOLITORIS. Mr. Chairman, may I get back to you to be sure that I am accurate on that?

Senator SHELBY. Sure, you can.

[The information follows:]

The Pennsylvania Station life safety improvements include improvements to the tunnels immediately beneath Pennsylvania Station and the James A. Farley Post Office Building. To date, Amtrak has spent approximately \$35 million on these improvements from funds provided by FRA for Pennsylvania Station. Additional life safety improvements below these two buildings will be included in the final Pennsylvania Station Redevelopment Plan and are estimated to cost approximately \$54 million.

TRANSIT CROSSINGS

Ms. MOLITORIS. Mr. Chairman, may I just add to the previous question that you asked about the transit crossings? FTA does collect all of that data. We collect the data on railroad crossings. I think there are very efficient and effective ways to produce that for you together.

Senator SHELBY. You have got a shortfall without all the information, have you not?

Ms. MOLITORIS. Well, it is easy to put that together, sir.

Also, in terms of your State, we would be more than happy to do a special initiative in Alabama to address this very serious problem at your crossings.

Senator SHELBY. Well, I am interested in my State, coming from there, but on the other hand, we are interested in all the States.

Ms. MOLITORIS. As are we, sir.

Senator SHELBY. I pointed out that my State had the fourth highest and it is much smaller than Texas and California in population and in size. But Louisiana was right there I believe number three. Were they not?

Ms. MOLITORIS. I do not know the numbers by heart.

Senator SHELBY. So, there has got to be a reason. Would you look into that too?

Ms. MOLITORIS. I certainly would, sir. You can tell by our charts that we are making progress, but one is too many.

Senator SHELBY. Sure.

[The information follows:]

TEN WORST STATES

| State | Number of Crossings | Incidents | Fatalities | Injuries |
|-------------------|---------------------|-----------|------------|----------|
| Texas | 18,509 | 364 | 41 | 172 |
| Illinois | 15,746 | 198 | 53 | 113 |
| Indiana | 9,188 | 191 | 26 | 63 |
| California | 12,848 | 190 | 24 | 70 |
| Louisiana | 6,716 | 176 | 20 | 70 |
| Ohio | 9,585 | 144 | 21 | 54 |
| Georgia | 8,385 | 134 | 7 | 39 |
| Mississippi | 4,872 | 131 | 17 | 81 |
| Alabama | 5,434 | 122 | 12 | 34 |
| Michigan | 8,429 | 114 | 14 | 43 |

Although both Alabama and Louisiana have a relatively high number of crossings based on state size, the most likely factor contributing to the number of injuries and fatalities is the number of crossings without active warning devices. Fewer than 20 percent of Alabama's 5,434 crossings and 18 percent of Louisiana's 6,716 crossings are equipped with these devices.

HIGHWAY-RAIL CROSSING INVENTORY

Senator SHELBY. The Federal Railroad Administration maintains a comprehensive national rail crossing inventory, which is a critical tool in helping States and the railroad industry identify potentially hazardous crossings and prioritize funding decisions.

According to an Inspector General audit of last fall, this inventory is not accurate, with discrepancies in a number of crossings between FRA data and the railroads' own records. Why are the errors and the discrepancies there, or why are there errors? What steps are you taking to correct this?

Ms. MOLITORIS. Mr. Chairman, FRA gets its information from railroads and from States, and it is a fact that many States still do not have a complete and comprehensive database or neglect to update the information for the national inventory.

Senator SHELBY. How do you check that out for accuracy what they are giving?

Ms. MOLITORIS. We work with the States, Mr. Chairman. For example, I know being from Ohio that some 5 or 6 years ago, when they really emphasized corridors, which we were encouraging them to do, they found many crossings that they did not know existed or were in a different location. There have been so many spinoffs, abandonments, changes in the infrastructure in a very rapid fire way during our Administration. The changes have really been dramatic. Sometimes the number of crossings changes dramatically because a whole line is abandoned.

What it takes is a team of State, Federal, and railroad people to go out and walk them and go to see them corridor by corridor. It is a big investment and FRA is encouraging States to do that and railroads as well.

Senator SHELBY. You do not have a big motivator like withholding money, do you? You just have to encourage them to cooperate?

ROLLOVER PROPENSITY RESEARCH

Ms. MOLITORIS. While many have been responsive, Mr. Chairman, there are a number of entities who have not updated their crossing inventories in many year. I do not know of anyone who has refused totally, but it does take money, time, and resources.

Senator SHELBY. Ms. Millman, the National Highway Traffic Safety Administration has had a long-running interest in the area of rollover crashes, and according to your budget justification, the agency's current focus in this area is to develop a formula on rollover propensity and provide a ranking or rating system for consumers. Is that right?

Ms. MILLMAN. Yes.

Senator SHELBY. What is the status of this research effort and what can we expect and when can we expect some specific action to be identified by your agency?

Ms. MILLMAN. Thank you, sir.

This is another issue that we have been looking at for 20 or 30 years. We recently completed the research part of that work, and we have a report available in the docket, which is also available online.

We have prepared a proposal that is currently in the clearance process within the Department. We think that we have a good proposal and that people will support it.

We have found with our front impact and side impact ratings that people just cannot get enough information, and it is one of our most popular locations on our web site. We have seen the manufacturers now start to advertise, when they do well, this is a four star vehicle or five star vehicle. So, we think that the rollover proposal will have that same—

Senator SHELBY. You think the message is out there.

Ms. MILLMAN. It seems that that is what the public wants.

TRUCKS, VANS, AND SUV ROLLOVER PROPENSITY

Senator SHELBY. Do you believe that consumers lack information about the greater rollover propensity of trucks, vans, and SUV's despite the widespread coverage by investigative journalists, consumer advocates, driving enthusiast organizations, yours, and others? Would your limited resources, for example, not be better dedicated to informing the public, which you alluded to, about the issues that they might not be so well informed about through other information channels? I know you mentioned the Internet.

Ms. MILLMAN. Other than?

Senator SHELBY. Anywhere. The more information they have, the better chance they have to make better decisions when they purchase something, which could really be life or death down the road.

Ms. MILLMAN. That is right.

We produce a brochure called Buying a Safer Car that talks about features that add to the safety performance of a vehicle, and we do address the higher rollover propensity of light trucks, vans, and SUVs. What we have seen in our research, though, is that even within a class of vehicles, let us say sport utility vehicles, there are very significant differences in rollover propensity. So, we want people to know that if they have made the decision to buy a

pickup truck, within that group, which ones have better safety performance than others.

ADDRESSING ROLLOVER ISSUES

Senator SHELBY. There are a lot of different ways to address rollover issues: one, a Government rating system for rollover propensity; two, encourage technologies that protect the occupant during this unusual type of crash; three, promote technologies that reduce the vehicle's likelihood of tipping in the first place; four, increasing seat belt usage, which we all believe in in these vehicles. I am sure there are many more. Those are just a few.

Ms. Millman, what should be the focus in this regard and which strategy would save the most lives? Out of the four I mentioned or others that I had not thought of. Seat belts maybe?

Ms. MILLMAN. The most dangerous part of a crash involving a sport utility vehicle is the chance of ejection during a rollover, and we find that seat belt use tends to be lower among SUV occupants than other vehicles. They have a very high number of ejections, which tend to be very serious. So, seat belts certainly would make the most immediate impact.

But, a combination of those techniques that you mentioned is really our best approach. Seat belts certainly in the short term; second, greater dissemination of information like the ratings that we are going to propose. But in the long term, certainly technology can address the propensity issue.

PORT SECURITY

Senator SHELBY. Admiral, port security is important. In the past several months, there have been a rash of incidents involving the smuggling of migrants, mostly from China, into the United States in large cargo ships. This particular activity raises the larger question of port security and safety. Considering that 95 percent of the goods exported and imported are processed at our Nation's ports, port security and safety has significant economic and national defense implications.

What is the role of the Coast Guard in protecting our ports from migrant smuggling, illicit drug trafficking, the threat posed by terrorist groups? And what other Federal, State, and local agencies are involved with you? What initiatives do you have for 2001 in the budget? Is that too much? It is what you do every day.

Admiral CARD. We will get right after it, yes, sir.

I think probably the most significant thing that is going on right now as far as the study goes is the Seaport Security Commission which is underway, including the Coast Guard, Customs, FBI, et cetera, to look at all that we need to have for our seaports.

But certainly the Coast Guard has been involved in our multi-mission capacity in drugs and migrants and terrorism kinds of things. We have, around the country, all of our units strategically located. Every water area has a Captain of the Port who is in charge of that water area. One of his or her missions is security. That is backed by our Group Commanders as well. So, we have got a network of both command and control and people and resources to pay attention to these things.

Many of these issues are better sought if they are pushed further away from the shore, and so you will see sometimes that we will be interdicting Chinese migrants 50 or 100 miles off the coastline because it is better to do it there. And in our drug strategy, we are trying to push that closer to where they are departing the scene down in Colombia, et cetera.

But more needs to be done. There is concern for terrorism in our country. That is being addressed by this commission. It has also been addressed by the Marine Transportation System study that we brought forward. This budget includes some issues that will protect our people. We are going to be the first responders. We want to have some chemical, biological, radiological kinds of things available, plus some training, to know what to do initially until other agencies get there because we are going to probably be the first on scene, as we are in most cases.

In a larger sense, we also have some other protection things in here for our people, survival equipment, cold weather equipment, some of those kind of things.

But I think you will see out of the Seaport Security Commission things that we are doing. The Coast Guard will have a lead role in port security for our country, and we are located in those places to be able to make that happen.

There will need to be cooperation with everyone else that needs to do it, including the State people and other Federal agencies. In that regard, we have instituted recently our Incident Command System which all State highway people use, fire people use. That makes it easier for us to respond as one when we go to any particular type of an incident.

Senator SHELBY. Thank you.

Senator Lautenberg.

Senator LAUTENBERG. Thanks, Mr. Chairman. I apologize for having been away. One of the things that we were just discussing at the Foreign Operations Subcommittee is our commitment to Colombia and other Latin American countries to see what we can do about stemming the drug flow there. It unfortunately is a constantly expanding business, and when you think about it, the toll taken in our country every year is 52,000 dead and about \$110 billion worth of cost, it is an important assignment. And we in no way diminish the effort that the Coast Guard is required to put into it. But that means that we have to take care of other things in other ways.

MSIS SYSTEM

I would ask you a question, Admiral Card, about the MSIS system, a project that was begun back in 1991. And the project is critical to your ability to meet the information needs and legal mandates of your marine safety and law enforcement missions.

The project was supposed to be completed in fiscal year 1996. All of us know that it is now 2000 and we have invested over \$45 million. The project is still not completed. Why the delays in getting this done?

Admiral CARD. Probably several, sir, but let me say that the project is now on track to produce what we want in the next year or so. And we have got some money in this budget.

Information technology projects, unlike buying a ship or an airplane or something else, were more difficult for us to get our arms around and describe correctly. I think you were at the other committee meeting earlier when the Chairman asked me about our National Distress and Response System Modernization Project. We are now much more capable of structuring those kinds of projects to be able to get positive results sooner, even though it seems like in the beginning it takes you longer to make sure you have a clear definition of what you want.

We are on track to do that now. We will be off the old system probably within a year with more capability. Our Operations System Center in Martinsburg, West Virginia has picked that up for us.

So, the details of how we got there, probably a combination of not being as clear as we thought we were going to be in the requirements and then some change in the way that the project looked along the way.

But I think we are on track and within a year or a year plus, we will have the old system operating. We need to expand it with our law enforcement system so all of them work together.

Senator LAUTENBERG. I hope that the prediction that it is a year away is more reliable than those forecast in the past.

Admiral CARD. Yes, sir.

HIGH-SPEED TRAINSET TESTING

Senator LAUTENBERG. Ms. Molitoris, good to see you.

Your agency is participating in the testing of the new high-speed train sets over the northeast corridor. You and I had a ride on the not-so-speedy high-speed train, and we are looking forward to the ultimate delivery of the equipment that can shorten the schedules between places.

Now, we have had a problem in terms of getting the high-speed equipment on line. That was due sometime last year, and we know that there was a problem. Tell me what you can about FRA's involvement in testing of the new train sets.

Ms. MOLITORIS. Senator Lautenberg, Mr. Chairman, the Acela trains are going to be a tremendous addition to the fleet of Amtrak, but this is a new technology. As you know, FRA was responsible for the safety requirements that Amtrak incorporated into the specifications, and we have been consistently involved with Bombardier and Amtrak in the testing program. The responsibility really lies with the manufacturer to meet the requirements set by Amtrak and to provide the service required in the contract with Amtrak.

I think we are making good progress, but I have not yet received a total confirmation on the date of delivery of these trains. I think it is fair to say that with a brand new technology of this complexity, it is not unusual to have a significant test period. It was the commitment of the Board and of Amtrak to assure that the introduction of the trains would be at a time when service would be of the highest quality.

One of the exciting things that you and I were able to do was to ride the train totally electrified from Boston to New York. And that was an achievement of no small measure, sir, and a tribute

to your leadership and also the support of the Congress throughout these years.

Senator LAUTENBERG. Well, the fact that we need a long test period is what we understood, and we had train sets tested and running. We had a problem with wheel wear.

And I would have to remind you, Ms. Molitoris, that technology on high-speed rail is certainly not new. It is disappointing, I must say, to learn, whether it is the manufacturer's responsibility or design responsibility and our demand for specifications that were wrong, the fact is that prospects are considerably dimmed by the experience to date. We are anxious to have these train sets in place and operating.

The chairman of this subcommittee is not a fan, and understandably so, because he is skeptical about promises that are made that are not kept. This is the kind of thing that, frankly, gives me a lot of concern. You are kind of a second stage in this, but we hope that when these specifications were given that specs were, A, met and, B, that they were sufficiently designed, that there was sufficient design put into this that we were not asking for the impossible.

Ms. MOLITORIS. Senator Lautenberg, may I just comment? There truly is a tremendous difference between the operating environment in Europe and the operating environment in the Northeast Corridor. It is a much more complex environment. It required specifications that were different. I think that the elements that are being tested and required certainly are the proper ones. We can assure safety to the passengers of the highest level, and I think that we will get there very soon.

Fortunately, at the very same time that these northeast trains were being tested, we have a new high-speed, non-electric locomotive so that the corridors throughout the country—some of very great interest in Birmingham—will be able to have high-speed trains also.

STATE COOPERATION

Senator LAUTENBERG. In order to maintain the speeds that we expect from Acela along the north and the south end of the Northeast Corridor, we are going to require strong cooperation out of the commuter rail authorities from Massachusetts to Virginia. How have things gone so far?

Ms. MOLITORIS. In terms of the relationship, Senator?

Senator LAUTENBERG. Cooperation. Have we gotten what we needed from the States along the way?

Ms. MOLITORIS. Well, I think there is a strong support network among the operators and the States, but indeed, there is a 10- or 12-year—maybe 20-year—outlook on the kinds of improvements in infrastructure to get to an improved state of repair on the south end. That is going to require investments.

I think Amtrak continues to work closely with the commuters because, as you know, it is the commuters that have the huge numbers of trains every single day, especially in New Jersey, New York, and Connecticut.

I think the working partnership is good. There are some elements that are still being discussed, but there certainly is not a

final decision on all of the investments and how much will come from where. That is still under negotiation.

Senator LAUTENBERG. So, we can expect that we will get the kind of help from the commuter organizations that we need and that we will be able, one day, to say that this is a completely coordinated program, because at this point there is a challenge by a lot of the commuters who say they need more of the time on the rail and that they cannot always make way for the high-speed trains to operate. But we hope that we can resolve that conflict and get on with it.

Your budget, with our strong interest in expanded high-speed rail, has a new \$468 million initiative. As you know, I have introduced a bill that would support roughly \$10 billion in high-speed rail improvements through these federally insured bonds.

RAIL LINE CONGESTION

One problem that is regularly cited as a limitation to deploy high-speed rail around the country is the problem of the right-of-way that is owned by freight rail and freight railroads. And they are busier than they have ever been as well.

What does FRA do to improve the opportunities for use of those tracks, freight-owned tracks, for our high-speed rail needs?

Ms. MOLITORIS. Well, of course, our focus is safety. The requirements that the railroads have to meet require all of our efforts. I do know, serving on the board representing the Secretary, that George Warrington has made a really new effort to become a good partner with the railroads and they with him. I would say to you that it is my observation that there has never been a stronger partnership between the freight railroads and Amtrak.

However, the congestion difficulties that the freights are experiencing, some as fallout from some mergers and acquisitions, impact Amtrak. It is a very difficult situation. I think, however, that there is a real working partnership, train by train, between Amtrak and the freight railroads to try and address this. We are not where we want to be in terms of on-time service, and that is not just on the Northeast Corridor, which is doing very, very well, but it is throughout the country where we have this particular situation where all the tracks are owned by freight railroads.

FRA is working on it. We have got to get the freights in a situation where they have less congestion and backup and more on-time performance themselves and the ability to get Amtrak through in a more timely manner.

AMTRAK/FREIGHT PARTNERSHIPS

Senator LAUTENBERG. Are we going to ask them to do less business? How do we accomplish—

Ms. MOLITORIS. Well, there are many ways, Senator Lautenberg. Certainly operational considerations. Amtrak does, by law, have first right to move.

Also, I think it is interesting to note that the new business partnerships, mail and express business partnerships, that Amtrak is developing with almost every major freight carrier are an incentive for the freight railroads themselves to move Amtrak timely because these freight movements are business partnerships that Amtrak

and Norfolk-Southern, BNSF, Union Pacific have developed. It is really a win-win situation. So, that is enhancing this partnership.

VEHICLE INCOMPATIBILITY

Senator LAUTENBERG. Ms. Millman, I wanted to check something. I was just asking whether it had been discussed earlier, and if it has, please let me know.

Almost half of the new vehicle registrations in 1998 are light trucks, including SUV's, pickups, mini-vans, and they sit higher off the ground. Have you discussed this at all? Has this been asked?

Ms. MILLMAN. Not today, no.

Senator LAUTENBERG. You might get the question occasionally. In an accident between light trucks and conventional cars, the light truck inflicts more damage to the car. Now, a NHTSA study found that a head-on collision between a car and an SUV resulted in five deaths per car driver to one per SUV driver. When the SUV struck the side of the car, there were 30 deaths per car driver for every 1 of an SUV driver.

Now, in light of these findings by your own agency, will the administration undertake any actions to improve safety for the drivers of conventional cars? I hear a lot of worry and concern by drivers of ordinary cars, particularly from those mothers with children in the car and so forth. They are frightened by the prospect. What is being done there?

Ms. MILLMAN. One of our first priorities is always avoid the crash in the first place. So, everything that we are doing on drunk driving and other kinds of crash avoidance activities will help address that specific problem.

We are working with the manufacturers and doing our own research to identify ways that we can address that problem—changing bumper height, changing the way the vehicles manage the crash energy. We do not have a specific rulemaking looking at it now. We are more in the research and analysis phase of it.

Senator LAUTENBERG. Do the automobile companies seem to be concerned as we are about the problems? Business is pretty good in that area, and I do not know whether having to change the configuration of an SUV, to use the general term, is a likely possibility without some pressure from Government. How do you see it?

Ms. MILLMAN. The manufacturers are certainly pleased with the sales of the larger vehicles and are concerned about any requirements that might make them reconfigure those vehicles. But I think that they also recognize the public is interested in safety. We were discussing earlier NHTSA's safety ratings of vehicles. The public is very interested in those. So, I think that the manufacturers have an interest in trying to address the problem.

ROLLOVER STANDARDS

Senator LAUTENBERG. Do you have, for example, a specific time table for establishing rollover standards for SUV's?

Ms. MILLMAN. Our focus right now is on providing more information to consumers so that they have a better understanding of the rollover issue and how individual vehicle models perform. We are not pursuing a regulation or standard at this time.

Senator LAUTENBERG. We impose standards on trucks, on highway design, equipment that is used in construction, things of that nature. Why would it not be of interest to introduce some regulations so that we can ensure the bulk of the automobile-riding public that they are as safe as we would like to see them be, considering the difference in the structure of the vehicles?

Ms. MILLMAN. The agency has been trying to answer that question for 30 some years.

One of the concerns is defining the threshold. If we were trying to say that there was a limit on rollover propensity, we would have——

Senator LAUTENBERG. Do we have rollover standards for regular cars?

Ms. MILLMAN. No.

So, in trying to set rollover propensity limits, we are asking at what point are we likely to see serious injury if there is a crash, and we have not been able to define those limits.

Also, several factors play into the equation of whether the rollover is going to occur, and driver behavior is a significant part of that.

CONSTRUCTION STANDARDS FOR ROLLOVER PREVENTION

Senator LAUTENBERG. Yes, but the construction standards for automobiles include the impact of a rollover as well. Does it not?

Ms. MILLMAN. I am sorry. I did not follow your question.

Senator LAUTENBERG. Well, in the construction standards for cars, is there not a consideration of impact of an accident in terms of possible rollover?

Ms. MILLMAN. I do not believe so, no, but I will double check on that.

Senator LAUTENBERG. Is there a roof-crush standard?

Ms. MILLMAN. Yes.

Senator LAUTENBERG. So, it sounds to me like we ought to take a little bit closer look at the SUV's and that line of vehicles.

I thank you very much, all of you. And thank you, Mr. Chairman.

Senator SHELBY. Thank you, Senator Lautenberg.

Senator Gorton could not be here today, but I would like to note for the record that my colleague from Washington State, Senator Slade Gorton, wanted to be here to discuss the pipeline safety program and last summer's fatal accident, but he has been unavoidably detained. We will submit his statement on this issue for the record.

Senator LAUTENBERG. Mr. Chairman, may I just interrupt for a unanimous consent request, that a speech made by the Commandant, Admiral Loy, in December entitled Readiness: The Reality Behind the Numbers, be included in the record?

Senator SHELBY. Without objection, it is so ordered.

PREPARED STATEMENT OF SENATOR SLADE GORTON

Mr. Chairman, a tragic pipeline accident in Washington state last year that killed three young people has focused my attention, as it has my colleague's, Senator Murray's, and that of the entire Washington state delegation, on the operation and funding of a relatively small office within the Department of Transportation with the enormous responsibility of ensuring the safety of liquid and gas pipelines. I see

that the Administrator of the Office of Research and Special Programs, Kelley Coyner, within which the Office of Pipeline Safety is located will testify today.

I am pleased to see that the President has recommended an increase in funding for OPS. While the proposed expenditures sound reasonable, it was unclear to me from reading the budget how much of the funds and OPS resources will be committed to concluding rule-makings that are required by Federal law, but that are shockingly overdue: in some cases by more than five years. These rules are intended to deal with issues critical to pipeline safety, including the use and frequency of internal pipeline inspection and the use of emergency flow restricting devices and leak detection equipment. I understand that OPS intends, prompted largely by the tragedy in Bellingham, to consolidate many of these rulemakings into a single "pipeline integrity" proceeding that it hopes to conclude this year, at least with respect to large operators. I expect the Office of Pipeline Safety to do this, and to make this rulemaking an absolute priority.

Because of the interstate nature of pipelines, Federal laws and rules regarding their safety are largely preemptive, which is to say that states are generally prohibited from adopting stricter safety standards. Legislation introduced in both the House by Representative Metcalf, and in the Senate by Senator Murray, would relax this Federal preemption. I agree that state and local governments should have more authority. While Senator Murray's bill does not address this issue as directly as many in Washington state would like, it makes an excellent start and I intend very shortly to co-sponsor the bill and work with her on amending it to reflect the comments and concerns of the many interested parties in Washington state.

The debate over Federal preemption, however, will be held in the Commerce Committee, not here. For purposes of appropriations it is important to recognize that despite preemption, states play a significant role in pipeline safety. They regulate, by mile, significantly more pipeline than does the Federal Government because they regulate intrastate lines. On very limited occasions, the OPS has also designated states as its agent for purposes of inspecting interstate liquid pipelines, a designation that I understand Washington state would like to obtain in the interim before it is permitted by Federal law to assume greater authority. To assist states with these responsibilities, the Federal Government provides grants of up to 50 percent of the cost of state programs. I fully support an increase in the funds available for these grants to help cover the costs in 2001 of the new pipeline safety functions that have been proposed in a bill moving through the Washington state legislature.

READINESS: THE REALITY BEHIND THE NUMBERS

AMENITIES

It has been said that "a conference is a meeting to decide where the next meeting will take place." That may be true of the WTO meeting out in Seattle this week, but I have much higher hopes for this gathering. My confidence comes partly from knowing that the importance of military readiness will draw the serious attention it deserves and partly because the CNA has done its homework so well in creating a forum for us to consider readiness issues in a way that can actually lead to improving readiness.

The panel topics are relevant and practical. How do we assess readiness? Is there a people problem? Has operational tempo affected readiness? What are the operators saying? Have we shortchanged training, maintenance, and spare parts? How should we protect readiness?

I'm delighted to join you as you grapple with these issues. I am grateful to Robert Murray [President of CNA], Dr. Samuel Kleinman [CNA VP], and Dr. Laura Junor [Conference Director] for their role in bringing us together. And I thank all of the conference participants and attendees for your commitment to military readiness.

INTRODUCTION: DIFFERENCES BETWEEN BUSINESS AND MILITARY MEASUREMENT

Dave Thomas—the fellow who founded the Wendy's hamburger chain—wrote a book about his meandering path to success in life. In that book, he briefly explained his approach to measuring the health of his company.

As you might imagine from the commercials you've seen, Mr. Thomas didn't spend a lot of time poring over spreadsheets. He was a hands-on leader. He formed the habit of identifying a very small set of numbers that gave him a good sense of what was going on. He briefly checked those numbers every day, and then he spent the bulk of his energy out on the floor with his customers and employees exercising the kind of leadership needed to keep the numbers tending in the direction he wanted.

These few numbers tracked carefully—combined with a lot of personal involvement—were all he needed to have a clear grasp of where he stood.

Those of us in the readiness business quickly encounter problems when we try to follow Mr. Thomas's worthy example. If a small set of numbers exists that can convey an accurate sense of overall military readiness, it has so far eluded the most determined efforts to find it. Three important differences between hamburger stands and armed forces keep us from nailing down a convenient index of readiness.

One difference between Dave's way and our way is that businesses measure results whereas military planners measure potential. Instead of measuring what we have done—how many hamburgers we sold and how much money we get to keep—we try to measure surge capacity—what level of effort would we amass if faced with an emergency?

A second difference is that extraordinary human effort can undermine the apparent reliability of the measures that do portray our readiness condition. The devotion to duty so prevalent among service members often puts the lie to our honest claims of reduced capability. We saw that happen a couple months ago when Hurricanes Dennis and Floyd hit the eastern seaboard. The public saw the Coast Guard at the center of a massive and well coordinated disaster relief effort. What they didn't see was the intense scramble to locate parts and perform maintenance to get all of our Elizabeth City C-130's operational and to keep them flying throughout the operation. The performance they delivered could not have been predicted from analyzing our availability statistics, and we shouldn't kid ourselves into believing we can expect similar results as a matter of course.

A third difference is that our measures resist aggregation. No matter how big a hamburger chain grows, you can combine the financial statements of the individual units, look at the totals and the ratios between various lines, and get an idea of the overall strength. It's a lot harder to see what combinations of military units might be able to do if they are needed to work together.

The difficulty of measuring an intangible element like potential output quickly leads to the even more daunting challenge of explaining the basis for our readiness concerns to the American public, the administration, and to Congress.

My plan this morning is to skirt these difficulties in measurement by looking in detail at a single operational community within the Coast Guard—our fleet of C-130 aircraft—and illustrating how our parts shortages, personnel issues, and increased optempo are serious individual problems that compound the effects of the other problems.

I will focus on C-130's for three reasons.

First, they are a common currency among the armed services. Everybody flies them, so the lessons they offer may resonate more broadly through the audience than those of systems unique to the Coast Guard. C-130's are the class of operating assets that is most dependent on DOD systems. Many of the stresses we feel are downstream manifestations of pain that is also felt by DOD.

Second, C-130's are a microcosm of the readiness problems that face every operational community within the Coast Guard. The combination of aging assets and sensors, increased operational tempo, personnel shortages and inexperience, and parts shortages that besets our C-130's also hinders the effectiveness of our cutters and our other aircraft.

Third, C-130's epitomize previously stable trend lines that are now headed in the wrong direction. Four or five years ago, C-130's were our most reliable platform. Now we struggle to meet even our normal day-to-day commitments.

OPTEMPO, PARTS, AND PEOPLE

Those trend lines raise serious concerns. Over the past four years, HC-130 availability has dropped from almost eighty percent to barely sixty percent. Air Station Elizabeth City, North Carolina, has five C-130's, and they are expected to have one of them immediately available at all times. During the first six months of 1998, they met the standard for ail but one hour. During the first six months of this year, the hours without a ready plane jumped to thirty seven. A standard we used to achieve easily now seems unattainable. E City hasn't gone a single month without a coverage gap in more than a year.

Optempo immediately looms as one cause. We've always worked our C-130's hard. They're getting old. They fly low altitude patrols in a salty environment, and we program them to fly about a third more hours than the DOD services do. Over the past few years, we haven't added new planes, and our Search and Rescue obligations haven't been reduced, but we have asked our C-130's to perform a lot of deployments in support of our drug interdiction mission. As a result, C-130 days away from home station have increased more than 60 percent over the last four years.

We've lost a full 25 percent of our availability while piling on additional mission requirements. That one-two punch consumes a whole lot of flexibility and surge capacity. Optempo feeds our parts problems. Older assets worked harder can be expected to break more often. When they do, they need more parts—parts that are becoming more scarce and more expensive.

We try to keep the percentage of hours for which aircraft are not mission capable because of parts to less than five percent. Before 1995, we were consistently at or near this standard. Since then, our parts-related unavailability has steadily risen, standing now at about 16 percent, more than three times higher than it ought to be. Over this same period, the inventory value of C-130 parts awaiting repair or replacement has doubled.

As budgets increase more slowly than costs, the problem reaches crisis proportions and desperately improvident measures suddenly seem reasonable and necessary. We look for other sources of funds—places like the training budget—and we cannibalize parts from otherwise serviceable aircraft to keep others flying.

Experienced aviators recall times when cannibalization simply was not done. Today it is almost routine for air stations to have a designated "Hangar Queen" out of service for months at a time because its parts have been transplanted in other air frames. Cannibalization takes planes out of the rotation, increases the workload and maintenance on the other planes, and depletes flexibility in meeting response requirements.

Worse still, cannibalization transmutes our parts shortage into personnel problems. When we cannibalize, we double the maintenance workload. The normal way for a mechanic to replace a part is to take a box off a shelf, remove the defective part, and install the new part. One part removed, one part installed. With cannibalization, two parts have to be removed and two parts have to be installed.

This doubled work is performed today by less experienced maintenance crews than we had working a few years ago. The average time in grade of our chief aviation mechanics has dropped 50 percent over the last five years. What this means is that less experienced crews who should be getting more training are instead performing the extra work occasioned by cannibalization.

These personnel pressures inevitably affect retention. We train our aircraft mechanics to be professionals, and they take pride in doing their jobs right. Because they are professionals, they know when we're doubling their work, and they know that cannibalization isn't the right way to do their job. Sooner or later, they have to ask whether they are willing to work twice as hard as they should in order to get paid less than they're worth to do a job in a way that offends their professional conscience. When they leave, our personnel shortages get worse.

Overworking inexperienced crews in a good economy is not a good prescription for improving retention.

The story here is that optempo, parts, and personnel problems feed off each other and compound each other.

CONSEQUENCES

The practical real world consequences of this situation play out in our routine operations. During the month of October, we observed the following situations as a result of C-130 readiness problems. We missed law enforcement missions in Florida and in Alaska. We lost track of a suspected drug smuggler because maintenance issues forced a late launch. We lost training flights to SAR and LE missions. C-130's left their home bases late and returned early from law enforcement deployments because of maintenance problems. We had C-130's fly search and rescue missions at higher than normal search altitudes to compensate for cabin cooling limitations, thereby reducing the probability of detection. And we had C-130's reduced to visual searches because their radars didn't work.

When we suffer such effects in one month of normal operations, we know we're operating without a net when called to perform major operations.

We almost had a dramatic example when Hurricane Lenny cut a swath through the Caribbean a couple weeks ago. We had a deployed C-130 in the region, and like most C-130's it had deployed with exactly one crew—we can't afford to send spares.

Just when the C-130 was needed for disaster relief operations, one of the crew members needed a root canal and was medically grounded. As it happened, the afflicted person was a basic air crewman, and the operational commander granted a waiver to fly one person short. It worked out fine. However, if almost anybody else on that crew had needed that root canal, the flight would have been canceled. Think about it, the United States Coast Guard, *Semper Paratus* since 1790, was one toothache away from not being able to respond to a hurricane!

One aviator recently told me, "What we're doing now is all that we can do." The frugal taxpayer may rejoice to hear this proclamation, but the stranded boater surely does not.

The commanding officer at Air Station Barbers Point in Hawaii recalls the airlift undertaken when the super typhoon Paka hit Guam around Christmas of 1997. We mounted an all-out relief effort to bring Red Cross supplies out to the western Pacific. Looking at current availability rates for his C-130's, he doubts he could deliver an encore performance this Christmas.

These problems also affect other armed services. Our air station out in Hawaii has a Long-Range Intercept mission requirement to have a C-130 available in case a civilian airplane has to ditch. Our air station increasingly finds itself unable to meet this requirement and has had to pass it off to Navy P-3s for as much as two days at a time. The P-3's are less well suited for this mission, and they already have jobs. So our readiness problem ends up becoming the Navy's readiness problem.

If that had happened last week, the results could have been deadly. A general aviation plane did have to make a nighttime ditching, and a C-130 was needed to get on scene to mark the ditch course with lights and get a fix on the downed aircraft.

AIRSTA SACRAMENTO SAR CASE: LACK OF READINESS MAY ALREADY BE COSTING US
LIVES

In one case last month, our readiness problems may have prevented us from saving a life. Air Station Sacramento has four C-130's. At the time of this incident, the first C-130 was the ready aircraft on immediate standby, and a second was ready to fly as a backup to the first. The third plane was deployed for counterdrug operations out of the country, and the fourth one was the hangar queen. It had been out of service since April and was being used as a parts source for the other planes.

This situation might have been tenable except that the second C-130—the backup to the ready aircraft—was overdue for some maintenance that could be extended only for a few more days before the airplane would have to be grounded.

The air station had to perform the maintenance, but scheduling the maintenance required them to choose a day on which they would have no backup to the ready C-130. Not having a backup is a bad situation for a search and rescue unit because mariners tend not to consult our availability schedules before getting themselves lost, and some of them persist in remaining lost until multiple sorties are flown.

But there was no choice. The air station picked a day with no law enforcement patrols planned, scheduled the maintenance, and took the plane off line to perform the work. Sure enough, there was a SAR call on the day they picked. Ordered to locate the source of an EPIRB alarm, the ready aircraft took off, flew 500 miles off Cape Mendocino, and found a genuine distress situation. A dismayed sailboat was battling 70 mile per hour winds, mountainous seas, and low visibility. The boat's lone occupant was in serious trouble. The air crew could see him through the weather from time to time, but they couldn't establish communications. They dropped a radio to the sailboat, but the operator wasn't able to retrieve it from the heavy seas.

Surface units were en route, but help was hours away.

In a case like this—crippled vessel, extreme weather, no communications—we definitely wanted to maintain continuous air presence until a cutter could arrive on scene. And we could have maintained that presence if our second C-130 had been ready to fly.

But it wasn't. It was being worked on, and there was no way to button it back together in time. We looked for other assets and found an Air National Guard C-130 in Portland, Oregon, but the distances involved meant that our C-130 would head home well before the relief plane arrived.

The Air National Guard plane reached the scene as night was failing. By that time, the EPIRB had stopped transmitting. There was no sign of the sailboat, no sign of its occupant. Nothing but wind and waves and rain.

We searched for six days. We flew eleven C-130 sorties from Sacramento. We brought in a buoy tender, a medium endurance cutter, and a high endurance cutter with an embarked HH-65 helicopter. The Air National Guard continued to provide C-130 support, and a USNS ship diverted to help. A huge effort. Spent more than we did on the more publicized JFK case. All we found was some debris.

A second C-130 might not have made any difference to the lost sailor. It's possible that he would have died even if we had kept a plane overhead. But at the very least, we would have known when and where his boat went down.

This case illustrates four unacceptable consequences of our readiness situation. First, we jeopardize our own crews by sending them into situations in which we

know we can't provide a backup if they get into trouble. Second, we don't have the confidence we ought to have that we are giving stricken mariners the best possible chance to be rescued. Third, our inability to do the job right the first time requires the expenditure of far more resources than would have been needed if the right assets had been available when first needed. And fourth, when we finally close the case, we find our already precarious readiness posture has been further degraded by the parts and the people we burned out in the too-much-too late rescue effort.

A readiness climate in which we habitually make extraordinary expenditures when it's too late because we can't bring the right resources to bear when it matters is simply intolerable to me—and ought to be intolerable to the American public.

CONCLUSION

Earlier in my remarks, I mentioned a ditching case out in Hawaii. Everybody involved in that case praised the downed pilot for his poise and professionalism. After being rescued, the pilot explained why he remained calm and confident throughout his ordeal. He said, "You know if you can hang on until the next morning that you're going to make it because the Coast Guard is going to come and get you. It's just a matter of if you can hang on."

Will Rogers once said that it's not what you don't know that gets you in trouble, it's the things you know that ain't so. This civilian pilot represents the American public in that he "knows" the Coast Guard will be there to save him if he can just hang on. Unfortunately, his knowing doesn't make it so.

I believe the readiness problems in the C-130 world mirror similar problems of similar magnitude in our other operational communities. In fact, given that our C-130 fleet is younger and better maintained than many of our cutters, it's almost inevitable.

The unfavorable trends in aircraft availability, parts inventories, and crew experience challenge our ability to provide mariners in distress with the rescue services Americans have come to expect.

These problems impose two responsibilities upon us, which I will offer as challenges for this conference.

The first responsibility is to speak frankly about the seriousness and the extent of the problems we face. We cannot permit the public to learn of this situation only when we fail dramatically to provide some service the taxpayers think they paid for. Many of our readiness issues are the sort of problem that really can be solved by throwing money at them. Twelve or thirteen million dollars to restore our parts inventories to where they were a few years ago would be a nice place to start. We should say so.

The second responsibility is to come up with better ways to think about managing our readiness challenges. Understanding that immediate relief from budgetary constraints is unlikely, we need to attend very seriously to the problems that will persist when we shake the money tree and nothing falls into our baskets. Not having enough is not a sufficient reason for not doing our best with what we have. We will all face difficult choices about balance, setting priorities, deciding where to allocate the next dollar. This conference offers an excellent opportunity to frame our understanding of the work that lies ahead.

Thank you.

ADDITIONAL COMMITTEE QUESTIONS

Senator SHELBY. Additional committee questions will be sent to the respective agencies for response in the record.

[The following questions were not asked at the hearing, but were submitted to the Agencies for response subsequent to the hearing:]

QUESTIONS SUBMITTED TO THE RESEARCH AND SPECIAL PROGRAMS ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

DEPARTMENT-WIDE REVIEW OF THE HAZARDOUS MATERIALS PROGRAM

Question. DOT will release shortly a departmental Hazardous Materials Program Evaluation in which the Office of Inspector General participated. What results do you expect from this evaluation?

Answer. The evaluation is showing some positive trends. For example, we expect DOT to establish a central focal point to coordinate a DOT-wide Hazardous Mate-

rials program. We will let Congress know when the results of this evaluation are released.

USER FEES

Question. What has been the reaction from the pipeline industry to this proposed increase in user fees.

Answer. It would not be appropriate for us to speak for the industry on this matter.

Question. If the proposed increase in user fees is rejected by Congress (as so many of the Administration's user fee proposals have been), what other potential funding sources are available.

Answer. We have no other proposed funding source.

GRANTS

Question. Why are interstate pipeline companies being asked to shoulder the entire cost of this program despite the authorization?

Answer. Outside force damage associated with construction is the leading cause of pipeline failures. It is the cause of at least 33 percent and 18 percent of the incidents in Gas Transmission and in Hazardous liquid lines, respectively. When we determine pipeline user fees, we prorate the assessment between gas and liquid in accordance with the degree of benefit which they accrue as a result of the Pipeline Safety program implementation.

QUESTIONS SUBMITTED BY SENATOR PATTY MURRAY

INTERSTATE PIPELINES

Question. What do you mean when you say that you want to expand and strengthen partnerships with states?

Answer. We have been committed over the past several years to working with states to strengthen the pipeline safety partnership and to providing adequate resources to support their activities. This budget provides record resources to increase states capabilities and builds on the actions we have taken in the State of Washington to work together to comprehensively evaluate and improve pipeline safety.

Question. Could you explain in what areas you would be comfortable seeing states have regulatory authority over interstate pipelines if they prove they have the money and the expertise to do so?

Answer. We do not support giving the states regulatory authority over interstate pipelines. The intention to "expand and strengthen partnerships with states" did not include giving states regulatory authority. Yet, we support states lending their technical knowledge and expertise to the Office of Pipeline Safety's oversight of interstate pipelines in areas where states knowledge of local safety and environmental concerns can be used to improve pipeline safety. We also support states being involved in responding to incidents, investigating and monitoring corrective measures with respect to safety-related conditions and other local conditions that increase risks to pipelines, handling local complaints and related inquiries, monitoring pipeline construction and reporting noncompliance with design and construction standards to OPS. We appreciate the states' involvement and knowledge in these areas.

PERIODIC INSPECTIONS

Question. My bill and the House bill will require periodic inspections every five years. Will your rule require mandatory periodic inspections? If not, what mechanism will be in place to ensure that we are relying on more than the industry's own self-interest?

Answer. Shortly, the Department will issue a rulemaking which will establish requirements for periodic testing. This rule will incorporate by reference a national consensus standard which identifies specific enforceable standards for the interval for internal inspection, repair criteria, and mitigation measures such as extra valves. The Department is concerned that a five year interval may result in some lines being tested too frequently. And it may be desirable to test some lines more often. Indeed through administrative action, the Department has required pipeline companies to test as frequently as every six months to a year. Similarly, the condition and nature of other lines does not merit testing as frequently as every five years, and we would prefer that safety resources be devoted to other more important activities.

CERTIFICATION

Question. Why don't you think it is feasible to have individual federal certification and testing of operators? It is feasible in the airline industry where the FAA determines the capabilities of individual employees who work on aircraft.

Answer. To be done properly, individual federal certification and testing of pipeline employees would be extremely costly. We believe that worker qualification will be achieved more effectively and efficiently by implementation of the operator qualification rule which we issued last year. To be qualified, an individual must be able to demonstrate the ability to successfully and consistently perform the task. Regulators will be looking to the operator to show how individuals performing covered tasks have been evaluated to ensure they are qualified.

OPS expects testing and certification to be a major way in which operators demonstrate that an individual is capable of safely and effectively performing a covered task. However, the testing and certification will be done under established national certification programs in the private sector rather than by creation of a new Federal program.

RESEARCH AND DEVELOPMENT TECHNOLOGY

Question. What types of research and development is OPS undertaking to better the level of inspection technologies?

Answer. We are completing a \$3.1 million research contract which commenced in June 1996 to identify and characterize pipeline mechanical damage by advancing magnetic flux leakage technology on an in-line inspection device, or "smart pig." This research was conducted under a Memorandum of Understanding with the Gas Research Institute (GRI). The research team of Battelle, Southwest Research Institute, and Iowa State University conducted the research. The laboratory work conducted under this research has revealed a multilevel magnetization signal is needed to fully characterize the two components of mechanical damage, which are the changes in pipe geometry and changes in the properties of the pipe metal resulting from mechanical damage. A procedure to distinguish the difference using the multiple magnetization level approach has been proven. The research team has also determined the effects of pipe stress and mechanical damage on the magnetic fields induced in the pipe wall by magnetic flux leakage "pigs" and has evaluated alternative methods of classifying and characterizing mechanical damage using neural networks and nonlinear harmonics. This work may allow a mechanical damage detection capability to be added to existing corrosion "pigs". In fact, a domestic "pig" vendor, Tuboscope Vetco Pipeline Services, is testing a prototype mechanical damage "pig" using data obtained as a result of this research.

At GRI's Pipeline Simulation Facility (PSF) near Columbus, Ohio, the research team upgraded the "pig" that serves as the Test Bed Vehicle (TBV) with state-of-the-art sensors, a new data acquisition system, and a more robust magnetizer system. The TBV has been used to gather data on mechanical damage defect sets in the 300-foot pull rig and in the 4700-foot pressurized flow loop located at the PSF.

A final report on the three-year research is being drafted and should be completed by the end of April. Once completed, it will be available on the Office of Pipeline Safety's Internet web site, <http://ops.dot.gov>.

The three-year research project was conducted with orientation of the magnetic field in the conventional direction along the longitudinal axis of the pipe. An fiscal year 2000 initiative will identify and characterize mechanical damage by conducting testing with the magnetic field in the pipe's circumferential direction. We expect completion by April 2002.

OPS has also requested funding for fiscal year 2001 to advance technologies for pipeline monitoring and pipe locating for broader use in protecting underground facilities. We expect to develop approaches to monitoring activity on the pipeline right of way so that excavation damage can be discovered in real time or near real time to preclude accidents from occurring. There is a range of emerging technologies for monitoring which can be used for prevention or detection of damage which deserve more research attention to advance their application to prevent pipeline failures. These would include use of acoustics, satellites and impressed current. We also have requested funding to identify and evaluate location equipment for buried plastic gas mains and services, develop performance criteria for improved generations of equipment with the desired locating capabilities, and investigate alternative ways to design plastic pipe so it can be more easily located.

REAUTHORIZATION BILL

Question. When do you plan on sending the Administration's pipeline safety reauthorization bill to Congress?

Answer. We will be sending the Administration's proposal shortly.

 QUESTIONS SUBMITTED TO THE U.S. COAST GUARD

QUESTIONS SUBMITTED BY SENATOR BARBARA A. MIKULSKI

COAST GUARD YARD—CORE FACILITY

Question. I'd like to raise the issue of the Curtis Bay Coast Guard Yard with Vice Admiral Card. As you know, the Coast Guard Yard has played a vital role in ensuring the readiness of the Coast Guard fleet through the construction, repair, and renovation of both vessels and aids to navigation peculiar to the Coast Guard.

The Yard provides essential capabilities that are simply not available in commercial shipyards. Those capabilities include the Yard's instant response for emergency and non-emergency work, special ordnance and electronic repair expertise, instant ability to obligate funds without pre- and post-contract requirements and delays, and no-risk performance guarantees. Without the help of the Yard, the Coast Guard would be unable to maintain its fleet and therefore unable to meet its mission of saving lives.

Do you consider the Curtis Bay Coast Guard Yard to be a Core Logistics Facility?

Answer. Yes. In response to requirements outlined by the Coast Guard Authorization Act of 1988, the Secretary of Transportation provided a list of "essential logistics" activities. The Coast Guard Yard is on that list. The Yard remains an essential component to meet Coast Guard support requirements for our fleet.

COAST GUARD YARD POLICY STATEMENT

Question. If so, will you state that the Curtis Bay Coast Guard Yard is a Core Logistics Facility in the policy statement that is currently being developed by Headquarters?

Answer. Yes, the Coast Guard will reaffirm the essential nature of the Yard in our new policy statement. Over the past 100 years, the Yard has adapted to significant changes and challenges the Coast Guard has faced. The Yard's flexibility is a key component of its value to the Coast Guard. The Coast Guard continues to evaluate how the Yard can best meet the needs of the fleet and also lend its expertise to other government agencies. The Coast Guard's assessment in this regard is a continuous process and includes accounting for changes in its fleet size and opportunities for new business.

REFURBISHING USCGC MACKINAW

Question. Also, is the Coast Guard giving serious consideration to refurbishing the Great Lakes Icebreaker at the Curtis Bay Coast Guard Yard?

Answer. The Coast Guard intends to replace (not refurbish) Coast Guard Cutter MACKINAW with a new construction multipurpose icebreaker.

The Coast Guard has determined that a competitive procurement is the most appropriate strategy to achieve performance, cost, and schedule objectives. Market surveys conducted by the Coast Guard reflect significant commercial interest in this acquisition.

USCGC MACKINAW REFURBISHMENT DECISION TIMELINE

Question. When will the Coast Guard decide where the Great Lakes Icebreaker will be refurbished?

Answer. The Coast Guard intends to replace (not refurbish) Coast Guard Cutter MACKINAW with a new construction multipurpose icebreaker. The Coast Guard intends to award a commercial contract to design and build the Great Lakes Icebreaker during the third quarter of fiscal year 2001.

AIR-21 IMPACT

Question. Admiral Card, as you know, the Senate and the House currently are conferencing on the so-called AIR-21, the FAA reauthorization bill. One of the areas that remains unresolved is the issue of budgetary treatment for aviation programs. The House has proposed to create a firewall that would guarantee both trust funds

revenues as well as general tax revenues for aviation programs. What impact would the House's budgetary treatment proposal have on Coast Guard safety programs?

Answer. AIR-21 mandates large increases for FAA capital spending under the budget caps, making it more difficult to fund other discretionary programs, including the Coast Guard. Nevertheless, safety programs are a core mission which we will attempt to protect and we will continue to seek your support for the funding levels for the Coast Guard requested in the President's Budget.

QUESTIONS SUBMITTED TO THE NATIONAL HIGHWAY TRAFFIC SAFETY
ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

ADVANCED SIDE GLAZING

Question. Has NHTSA finalized its decade-long research of this technology, and if not, when can we expect its completion?

Answer. NHTSA is conducting additional research to address potential adverse safety effects that advanced glazing may cause. Specifically, this glazing might have durability problems, might make rescue more difficult by entrapping people in vehicles, and might increase head and neck injuries if it does not break out. To better judge the costs associated with advanced glazing, NHTSA is examining whether installing this glazing in windows without frames is feasible and cost beneficial. As a result of these concerns, NHTSA is currently conducting tests and performing further analyses to determine an appropriate test impact speed, to ensure repeatability of test procedures, and to evaluate selected impact points. This research is expected to be completed by the end of August of this year, at which time the agency will have sufficient information to arrive at a regulatory decision regarding ejection mitigation. However, with the new laminated window materials, the increased use of laminated side windows in Europe and Mexico, and a drive for harmonized world glazing standards, it is important that NHTSA continue research to provide objective analysis of the evolving safety opportunities and implications of advanced glazing. Furthermore, research will continue beyond August for studying entrapment issues, lacerations, and the revised costs associated with the newer ejection resistant glazing systems that will be introduced to the marketplace.

Question. What other projects is NHTSA working on that take precedence?

Answer. Ejection mitigation research is one of NHTSA's efforts with a high potential of large safety benefits. Consequently, this research has been fully funded and is underway. The side head air bag research is a parallel research program with the advanced glazing research program. Both of these research efforts are targeting the same potential benefit for reducing ejection likelihood.

Question. What is the status of testing advanced side glazing for head and neck impact injury?

Answer. Substantial work on evaluating the head and neck injury potential of advanced side glazing has been completed. The results and analysis from this effort are contained in the August 1999 status report. Additional analysis of head and neck injury is planned.

The dummy neck responses in the sled tests were not repeatable, especially for the tempered glass impacts. Therefore, an additional series of sled tests was performed, using tempered glass. The results from these tests are currently being analyzed, and additional testing may be required.

The level of door frame modification directly affects the occupant retention capability of advanced side glazings. The agency is, therefore, examining what effect that door frame modification has on head injury potential. The free-motion headform is being used to measure head responses from impacts into advanced side glazings mounted with differing levels of door frame modifications. This testing is currently underway.

These additional head and neck injury evaluations will be completed in August 2000.

Question. Does it make sense to implement side glazing standards while NHTSA pursues other more long-term research into preventing ejections and roll-overs?

Answer. The agency expects to complete its advanced side glazing testing in the fall of 2000. The agency will make its final decision once the advanced glazing testing is complete and agency staff have had the opportunity to review the results of the testing. At that point, the agency will be able to compare the relative merits and drawbacks of side glazing standards versus other technologies to prevent roll-over ejections.

SEATBELT USAGE

Question. Ms. Millman, has your agency shied away this goal?

Answer. NHTSA has not shied away from the goal of 85 percent seat belt use. While it is apparent that an 85 percent use rate is a very ambitious goal, steady progress is being made and we plan to maintain our vigorous approach to raising seat belt use rates nationwide. Two states, California and New Mexico, currently exceed 85 percent belt use. Eight other states, the District of Columbia and Puerto Rico, have use rates near 80 percent.

The agency has outlined a two-pronged approach to achieve a significant increase in seat belt use over the next year. This two-pronged approach requires NHTSA to (1) expand the scope of the Buckle Up America Campaign in all 50 states; and (2) focus on several opportunities including: states with high seat belt use rates, states with new primary laws, states with potential to increase belt use, and states likely to pass primary seat belt laws.

In addition to the two-pronged approach, NHTSA has also assisted the states financially with grant money authorized in the Transportation Equity Act for the 21st Century (TEA-21). TEA-21 authorized \$500 million over the next five years in grants to encourage states to increase seat belt use rates. In November 1999, NHTSA awarded \$54.6 million to 34 states, the District of Columbia, and Puerto Rico in incentive grant funds used for supporting programs that encourage seat belt use. In February of this year, NHTSA awarded 44 states, the District of Columbia, and Puerto Rico grants worth \$25 million for innovative projects to promote increased seat belt use rates.

Also, Section 405 of TEA-21 calls for occupant protection incentive grants to be awarded to States that adopt and implement effective programs to reduce highway deaths and injuries resulting from individuals riding unrestrained or improperly restrained in motor vehicles. In fiscal year 1999, NHTSA awarded 43 states and territories \$9.5 million in funding.

The combination of a two-pronged approach and grant money for the states should result in a substantial increase in seat belt use.

STATE SURVEY ON SEAT BELT USE

Question. I understand that the NHTSA has collected the latest state survey data regarding seat belt use. What does the data tell us that seat belt usage is increasing?

Answer. By March 1, 2000, all states, except South Dakota and Wyoming, submitted data from seat belt observation surveys conducted in 1999. South Dakota and Wyoming informed the agency that they had conducted no observational survey in 1999. New Hampshire submitted an observed use rate without an accompanying report, and informed the agency that the survey methodology they had employed was not in compliance with the uniform criteria developed by the agency for the Section 157 incentive grant program. The agency has not yet completed the technical review of the submitted reports to verify the accuracy of the reported usage rates. However, a preliminary analysis of the reported rates indicates the average of the states' usage rates for 1999, weighted by vehicle miles traveled, is approximately 70 percent, up approximately one percentage point from the weighted average for 1998.

Question. Considering that seat belt usage has remained essentially flat during the past four years, what new strategies is NHTSA intending to implement to achieve this goal?

Answer. The agency acknowledges that seat belt use has not grown much as we hoped. It is apparent that the 85 percent use rate is a very ambitious goal. NHTSA plans to maintain a vigorous approach to raising seat belt use rates nationwide. Two states, California and New Mexico, currently exceed 85 percent belt use. Eight other states, the District of Columbia and Puerto Rico, have use rates near 80 percent. The agency has outlined a two pronged approach to achieve a significant increase in seat belt use over the next year. This two pronged approach requires NHTSA to: (1) expand the scope of the Buckle Up America Campaign in all 50 states; and (2) focus on several opportunities including: states with high seat belt use rates, states with new primary laws, states with potential to increase belt use, and states likely to pass primary seat belt laws.

Question. Is the goal for 2005 to increase seat belt usage to 90 percent more realistic than the 85 percent goal?

Answer. The goals to reach 85 percent by 2000 and 90 percent by 2005 are both realistic. A primary reason that these goals can be met is the large amount of grant money that has become available under the Transportation Equity Act for the 21st Century (TEA-21). TEA-21 authorized \$500 million over the next five years (beginning in fiscal year 1999) in incentive and innovative grants to encourage states to

increase seat belt use rates. In 1999, NHTSA awarded \$54.6 million in incentive grants to 34 states, the District of Columbia, and Puerto Rico. The grant funds will be used to support highway safety programs, including those encouraging seat belt use and special traffic enforcement programs. In addition, funds have been awarded to States to carry out innovative projects to promote increased seat belt use rates. In fiscal year 2000, 44 states, the District of Columbia, and Puerto Rico have been awarded grants worth \$25 million. Also, under Section 405 of TEA-21, the legislation calls for a second occupant protection incentive grant program to reduce the number of Americans riding unrestrained in motor vehicles. In fiscal year 1999, 43 states and territories received \$9.5 million to increase belt use.

To assist the states in implementing their new program efforts and to insure that national goals are met, the agency has outlined a two-pronged approach to achieve a significant increase in seat belt use. This two-pronged approach requires NHTSA to: (1) expand the scope of the Buckle Up America Campaign in all 50 states; and (2) focus on several opportunities including: states with high seat belt use rates, states with new primary laws, states with potential to increase belt use, and states likely to pass primary seat belt laws.

QUESTIONS SUBMITTED BY SENATOR BEN NIGHTHORSE CAMPBELL

ROLE OF THE NTSB IN THE AIR BAG TEST DECISION-MAKING PROCESS

Question. Could you please tell me what role the NTSB plays in your decision-making process? Aside from the statistics and recommendations provided from the NTSB, on what other input do you rely?

Answer. The NTSB interacts with NHTSA both informally and formally on scientific and policy levels. Informally, respective staff members coordinate activities on technical issues, exchange ideas, and share crash investigation results. The automotive safety information exchange benefits all participants in the decision making process. On a more formal basis, NHTSA attends numerous NTSB hearings and briefings to learn more about NTSB's investigations of automotive safety. NHTSA also carefully considers any comments submitted by the NTSB to our formal rule-making dockets. Periodically (usually annually), the NTSB issues a series of recommendations designed to shape NHTSA's rulemaking strategies. NHTSA replies to the NTSB's recommendations in writing, either providing reasons for implementing the recommendation, or informing the NTSB that an alternative approach may more effectively attain the stated objective. The NTSB's recommendations, together with NHTSA's responses, represent an iterative process that concludes only when the NTSB determines that a specific recommendation is "Closed—Acceptable Response." More often, NHTSA's actions in meeting the NTSB's recommendations are rated as "Open-Acceptable Response," or "Open—Acceptable Alternative Action," simply because most regulatory actions are of long duration. In summary, NHTSA benefits from NTSB inputs to NHTSA's automotive engineering knowledge and in mutual efforts to improve Federal Motor Vehicle Safety Standards by:

- attending NTSB conferences, symposia and safety hearings;
- responding to NTSB recommendations for improving automotive safety;
- reviewing NTSB formal comments submitted to our rulemaking dockets;
- participating informally with NTSB staff to advance safety performance standards.

Question. Since the NTSB cannot make any regulations, and can only provide recommendations for safety improvements, what recourse is there if their data and recommendations are in dispute with your new rule?

Answer. NHTSA and the NTSB both believe transportation safety is the number one goal of our efforts. On those occasions when there are reasonable differences, NHTSA and the NTSB openly share technical reports and supporting data so that both entities are well aware of the other's position. NHTSA respects and always weighs the NTSB's opinions as extremely significant.

If the NTSB continues to disagree with an NHTSA decision, the NTSB can and does re-address its opinions and concerns to NHTSA and the Secretary of Transportation. NHTSA has found that the inputs of the NTSB are informative and add value to the deliberations. For example, in a recent significant rulemaking, NHTSA specifically solicited the NTSB's comments and delayed deliberations when agency staff noted the NTSB's comments were absent at the end of the open comment period. The NTSB did provide comments shortly after the deadline, and the comments were considered. In general, when there is a substantive disagreement, NHTSA frequently conducts scientific tests and analyses to reinvestigate the NTSB's assumptions and conclusions.

However, in making decisions that concern ongoing rulemaking actions, NHTSA relies on its knowledge of advanced automotive engineering and test results acquired at NHTSA's test facilities. Moreover, NHTSA is required by law and executive orders to consider additional factors in decision making that are not required of the NTSB.

Question. Has NHTSA looked into the recommendations of the NTSB? Do you plan on issuing a rule such as the one proposed?

Answer. NHTSA requirements regulate new vehicles that carry 11 or more persons that are sold for transporting students to or from school or school related events. Those vehicles are required to meet all Federal Motor Vehicle Safety Standards (FMVSS) for school buses. The FMVSSs applicable to school buses require that school buses have safety features over and above those of other passenger vehicles. Under 49 U.S.C. 30101, et seq., a vehicle is regarded as being sold for use as a school bus if, at the time of sale, it is evident that the vehicle is likely to be significantly used to transport students to or from school or school related events. This statute applies to school buses sold to public as well as parochial schools. Thus, a dealer selling a new 15-passenger van to be used for school transportation must ensure that the van is certified as meeting our school bus FMVSSs. Again, NHTSA regulations can only apply to the manufacture and sale/lease of new vehicles. Each State prescribes its own regulations that apply to the use of any vehicle that is used to transport students. It has been a long standing agency policy that school buses be used to transport school children to and from school or an event related to school.

NTSB did not make any safety recommendation on this subject to NHTSA. The safety recommendation from NTSB went to the governors of all 50 states and the District of Columbia. The safety recommendation asked that the jurisdictions that have the authority to regulate the type of vehicles that are used for school transportation, require that those vehicles carrying more than ten passengers (buses) and transporting children to and from school and school related activities (including but not limited to, Head Start programs and day care centers) meet the Federal school bus safety standards.

REGULATIONS ON HOW FAR/LONG VANS MAY BE DRIVEN

Question. I also understand that unlike those rules governing commercial bus drivers, no regulations exist covering how far or how long vans may be driven. Is this an area of concern for NHTSA? Does NHTSA have any plans to address this issue?

Answer. Safe transportation is always a concern of NHTSA. The agency has advocated through our traffic safety program the effects of fatigue and other conditions that impair a person's ability to drive a motor vehicle safely. However, NHTSA does not have the authority to issue regulations regarding how far or how long vans can be driven. Currently, the States have authority to issue regulations regarding how vehicles are used. Federal requirements pertaining to this type of regulation come under the jurisdiction of the new Federal Motor Carrier Safety Administration.

ROLLOVER COUNTERMEASURES

Question. With the increasing popularity of SUV's, rollover crashes are becoming more frequent and a more significant injury/fatality statistic. Some domestic auto manufacturers have already gone on record with plans to install rollover countermeasures in the near future. How does DOT/NHTSA propose to address this issue? For example, does the government plan to require these types of systems for rollover protection.

Answer. NHTSA has been conducting tests and studying the issue of rollover for several years. Both static stability tests and dynamic rollover tests have been conducted since 1997. In July 1999, the agency published a report on the results of the rollover research program. The agency has developed, and plans to issue within a short time, a Request for Comments on a Consumer Information Program giving rollover risk ratings for passenger cars and light trucks, in lieu of rulemaking at this time. NHTSA also intends to continue its dynamic rollover research program, and to evaluate any rollover countermeasures that might be developed.

AUTOMOTIVE SAFETY FOR AN AGING POPULATION

Question. The aging of the baby-boomer generation raises significant(ly the) population of imminent elders. Older people are more susceptible to injuries and fatalities. As the baby-boom generation ages, (the) sheer number of this population segment (will) heighten the importance of this issue. At present, occupant protection strategies are focused on younger adults. What do the government regulatory bodies intend to do to address automotive safety for an aging population?

Answer. Secretary Rodney Slater has indicated the high priority he places on this issue, and his desire that the Department undertake additional initiatives to assure continuing safe transportation for older adults. NHTSA, the Federal Transit Administration, and the Federal Highway Administration have numerous projects underway that will contribute to meeting the challenge of preparing the transportation system to accommodate this rapidly growing segment of society.

NHTSA is pursuing several approaches in its efforts to protect older drivers and passengers of motor vehicles. NHTSA is looking at a range of safety issues involving older occupants of vehicles, from ways to help them avoid crashes (e.g. regulatory changes to reduce headlighting glare) to ways to protect them from injury when crashes do occur. The current state of crash dummy development already provides a level of instrument calibration that allows us to address the particular susceptibilities of older individuals. NHTSA expects older occupants to benefit from air bag improvements, including dual stage systems, resulting from the current agency rulemaking on advanced air bags.

Other agency activities include collaboration with the Centers for Disease Control and Prevention and the National Institute on Aging to update the transportation research and development requirements for the elderly for the next 25 years. This research plan will be published by the Transportation Research Board this year. NHTSA also is working with the AAA Foundation for Traffic Safety and the Eno Transportation Foundation to initiate a national dialogue on the transportation needs of older adults and to devise solutions where problems are found.

In addition, NHTSA is examining several new technologies as part of the Intelligent Transportation System (ITS) Intelligent Vehicle Initiative (IVI), to help older drivers avoid crashes. These technologies have the potential to help meet the special needs of older individuals—needs such as slowed reactions, sensitivity to glare, and a narrowed field of view. Among the in-vehicle technologies the agency is examining are collision warning and near-object detection systems for backing and lane changing, night vision enhancement, forward collision avoidance systems, and intelligent cruise control.

MODIFICATION OF THE DEFORMABLE BARRIER

Question. The Federal Motor Vehicle Safety Standard (FMVSS) 214 moving deformable barrier test is configured to represent a typical passenger vehicle. Significant increases in SUV purchases, however, indicate a potential need to modify the deformable barrier to better represent real-world vehicle crash scenarios. Are there plans to do so to more accurately reflect this shift in the automotive population?

Answer. On July 2, 1998, Advocates for Highway and Auto Safety (Advocates) submitted a petition for rulemaking requesting that FMVSS 214, "Side Impact Protection," be upgraded. In its petition, Advocates indicated that the requirements of FMVSS 214 are insufficient to provide adequate protection to occupants of passenger cars and small LTVs when their vehicles are struck on the side by larger, heavier and more aggressive vehicles. Advocates argued that the moving deformable barrier (MDB) of FMVSS 214 is not high/heavy enough because the MDB was originally designed in 1988 for a vehicle fleet that was projected to be lighter and smaller than the current vehicle fleet population. Advocates also argued that the test dummy of FMVSS 214 should be replaced with the EuroSID-1 dummy which has more measurement capability. The petitioner recommended that FMVSS 214 be amended to a higher safety performance level so that superior side impact air bags would be developed and installed in vehicles as standard equipment. The agency granted the Advocates' petition because the current NHTSA's research plan on side impact protection will fully address the issues in the petition.

The agency delivered a second Report to Congress in June 1999 on the rulemaking status of FMVSS 214. This Report to Congress contained current results and the agency's research plan. With respect to the impact barrier (MDB) upgrade, the agency initiated a crash data analysis using 1988-1997 NASS/CDS data to characterize the current and future side impact crash environment in the United States. The study addresses issues concerning vehicle involvement, occupant exposure, and incidence of casualties with special emphasis on determining the mechanisms of injury. Recognizing the growing population of light trucks in recent years, the agency plans to re-examine the current MDB weight, geometry, and stiffness.

The agency started the research needed to make the deformable barrier more representative more than a year ago. NHTSA plans to finish this research within two years and propose any appropriate changes to the barrier then.

QUESTIONS SUBMITTED BY SENATOR FRANK R. LAUTENBERG

STATE DATA PROGRAM

Question. Your budget request for the State Data Program is for \$3.024 million, the amount enacted for fiscal year 1999 and a \$600 thousand increase over the current fiscal year funding.

Why is the increase needed?

Answer. In fiscal year 2000, the State Data Program request was cut \$600 thousand from the requested level to comply with an overall limitation in the Research and Analysis budget. Consequently, the amount of funding available for implementing new Crash Outcome Data Evaluation System (CODES) grants and the new CODES Data Network grants was reduced. The additional funding requested for fiscal year 2001 will permit 4 grants to new CODES states to be awarded, new CODES Data Network grants to be awarded to the remaining qualified CODES states, and second year funding to the states that were awarded Data Network Grants in fiscal year 2000.

USE OF STATE DATA FUNDS

Question. Since there are only 2 NHTSA employees assigned to this program, provide a breakdown of the uses of the funds expended in fiscal year 1999, fiscal year 2000 to date and the anticipated uses of the fiscal year 2001 funds?

Answer. The following table shows the breakdown of spending in the State Data Program area for fiscal year 1999 and anticipated spending for fiscal year 2000 and fiscal year 2001.

[In thousands of dollars]

| Spending area | Fiscal years— | | |
|---|---------------|-------|-------|
| | 1999 | 2000 | 2001 |
| 17 State Data System Operation and Analysis | \$177 | \$195 | \$260 |
| State Data Electronic Collection Project | 308 | n/a | n/a |
| Model Minimum Uniform Crash Criteria (MUCC) Support Development/ Implementaion | 89 | 120 | 85 |
| New CODES/Other CODES Grants | 2,245 | 950 | 1,350 |
| CODES Data Network | n/a | 795 | 1,015 |
| CODES Contractual Support | 205 | 284 | 314 |
| TOTAL | 3,024 | 2,344 | 3,024 |

STATE ELECTRONIC FILES

Question. Your justification states that state electronic data files containing data on crashes are used by NHTSA and that during fiscal year 2000 you are obtaining data from 17 states. Has NHTSA experienced any resistance to obtaining state electronic files and, if so, what is being done about it?

Answer. Most of the 17 states in NHTSA State Data System have willingly provided NHTSA with copies of their electronic crash data files. NHTSA is an extensive user of state crash data and often provides feedback to the states that results in improving crash data or crash systems. Some states, however, have been concerned that NHTSA may have to provide their data to groups outside of the agency and that the data may be misused. Consequently, NHTSA treats state crash data as belonging to the originating state and will not release any of the 17 state crash data files in the State Data System to outside groups without the outside group first obtaining permission from the state. This policy has alleviated state concerns.

STATE DATA COLLECTION UNIFORMITY

Question. Is it essential that states participating in the crash data collection and analyses program collect data in a uniform manner and use a standard means of recording and accessing the data? If so, do the 17 states targeted for the program meet those requirements and, if they do not, what is NHTSA doing to assure uniformity?

Answer. It is not essential that the 17 states in the State Data System be uniform in the collection and processing of state crash data. NHTSA has made use of the crash data from these states in numerous analyses and evaluations. Specific data elements collected by only some states are valuable for particular issues. However, non-uniformity in the elements collected, and in their definition, does complicate NHTSA analyses and prevents combining of state databases into larger sets for analytical purposes. Caution must be exercised when performing analyses and interpreting results.

Uniformity in the collection and recording of crash data, if adopted by states, would assist all levels of users. The advantages of uniformity include: improved interstate comparisons and analyses; enhanced decision making for targeting resources, implementing performance measures, and evaluating program effectiveness; the ability for states to learn from each other by sharing their information, identifying their common problems and working together on joint program priorities; and development of common software for crash data entry.

At the national level, uniform state data would ease the potential analytical issues NHTSA experiences when dealing with non-uniform databases. Also, the collection and coding of information in NHTSA data systems, including the 17 State Data System would improve, possibly leading to further revisions and economies in how the data are collected.

In 1998 NHTSA, in cooperation with the Federal Highway Administration (FHWA), the National Association of Governors Highway Safety Representatives (NAGHSR), and the highway safety community in general, developed a standardized list of data elements to be collected on motor vehicle crash reports, the Model Minimum Uniform Crash Criteria (MMUCC). Currently NHTSA, also in cooperation with FHWA and NAGHSR, is encouraging the adoption of MMUCC by the states.

Question. Is the State of Maryland collecting and formatting data in a manner that could be used as a model by the other states? If so, what is NHTSA doing to encourage the use of the Maryland system?

Answer. The Maryland crash report was most recently revised in the early 1990's and, therefore, does not include all of the data elements recommended in the Model Minimum Uniform Crash Criteria (MMUCC). Consequently, it cannot be recommended as a model for other states.

NHTSA is cooperating with the Federal Highway Administration (FHWA) and the Iowa Department of Transportation (IDOT) to develop the National Model, a suite of software which includes electronic versions of the Iowa police crash report, the electronic form that started the effort, as well as commercial vehicle inspection reports, drunk driving reports, and incident reports. The forms all share data among the applications, eliminating the need to enter data more than once. Full use is made of pen computers, portable printers, bar code readers, digital cameras, global positioning (GPS), and Geographical Information Systems (GIS) to streamline data entry and reduce data collection burden on police officers. Data can be electronically uploaded to a central repository in the IDOT. Iowa is currently revising its crash report and will be basing the revision on MMUCC. NHTSA is funding the IDOT to incorporate MMUCC into the electronic crash form of the National Model and, when completed, will encourage the adoption of the National Model by other states.

COLLECTION AND ANALYSES OF CRASH DATA

Question. How will NHTSA coordinate with the Federal Motor Carrier Safety Administration regarding the collection and analyses of crash data involving motor carriers?

Answer. Two separate activities requiring NHTSA/FMCSA coordination were mandated by Section 225 of the Motor Carrier Act of 1999. The first is the development and implementation of a truck crash causation study. The second is the planning, development, and implementation of a continuous crash data collection activity that will be used to support the FMCSA's enforcement and analyses efforts.

Working groups, consisting of representatives of both agencies, have been established to identify the needs and requirements of these efforts. We recognize that the continuous involvement of both agencies is critical to the success of this activity.

QUESTION SUBMITTED BY SENATOR BARBARA A. MIKULSKI

AGGRESSIVE DRIVING

Question. What is the status of the \$1 million earmarked for fiscal year 2000 for Maryland's aggressive driving program? What do you think about states implementing laws that make aggressive driving a crime?

Answer. NHTSA has been working with the Maryland Motor Vehicle Administration (MD MVA) to award the \$1 million earmarked for the Maryland Aggressive Driving program. MD MVA submitted its program proposal on February 28, 2000 to use these funds for a Public Information and Education (PI&E) program to pay for radio spots, newspaper advertisements, print and public service announcements (billboards, road signs, brochures), hold a symposium to announce the PI&E campaign and the other components of the program, and send out letters and leaflets. NHTSA expects soon to award the grant to the MD MVA.

The need for new laws to address the aggressive driving problem varies from state-to-state. The Department of Transportation sponsored a legal symposium in January, 1999, that brought together representatives from the judiciary, prosecution, defense bar and law enforcement communities to discuss the legal issues associated with aggressive driving and the need for new aggressive driving laws. While no consensus was reached, the participants felt that each state should examine its current statutes to determine their adequacy in dealing with the aggressive driving problem. Some states may have no need for new laws, while others, particularly those with weak reckless driving statutes, may have a need for new statutory approaches.

An Aggressive Driving Implementation Team was formed following the Symposium to work towards more fully developing and implementing the ideas brought forth at the symposium. The team is made up of judges, prosecutors, a defense attorney, and law enforcement executives and is charged with developing a National Action Plan to reduce aggressive driving by the end of 2000. They are also addressing the need for new laws.

NHTSA is concerned that some aggressive drivers may not be adequately identified and sanctioned in some states under current laws. For example, in situations where drivers commit multiple moving violations, in some states law enforcement officers can only write a single violation on a ticket, some judges may convict on only one violation when multiple charges are filed, and, in many states, offenders can pay a fine by mail that will not result in any notation on their record that they were guilty of aggressive driving. Thus, there may be a need for some means of identifying drivers who engage in aggressive driving so that judges can deal with them appropriately, particularly for subsequent similar offenses. All states should have laws that provide for enhanced sanctions for aggressive driving (rather than the current penalties for simple moving violations). Statutes must be tough enough to allow conviction on each and every traffic violation observed. Sanctions should include points for repeat offenders.

QUESTIONS SUBMITTED TO THE FEDERAL RAILROAD ADMINISTRATION

QUESTION SUBMITTED BY SENATOR RICHARD C. SHELBY

ACTIONS IN PREVENTING TRESPASSER FATALITIES

Question. The story you tell on grade crossing accidents is a good one—the number of grade crossing accidents on the general railway system has been reduced by 28 percent from 1993 through 1998. However, trespassing accidents and fatalities involving pedestrians in crossings and elsewhere on railroads' properties have not been reduced, and are now the leading cause of railroad fatalities. Trespassing is a complicated problem and is difficult to address. Over the last six years, the number of railroad trespassing fatalities has averaged 514 a year. A specific difficulty is that some of these pedestrian fatalities—perhaps as much as 40 percent, according to some government and railroad authorities—are suicides. What actions do you think the FRA can take to address prevention? Are taxpayers likely to get as good a “bang for the buck” on these efforts as they would on grade crossing safety efforts?

Answer. Trespassing is a complicated problem and one that is much more difficult to address than grade crossing safety since trespassing acts occur on private property. FRA believes some of the same strategies that work for grade crossing safety can also work for trespass prevention. Education is key and FRA will not only continue but increase its education programs. FRA is working with Operation Lifesaver, Inc. (OLI), to develop PSA's that will address grade crossing safety and trespass prevention. Focus groups will be convened in Los Angeles, New Orleans and Chicago to help determine how the PSA's resonate with the public and they will be revised to be responsive to the public.

FRA has also worked with law enforcement agencies and local communities to develop and implement strategies and technologies for trespass detection on railroad right-of-ways and a system of immediate reporting to law enforcement officials to

effect apprehension and/or removal of a trespasser. FRA, OLI and the railroad industry have, in partnership, developed a Trespass Abatement Guide that will help communities identify strategies to prevent trespassing on railroad right-of-ways.

Implementation strategies become much more effective if either locations where trespassing occurs are targeted or demographic targets can be established. To help focus on trespass abatement initiatives, FRA and OLI have scheduled a working group meeting of professionals to determine how demographic data can be collected to assist with targeting those groups most likely to be involved in trespassing and identifying their reasons for doing so. By collecting this data FRA can tailor existing strategies to be more effective in reaching targeted audiences.

QUESTIONS SUBMITTED BY SENATOR PETE V. DOMENICI

FISCAL YEAR 1998–2000 GRADE CROSSINGS FUNDS UNDER SECTION 130

Question. Administrator Molitoris, TEA–21 increased amounts for existing safety related programs and included new safety-related programs. TEA–21 continues to set-aside funding from FHWA’s surface transportation program for railway-highway crossings, which has resulted in a funding increase for this program. How much funding (obligational authority) was available for the railway-highway crossing program under section 130 of title 23, U.S.C for fiscal years 1998, 1999 and 2000?

Answer. The obligational authority available for the highway-rail grade crossing program under section 130 of title 23, U.S.C., for fiscal years 1998, 1999 and 2000 is as follows:

| | | |
|-------------|-------|---------------|
| Fiscal Year | | |
| 1998 | | \$154,362,968 |
| 1999 | | 154,767,190 |
| 2000 | | 154,929,630 |

To put these figures in context, these amounts would pay for gates and lights at approximately 1,000 highway-rail crossings each year (\$150,000 per crossing).

NEW MEXICO 130 GRADE CROSSING FUNDS

Question. How much obligational authority was available for New Mexico for section 130 of title 23, U.S.C for fiscal years 1998, 1999 and 2000?

Answer. The obligational authority available for the State of New Mexico for the highway-rail grade crossing program, under section 130 of title 23, U.S.C. for fiscal years 1998, 1999 and 2000 is \$1,205,846 per year.

130 OBLIGATIONS FOR NEW MEXICO

Question. How much did New Mexico obligate in 1998 and 1999 for section 130 projects?

Answer. The State of New Mexico obligated \$1,004,951 in fiscal year 1998 and \$967,190 in fiscal year 1999 for section 130 projects.

EFFORTS USED TO REDUCE GRADE CROSSING ACCIDENTS

Question. Administrator Molitoris, I understand that incidents at the 259,000 highway-rail grade crossings have decreased by 37 percent from 1993 levels. I am encouraged by these results. I agree with you, however, that more work needs to be done to reduce the fatalities level well below the current level of about 400. In your view, what is the most significant program or effort that has contributed to the 37 percent reduction in fatalities?

Answer. No single program, initiative or effort can lay claim to being the most responsible for the recent successes in this area. Rather, it has been the partnership of the Federal Railroad Administration (FRA), Federal Highway Administration, National Highway Traffic Safety Administration, Federal Transit Administration, National Transportation Safety Board, Operation Lifesaver, Inc. (OLI), railroad labor, railroad management, the railroad supply industry, Amtrak, the American Trucking Association, the school transportation industry (bus drivers), and law enforcement agencies that have contributed to that success.

One program initiative warrants special mention, but not to the exclusion of the significant partnership efforts previously mentioned. In 1994, the FRA filled eight positions in order to concentrate efforts on highway-rail grade crossing safety and trespass prevention. These eight Highway-Rail Grade Crossing and Trespass Programs Regional Managers have been able to leverage Federal participation in grade crossing safety and significantly increase the number of safety initiatives within the

Department to reduce fatalities. They have also been catalysts for increasing the number and focus of national grade crossing safety initiatives at the community level. They have done so by facilitating existing and creating new partnerships, and initiating special safety programs at the state and community level. In the five-year period since the establishment of the Grade Crossing and Trespass Programs Managers's positions, the rate of crossing safety improvements accelerated by 33 percent when compared to the five-year period preceding the establishment of those positions. Their efforts have been so successful that eight Assistant Highway-Rail Grade Crossing and Trespass Programs Regional Managers were hired in 1999 to further develop this program.

QUESTIONS SUBMITTED BY SENATOR BEN NIGHTHORSE CAMPBELL

PURPOSE OF FULL-SCALE PASSENGER RAIL CAR CRASH TESTS

Question. I am aware that the Federal Railroad Administration (FRA), in conjunction with a number of other entities, has recently conducted a full-scale passenger rail car crash test at the Transportation Technology Center in Pueblo. Can you tell me the purpose of this test, and whether or not it was a success?

Answer. The test conducted on November 16, 1999, was the first in a series of full-scale passenger rail car crash tests. The purpose of the test program is to collect engineering data to validate analytical tools and procedures used in the safety assessment of passenger rail equipment. The test was very successful. In addition to the large amount of data on the structural deformation of the rail vehicle as the car crushes, FRA was also able to measure the vertical and lateral motions of the car during the test, and the influence of these car motions on the responses of the Anthropomorphic Test Devices (test dummies) in three different interior seating configurations. The information from this test is being used to modify the passenger seats for the next test.

PURPOSE OF SECOND PASSENGER RAIL CAR CRASH TESTS

Question. I understand another full-scale crash test is scheduled for April 4. What do you hope to learn from that test?

Answer. In this test, two coupled passenger cars of the same design will be crashed into a rigid barrier. In addition to measuring the crush response of the cars and the influence of these car motions on the test dummies, the interactions between the coupled cars will be measured. These interactions could lead to lateral buckling of the train during a collision, and/or the override of one car onto another. The cars are expected to start buckling out laterally during the test, with approximately two feet of misalignment at the coupled ends of the cars. Modifications have been made to the mountings to be used in the commuter seat interior arrangement. These modifications are relatively minor, but should increase the strength sufficiently to prevent failure of the seat mountings in this test. With the seats performing as intended, the influence of the vertical and lateral carbody motions on the test dummies can be observed.

NEED FOR FUTURE RAIL CAR CRASH TESTS

Question. How many additional tests will be required to obtain the data necessary to enhance passenger rail safety? It is my understanding that the initial tests are designed to establish a simple baseline and that subsequent tests will need to be of a more complex nature to adequately represent real accidents. Is this an accurate characterization of the program objectives?

Answer. That is an accurate characterization of the program. Beyond the test scheduled for April 4, 2000, 10 additional tests are currently planned for a total of 12 tests. The first four tests characterize current typical passenger rail equipment in a head-on collision:

- Single-car test into a rigid barrier (the November 16, 1999 test)
- Two-car test into a rigid barrier (planned for April 4, 2000)
- A cab car-led train colliding head-on with a locomotive led train (planned for November, 2000)
- A cab car-led train colliding with a cab car-led train (planned for March, 2001)

The next four tests are to evaluate the effectiveness of improved equipment in a head-on collision. The improved equipment includes crushable end structures, a crashworthiness strategy known as crash energy management. These "crush-zones" act to distribute the crush among all the cars in the train and to limit the decelerations of the cars during a collision. For the current strength-designed cars, nearly all the damage occurs to the cars closest to the impact, often with significant loss

of occupied space, while there is little damage at all to the cars away from the impact. These tests are intended to measure the increase in occupant protection afforded by passenger rail cars with crash energy management.

Two additional tests are intended to characterize the current equipment in oblique collisions, such as the accident in Secaucus, New Jersey in February, 1996. They include a cab car-led train colliding at a switch with a locomotive-led train and a cab car-led train colliding at a switch with a cab car-led train.

Finally, two tests are planned to characterize the effectiveness of improved equipment in an oblique collision. The leading cab cars will incorporate integrated end structures. All the elements of the end structure of the cab car will be integrated such that when one portion of the structure is impacted, the entire structure will help support the load. This integration significantly increases the strength of the end structure, and helps control the crushing of the end structure.

FUNDING FOR FULL-SCALE PASSENGER RAIL CAR CRASH TESTS

Question. What has the FRA requested for the crash test of passenger rail cars in fiscal year 2001? What will be accomplished with this level of funding? What portion will be devoted to occupant protection issues? Is additional funding required to adequately cover the necessary occupant protection tests, in addition to the tests on the rail cars themselves? Shouldn't the top priority of the FRA be passenger safety and occupant protection?

Answer. A total of \$2.2 million is requested for the crash test of passenger rail cars in fiscal year 2001. With this level of funding, FRA plans to conduct two crash tests of passenger rail cars with improved crash energy management design. These single-car and two-car tests will be conducted with the fixed barrier at the TTC facility in a similar manner like the first test last November.

Depending on the cost of structural modification to the rail vehicles to incorporate the crash energy management design, less than half the funds are planned to support the occupant protection portions of the tests. The remaining funds are required to implement the structural portion of the tests. Additional funds may be required to analyze the test data for both the occupant protection as well as the structural portion of the tests. As more test data becomes available, plans may be modified to investigate the most effective means to protect the passengers.

It is important to note that all aspects of the testing are designed to improve our understanding of how best to protect occupants. The term "occupant protection" is also used above in the narrower sense in reference to issues of compartmentalization and occupant restraint.

TESTS AT TTC

Question. Will these tests continue to be conducted at TTC in Pueblo?

Answer. Yes, TTC is the ideal facility for conducting these tests. It has the rigid barrier with sufficient size and appropriate track for the single-car and two-car test, as well as the appropriate space and track for the train collision tests.

OTHER RAIL CAR CRASH TESTS

Question. What other rail crash tests could be undertaken? Specifically, what is the relationship between the current series of passenger rail tests and commuter rail travel? Did the recent commuter rail crash in England shed any light on the types of systems that might be employed to protect occupants?

Answer. Other full-scale rail crash tests could be undertaken to evaluate the effectiveness of occupant protection strategies during derailment and during grade crossing collisions.

The FRA will use the results of the current series of passenger rail tests in its second phase of rulemaking to enhance the safety standards for commuter passenger safety. Currently, the FRA requires commuter and intercity rail passenger seats to support the load associated with an impact from an unrestrained occupant. Based on the test results and other information, the addition of occupant injury criteria to this requirement may be considered along with a reevaluation of the impact conditions prescribed in the rule. The test results are also expected to be useful in considering the application of seatbelts, crash energy management systems and other improved structures for better passenger safety.

The recent commuter rail crash in Ladbrooke, England showed that the issue of structural damage of aluminum-bodied rail cars as well as fire safety and emergency responses should continue to be examined in safety research.

QUESTIONS SUBMITTED TO THE NATIONAL TRANSPORTATION SAFETY BOARD

QUESTION SUBMITTED BY SENATOR PETE V. DOMENICI

AVIATION RUNWAY INCURSIONS

Question. Chairman Hall, as you mentioned in your testimony, aviation runway incursions have been increasing. In fact, the 1998 level of 325 incursions represents an increase of 11 percent over the 1997 level. The National Transportation Safety Board as well as the Inspector General and the General Accounting Office have consistently identified runway incursions as a problem for many years.

Although the FAA has made some progress in addressing runway incursions, the Inspector General recently stated that FAA may not meet its goal to decrease these incidents.

Why has the FAA had problems addressing runway incursions?

Answer. The Federal Aviation Administration (FAA) has not managed this program as effectively as anticipated. The FAA's managers of the runway incursion program changed often, and the program did not appear to receive adequate support from top management. In response to Safety Board recommendations dating back to 1991, the FAA indicated that its solution to the runway incursion problem was the Airport Movement Area Safety System (AMASS).

AMASS, designed to operate in conjunction with Airport Surface Detection Equipment-3 (ASDE-3) surface radar systems, is behind schedule. Although it is currently being installed, it is still not operational nine years after the FAA began working on the project. In addition, some tower facilities, such as Ronald Reagan Washington National Airport, will experience further delay in the operational use of AMASS because ASDE-3, which is designed to provide tower air traffic controllers with position information on all aircraft and vehicles operating on airport runways and taxiways, has not yet been commissioned. In addition, AMASS is scheduled to be installed at only 34 of the busiest airports nationwide, leaving other airports with substantial air carrier traffic without any automated assistance in preventing surface incidents. Further, the FAA recently stated that AMASS will not do all it was originally intended to do, and can only be considered a start on addressing the problem.

Question. What is the major barrier facing FAA in achieving its goal of reducing runway incursions to 248 or less in 2000?

Answer. On August 12, 1991, the FAA stated that its solution to reducing runway incursions was the development of the AMASS designed to alert controllers to pending runway incursions at all terminal facilities scheduled to receive the ASDE-3. However, discussions with the FAA reveal that the AMASS will not detect runway incursions but may possibly prevent runway collisions in certain circumstances.

Because it is not providing any new technological means that will help to reduce runway incursions, the FAA is now focusing on pilot education and increased awareness of the runway incursion problem. In October 1999, the FAA created the Runway Safety Program, which has instituted several education and awareness programs to do that. The number of incursions has not reduced significantly—from 325 in 1998 to 322 in 1999—and more must be done to ensure the number of incursions does not increase, let alone reduce the number to 248—the FAA's stated goal.

Question. In your opinion, is the problem related to funding?

Answer. Congress has provided more than \$380 million over the years in funding for runway incursion projects. Although this figure seems generous, the Board has not studied the funding issue. We are aware, however, that the Department of Transportation Inspector General's office has twice reviewed FAA's runway incursion program.

SUBCOMMITTEE RECESS

Senator SHELBY. This hearing of the Transportation Appropriations Subcommittee is now recessed. We are scheduled to meet next week, Thursday, March 2, in Dirksen 192 at 10:00 a.m. to hear about States' experiences in implementing the Drivers Privacy Protection Act.

[Whereupon, at 11:50 a.m., Thursday, February 24, the subcommittee was recessed, to reconvene at 10 a.m., Thursday, March 2.]

DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2001

THURSDAY, MARCH 9, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:02 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Richard C. Shelby, (chairman) presiding.

Present: Senators Shelby, Gorton, Bennett, Lautenberg, and Kohl.

OVERSIGHT HEARING ON DEPARTMENT OF
TRANSPORTATION PROGRAMS—FISCAL YEAR 2001
NATIONAL RAILROAD PASSENGER CORPORATION
(AMTRAK)

STATEMENT OF HON. TOMMY THOMPSON, CHAIRMAN, BOARD OF DIRECTORS

ACCOMPANIED BY GEORGE WARRINGTON, PRESIDENT, AMTRAK

DEPARTMENT OF TRANSPORTATION

OFFICE OF INSPECTOR GENERAL

STATEMENT OF HON. KENNETH M. MEAD, INSPECTOR GENERAL

DEPARTMENT OF TRANSPORTATION

STATEMENT OF PETER J. BASSO, ASSISTANT SECRETARY FOR BUDGET AND PROGRAMS AND CHIEF FINANCIAL OFFICIAL

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. The hearing is called to order.

Senator Lautenberg will join us soon.

First of all, I would like to thank Ken Mead, the Department of Transportation Inspector General; Jack Basso, the Assistant Secretary of Transportation for Budget and Programs; and Governor Thompson, the Governor of Wisconsin, Chairman of the Amtrak Board of Directors for being here today to discuss the Department's most pressing management and oversight challenges.

Many of the issues we discuss today will be familiar to the three of you and probably everybody in the room. Many are issues that

we discussed last year and, unfortunately, many will probably be the subject of at least one hearing next year.

We were going to break this hearing into two panels and talk about Amtrak finance and management issues separately, but both Senator Lautenberg and I are very pressed for time this morning and agreed that we would have all three of you at the witness table, as you have seen, in the interest of saving time.

Thank you again, all of you, for coming, and I am pretty sure we are going to keep this as short as we can.

AMTRAK

Now, I would like to step through the looking glass and talk about Amtrak a minute. Since 1971, the American taxpayers have spent more than \$23 billion on Amtrak. Yet, in 1999, the railroad's operating losses were \$916 million, the largest in history. Cash losses, which do not include depreciation, were \$579 million, which is \$54 million higher than the 1998 cash losses and \$19 million worse than Amtrak's own projections for 1999.

Amtrak's premier new Northeast Corridor high-speed rail service is delayed by at least 6 months with a negative impact of over \$142 million on the Amtrak bottom line.

In addition to high cash losses and unrealized revenue proposals, Amtrak's capital wish list is growing, and there is still no realistic plan for addressing even modest, by Amtrak standards, reinvestment in the capital plan. According to the Inspector General, the railroad's projected Federal funding through 2002—that is, the administration's and Amtrak's execution of the elusive glide path to operational self-sufficiency funding plan—will fall short of the railroad's minimum capital needs during this period by \$244 million.

Also waiting in the wings are \$12 billion in capital projects on the Northeast Corridor between New York City and Washington, DC, of which \$654 million are unaddressed fire and safety projects in the Penn Station, Hudson River, and East River tunnels.

So, what exactly are we on a glide path to?

In the fiscal years 2001 and 2002, the glide path funding plan provides a constraint on both Amtrak and the administration. The budget request is \$521 million for each of these 2 years. But once Amtrak reaches or does not reach operational self-sufficiency in October 2002—and I say reach or does not reach in the firm belief that the whole self-sufficiency issue is basically a question of semantics. Once that milestone date is reached, then it is "Katie bar the door." That is when the real money requests for Federal taxpayer subsidies for Amtrak are going to begin.

Ken, I feel I might have gotten carried away there. Check my facts for me, if you would. I know you would. Do you believe it is true that Amtrak will request substantially increased Federal capital funding after the fiscal year 2002 and that this increased capital funding need will extend over the long term? You do.

So, can anyone tell me what is meaningful about the phrase "operational self-sufficiency"? I have here a copy of Public Law 106-69, the fiscal year 2000 Transportation Appropriations Act, and I see capital grants to the national passenger railroad corporation. Those are capital grants with a flexibility provision which allows the railroad to use their Federal funds for some operating pur-

poses. We gave Amtrak this expanded capital definition at the administration's request.

So, it looks to me like the smartest thing we might do would be to declare victory and go home. Amtrak is not receiving an operating grant from the Federal Government now, but this does not mean that the railroad is self-sufficient, not by a long shot. Unless we dramatically change the railroad's structure and direction, real Amtrak self-sufficiency is and always will be an oxymoron.

I feel like I have been talking until I am blue in the face about the hole Amtrak has dug for itself. But when do we begin damage control? When do we back away from this cliff and start to show some responsibility for the taxpayers' money?

A friend and ranking member of this subcommittee, Senator Lautenberg, has championed Amtrak and Federal funding for the railroad since he came to the Senate. You could not ask for a more passionate or effective advocate.

Unfortunately, Amtrak has not lived up to his vision for passenger rail in this country. I sincerely believe that a train or major Amtrak facility should be named after Frank. He is the leading benefactor and has worked tirelessly on the railroad's behalf his entire Senate career. But part of me also wonders whether that would be the sort of tribute that my colleague would want to be remembered by 10 years from now.

Senator Lautenberg, it is always a pleasure to work with you on all the transportation programs and issues that we share in this bill. I know that Amtrak is close to your heart and I welcome you to make any opening comments you might have.

STATEMENT OF SENATOR FRANK R. LAUTENBERG

Senator LAUTENBERG. Thank you very much, Mr. Chairman.

One of the difficulties I have with our situation here is that we are good friends, but we disagree on a few things. And it is hard when good friends disagree. Mr. Chairman, we could dispense with our disagreements if you would just let me manage this according to my judgment.

Senator SHELBY. As much as I love you, I would have to hold on to you there.

Senator LAUTENBERG. I must say this, that Senator Shelby's attitude is one that, while I do not agree, I can certainly understand in terms of what Amtrak's role is because he does not see it as much in his area as we do in ours.

But one of the things that I think we have to be wary of is looking at Amtrak without looking at other modes of transportation and see what we do in those cases. And I am going to be discussing that in just a moment in my remarks because yesterday we passed what I would consider kind of a landmark bill, and that does not mean I like it, but it is a change from not only the procedures here but the attitude that we see in the capital.

So, I am pleased, Mr. Chairman, to have Governor Thompson, who is the Chairman of the Amtrak Board, with us today, and I thank you for doing that.

This is a special hearing for me because it is likely to be my last hearing regarding Amtrak.

Now, when I look at Amtrak, I look at it in terms of not only the Northeast quadrant of the United States, but the value throughout the country as an essential, critical mode of transportation affixed to the other modes, aviation, highways, sea of course, and with the understanding that these other modes—we were so generous with aviation yesterday—will not be able to carry the load we have to carry for passengers in shorter distances.

As a matter of fact, there is a considerable debate about where rail is the best use of the transportation facilities and aviation. And I use my experience, having been in France last year and Belgium, when I went to NATO headquarters. I was in Paris, went to NATO headquarters, and it took me an hour and roughly 20–25 minutes to go 200 miles. People there do not even think of getting on an airplane. It saves so much congestion in the air. And no matter what we put into the system, if we think that we can carry unlimited numbers of passengers in aviation without having things get more congested, less comfortable, less effective, we are kind of kidding ourselves.

So, we are now looking at what we do about Amtrak. With the initiation of truly high-speed rail service in the next several months, it is going to be a real boon to travel and to reductions in congestion and polluted air.

When we said yes to aviation yesterday, we added to the volume of investment in the aviation system substantially, \$2 billion this coming year, 2001, as I see it happening. I had my staff people check to see what it is that we spent on aviation in the last years, last decade, regardless of the source whether it was trust fund or otherwise. It was some \$85 billion—\$85 billion—in airports and FAA operations and things of that nature. That was besides the revenues derived from the PFC's, the passenger facility charge. So, we are looking at an investment in one sector of our transportation network while we, frankly, diminish the other.

Well, when I came to the Senate almost 18 years ago, Ronald Reagan was President. The administration's budget request was zero for Amtrak each year. We know one thing, that if you stay around Washington long enough, you start to see some things change.

Some of my earliest legislative actions in the Senate took the form of amendments to the budget resolution that sought adequate funding for Amtrak. We have always faced an uphill battle, and back then it was even more pronounced, despite the fact that we had some very good friends of Amtrak in John Heinz and Bob Stafford of Vermont and Mark Andrews of North Dakota, and of course, our friend John Chafee, who passed away a few months ago.

In more recent years, I have seen an interest in Amtrak on the part of Senators from other regions of the country. I see more States wanting better, higher speed rail service. In many instances, we see those States putting up the money to meet these needs.

Just last week, the National Governors Association unanimously adopted a resolution calling on this subcommittee to fully fund Amtrak's request of \$989 million for fiscal year 2001. This is the first time that I can remember the Nation's Governors speaking so clearly and forcefully on behalf of Amtrak's funding. I particularly want to commend my friend, Governor Thompson of Wisconsin, and

his colleague, Governor Carper of Delaware for this initiative. Mr. Chairman, the Governors of the United States want more Amtrak funding because they know that, even in this period of growing investment in our Nation's highways, we cannot build our way out of congestion.

Just yesterday, when we passed that aviation authorization bill, I led the fight against it. I guess I was not persuasive because we only got 17 votes. But the fact of the matter is that there is a lot of illusion about what that bill is. I opposed the bill because it was unbalanced from the perspective of the needs of the FAA, and it was unbalanced from the perspective of the needs of the entire national transportation system. That bill seeks to force this subcommittee, Mr. Chairman, to provide dramatically increased amounts for FAA's capital accounts. If this subcommittee does not get a very sizeable allocation, these attempts could undermine our ability to fund the FAA's operating account because the \$2 billion that was requested this year and is now a new entitlement, which is strange for this body to be considering—an entitlement—it says that these funds have to be met from general revenues over and above that which is produced in the trust fund.

Well, if we do that and let us say that transportation allocation is limited to approximately last year's and we have a \$2 billion increase request for FAA, I ask you where is it going to come from. Is it going to come from the Coast Guard?

I heard the argument made yesterday—and I listened very carefully to what my colleagues were saying. There are a lot of supporters for this FAA reauthorization. Talk about the possibility of air crashes once every 10 days when you get to the year 2015. And I assume that, therefore, means that if we want to avoid that, that all the other nations around the globe will also upgrade their systems. But is it any more tragic when people go down in an airplane than when they go down in a ship? And we do not welcome that immigration, but we cannot ignore, being the society that we are, people who are out there on those rafts and have to be stopped from coming. But we do want them to drown as a result.

The Coast Guard's incredible agenda of the things that they have to take care of—I noticed in the paper yesterday, the day before, that the Coast Guard is unable to monitor waste being discharged from cruise ships and it is polluting the waters. They just do not have enough people. Now we are going to man the helicopters with the machine guns so they can stop illegal immigration—I am sorry—whether they can stop drugs from coming in. They do not want to shoot them—but to stop drugs from coming into the country.

Well, then we have got the illegal immigration flow that we see, and we have got the general pollution control. And we see that the Coast Guard is having a tough time keeping up with examining its fishing licenses and requirements for commercial boats. And then they have got the whole navigational structure.

Well, are we going to say to the Coast Guard, too bad, we are just not going to be able to give you the funding? We are going to say the same thing to Amtrak and we will say the same thing to NTSB and other safety agencies. If we have to give it to FAA, it is going to come out of someplace.

Now, if the amount given to transportation is increased by the roughly \$2 billion, it is going to come out of someplace like Veteran's Administration or education or something else. Are we so committed to aviation that we are going to ignore other needs in our transportation system? I hope not.

Besides all of that, these funds are earmarked for capital investment facilities and equipment. But we are not guaranteeing any improvement in the account for operations. We are guaranteeing any improvement for training full performance—no, strike that. We are not training controllers to fill in the gap of retirement, which is contemplated in the not too distant future. As a matter of fact, we have just shut down a training facility for controllers. We are walking around as if our heads are in the sand.

I must say it is going to take a great deal more than just increased airport grants to handle the boost in traffic and intra-city traffic in particular. In today's aviation system, we have already too much air space and too many airport gates being absorbed by short-haul flights between cities that would be better served with high-speed rail. Perhaps we are going to be able to call it "winglock" at our airports, just like gridlock on our highways. It is going to get worse if we do not take an aggressive approach to expanding the use of high-speed rail across the country.

That is why I have introduced S. 1900, the High-Speed Rail Investment Act. This legislation uses innovative financing to allow Amtrak to sell \$10 billion in bonds over the next 10 years to fund the development of high-speed rail corridors across the country. These corridors represent the future of transportation in America. Congestion on our roads continues to worsen. There is only so much we can do to increase road capacity. The same goes for our airports. New airports are expensive to build and people just do not want them in their back yards.

On the other hand, our rail infrastructure is already there, an untapped resource waiting for its full potential to be realized. Improving our rail infrastructure is a cost effective and environmentally sound way to go. That is why support for developing these high-speed rail corridors is so strong. We do have 35 Senators signed on as cosponsors of S. 1900, and last week Congressman Amo Houghton and James Oberstar introduced House companion legislation.

I look forward to working with Governor Thompson and my colleagues and the chairman of this subcommittee. I say this to Senator Shelby. We have worked together on a lot of things. I have found him to be willing to listen, and even if we do not agree, we reason it out between us and it works better that way.

I thank you, Mr. Chairman, for the indulgence.

Senator SHELBY. Thank you, Senator Lautenberg.

We have before us, as you know, the honorable Tommy Thompson, Governor of Wisconsin, Chairman of the Amtrak Reform Board, and we have the honorable Kenneth Mead, Inspector General, U.S. Department of Transportation. We also have Peter Basso, Assistant Secretary for Budget and Programs and Chief Financial Officer of the Department of Transportation. Gentlemen, welcome. Governor Thompson, you proceed as you wish.

STATEMENT OF GOV. TOMMY THOMPSON

Governor THOMPSON. Thank you very much, Senator Shelby. I am sort of in a quandary. I have a prepared speech here, Mr. Chairman and Senator Lautenberg, and I decided, after listening to you, Senator Shelby, I wanted to answer your questions.

Senator SHELBY. Absolutely.

Governor THOMPSON. So, I am going to not give my prepared—
Senator SHELBY. Your statement will be made part of the record.

Governor THOMPSON. I wanted to because I have the greatest respect for you, Senator Shelby, always have. I think you are an outstanding individual and I do not say that because I want anything out of you. I just come here because I am passionate about Amtrak. I am passionate about rail passenger service.

I do like your suggestion about naming something after Senator Lautenberg, but I do not know if it should be a train. Maybe a railroad station that we are working on. That would be a nice, fitting tribute to.

Senator SHELBY. We want it to be appropriate, do we not?

Governor THOMPSON. It is going to be appropriate. It will be very nice and I think that that is what we should do.

But I want to thank Senator Lautenberg for his support for Amtrak and, above all, for his tremendous service to the United States. Both of you gentlemen.

Senator LAUTENBERG. Thank you.

RAIL PASSENGER SERVICE

Governor THOMPSON. Senators, I come from a rural State, Wisconsin. And I listened to what you said, Senator Shelby, and I know you are conservative and so am I. And I look at what can we do to invest in the future, to save the taxpayers money and do what is right for America. And I know that is what is in the bottom of your heart, and what you really want to do.

Then I look around the world and I see all the countries in the world that have high-speed trains. I see Spain. I see France. I see Japan. I see all of those countries investing in high-speed trains, much more so than America. And every one of them use that as an integral part of their transportation system. I look at that and I say, if they can do it, why not the United States of America?

Then I take a look at the transportation budget over the last years. You mentioned \$23 billion that has been given to Amtrak. You know, that is a big figure until you put it in comparison to the other modes of transportation. Last year alone you spent \$32 billion, \$10 billion more than the total 25 years that Amtrak has been in existence, for highways. And has highway congestion gone down? Absolutely not. Airports, \$12 billion last year. You are going up to \$13 billion. We get \$521 million, not billion, compared to \$30 billion for highways, \$12 billion for airports, \$5 billion for mass transit. We are the poor stepchild. We are like Cinderella.

But we are something nice to behold. Once you see us, you like us. You are fascinated by us. You want to ride us. And that is what is happening in America. All across America there is a newfound fascination, Senator Shelby, for rail passenger service.

Granted, we have had some mistakes, but George Warrington, who is our President, and this board are dedicated to making the corporation operationally self-sufficient.

OPERATIONAL SELF-SUFFICIENCY

Now, you asked what is operational self-sufficiency. It means that by the year 2003, under the dictates and under the definition of the congressional law, we are going to be able to operate our trains without asking Congress to give us money for operation of passenger services or operation of the trains. But we are coming to you—and we never said we would not—for capital. We are coming to you for capital because we need capital. Every other country subsidizes trains. Even when rail passenger service was at its heyday in the 1920's and the 1930's and the 1940's, it still required the passenger train services to haul mail and express in order to pay their bills. So, you are going to have to subsidize the system with capital.

And let us take a look at this. Now, this is not a Democrat thing or a Republican thing. This is something for America. In California, by the year 2020, there are going to be 19 million more people—19 million more people. That is 55 million people by the year 2020 in California. You have been there, Senator Shelby. You have been there, Senator Lautenberg. Do you think there is any way this country can build enough highways to accommodate another 20 million people in California? Do you think there is a way to site enough airports to handle and accommodate that kind of population growth in California? Absolutely not.

HIGH SPEED CORRIDORS

The only salvation for California is rail passenger service, and that is why the high-speed corridors, that is why the Senator Lautenberg bill, is important. It is an investment. We have to move populations from one center to another for the economy, for safety, and for the overall good of America.

And where is this increased mobility going to come from? I think the future is rail passenger service. We are going to be able to start running high-speed trains.

Granted, George and I are just as upset as you are that they have been delayed for 7 months. You know, we fight with the consortium. I wish you could be in our board rooms when we bring in—

Senator SHELBY. Well, I believe you. I know you, Governor.

Governor THOMPSON. Bombardier hates to hear from Tommy Thompson and George Warrington. We call them every week and say, how is it going? But these trainsets are going to be something of beauty. They were supposed to be delivered in December. They are not going to be here until at least July.

And we want you to ride on one. I want you and Senator Lautenberg to be up in the locomotive with me, and we will even let you drive it, just to show you how fast it goes.

Senator SHELBY. How about letting Lautenberg drive it. He has had more experience.

Governor THOMPSON. Well, that is fine.

Senator SHELBY. But I will go with you.

Governor THOMPSON. But we are going to be able to go from New York City to Washington, DC, in 2½ hours. We are going to be able to go from New York City to Boston in 3 hours. Now, if we can do that, why would you want to get on a commuter airline? Why would you? You are going to be able to get on the train in downtown New York. You are going to be able to get to Washington, DC, in less than 3 hours. You will not have to go out to the airports in that congestion, where it takes you about an hour to get out there. You will be able to get downtown to downtown in about 2½ hours. Your luggage is going to be with you, and we are going to do it with a smile. You are going to be able to get off here at Union Station and be able to come over to the Capitol. People are going to be riding those rail passenger cars, and they are going to be increasing—

Senator SHELBY. When is that day going to be we are going to ride it together?

Governor THOMPSON. Sometime in July, I hope. You are invited and I am going to make darned sure you come. I will come down and pick both of you up and fly you up there.

Senator LAUTENBERG. Order me an engineer's hat.

Governor THOMPSON. All right. We are going to have an engineer's hat.

That is the excitement.

GOVERNOR CONTRIBUTIONS FOR RAIL SERVICE

I realize that I am running out of time, but let us take a quick look at what is happening all over the United States.

Governor Ryan from Illinois has just put in \$125 million in capital funding for rail service—\$125 million. Governor Ridge, another Republican, Pennsylvania. Governor Hunt, Democrat, North Carolina. Governor Gilmore, Republican from Virginia. Governor Gray Davis, Democrat from California, hundreds of millions of dollars for rail passenger service. Governor Locke from Washington, Democrat. The Democratic and Republican Governors are ponying up money and saying, Washington, Federal Government, meet us half way. Give us the opportunity to develop a rail passenger service in America that you can be proud of, that I can be proud of as Board Chairman, that George Warrington can be proud of as President.

OPERATIONALLY SELF-SUFFICIENT

And that is what we are asking. All we are saying is give us a chance. Give us a little money for capital. We will become operationally self-sufficient under the law by 2003. We are already on the glide path. Ken Mead has indicated we have got some trouble, but we can make it and we are going to make it. I guarantee you we will, and then, with the infusion of capital, we will make a rail passenger service, a national system that will go through Alabama, you know, the Crescent, the Sunset Limited—

Senator SHELBY. Right through my hometown.

Governor THOMPSON [continuing]. And 52,000 people from Alabama rode it last year. We want 152,000 next year, and we want you to be an avid passenger, and we want you also to be a supporter of Amtrak.

PREPARED STATEMENT

That is my testimony, and I thank you very much for your giving me this opportunity.

Senator SHELBY. Thank you, Governor.
[The statement follows:]

PREPARED STATEMENT OF GOV. TOMMY THOMPSON

Mr. Chairman and Members of the Subcommittee: I deeply appreciate the opportunity to appear before you today to talk about one of my favorite subjects: Amtrak.

I want to make three major points today—the first is the positive results Amtrak is delivering that put us on a glidepath to operational self-sufficiency. The second is the strategic steps we are taking to operate more like a business and improve Amtrak's financial performance, including the recent announcement of our Network Growth Strategy. And the third is the very exciting future of high-speed rail, especially the growing partnerships with states. Taken together, these results, commercial actions, and high-speed rail initiatives tell a story of a new Amtrak—an Amtrak committed to growth and performance, an Amtrak that is delivering on the promise made to Congress to become operationally self-sufficient by fiscal year 2003.

Let's start with results.

The last time I appeared before you as Chair of the Amtrak Reform Board was on March 10, 1999—almost a year ago to the day. At that time, I was able to report that our new, commercially focused business plan was already showing positive results. For the first time in Amtrak's history, corporate revenue topped the \$1 billion mark for fiscal year 1998, and ridership was up 4.5 percent.

Today, I am happy to say that these positive trends are continuing. Fiscal year 1999 was a record-breaking year for Amtrak. The corporation's revenue reached an all-time high of \$1.84 billion, a 7 percent increase from the previous year. Revenue growth helped Amtrak exceed the bottom-line target set in the corporation's business plan for the second straight year—this year by \$8 million—keeping us not only on track, but ahead of plan, to achieve operational self-sufficiency by 2003. And total ridership exceeded 21 million in 1999, up 2 percent from last year and 10 percent since it began rebounding three years ago.

As a new millenium dawns, Amtrak is maintaining and gaining momentum. For the first quarter of fiscal year 2000, Amtrak beat its business plan by more than \$2 million, with total revenue up 8 percent to \$476 million. In Amtrak's national system, many trains saw increased ridership in the first quarter. For the corporation as a whole, ridership increased for a record 12th consecutive quarter.

Second, let me turn now to our commercial initiatives and partnerships.

Mr. Chairman, the last time I testified before this Subcommittee, I pledged to you that Amtrak would become a more market-driven, commercially-oriented company using proven business techniques to maximize our marketplace potential. Let me tell you how Amtrak has kept that promise:

- To improve its bottom line, Amtrak entered into business partnerships with Dobbs International Services, Burlington Northern Santa Fe, United Parcel Service, the United States Postal Service, ExpressTrak, and Dynamex. These partnerships are expected to generate more than \$20 million in additional annual revenue and \$28 million in long-term savings.
- The mail and express business, which involves the transportation of time-sensitive shipments, produced \$98 million in revenue for fiscal year 1999, up 18 percent from fiscal year 1998.
- In fiscal year 1999, capital investment partnerships with states garnered a record \$300 million.
- The corporation's real estate and telecommunications ventures returned profits of \$106 million, a record high.
- Based on its "expectation that operational self-sufficiency will be achieved," Moody's Investor Service improved Amtrak's credit rating to A3, reflecting a stable outlook. Standard and Poor's publicly assigned Amtrak a triple "B" issuer rating.
- In the area of customer service, Amtrak trained 16,500 employees to begin implementation of the American travel industry's first-ever service guarantee.
- And just ten days ago, Amtrak announced plans to expand passenger service in 21 states and strengthen our competitive edge in the mail and express business—steps that will increase our reach and connectivity and generate \$65 million in improvements to our bottom line beginning in 2003. Based on unprecedented, comprehensive economic analysis of our national rail system, our Net-

work Growth Strategy is a market-driven plan to expand our existing network, increase our profitability, and better serve our passengers and partners.

—Let me give you one example of this initiative that demonstrates clearly how our market analysis can improve the performance of under-performing trains and Amtrak as a whole. Our transcontinental train, the Sunset Limited, goes from Orlando to Los Angeles. By rerouting the service from San Antonio directly north to Dallas/Ft. Worth, and then west through Abilene, we immediately improve the financial performance of the train by \$2.9 million. We are also bringing it from a regional market of 30,000 people to a much more densely populated market of more than 300,000 people, we are reducing the Ft. Worth to Los Angeles segment of the trip by ten hours, improving the connectivity with other national routes, and increasing both our mail and express and our passenger revenue.

This raises the question—if it is still losing money, why are we operating it? If we took the same train and eliminated it, we would lose \$3.2 million of direct savings plus \$4.8 million of other variable costs, for a total route savings of \$8 million. However, eliminating the train also reduces passenger revenues by \$3.5 million and connecting mail and express revenues by \$6 million, for a total revenue loss of \$9.5.

Simply, we would lose more money by eliminating the train than keeping it. So instead we take the right kinds of action and improve the train's performance by \$2.9 million.

Let me turn now to our third major point—developing new, high-speed rail corridors across the nation. On January 31, 2000, Amtrak took the first step in our high-speed rail program—the launch of Acela Regional train service between Boston and New York. The new, all electric Acela Regional service dramatically reduces travel times within New England, making rail an attractive alternative for both leisure and business travelers. So far, Acela Regional is doing 25 to 30 percent better than our initial projections, and outperforming the trains they replaced by 55 to 65 percent.

With this success with the Regional service, it is no wonder that we are anxious to debut Acela Express. When we are confident about announcing a start date, we will do so. The consortium manufacturing the trainsets tell us it will be in July, and we are continuing to have discussions with them. But I would remind everyone that high-speed trainsets in the Northeast are a new technology, and we owe it to the American people to see to it that this technology meets our high standards. Only when it has done so, will we announce a starting date for Acela Express. That is our responsibility, and we intend to live up to it.

Of course, high-speed rail isn't just something that the Northeast wants. The development of high-speed rail corridors is a key component of Amtrak's business plan, but it is even more critical to a balanced and integrated intermodal transportation system. A grassroots movement to expand passenger rail is sweeping across the nation and, as is so often the case in American history, the states are leading the way. State investment in passenger rail is on the rise, with high-speed rail programs now actively underway in 29 states, led by Chief Executives from across the political spectrum, proving that states are willing to partner with the federal government to develop these high-speed rail corridors. Look at the state budgets proposed by my colleagues—governors are serious about developing rail corridors because it represents jobs, clean air, mobility, accessibility, reduced congestion and smart growth—all of which fuel economic competitiveness.

But the federal government has to play a role here, too. Just two weeks ago, at the Winter Meeting of the National Governors' Association, the nation's governors unanimously adopted a resolution calling on Congress to fully fund Amtrak at the authorized level of \$989 million for fiscal year 2001.

Of that amount, \$521 million—or \$48 million less than our request for fiscal year 2000—would enable Amtrak to continue to achieve its goal of operational self-sufficiency by 2003. The balance, \$468 million, would be used to develop high-speed rail corridors in states nationwide.

And the collective voice of the nation's governors strengthens a long list of organizations supporting this request. The President has requested it. I am here today to urge you to fulfill this request and thus take the first step in creating a desperately needed federal high-speed rail program. The states have invested their dollars in rail. We now ask Congress to do the same.

It can be successful, Mr. Chairman. As Inspector General Mead said in his testimony before the Senate Commerce Committee only two weeks ago, "If the Administration's proposed budget for 2001 is adopted, Amtrak would have sufficient funds to address minimum needs and invest in projects with long-term growth opportunities like new high-speed corridors." He is absolutely right.

Mr. Chairman, when I appeared before this Subcommittee a year ago, I stressed Amtrak's determination to achieve operational self-sufficiency by 2003. Today, I'd like to reiterate that pledge, but I'd also like to go a step further. Our goal is not merely to survive. It is nothing less than to become a world-class national passenger railroad system—a growing, thriving commercial enterprise that is poised to take advantage of market opportunities and meet the demands of today's travelers. And I believe that our results, our commercial initiatives, our network growth strategy and our high-speed rail plans, demonstrate clearly that this is more than a promise. We are on track to meet these goals, and I urge you to support this effort.

STATEMENT OF KENNETH M. MEAD

Senator SHELBY. Mr. Mead.

Mr. MEAD. The Governor is good, is he not?

Senator SHELBY. He is good. I am ready to vote for him, whatever he runs for. That is why the people of Wisconsin like him.

Senator LAUTENBERG. Amen.

Mr. MEAD. I want to switch gears off of Amtrak just for a moment and preface my brief remarks by saying I have a lot of respect—and the Department does too—for this committee taking pause once a year to focus on what the top issues are facing the Department. I think that is important, to say what the top issues are and how they have changed from the year before.

I am glad Senator Bennett is here, having been such a champion of getting the challenges of Y2K in hand. We dropped Y2K off the list, happily. I think a lot of people thought we were not going to make it at the Department, but with a big effort, we did.

Senator SHELBY. You would not have made it if there had not been the emphasis that was put on it, and we all owe a lot to Senator Bennett for his leadership in the Senate on this issue.

Mr. MEAD. Oh, his leadership was incredible, and we started late too.

COAST GUARD DEEPWATER PROJECT

We added something called the Coast Guard Deepwater Project, which is where the industry is developing a plan for modernizing Coast Guard assets used 50 miles or more off the coast. That is going to be very similar, in terms of dollars, to FAA's National Air Space System plan—about \$9 billion to \$15 billion. The issue is really not whether the Coast Guard needs to replace these assets. The question is going to be when, how and at what cost.

MARAD'S SHIP-SCRAPPING PROGRAM

We also added MARAD's ship-scrapping program, which is not even within the jurisdiction of this committee, but is an environmental time bomb. The Department of Transportation has fleets of old ships—some dating back to before World War II—and the hulls are corroding. They are sitting there in such waters as the James River. Currently the Coast Guard asks people to pay it—pardon me, not the Coast Guard. MARAD wants to ask people to pay it to scrap these vessels. Well, that is not going to work. The U.S. Navy is doing the opposite, paying people to scrap obsolete Navy vessels.

COMPUTER SECURITY

We split out transportation security and computer security, and we did that because we think the issues are distinct. We think computer security is going to be a major issue, just like Y2K. A big difference, though, is that there is no ending date. Many of the vendors that were around to help you out with the Y2K now are standing in line to help you assess your computer security problems.

FAA

On FAA, we testified a couple of weeks ago on air traffic control modernization and FAA financing. Not to be redundant about our message at that hearing, but I should say that if people believe that FAA's problems with these big modernization initiatives have been a lack of money, they are incorrect. I think everybody wants to invest appropriately in FAA, but more money is not going to solve some of the big problems that have haunted these modernization programs.

Senator SHELBY. Are you going to speak to what will solve some of the problems other than money?

Mr. MEAD. Yes, I certainly can. I was going to save that for questions and answers.

Senator SHELBY. Okay.

AVIATION SAFETY

Mr. MEAD. In aviation safety, I wanted to mention three points. One is runway incursions. We absolutely have to get a handle on runway incursions. They were about 160-170 a year in 1993. They are now up to 327 a year. This is an accident waiting to happen. I have a chart I would like to put in the record, if I might, that shows the trend line.

Senator SHELBY. Without objection.

[The information follows:]

Senator SHELBY. Are you going to talk about the chart?

Mr. MEAD. Yes. You can see that, between 1994 and 1999, it has gone from about 200 to 322. Runway incursions, Mr. Chairman, are similar to a near mid-air collision. It is just that planes come too close together on the ground. In fact, the worst aviation tragedy in history occurred on the ground in the Canary Islands.

Operational errors. These are errors made by controllers. They have been going up too. They went from 185 in 1998 to 940 in 1999. I want to commend FAA and the Secretary for taking the initiative on code-share safety. This is where you have different airlines taking separate legs of a trip. If you are flying on a foreign carrier, what assurances do you have that that foreign carrier is safe? FAA has initiated a program there.

In surface transportation safety, Congress enacted the Motor Carrier Safety Improvement Act. There are 10,000 carriers on the road today that have an unsatisfactory safety fitness rating. We need to get serious here and not only establish a vision of leadership in the new administration, but also shut down some of these carriers. If they are not going to be safe, we need to get them off the road.

Transportation infrastructure. This represents a major infusion of dollars into transportation. I think the experience of the last 2 months with the Central Artery—this is a project that went from about \$3 billion to, recently announced, about \$12.2 billion. I do not believe the Artery management was forthright with the Department or anybody, at least publicly. I think the Department and the Federal Highway Administration had gotten too close to the project management in that case. I am pleased to see Secretary Slater has moved out to, I think, take firm, corrective action in that area.

FINANCIAL STATEMENT

We signed off yesterday on a clean opinion on FAA and the Department's financial statements. They have been trying for 9 years to get an unqualified or "clean" financial opinion, the kind most corporations have to have. We were very pleased to do that. The Department deserves a lot of credit. Mr. Basso, on my right, was a chief architect behind the Department's success there.

On Amtrak, sir, if Amtrak makes it, they are not going to make it by much on operational self-sufficiency. In the capital area, they are, by our projections, going to fall short by over \$200 million through 2002. And Governor Thompson is right, after that glide path is over, they are going to require capital assistance. There are no two ways about it.

I think a key issue here is getting the Acela high-speed train in operation and deployed. We really will not know about the future of Amtrak until we get that high-speed rail line running.

Senator SHELBY. Are you going to be on that train with us?

Mr. MEAD. I will be on it. I will not be driving it. I will sit next to you.

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. I am driving it.

PREPARED STATEMENT

Mr. MEAD. I also want to make a passing reference to work that we are doing in the aviation area. We have some obligations to review how well the airlines are treating their passengers through airline service commitments. We are also doing a lot of work on aviation delays, which I think is quite interesting. Actually, we are doing that work for this committee. If you have any questions and answers about that, we would be glad to answer them too.

I will conclude with that, sir.

[The statement follows:]

PREPARED STATEMENT OF KENNETH M. MEAD

MANAGEMENT OVERSIGHT ISSUES

Mr. Chairman and Members of the Subcommittee: We appreciate the opportunity to appear today to discuss the major management issues facing the Department of Transportation (DOT).

Last year, we testified before this Subcommittee on what we then saw as the top 10 management issues facing DOT. At the request of Congressional leadership, we updated our list and prepared a new report outlining the top 12 significant issues facing DOT. This report, issued in December, includes the Department's progress in the last year. Copies of the report have been provided to the Subcommittee as part of my written statement.

The 12 items on this year's list are:

- Aviation Safety*.—The Federal Aviation Administration (FAA) must proactively address aviation safety issues such as growth in the number of runway incursions and operational errors.
- Surface Transportation Safety*.—The Department must effectively implement new enforcement tools and other improvements to the commercial driver's license program resulting from the Motor Carrier Safety Improvement Act of 1999, better coordinate the hazardous materials programs of the various Operating Administrations, and target its efforts to reduce rail-highway grade crossing accidents with proven, cost-effective strategies.
- Air Traffic Control Modernization*.—Problems persist with technologically challenging systems, such as the Wide Area Augmentation System (WAAS) and Standard Terminal Automation Replacement System (STARS). These two systems alone have cumulative estimated program costs of over \$4 billion, and are experiencing cost and schedule difficulties. For example, WAAS is experiencing software and hardware problems that will have significant cost and schedule implications that have yet to be determined. Consequently, WAAS will not meet the September 2000 milestone for initial operating capability. The STARS schedule has been impacted by the software development needed to resolve computer-human interface issues and other new requirements. The last full service STARS is now planned to be deployed by September 2008, over 3½ years behind schedule.
- FAA Financing*.—Congress is getting closer to finalizing a new authorization bill for FAA. The proposed package includes \$40 billion over 3 years with large increases for airport improvements and air traffic modernization. While the increases represent a significant investment opportunity for aviation infrastructure, additional funding alone is not the only solution. FAA will need to contain the growth in operations costs, provide for greater risk sharing with contractors, and expedite an accurate cost accounting system.
- Surface, Marine, and Airport Infrastructure Needs*.—It is imperative that the historic levels of expenditure on transportation infrastructure, amounting to \$50 billion in fiscal year 2000 alone, be effectively monitored. We recently reported that trends in construction cost on the Central Artery could raise the cost of that project by up to \$942 million. Last October, both FHWA and project officials rejected our projections. Then, on February 1, 2000, FHWA accepted the project's latest Finance Plan. Later that same day, the project announced a \$1.4 billion cost increase that was not reported in the Finance Plan. If the FHWA's oversight had been effective, they would have known about cost increases as they were occurring, and certainly before they accepted the project's Finance Plan.

- Transportation Security*.—FAA must continue to improve its oversight of aviation security, particularly in areas such as airport access controls and the effective use of baggage screening equipment. In surface transportation security, DOT must begin to develop a comprehensive research strategy and the ability to perform meaningful risk assessments.
- Computer Security*.—DOT needs to perform risk/vulnerability assessments on its critical computer systems and use these assessments to prioritize its work in addressing computer system vulnerabilities.
- Financial Accounting as Related to the CFO Act*.—After 9 years of work and because of extraordinary efforts in the last 2 years, DOT was able to support all material line items in its fiscal year 1999 Consolidated Financial Statements, thereby earning DOT its first “clean” audit opinion. These Consolidated Financial Statements show DOT and its Operating Administrations had assets of \$76 billion, liabilities of \$30 billion, operating costs of \$42 billion, and total budget authority of \$57 billion. While significant progress has been made in improving the financial records, DOT still needs to make major improvements in its financial management systems.
- Amtrak Financial Viability/Modernization*.—Amtrak still faces major challenges to its goal of operating self-sufficiency: 1999 cash losses were higher than expected, implementation of high-speed train service has been delayed; and there are significant capital investments which must be made to protect Amtrak’s future safety and potential profitability.
- The United States Coast Guard’s (USCG’s) Deepwater Asset Replacement Project*.—The Coast Guard faces a challenge in developing an acquisition and budgeting strategy for replacing its Deepwater aircraft, vessels and related equipment. These assets will reach the end of their useful lives over the next 30 years. It is expected to cost \$9.8 to \$15 billion to replace this capability. The question is not whether Deepwater assets have to be replaced or modernized, but how, when, and at what cost.
- The Maritime Administration’s (MARAD’s) Ship Scrapping Program*.—MARAD, the Administration, and Congress need to consider how MARAD can best dispose of the 110 vessels it currently has slated for disposal (many of which pose significant environmental dangers). Overseas sales have been halted, there is limited capacity in the domestic ship scrapping industry, and MARAD is required by law to dispose of these ships in a manner that brings the greatest financial return to the Federal Government. The approach of selling vessels for scrapping will not work in today’s marketplace. MARAD will need relief from the requirement to maximize financial returns and will need authorization and funding for a program similar to a Navy pilot project that is paying to have vessels scrapped.
- DOT Implementation of GPRA*—For DOT to continue its success in implementing GPRA, it must improve the timeliness and reliability of its performance data.

In addition to the 12 management issues presented above, the state of service delivery in the aviation industry has developed into a major customer service policy matter. In order to apprise the Congress and the Secretary about the progress of airline efforts, we will be engaged this year in several important audits of the state of service delivery in the aviation industry. In my testimony today, I would also like to summarize for you the status of our work on airline flight delays and on airline pricing and customer service issues.

I. CHANGES FROM THE OIG’S 1998 LIST OF TOP PRIORITY MANAGEMENT CHALLENGES

Our 1998 and 1999 lists are very similar. We deleted only one item from the 1998 list: Year 2000 Computer Issues. From mid-1997 to December 1999, DOT repaired, tested, implemented, and independently verified fixes to over 300 mission-critical systems. Contingency plans and command centers were established in case of any Year 2000 problems. These were not needed, as all mission-critical DOT systems successfully transitioned to the year 2000.

We added two issues to this year’s list: the United States Coast Guard’s Deepwater Capability Replacement Project and the Maritime Administration’s Ship Scrapping Project.

Coast Guard’s Deepwater Capability Replacement Project.—In its Deepwater Project, the Coast Guard proposes spending \$9.8 to \$15 billion over the next 20 years to replace or modernize all of the vessels and aircraft it uses 50 miles or more offshore. Current deepwater assets include 206 aircraft, 93 vessels, and related sensor, communications, and navigation systems. This represents 99 percent of the Coast Guard’s aircraft and 100 percent of its vessels 110 feet and longer, excluding

buoy tenders and icebreakers. Primary deepwater missions include search and rescue, drug interdiction, alien migrant interdiction, and fisheries law enforcement.

In 1996, the Coast Guard received Departmental approval to proceed with the design of the Deepwater Project. Through fiscal year 2000, a total of \$75 million has been appropriated for project planning and preliminary design. For fiscal year 2001, \$42.3 million has been requested to allow the Coast Guard to finish the planning phase and prepare its acquisition strategy. For fiscal year 2002, the Coast Guard anticipates requesting \$350 million to begin the Deepwater acquisition.

The Coast Guard's Deepwater assets will reach the end of their useful lives over the next 30 years. The question is not whether they have to be replaced or modernized but how and when. However, the planning phase for the project will not be completed in time to support the fiscal year 2002 budget request. Coast Guard will have to reconcile how it can proceed with a budget request in advance of completing the planning process. An important subsidiary issue is how priorities will be established within annual fiscal limitations. Three options are to: defer the anticipated \$350 million fiscal year 2002 Deepwater budget request until the results of the planning process are known; expedite the planning process to identify the most critical deepwater needs and justify the fiscal year 2002 budget request on that basis; or use information available to develop a current cost and schedule estimate for the project that identifies anticipated acquisitions and use that to justify the fiscal year 2002 request.

MARAD's Ship Scrapping Project.—The Department, the Administration, and the Congress also face a challenge in determining how to dispose of MARAD's fleet of environmentally dangerous vessels in a timely manner. MARAD currently has 110 vessels in its fleet awaiting disposal, with 88 of these vessels slated specifically for scrapping. The average age of these vessels is 46 years, and they have been awaiting disposal for an average of 13 years. Forty of these vessels are considered "worst condition." These vessels are literally disintegrating.

Environmental dangers associated with MARAD's deteriorating vessels increase daily. These ships contain hazardous substances such as asbestos and solid and liquid polychlorinated biphenyls. These vessels also contain oil that, if leaked into the water, would require immediate Federal and State action. MARAD has applied over 20 patches to leaks, removed hazardous materials, and pumped oil out of one vessel in the James River Reserve Fleet that is over 30 years old. That vessel is disintegrating to a point where it will not be seaworthy much longer.

Given the small size of the domestic ship scrapping industry and the Administration's policy against using foreign ship scrapping facilities (which have poor environmental records), MARAD will likely need relief from the legislative requirement that it dispose of all obsolete vessels by 2001 in a way that maximizes financial return to the Government. MARAD would also benefit from authorization and funding for a program similar to a Navy pilot project, which pays for ship scrapping.

This year's list has one other change. Last year our list cited Transportation and Computer Security as one issue. In view of the significance of both of these issues, we identified them separately in this year's report.

Transportation Security.—The U.S. transportation system includes 3.9 million miles of public roads, 1.5 million miles of oil and natural gas pipelines, 123,000 miles of major railroads, over 24,000 miles of commercially navigable waterways, over 5,000 public-use airports, 508 transit operators in 316 urbanized areas, and 145 major ports on the coasts and inland waterways. Over the last several years, the changing threat of terrorist and other criminal activities has heightened the need to improve domestic transportation security over these vital transportation assets.

The need to protect aviation security has long been recognized. Over 450 airports and 290 air carriers are subject to Federal Aviation Regulation security requirements and have FAA-approved security programs. More than 500 FAA security field agents monitor industry's compliance with these programs. Since 1997, FAA has also deployed more than 600 machines, at a cost exceeding \$250 million, for screening passenger checked and carry-on baggage. To improve its aviation security program, FAA should develop an integrated strategic security plan, work with the industry to improve airport access controls, and develop new requirements for issuing and accounting for airport identification media.

Surface transportation security issues, on the other hand, have not been a high priority. Also, the size and openness of surface transportation systems makes it much harder to develop appropriate, cost-effective security requirements. Precisely because of their size and openness, however, surface transportation locations can become terrorist targets. For example, in March 1995, a cult released nerve agents in a Tokyo subway, and over 5,500 subway travelers required medical treatment. As a first step toward addressing these vulnerabilities, the National Research Council

recommended that the Department work toward a surface transportation security strategy and develop the ability to perform meaningful risk assessments on surface transportation security threats.

Computer Security.—The Department needs adequate computer security to ensure the integrity, confidentiality, and availability of its automated operations. The recent network attacks on major e-retailers demonstrate the need to re-examine this area in light of today's technology. While interconnected computer networks have made our operations more efficient, they also created new challenges for us. For example, we can no longer rely on physical isolation as our key safety net, which has been an important part of security for the Air Traffic Control Systems.

DOT, with \$2.7 billion in planned expenditures for fiscal year 2000, is responsible for the largest information technology investment among all civilian agencies. There are over 600 mission-critical systems in DOT, including safety-sensitive Air Traffic Control Systems, Coast Guard search and rescue systems, and financial management systems supporting the distribution of billions of dollars in grants.

Computer security comprises a wide range of work, from implementing sophisticated network tools to increasing employees' security awareness to performing proper background checks on people occupying key positions. To meet its responsibilities for secure computer operations, DOT should: perform risk assessments of its computer systems in order to prioritize use of limited resources, implement cost-effective protections for its critical systems, secure entry points to its interconnected network systems, and emphasize basics such as security training and background checks.

II. ITEMS CONTINUING FROM THE OIG'S 1998 LIST

Eight items on last year's list are also on this year's list. They are: Air Traffic Control Modernization; FAA Financing; Aviation Safety; Surface Transportation Safety; Surface, Marine, and Airport Infrastructure Needs; Financial Accounting as Related to the Chief Financial Officers Act (CFO Act); Amtrak Financial Viability/Modernization; and DOT Implementation of the Government Performance and Results Act (GPRA).

Last month, at a joint hearing of this Subcommittee and the Senate Budget Committee, we testified on Air Traffic Control Modernization and FAA Financing. That testimony included detailed and updated discussions of our concerns in these areas, so we have not addressed them in this statement.

I would like to give you a short summary of the other six items continuing from last year.

Aviation Safety.—The aviation industry expects continued growth in air traffic and closer spacing between airplanes due to increased demand and the implementation of new technologies. The key safety issues facing FAA include: ensuring that U.S. air carriers perform meaningful safety assessments on their foreign code share partners; using training and new technology to reverse the upward trend of runway incursions; reducing the number of air traffic operational errors and deviations; and working with the Congress to ensure passage of the FAA Reauthorization Act.

Surface Transportation Safety.—Motor vehicle, railroad, and rail transit accidents account for over 42,000 deaths annually—more than 90 percent of all transportation-related fatalities. The Department's first priority in this area is effective implementation of the Motor Carrier Safety Improvement Act of 1999. DOT must move quickly to establish the needed leadership in the new Federal Motor Carrier Safety Administration (FMCSA) and publish the 30 rulemakings FMCSA believes necessary to implement the new Act. These rulemakings would strengthen the commercial driver's license program by enhancing the number and type of disqualifying violations, the enforcement of civil penalties, and reviews of new motor carrier operators.

In terms of railroad safety, DOT has made significant progress in reducing rail-highway grade crossing accidents and fatalities, which were once the leading cause of railway deaths. To continue this trend, DOT should target its limited resources to proven, cost-effective strategies, such as installation of median barriers preventing drivers from crossing tracks when a train is approaching.

The Department must also make adequate provisions for the safe transport of hazardous materials. While the probability of a serious hazardous materials incident is low, the consequences of such an incident can be catastrophic, as evidenced by the 1996 ValuJet crash in Florida. The Department is about to issue a Hazardous Materials Program Evaluation (HMPE), which will recommend establishing a central focal point to administer and deliver a DOT-wide hazardous materials program. This DOT-wide program would focus more outreach and inspection resources on shippers who introduce hazardous materials into the transportation stream and

strengthen standards to ensure that all employees handling hazardous materials are adequately trained.

On the issue of pipeline safety, there is a critical need to ensure that DOT continues to enforce pipeline safety laws and implements recommendations that could further strengthen pipeline safety programs. Issues to be considered during reauthorization include: requiring Research and Special Programs Administration (RSPA) to comply with outstanding Congressional mandates to revise the inspection process; expanding the focus of RSPA research to include “smart pigs” that can detect seam weld defects and alternative pipeline inspection technologies for pipelines that cannot accommodate smart pigs; training RSPA safety inspectors on the capabilities and use of pipeline inspection technologies; and implementing revisions in the collection of pipeline accident data to expand accident causal categories for more detailed trend analysis.

Surface, Marine, and Airport Infrastructure Needs.—The Transportation Equity Act for the 21st Century (TEA–21) guarantees a minimum of \$198 billion in Federal funds for surface transportation infrastructure in fiscal years 1998 through 2003.

Since the oversight of TEA–21 projects has shifted to grantees, resulting in less direct Federal Government control over infrastructure projects, there is a need to identify and apply best practices to major projects and find systemic solutions to problems. For example, DOT needs to: require and closely examine finance plans for all large infrastructure projects; establish criteria for finance plans to ensure complete and consistent reporting of basic standardized financial data in the plans; monitor project performance and mitigate funding risks for infrastructure projects to protect the Government’s financial interests as soon as problems are identified; and continue to promote owner-controlled insurance programs that can reduce program costs, while ensuring that Federal reimbursement for these programs is limited to the amounts actually needed to purchase insurance coverage or pay claims.

Also, as the results of OIG investigations demonstrate, vigilance must be improved across the Federal, state and grantee levels, in order to thwart fraud against TEA–21 funds.

In terms of airport infrastructure, FAA must exercise adequate oversight to ensure that airport revenues are reasonably established and that funds are used for eligible purposes. FAA must also ensure that airport sponsors require that their annual audits cover airport revenue use. The most important priority to support this and other aviation issues, is passage of the FAA Reauthorization Act.

Financial Accounting as Related to the Chief Financial Officers (CFO) Act.—During fiscal year 1999, DOT made extraordinary and labor-intensive efforts to overcome its accounting and financial system weaknesses. With these efforts, DOT was able to support the material items on its financial statements, thus earning an unqualified, or clean, audit opinion on the fiscal year 1999 Highway Trust Fund, FAA, and DOT Consolidated Financial Statements. Although getting a clean audit opinion was a major achievement, it is not the ultimate goal.

DOT still has to make long-term improvements in its financial management and accounting systems. If such improvements are not made, DOT will have to continue the same type of extraordinary, expensive, and labor-intensive efforts in the future. Such efforts are not sustainable for the long term and unnecessarily expend significant amounts of resources to maintain accurate records, which should be routinely produced by the accounting systems.

To its credit, DOT recognized several years ago that its financial systems do not meet today’s needs. DOT is currently designing a new system, and plans to have a state-of-the-art, off-the-shelf commercial financial management system, with a cost accounting module, fully operational by June 30, 2001. FAA also is developing a separate cost accounting system for its management needs and to support user fee calculations. FAA’s system is scheduled to be fully operational by fiscal year 2002.

Amtrak Financial Viability/Modernization.—Amtrak’s 1999 financial results show some progress, but still indicate the need for major improvement. Amtrak’s cash loss last year was \$579 million, \$54 million higher than the 1998 cash loss and \$19 million worse than Amtrak had projected. Over half of the \$692 million in projections we considered to be “at risk” in the 1999 Business Plan represented investments and revenue placeholders for actions including the Market Based Network Analysis. This year, it is imperative that Amtrak begin to realize the payoffs of such investments—the small steps made the past 2 years must now be replaced with large strides. First quarter 2000 performance indicates these strides are slow in coming. Passenger revenues continue to lag, led by Intercity, which finished nearly \$11 million behind plan, \$2 million worse than the same period last year. Acela high-speed rail is critical to Amtrak’s ability to reach operating self-sufficiency. The impact of delays in 2000 will be mitigated by offsetting expense savings and other means, but

this should not understate how important it is for Amtrak to bring high-speed rail on line as soon as possible.

The criteria used to measure whether Amtrak has made its self-sufficiency goal needs to be defined: Amtrak will require capital funding after 2002 to continue operations of the railroad, and will not be able to fund depreciation, the costs of capital replacement, without Federal assistance. Allowing Amtrak to use capital funds for progressive overhauls will encourage Amtrak to make overhaul decisions based on good business practices, rather than what can be federally funded after 2002.

Amtrak's capital program should first address minimum needs before investing in high rate-of-return projects like new high-speed corridors. Although these investments are likely to result in revenues that will help Amtrak reach and sustain financial viability, Amtrak must first make the investments necessary to ensure the safe, reliable operations of the existing system. It will not have enough capital funds available to do both. One of Amtrak's most pressing needs is the \$654 million unfunded fire and life-safety needs in Penn Station-New York and the associated river tunnels. Unless additional funding can be identified, the schedule for meeting these needs will extend to 2014. To ensure that these life-safety-requirements are completed in a timely manner, the Federal Railroad Administration (FRA) Administrator should work with Amtrak, New Jersey Transit, and the Long Island Rail Road to identify the necessary funding.

DOT Implementation of GPRA.—DOT's first strategic and performance plans were rated by Congress as the best in the Federal Government. Further, in 1999, DOT had the foresight to do a dry run of preparing a performance report for the Congress by March 31, which will be the annual statutory due date starting in 2000. In the dry run, DOT was able to report prior year data for only 63 percent of its measures. Agency staff expect to be able to provide 1999 data for over 90 percent of the measures in the performance report they will submit to Congress this March 31.

To continue its GPRA success, the Department needs to continue to improve the reliability and timeliness of its performance data; face the challenge of having to accomplish some significant goals through States and other third parties; and ensure that the Operating Administrations set baselines, develop performance measures, and set performance goals for all important initiatives.

III. OIG FLIGHT DELAYS AND AIRLINE PRICING AND CUSTOMER SERVICE REVIEWS

In addition to the 12 management issues presented, the state of customer service delivery in the aviation industry has developed into a major policy matter. At the request of the Congress, we have initiated three reviews in this area.

—*Airline Flight Delays.*—Last summer, the increasing number of delayed and cancelled flights sparked sharp debate over the cause or causes of these delays and cancellations. FAA cited unusually bad weather as the primary culprit. In contrast, the airline industry held FAA responsible, citing several problems with air traffic control procedures and equipment outages. To gain a better insight into this important service delivery issue, this Subcommittee asked us to examine the sources of delays and cancellations and the factors that contribute to them. We are currently preparing our report and expect to issue it this Spring.

—*Airline Pricing and Customer Service.*—The Transportation Appropriations Act of 1999 required the OIG to report on consumer access to lowest fares and airline overbooking disclosure practices. We recently initiated a review to: identify the extent to which actual or potential barriers exist to consumer access to comparative price and service information; and determine the extent to which airlines fail to disclose to passengers or ticket agents whether flights are overbooked. In addition to airlines and travel agents, we will be exploring these issues with Internet and other ticket distribution providers, consumer organizations, and aviation industry experts.

We have established an Internet web site and a toll free telephone number where consumers can submit descriptions of their travel experiences directly to us, and we will include an analysis of these experiences in our report. We expect to issue our findings later this year.

In December 1999, the Chairman of the Committee on Commerce, Science, and Transportation asked the OIG to review the domestic air carriers' customer service commitment plans. These plans describe what the airline will do in areas such as notifying passengers of known flight delays and cancellations; meeting customers' essential needs during long on-aircraft delays; improving on-time baggage delivery; providing prompt ticket refunds; and accommodating disabled and special needs passengers.

By mid-June, we will provide the Commerce Committee with an interim report on the completion, publication, and implementation of the airlines' Customer Service Commitment Plans and the individual air carriers' procedures to carry out their commitments. Our final report, due on December 31st of this year, will provide our evaluation on the quality of each air carrier's plan compared to the commitments. To date, we have visited the corporate headquarters of each of the 14 air carriers included in our review. We are developing procedures for testing and evaluating the air carriers' implementation of the commitments.

This concludes my formal remarks. Thank you for inviting me to testify this morning. I would be happy to answer any questions the Subcommittee may have.

STATEMENT OF PETER J. BASSO

Senator SHELBY. Mr. Secretary?

Mr. BASSO. Thank you, Mr. Chairman, Senator Lautenberg, and Senator Bennett. Good morning. I will be very brief.

Senator SHELBY. Your written statement will be made part of the record.

Mr. BASSO. Thank you, sir.

SAFETY AND Y2K

Let me just, in the interest of time, Mr. Chairman, touch on two things that are very important in the management areas of the Department.

They are, first of all, our management and expansion of our safety programs. The budget that we put before this subcommittee this year for fiscal year 2001 requests substantial increases in all areas of safety, and I want to particularly emphasize the importance of us working with the Congress to assure that those funds are made available. I would hope that the subcommittee can accommodate those changes.

The other area that I want to touch on is the Y2K issue that Mr. Mead has touched on. Senator Bennett certainly deserves great credit for the prod that helped this Department go from what I would consider basically nowhere to completing the job on time. I particularly appreciate that, and Deputy Secretary Downey, Jane Garvey, and others deserve great credit for delivering on that point.

CLEAN AUDIT

The other point I wanted to touch on—there are many I could in these management challenge areas—is the Department receiving a clean audit opinion, something that we pursued somewhat like the holy grail since 1991. As one of the people who actually worked on writing the Chief Financial Officers Act, I know what it means. It is not important to get an A on the report card, although I have to give great credit to the Inspector General who worked very closely with us to get this done, as well as others. What is important is that it represents an integrity that we can represent to the American public and the Congress as to what we have done with assets and how we have accounted for them.

But if it stops at that point—and I probably will not have the opportunity to appear before this subcommittee again on this issue—it would be a total failure. To simply get an A on the report card is a failure.

What has to be done, and what I committed to assuring gets done as the CFO of the Department, is that the systems and procedures are in place that are necessary to make this a routine matter so that this committee does not have to ask the question about this challenge in future years. What really is at the heart of what we are going to complete this next year with our new DELPHI accounting system, a state-of-the-art system, our cost accounting system at FAA, and the audits I think are essential to keep us all on our toes and focused on the issues in that regard. So, we should give the IG a little more money for that, but that is another issue. We will deal with that.

PREPARED STATEMENT

In conclusion, Mr. Chairman, I really do appreciate the opportunity to appear this morning, but I would prefer I think, in deference to the committee, to offer the opportunity for you to ask questions of myself and others here rather than carry on at great length.

Senator SHELBY. Thank you.
[The statement follows:]

PREPARED STATEMENT OF PETER J. BASSO

Mr. Chairman, Members of the Subcommittee. Thank you for the opportunity to testify on management issues, challenges and related accomplishments of the Department of Transportation.

OVERVIEW

Last year, when I testified before this Subcommittee on management challenges facing the Department of Transportation (DOT), I stated that Americans demand mobility and that we have an obligation to provide a transportation system that meets both our economic and mobility requirements in a safe and environmentally friendly way. This obligation is a long-term one and must be part of our vision for the transportation system of the 21st century. The management challenges that face our transportation system and the Department today are critical to our long-term success in meeting this obligation.

These challenges include:

- Rapidly growing travel demand, which affects the condition and performance of our transportation system. We face this challenge on the water, on the land, and in the air.
- Population changes, including increasing number of elderly individuals and drivers, which presents new mobility and safety challenges.
- Transportation behavior that is not acceptable, such as aggressive driving. The Department continually strives to find new ways to convince people to drive safely on our roads. Even though our transportation system's performance reflects the strength of our safety commitment, with 4,300 fewer people dying on our roads than in 1993, an unacceptably high number of people continue to die on our roads each year.
- Using technology in a cost-effective manner to improve our performance.

OVERALL DEPARTMENTAL MANAGEMENT

The Clinton-Gore Administration has made management of the Federal Government a top priority and a reality. The Secretary and Deputy Secretary have put in place an overall Departmental management structure that stresses leadership, coordination, innovation and results.

We in DOT strive to be excellent managers of DOT's resources, ensuring that we deliver programs that customers want with maximum efficiency, and that we manage for results. To determine how best to deliver programs we emphasize goal setting, customer involvement, and measurement of progress against these goals to determine our effectiveness and efficiency.

The Department has been aggressively implementing the National Partnership for Reinventing Government (NPR) and Government Performance and Results Act

(GPRA) mandates as well as the Chief Financial Officers (CFO) Act. In reinventing our procurement practices, we now use the purchase card for over ninety percent of our small purchases. We are now utilizing e-commerce solutions, so that those who need to pay us for services, fines and fees can do so quickly and efficiently. Our strategic and performance goals focus on outcomes—what we are attempting to achieve—not outputs (how much we do of one activity or another). In addition in fiscal year 1999, DOT established a procurement performance management system that uses a set of balanced performance measures to evaluate the effectiveness and efficiency of our procurement system in helping achieve our missions. The public deserves a Department of Transportation that is outcome oriented and our best-in-government strategic and performance plans show that we know what the public expects of us.

We have one transportation system, and making it work better requires a ONE DOT approach. The Department is improving its internal management activities by bringing intermodal energy and expertise to bear on all transportation problems. Our ONE DOT corporate management strategy is of special note. This strategy encourages and rewards collaboration across modes and agencies at all levels. It promotes efficiency and creativity, and instills in our employees the sense that they represent not just their operating administration but the whole Department in its response to the public. This innovative team thinking has led to the completion of our hazardous materials program evaluation whereby the Department's programs regarding both shippers and carriers of hazardous materials were evaluated, and our success in achieving an unqualified audit opinion on our financial statements this year for the first time.

My testimony today addresses our progress on the management challenges identified by the Inspector General: Surface Transportation Safety; Aviation Safety; Air Traffic Control Modernization; FAA Financing and Reauthorization; Surface, Marine, and Airport Infrastructure; Transportation Security; Computer Security; Financial Accounting/Chief Financial Officers Act; Amtrak Financial Viability and Modernization; Coast Guard Deepwater Capability Replacement Project; Ship Disposal Program; and Government Performance and Results Act Implementation.

SURFACE TRANSPORTATION SAFETY

Transportation safety is the Department's top priority. Safe and efficient transportation systems are critical to our economic security and our quality of life. Although our transportation system is already the safest in the world, much of what we do is aimed at making it safer, as travel continues to grow. In managing a myriad of safety programs in conjunction with the states, other public authorities, and the private sector, as well as directly through enforcement, we must constantly focus on outcomes. The fiscal year 2001 budget directs a record \$4 billion to transportation safety programs, 13 percent above this year's level.

A major focus of the management of our safety efforts is reducing highway crashes, which account for more than nine out of every ten transportation fatalities. Highway crashes are the leading cause of death for children, teenagers, and young adults. In addition to the tragic toll on our families, crashes cost our economy an estimated \$150 billion annually. Unless we continue to lower the fatality rate, the growth in travel created by our expanding economy will result in an increase in the number of deaths. To reduce the fatality rate, we must focus on all three components of the safety equation: safer roads, safer vehicles and safer drivers.

The top priority to improve safety is simple—seat belts and child safety seats work! A person is almost twice as likely to die or sustain a serious injury in a crash if unbelted. Today, seat belts save about 11,000 lives annually. In 1997, the President set a national goal of achieving an 85 percent seat belt use rate by 2000 and a 90 percent seat belt use rate by 2005. These goals will be difficult to achieve, as our progress in increasing seat belt use has been incremental. Information, education and outreach are critical efforts if we are to reach that goal and the fiscal year 2001 budget proposes substantial funding increases for NHTSA in these areas.

The President has also set a goal of making .08 the national standard for maximum blood-alcohol levels while driving. Although alcohol-related fatalities have declined over the past ten years, impaired driving remains a leading cause of traffic fatalities. These are irresponsible actions on the part of the driving public and should not be condoned. The fiscal year 2001 budget includes additional NHTSA funding to implement aggressive programs aimed at reducing drinking and driving.

Ensuring safe motor carrier transportation is a critical part of our overall efforts to improve highway safety. Historic levels of economic growth and logistical innovation have resulted in significant increases in truck travel. While the motor carrier fatality rate (relative to vehicle miles traveled) has decreased, the actual number

of fatalities has increased. That is not acceptable and the Secretary has set a goal of reducing motor carrier fatalities by 50 percent by 2009. With truck transportation a backbone of our economy, the management challenge facing DOT is to implement a risk based, systems approach that gets unsafe trucks and operators off our highways.

The new Federal Motor Carrier Safety Administration has already significantly stepped up its enforcement efforts. The number of Federal compliance reviews conducted has doubled since the beginning of 1999. The backlog of enforcement cases has been nearly eliminated. And, senior management of the Department is reviewing progress quarterly. We will be accountable for assuring that this effort succeeds.

To judge its progress in meeting this challenge, the new Federal Motor Carrier Safety Administration has set specific near term goals, including:

- deploying Commercial Vehicle Information System technology in 26 states by September of 2003;
- limiting the instances of negotiated settlement costs, so that violators of safety regulations will not view penalties as merely a cost of doing business; and
- pilot testing a new brake testing device by January 2001, in order to improve the efficiency and effectiveness of roadside inspections.

FMCSA also just launched a safety website to share detailed safety information with the public. Now each citizen can determine how safe his area is in comparison to the rest of the country. In addition, the Office of the Inspector General is continuing its criminal investigative emphasis on targeting parties which egregiously violate motor carrier safety standards.

Improving the safety of highway-rail grade crossings and pipelines also presents management challenges for the Department. Our ONE DOT management and our partnerships with states and local entities are the key to achieving results. FRA and FHWA work with state and community officials to raise awareness that the safest and most efficient way to reduce crossing collisions is by eliminating or consolidating highway-rail crossings. Since 1991, 12 percent of all public and private highway-rail grade crossings have been closed by states and localities, but our goal is to close a total of 25 percent by 2004 as trespasser fatalities represent over 90 percent of all railroad-related fatalities.

The accident last year in Bellingham, Washington revealed the need to comprehensively evaluate and improve pipeline safety. RSPA is committed to working with states to strengthen the pipeline safety partnership and to provide adequate resources to support pipeline safety activities. The fiscal year 2001 budget provides record resources to increase states' capabilities and builds on the cooperative actions RSPA has taken with the State of Washington. The \$23.5 million we request in fiscal year 2001 includes funding for the base pipeline safety program, as well as damage prevention and risk assessment initiatives.

While recreational boating fatalities have fallen steadily for three decades, commercial fishing and passenger vessel safety provide formidable challenges in the maritime environment. The Coast Guard recently concluded a task force report and is pursuing initiatives in 2001 to bring fishing vessel safety in line with the rest of the commercial fleet. They are also partnering with the maritime response community and cruise industry stakeholders on numerous initiatives designed to minimize risk and maximize safety in the burgeoning passenger vessel arena.

AVIATION SAFETY

With growing congestion in the air and at airports, and with growing numbers of Americans traveling on foreign carriers, FAA faces challenges in maintaining the safety of aviation passengers and employees. We must be vigilant on all aviation safety issues, including runway incursions. The tragic Alaska Airlines Flight 261 crash reminds us of the importance of our commitment to making our skies—the safest in the world—ever safer. We are putting programs in place that provide countermeasures for known accident causes and will remain vigilant enforcing safety regulations.

The funding we request in fiscal year 2001 will help us move towards our “stretch goal” of an 80 percent reduction in the rate of fatal commercial aviation crashes by 2007. FAA's Safer Skies agenda focuses on the most critical safety problems in commercial and general aviation including loss of control, pilot decision making, runway incursions, passenger seat belt use, uncontained engine failures and survivability. In order to prevent runway incursions, FAA has set goals for heightened situational awareness for both pilots and controllers, and is providing training for controllers, developing procedural initiatives to prevent incursions, using more sophisticated statistical and trend analysis and fully implementing new technologies to better identify and prevent such incidents. In addition, FAA will be focusing on runway

incursion prevention around the country and will bring together all of those involved to identify airport-specific improvements.

FAA is also targeting safety resources to commercial air carriers based on performance information such as operator experience, safety trends and company growth. A total of \$1.1 billion is requested in fiscal year 2001 for our aviation safety programs, six percent above this year's level.

Additionally, the Office of the Inspector General will continue its focus on investigating and prosecuting suspected unapproved parts (SUPs) where appropriate. The Department supports legislation to increase criminal penalties in the area of SUPs.

AIR TRAFFIC CONTROL MODERNIZATION

Modernization of our air traffic control system is important for both safety and efficiency reasons. Modernization is necessary to keep pace with improvements in technology and to accommodate air traffic growth. As aviation grows, FAA needs ever more sophisticated equipment and procedures to prevent additional delays. The economic impact of delays is substantial and must be controlled. Given this demand, we also have to recognize that modernization of complex systems presents challenges in maintaining schedule and cost discipline.

FAA has been faced with both successes and failures in its modernization efforts. Some programs such as the Display System Replacement and Free Flight Phase I are being accomplished within cost and schedule baselines. However, FAA has an unacceptably high rate of schedule slips and cost growth for its major modernization programs. FAA has faced problems with both the STARS and WAAS developments largely because these are technically complex programs that require more software development, and must be able to support the high standards of performance FAA demands from its workforce and equipment. To minimize problems with future projects, FAA is more intensively monitoring programs to stay within baselines, requiring more up front human factors analysis, and developing new projects in smaller increments.

A total of \$2.5 billion, 22 percent more than this year, is proposed for FAA's capital modernization program in fiscal year 2001. You need to be assured that these dollars will be spent wisely. FAA has a number of initiatives underway to help it meet this assurance. The FAA has baselined most major projects, so that progress against planned performance can be quickly measured. FAA is also using Earned Value Management for all new large acquisition projects and is awarding contracts more quickly, through its new acquisition management system.

In addition, FAA has set two important modernization goals. One, is to keep at least 80 percent of contracts within 3 months of their schedule baseline. The other is to keep costs within 5 percent of baseline for the 20 largest acquisition projects.

FAA FINANCING AND REAUTHORIZATION

Given the recent action on FAA reauthorization, it appears that the Administration's goal for FAA financing, which was to move FAA to a user fee financing system within a performance-based organization, will not be met at this time.

Nevertheless, FAA is on target to implement a cost accounting system throughout the agency in fiscal year 2002 and received an unqualified audit for fiscal year 1999. The cost accounting system will allow FAA to comply with the court order on over-flight fees and develop fees in line with FAA costs. The cost accounting system also will help FAA have the information it needs to evaluate its financial goals and maintain fiscal prudence.

SURFACE, MARINE AND AIRPORT INFRASTRUCTURE

One of the major goals of the Department is to improve the overall conditions and performance of our transportation system. Much of the progress toward this goal relies on improvements in the infrastructure itself and the way it is integrated throughout the transportation system. The Inspector General has identified a need for the Department to identify and apply best practices of major infrastructure projects and to enhance the monitoring of project performance and finance plans.

The Department is comprehensively dealing with the need to substantially increase our monitoring of major projects. We saw the need to do this recently with the Central Artery project, where the FHWA approved a finance plan for this project on the very same day that the state of Massachusetts announced increased costs for the project. This is not acceptable and the Department has laid out an action plan for a complete review of this situation. The Federal Transit Administration will increase its oversight of transit projects by five percent in fiscal year 2001. In addition, the Office of the Inspector General has implemented a program to heighten vigilance for fraud at the state and federal levels.

The Department believes the integrity of our nation's Maritime Transportation System (MTS) is important to the Nation's economy. Trans-ocean shipping supports the majority of the United States' global commerce, and secure ports and harbor facilities are essential to ensuring the safe, efficient transfer of goods between waterborne vessels and highway and rail routes. Our recent MTS report, developed with significant collaboration from private and community stakeholders, provided recommendations to ensure the MTS meets the future needs of the American economy.

Regarding airport revenue diversion, the FAA has implemented all of the revenue use enforcement provisions in the Reauthorization Acts of 1994 and 1996. The FAA issued a comprehensive final policy on the use of airport revenues after extensive public and industry comment. FAA compliance staff review the annual financial reports filed by commercial airports and follow up on potential compliance issues. Local government airport sponsors are also required to review airport revenue use as part of their annual audit of Federal programs under the Single Audit Act. FAA, in coordination with the Office of Management and Budget and the General Accounting Office, has issued detailed guidance to auditors on the conduct of those reviews. These actions, in addition to the FAA's continuing education and outreach to the airport community, serve to continue the dedication of airport revenue to airport purposes.

TRANSPORTATION SECURITY

It is critical that our transportation system be safe and secure. Even though the most visible security issues occur with the FAA and Coast Guard, several administrations within DOT are increasing their efforts on transportation security issues throughout the transportation system.

This year, the OST Intelligence and Security Office is working with the transportation industry to develop a mechanism for quick dissemination of security threats. In addition, the fiscal year 2001 budget contains funding for transportation risk assessments, which the IG has recommended that the Department conduct.

The security of our aviation facilities, specifically our airports, is a top priority of the Department. FAA has implemented all of the recommendations of the White House Commission on Aviation Safety and Security. However, we still face the management challenge of developing comprehensive procedures, technologies and measures of effectiveness to minimize the possibility that unauthorized persons gain access to restricted areas at airports. FAA research in fiscal year 2001 will be aimed at improving the speed and effectiveness of weapons and explosive detection devices to protect travelers from potential terrorist actions. FAA is also developing a regulation to stiffen the security procedures that prevent unauthorized access.

COMPUTER SECURITY

Not surprisingly, DOT's critical information technology assets reside within FAA and the Coast Guard, with no other DOT systems meeting the criteria of Presidential Decision Directive 63. Plans to evaluate, remediate, test and certify these systems in accordance with existing Federal IT security policy and guidance are now under development. Risk assessments will be conducted for these systems, with our goal of completing all risk assessments by November 2002. We also plan to have all remediation and testing of these critical systems completed by May of 2003. Steps are being taken now and efforts will be accelerated to improve detection of potential intruders in our computer systems and prevent them from damaging our systems. In addition, physical security is being improved to deny access to critical facilities.

In addition to our actions on our critical systems, DOT has worked vigorously to ensure the security of other systems. For example, my office completed a recertification last year of all accounting system users to ensure they were current and authorized personnel. The CIO's office established an IT security policy that requires all DOT IT systems be assessed to identify vulnerability, evaluate and mitigate these where justified, and then test and certify that adequate protection has been implemented. The CIO's offices will provide IT security awareness training to all of our workforce this fiscal year. And, we have set goals to develop an overall strategy/plan for ensuring that our IT assets are in compliance with OMB Circular A-130 by March 2001 and to assess, test, and certify no less than 25 percent of our non-critical IT assets by September 2001.

We have requested \$100 million in 2001 to allow us to proceed vigorously to address critical infrastructure concerns Department-wide.

FINANCIAL ACCOUNTING/CHIEF FINANCIAL OFFICERS ACT

I am most pleased to report that all DOT's fiscal year 1999 financial statements (the Consolidated Statements, the Highway Trust Fund statements, and the FAA Statements) received unqualified opinions from the Office of Inspector General. An unqualified opinion means that the financial statements meet accounting standards and all major dollar amounts are supported. This marks the first time that ALL DOT financial statements received unqualified opinions. This happened because numerous people in various financial, program, systems, and audit organizations worked together. It epitomizes the ONE DOT philosophy.

Financial statements, in general, are an important tool to promote and improve accountability and stewardship over the public resources entrusted to the Department. With the results of this year's statements, the Secretary now knows that:

- DOT's financial statement fairly represents its financial position and results of operation;
- DOT has a serviceable internal accounting and administrative control structure;
- DOT has complied with laws and regulations;
- DOT's Management Discussion and Analysis, which addresses goals and program results, is consistent with the financial statement information; and
- DOT's performance measures are supported and properly reported.

Following the fiscal year 1998 audit, DOT needed to resolve several major issues to receive an unqualified opinion on its fiscal year 1999 financial statement. But the major outstanding departmental issue was valuation and supporting documentation for property, plant, and equipment. FAA and USCG own most of DOT's property and equipment.

When the President announced in May 1999 the goal to have an unqualified audit opinion on the Federal Government's fiscal year 1999 financial statements, both FAA and USCG responded by developing plans to address the fiscal year 1998 property, plant, and equipment deficiencies. The plans covered three fronts: Real Property, Personal Property, and Work In Process (WIP). The OIG was instrumental in the success of the effort. Throughout the planning and execution, the OIG identified the types of accounts to be covered and the types of documentation that were acceptable; examined documentation supporting acquisition cost and accumulated depreciation; and, used a combination of statistical sampling, nonstatistical sampling of high-dollar items, and extensive testing to examine each major account of the property, plant, and equipment line item. The OIG reviews were conducted throughout all nine FAA regions. From the OIG perspective, the \$10.8 billion reported by FAA for its property, plant, and equipment is fair and reasonable as of September 30, 1999. This could not have been accomplished without the excellent partnership we have with the Inspector General.

DOT is moving aggressively to update its aging financial system with Delphi, a commercially available, off-the-shelf financial application. It is scheduled for full implementation in fiscal year 2001. All DOT entities are cooperating in its implementation. It will provide DOT with a solid financial system for sound financial management reporting. Delphi will have built-in capability to produce all the financial and budgetary information for preparing our financial statements.

Although FAA was able to support the cost of its property, plant, and equipment accounts by using alternative procedures and labor-intensive methods, we recognize that the deficiencies in its existing property systems still represent a material internal control weakness. Although FAA is making changes to its existing systems, FAA recognizes that it needs a better property management systems environment and has taken the following steps:

- In fiscal year 2000, FAA has initiated action to implement the Oracle Fixed Asset Module to consolidate all its property assets, to compute depreciation, and to maintain a record of changes to the financial information on its assets.
- In fiscal year 2001 and beyond, FAA will initiate actions to provide an integrated solution to its financial and property management accountability through an Asset Supply Chain Management (ASCM) program that will be compatible and fully integrated with the Department's Delphi system.

It is not sufficient to simply get an unqualified opinion. We must also assure that the systems are in place to make this the norm in the long run.

AMTRAK FINANCIAL VIABILITY AND MODERNIZATION

The 1997 Amtrak Reform and Accountability Act mandated that Amtrak develop a plan to eliminate its need for Federal operating support by 2003. Amtrak is making progress toward its goal of operating self-sufficiency by 2003, but it still faces significant management challenges toward reaching this goal, and the next two years are critical.

Amtrak has increased ridership for three consecutive years—ten percent since 1997 demonstrating that many Americans continue to want intercity passenger rail transportation. In 1999, Amtrak increased its commercial revenues by 16 percent. Meeting the operational self-sufficiency goal can be achieved by continuing this ridership growth and increasing revenues, a significant management challenge.

DOT is committed to supporting Amtrak as it progresses toward operating self-sufficiency. High-speed rail service in the Northeast Corridor and improvement to intercity passenger rail service nationwide are key investment strategies that we will pursue to help Amtrak meet this goal. We expect Amtrak's financial performance to continue to improve as a result of the introduction of the Acela Regional service on January of this year and Acela Express service on the Northeast Corridor later this year.

The fiscal year 2001 budget proposes a substantial investment in passenger rail service, building on the growth in ridership and ability to cover operating costs that our Northeast Corridor investment has supported. Many state governments have invested in passenger rail service, including high speed rail, and Federal funding will provide the foundation for it to be a significant transportation solution for the future. We propose \$468 million for this new program, in addition to continued Amtrak capital funding to expand Amtrak's intercity passenger rail service, including improvements necessary for high-speed rail service and other increases in average speeds through rail infrastructure improvement.

The Department will use funds under this new program to fund such improvements made by Amtrak and/or a State or consortium of States. Project funds would go towards the acquisition of right-of-way, and planning and design. Expanded intercity passenger rail service can and should play an important role in improving mobility.

COAST GUARD DEEPWATER CAPABILITY REPLACEMENT PROJECT

The Coast Guard has embarked on a long-term project to systematically replace or modernize the assets it uses for its Deepwater missions—generally speaking, those that occur more than 50 miles offshore. This past month, the President's Interagency Task Force on Coast Guard Roles and Missions issued their report, concluding that the Coast Guard is a national asset and that the nation needs a viable, well-equipped Coast Guard to carry out its 14 statutorily mandated missions performed in the Deepwater environment. These missions include drug interdiction, illegal immigrant interdiction, and fisheries law enforcement. The assets the Coast Guard needs to replace include cutters, aircraft, and sensors a system of equipment that gives the Coast Guard its ability to protect our borders and ensure the security and sovereignty of our nation.

The Coast Guard is planning for the replacement of its Deepwater capability as an integrated system rather than a series of distinct procurements. Using a unique mission-based performance acquisition strategy, this largest acquisition in the Service's history is setting a new standard for project management and was designated a Reinvention Lab this past year. While there will be many management challenges facing the Coast Guard with this effort, the Service has shown throughout the early stages of this project its ability to effectively plan and manage this acquisition, which could take up to 20 years to complete.

The Coast Guard has aggressively worked to minimize project risk and achieve the efficiencies of a systems approach. First and foremost, during the design phase, the Coast Guard is engaging in collaborative communications with all three contractors, to ensure that the final design submissions answer all major issues. The project has also developed an extensive and flexible Risk Management Plan that strives to identify specific risks then develop mitigation strategies to deal with them far in advance of any adverse impact.

The three industry teams currently under contract will submit their final proposals by July 2001. At that time, the functional designs will be approximately eighty percent complete and will provide the Coast Guard with a level of design and cost detail necessary to help mitigate acquisition risk. We believe that the Coast Guard's deepwater approach will produce a system of tools that will maximize the operational effectiveness of the Coast Guard while also minimizing the total ownership cost of the system.

SHIP DISPOSAL PROGRAM

Even though not within the specific jurisdiction of this Subcommittee, the Maritime Administration must dispose of government-owned, obsolete merchant and non-combatant vessels in the National Defense Reserve Fleet (NDRF). Since 1994, MARAD has refrained from exporting these vessels because of concerns about the

environment, worker health and safety. As a result, DOD has incurred additional costs to maintain the ships prior to their sale and disposal in the U.S., where there is only a small domestic ship scrapping industry.

The Federal Government faces challenge in disposing of its obsolete vessels in a timely manner. In fiscal year 1999, the NDRF contained 112 vessels designated for priority disposal. MARAD's goal is to reduce the inventory of obsolete vessels and is working to determine a viable, legal way to do so.

GOVERNMENT PERFORMANCE AND RESULTS ACT IMPLEMENTATION

The Department is now preparing its performance report for 1999, the first to be submitted under GPRA. The IG expressed concern that the Department would not have all of the data available to report on its performance results. The Department will have over 90 percent of the data elements available either in final or preliminary form. Therefore, the Department will be able to honestly report on its 1999 performance by the March 31 deadline.

CONCLUSION

Working in close cooperation with the Inspector General and the Congress, last year the Department was able to make progress on many challenging issues. These include the Department's first unqualified financial audit, a ONE DOT program evaluation of our hazardous materials safety efforts, and our successful Y2K conversion efforts.

STATEMENT OF SENATOR ROBERT F. BENNETT

Senator SHELBY. Senator Bennett, do you have any comments, opening statements?

Senator BENNETT. No, Mr. Chairman. I appreciate the opportunity to be here, and I thank everyone for the kind words that they are giving me with respect to Y2K.

Senator SHELBY. You earned them.

Senator BENNETT. I am reminded of the comment Bob Hope made. He used to travel around the world at Christmas time, and he said, you know, the Army really must hate me because every time I go out, they give me all these shots. And it is completely worthless because I have never gotten sick at all. I kind of have that feeling with respect to Y2K. A lot of people say, gee, you got us all excited, and look, there was not any problem.

So, the real tribute goes to people like those at the table who did the actual work. All we did was hold a few hearings.

Governor Thompson, I cannot pass up the opportunity to reminisce a little. Members of the subcommittee know that at one point I sat at the same table as an employee of the Department of Transportation in the Nixon administration. I have in my file a letter from Secretary Volpe congratulating me for lobbying through the Congress—my job was the head of congressional liaison, congressional relations within the Department—the bill that created Amtrak in the first place. And I, in mea culpa, full confession, here acknowledged that I promised the Congress that Amtrak would be financially self-sufficient within 3 or 4 years. That was in 1970.

As I sit here and listen to you say you are going to be financially self-sufficient in 2003, I say to you thank you for finally validating a promise that I made 30 years ago that has not come true in that 30 years.

I think there is no question but that we need high-speed rail service in certain parts of this country. I am a little less convinced that we need it in a national network. We have an awful lot of space out in the West that is best covered by air. We have got Amtrak service in Utah but the trains arrive at about 2 o'clock in the

morning and they come three times a week and they have maybe 15 people on them. I am not sure that is the very best way to proceed.

But certainly seeing what can be done in the more heavily populated corridors of the Nation and how this becomes a very intelligent alternative to air certainly in the Boston-Washington corridor and so on—I have taken Amtrak there. I am delighted it will get better and faster, and I would be delighted to be on that train with you that you described.

Governor THOMPSON. You are invited, but I promised the engineering duties to Senator Lautenberg and Senator Shelby, so you will have to be a passenger with me.

Senator BENNETT. You are very wise to keep me out of the train driving business.

I appreciate your enthusiasm, and on behalf of the country, I thank you for the zest that you bring to this particular challenge.

That is all I have.

Senator SHELBY. Senator Gorton, do you have any comments, opening statement?

STATEMENT OF SENATOR SLADE GORTON

Senator GORTON. Well, I am late here. And I am not going to repeat anything else, except perhaps what I have heard from Senator Bennett. I must say I have about the same faith in Governor Thompson's promise of black ink as I would have, I trust, in 1970. I do not think it is going to happen in spite of all of his greatest efforts.

I also share Senator Bennett's views that we have to look at this whole problem quite differently in different parts of the country. The Boston-Washington corridor, a corridor in which obviously Senator Lautenberg has the greatest interest, from my perspective is an area in which rail passenger service is absolutely vital and has a very real promise to be self-supporting.

About 3 years ago, one weekend in going home, I flew to Chicago and took the Empire Builder to Seattle. It was absolutely full and I am sure it was losing \$50 a passenger. Absolutely full. It was very difficult for me to see those long-haul routes being any part of a major, necessary transportation system in the United States.

I was encouraged, however, by reading recently that at least on one of the more southern routes, what Amtrak is going to do is to try to—I guess the best way to describe it would be land cruise ships. If Amtrak can create a luxury experience for tourists to enjoy the United States and stop pretending that it is really a competitor to airlines or something of that sort, there may be some promise. Many of those routes are interesting to travel, but the kind of equipment that Amtrak is using—it was a very frustrating ride for me. It was not a good tourist experience. And obviously, it was not a particularly efficient way to get from here to Seattle. But imagination seems to be gaining a little bit of ground at least in Amtrak, and I hope that its managers go ahead with it. But I am not holding my breath until it is operating in the black.

Senator SHELBY. Thank you.

Senator Kohl, do you have any comments?

STATEMENT OF SENATOR HERB KOHL

Senator KOHL. Yes, I have a brief statement.

Mr. Chairman, I thank you for providing this opportunity to discuss Department of Transportation management issues here today. Although I am not able to stay this morning, I do want to offer brief comments on Amtrak and welcome Governor Thompson and Messrs. Basso, Mead, and Warrington. It is heartening to have the interests of my State and the Midwest well represented here with Governor Thompson.

Half a million Wisconsinites ride Amtrak. We also have ambitious plans to develop high-speed rail in the Midwest and commuter rail in southeastern Wisconsin. Clearly, we are counting on both reliable and efficient service, and smart, sound management at Amtrak as we work to reach these goals.

It is good to be addressing today the question of how Amtrak will grow rather than mourning lost services as we have in the past. It was not so long ago that the Governor and I had a fight to save Wisconsin's Hiawatha service between Chicago and Milwaukee.

Now we are learning of Amtrak's plans to expand routes to Fond du Lac and Janesville, Wisconsin. Times and the nature of these hearings have certainly changed, but we must temper our high hopes for Amtrak's future with sound business sense. The burden is on you to prove that the new routes in Amtrak's bottom line do not compromise reliable service on all routes and are part of a balanced national transportation strategy that also includes road and air travel.

This year we have an administration request for a new high-speed corridor account in the amount of \$468 million. This too holds potential for the Midwest, but it also demonstrates the significant budget challenge that we face. The funding for the high-speed rail proposal comes from the so-called RABA funds that are promised for highways and bridges. And yesterday we approved an aviation bill that increases airport capital funds by roughly 60 percent, an increase that will compete directly with the high-speed rail money.

So, simply put, the challenges are greater for all of us. We need to stay the course on the road to self-sufficiency, and we need to work even harder to make sure that our transportation investment remains in balance.

Thank you again for coming to speak with us today. We look forward to working with you as the appropriations process continues.

Senator SHELBY. Thank you.

Mr. Mead, over the years, we have spent a great deal of time talking about aging and inadequate infrastructure. I was informed recently, today, of a self-proclaimed critical piece of aging transportation infrastructure that has been poorly, some would even say negligently, maintained. Of course, I am talking about the minority clerk of the Transportation Subcommittee, Peter Rogoff. I am told it is his 40th birthday today and that there is no better place he would rather be than at this hearing. That by itself warrants an investigation, Mr. Inspector General, by your office. Do you not agree?

Mr. MEAD. Knowing Peter, yes, sir.

Senator SHELBY. Peter, happy birthday.

Senator BENNETT. Happy birthday.

Senator SHELBY. Senator Lautenberg, I know you have got a Budget hearing.

Senator LAUTENBERG. Thanks for taking care of Peter for me.

Senator SHELBY. Well, he has got to take care of that infrastructure.

OPERATIONAL SELF-SUFFICIENCY

Senator LAUTENBERG. He has got to be the continuity on this, so we wish him well.

I just want to respond to the comments of my colleagues here. We are talking about self-sufficiency. We are talking about a rather ambitious quest because we are discussing, A, operational self-sufficiency. We are kind of embarrassed that we have to defend the fact that this railroad will be the only one in the world that does not require subsidy from Government. In West Germany, they are going to spend \$70 billion on high-speed rail service in 10 years—\$70 billion. So, in our country we have spent over \$85 billion on aviation plus the PFC's which bring that sum up substantially. So, that is our mission.

And while Senator Gorton noted that my interest is primarily in the Northeast, I must say I genuinely believe that high-speed rail service, maybe not of the type and the length of journey that Senator Gorton described, is an essential factor around the country. All of us have had the opportunity to travel this great Nation and whether it is high-speed rail service out of Chicago, Milwaukee, et cetera, or whether it is on the West Coast—and I know that work is going on in some of the States on the West Coast to try to bring high-speed rail service—or the Southeast or the South, all of these have piqued the interest. Seattle to Portland, et cetera. So, this is not just give it to the East.

But I will say this, that when the Northeast has air jam-ups and we are behind schedule, it affects every major airport in the country whether it is Seattle or Los Angeles or San Francisco. You name it. And we just cannot squeeze more. These airport incursions that Ken Mead mentioned are happening and they are frightening. The result there of an accident can be quite substantial.

But we are bent on this not because I—like I said when we initiated the Boston to New York service, that as a child I came from a hardworking but very modest income family, and I had always wanted electric trains and I never got them. And now I am really getting a big set, and I am excited about it.

But there is more to it than that. I genuinely believe that unless we pay attention to the development of rail service that is efficient, high-speed, that we will be dooming ourselves to congestion and delays and pollution all over this country. We all agree we cannot do more on highways. But people fail to understand that as big as that sky is, there are limitations. We cannot get the airports. How many of us have experienced—and I can tell you between Washington and New York, it has happened frequently—where the wait to get a gate is longer than the amount of time it took to fly from place to place?

So, we are deluding ourselves if we think that we can just continuously expand this aviation system. People do not want them in their neighborhoods. They do not want to listen to the noise. They do not want to listen to the clutter. People are tired about missing appointments and missing connections and things of that nature.

So, we are working on something that I think really deserves the support and full attention of our Government. I hope that we will continue to give Amtrak a chance to develop.

RIDERSHIP INTEREST

In the next couple of years, we will see what happens in terms of ridership interest. One of the questions I was going to ask Governor Thompson was the ridership increase, Mr. Chairman, between Boston and New York that has exceeded all of the projections, as a matter of fact, is up over 60 percent in just a couple of months.

Governor THOMPSON. 64 percent.

Senator LAUTENBERG. 64 percent.

So, there is a hankering out there for high-speed rail and I hope we will be able to satisfy it.

I thank all of you. I have worked with Ken Mead and Peter Basso and George Warrington and the Governor for some time now.

This likely being my last hearing for Amtrak, Mr. Chairman, I thank you for your consideration and patience as we discuss Amtrak. I know maybe it may be an overly discussed subject sometimes, but you have been very good about it.

Senator SHELBY. Well, I am waiting for those hourly trains to come through from Atlanta and New Orleans through my part of Alabama where I can ride it. Right, Governor?

Governor THOMPSON. That is right, Senator. We are coming.

Senator SHELBY. I know, I know.

Governor THOMPSON. We just need your help.

AMTRAK FUNDING

Senator SHELBY. Mr. Secretary, you and the Inspector General have questions. It may be more of a statement first.

Last year the administration's 2000 budget proposed to divert funding from the highway firewall into the transit account, the rail account, and the highway safety account. There was an immediate and strong negative reaction from Congress to this proposal. These funds were guaranteed for highway construction under TEA-21 and there was absolutely no interest in undoing that agreement.

Yet, the administration's 2001 budget proposes to do exactly the same thing again; that is, divert \$600 million from this fund, revenue aligned budget authority, to non-highway purposes. The administration has identified \$468 million of this proposed transfer for passenger rail.

Perhaps that is more than a statement, but it is clear to the Secretary that this proposal to divert highway funds for non-highway purposes is dead here in the Congress, dead on arrival, the same proposal as last year.

Mr. Mead, as a follow-up to that question, your staff has worked closely with Amtrak on an independent assessment of the railroad's

financial outlook. In this oversight work, what Federal funding level does Amtrak assume in fiscal years 2001 and 2002?

Mr. MEAD. We have consistently used \$521 million.

Senator SHELBY. It is a lot of money, is it not?

Mr. MEAD. Yes. It seems like it to me anyway.

Senator SHELBY. Governor Thompson, I think it is fair to say that a lot of people were surprised by last week's announcement of Amtrak's market-based network analysis and associated network restructuring plans. This was a widely expected result and recommendations for route restructuring and elimination. It is well-known that all but one of Amtrak's 40 routes lose more than they make in revenues. Some lines lose more than three times as much as they generate in revenues in a year. But what was announced last week was a service expansion plan with no route eliminations or decrease in labor costs.

Amtrak believes it can increase its revenue through adding routes and trains and increasing its mail and express business. Maybe so. I hope so. This approach is not responsive to the intent of the Senate Appropriations Committee which directed, in the fiscal year 2000 report language, that Amtrak's MBNA will analyze different service alternatives, including route restructuring and modifications, frequency changes, route expansions, and route eliminations. Nor is this approach responsive to the letter that Chairman Wolf and I sent to George Warrington, President of Amtrak, last April 28 in which we directed that MBNA analysis must consider a full range of options including route elimination and rationalization.

What is going on, Governor?

Governor THOMPSON. Thank you very much, Senator Shelby. You are absolutely correct. Now let me tell you what we did. Until now, Amtrak had never gone through a detailed analysis of every route and every piece of equipment. So we spent the last 15 months going through every route and every piece of equipment and every service and found out how we can make it more profitable. How could we make it more passenger friendly? How could we do a better job?

We determined that for several years Amtrak has tried to shrink itself into self-sufficiency or profitability, and it did not work. Just because you reduced the number of services and restricted the amount of passenger services, you still had the fixed costs. So, we asked, how can we grow this railroad and increase the revenue and increase the number of passengers. We did this by looking at each route, and we found ways that we could improve it.

For instance, at Meridian, Mississippi, we are going to split the train. We are going to use part of the train to continue on south, but part of the train will go east and west, and increase the passenger service, as well as the opportunity for mail and express.

The Texas Eagle. We found ways that we could go 7 days there, pick up more passengers, as well as mail and express contracts that would allow us to earn more money.

Overall our MBNA is going to bring in \$65 million to the bottom line by fiscal year 2003.

We also did something else. We went and reached agreements with the freight railroads, as well, on mail and express. We said,

you know, we have been fighting you for a long time. How can we cooperate? Is there a way that we can carry some of your load, and make it more profitable for you, and also bring some money into Amtrak? We are sitting down and negotiating and we have reached agreement with many of the freight railroads. So, they are giving us some express to haul. You know, 5 years ago, they would have fought us. Now, they are contacting us and giving us some of their business. As a result, we are both making money.

There is more than \$8 billion of refrigerated produce that is being transported across the country. We have looked into it and found that we can have rail passenger cars bringing refrigerated produce from California to New York. So, we are going to develop a new route from California to New York on produce and passengers. We think we can cut into that \$8 billion business. We have got commissions set up—

Senator SHELBY. Can you do it faster?

Governor THOMPSON. We can do it faster and more reliably. We think we are going to have a really nice little cash infusion from this business.

Overall, the MBNA is going to bring us \$65 million more than what we have right now.

Senator SHELBY. But will you also have a stand alone route elimination analysis prepared?

Governor THOMPSON. We already did that.

Senator SHELBY. You have.

Governor THOMPSON. We have.

Senator SHELBY. Do you not think as you look at the whole picture, you have to, as you want to grow things—and that makes sense—grow revenue and promote routes—

Governor THOMPSON. I think George wants to answer that one.

Senator SHELBY. George, do you want to get in on that?

Mr. WARRINGTON. Yes, Mr. Chairman. The MBNA work really was an examination of every single route that the company operates today and every single segment and every city that is out there today.

REACH AND CONNECTIVITY

You may recall in 1995 Amtrak went through a very difficult series of truncations and terminations of all or portions of routes. In the end, because of the fixed cost and overhead cost nature of the business, what you find is that unless you eliminate the entire system, as a practical matter, the costs you are able to eliminate in connection with incremental service reductions do not come close to the amount of incremental revenue you lose associated with the termination of the service. The freight lines figured this out a long time ago, which is why reach and connectivity are critical elements underpinning the kind of planning work that we have done.

We did the take-out analysis on every segment—

Senator SHELBY. Elaborate just a minute on the phrase you just used, “reach and connectivity.” I think that is important.

Mr. WARRINGTON. Yes, and this is underpinned with a lot of market research, Mr. Chairman. What our research tells us and what our models confirm is that the more you reach more markets, the more connectivity the system provides—and Dallas-Fort Worth is a

good example of where we are creating that kind of opportunity. Running a 7-day a week Texas Eagle to Dallas-Fort Worth, extending a Crescent from Atlanta-Meridian-New Orleans to Dallas-Fort Worth. The synergy that provides, along with our new Oklahoma service from Oklahoma to Dallas-Fort Worth, the potential opportunity to also run an extension of that Eagle to Monterrey, Mexico, in part driven by passenger demand in Laredo and in part, frankly, by express markets like auto parts moving from Delaware and Detroit and Chicago to assembly plants in Monterrey, Mexico—the combination of the synergy that you create and, in addition, rerouting our Sunset Limited, which runs from Jacksonville to Los Angeles, rerouting that north of Houston, bypassing actually several smaller markets that are currently being served in south Texas and tapping into the Dallas-Fort Worth market and the Abilene market in west Texas. Where the size of our reach is about 300,000 customers, compared to 30,000 customers in south Texas, when you put it all together, you have a much more attractive system not only for passenger business, but for mail and express business.

And the Postal Service will tell you that as well, that we are a much more attractive carrier of not only periodicals, but also second class and conceivably first class mail, if we have better reach and better frequency to markets that they need to have served.

All of that enables us to secure more revenue that we can contribute to the bottom line, although we are not necessarily profitable on every train across the entire system. I use as an example Continental Airlines. Continental is Newark Airport's, New Jersey's, dominant carrier. I will guarantee you that every plane feeding Newark airport is not making money for Continental, but it is feeding a network and feeding a system. It is the same basic concept, Senator.

Senator SHELBY. Senator Bennett?

Governor THOMPSON. Senator Shelby, if I could just quickly add.

Senator SHELBY. Yes.

Governor THOMPSON. But at the same time that we are doing this, we are also asking the States to step up.

Senator SHELBY. Absolutely. Well, they have to step up.

Governor THOMPSON. They have to. And the States are coming in and back-filling some of these routes to the tune of about \$300 million a year.

Senator SHELBY. Senator Bennett.

Senator BENNETT. Thank you, Mr. Chairman.

I am delighted with this conversation. You are actually starting to run it like a business.

Governor THOMPSON. Yes, we are.

Senator BENNETT. Again, from the historic perspective, a lot of the original support for Amtrak came from people that I would describe, not in a pejorative sense, as hobbyists, people who just had a great love for the romance of train travel, and they wanted to make sure that passenger train travel did not disappear. So, the whole focus was on preserving the romance of being on a train.

There was a clear divorce between passenger travel and freight. The freight people wanted out of the passenger business so badly, if you remember the history, they subsidized Amtrak in the very beginning. They paid to get out. A lot of the original capital forma-

tion of Amtrak, or Railpax, as we called it in those days, came from literally ransom payments made by the freight lines to say, get us out of this business. We want absolutely nothing to do with it. It had been a tremendous loser for a long time, and the railroads were in real trouble and this was a way that they would get out from under the albatross.

To be talking now about competing for some of their business, about competing with trucks for some of their business is a very heartening kind of thing. Instead of focusing strictly on the romantic and nostalgic view of the kind of train ride that Senator Gorton described, which you take if you are retired and have the time, to say, okay, we will move refrigerated goods, we will move packages that might compete with Federal Express—the same kind of problems getting in and out of airports apply to Federal Express as apply to a passenger—is a very heartening development. I have not heard this kind of conversation on this issue before. Maybe I just have not attended the right hearings, Mr. Chairman, but to hear this kind of dialogue is just really quite exciting to me. I want to congratulate you all on your willingness to do this.

Again, a piece of historic perspective. It was not air travel that killed rail passenger in this country. It was the interstate highway system. Ninety-eight percent of city-to-city trips for passengers are taken in the automobile. So, for you to start talking about competing with the interstate highway system by taking things that are currently going by truck and saying we can put them on our high-speed trains and get them there faster and cheaper than the trucks can is, I think, a very farsighted point of view. You are going to where the competition really is, and that is something any businessman needs to do.

So, just keep it up. More and more of this kind of thing I think is terrific.

Mr. MEAD. I would like to offer just a perspective on that going back in time a bit. Amtrak for years thought that it was supposed to stay away from the freight business except for hauling mail. Now, Amtrak is getting into niche markets. So far, they have not made the truckers or the freight railroads angry in terms of cutting into their business. If they do start to get angry, their first broadside will be, this is unfair because Amtrak is receiving a Federal subsidy, and whether it is called a capital subsidy or an operating subsidy, I am not sure that the competitors will appreciate that distinction.

Governor THOMPSON. Senator Bennett, just quickly. Thank you very much for your comments. I really appreciate it and I really appreciate, as Chairman of the Board, to hear your historical perspective. I did not know all of these things. I learned a lot this morning listening to you, and I thank you for that.

This past year we have picked up \$100 million of mail and express for Amtrak, and that is just the start. We are expecting to expand that.

Ken Mead said it correctly. We sat down with the freight railroads. You know, we used to fight all the time. They could not stand us; we could not stand them. And we would come running to you to solve it. But George Warrington and this board decided why fight. Let us go see how we could cooperate.

So, we have quarterly meetings. George meets with the freight railroads, and I meet with them once a year. And we meet with the freight railroads and say we are going to be here. Can we work together? How can we help you and how can you help us be more on time? And how can we both make some money out of the proposition? And you know something? They like us a lot better. They still do not completely trust us, but they like us a lot better. They are talking to us and we are communicating. That is helpful.

The refrigerated car business—the roads are too congested, so we decided to try it. We are going to try it and we are going to go from California to New York and transport produce. We think it is a niche market that can pick us up a lot of money.

We are also going to make an agreement with UPS and some of the other people about express. That is the kind of business that we need.

Quad Graphics is a big printing company. We are hauling all their periodicals and distributing their periodicals, and we are making good money on it. That is what we have to do.

We are trying to run this railroad like you would run a business. We have completely changed our philosophy and our direction, and we are going to keep doing it till we make you proud of it.

Senator BENNETT. Well, you may get to your goal by 2003 with that kind of attitude.

In the spirit of Senator Gorton, let me just share one personal experience with you that I think summarizes where we are. My wife and I some years ago went to Great Britain. I had lived in Great Britain for 2 years in my early 20's on a church assignment. My son was there finishing up his church mission. We went back to pick him up. Like all tourists, we rented a car. It took me a little while to get used to driving on the funny side of the street. But we drove around Great Britain and saw all the sites, and I went to all the places that I had visited as a young man. And our son took us to places. It was wonderful.

After about 4 days of that and our schedule called for us to be back in London to see some shows and do the kinds of things you do in London, I was kind of tired of that little car. We found a Hertz place and checked the car in and got on the train. And we got to London so fast by comparison that my wife said, what have we been doing in the car the whole time we have been here?

Well, we had been touring. It was a logical kind of thing to do, but when the time came that you wanted to move quickly, we moved to the train.

I think that is a paradigm for where we may go here. In my own State of Utah—Mr. Basso, of course, knows Utah's transit problems backwards and forwards. He lives with them. I think he is probably sick of hearing from people from Utah. From Provo to Ogden now, you have got about 80 percent of the State. We are thought of as a rural State. We, Mr. Chairman, are probably one of the most urbanized States in the country. The highway traffic from Provo to Ogden now is a long schlep. If you do not do it at exactly the right times of day, it can take you time. They are saying, well, if you can get a high-speed connection—now, this clearly does not belong in any Amtrak national plan, but if you can get a high-speed commuter rail from Provo to Salt Lake to Ogden, a lot of folks would

get out of their cars just to have the same kind of experience we had in Great Britain, to say if I want to go as a tourist, I will take the car. If I want the convenience of being able to get off and do the kinds of things we did, I will take the car. If I just have to get there to a business appointment, speed is the all important thing, amazingly rail will come back because your competitor is not the airplane. Your competitor is the highway. And as highways get congested, the train becomes more and more attractive.

Governor THOMPSON. You build it. We will operate it.

Senator BENNETT. Okay, very good.

Senator SHELBY. Thank you.

ADDITIONAL COMMITTEE QUESTIONS

I have a number of written questions that we would like to submit to you for the record. You have always been courteous enough to answer them fully.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

AMTRAK ACELA DELAYS

Question. I understand that the Acela Express high-speed service, originally scheduled to begin by the end of calendar year 1999, has been delayed until July of this year, a delay of at least 6 months.

What are Amtrak's remaining challenges to meeting the new start-up date of July 2000? Are they going to make it?

Answer. Amtrak currently anticipates beginning Acela-Express high-speed passenger service in the Northeast Corridor in July 2000, about 7 months later than originally planned. The delays thus far relate to suspension and oscillation problems in the wheel trucks discovered during testing on the high-speed trainsets and locomotives. While progress has been made on fixing these problems, there are still issues that will need to be addressed before the trains can operate at their design speed of 150 m.p.h. Time is getting short for Amtrak to meet the July deadline and service may either be delayed or start with a maximum speed less than 150 m.p.h.

Question. What is the financial effect of this delay on Amtrak's revenue projections for fiscal year 2000?

Answer. Amtrak estimates that if service begins in July 2000 as currently planned, the lost passenger revenues in fiscal year 2000 associated with the delayed start-up would total \$142 million. Amtrak projects that this revenue loss will be mostly mitigated by operating expense savings, interest savings, and contractor penalties for late equipment delivery. Amtrak plans to offset the remaining \$44 million with new leasing agreements. The revenue loss will be higher if delays extend beyond July. The months of July and August are typically heavy travel months for Northeast Direct service, and a later start-up will mean that Amtrak will not be able to capitalize on this heavy seasonal ridership to boost revenues. While Amtrak would be able to partially mitigate the revenue impact of further delays through operating and interest savings, the net impact to Amtrak's bottom line in fiscal year 2000 will be negative.

Question. Will the delay have a domino effect on the implementation of high-speed Acela service in fiscal year 2001, as well, because the trainset delivery schedule has been set back?

Answer. Once the issues that are causing the current delays are resolved, "fixes" to the trainsets could be completed relatively quickly, allowing for an accelerated delivery schedule. Amtrak is working with the consortium building the trainsets to compress the delivery schedule and ramp up to full service in a shorter period of time—which it currently plans to do by December 2000. The original schedule called for full service by July 2000. However, at this time, we do not expect full service with all 20 trainsets before December 2000.

OVERSIGHT OF HIGH-DOLLAR INFRASTRUCTURE PROJECTS

Question. One of the issues that made the Inspector General's oversight report last year and again this year is that DOT needs to improve its management of transportation infrastructure projects. It is especially important for the management of high-dollar projects to be aggressive, because the risks to the government's financial interests are increased proportionally.

The Inspector General Report says that DOT should do the following: (1) Strengthen internal controls over project cost estimates; (2) Require and closely examine project finance plans; (3) Monitor project performance to minimize funding risk.

Has the Department of Transportation been implementing your recommendations? Which agencies are doing the best job reducing financial risk with Federal funds? Which agencies are not doing as well?

Answer. The Department of Transportation has been implementing our recommendations with varying degrees of success. The majority of high-dollar infrastructure projects using Federal funds are highway and transit projects.

With respect to reducing financial risk with Federal funds, the Federal Transit Administration's (FTA) use of full funding grant agreements has effectively limited the Federal government's financial risks and promoted accountability in the funding of new starts capital projects. These full funding grant agreements set the maximum amount of discretionary capital investment funds that can be used for transit projects.

The full funding grant agreements have effectively limited the exposure of the Federal government for project cost increases. They also provide local accountability and incentives for grant recipients to exercise tight control over project costs. Grantees know they must find the funds needed to pay any additional costs and that the Department will not entertain requests for any more discretionary funds.

Of the current 15 projects with grant agreements, 3 had cost increases of approximately \$929 million. None received additional discretionary capital investment funds. For example, the new starts funds committed for the South Boston Piers Transitway remains \$331 million, as established by the 1994 grant agreement, despite an increase of \$188 million in the project's estimated cost.

By contrast, Federal Highway Administration (FHWA) projects have no comparable limitations. For example, the FHWA share of the Central Artery/Ted Williams Tunnel Project has increased by more than \$8 billion as the project's costs have increased from \$2.6 billion to over \$13 billion.

We have also recommended finance plans as essential tools for identifying project costs and funding needs. Finance plans describe how projects will be implemented over time. They identify project costs and timing, and the financial resources needed to pay for those costs. However, better criteria are needed to ensure finance plans are complete, reliable, and consistent.

We found the quality and completeness of finance plans for highway and transit capital projects to be highly variable. Some finance plans accurately reported costs and identified funding shortfalls. Others needed to be more thorough in disclosing problems and presenting information in a consistent manner over time. For example, the 1999 Finance Plan for the Bay Area Rapid Transit District includes construction costs and operating costs for both the existing and new segments; includes a 10-year forecast that identifies underlying revenue and expense assumptions; and demonstrates that Bay Area Rapid Transit District has the financial capacity to operate its entire transit system, including the airport extension, after it opens in mid-2002.

Conversely, our most recent report on the Central Artery/Ted Williams Tunnel Project indicated significant, fundamental problems with its finance plan. The reporting methodology was changed so that the reviewer could only see the cost to complete, not the total project cost. The plan did not report specific cost, funding, and schedule indicators, such as "budgeted cost of work performed" versus "actual cost of work performed," "contract awards versus budget," "total projected cost by type of cost," and "annual funding requirements by source." However, in some specific cases (e.g. I-15 and California 210) FHWA has agreed with our recommendations to require updated finance plans and in the case of I-15, that update is much improved—i.e., it closed the funding gap, it identified sources for all funds necessary to cover all cost estimates. We recommend that FHWA revise its guidance on finance plans to ensure more complete and accurate reporting of financial performance. On February 17, 2000, after a \$1.4 billion cost increase was announced by the Central Artery, the Secretary directed FHWA to accept and implement our recommendation.

AMASS

Question. There has been a continuing concern about the increasing number of runway incursions, collisions or potential accidents on the ground. The upward trend in runway incursions continued in 1998, with 325 incursions, an 11 percent increase from 1997. AMASS is the radar and related software/hardware to monitor airport surfaces and warn of potential runway incursions. A month or so ago, FAA announced that it was going to be two years behind schedule in deploying AMASS.

Would you please explain the reasons for the delay in the AMASS program, and tell us how this will affect FAA's initiatives to reduce the number of runway incursions? Should we be looking at other solutions?

Answer. Software development problems caused delays. Unresolved human factors issues are now causing additional delays. For example, the AMASS alert message on the ASDE-3 display is not readable beyond 10 feet, which is a concern since controllers are often further than 10 feet from the display during their normal operations. The delays in deploying AMASS will not affect other FAA initiatives such as educating and training pilots and controllers on reducing runway incursions. However, delaying AMASS increases the potential for an accident on the runway.

FAA should be looking at other solutions especially low cost solutions that can be implemented in a short time frame. AMASS will only help the 34 large airports designated to receive this system. Improving pilot situational awareness with technologies, such as in-cockpit moving map displays, that would identify what is on the runway and provide two set of eyes, the pilots, and the controllers, would reduce response time required to alleviate a potentially hazardous situation.

FAA is also looking to award a contract by the end of this fiscal year for a low cost Airport Surface Detection Equipment system that will provide surface surveillance for the small and mid-size high priority airports not designated to receive AMASS. FAA, however, has as yet to determine beyond Orlando, Florida, the proposed key site for the system, which small to mid-size high priority airports will receive the system.

GREAT LAKES ICEBREAKER REPLACEMENT

Question. The Coast Guard has expanded the mission requirements for the Great Lakes Icebreaker Replacement by proposing to add a buoy tender capability to the new icebreaking vessel. I understand that this is the first time the Coast Guard has proposed building other capabilities into an icebreaking platform.

Are you aware of any requirements or design specifications in the Great Lakes Icebreaker Replacement project that would inhibit this procurement from being a full and open competition?

Answer. The Coast Guard's current acquisition strategy does not call for completing final design until at least the first quarter of fiscal year 2001. Consequently, it is not yet possible to determine if these requirements and design specifications will restrict competition. Award to the firm submitting the successful proposal for this icebreaking vessel with buoy tending capability is scheduled for June 2001.

DEEPWATER REPLACEMENT PROJECT

Question. It is my understanding that the planning phase for the Deepwater project will not be completed before the Department submits its fiscal year 2002 budget request and Congress takes action on that request. Based on your experience, would you consider this approach to be consistent with recognized best practices in government acquisition programs?

Answer. Requesting budget authority without critical cost and schedule information carries substantial risk and is inconsistent with acquisition program best practices. Although the Coast Guard plans to request \$350 million for the Deepwater Replacement for fiscal year 2002, industry teams will not complete their planning effort until several months after the budget requests must be submitted to the Congress. Experience in other major procurements such as those in the Federal Aviation Administration, has shown that factors such as uncertain designs and funding increase the likelihood that projects will experience problems associated with cost and schedule slippage.

The Coast Guard's Deepwater assets will reach the end of their useful lives over the next 30 years. The question therefore, is not whether they have to be replaced or modernized but how and when. To achieve success, the Coast Guard must identify and manage the risk associated with a project of this magnitude.

Question. What steps would you recommend that the Coast Guard take to ensure that it has adequate management controls in place prior to the fiscal year 2002 Budget Request?

Answer. While this Project employs a sound process to identify needs and alternatives, it is too early to determine with any degree of precision what the Project will cost or how long it will take to complete. The Coast Guard plans to submit a request in February 2001 for \$350 million to begin construction in fiscal year 2002. The industry teams' proposals for an integrated system are not due until April 2001 and the final decision on what assets the Coast guard will replace or modernize will not occur until July 2001. The lack of industry teams' cost and schedule information when the budget is being prepared could adversely affect the Coast Guard's budget decision. To reduce the risk associated with this lack of information, the Coast Guard needs to justify to the Department and the Congress, how it can proceed without full cost data and a rational acquisition strategy. Three options it can consider are to:

- Defer the anticipated \$350 million fiscal year 2002 Deepwater budget request until the results of the planning process are known.
- Expedite the planning process to identify the most critical Deepwater needs and justify the fiscal year 2002 budget request on that basis.
- Use information available from the industry teams to develop a current cost and schedule estimate for the Project that identifies anticipated acquisitions and justify the fiscal year 2002 budget request on that basis.

Another area requiring Coast Guard attention is how to ensure continuity of staffing in a project that could last 20 or more years. The Coast Guard's policy of rotating military officers could adversely impact institutional memory that could be critical to successful implementation of the project. We have suggested that the Coast Guard consider the need for senior level civilian leadership as a solution.

SUBCOMMITTEE RECESS

This hearing of the Subcommittee on Transportation is now recessed. The subcommittee will convene on Tuesday, March 28, at 2 o'clock in Dirksen 192 for an oversight hearing on the implementation of the Driver's Privacy Protection Act and the positive notification provision that was included in this year's transportation appropriations bill.

I want to thank all of you, Governor Thompson, Mr. Mead, and Mr. Basso.

Governor THOMPSON. On behalf of Amtrak, I would like to thank you, Senator Shelby.

Senator SHELBY. Thank you.

[Whereupon, at 11:17 a.m., Thursday, March 9, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2001

TUESDAY, MARCH 28, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 1:57 p.m., in room SD-192, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senator Shelby (presiding).

OVERSIGHT HEARING ON DEPARTMENT OF TRANSPORTATION PROGRAMS—FISCAL YEAR 2001—CONTINUING

DEPARTMENT OF TRANSPORTATION

STATEMENTS OF:

PETER J. BASSO, ASSISTANT SECRETARY FOR BUDGET AND PROGRAMS, AND CHIEF FINANCIAL OFFICER
HON. KENNETH M. MEAD, INSPECTOR GENERAL

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. The hearing is called to order. First of all, I would like to thank Ken Mead, the Department of Transportation Inspector General, and Jack Basso, the Assistant Secretary of Transportation for Budget and Programs, for being here today to reconvene and conclude the subcommittee's hearing on the Department of Transportation's most pressing management and oversight challenges.

We began this hearing early this month on March the 9th, but due to tight schedules on my part and that of Senator Lautenberg we were not able to finish the hearing. Since the witnesses have already made their opening statements when we first convened the hearing earlier this month, I would like to move things right along. So when Senator Lautenberg, if he comes here, I will recognize him.

AIR-21

Mr. Basso, Mr. Mead, we are pleased that you are here. If I could, I would just move into some questions. Mr. Basso, I understand that the President is expected to sign the FAA reauthorization bill that the Senate and the House recently passed, which the Secretary described as "a giant step forward." After the bloom is

off this rose, it will fall to people like you and Mr. Mead in his oversight and audit roles to manage all the Department's programs, those in both the protected and in the nonprotected categories.

I am increasingly concerned that Congress has not yet found the right balance of adequate investment in transportation infrastructure and also providing a programmatic and budgetary environment that encourages the maximum efficiency of our transportation systems, as opposed to simply maximizing our commitment of Federal dollars to payment or construction.

I will ask both of you this: Does this concern resonate with either of you? Do you believe that the budgetary structures that we are adopting may stifle or inhibit our common goals of increased and responsible Federal transportation investment? Mr. Secretary, you want to tackle that first?

Mr. BASSO. Yes, Mr. Chairman, thank you.

Let me say on the question of AIR-21, the President has clearly expressed his intent to sign the bill. In fact, I was advised we received the bill a little earlier in the day, so the clock has begun. AIR-21 I think clearly has some mixed blessings and challenges for all of us. On the infrastructure and modernization side, the additional funding, particularly for facilities and equipment, which is above the President's budget, will help us to move forward on the modernization issues. I think we all recognize, in the growth in the industry, that this is crucial.

On the other hand, as the President expressed, there are concerns as to how we will assure that the appropriate level of operational funding is maintained. I think that is a challenge that clearly is going to face the administration and the Congress as to how we work that out in the appropriations process, and I am very mindful of that challenge. We have talked about it, and I think we have an awful lot to do.

To complete the answer to your question, we have to do that within a balance in the Department, particularly where it relates to the United States Coast Guard and other critical national security and lifesaving functions of the Department.

Senator SHELBY. Mr. Mead, do you have any comments on that?

Mr. MEAD. Yes. I am glad you picked on him first. I get to reflect on the answer.

Senator SHELBY. Well, we like you both. We just happened to do this.

Mr. MEAD. There are a couple of implications that flow from AIR-21. One of them that I have difficulty sorting through is the effect on the budgets of agencies other than highways, mass transit, and aviation. In other words, there may well be implications for Amtrak, the Coast Guard and pipelines.

The other implication is for aviation itself. For example, the essential design of AIR-21 is that airports are funded first. Second, capital facilities and equipment modernization are funded. The third thing you fund—with what's left over—is salaries and operations expenses, which include safety inspectors and things of that nature. Yet, as we speak the Congress is being asked to sign off on a supplemental that is predominantly operations in nature.

There is not going to be enough money—

Senator SHELBY. That is right.

Mr. MEAD [continuing]. In the trust fund to pay operations, airports, and facilities and equipment. And since AIR-21 sets the order for funding as I described it, there will be a need to dip into the general fund to take care of operations.

Senator SHELBY. Mr. Basso, for this fiscal year the FAA's operations budget grew by 6 percent. I would think that the FAA Administrator would be able to find somewhere within the several hundred million of dollars of growth in the 2000 appropriation one-tenth of one percent to maintain the safety inspection work force. Are my expectations there unrealistic, considering the size of that budget? You know, you can always find something. The bigger the budget, you can squeeze a little. The smaller the budget, it is harder.

Mr. BASSO. I appreciate that, Mr. Chairman.

Senator SHELBY. I know it is tough and I know you have got a tough job.

Mr. BASSO. Let me just say this, I want to assure you, Mr. Chairman, we have done that squeeze. In fact, last night the White House transmitted to Congress—

Senator SHELBY. Did you find the money?

Mr. BASSO. No, sir. Let me say this: we found part of the money.

I do not mind sharing with you what really came over to us. Originally we started with a figure of about \$200 million and I would say out of the \$200 million we found enough to make up about \$120 million or so of it by making appropriate adjustments, making the kind of adjustments we should. We then reached the point where we came to the realization that if we made up changes in other areas it meant really weakening our inspection work force and cutting some of the areas that I think we all agree are really crucial to managing safety in the FAA.

So after some, I will tell you, considerable examination, about 8 weeks worth of examination, we concluded that the only alternative was to come to the Congress. There is no more fat that we can find at this point in the short term to deal with it.

EMERGENCY RELIEF

Senator SHELBY. I want to get into emergency highway deficiency as we see it. We noted that the TEA-21 authorization provides an emergency highway program of \$100 million a year.

Mr. BASSO. Yes, sir.

Senator SHELBY. And the administration has not requested additional emergency highway funds, notwithstanding the backlog of emergency projects from natural disaster I understand currently exceeds \$500 million.

Mr. BASSO. Yes.

Senator SHELBY. Do not firewalls or special budgetary treatments make it more difficult, Mr. Secretary, to address emerging transportation requirements like the emergency highway program?

Mr. BASSO. Let me talk just a moment, Mr. Chairman, about emergency highway funds. One of the things that has troubled me is the fact that the \$100 million that we have which is exempt from all other restrictions, was enacted in the 1973 Highway Act. So we have not really seen a change in that level in almost 28 years.

Senator SHELBY. It is not a lot of money, is it?

Mr. BASSO. No, sir, and it just does not make it from here to there, there is no question.

Senator SHELBY. In a Nation this size.

Mr. BASSO. Absolutely, and particularly what we have been experiencing the last several years, which averages well above that amount. In any event, what we did do was send up with the budget a proposal which would deal with the emergency relief question—which you are absolutely right, as of September 2000 we had a backlog of \$500 million and is probably bigger than that now. Our proposal is to create new contract authority, but confine it within the obligation ceiling set in TEA-21, so that we did not basically end up burdening the committee with the additional outlays to be paid for in this program.

So we took our shot over 3 years of paying off that debt. I do think, though, that it is important to recognize that sooner or later we are going to have to find a more permanent and a better solution to the emergency relief program.

Senator SHELBY. Of course you are aware of the fact that the administration's proposed shift of funds from other guaranteed highway programs to emergency highways has been rejected by both the authorizing and appropriations committees in the House and the Senate?

Mr. BASSO. Yes, sir, I am aware of that.

CONSULTING CONTRACTS

Senator SHELBY. Mr. Mead, there have been a series of recent newspaper articles raising questions about Washington's Metro procurement policy regarding consulting contracts. You are probably familiar with some of these. Does the publicity concerning Washington Metro's lack of procurement control suggest to you an issue that the Inspector General's Office should look into, or perhaps you are looking into, and are standards for noncompetitive consulting contracts for organizations receiving substantial Federal funds an area that your office should get into, at least look at?

Mr. MEAD. Yes, I think that it's an appropriate area. Right now we have our investigation side of the IG's office—

Senator SHELBY. Are you looking into that?

Mr. MEAD. Yes. I think what is troubling there is the purposes for which the consulting contracts are let and the disparity between what you would pay an ordinary public servant for a task and what the consultants would get. Much of this is falling into the category of overhead, and when we are done with our work we will make a full report to the committee.

Senator SHELBY. Okay.

WAAS

The Wide Area Augmentation System, WAAS. Mr. Mead, Mr. Basso, let us just go back just a little bit to an article that appeared in Aviation Daily, I believe in 1996, 4 years ago. It said: "The Federal Aviation Administration abruptly terminated its \$475 million pact with Wilcox Electric to apply global positioning system [GPS] technology to the Nation's air traffic control system, charging that the company had mishandled the contract. David Henson"—

I am just continuing to quote—"the FAA's Administrator, used strong language to describe his decision to cancel the contract only 8 months after the award, saying "The agency no longer has a tolerance for ineptitude.'" Those were his words.

Now, 4 years later, to the current status of this procurement. The WAAS program is hopelessly off track. Its cost has escalated to \$3.2 billion and it will not provide the capability it was advertised to do 4 months ago, much less 4 years ago. Does this mean that the FAA has rediscovered its tolerance for ineptitude, to use those words?

Mr. Basso, you want to answer that?

Mr. BASSO. Mr. Chairman, I think I can give you assurances that we have little or no tolerance for a continuation of ineptness.

Senator SHELBY. You do not have room for it, do you?

Mr. BASSO. No, sir, we sure do not.

I know the Administrator is spending a lot of personal time on this. One of the things that we intend to do with this program is to move very slowly and carefully to ensure that as we invest any more in this we know that each step of the way actually produces a result. We also are doing or planning to do a series of independent reviews by independent experts on that system to ensure that what we do in fact has an effective outcome.

I think there is no question in the past we have had huge problems with this. But I do think the current management has the program under control and is taking very judicious small steps to move forward cautiously and correctly on it.

Senator SHELBY. Mr. Mead.

Mr. MEAD. I think two essential things need to be done here. First, the burn rate of the contract ought to be reduced very substantially. Right now FAA is spending between \$4 and \$5 million a month on the contract, and the agency does not know how it will fix some of the technical problems with WAAS.

Second, as Mr. Basso indicated, FAA needs an independent assessment of WAAS problems by scientists and technical experts.

Senator SHELBY. How can you do that?

Mr. MEAD. We made a suggestion before Mr. Wolf's committee last week that FAA seek independent advice. The National Academy of Sciences has a track record of dealing with complex issues, and does not have a vested financial interest in the outcome. We did not mean to suggest, though, that it had to be the National Academy of Sciences. I just do not know of an equivalent group that can bring to bear a wide range of skills. I think it is important that the contractor provide information to this independent group, but that the contractor should not be a member in any way, shape, or form of this group.

Senator SHELBY. Mr. Mead, I believe you were quoted last week as being concerned "that neither FAA nor Raytheon has the necessary expertise to resolve problems faced by this procurement." You still believe that?

Mr. MEAD. Yes, and the FAA shares this view.

Mr. BASSO. Mr. Chairman, I would affirm that they do. In fact, I spoke with the Administrator this morning on this very subject.

Senator SHELBY. How can we help you resolve that? Is there a way?

Mr. BASSO. Yes, sir, I think you actually have. I think your—
Senator SHELBY. We have tried.

Mr. BASSO [continuing]. Attention to this has caused us to focus very clearly on it. The Administrator I know is committed, because I spoke to her this morning, about bringing in independent technical expertise to address that question.

I should also mention, I did not make it clear in my previous answer, but we do plan to reduce the burn rate on the program. We fully agree with the Inspector General's observations on what needs to be done here.

Mr. MEAD. Mr. Chairman, the key technical problem with WAAS is quite an interesting one. It focuses on the WAAS signal coming down from space. A pilot in an airplane has to know that the WAAS signal is exact, particularly when the pilot is landing. The signal must be precise. There is precious little room for error when you are landing. You have to know exactly where you are, and when WAAS cannot be relied upon.

So one of the problems FAA is having is knowing when the signal is unreliable, when it ought not to be used. I would say that FAA is 90 or 95 percent of the way there, but in aviation you cannot afford to have that extra 5 or 10 percent unresolved.

Senator SHELBY. It is not enough, is it?

Mr. MEAD. No. It is a very technical and complicated issue that FAA needs to solve.

CONTRACTING FAA FUNCTIONS

Senator SHELBY. Mr. Basso, dealing with FAA operations, given the pressures that we are likely to face—that are likely to face the FAA operations account under the new authorization bill, does it make sense—yes, does it make sense to pursue a greater level of contracting out of some of the functions that FAA has traditionally not done well, such as oceanic services, procurement of communications services, expanding the contract tower program, or others?

Mr. BASSO. Mr. Chairman, we have been looking at the potential for contracting out some services. That is under way. I cannot give you an exhaustive list of exactly which ones we would proceed with, but they are clearly under consideration. We have been consulting, not only with ourselves, but also with our unions and other people who have a role in all of this, and I would expect you would see some results of that.

Senator SHELBY. Does the oceanic modernization program offer you any opportunities for exploring different ways of contracting?

Mr. BASSO. I think the oceanic modernization program clearly does. One of the things that we face in the oceanic environment is the need to make investment upgrades. There is also competition from other international bodies. As you know, we are delegated authority to provide air traffic service for large areas of Atlantic and Pacific Ocean airspace.

Senator SHELBY. Mr. Mead.

Mr. MEAD. I think the answer to your question is yes. Oceanic is different from domestic operators, in that changes will not affect general aviation. You do not have as many of the different stakeholders in oceanic. You have mostly big airlines in that environment. Also you have an environment where there has been an incli-

nation, more of a willingness, by the carriers to pay user fees, which as you know is very controversial for domestic air space.

Another issue that you have to deal with, quite frankly, is the controllers' union and the workforce issue. In both contract towers, which FAA says can yield savings of \$700,000 a tower over time, and oceanic, there are workforce issues where the union would be concerned about jobs. But I think that is a factor that could be worked out if Congress were to seriously pursue an effort in the oceanic air traffic control environment.

COST ACCOUNTING

Senator SHELBY. Mr. Mead, would it not be helpful to have a good cost accounting system in place so that they would be able to assess which functions or activities held the greatest promise?

Mr. MEAD. Yes, sir. As we discussed in the budget appropriation committee hearings several weeks ago, if FAA does not have that cost accounting system it cannot get control of operations costs. Further, FAA cannot figure out where its operations costs are actually going and the agency cannot identify opportunities for savings. So FAA has an operations account that between this year and next is going to increase by about 12 percent. We cannot keep that up in perpetuity.

DEEP WATER

Senator SHELBY. Mr. Secretary, we are concerned that the Coast Guard will have three proposals of deep water assets to acquire, but no clear understanding of what capabilities are necessary. In other words, we will not know where to go, but nevertheless we will have three versions of how to get going, maybe not to get there but to get going.

Would it make sense for the Coast Guard to formally establish asset requirements to meet its roles and missions?

Mr. BASSO. It does, Mr. Chairman.

Senator SHELBY. Otherwise you are flying blind in a way, are you not?

Mr. BASSO. Yes, sir.

Senator SHELBY. Or sailing blind.

Mr. BASSO. Yes. Let me just add that we actually go through a three-level process. One, a roles and missions study was just completed for the Coast Guard, the first update since 1980, which I think—

Senator SHELBY. Was that done in house?

Mr. BASSO. It was done in house, but it included a wide range of expertise, not just limited to the Coast Guard or the Department.

Senator SHELBY. Is that the inter-agency task force?

Mr. BASSO. It is, yes.

Senator SHELBY. Do you feel like they are doing a good job there?

Mr. BASSO. I do. I really do. I think I can come to you with a straight face and say that.

In addition to that, we have done as we go through these projects a mission needs analysis based on those roles and missions to take it down to a level of more detail, and then finally the capital management plan. So I think we do that work.

Senator SHELBY. Mr. Mead, what is your thought to that? What are your thoughts? Is that a valid concern?

Mr. MEAD. Pardon me?

Senator SHELBY. Is that a valid concern on our part?

Mr. MEAD. Yes. I think roles and missions is an issue. I think the Coast Guard has done a good job of planning, but the whole Deepwater project to date is just that, a planning process. It is not a budgeting process. The Coast Guard can plan its needs for the next 20 years. But it just does not follow that it can say, here is what the budget is going to be for the next 20 years. That is where I see a disconnect.

Senator SHELBY. Basically, you have got to know where they want to go, have you not?

Mr. MEAD. Yes. Well, just one quick example. The Coast Guard's planning process for its Deepwater needs will not be done until 2001, after the date it is going to be making its first budget request for Deepwater assets. It has the cart before the horse.

CENTRAL ARTERY

Senator SHELBY. Mr. Mead, I want to go to Boston just briefly, the area. It seems that the Big Dig in Boston seems to be a full employment project for your office, unfortunately. A recent report on the owner-controlled insurance program for the Central Artery Project recommended that the overpayments of insurance premiums should be recovered and reallocated.

Would you provide a brief summary of the problem and give a status report on this and the issue of the overpayments? Do you want to do it later or do you want to touch on it now?

Mr. MEAD. I can do it quickly.

Senator SHELBY. Okay.

Mr. MEAD. The problem was that the Artery was overpaying insurance premiums. After the insurance period was over, the insurer would say: Well, you paid too much. And the Artery would say in effect: Keep it, put it in an investment account. And they would. Our point is, the Federal Government will pay you back for insurance, but we are not going to pay you back for an investment account. If you are going to have an investment account, you will have to spend that Federal money on your highway projects.

The Federal Government is not in the business of funding investment accounts and we had an investment account there. The current status, I believe, is that the Department is of one mind—Mr. Basso can speak to that—that this should be discontinued. However, I think we still have some convincing to do in the State of Massachusetts.

Mr. BASSO. I might just add, Mr. Chairman, we are in full agreement. Mr. Mead and I personally spent a lot of time on this the last several months. The \$150 million in the fund is to be liquidated. We have that agreement.

Let me just mention quickly that I have asked for and intend to get an independent actuarial evaluation of what needs to be in that fund, because the concept is good. Actually it can be a savings of owner-controlled insurance as long as the amount in the fund is right.

Senator SHELBY. How long will that take to do?

Mr. BASSO. I would bet we can get this done within the next 30, 60 days. This is not rocket science, let me say.

Mr. MEAD. It is a lot of money, though.

Senator SHELBY. It is a lot of money.

Mr. MEAD. It is over \$129 million, plus interest. If you had that today, FAA could say, well, here is our supplemental.

Senator SHELBY. It would take care of a lot of problems, would it not?

Mr. BASSO. Yes, sir, it sure would.

FLIGHT DELAYS

Senator SHELBY. Mr. Mead, you are doing some work on the cause of flight delays in the aviation industry for the Congress. How is that work coming and are there other previews that you might share with us before the summer thunderstorms?

Mr. MEAD. Sure. We will be issuing a report later this spring to your committee, but here is some preview information I find absolutely fascinating. In the past several years, the number of flights spending one hour or more on a taxiway waiting to take off has increased 130 percent.

Senator SHELBY. Why?

Mr. MEAD. That is a good question. It depends on who you ask. An airline executive may say, "Well, it is FAA." An air traffic controller may say it is the airlines' fault. Others will say it is God, because of poor weather. A whole variety of different factors contribute.

One of our findings is that a huge deficit of information exists on the causes of these delays. Another major finding is the amount of hidden delays built into the airlines' block times. For the airlines to maintain good on-time performance statistics, they increase the length of the scheduled flight times to build in time for potential delay. The overall time it takes to complete a flight on about 77 percent of the routes in the United States has increased over the past 10 years.

Senator SHELBY. Mr. Mead, is there any value to the consumer—to the consumer—of the current delay reporting system? Do you see any value in reporting on-time departures? Are not consumers basically interested in on-time arrivals?

Mr. MEAD. I think consumers are more interested in on-time arrivals. I have a hard time, Mr. Chairman, understanding why it is relevant to me that my flight backed away from the gate within 15 minutes of the scheduled departure and then proceeded to spend 3 hours on the runway. Under this scenario, I do not think I took off on time, and I think most Americans would agree with that view.

Our current reporting system, though, says we took off on time that our flight was an on-time departure—because it backed away from the gate within 15 minutes of the scheduled departure time.

Senator SHELBY. That is what they claim it to be, anyway.

Mr. MEAD. Yes, sir.

FAA—NATCA

Senator SHELBY. Mr. Basso, the FAA has claimed that the FAA—NATCA agreement has significant productivity and offsetting cost

gains. Have those promised savings or productivity gains emerged yet, and what are the actual cost savings and productivity gains that have been realized to offset the cost of the agreement?

Mr. BASSO. I would say at this point, in fairness, Mr. Chairman, that I could not say that those productivity gains have offset the cost of the agreement. But we are in the early stages of it, within the first year and a half of this agreement. The data—I think the jury is still out. The data has not been sufficient for me to come up here and give you an honest yes to that.

I would like to supply for you for the record some additional information that would help show where the trends are likely to take us.

[The information follows:]

During the first part of fiscal year 1999, the FAA and NATCA worked to finalize the rules associated with the various productivity articles of the contract and the rules for the new pay system. A metrics team was established to identify and track measurable results of implementing the contract. The FAA will continue to refine and analyze this data to provide additional information to Congress on the results of this contract.

There are many indirect results of the contract, including an improved and more productive working relationship between FAA management and NATCA in modernizing the aviation system. An example of this partnership is the manner in which DSR has been fielded throughout the country, resulting in FAA completing many facilities well ahead of schedule. Another example is the STARS program; FAA has fielded the first segment at El Paso and Syracuse and is working on the advanced configurations of that program.

Mr. MEAD. This committee could help there, Mr. Chairman. When FAA signed that agreement, it said there would be productivity gains that it would quantify. We have been monitoring the situation since FAA signed the agreement. We think it is about time that FAA identified what those productivity gains are going to be and quantify them. But we are getting in the neighborhood of some big money when we are talking \$6 or \$7 billion a year in an operations account.

PROCUREMENT REFORM

Senator SHELBY. Do either of you expect anything significant to change at the FAA in terms of procurement management, FAA culture, employee morale, or financial management, or are we likely to see a new list of reasons why it is someone else's fault that the FAA is unable to improve in those areas? Mr. Mead?

Mr. MEAD. I think the jury is still out.

Senator SHELBY. I am talking about, as you know, the procurement personnel reform.

Mr. MEAD. I think the jury is still out. What you have seen essentially on procurement reform so far, is that FAA awards contracts quicker, but I think the point behind procurement reform was not only to award contracts quicker, but also to get the results. There is no question, on some acquisitions that FAA has brought them home quicker—HOST, and DSR, for example. But on big acquisitions like WAAS and STARS, we do not see the results yet.

On personnel reform, I think the jury still is out too. So far morale among controllers is a lot higher. Personnel reform has measurably improved relations between FAA management and the controllers. At the same time, the tangible evidence is in higher salaries.

ACQUISITION PROGRAMS

Senator SHELBY. In the area of software development, one of the difficulties that the FAA has experienced in its effort to modernize the air traffic control system has been an inability to prevent acquisition programs that are heavily dependent upon software development from extensive schedule delays and explosive cost growth. Similar problems are appearing elsewhere in the Department. The National Advanced Driving Simulator and the Coast Guard's Marine Information for Safety and Law Enforcement Project come to mind.

Mr. Secretary, considering that more and more acquisition projects will be software intensive, what steps can you take at the Department to better manage these types of development programs and share lessons learned from one modal administration to another?

Mr. BASSO. I think there are three steps, Mr. Chairman, one of which—

Senator SHELBY. This is going to involve big money, is it not?

Mr. BASSO. Yes, sir, absolutely it does.

The first step we took was to get a professional chief information officer on board who has real background in these areas.

Senator SHELBY. Did you have to go to the marketplace to do that?

Mr. BASSO. We did. We did in fact. I think that step one is to get someone, to put it bluntly, who knows what they are doing in charge of that.

Second, our monitoring of these projects has stepped up, and we have had a lot of assistance from the Inspector General's Office in that regard to really monitor closely what goes on.

Then I think, thirdly, what we need to do is to examine very carefully and share—you hit the nail right on the head—share the results of when something has gone wrong, why, so that we basically do not, so to speak, draw the cartoon of beating ourselves over the head with the same hammer every time.

FAA PROCUREMENT

Senator SHELBY. Dealing, Mr. Mead, with FAA procurement problems, I have been told that it appears to some in the industry that when a ready solution is presented to the FAA that can be deployed quickly, the FAA does not use its procurement reform authority to fast track that solution. Instead, the FAA begins a long process that enables competitors to catch up and leads all bidders to spend substantial sums of money with little or no return.

It seems to me that it is almost as though the FAA sits back and says: But wait, there must be a harder and more expensive way to do this. What steps, Mr. Mead, can the FAA and others take to remedy this perceived problem and find a solution for the aviation community? Is it real?

Mr. MEAD. Yes, there is—

Senator SHELBY. The perception is real, maybe?

Mr. MEAD. The perception is real, and FAA knows that it is real. I think Administrator Garvey has taken steps to get a grip on this.

Senator SHELBY. What steps? What steps?

Mr. MEAD. In some acquisitions, you will notice that FAA is doing what it calls build a little, test a little. It is taking smaller steps instead of trying for the big bang. But there are other cases, such as with STARS and with WAAS, two big acquisitions, where you do not see that in place.

I think that FAA can take heed to your advice on this, Mr. Chairman, still. But you cannot turn the ship around overnight.

Oceanic is another one. You mentioned this one earlier. Right now FAA is paying a total of \$1 million, or \$1.5 million, to some vendors to come out and demonstrate their wares. But the United States should already have a very advanced oceanic air traffic control system in place. It is woeful that we are so many years behind on this. One reason we are behind the eightball is because we tried to bite off more than we could chew years ago.

Senator SHELBY. Mr. Mead, would you provide for the record the relative work load of your office for each of the individual Department agencies?

Mr. MEAD. Yes.

Senator SHELBY. Would you do that? That would be helpful to us. [The information follows:]

OIG Resource Utilization by Operating Administration

[Percent of total staff in fiscal year 1999]

| | |
|------------------------|-------|
| FAA | 37.0 |
| FHWA | 20.8 |
| OST ¹ | 18.2 |
| USCG | 9.0 |
| FTA | 6.1 |
| FRA | 3.2 |
| MARAD | 2.7 |
| RSPA | 2.0 |
| NHTSA | 1.0 |
| Total | 100.0 |

¹A large portion of this work was dedicated to reviewing DOT's consolidated financial statements.

ADDITIONAL COMMITTEE QUESTIONS

Senator SHELBY. You know we have got a couple of votes on the floor. We are going to recess the committee. We appreciate you both appearing to let us go through this expeditiously.

[The following questions were not asked at the hearing, but were submitted to the Agencies for response subsequent to the hearing:]

QUESTIONS SUBMITTED TO THE OFFICE OF BUDGET AND PROGRAMS PERFORMANCE

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

OVERSIGHT OF HIGH-DOLLAR INFRASTRUCTURE

Question. One of the issues that made the Inspector General's oversight report last year and again this year is that DOT needs to improve its management of transportation infrastructure projects. It is especially important for the management of high-dollar projects to be aggressive, because the risks to the Government's financial interests are increased proportionally.

The IG's December 1999 Top Twelve Management issues says that the DOT should do the following: 1. Strengthen internal controls over project cost estimates, 2. Require and closely examine project finance plans, and 3. Monitor project performance to minimize funding risks. Please describe the Department's plans for improving the Federal Highway Administration's management of large construction projects.

Answer. DOT agrees fully with the IG's recommendations. The Secretary has directed the Assistant Secretary for Budget and Programs to issue a DOT-wide requirement for project finance plans and monitoring by June. FHWA has recently initiated two distinct actions to strengthen its management of high-dollar projects, improve controls over cost, and reduce funding risks. First, FHWA has formed a "Major Projects Team" to strengthen the oversight of all Federal-aid high-dollar projects. This team will consist of Headquarters and resource center personnel, including financial specialists, attorneys, engineers and other program specialists led by a core of Headquarters managers. While the FHWA Division Offices will remain responsible for traditional Federal-aid oversight responsibilities, the Major Projects Team will assist the Division Offices with risk assessment and oversight decisions in the areas of finance, public relations, environment, program development, and unusual engineering decisions. The Major Projects Team will support the Division Offices during the review of the financial plans and independent verification of financial data. The team will also review and oversee the implementation of recommendations from government audits and reviews. The Major Projects Team will report to the Director of the Office of Program Administration, Infrastructure Core Business Unit.

Second, FHWA created a task force to update our August 1998 guidance on financial plans. While FHWA's 1998 guidance fulfilled the provisions of TEA-21 Section 1305, OIG recommendations made it clear that more definitive guidance was necessary. The revised guidance will:

- Define the content and format of the Initial Financial Plan and the Annual Updates in terms of accepted accounting standards,
- Provide example charts and tables to promote uniformity,
- Require a commitment and acceptance of the plan by the leader of the State Transportation Agency, and
- Standardize FHWA's procedure for reviewing financial plans and annual updates.

AMASS

Question. There has been a continuing concern about the increasing number of runway incursions—collisions or potential accidents on the ground. The upward trend in runway incursions continued in 1998, with 325 incursions, an 11 percent increase from 1997. AMASS is the radar and related software/hardware to monitor airport surfaces and warn of potential runway incursions. A month or so ago, FAA announced that it was going to be two years behind schedule in deploying AMASS. Would you please explain the reasons for the delay in the AMASS program, and tell us how this will affect FAA's initiatives to reduce the number of runway incursions? Should we be looking at other solutions?

Answer. The previous AMASS schedule relied on a very high-risk acquisition strategy and schedule that included concurrent development and production phases. In addition, during April 1999 new program requirements related to human factors evaluations were added. At that point, FAA recognized that the development effort required to meet user requirements was far more extensive than originally envisioned, and that it would be unable to meet the October 2000 date for commissioning AMASS. The AMASS program underwent an in-depth review and restructure during the late summer and early fall of 1999.

AMASS will not reduce runway incursions, but will help prevent accidents if runway incursions occur. The implementation of AMASS at the nation's 34 busiest airports, which is an enhancement to the Airport Surface Detection Equipment Model 3 (ASDE-3) radar, is one of FAA's initiatives to prevent accidents that may result in loss of life and/or property resulting from runway incursions. This spring, the FAA is holding nine regional workshops, bringing together airlines, airport officials, general aviation organizations, pilots and air traffic controllers to develop additional ways to reduce runway incursions at airports in the regions. These will be followed in late June, 2000 by a national runway safety summit in Washington, which will include results from the regional sessions and review of efforts in human factors and new technologies.

GREAT LAKES ICEBREAKER REPLACEMENT

Question. The Coast Guard has expanded the mission requirements of the Great Lakes Icebreaker Replacement by proposing to add a buoy tender capability to the new icebreaking vessel. I understand that this is the first time the Coast Guard has proposed building other capabilities into an icebreaking platform. What companies in the domestic shipbuilding industry, if any, have experience with this type of de-

sign? Are there any technical challenges and management risks caused by trying to incorporate other missions into the replacement Great Lakes icebreaking ship?

Answer. No heavy icebreakers with buoy tending capability have been built in the United States, although ships with similar multi-purpose capabilities were built in Germany and Finland within the last 10 years. To determine the interest and capabilities of the domestic shipbuilding industry to successfully construct a multi-purpose icebreaker, the Coast Guard conducted two rounds of market research to identify domestic shipyards capable of design and construction of this unique vessel. Numerous companies responded to the surveys and several were found to be capable and experienced in the design and construction of vessels of comparable size, technology and function.

The primary technical challenge of incorporating heavy icebreaking and buoy tending capabilities within the same vessel relate to hull design and effectively balancing the competing design requirements of the two missions. For example, heavy icebreaking requires a deep draft, large displacement, and high horsepower vessel. On the other hand, buoy tending requires a shallow draft, highly maneuverable vessel with accurate navigation and good sea keeping characteristics. Alternatively, many design characteristics complement the combination of the two missions. For example, the same maneuverability characteristics required to break out a vessel beset in ice will also provide the maneuverability required to place a buoy. To mitigate the technical risks, the Coast Guard developed a conceptual multi-purpose design and successfully tested the model hull form in an ice tank to validate its technical feasibility. This study was used to develop the proper design balance between the two missions that will result in the successful execution of both within the same platform.

DEEPWATER REPLACEMENT PROJECT

Question. The Coast Guard has three industry teams under contract to conceive and design a plan to modernize its deepwater fleet, aircraft, sensors and communications equipment over the next twenty years. While there may be value in receiving three independent options for acquiring new deepwater assets, I remain concerned that the Deepwater acquisition strategy is not grounded in political or fiscal reality. The project's price tag has been well discussed by the GAO, the Department IG, and this committee. It will be difficult to bind future Administrations or commandants—or even disgruntled industry contractors—to the January 2002 award decision. When the Coast Guard awards the Deepwater contract, will the award be a “winner-take-all” contract for one industry team or will the Coast Guard pick and choose the best, most innovative procurement ideas from all three teams and compete each item separately?

Answer. In January 2002, the Coast Guard intends to award the Integrated Deepwater System acquisition contract to just one of the three competing industry teams. However, the Coast Guard retains the right to “mix and match” from the three competing designs, in the event that all three designs contain some deficiency. To obtain essential contractual flexibility and protection for the Government, the Coast Guard intends to structure the Deepwater acquisition contract as an incentivized, indefinite delivery, indefinite quantity contract. The Coast Guard will issue separate delivery orders under this contract to perform the upgrades and acquire the new assets comprising the industry's proposed Integrated Deepwater System. In addition, the Coast Guard intends to include specific Value Engineering and/or Technology Refreshment contract clauses. These clauses will enable the Coast Guard to acquire new technology that meets or exceeds proposed cost and performance levels from firms not originally part of the selected Deepwater industry team.

FAA FINANCIAL STATEMENT

Question. One of the things that your office, the Office of the Secretary of Transportation, and the FAA Administrator's office has taken some pride in is the clean audit opinion for the FAA for this year. However, at the same time, I note that the Government Performance Project as reported in the Washington Post gives the FAA a “D” for Financial Management. Is this clean audit a one-time event, or have the structural and procedural changes been made at the FAA that will permit the FAA to continue to receive clean financial statement audits in the future?

Answer. DOT's goal is to ensure that the clean audit is not a one-time event. The first clean audit involved substantiating inception to date property and other accounts that were accumulated over 30 or more years. Fiscal year 2000 and future years will be based on transactions that occur within one fiscal year. In addition, as new property systems and the new DOT accounting system are put in place in fiscal year 2001, issues that needed to be addressed in the 1999 audit will be sys-

tematically resolved. Procedural changes have been made, but system changes will evolve as the new commercial off-the-shelf programs are funded.

QUESTIONS SUBMITTED BY SENATOR FRANK R. LAUTENBERG

TERMINAL VOICE SWITCH REPLACEMENT

Question. The Terminal Voice Switch Replacement (TVSR) program was established to replace 421 electromechanical and supportable voice-switching systems in the Federal Aviation Administration (FAA) by 2002. Within this program 267 systems are for larger more critical sites. These sites are receiving equipment under the existing Enhanced Terminal Voice Switch (ETVS) and the Rapid Deployment Voice Switch (RDVS/RDVS IIA) contracts. Does the FAA have a procurement plan for TVSR in fiscal year 2001-fiscal year 2004? Please present that plan and explain the anticipated changes from year to year.

Answer. The FAA is procuring equipment under the budget item entitled Terminal Voice Switch Replacement (TVSR)/Enhanced Terminal Voice Switch (ETVS). The following is the procurement plan for the TVSR/ETVS Program for fiscal year 2001-fiscal year 2004.

[Dollars in millions]

| | Fiscal years— | | | |
|-----------------------------|---------------|-------|-------|-------|
| | 2001 | 2002 | 2003 | 2004 |
| Large Switches (ETVS) | 10 | 10 | 17 | 17 |
| Budget | \$5.0 | \$5.0 | \$8.4 | \$8.4 |

The number of systems to be procured is based on the production capacity of the contractor, the available FAA engineering personnel to oversee installation of the equipment, and the relative priority of this project compared to other FAA programs.

VOICE RECORDER REPLACEMENT PROGRAM

Question. The Voice Recorder Replacement Program (VRRP) was established to replace 579 aging analog voice-recording systems that have reached the end of their service life. These sites are receiving modern digital equipment from the Digital Voice Recording System (DVRS) contract. The FAA must procure an approximate average of 84 systems per year (fiscal year 1999-fiscal year 2002) if it is to replace analog systems that have reached the end of their service life at the remaining 337 ATC facilities by the time the last DVRS production period expires in fiscal year 2002. Does the FAA intend to procure sufficient DVRS systems to replace the analog systems? If not, why not?

Answer. Yes, the FAA intends to procure sufficient DVRS systems to replace the analog systems. FAA is planning to renegotiate the contract so that the production period will be extended from August 2002 to July 2004.

FLIGHT SERVICE STATION SWITCH MODERNIZATION PROGRAM

Question. The Flight Service Station Modernization Program is being established to replace 64 aging technology voice-switching systems with limited supportability for the FAA's Automated Flight Service Stations (AFSS). I am told that current AFSS systems have, with minor modifications, been used in Terminal facilities. Is that correct? Both ETVS and RDVS were designed and procured to replace aging technology voice switches. Both of these voice switches have completed extensive FAA and Department of Defense testing programs to qualify for Air Traffic Control (ATC) operations. Is it true that either ETVS or RDVS Switches, with minor modification, can be utilized to satisfy the AFSS requirements? If so, why is the FAA initiating a development program for an alternative?

Answer. The FAA program currently identified to replace voice switches in the flight service option is known as the Automated Flight Service Station Voice Switch (AFSSVS). A switching system currently used in AFSS (Denro ICSS-1A) was adapted for a terminal application for its use in Southern California TRACON (SCT). However, the modifications required were not minor and, in addition to relative size, reflect the fundamental differences between the terminal and flight service environments and associated functions. The modifications included linking three systems together and removing position functions and peripherals found in existing AFSS

switching systems. The ETVS and RDVS IIA were designed specifically for terminal Air Traffic Control (ATC) operations. The ATC environment is primarily concerned with aircraft separation while flight service is an advisory and planning service. It is not certain that the ETVS or RDVS IIA voice switches can, with only minor modifications, be adapted to satisfy the AFSS requirements. The FAA has evaluated no design or product. Requirements for the AFSSVS have been developed to satisfy a FAA developed mission need statement that identifies operational needs that differ from the existing terminal and flight service environment. The AFSSVS requirement includes the capability to fold back operations during non-peak hours, which will require the ability to reroute radio frequencies between facilities to maintain service.

The FAA is currently performing an investment analysis on a number of alternatives selected to meet the approved mission need for AFSSVS. The objective of the investment analysis process is to determine which alternative approaches are feasible and affordable. The process is expected to be complete this spring and the results of this process will be presented to the FAA executive level for a decision in the summer of 2000. Subsequent to this decision, the selected alternative will be pursued in accordance with the FAA Acquisition Management System.

NEW YORK TERMINAL AIRSPACE REDESIGN—NEWARK DELAY REDUCTION

Question. The last major airspace redesign in the New York Terminal Area was initiated in the early 1980's, and implemented in 1987 and 1988. Since then, air traffic has grown, en route flows have changed, and aircraft performance and navigation capabilities have improved.

Unfortunately, the airspace structure has not kept pace with these changes. For nine of the last 12 years, and every year since 1995, Newark has been the most delayed airport in terms of FAA delays per 1,000 operations. JFK and LaGuardia are similarly impacted. In response to this situation, and at the urging of ATC system users and the Port Authority of New York and New Jersey, FAA announced the initiation of the New York/New Jersey Airspace Redesign Project in April 1998.

In the Fiscal Year 1999 Senate Transportation Appropriations Full Committee Report, \$11 million was designated to support the Administration's national airspace review and redesign initiative, with \$3 million specifically designated for the New York/New Jersey metropolitan airspace. Ultimately, the Omnibus Consolidated and Emergency Supplemental Appropriation Bill included only \$3 million for New York/New Jersey metropolitan airspace design.

In fiscal year 2000, the Committee again allocated \$11 million to support the comprehensive review and redesign of the nation's airspace with direction to FAA to concentrate on the eastern region, and in particular, the New York/New Jersey metropolitan airspace. The conference agreement funded the \$9.622 million FAA request and directed \$6.6 million to be used in direct support of the NY/NJ airspace redesign effort.

Considering this significant funding support over the last two years, what progress has been made on the New York/New Jersey airspace redesign? In FAA's Quarterly Report to Congress on Newark Delay Reduction Initiatives (Oct-Dec 1999), you advised that two milestones had slipped, and NATCA had directed its members to withdraw from the redesign project until facility pay classification guarantees were negotiated. What is the status of the NATCA negotiations, and what is the impact of these issues on the redesign schedule? What alternatives are available to FAA to proceed with airspace redesign without NATCA participation? What would they cost over the life of the project, and how long would it take to implement them?

Answer. The New York/New Jersey airspace redesign project has completed 31 public meetings to seek input from the public prior to developing redesign concepts. The first meeting was held September 22, 1999, and the last meeting was held on February 3, 2000. A total of 1,174 individuals attended the meetings and over 700 people provided written comments. FAA's Eastern Region will have a full report documenting the results of the meetings and this report will be available by May 2000. The Eastern Region will complete the computer modeling of the airspace baseline by April 2000. The Eastern Region has established joint NATCA/management redesign teams. These redesign teams are currently developing airspace design alternatives. Two alternatives will be ready for computer modeling by July 2000.

In December 1999, Eastern Region NATCA directed its members to stop work on the National Airspace Redesign project pending discussions on a national memorandum of understanding. In late February 2000, Eastern Region NATCA resumed work on airspace redesign, although no memorandum of understanding has been signed. FAA continued the customer and community meetings, but the timeline

slipped by 4 months. FAA management prefers to redesign the national airspace in collaboration with NATCA, however a contingency plan was developed to continue the project if NATCA did not return. The plan is still available to use if necessary. To continue the project, FAA would have added additional management employees to fill the teams. Typically, the new team members would have been first line supervisors from the major air traffic facilities. If FAA were to use this plan, they anticipate losing from 3 to 6 months to get the new work groups educated. The overall cost of this project would remain the same.

Question. Assuming that an agreement can be reached quickly with NATCA, what level of funding is required in fiscal year 2001 and in future budget years to achieve the milestones contained in the Quarterly Report on Newark Delay Reduction Initiatives?

Answer. In late February 2000, Eastern Region NATCA resumed work on airspace redesign, although no memorandum of understanding has been signed. Assuming Air Traffic Airspace Management Program receives the fiscal year 2001 Budget request of \$20,578,000 for the national airspace redesign activities, Eastern Region will request \$5,838,000 for fiscal year 2001. Support from the New England Region, Great Lakes Region, and Southern Region will be critical in achieving the milestones stated in the Quarterly Report on Newark Delay Reduction Initiatives. Future funding has not been determined.

Question. Considering the potential magnitude of any future airspace changes and the length of associated environmental reviews, what plans does the FAA have to phase in changes that could reduce delays at EWR? For example, the fiscal year 2000 appropriation provides \$1.16 million to install an LDA with glide slope at Newark. What progress has been made to date on this project: what is the status of the required environmental review; and when will the facility be commissioned?

Answer. Airspace modeling at the William J. Hughes Technical Center is scheduled to be completed by the summer of 2000. The modeling results will help determine whether the Localizer Type Directional Aid/Simultaneous Offset Instrument Approach/Precision Runway Monitor project may proceed separately from the larger airspace redesign effort.

Should it be determined that the LDA/SOIA/PRM can be separated from airspace redesign, then a subsequent environmental review will be conducted and an implementation schedule will be developed.

Question. In the fiscal year 2000 Senate Transportation Appropriations Report, this committee directed the FAA to continue to work with the appropriate local authorities toward the installation of a PRM (Precision Runway Monitor) at Newark International Airport. This followed the provision of \$2 million in fiscal year 1999 for preliminary work necessary for the installation of two localizer directional aids and a precision runway monitor at Newark. Several other airports (Cleveland, San Francisco, and Los Angeles) are interested in PRM technology. How does the FAA plan to procure PRM's to satisfy these needs? When will they be available for installation? Is there a PRM available for installation at Newark?

Answer. The FAA has not validated a requirement for a federally funded PRM system for Cleveland, San Francisco or Los Angeles. However, we have been working very closely with the city of San Francisco and the Airport Authority to prepare for the installation of a PRM system that the city of San Francisco is procuring directly from the manufacturer. The FAA is providing engineering and programmatic support to assist in the installation of this system.

The FAA has been working very closely with the New York/New Jersey Port Authority on the preliminary work to establish a PRM system at Newark. The use of PRM requires new procedures which are complicated and must be analyzed for safety and feasibility. Significant procedural work and modeling will validate the feasibility of installing a system. When validated, the FAA will work with the Port Authority to determine the best procurement option.

Question. Another concept that may hold promise for delay reduction at Newark is called Along Track Separation (ATS). It can be applied to closely spaced parallel runways and uses existing straight-in instrument landing system flight paths, which should minimize environmental concerns. The procedure permits the air traffic controller to reduce separation behind specific qualifying aircraft classes in both visual and poor weather conditions. A PRM and other airspace changes may be required to conduct these approaches in poor weather, however a good weather application may be possible with existing radar equipment, airspace configuration, and controller staffing. Since existing flight tracks and instrumentation can be used, it may be possible to obtain early delay reduction benefits. What plans does FAA have to evaluate ATS in fiscal year 2000? Is funding available for this project in fiscal year 2000? What funding is required to pursue this initiative in fiscal year 2001 and when can a proof of concept evaluation be started.

Answer. The FAA currently is working on several delay reduction initiatives specifically for Newark International Airport and other national initiatives with possible application to Newark. We have preliminarily determined that an evaluation of the ATS concept would require the development of new FAA separation standards. A complete analysis would be required to include modeling, simulation, and, possibly, an operational demonstration. Typically, this would be a very time consuming process. As part of the process, the FAA would evaluate the possibility of segmenting certain portions of the ATS analyses so that incremental benefits could be derived through a phased implementation. The FAA has not evaluated the ATS concept sufficiently to warrant a budget request in fiscal year 2001.

Question. As part of the language and funding associated with airspace redesign in the fiscal year 2000 Senate Transportation Appropriations Committee Report, FAA was encouraged to take advantage of new technologies to better manage traffic and capacity in the NY/NJ metropolitan area. The development of Area Navigation (RNAV)/Flight Management System (FMS) procedures is a Newark Delay Reduction Initiative. Development of RNAV/FMS procedures for Newark has been expedited by the use of technical support from MITRE/CAASD. FAA should continue to use this resource to develop and test advanced flight procedures that reduce controller and pilot workload, increase airspace capacity and efficiency and minimize noise impacts. Is adequate funding identified and available in the fiscal year 2001 budget request to continue this valuable process? What specific level of funding is required to support continued procedural development for Newark?

Answer. In fiscal year 2000, 12 staff months were allocated out of the MITRE-CAASD work program to support RNAV/FMS route development at Newark. In fiscal year 2000, approximately \$370K was allocated for the Newark analysis. These resources have been provided through the MITRE-CAASD F&E and funding of the National Airspace Redesign. Planning for the fiscal year 2001 MITRE-CAASD work program is in its initial phases. Sustained support for Newark procedures and RNAV development will be included as part of the proposal developed by the FAA and MITRE-CAASD. It is expected that the same approximate level of staffing will be required in fiscal year 2001. Again, the request for this effort is approximately \$370 K.

DEPLOYMENT OF NEW TECHNOLOGIES IN THE NEW YORK AREA

Question. Emerging technologies, including those associated with Free Flight, may permit FAA to improve the safety and efficiency of air traffic operations in the New York area, particularly during severe weather. Implementation of the Automated Flight Plan Processing—Departure Spacing Program (DSP) at the New York Air Route Traffic Control Center has been delayed repeatedly. The latest Quarterly report to Congress on Newark Delay Reduction Initiatives indicated Phase II, i.e., full two-way Host interface at New York Center, should be operational for the 2000 severe weather season. The fiscal year 2000 conference agreement provided funding for expansion of the system to Teterboro, White Plains, Islip, and the Air Traffic Control Systems Command Center. Will the system be operational for the summer of 2000? When will the expansion to the new locations be completed? What level of funding is required to sustain the system in fiscal year 2001 and is this funding identified in the FAA budget request?

Answer. The Departure Spacing Program (DSP) became operational for the Kennedy, LaGuardia, Newark, and Philadelphia airports on April 1, 2000. The tentative date for expanding DSP to include the Teterboro, Islip, and White Plains airports is December 15, 2000. The Air Traffic Control System Command Center is scheduled to have DSP operational in the spring of 2001, prior to the severe weather season. The level of funding needed to sustain the system is \$7,400,000 and has been requested in the FAA's fiscal year 2001 budget request.

Question. The airlines and other industries make extensive use of simulators to improve training and reduce costs. Technology exists to provide site specific air traffic control tower simulators. NASA Ames has an extremely sophisticated unit, and the City of Chicago tried to purchase one for O'Hare. These devices would speed controller training and reduce the operational impacts associated with controller on-the-job-training. Does FAA have a program to procure tower simulators? How much would a simulator for the new Newark Tower cost and when could it be operational? Does FAA have any plans to acclimate controllers to the new perspective in the new tower prior to commissioning of the facility? Has FAA done any studies to determine the cost savings associated with a tower simulation device?

Answer. The FAA does not have a program to procure tower simulators for individual facilities. FAA operates the Airway Facilities Tower Integration Laboratory (AFTIL) at the William J. Hughes Technical Center in Atlantic City, New Jersey.

The new Newark Airport Traffic Control Tower simulation scenario is in place in the AFTIL lab. Teams of Newark controllers have visited the lab. Views and perspectives from the new location were observed and assessed. A mock-up of the cab interior is planned for the purpose of addressing human factors and technical issues and making necessary adjustments to ensure an efficient transition to the new facility. In addition, each Newark controller will spend a minimum of eight hours in the new tower, prior to its commissioning, in order to observe the operation from a new vantage point. The intent is to orient and acclimatize the controllers to the new perspective in order to ensure a seamless cut-over. FAA has not done any studies to determine the cost savings associated with a tower simulation device.

CONTROLLER STAFFING AT NEW YORK AREA ATC FACILITIES

Question. New York area ATC facilities have been difficult to staff in the past. Over the next several years, controllers hired in 1981 will be eligible to retire. This may result in a serious staffing shortage or an influx of new trainees at all facilities, particularly New York Center. We understand it typically takes two or more years for controllers to become fully certified. What are FAA's projections for future retirements at the major New York area terminal and en route facilities, including Newark Tower?

Answer. The Eastern region has a plan to maintain a flow of trainees into their facilities in the most efficient manner possible, balancing training requirements, operational efficiency, and budget constraints. All New York facilities have on-board staffing that exceeds staffing standards. We anticipate no problems in maintaining adequate levels of staffing in the New York area. Although more controllers will become eligible for early retirement beginning in 2001, experience shows that controllers do not retire when they first become eligible.

Question. Does FAA have a plan to insure an adequate flow of trainees to these facilities so ATC system capacity and efficiency is not adversely impacted by staffing shortages, training activities, or excessive overtime?

Answer. Yes, the FAA maintains a developmental pipeline of controllers. The pipeline is based on historical experience and is timed to provide fully trained controllers to backfill for expected retirement increases and to provide for growth in aviation activity.

QUESTIONS SUBMITTED TO THE OFFICE OF INSPECTOR GENERAL

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

LOS ANGELES MTA

Question. The President's budget request includes a recommendation for an appropriation of \$50 million to Los Angeles MTA to purchase buses consistent with the master's ruling which is currently under judicial review. In the course of your Mega-project review or other work addressing some of the difficulties experienced by the LA MTA in recent years, have you developed an impression of the economic impact of the master's ruling on the LA MTA capital investment plan by virtue of the required acquisition of buses. In addition, what would be the economic and road congestion impacts on LA streets if the thrust of the master's ruling to reduce the number of standees on board heavily trafficked transit systems became a trend? Would it increase roadway congestion? Would it increase operating and/or capital costs for impacted transit properties? The Committee's information is that the trend in urban transit systems is toward perimeter seating configurations and more standees as opposed to the direction that the master's ruling seems to advocate. Is the Committee's information accurate?

Answer. Yes we have. The Office of Inspector General estimates that the capital cost to purchase the buses in the master's ruling could be as much as \$187.6 million above the current LA MTA budget for its bus program. LA MTA projects that the cost to operate the additional buses will run about \$21 million per year. LA MTA will have to reallocate funds from its other programs to purchase and operate these buses. LA MTA does not at present have a plan showing how it will fund the additional capital and operating costs.

OIG REIMBURSEMENTS

Question. Please prepare a table summarizing all proposed fiscal year 2001 reimbursements to the Office of Inspector general from other DOT modes, and what level of reimbursements were provided from other modes in fiscal year 2000.

Answer.

OIG REIMBURSEMENTS FROM OTHER DOT MODES

[Dollars in millions]

| DOT mode | Fiscal year | |
|----------------------------|-------------|---------------|
| | 2000 Actual | 2001 Proposed |
| FHWA | \$2 | \$3.524 |
| FTA | 1.5 | 1 |
| Total Reimbursements | 3.5 | 4.524 |

WOODROW WILSON BRIDGE

Question. The most current estimate being used by the FHWA for the Woodrow Wilson Bridge Project was developed in 1995, and the OIG identified \$227 million in net increases to that number. According to FHWA, a new, more accurate estimate for the Woodrow Wilson Bridge Project was to be prepared by the end of 1999. What is the status of the estimate and how accurate is the estimate going to be?

Answer. FHWA expects to have the updated cost estimate by early May 2000. The Maryland State Highway Administration, Virginia Department of Transportation, and the District of Columbia's Department of Transportation have been working with their general engineering consultant to develop an updated estimate for the Woodrow Wilson Bridge since the project completed 30 percent design plans late last year. The states are merging the most current designs with the construction bid data to provide a current cost estimate for the project. The states are currently performing value engineering and constructability reviews to try to keep the cost within the \$1.9 billion budget.

ALAMEDA CORRIDOR

Question. The most expensive and complex segment of the Alameda Corridor-Megaproject is being constructed using a design/build contract. What benefits, if any, have been derived from the use of this method?

Answer. The anticipated benefits of design/build contracting are: (1) allowing the project to begin sooner due to combining design and construction, (2) streamlining and expediting the contract award process, (3) awarding the contract based on "best value," (4) transferring risks of cost growth to the contractor, and (5) accelerating project completion. We have not evaluated the benefits of design/build and therefore cannot address whether or not they are being achieved.

According to the Program Manager with the Alameda Corridor Transportation Authority using design/build for the Mid-Corridor segment benefited the project in several ways. These are: (1) maintaining the original schedule, (2) transferring risks to the contractor for differing site conditions and environmental conditions encountered during construction, (3) improving coordination efforts with municipalities and utilities during construction, and (4) managing traffic during construction. As of March 2000, the Mid-Corridor segment is 27 percent complete.

INTERSTATE 15

Question. The IG has previously reviewed the Interstate 15 (I-15) Reconstruction Project in Utah. What are the objectives of any follow-up audit work planned?

Answer. The objectives of our current follow-up review of the I-15 Reconstruction Project are to: (1) update and evaluate the status of the project's costs, funding, and schedule since our previous report issued November 24, 1998; (2) identify any risks or emerging issues that could affect the completion of the project; and (3) follow up on the implementation of the recommendation contained in our previous report. (Our 1998 report recommended that FHWA require the Utah Department of Transportation to keep its finance plan current and to identify how it intends to resolve the funding shortfalls noted in the report.) We are nearing completion of our current review of the project. Our preliminary results indicate that project cost estimates remain at \$1.6 billion; that funding is sufficient to cover these costs; and that the project is expected to be completed in July 2001, 7 months prior to the opening of the 2002 Winter Olympics in Salt Lake City.

MEGAPROJECT

Question. Are there lessons learned from previously problematic “Megaprojects” that the Department should apply to the oversight of other projects to avoid the same pitfalls?

Answer. Specific lessons that we have learned are that:

1. The Federal Transit Administration’s full funding grant agreements have effectively limited the Federal Government’s financial risks and promoted accountability. These grant agreements set the maximum amount of discretionary capital investment funds that can be used for transit projects. By contrast, Federal Highway Administration projects have no comparable limitations.

2. Finance plans are essential tools for identifying project costs and funding needs. However, better criteria are needed to ensure finance plans are complete, reliable, and consistent.

3. DOT needs to provide effective independent oversight of major projects to minimize funding risk.

4. Owner-controlled insurance programs should be considered on very large projects and used when they reduce program costs. However, DOT needs to ensure that Federal reimbursement for these programs is limited to the amounts actually needed to purchase insurance coverage or pay incurred claims.

5. Value engineering is a good tool for controlling cost and should be used on all major capital projects.

COMMERCIAL DRIVER’S LICENSE PROGRAM

Question. Has the OIG conducted any reviews of the Commercial Driver’s License Program? If so, what are the findings and recommendations from the reviews conducted? What future work, if any, is planned?

Answer. Yes, we have an ongoing audit on Disqualifying Commercial Drivers. Overall, we found that Federal oversight of the Commercial Driver’s License (CDL) Program has not been adequate to reasonably ensure that states properly disqualify commercial drivers. This situation occurred because the Federal oversight reviews were not comprehensive and did not include operational tests of the state systems to ensure compliance. We found significant deficiencies in the state systems for untimely, incomplete, and inconsistent reporting of traffic convictions, inaccurate recording of convictions, and not properly disqualifying commercial drivers.

We plan to recommend that the new Federal Motor Carrier Safety Administration improve its oversight reviews conducted at the states and make use of centralized monitoring through the Commercial Drivers License Information System.

Future audit work involving CDLs will focus on the processes for testing commercial drivers and issuing licenses, medical qualification requirements for commercial drivers, and training requirements for commercial drivers.

In addition, we have conducted criminal investigations related to state issuance of CDLs, such as Operation Safe Road. This joint Federal and state task force found that corrupt officials had accepted bribes to issue CDLs. To date, 30 individuals have been charged criminally; 22 of these have either pleaded guilty or been sentenced. The investigation identified in excess of 1,000 truck drivers who may have illegally obtained their licenses in Illinois. Of these, at least 175 are now licensed in others states. The Secretary of State notified all 50 states of the potential problem truckers. The investigation is continuing in its effort to uncover additional violations.

MEXICO-DOMICILED MOTOR CARRIERS

Question. What actions has the FMCSA taken as a result of the 1999 OIG report on Mexico-Domiciled Motor Carriers?

Answer. FMCSA agreed corrective actions were needed. In addition, the Motor Carrier Safety Improvement Act of 1999 provided them with greater authority to take enforcement actions against carriers found to be operating beyond their authorized geographical areas. This new authority will be helpful to the FMCSA in implementing the recommendations. According to FMCSA’s written response to our recommendations, it is:

- Drafting regulations revising the registration process for foreign motor carriers to include additional safety-related questions and certifications of compliance.
- Developing reports that will be generated monthly, using data from the Motor Carrier Management Information System, to identify Mexican motor carriers operating outside their commercial zones.

- Developing implementation procedures for new enforcement provisions contained in the new safety law, which imposes substantial penalties and includes suspension and revocation of operating authority.
 - Issuing policy guidance that addresses relevant registration and insurance provisions to be enforced by the states at roadside inspections. Also, requiring the states to describe enforcement activities for registration and insurance provision in their Commercial Vehicle Safety Plan when requesting Motor Carrier Safety Assistance Program grant funds.
 - Drafting consistent policies and procedures for the newly established North American Borders Safety Border Program Division in FMCSA.
- When the above actions are completed and fully implemented, the intent of our audit recommendations should be satisfied.

FINANCIAL PLANS

Question. Over the last several years the OIG has reviewed a number of financial plans for transportation Megaprojects. Please comment on the usefulness of these plans for reporting on the financial status of projects?

Answer. We found the quality and completeness of finance plans for highway and transit capital projects to be highly variable. Some finance plans accurately reported costs and identified funding shortfalls. Others needed to be more thorough in disclosing problems and presenting information in a consistent manner over time. For example, the 1999 Finance Plan for the Bay Area Rapid Transit District includes construction costs for the new segment; including a 10-year forecast that identifies underlying revenue and expense assumptions.

By contrast, in 1998, we reported that the Los Angeles Metropolitan Transit Authority did not have an updated, comprehensive finance plan but separate capital and operating budgets. At the time of our audit, these budgets reflected a \$495 million capital funding shortfall and a \$643 million operating shortfall.

Similarly, in our most recent report on the Central Artery/Ted Williams Tunnel Project we also found significant, fundamental problems with its finance plan. The reporting methodology was changed so that the reviewer could only see the cost to complete, not the total project cost. The plan did not report specific cost, funding, and schedule indicators, such as “budgeted cost of work performed,” “actual cost of work performed,” “contract awards versus budget,” “total projected cost by type of cost,” and “annual funding requirements by source.”

Finance plans are essential tools for identifying project costs and funding needs. However, better criteria are needed to ensure finance plans are complete, reliable, and consistent. Neither FTA nor FHWA have adequate guidance for grant recipients to prepare finance plans. Finance plans describe how projects will be implemented over time. They identify project costs and timing, and the financial resources needed to pay for those costs. At a minimum, finance plans should:

- Include the assumptions underlying both cost and revenue estimates;
- Report actual versus budgeted amounts for contract award costs, the cost of work performed, and revenue;
- Clearly describe cost trends (e.g., contract change orders and contract awards) and the potential impact of those trends on project costs;
- Identify measures being taken to monitor and control costs;
- Identify sources of funding that can be used if costs rise or other anticipated funding is not received;
- Identify significant changes to the scope of projects, and the effect of these changes on the cost and capacity of the project; and
- Identify the grantee’s plan for financing existing operations during construction of new or extended segments, as well as its plans for financing all operations, both new and existing, once construction is complete.

OWNER CONTROLLED INSURANCE PROGRAM

Question. A recent report on the Owner Controlled Insurance Program (OCIP) for the Central Artery project recommended that the overpayments of insurance premiums should be recovered and reallocated. What is the status of the OCIP and the issue of the overpayments?

Answer. On September 13, 1999, FHWA agreed to require the Central Artery to use past overpayments to pay the premiums for policy years 1999/2000 and 2000/2001. We also agreed to allow credit for any “past use” of overpayments to pay premiums between the end of our audit and the date of the agreement. FHWA also agreed to issue guidance to ensure insurance reserves for owner-controlled insurance programs do not exceed allowable amounts, and that any premium adjust-

ments are immediately used for other approved costs or returned to the Federal government.

Information provided by the Central Artery's insurance broker on April 4, 2000, indicates the Central Artery has used excess reserves to make scheduled payments of \$12.3 million on August 1, 1999; \$13.2 million on December 1, 1999; and \$13.2 million on February 1, 2000. The state also is claiming "past use" credit for an \$8.5 million reduction in the project's 1997/1998 premium; a payment of \$7.2 million made with funds from the trust on August 1, 1998; and a payment of \$13.5 million on December 1, 1998. The state's total claimed use of past overpayments is \$67.8 million. FHWA and OIG are currently reviewing the supporting documentation regarding the above use of past overpayments.

FHWA has not yet issued a policy to limit Federal contributions to insurance reserves to the amount needed to pay incurred claims. The policy is still needed to ensure this and other highway construction projects do not attempt to use OCIPs as a means of drawing down Federal funds for investment purposes. FHWA's current target date for issuing the policy is July 31, 2000.

AIRPORT SURVEILLANCE RADAR

Question. Please describe, from your review of the installation of uninterruptible power systems (UPS) work on the Airport Surveillance Radar (ASR), whether a 480v design was a necessary requirement of a solution for the ASR-9 support. The committee's understanding is that the 480v design required a larger engine/generator to support the selected UPS-but that the ASR-9 solution could have been accomplished with a 240v system (and either the existing generator or a replacement generator) for substantially less cost. Is the Committee's understanding correct? Please discuss why the Office of Inspector General believes the 480v design was selected.

Answer. FAA considered remaining with a 208v system [referred above as 240v] as well as higher voltage systems to address the power-related problems with the ASR-9. Specifically, FAA evaluated three alternative designs: (1) a 208v UPS installation, at an estimated cost of \$130,000 per site; (2) a 208v system upgrade (UPS, generator, wiring, circuits, etc.), at an estimated cost of \$310,000 per site; and (3) a 480v system installation, at an estimated cost of \$320,000 per site. FAA officials stated that their decision to utilize the 480v design was based on several factors including the better electrical noise reduction provided by a higher voltage design and the minimum disruption to radar service required for installation—two 4-hour shutdowns for the 480v design compared to 7–10 days for the 208v upgrade. The 208v installation would have been less costly, but would not have addressed all of the problems with the ASR-9 power system, such as the instability and capacity of the generator, poor circuit breaker coordination and transmitter circuits, and random electrical noise on the power conductors.

SUBCOMMITTEE RECESS

Senator SHELBY. We will convene again next Tuesday, April 4, at 10 a.m. here in this room, Dirksen 192, to hold an oversight hearing on implementing the Drivers Privacy Protection Act positive notification requirement, which was part of the 2000 transportation appropriations bill.

Gentlemen, thank you both. The hearing is recessed.

[Whereupon, at 2:32 p.m., Tuesday, March 28, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENT OF TRANSPORTATION AND RE-
LATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

TUESDAY, APRIL 4, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:06 a.m., in room SD-192, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby and Bennett.

**IMPLEMENTING THE DRIVER'S PRIVACY PROTECTION ACT
EXPRESS CONSENT REQUIREMENT**

NONDEPARTMENTAL WITNESSES

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. The subcommittee will come to order.

As we enter the 21st Century, we live at a time when the influence of technology in our lives has never been greater. The advent of personal computers, the Internet, silicon chips, ATM's, and cellular phones have changed almost every aspect of the way we live and have greatly enhanced the quality of our lives.

The introduction of these new technologies has transformed our society and economy with breakneck speed. In little more than the blink of an eye we moved from the Industrial Age to the Digital Age. While the changes bring forth great economic promise and personal convenience, they also present difficult challenges.

One of the most important of these challenges is establishing ground rules that preserve the privacy rights of individuals, while providing an atmosphere in which society can take advantage of the advances in information technology.

Because recent technological innovations have the capability to compile, organize, store, and transmit data captured from all walks of life, I believe we must pay close attention to the manner in which personal information is handled in the Digital Age.

Clearly, it would not be an understatement to say that the new technology economy has a voracious appetite for information. Information itself may now be the most valuable commodity in our economy.

Furthermore, personal information is rapidly becoming the most valuable kind of information. The considerable demand for this type of information compels businesses to become much more ag-

gressive in acquiring information to try to better understand anything and everything about consumers.

Medical, credit card, banking, phone records, as well as personal information collected under force of law by government—records covering just about every activity in our lives—are being gathered, stored, shared, and sold.

Even as we enjoy the benefits brought about by the surge of new technologies, most of us are developing an eerie uneasiness that government and industry are collecting so much personal information, that our privacy is at risk, and occasionally, we get a tangible glimpse of just how vulnerable our private lives are.

Trans Union, which is one of the three largest credit reporting agencies, was selling the bank activity, mortgages, car loans, and credit card histories of 160 million Americans to direct marketers until the Federal Trade Commission ordered it to stop last month.

DoubleClick, Inc., a leading Internet advertising company, was forced to delay linking web cookies or histories to individual accounts after a public outcry against the practice. The company's massive database that was put on the shelf, would have merged the names, addresses and other personal information of Internet users to a log of web sites each individual had visited and the purchases each had made online.

In any event, I believe that it should be left to the individual to choose when and how to participate in a marketplace that has become obsessed with learning his or her personal facts. All of us already make decisions everyday regarding the scope and level of that participation.

For instance, you may join a grocery store membership club that allows access to special discounts, and you should expect your purchasing habits to undergo a data sweep. You may choose, however, not to enter a particular web site for fear that your information would not be secure at that web site, and later choose to take advantage of the convenience of purchasing from a catalog sent to your home.

Just as we have found that some consumers are price-sensitive and others are time-sensitive in airline tickets purchasing, I believe that in our new economy, some consumers will be privacy-sensitive, and successful businesses will embrace this by providing consumers with greater control over their personal information they use or place in the commercial marketplace.

So, an individual, at his or her discretion, may supply information to private industry. I was shocked, however, when I learned that much of what enters private databases is gathered from government records.

Individuals are forced to provide their names, addresses, social security numbers, and vital statistics to the state when they apply for a driver's license, and additionally provide the make, model, and the unique number of their automobile when they apply to register their vehicle. This personal information, some of which is rather sensitive, is not volunteered, as it is in private transactions.

It is compelled by the state as a condition of granting the license and enforced with criminal sanctions. While it is obviously necessary for state governments to collect such information for its own use, I believe it is insidious that state governments use the power

of law to extract information from you while never intending to keep that information confidential or to seek your consent before sharing that information with others.

I became interested in the sale of state government records after reading in several Washington Post articles that South Carolina had sold the photographs of its drivers to a business in New Hampshire, purely for making a profit. In this case, the business was in the process of building a national database of drivers' license photographs and personal information to allow retail clerks to verify consumers identities.

It is a laudable goal to protect consumers from identity theft, a growing crime, whereby fraud artists steal personal information from their victims to set up phony bank and credit card accounts and run up huge bills.

I am gravely concerned, however, about using drivers' license photographs coerced from citizens and used without authorization for any non-official purpose. Public outrage forced South Carolina, Florida, and Colorado to cancel the proposed bulk sale of drivers' photographs.

I believe that outrage is a very reliable indicator of the public's desire to not have their personal information distributed without their own permission.

Sadly, this particular incident is just the tip of the iceberg. Whereas this was the first instance in which states had begun selling images wholesale, for decades they have been routinely selling sensitive personal information from public records. The technology of the Digital Age has rendered public record law as obsolete as the transistor.

No longer are public records maintained in file boxes or microfiche drawers in isolation from one another at government repositories with limited access. Instead, states store public records in electronic formats and use sophisticated databases that merge and index all of an individual's information from numerous public records.

Some states are even discussing making certain records available on the Internet. The personal information required from individuals by law has become too accessible and potentially too vulnerable to computer pirates.

Unrelated secondary uses of personal information without the knowledge of the general public—and often without prior approval—is troubling to a lot of us. Selling personal information for inspection by anyone does not promote accountability for government or increase the efficiency of its service to the citizens of that particular state.

I believe, rather, that it is a violation of the public trust for the government to compel citizens to reveal their private information and then sell it to outsiders for profit. It undermines public confidence in government and encourages people to withdraw from the marketplace and society.

I think that the government should either have express consent prior to making a sale or keep personal information confidential, absent a compelling need to disclose it.

Sales of personal information to commercial enterprises, solicitors and direct marketers may raise money for state governments,

but they do not meet a compelling need standard. In fact, I believe these profits amount to an unauthorized tax on the privacy of the American people. Rather than taking our money, the government has appropriated something arguably much more precious—a piece of our lives.

In an effort to stop unauthorized sales of personal information by state governments, I included a general provision in the 2000 Transportation Appropriations bill that does two things; first, it ties federal transportation funding to compliance with the Driver's Privacy Protection Act of 1994. And second, it requires states to obtain the express consent prior to release of information in two situations.

First, individuals must give their consent before a state is able to release a category of information. This category is particularly sensitive information, including photographs, social security numbers, and medial or disability information.

Second, individuals must grant their consent before the state can sell or release other personal information when it is used for the purpose of direct marketing, solicitations or individual look-up.

These provisions have ended an unusually loathsome practice—an ever dangerous practice, if the information lands in the hands of thugs, thieves and stalkers—and promises greater protection for the privacy of the American people.

Recently, in *Reno versus Condon*, a South Carolina case, the Supreme Court of the United States upheld the constitutionality of the Driver's Privacy Protection Act. I believe, as do all nine members of the Supreme Court in an unaccustomed unanimous ruling, that the sale of personal information collected by state governments is clearly within the purview of Congress to regulate in the national interest.

Unfortunately, in our fervor to transform the economy, we have not established rules to protect ourselves or our privacy. By pursuing the unbridled exchange of information, we have proceeded headlong into the modern equivalent of the unregulated Wild, Wild West, and there is no sheriff in Dodge.

We are at the point where strangers, from telemarketers to government bureaucrats, obtain personal information about us and our children that we would not discuss at the dinner table, much less with a neighbor, and trade on it for profit.

I am not sure this is the direction we want this new frontier to go. I do not believe that anyone, either in the marketplace or the government, has an unfettered right to the personal information of Americans. That is why I was inspired to draft the provision of last year's appropriations act.

I am a firm believer in free markets and the benefits of the new technology economy. We live in the most prosperous society on earth because of willingness to embrace free markets and to adopt new technologies to our goals.

However, as we move forward and technology plays an even greater role in our lives, it is essential that technology serves us, rather than us serving it. To fully reap the promise of technology in the Digital Age, it is more important than ever for us to establish a framework that respects and protects individual freedom and preserves the ability of individuals to make their own choices.

The American people, as individuals, not state governments or financial service corporations or Internet service providers, should have the power to decide for themselves when and how they want to participate in the economy.

It boils down to this: We have doors on our homes so that outsiders who seek entry must knock and ask our permission to enter. When we want people to come in, we invite them. When we do not want them in, they are not permitted to enter.

Doors provide us with the means to control our interactions with other people. American citizens should have the power to put doors on all aspects of their private lives and to expect that anyone who wants to enter must seek and gain consent.

Senator SHELBY. Senator Bennett.

STATEMENT OF SENATOR ROBERT BENNETT

Senator BENNETT. Thank you, Mr. Chairman. I appreciate your—your comments. And I commend you for holding this hearing and focusing on this issue, because this is an issue that comes up again and again and again.

I first entered it about 4 years ago, when quite innocently, I tried to draft a bill dealing with the privacy of medical records. And I thought this was going to be a very simple sort of thing. We wanted to make sure that everybody's medical records were held confidential. And we had plenty of horror stories of people who had been victimized by people—other people getting hold of their medical information.

Four years later, I have discovered that it is not a simple issue at all. And as you have appropriately and correctly pointed out in your opening statement, Mr. Chairman, we have the challenge of balancing the advantages of the technological age with the very appropriate American desire to keep everything confidential.

If I may use an analogy from my odyssey through the difficulty of medical privacy, from a treatment point-of-view, it is now possible for an individual to carry a—not only a card, a tiny chip embedded in a card, in which his entire medical history is available, so that if the individual is in an accident, the paramedic can take that card out of his wallet, put it in computer, and have all of his allergies, all of the “reactions to” information, everything in front of him, immediately available. And that is wonderful.

And the flip side of it is that someone can get a hold of the medical records, say, an—a prospective employer, look through all of those records and say, “I do not want to hire this person, because he or she might add to the cost of my insurance policy, because, look, here is a—here is a disease that occurred 20 years ago. And having somebody of that kind in my insurance pool might raise my rates. And I am not even going to interview him.”

Now, the same thing applies all across the board. There are enormous advantages that can come from having information available. You can be saved money, you can be saved time and effort by having information about your buying habits available to the marketers, because they will not market things to you if it becomes clear from your buying pattern that you do not buy those things.

The flip side of it is, you get invasion of your privacy in areas that you might not want.

So, the challenge is finding a balance between the very appropriate desire of all Americans for privacy and the desire of Americans to say, "Gee, if there are advantages that will save me time and money by having some of this information out, I would like those, too."

Striking that balance is a very difficult challenge. And I am hoping in the hearing today that we can get information from these witnesses that will help us strike that balance.

So, I commend you, Mr. Chairman, for your past interest in this subject. You have been one of the leaders on this and helped us—helped us move forward.

I would ask that written testimony, after the hearing, might be also made available, because I think people who read these hearings are going to have reactions that could be useful to us.

So, I would ask, Mr. Chairman, that the record be kept open for a time after the hearing for additional written comments, if they might come in.

Senator SHELBY. Without objection, it will so be made.

Senator BENNETT. Thank you, Mr. Chairman.

Senator SHELBY. Our first panel today will be—and you all can come on up—is Phyllis Schlafly, Eagle Forum; Mr. Ed Mierzwinski, Public Citizen; Ms. Susan Herman, National Center for Victims of Crime; and Greg Nojeim, American Civil Liberties Union.

I want to welcome all of you to the Appropriations Oversight hearing today. Your written testimony will be made part of the record in its entirety.

I will start with you, Ms. Schlafly. You proceed as you wish. Welcome, again.

STATEMENT OF PHYLLIS SCHLAFLY, PRESIDENT, EAGLE FORUM

Ms. SCHLAFLY. Thank you, Mr. Chairman, for holding this hearing, and Senators. We appreciate your interest in this subject.

I am Phyllis Schlafly, President of Eagle Forum.

The Fourth Amendment is one of our precious constitutional rights: "The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated."

For various specific purposes, the government requires us to disclose information about our persons, houses, papers and effects. But the government's use of that information should be restricted to the purpose for which it was constitutionally demanded and received. The government should not be able to act as though it owned that information, or to sell it or display it or traffic with it without our consent.

Some years ago, the telephone companies asserted a copyright or property right in the telephone book, with its listings of our names, addresses and telephone numbers. The Supreme Court unanimously ruled, in *Feist versus Rural Telephone Service* (1991) that copyright protection is granted only to authors who create new works, not to corporations that merely collect data. So, the phone companies do not own their listings of names and phone numbers just because they spent money collecting them.

Likewise, the government does not own its listings of our name, address, phone number, social security number, photograph, or

other personal information just because we are required to provide them for specific purposes.

For the government to behave as though it owns that information, or to sell it to others, is not only a misappropriation of rights that belong to the individual, it is an action that tends to destroy public confidence in government and its trustworthiness.

For example, we are required to give a great deal of personal information to the Internal Revenue Service, but we would be outraged if we discovered that the IRS were transferring that information to other agencies or selling it. Likewise, for the information we give to the Social Security Administration.

When we apply for a driver's license, we give our identity information, along with a photograph and medical information, to our state's motor vehicle bureau, in order to be granted the privilege of operating a motor vehicle on the public streets. We do not give that information for any other purpose.

We have been shocked to discover that some states have been selling that information for commercial use or otherwise making it available to the public. That was not why we gave the state that information.

We were particularly dismayed to discover that the U.S. Secret Service gave a grant to a New Hampshire business to buy state drivers' license information, including photos, which was then marketed to private companies.

The discovery that states have been engaging in these practices, makes us feel used and betrayed. We feel the state has appropriated our identity without our consent. Worse still, this contributes to a growing perception that we cannot trust our government.

The Driver's Privacy Protection Act, passed in 1994, forbade states from making such information available without providing individuals the option of having their information protected. In other words, the individual had to affirmatively opt-out of the system in order to keep their information from being sold. The Supreme Court unanimously upheld this law last year in *Condon versus Reno*.

Last year, due to the vigilance of Senator Richard Shelby, this law was strengthened by a provision in the Transportation Appropriations bill to change "opt-out" to "opt-in." This means that motor vehicle bureaus must seek each driver's written consent before selling photos and personal information about individuals who apply for driver's licenses.

This change is very welcome. It not only corrects an injustice, but it helps to reassure citizens that the government is not cheating on us behind our backs.

We should be particularly solicitous about government's use of driver's licenses, because it appears that driver's licenses have become an extraordinary temptation to various special interests who see them as a means to achieve other objectives. At the federal level, some people want to convert driver's licenses into federal ID cards; something that is intolerable in a free society.

The 1996 Immigration Act mandated that state drivers' licenses contain machine-readable social security numbers as the unique numeric identifier, thereby enabling the federal government to use

the driver's license as a federal ID card. After public protest, this requirement was repealed in 1999.

Driver's License Protection is not a standalone issue. It comes in the context of the growing issue of privacy and what many see as an orchestrated invasion of our privacy by the government in violation of the Fourth Amendment, as well as by legitimate commercial interests and by fraud and theft. What makes these invasions so easy is the ability of computers to store massive quantities of personal information on databases and access that information in sophisticated ways.

For example, yesterday's New York Times carries a large front-page news article relating that "Law enforcement authorities are becoming increasingly worried about a sudden sharp rise in identity theft, the pilfering of people's personal information."

And William Safire's column, of the same date, calls attention to two notorious examples of the release of personal privacy information by the White House and the Pentagon.

It is bad enough when private interests invade our privacy, but it is positively offensive when the government does this.

That is why Census 2000 has stirred up a firestorm. Americans have become increasingly fearful of giving the government so much personal information that can be so efficiently and rapidly retrieved from computers. Databases give the government extraordinary powers to monitor the daily activities of law-abiding citizens.

Now, I have, in my testimony, a lot of examples of how the government is gathering all of this personal information and how much public outcry it has caused. And all of this government monitoring is allegedly for the purpose of locating terrorists and money launderers and drug kingpins and Medicare and Welfare cheats, but the reach of the monitoring goes far beyond what is necessary to achieve its purported objectives. Only totalitarian regimes monitor the private actions of law-abiding citizens.

We should prohibit the government from building databases of personal information on American citizens that is none of the government's business. And when the information is the government's business, the information should be allowed to be used only for the purpose for which we give it.

Thank you, Mr. Chairman.

Senator SHELBY. Thank you, Ms. Schlafly.

[The statement follows:]

PREPARED STATEMENT OF PHYLLIS SCHLAFLY

The Fourth Amendment is one of our precious constitutional rights: "The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated."

For various specific purposes, the government requires us to disclose information about our persons, houses, papers and effects. But the government's use of that information should be restricted to the purpose for which it was constitutionally demanded and received. The government should not be able to act as though it owned that information, or to sell it or display it or traffic with it without our consent.

Some years ago, the telephone companies asserted a copyright, or property right, in the telephone book with its listings of our names, addresses and telephone numbers. The Supreme Court unanimously ruled in *Feist v. Rural Telephone Service* (1991) that copyright protection is granted only to authors who create new works, not to corporations that merely collect data, so the phone companies do not own

their listings of names and phone numbers just because they spent money collecting them.

Likewise, the government does not own its listings of our name, address, phone number, Social Security number, photograph or other personal information just because we are required to provide them for specific purposes. For the government to behave as though it owns that information, or to sell it to others, is not only a misappropriation of rights that belong to the individual, it is an action that tends to destroy public confidence in government and its trustworthiness.

For example, we are required to give a great deal of personal information to the Internal Revenue Service, but we would be outraged if we discovered that the IRS were transferring that information to other agencies or selling it. Likewise for the information we give to the Social Security Administration.

When we apply for a driver's license, we give our identity information along with a photograph and some medical information to our state's motor vehicle bureau in order to be granted the privilege of operating a motor vehicle on the public streets. We don't give that information for any other purpose.

We have been shocked to discover that some states have been selling that information for commercial use or otherwise making it available to the public. That wasn't why we gave the state that information.

We were particularly dismayed to discover that the U.S. Secret Service gave a grant to a New Hampshire business to buy state driver's license information, including photos, which was then marketed to private companies.

The discovery that states have been engaging in these practices makes us feel used and betrayed. We feel the state has appropriated our identity without our consent. Worse still, this contributes to a growing perception that we cannot trust our government.

The Driver's Privacy Protection Act, passed in 1994, forbade states from making such information available without providing individuals the option of having their information protected. In other words, individuals had to affirmatively "opt-out" of the system in order to keep their information from being sold. The Supreme Court unanimously upheld this law last year in *Condon v. Reno*.

Last year, due to the vigilance of Senator Richard Shelby, this law was strengthened by a provision in the Transportation Appropriations bill to change "opt-out" to "opt-in." This means that motor vehicle bureaus must seek each drivers' written consent before selling photos and personal information about individuals who apply for driver's licenses.

This change is very welcome. It not only corrects an injustice but it helps to reassure citizens that the government is not cheating on us behind our backs.

We should be particularly solicitous about government's use of driver's licenses because it appears that driver's licenses have become an extraordinary temptation to various special interests who see them as a means to achieve other objectives. At the federal level, some people want to convert driver's licenses into federal I.D. cards, something that is intolerable in a free society.

The 1996 Immigration Act mandated that state driver's licenses contain machine-readable Social Security numbers as the unique numeric identifier, thereby enabling the federal government to use driver's licenses as a federal I.D. card. After public protest, this requirement was repealed in 1999.

Driver's License Protection is not a stand-alone issue. It comes in the context of the growing issue of privacy and what many see as an orchestrated invasion of our privacy by the government in violation of the Fourth Amendment, as well as by legitimate commercial interests and by fraud and theft. What makes these invasions so easy is the ability of computers to store massive quantities of personal information on databases and access that information in sophisticated ways.

For example, yesterday's New York Times (4-3-00) carries a large front-page news article relating that "Law enforcement authorities are becoming increasingly worried about a sudden, sharp rise in identify theft, the pilfering of people's personal information . . ." William Safire's column of the same date calls attention to two notorious examples of the release of personal privacy information by the White House and the Pentagon. It's bad enough when private interests invade our privacy, but it's positively offensive when the government does this.

This is why Census 2000 has stirred up a firestorm. Americans have become increasingly fearful of giving the government so much personal information that can be so efficiently and rapidly retrieved from computers. Databases give the government extraordinary powers to monitor the daily activities of law-abiding Americans.

The 1996 Welfare Reform Act requires all employers to send the name, address and Social Security number of every new worker, and every employee who is promoted, to a new government database called the Directory of New Hires. We were told that this was just to locate Deadbeat Dads, but now we find that another law

passed last year allows this database to be shared with the Department of Education. Another problem with the New Hires Directory is that small banks and credit unions, which can't afford the technology or manpower to search their customer databases every three months for "matches" against state-provided lists of deadbeat dads, are just handing over to the government all confidential information on all their customers and letting the government conduct its own search for "matches."

We in Eagle Forum have long been concerned about the aggressiveness of public schools in requiring children to fill out nosy questionnaires revealing all sorts of non-academic information about attitudes, behavior, health and family privacy. It was offensive enough when all this personal information went into manila file folders, but now it is entered on easily accessible databases where it can be shared with other databases.

The Federal Deposit Insurance Corporation (FDIC) tried to impose a regulation called Know Your Customer—a plan to require banks to make a computer profile of all their customers' deposits and withdrawals and report "inconsistent" transactions to a federal database in Detroit called the Suspicious Activity Reporting System. After the comment period produced more than 250,000 negative and only 3,000 positive comments, the FDIC backed down and abandoned its plan temporarily.

However, during congressional consideration of the big Financial Modernization bill last year, we discovered that many banks are already making customer profiles and selling them to telemarketers. We are disappointed that the banking lobby successfully blocked Senator Richard Shelby's amendment that would have required banks to get the prior consent of customers before selling private financial information.

The Federal Communications Commission (FCC) has mandated that all wireless providers by 2001 be able to pinpoint the location of wireless phone calls. Cell phones are becoming homing devices for the government to track our whereabouts.

The Federal Aviation Administration (FAA) has proposed a regulation that would effectively give the government unlimited access to everyone's personal travel records. The FAA gave \$3.1 million to Northwest Airlines to create software for a database of personal travel records, plus \$7.8 million to other airlines to assist in deploying it.

The 1996 Kennedy-Kassebaum Act authorized the Department of Health and Human Services (HHS) to assign a "unique health care identifier" to every American so the government can enter and track individual medical records on a government database. Public reaction was so adverse that Congress put a moratorium on implementation.

The 1993 Comprehensive Childhood Immunization Act gave the Department of Health and Human Services \$400 million to induce states to create databases of all children's vaccinations. The Centers for Disease Control (CDC) is trying to link these state databases into a federal database, and this will ultimately enable the government to deny admission to daycare, kindergarten, school or college, or even access to medical care for any child who has not had all government-mandated shots.

Another plan to collect private information on a government database involves sending "home visitors" into the homes of all first-time parents in the project called Healthy Families America. Information is entered on a nationwide computerized tracking system called the Program Information Management System that can eventually be combined with preschool and public school tracking systems.

HHS is recruiting senior citizens to spy on their own physicians by offering a reward of up to \$1000 if they call the toll-free "Fraud Hotline" and file a report that leads to a monetary "recovery" from their doctor. The harassment potential is enormous when 39 million seniors start trying to collect a bonus if the doctor's office enters the wrong code number on a Medicare form.

All this government monitoring is allegedly for the purpose of locating terrorists, money launderers, drug kingpins, Medicare and welfare cheats, student loan delinquents, and deadbeat dads. But the reach of this monitoring goes far beyond what is necessary to achieve its purported objectives. Only totalitarian regimes monitor the private actions of law-abiding citizens.

We should prohibit the government from building databases of personal information on American citizens that is none of the government's business. And when the information is the government's business, the information should be allowed to be used only for the purpose for which we give it.

**STATEMENT OF ED MIERZWINSKI, CONSUMER PROGRAM DIRECTOR,
UNITED STATES PUBLIC INTEREST RESEARCH GROUP**

Senator SHELBY. Mr. Ed Mierzwinski, go ahead.

Mr. MIERZWINSKI. Thank you, Senator—
Senator SHELBY. Public citizen.

Mr. MIERZWINSKI [continuing]. Shelby. That is correct.

Mr. MIERZWINSKI. Senator Shelby, Senator Bennett, my name is Edwin Mierzwinski. I am Consumer Program Director for the United States Public Interest Research Group, a consumer advocacy organization. And my testimony today is on behalf of both USPIRG and Ralph Nader.

And I apologize Mr. Nader could not be here today. As you know, he has been a longtime supporter of privacy interests and appeared with you last summer at one of your press conferences—and Ms. Schlafly—at a press conference on the Financial Privacy bill. So, he apologizes, but he strongly supports your legislation.

I also want to commend you, before I start, on your ongoing support for privacy. Your development of the Privacy Coalition forged between a family-based consumer and civil liberties organizations that has worked, first, on the Know Your Customer regulations, to oppose those.

Second, on trying to achieve a financial privacy opt-in. And we will continue to fight with you to achieve that.

And finally, your founding of the Bicameral/Bipartisan Congressional Privacy Caucus that has already shed light on a number of intrusive privacy practices.

My testimony—my written testimony summarizes all of my remarks, in detail. I will just be very brief.

The Shelby Amendment is important for the following reasons: First, citizens deserve control over their personal and confidential information, particularly when it is going to be used for unrelated secondary purposes.

We believe that in such circumstances, government agencies—whether state or federal—should comply with fair information practices. And that means, among other things that I outline in my testimony, that consumers ought to provide express consent before their information is used for any secondary purpose, particularly a commercial purpose which is not related to the purpose for which it was collected.

Second, as you pointed out in your opening remarks, this requirement is particularly strong when the information is compelled to be provided. The government requires consumers to provide these pieces of information. In that circumstance, we believe that it is increasingly more important that the information be subject to an opt-in, rather than a weak opt-out.

The other reason that your amendment is so critically important is that since the 1994 Driver's Privacy Protection Act was enacted, we have come to find that there are additional privacy invasions, such as the sale of digitized photographs of citizens to third-party marketing and commercial entities, such as Image Data of New Hampshire. And the fact that these new uses of data have come to light, just means there are more important reasons that we need to enact your stronger protections.

And finally, the other—the other issue is whether an opt-out actually can and does work. And in my testimony, I go into great detail as to a number of the problems with opt-outs. The industry has, as you know, succeeded in a number of commercial areas in

creating what they call a sector-by-sector approach to privacy—find a problem, solve it, but do not impede commercial interests with a broad right of privacy.

Well, consumer groups think that the convergence of industry sectors that is occurring in society today means that we, in fact, do need to enact a broad right of privacy, but notwithstanding that, if you look at all of the opt-out programs that the industry has provided, whether voluntary programs of the Online Privacy Alliance or the Direct Marketing Association, we believe that they are designed not to protect privacy, but to protect commercial interests. We believe that they are designed to fail.

One statutory opt-out that I find particularly outrageous is one that I worked for many years to enact amendments to the Fair Credit Reporting Act to strengthen consumer rights in credit reports.

Every year, consumers receive 3.5 billion credit card solicitations by mail. They receive those generated from companies looking at your credit report and deciding that you qualify for a credit card offer.

We sought to require that credit reports only be used for that purpose, on an opt-in basis. Of course, consumer groups failed and the anti-privacy interests prevailed. They succeeded in changing that to a weak opt-out.

You must look at each of those solicitations you receive in the mail; you must look at the back of the solicitation; you must find the telephone number to call; you must figure out that the obtuse language that they use actually means that they are giving you a right to opt-out; then, when you call them on the phone to opt-out, your opt-out is only guaranteed for two years.

If you choose to opt-out forever, which I believe should be your right, you must ask them and request a “signed notice of election,” and then receive it in the mail and send it back for your opt-out to continue past the two-year period.

And that is the example that I think just proves that opt-outs are designed to fail.

In summary, USPIRG strongly supports the Shelby Amendment; believes that there is no public policy reason that it should not be implemented on the first of June. And we, again, want to commend you for your leadership and the fact that you have demonstrated that privacy is an issue that—that effects all Americans on all sides of the political spectrum. And ultimately, I believe we will prevail.

Thank you.

Senator SHELBY. Thank you.

STATEMENT OF SUSAN HERMAN, EXECUTIVE DIRECTOR, NATIONAL CENTER FOR VICTIMS OF CRIME

Senator SHELBY. Ms. Susan Herman, National Center for Victims of Crime.

Ms. Herman.

Ms. HERMAN. Good morning, Mr. Chairman, Senator Bennett.

My name is Susan Herman. I am the Executive Director of the National Center for Victims of Crime.

The National Center works with 10,000 organizations across the country to help victims of crime rebuild their lives.

Thank you for inviting me to address the important issue of privacy of personal information; specifically, how releasing motor vehicle records impacts victims of crime.

In 1994, the landmark Driver's Privacy Protection Act required states to give licensed drivers the option to keep their contact information confidential, limiting disclosure to narrowly defined purposes. As a result, victims of stalking, battered women, and intimidated witnesses—who need to conceal their whereabouts—were better able to protect themselves.

Unfortunately, because many states required affirmative requests to keep information confidential, many people were still at risk. Without making such a request—perhaps not knowing the option existed—personal information remained available to anyone able to pay a nominal fee.

Amy Boyer, a young New Hampshire woman, did not know her life was in danger. Her stalker, a man she barely knew in junior high school, used the Internet to get information about her workplace and her license plate number. With just two pieces of information purchased from the Internet companies, he found her and killed her. She never knew she was at risk. Amy Boyer never knew she needed protection.

And over the last few years, we have the emergence of a new pernicious crime—identity theft. It thrives on access to personal information.

Identity theft can happen without your knowing it. Your financial security can be shattered. And victims who obtain a criminal record via identity theft have a particularly difficult time clearing their names.

Mr. Chairman, because of your efforts last year, the law was amended to change the opt-out provision to an opt-in provision. In other words, individuals now have to affirmatively waive confidentiality. We applaud you. This effort will prevent harm.

Since enactment of this historic legislation, however, the National Center has come to believe that the scales have tipped much further in the direction of full protection of privacy. Based on our work with victims of stalking, domestic violence and identity theft, we recommend that the DPPA be amended again to protect victims. There should be no options. Drivers' personal information should never be released, except as outlined in the Act.

The National Center operates a Help Line for victims of all types of crime. A large percentage of calls come from stalking victims. One of their principal concerns is that they do not know why they were targeted or how they were found. This is especially true in the 40 percent of stalking cases that do not arise out of a domestic situation.

Victims of stranger stalking, at the time they were asked whether the government could release their personal information, may have had no reason to opt for privacy. How many people know that one in twelve women and one in forty-five men in America will be stalked during their lifetime?

We also hear from victims of identity theft, who tell us they, too, never realized they were vulnerable. They were simply undergoing

normal everyday activities, and their social security number or other information fell into the wrong hands. Like the stalking victims, identity theft victims had little reason to believe they needed to protect their records when they made their opt-in/opt-out decision. How many people know that each year more than 400,000 Americans will be victims of identity theft?

Viewed from a victim's perspective, the opt-in/opt-out decision we are now offered really only helps people who know they are in danger or understand the risks we all face. We have heard from too many victims who realized too late that their personal information can be used to harm them.

That is why, on their behalf, we respectfully request that drivers' personal information, with rare exception, never be released.

In the alternative, we would urge this committee to consider legislation that would require states to notify individuals whenever their information has been released. When citizens give their government the right to release personal information, the government should have an obligation to inform them every time information is released and to whom it is released.

Last year, this committee amended the Transportation Appropriations bill to include social security numbers within the scope of protected information. Now social security numbers, like addresses, cannot be released without permission. It is unclear, however, what effect this will have on those states that use social security numbers for the driver's license number, or states that show the social security number on the face of the license. That number is then available every time an individual writes a check, boards a plane or enters a secured building.

States should also be prohibited from including social security numbers on licenses. In this age of technology and identity theft, no one should be required to display their social security number to countless strangers in the course of everyday life.

In summary, we believe the government should not release personal information. If this practice continues, however, the government should at least notify individuals whenever it does release information. And to further decrease the risk of danger, social security numbers should be removed from licenses.

Thank you for the opportunity to address you today on this critical issue. We look forward to working with you as you develop proposals.

[The statement follows:]

PREPARED STATEMENT OF SUSAN HERMAN

Good morning, Mr. Chairman, and members of the Subcommittee. My name is Susan Herman, and I'm the Executive Director of the National Center for Victims of Crime. The National Center works with 10,000 organizations across the country to help victims of crime rebuild their lives.

Thank you for inviting me to address the important issue of privacy of personal information, specifically, how releasing motor vehicle records impacts victims of crime.

In 1994, the landmark Driver's Privacy Protection Act required states to give licensed drivers the option to keep their contact information confidential, limiting disclosure to narrowly defined purposes. As a result, victims of stalking, battered women, and intimidated witnesses—who need to conceal their whereabouts—were better able to protect themselves.

Unfortunately, because many states required affirmative requests to keep information confidential, many people were still at risk. Without making such a re-

quest—perhaps not knowing the option existed—personal information remained available to anyone able to pay a nominal fee.

Amy Boyer, a young New Hampshire woman, did not know her life was in danger. Her stalker, a man she barely knew in junior high school, used the Internet to get information about her workplace and her license plate number. With just two pieces of information purchased from Internet companies, he found her and killed her. She never knew she was at risk. Amy Boyer never knew she needed protection.

Over the last few years, we have seen the emergence of a new pernicious crime—identity theft. It thrives on access to personal information.

In Florida, a woman obtained a fraudulent driver's license in the victim's name. She used the license to withdraw more than \$13,000 from the bank, obtained five department store credit cards, and charged nearly \$4,000 in the victim's name.

Identity theft can happen without your knowing it. Your financial security can be shattered. And, victims who obtain a criminal record via identity theft have a particularly difficult time clearing their names.

Mr. Chairman, because of your efforts last year, the law was amended to change the "opt out" provision to an "opt in" provision. In other words, individuals now have to affirmatively waive confidentiality. We applaud you. This effort will prevent harm.

Since enactment of this historic legislation, however, the National Center has come to believe that the scales have tipped much further in the direction of full protection of privacy.

Based on our work with victims of stalking, domestic violence, and identity theft, we recommend that the DPPA be amended again to protect victims. There should be no options. Drivers' personal information should never be released except as outlined in the Act.

The National Center operates a helpline for victims of all types of crime. A large percentage of calls come from stalking victims. One of their principle concerns is that they don't know why they were targeted or how they were found. This is especially true in the 40 percent of stalking cases that don't arise out of a domestic situation. Victims of stranger stalking, at the time they were asked whether the government could release their personal information, usually have no reason to opt for privacy. How many people know that one in twelve women and one in forty-five men in America will be stalked during their lifetime?

We also hear from victims of identity theft who tell us they, too, never realized they were vulnerable. They were simply undergoing normal everyday activities, and their social security number, or other information, fell into the wrong hands. Like the stalking victims, identity theft victims had little reason to believe they needed to protect their records when they made their opt in/opt out decision. How many people know that each year more than 400,000 Americans will be victims of identity theft?

Viewed from a victim's perspective, the opt in/opt out decision we are now offered really only helps people who know they are in danger or understand the risks we all face. We've heard from too many victims who realized too late that their personal information could be used to harm them. That's why, on their behalf, we respectfully request that drivers' personal information, with rare exception, never be released.

In the alternative, we would urge this committee to consider legislation that would require states to notify individuals whenever their information has been released. When citizens give their government the right to release personal information, the government should have an obligation to inform them every time information is released and to whom it is released.

Last year, this committee amended the Transportation Appropriations Bill to include social security numbers within the scope of protected information. Now, social security numbers, like addresses, cannot be released without permission. It is unclear, however, what effect this will have on those states that use social security numbers for the driver's license number, or states that show the social security number on the face of the license. That number is then available every time an individual writes a check, boards a plane, or enters a secured building.

States should be prohibited from including social security numbers on licenses. In this age of technology and identity theft, no one should be required to display their social security number to countless strangers in the course of everyday life.

In summary, we believe the government should not release personal information. If this practice continues, however, the government should at least notify individuals whenever it does release information. And to further decrease the risk of danger, social security numbers should be removed from licenses.

Thank you for the opportunity to address you today on this critical issue. We look forward to working with you as you develop proposals.

Senator SHELBY. Thank you.

STATEMENT OF GREG NOJEIM, LEGISLATIVE COUNSEL, AMERICAN CIVIL LIBERTIES UNION

Senator SHELBY. Mr. Greg—is it Nojeim?

Mr. NOJEIM. Yes.

Senator SHELBY. You say it. You pronounce it. Is that right?

Mr. NOJEIM. I say it “Nojeim,” too.

Senator SHELBY. Nojeim. Great. American Civil Liberties Union. We welcome you here today, sir.

Mr. NOJEIM. Thank you, Senator Shelby, Senator Bennett. It is a pleasure to be here today to testify on behalf of the ACLU.

The ACLU is a nationwide, nonpartisan organization consisting of over 275,000 members dedicated to protecting the principles of privacy and other—and freedom that are set forth in the Bill of Rights.

And Senator Shelby, I want to salute you, also, for your leadership in this area. You have been a stalwart defender of privacy. And we look forward to working with you and the other members of the privacy caucus on this and other issues in the future.

It should not take a tragedy—it should not take a tragedy for Congress to act to protect a person’s individual privacy, and yet, time and time again, it does take a tragedy.

We have heard of victims of crime that prompted Congress to enact the Driver’s Privacy Protection Act in the first place. And we heard that a Nashua, New Hampshire company committed its own privacy tragedy by trying to collect up the images of 22 million drivers—eventually, they wanted the images of all the drivers in the country—so that they could provide access to those images to businesses that, for legitimate reasons, wanted to prevent fraud.

You know, when drivers heard about that, they were outraged. And it really went against one of the most fundamental principles of fair information practices that Mr. Mierzwinski mentioned earlier. That principle is that information given to the government for one purpose, ought not to be used for another purpose without the authorization of the person to whom that personal information pertains.

Well, the Driver’s Privacy Protection Act did a lot to advance that principle, but because of loopholes in the Act, it has fallen short. One of those loopholes allows for disclosure of a driver’s personal information in response to an individual request or for bulk distribution for marketing, solicitations and surveys, if the driver is given notice and a chance to opt-out of dissemination of the driver’s personal information.

Another loophole—the one that Image Data used—allowed for the distribution of a driver’s personal information for use in the normal course of business by a legitimate business—whatever that means—to pursue debtors and to verify information submitted to the business.

I think that Governor Jeb Bush, the governor of Florida, summed up drivers’ sentiments best about the Image Data mini-scandal, when he said, “I am personally not comfortable with the state mandating license photos for the purpose of identifying authorized driv-

ers, then selling those photos at a profit for a completely different purpose.”

Every state that participated in that plan was flooded with citizen complaints. And every state that participated in that plan called it off, as a result.

Now, in an effort to prevent a recurrence and other abuses, Congress, under your leadership, Senator Shelby, enacted two additional privacy protections in the Transportation Appropriations Act for fiscal year 2000.

The first effectively requires states to obtain express consent before releasing a driver’s photograph, social security number, or medical and disability information. In other words, those were given special additional protections because of their sensitivity. However, to have the desired effect, this new protection would have to be reenacted every year.

The second 1999 enhancement is permanent. It amounts to amendments to the Driver’s Privacy Protection Act to require the express consent of a driver before a state DMV releases any personal information, such as address, gender and age, whether it is in bulk, for marketing, or pursuant to an individual, so-called, look-up request.

The ACLU supports these changes. As a practical matter, the opt-out approach offers much more limited protection than does an opt-in. I like to call opt-out—the opt-out approach, “presumed consent.” Unless the driver acts, consent to dissemination of the driver’s personal information is presumed.

Likewise, an opt-in could be viewed as requiring true consent. The 1999 changes to protect driver privacy went a long way toward turning the DPPA into a true consent stature. However, more needs to be done. We recommend five additional steps.

First, to fully secure the additional—the additional protections the 1999 changes afforded drivers—photographs, social security numbers, and medical and disability information—those changes should be made permanent.

Second, Congress should plug as many of the remaining loopholes in the Driver’s Privacy Protection Act as is practicable.

Third, Congress should ensure that the Driver’s Privacy Protection Act is enforced. We recommend that the GAO be asked to conduct a state-by-state survey, effective June 1, to identify—for potential civil penalty under the Driver’s Privacy Protection Act—the states that are not in compliance with the Act.

In addition, Congress should make it clear, beyond doubt, that failure to comply with the DPPA will result with withholding of a portion of a state’s federal highway money.

Fourth, we ask that Congress repeal a mandate that Congress itself imposed on the states, to collect drivers’ social security numbers on the application forms for drivers’ licenses.

At roughly the same time Congress acted to promote driver privacy by enacting and improving DPPA, Congress enacted other legislation that undermines the very principle upon which the DPPA rests; that is the principle that information submitted to the government for one purpose, ought not be used for another without consent.

You know, social security numbers were originally authorized for one purpose, and that was to track contributions to the Social Security Trust Fund. Instead, they have morphed into what can only be described as a universal citizen identifier.

Congress enacted two laws in 1996 to require the states to collect drivers' social security numbers and keep them in their records. Now, Congress did take one step last year to repeal these anti-privacy mandates.

First—and that step was to repeal Section 656(b) of the 1996 Illegal Immigration Reform and Immigrant Responsibility Act. That section would have required states, among other things, to demand drivers' social security numbers on drivers' licenses and application forms, but Congress left in place the mandate to collect the social security number that appeared in the Welfare Reform Act, as amended by the Balanced Budget Act of 1997.

Finally, Congress should insist that states implement the 1999 privacy protections relating to the Driver's Privacy Protection Act without delay. These provisions became law almost six months ago. For the most part, the states were given eight months to implement the provisions.

Special steps were taken for states that have legislatures that do not meet this year. They were given an exception, so that they could implement 90 days after they next meet.

For states that challenged the Driver's Privacy Protection Act all the way to the Supreme Court in *Reno v. Condon*, these states were given 90 days after that case was decided.

Today, more than a full year after Colorado, Florida, and South Carolina stirred up citizen outrage by proposing to sell millions of their drivers' photographs without consent, no provision of federal law is in force to barr such an abuse in the future.

PREPARED STATEMENT

Now, more than ever, Congress must insist on prompt compliance with the law to protect the privacy of drivers' personal information.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF GREGORY T. NOJEIM

Chairman Shelby, Ranking Member Lautenberg and members of the Subcommittee: I am pleased to testify before you today on behalf of the American Civil Liberties Union about amendments to the Driver's Privacy Protection Act adopted last year. The ACLU is a nation-wide, non-profit, non-partisan organization consisting of over 275,000 members dedicated to preserving the principles of freedom set forth in the Bill of Rights.

Today I will identify the abuses that lead Congress to enact the Driver's Privacy Protection Act and the 1999 amendments to the Act. I will explain that the ACLU supports both because they can protect the privacy of the information drivers submit in order to obtain driver's licenses. I will also suggest additional steps Congress should take to close loopholes in the DPPA and ensure that drivers secure of the privacy benefits of the DPPA, including the 1999 amendments.

THE DRIVER'S PRIVACY PROTECTION ACT

An obsessed fan who had obtained the address of actress Rebecca Shaeffer from the California Department of Motor Vehicles (DMV) stalked and murdered Ms. Shaeffer. She had taken steps to protect her personal information. She had paid to keep her home phone number unlisted. She was careful about giving out her ad-

dress. Yet, when she applied for a California driver's license, she had no idea that California would freely sell the information she had tried to keep private.

In response to the killing, Congress enacted the 1994 Driver's Privacy Protection Act (18 U.S.C. 2721–2725) to require states to protect the privacy of the information that drivers submit in order to obtain a driver's license. This information includes the driver's name, address, phone number, Social Security Number, driver identification number, photograph, height, weight, gender, age, certain medical or disability information, and in some states, fingerprints. The DPPA does not extend privacy protection to information relating to a driver's traffic violations, license status, and accidents.

The ACLU supported the Driver's Privacy Protection Act. We testified in 1994 that although that state DMV records had traditionally been open to the public, this could no longer be justified. We acknowledged that access to government information fosters democracy and enhances personal freedom. It encourages informed citizen participation in the governing process, promotes accountability of government employees, deters government abuse, and instills public confidence in government through increased awareness. However, we believe that access to personal information collected and maintained by state DMV's does not substantially advance these goals and thus does not meet the criteria necessary to be made available under an open-records policy. We believe that the individual's interest in avoiding the disclosure of personal information outweighs the public interest in disclosure in this context.

As we indicated in 1994, state DMV records ought to be treated with protections similar to the protections afforded federal records subject to the federal Privacy Act of 1974. Its central principle is that personal information collected by the government for one purpose may not be used for another purpose without the consent of the person to whom the information pertains. As applied to drivers' records, this would mean that information submitted by an applicant in order to obtain a driver's license could not be used for another purpose without the express consent of the driver.

LOOPHOLES IN THE DPPA COMPROMISE ITS PRIVACY PROMISE

The DPPA fell short of this ideal because loopholes in the Act have proven problematic. There is no way under the Act for a driver to prevent disclosure of personal information when a loophole applies. Among others, there is a loophole for:

- Each government agency to use personal information in the state's DMV records “in carrying out its functions” 18 U.S.C. 2721(b)(1);
- “Performance monitoring of motor vehicles” 18 U.S.C. 2721(b)(2);
- “Use in connection with . . . any investigation in anticipation of litigation” 18 U.S.C. 2721(b)(4);
- “Use in connection with the operation of private toll [roads]” 18 U.S.C. 2721(b)(10);
- “Use by an employer or insurer to verify information relating to the holder of a commercial driver's license” 18 U.S.C. 2721(b)(9); and
- Any other use authorized by state law “related to operation of a motor vehicle or public safety” 18 U.S.C. 2721(b)(14).

The DPPA also included other overly broad loopholes. It allowed for disclosure of a driver's personal information in response to an individual request, or for bulk distribution for marketing, solicitations and surveys, if the driver is given notice and a chance to “opt out” of the dissemination of the driver's personal information. 18 U.S.C. 2721(b)(11) and 2721(b)(12). Another loophole allowed for the distribution of a driver's personal information for use in the normal course of business by a “legitimate” business to pursue debtors who had provided inaccurate or outdated information, and to verify the accuracy of information submitted by an individual to the business. 18 U.S.C. 2721(b)(3).

ABUSE OF DRIVERS' PERSONAL INFORMATION

This latter loophole has led to abuse. Last year, a Nashua, New Hampshire company tried to exploit this loophole by purchasing from state DMV's the images and other personal information about 22 million drivers in order to build a national drivers' database. Once a sufficient number of drivers' images were purchased—often for a penny a piece—Image Data, LLC would have made its database available for a fee to businesses seeking to prevent fraud by retrieving the photograph of any customer using a credit card or a check. Image Data and South Carolina, Colorado and Florida, which had contracted with it to sell their drivers' personal information without consent, apparently took the position that the sale facilitated business use to verify the accuracy of personal information submitted to the business, and thus

fit within the 2721(b)(3) loophole. This justification was called into question when it was revealed that the Secret Service had helped fund the drivers' photo database in an apparent effort gain access to the database to fight immigration fraud and airport terrorism.

Drivers were outraged when they learned that their photographs and other information were being sold without their consent to create a national database of driver images.

Florida Governor Jeb Bush probably summed up drivers' sentiments best when he reportedly said, "I am personally not comfortable with the state mandating license photos for the purpose of identifying authorized drivers, then selling those photos at a profit for a completely different purpose." Every participating state was flooded with citizen complaints about privacy. And every participating state called off the sale.

1999 AMENDMENTS TO THE DRIVER'S PRIVACY PROTECTION ACT

In an effort to prevent a recurrence and other abuses, Congress enacted two additional privacy protections in Section 350 of the Transportation Appropriations Act for fiscal year 2000, Public Law 106-69. The first lasts only as long as the highway money Congress appropriated in the law. It effectively requires states to obtain express driver consent before releasing the driver's photograph, Social Security Number, or medical or disability information. Exceptions to the new rule were provided for law enforcement and the execution of judgments, insurance claims investigations and underwriting, organ donation programs, and verification of information relating to the holder of a commercial driver's license. Thus, this sensitive information cannot be released for a different use authorized under the DPPA without the driver's express consent. To have the desired effect, this new protection would have to be re-enacted each year because it was tied to money appropriated in the Transportation Appropriations Act for Fiscal Year 2000.

The second 1999 enhancement of driver privacy is permanent. Congress amended the Driver's Privacy Protection Act itself by requiring the express consent of a driver before a state DMV releases any personal information such as address, gender and age, in bulk for marketing, solicitations and surveys. Congress also amended the DPPA to require express consent for the release of personal information about a particular individual—as opposed to a bulk distribution—for any purpose not mentioned as an exception in the DPPA itself. Previously, such information would be released pursuant to a request for an individual's information, or a request for bulk distribution for marketing purposes, if the individual had failed to "opt out" of the disclosure.

The ACLU supports these changes to protect driver privacy. By requiring express consent as a condition of dissemination of personal information in many circumstances, Congress made the DPPA more closely resemble the federal Privacy Act and other legislation protecting the privacy of information in record systems maintained by governmental entities. As a practical matter, the "opt out" approach offers much more limited protection than does an "opt in." I like to call the opt out approach, "presumed consent." Unless the driver acts, consent to dissemination of the driver's personal information is presumed. Likewise, the "opt in" could be viewed as requiring "true consent"—an expression of consent prior to the sharing of information. The 1999 changes to protect driver privacy went a long way toward converting the DPPA from a "presumed consent" into a "true consent" statute. However, more needs to be done.

ADDITIONAL STEPS CONGRESS SHOULD TAKE TO PROTECT DRIVER PRIVACY

Make 1999 Protections Permanent.—First, to fully secure the additional protections the 1999 changes afforded for drivers' photographs, SSNs and medical and disability information, Congress should make the changes permanent. This would not only protect driver privacy, it would give states additional certainty with respect to the rules they would be required to follow in the future. In the alternative, Congress should ensure that this year's transportation appropriations bill carries forward the good work Congress began last year to protect drivers' photographs, SSNs and medical and disability information.

Plug Loopholes.—Second, Congress should plug as many of the remaining loopholes in the Driver's Privacy Protection Act as is practicable.

Beef Up Enforcement Efforts.—Third, Congress should ensure that the Driver's Privacy Protection Act is enforced. The DPPA allows the Department of Justice to seek civil penalties of \$5,000/day under 18 U.S.C. 2723(b) from states that fail to comply with the DPPA. To our knowledge, no state has been fined for failure to comply. However, in the legislature of at least one state—Minnesota—steps are report-

edly being taken to prohibit state implementation of the true consent provisions Congress adopted last year unless the federal government fines the state for non-compliance. 26 Access Reports No. 4, pp. 3–4 (February 23, 2000). Now that the Supreme Court has unanimously upheld the DPPA as a proper exercise of Congressional authority., (*Reno v. Condon*, No. 98–1464 (January 12, 2000)), Congress should call on the Government Accounting Office to conduct a state-by-state survey to identify for potential civil penalty the states that are not in compliance.

However, fines may not be enough. States may attempt to challenge the imposition of fines by the federal government on sovereign immunity grounds. In addition, states may argue that the fines only apply to violations of the DPPA, and thus are not applicable with respect to the 1999 protections afforded SSNs, photographs, and medical information. These additional protections do not appear in the text of the DPPA. Moreover, while we believe that the 1999 privacy enhancements require states receiving federal highway funding to comply with the DPPA and the 1999 changes, some have disputed that. As a result, we recommend that Congress make it clear beyond doubt that failure to comply will result in the withholding of a portion of a state's federal highway money.

Repeal SSN Solicitation Mandate.—At roughly the same time Congress acted to promote driver privacy by enacting and improving the DPPA, Congress enacted other legislation that undermines the very principle upon which the DPPA rests. That is the principle that information submitted to the government for one purpose ought not be used for another purpose without the consent of the person to whom it pertains. This other legislation requires the states to demand drivers' Social Security Numbers on driver's license application forms.

Social Security Numbers were originally authorized to help the government keep track of contributions made to the Social Security trust fund. At the time they were authorized, a promise was made that the numbers would not become universal identifiers. This promise has been broken repeatedly. Each time it is broken, personal privacy is compromised by linkage of data files reliant on the SSN.

In Section 317 of the 1996 Personal Responsibility and Work Opportunity Act (Public Law 104–193), Congress effectively required the states to ask applicants for commercial driver's licenses, occupational licenses and marriage licenses to provide their SSNs on the application form. In Section 5536 of the Balanced Budget Act of 1997 (Public Law 105–33), Congress extended the requirement to cover all driver's licenses, as well as hunting, fishing and other recreational licenses. The purpose of the legislation was to help track down parents who had failed to pay child support. The effect was to diminish the privacy of all license applicants, including the vast majority who do not owe child support.

Congress should do its part to protect driver privacy by repealing this anti-privacy mandate to the states. This would complete the work Congress began last year in the Transportation Appropriations Act for fiscal year 2000 when it repealed Section 656(b) of 1996 Illegal Immigration Reform and Immigrant Responsibility Act. That section would have, among other things, required states to demand drivers' SSNs on drivers' license application forms. In other words, while one federal requirement that states solicit drivers' SSNs was repealed, another was left in place. Congress should finish the job.

Reject Calls for Delay.—Finally, Congress should insist that states implement the 1999 privacy protections relating to the Driver's Privacy Protection Act without delay. These provisions became law almost six months ago. For the most part, they must be implemented by June 1, 2000—nearly 8 months after they became law.

Congress went to great lengths to accommodate the special circumstances faced by some states. For the six states whose legislatures were not scheduled to meet this year—Arkansas, Montana, Nevada, North Dakota, Oregon and Texas—Congress extended the deadline to the date 90 days after the legislature next convenes. For the three states which had challenged the Driver's Privacy Protection Act in the Supreme Court—Wisconsin, South Carolina and Oklahoma—Congress allowed 90 days after the Supreme Court rendered its decision in *Reno v. Condon*.

Today, more than a full year after Colorado, Florida and South Carolina stirred up citizen outrage by proposing to sell millions of their drivers' photographs without consent, no provision of federal law is in force to bar such an abuse. This is a recipe for disaster. Enticed by the millions of dollars of revenue that sale of personal information generates for some states, absent a signal from Congress, a repeat performance is almost a certainty. Now more than ever, Congress must insist on prompt compliance with the law to protect the privacy of drivers' personal information.

Thank you.

Senator SHELBY. Thank you.

Just an observation: I think it is rare when you have the Eagle Forum, the Public Citizen, the National Center for Victims of Crime, the ACLU to sit here together, on the same panel, and even more rare that you agree on this issue of public policy that affects every American. I think that you are to be commended.

What is so compelling about this privacy issue that resonates with all four of your organizations? We will start with you, Ms. Schlafly.

Ms. SCHLAFLY. It is a growing issue. It is new. It has just come about in the last few years. And I think people are realizing the power of the databases to gather all of this personal information.

And in my full testimony, I pointed out it is in banking; it is in travel; it is in cell phones; it is in the employment records, drivers' licenses, censuses—all of these areas. And we are very rapidly approaching the time when it will be very easy for the government to mix all of these databases.

And then it is a power to control us. In the totalitarian systems, they had all of these files in manilla folders, and they had a secret police and a method of having family members snoop on each other, but it is all so easy now with the technology.

And I think there is simply a growing realization of what is going on.

Senator SHELBY. Mr. Mierzwinski.

Mr. MIERZWINSKI. Thank you, Senator.

I go back to Justice Brandeis, when he said that privacy, the right to be left alone, is the right most cherished by civilized men and women.

I just think that our organizations, from all parts of the political spectrum, have recognized what nearly every other country has recognized, and that is that privacy is a freedom, that privacy is a liberty, and that these large databases of information, whether they belong to the government or whether they belong to private interests, are infringing on that liberty or freedom.

Privacy should not be for sale, and that is what we agree on.

Senator SHELBY. Ms. Herman, you bring an added perspective here as a representative of the victims of crime. We all want to be safe, but a lot of this information will make us unsafe, as you pointed out.

Ms. HERMAN. Thank you, Senator.

I think it is—it is very clear to us why this issue is compelling, because we hear from victims everyday. There is no confusion among people who work with victims of crime that releasing personal information leads to death. Stalkers, identity thieves are dangerous individuals. Technology has enhanced their ability to reach their victims. Selling, distributing, releasing personal information only increases the chances that we will have more victims.

Senator SHELBY. Mr. Nojeim.

Mr. NOJEIM. First, I want to say that there is a benefit in openness by the government, and that there are—there is a Freedom of Information Act in most States, and certainly at the Federal Government level.

The issue is, as Senator Bennett said, trying to balance privacy interests as against the interests in keeping government accountable to the people. And in the case where personal information is

primarily what is in the database, we believe that the interests in keeping that private—keeping that information private, trump the interests in, you know, good government and open government and sunshine.

It used to be that the Fourth Amendment was good enough to protect people's privacy, because most of the private things that you had were kept within your home. If they were outside your home—somebody learned them because of a transaction that you did—it was very difficult to gather all of that information together.

Today, a point and a click, and you can gather all of that information together. And I think that is why the privacy issue is really starting to resonate in this country.

Senator SHELBY. Ms. Schlafly, is the basic issue, with regard to the treatment of personal information collected by the government, one of who controls the use of such information in the commercial area?

Ms. SCHLAFLY. Well, I think the individual should control his own information about his identity, his name, his picture. And you give it for specific purposes, or in the case of the government, it is demanded for—and required for specific purposes.

But yes, I think the basic issue is: Who does it belong to? And it does not belong to the government. It does not belong to the—even the commercial entities that are gathering it for a specific purpose.

And I think that is a—it is a tremendous and growing issue that people are just beginning to realize. More and more people are deciding they want to pay cash, so it is not recorded what—on somebody's database, what they are buying.

And we find that—well, the government made a payment to Northwest Airlines to set-up a software to monitor our travel. Well, should government be doing that?

We just do not think we want to live in a society where government is monitoring the daily activities of law-abiding citizens.

Senator SHELBY. Mr. Mierzwinski, earlier, you were talking about the opt-in and opt-out approach. Is not the opt-out approach dealing with financial records and so forth? Is that not a sham, in a sense? In other words, they know what that is. They know that the average person does not know about that and it is difficult to opt-out.

Mr. MIERZWINSKI. The opt-out approach, in my view, is designed to fail. It is set up as a sham. And consumers do not usually have any idea that they have a right to opt-out.

As you so eloquently opposed the—in the Financial Modernization Act that Congress passed last year, that Act allows companies which are merging with all kinds of affiliates, have all kinds of subsidiaries, to share their information among each of their affiliates and subsidiaries, and even with many third-parties, without even granting you an opt-out.

Then, in some limited circumstances, that bill provides for a limited opt-out.

Consumers have no idea how their information is being shared; how their information is being sold. And opt-outs are—are simply designed to fail. And that is why so few consumers participate in even the existing opt-out programs that exist.

That is why we believe that the only way to really and truly protect privacy is to have meaningful protection by providing expressed consent through an opt-in.

Senator SHELBY. Senator Bennett.

Senator BENNETT. Thank you, Mr. Chairman.

I want to thank all of the witnesses. As I said in my opening statement, this is a difficult challenge to get the right kind of balance. And Ms. Schlafly, you are exactly right. Technology is bringing it home in a way that it never was before.

If I may be—be a little bit—give a little bit of personal history, I used to work for the J. C. Penney Company. And they—to show you how old I am, they had just initiated, when I went to work for them the—for them, brand new experience of a credit card. Prior to that time, it was strictly cash at J. C. Penney. We used to joke that the “C” in J. C. Penney stood for “Cash.” That is true. That was his middle name—Cash—James Cash Penney.

Anyway, I asked the question of the leadership of the company at that time about this new phenomenon of generic credit cards. VISA and MasterCard, they did not exist at that time. This was prior to the VISA, but people were putting out generic credit cards.

And I remember the CEO saying, “We do not ever want to have—anybody have a generic credit card at Penney’s. We want them to have the Penney card, only.”

And I said, “Why is that?”

And he said, “Because we want to own the information of the shopping habits of our customers. We do not want some outside organization to—to know what our customers buy.” And then he said, “Because we will know what our customers buy, we will be able to target our advertising more efficiently and beneficially for the customer. In other words, we will not try to sell a housewife who buys soft goods and children’s clothing, automobile batteries and television sets, because we will know that that particular customer is interested in this brand of goods. Since we are a full-service department store, it would be inefficient for us to sell—send every customer every flyer that we have on every type of goods that we sell. We can target the advertising to the benefit of the customer.”

Well, the customer demanded that the Penney Company honor MasterCard and VISA, because it became a matter of customer convenience. The customer said, “I do not want to go to the Penney store and not be able to use my MasterCard.”

And very reluctantly, customer demand caused Penney to back away from their original position that said, “We will not have any credit information, except with our own customers, that will be held within our own company.”

And it is an illustration of how the customers come along and change things as to people’s perception.

My concern is—is summarized, I think, in that—that vignette, because I want the customer to know the advantages that are available in the modern world and to make an informed decision.

You talked, Mr. Mierzwinski, about the customer does not understand the opt-out. And I think you are right in many instances to have an opt-in, but it is not properly explained to them.

I am a little concerned that the opt-in is not going to be properly explained to them, because there are some advantages for my infor-

mation to be in the right place. I do not like to be flooded by catalogs for stuff that I never, ever buy.

But I get flooded, because people sell the lists, and they say, "Gee, he has got these kinds of demographics, he has got this kind of an income platform, maybe he would love my bamboo gazebos from the Phillippines, because he can afford it." And they send me those kinds of weird catalogs. I do not want those catalogs.

And if more information—if I opted in—and had more information about me, some catalog people would say, "Gee, he does not buy that stuff at all. We will never send him—we will never send him a cigar catalog, because we know he is a non-smoker."

And therefore, I am benefitted. Without information, I can be disadvantaged. That is the balance that we have to strike here.

Now, Mr. Nojeim, I am interested—the ACLU sells its list. And I would like to read to you the ACLU policy here and talk about this whole thing.

I am quoting from the American Civil Liberties Union Magazine. You say, "The ACLU defrays the cost of our new member recruitment by renting our list to other non-profit organizations and publications."

In other words, you are making the decision as to who should have access to your list. I am not, if I join you.

"Never to partisan political groups or to groups whose programs are incompatible with ACLU policies." I salute you for that. The PBS should do that when they sold their list to the Democratic National Committee. They got themselves in trouble that you are avoiding.

"All lists are rented or exchanged according to strict privacy procedures recommended by the U.S. Privacy Study Commission. We never give our list directly to any organization. Instead, we send the list to a letter shop that prepares the mailing for the organization that is participating in the rental or exchange. That organization never sees our list and never knows what names are on it, unless an individual responds to the organization's mailing." I applaud you for that kind of protection.

"The ACLU always honors a member's request not to make his or her name available. If you do not wish to receive materials from other organizations, write to the ACLU Membership Department, and we will omit your name from list rental or exchange. Thank you for your understanding."

So, you have chosen the opt-out, but you have put in certain controls that you advertise to your members, saying we will not make our list available to the Democratic National Committee, the Republican National Committee, whatever, or anybody that is not compatible with ACLU policies.

This is an informed kind of choice. I think it is in—written in very clear language.

Can you discuss this whole issue with me, if I want to make an informed choice as to how my information is distributed, how do I do it under the opt-in provisions, or is the opt-in going to be the flip side of what you are talking about of opt-out—so complicated and so weighted down with legal language that I could never understand it?

Mr. NOJEIM. First, there is a difference between a private organization and government. In the case of a government, there should be—

Senator BENNETT. I understand that. I am not accusing you of hypocrisy here. I am—

Mr. NOJEIM. No. Let me just—let me just finish. There should be—there should be a presumption that it would be an opt-out; that there would be additional protections, because it is a government, as opposed to a private organization.

And I do not think it would be particularly confusing to operate on an opt-in basis. In fact, I think that, Senator Bennett, you described very well the benefits that a consumer might choose to have on an opt-in.

A consumer—if it is explained to the consumer that “The reason we want you to opt-in and allow us to share your information is because we would like to market to you and ensure that you receive things that we think are tailored to your interests. Check here, if you would like to receive these—these offers.” I think that is pretty simple and pretty clear, and that it could be done that way.

Senator BENNETT. Let us talk about the driver’s license for just a minute. I agree, by the way, absolutely. I cannot conceive of any circumstance where a photograph should be made available to anybody, particularly, Ms. Herman, in the area that you are talking about.

I have held hearings on the issue of identity theft. And unfortunately, a particularly attractive woman drives down the street, someone sees her in the car, takes down her license number, and then has the ability to find out where she lives. No. That is—clearly, we need to do everything we can to prevent that kind of thing from happening.

On the other hand, I buy a new car—I have had this experience and maybe some of the rest of you have—I buy a new car. And the manufacturer knows who I am, and starts to send me information about options that I can buy directly from the manufacturer to add to the automobile.

There are other manufacturers that have things that could add to the automobile that cannot know that I own a Ford or Chrysler or what have you, that I might like to hear from. Is there any way that the Department of Motor Vehicles can say to me, “We would be willing to share with people who manufacture options for your Chrysler minivan, the fact that you own a Chrysler minivan.”

Mr. NOJEIM. Sure. Check here. I think that is the way that Maryland does it, now. And you will be hearing from the Maryland witness in the next panel. But asking—telling them “This is what we want to use that information for. This is the benefit we expect you to get.” You might even have something that says, “This is what we will not use the information for, check here.”

Senator BENNETT. If we get back to Ms. Schlafly’s point—if this information is owned by the customer—and I agree with you, it is owned by the individual—the individual ought to have a more informed opportunity to determine how it is being used.

In other words, if you take the position, okay, the government should not use it willy-nilly for whatever the government wants, by

the same token, the government should not forbid its use, willy-nilly, for something that the customer may want.

That is the balance, I think, that we are trying to strike here, in terms of the concept. And I agree. I think you have summarized the principle very well. Information is owned by the individual.

And there are, in today's cyberworld, advantages to the individual to have that information be more widely available than it might not otherwise be. And the individual ought to have an informed opportunity to take advantage of those advantages.

It is a very difficult kind of problem.

Senator SHELBY. Ms. Herman wants to comment first, and then Ms. Schlafly.

Ms. HERMAN. I think it is very important when we are talking about an informed decision making process to realize that there is a very narrow, narrowly defined decision of whether this corporation or that corporation gets your information.

And then there is, sort of, unintended secondary impact, I would say—the stalking that occurs, the identity theft that is growing as a crime in this country—that I do not believe that Americans today are fully informed about the extent of scope—of stalking, the extent of identity theft.

And so, it is hard, right now, at this point in history, to argue that you can have a fully informed decision about the possible consequences of this decision.

The information gets out too easily to too many people.

Senator BENNETT. In our hearing on identity theft, we found that the primary source of information is stealing mail, which is—I mean, people send out credit cards in as bland a manner as they possibly can. I often almost throw away the credit cards, because there is no return address, there is no indication of what it is. And you have to open it up.

And then I say, “Oh. Well, they did this in such a way so that if somebody saw this envelope they would not recognize that it was a credit card.”

But there are people who go out and just simply steal large chunks of mail and go through them, hoping to find a bill or a credit card solicitation or something else that has a social security number, an address and a name on it, and then the identity theft begins. Yes. This is—

Ms. HERMAN. There are also people who are ordering that credit card for you, and then waiting until it is delivered to your home, and then picking through your garbage.

Senator BENNETT. Yes. That is part of the pattern.

Ms. Schlafly, you were—

Ms. SCHLAFLY. Yes. I guess we can agree it is the individual who owns his personal information and not the government or the commercial outfit that gathers it, but I think we need to make a difference between the databases that are government-owned—government-collected and the private industry.

Now, I am quite willing to let the free market cope with how these databases are handled in commercial affairs. ACLU sells their members database. Eagle Forum does not sell our database. That is personal organization choice.

And I like all of those mail order catalogs. I buy mail order. And the stack I got before last Christmas was 6 feet high. I kind of like them. That is the way I do my shopping. And I know they are trading them. That does not bother me.

I think when it comes to what government is doing, that we are really very concerned. There are just a lot of things that have happened in the last few years that have caused Americans to distrust government.

There have been mistakes in law enforcement. There have been mistakes in FBI files. And there have been mistakes in gathering information. And it is such power in the hands of government, that we just do not think this—they ought to be able to use it any way they want.

And now, with technology moving so rapidly, so that they can all be exchanged. For example, we are worried that the vaccine registries and the effort of the CDC to merge the state registries of vaccines is going to give the government a control of all of our medical records and enable the government to deny access to day care, kindergarten, school, college, even emergency rooms in hospitals, unless you have had the vaccines that the government has decided you ought to have.

Now, this is government power that we are worried about. And then, of course, Eagle Forum, for 20 years, has monitored the gathering of private information by the public schools. This is another proof that the opt-out does not work, because you put these nosey questionnaires in front of the children in school, and children are supposed to do what the teacher tells them, and they gather all of this information. Years ago, it went in a manilla file. Now, it goes on the computer database.

And it is power that we do not know how it is going to be used when it is in the hands of government. And we are concerned.

Senator BENNETT. Sir?

Mr. MIERZWINSKI. Very briefly, Senator Bennett, on the issue of identity theft, our organization has conducted a lot of research and published several reports. We obviously supported the criminalization legislation, but we believe that the big problem gets back to the fair information practices, again.

And that is, as you alluded in the—in the theft of mail, that companies do not have adequate fair information practices when it comes to protecting the accuracy and security of their databases.

So, the thief applies for credit. The thief only knows part of my personal information and applies from his address. The companies do a terribly sloppy job of determining whether or not that new address is, in fact, an exact address. They do not match credit report to the credit application adequately enough.

So, really, we think that a large part of the solution is to—is to not just go after the criminals, which I think is, to some extent, after the horse has left the barn, but to try to close the door of the barn better, by requiring companies to protect information better than they do—no more instant credit, better address change verification, and better matching of information.

And that is just an example of one of the additional fair information practices that these firms do not comply with.

Senator BENNETT. Interestingly enough—and I am sorry, Mr. Chairman, but what step back. What you are really asking for is more use of data to solve the problem of improper use of data.

Mr. MIERZWINSKI. Well, no. I am not more use, but better use. The companies just have sloppy databases. They have got mixed up credit reports, mixed up credit applications. They are not—

Senator BENNETT. To clean up—to clean up their databases. They would like to have more access to more information. It is part of the dilemma that we face.

Mr. MIERZWINSKI. We would disagree that they would need more information about consumers to do that. We would simply think that they need to have better practices when they grant credit.

Senator BENNETT. Thank you, Mr. Chairman.

Senator SHELBY. Thank you, Senator Bennett.

This past January, the Pennsylvania Department of Transportation canceled its contract with Choice Point Services, Inc., a private personal data clearinghouse, because the data firm made driver's license records accessible by way of the Internet, despite being specifically prohibited by state contract.

Personal information about Pennsylvania drivers somehow became available to Data Land, an Internet site that advertised and sold background information on people for \$69.95 to anyone willing to pay.

It seems to me that this does not inspire confidence that these data providers are good stewards of the personal information that the information collects. In other words, once they get it, it is gone.

Ms. SCHLAFLY, is that what fuels people's mistrust of government?

Ms. SCHLAFLY. Well, it is just another—another example to add to various items that have caused our distrust.

While I—I want to add one more comment to what I said earlier. While I think the free market can and should deal with the commercial collections of information, we do not want—we do not want any law that gives these commercial outfits a copyright or an ownership in these collections of information that is accompanied by criminal penalties. And there has been legislation cooking around in Congress on that area.

I feel that the free market can deal with it, but we do not want them running to the local District Attorney to prosecute anybody who wants to get her own medical records out of a government or— or AMA database.

Senator SHELBY. Well, you should have that right anyway. Should you not?

Ms. SCHLAFLY. Should have that right, because the information should belong to the individual.

Mr. MIERZWINSKI. Senator, I think—

Senator SHELBY. If Congress passes my bill, you will have that right.

Mr. MIERZWINSKI. Senator, I think that the example you gave from Pennsylvania—there are other examples very similar to that. Some of the states have entered into contracts with private firms that want to sell wage and unemployment data, ostensibly, to make credit applications easier.

And in audits of some of those firms, I believe the Department of Labor has found that their data protection practices have not

been adequate. And it just goes to show you that putting public records up for sale imposes grave privacy risks.

Senator SHELBY. Okay. I want to thank all of you in the first panel. We appreciate your participation. We appreciate your insight into this issue. And we will keep working this issue. Thank you so much.

Ms. SCHLAFLY. Thank you, Mr. Chairman.

Ms. HERMAN. Thank you.

STATEMENT OF LARRY MAJERUS, VICE PRESIDENT OF GOVERNMENT RELATIONS, POLK COMPANY

Senator SHELBY. On the second panel, we will hear from Mr. Larry Majerus from the Polk Company; Mr. Roger Cross, the Administrator of the Wisconsin Division of Motor Vehicles; and from Ms. Anne Ferro, the Administrator of the Maryland Motor Vehicle Administration.

If you folks would come up to the table. Your written statements will be made part of the record in their entirety.

Mr. Majerus. Is that right?

Mr. MAJERUS. That is correct.

Senator SHELBY. You proceed, as you wish.

Mr. MAJERUS. Thank you very much. Mr. Chairman, I very much appreciate you inviting me to appear before you today. My name is Larry Majerus. I am Vice President of Government Relations for The Polk Company in Southfield, Michigan.

Polk has a long strong commitment on privacy. And we commend your interest and leadership on privacy. And we share your view that an opt-in is an appropriate approach for sensitive information, such as photos and medical data.

At Polk, we obtain motor vehicle title and registration information, which we use for several purposes, including publishing statistics on the sale and use of automobiles, safety recall, product and performance surveys, and marketing.

Prior to coming to Polk, I was Director of Motor Vehicles for the State of Montana. In both positions, I have developed considerable experience dealing with the appropriate uses of motor vehicle information, balanced with citizens' concerns about privacy.

Polk has helped the automotive industry develop careful practices involving the use of public records. And we have assisted many motor vehicle departments in developing and implementing opt-out systems for marketing use.

I would like to make three points today. First, the opt-out systems that were in place were working to effectively protect privacy. Many States will be unable to convert to an effective opt-in system by June 1, causing them to shut down access for marketing and surveys—effectively, a prohibition.

Second, the principal use of motor vehicle records are manufacturers and dealers who have used this public information since 1922. They would be seriously impacted by the express consent provision.

And third, we believe opt-out versus opt-in needs a more thorough study before such action is taken. We urge the bill's implementation date to be delayed, to allow for a such a study of Section 350, paragraph D, of the Transportation Appropriations bill, and to

provide adequate time for States to comply with the new requirements.

We have heard that success of an opt-in and an opt-out program is going to be based on the communication to the consumer. So, we feel that is very important.

The auto industry deals almost exclusively with vehicle registration and titles, which only contain owner name, address, make and year of car or truck. Provisions were made in DPPA for many appropriate uses of public vehicle records.

It was accompanied by an option for consumers who might object to receiving mail advertising or surveys to request to have their name and address withheld for those purposes.

Polk helped seven States develop opt-out systems, even before Congress first introduced the Driver's Privacy Protection Act. Thirty-one States are now operative. Today, citizens in these states are told that they may have their motor vehicle records withheld for surveys, marketing, solicitation, and those concerned are doing so.

These States have descriptive opt-out language, visible on the application or renewal package, allowing the owner to opt-out or make a choice. Citizens are opting out at double digit levels, which we believe indicates the opt-out systems are working as they were intended.

Many States will have to scrap their existing opt-out systems, prepare notifications, and build new opt-in systems. We anticipate some States will shut down this important resource under these circumstances.

Without a delay, auto manufacturers and thousands of dealers will no longer be able to reach finite markets for their products. We are talking about marketing a sophisticated expensive product to a narrow market of potential customers.

And what of the many small businesses that have been created in the automotive industry and depend on make and year model information for their survival; like the producer of a special accessory for specific cars and trucks? They, like the auto dealers, need to reach specific vehicle owners with special offers.

The new language seriously damages the auto industry, which really has no effective alternative source for motor vehicle ownership information. Without that specific vehicle ownership information, they have to do more data mining; they have to do more modeling; they have to do more consumption of consumer data.

Finally, DPPA implementation was completed over a 3-year period, ending in September 1997. That timeframe was needed to achieve the objectives. By contrast, the current law passed as part of the final Appropriations bill in October 1999, States were given only until June 1 to dismantle their existing system and develop a whole new system. And we wonder how much confusion that is going to create among the consumers.

In closing, a quick opt-out—excuse me—a quick opt-in for motor vehicle records will effectively be a shut-off. It will definitely impact the auto industry; an industry that has depended upon and carefully used this public information for over 70 years.

PREPARED STATEMENT

We urge you to consider a delay in the implementation to give all parties a fair and reasonable time to discuss the objectives, reach acceptable conclusions, and provide adequate time for the States to comply.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF LARRY G. MAJERUS

Mr. Chairman, I very much appreciate your inviting me to appear before you today. My name is Larry Majerus and I am Vice President of Government Relations for The Polk Company in Southfield, Michigan. We gather motor vehicle title and registration information, which is then used for several purposes including publishing statistics on the sale and use of automobiles, safety recall, product and performance surveys, and marketing. Prior to my 12 years at Polk, I was Director of Motor Vehicles for the State of Montana for 11 years. In both positions, I have developed considerable experience dealing with appropriate uses of motor vehicle information balanced with citizens' concerns about privacy. My staff and I have helped the automotive industry develop careful practices involving the use of these public records, and we have assisted many state motor vehicle departments in developing and implementing opt out systems for marketing uses. My experience allows me to view this subject as a consumer, a retailer, a government official, and a businessman.

I would like to make four major points today—all facts that suggest that last year's appropriations bill amendment to the Driver's Privacy Protection Act ("DPPA") requiring "express consent" from consumers for surveys, marketing and solicitations is an unnecessary restriction on public records, and will greatly damage many businesses, especially those in the automotive industry. The four points I hope you will consider are first, the opt out systems that were already in place were working to effectively protect privacy. Many states will be unable to convert to an effective opt in system by the June 1st date, causing them to shut down access for marketing and surveys. Therefore, this abrupt opt in system is effectively a prohibition. Second, the principal users of motor vehicle records are manufacturers and dealers who have used this public information since 1922. They would be seriously impacted by the "express consent" provision. Third, the economic growth of this country may well be impacted by this new limitation. And fourth, we believe this bill needs a more thorough study before such drastic action is taken. We urge the bill's implementation date be delayed to allow for such discussions, and to provide adequate time for states to comply with the new requirements.

Most of the motor vehicle record information under discussion has been open record for so long that many do not consider it "personal." For example, the auto industry deals almost exclusively with vehicle registrations and titles, which contain only owner name and address and make and year of car or truck. Until now, users of motor vehicle records and the state agencies releasing them have been guided by the 1994 DPPA. That legislation was carefully considered so as to provide consumer privacy protections (and even avoidance of unwanted mailed advertising)—balanced with the needs of the nation's businesses for access to these open public records. Provision was made in the DPPA for many appropriate uses of public motor vehicle records including safety recall, fraud detection, statistics, motor vehicle research, and marketing. More importantly to our discussions today, inclusion of marketing, surveys and solicitations was accompanied by an option for consumers who might object to receiving mailed advertising or survey requests to have their names and addresses withheld for those purposes. "Clear and conspicuous" notice is provided and the consumer can opt out.

We have had such a system within our own company for many years, and we helped seven states develop opt out systems even before Congress first introduced the Driver's Privacy Protection Act. We believe DPPA was a good balance of the principles. Accordingly, states set about, with industry help, to develop opt out systems. Thirty-one states are now operative. Today, citizens in these states are told that they may have their motor vehicle records withheld from "surveys, marketing, or solicitations," and those concerned are doing so. These states have very descriptive opt out language, clearly visible in the application or renewal package, making it easy for the owner to opt out and detailing what will happen as a result of that choice. States flag the record information we receive so that those owner names may be used for safety recall, for example, but not for "surveys, marketing and solicita-

tions.” Citizens are opting out at double-digit levels, which we believe, and the states confirm, indicates that the opt out systems are working as they were intended.

Many people, however, choose not to opt out. As the advertising industry knows, people are informed, educated, and motivated by advertising but they do not usually seek it out. The 1999 USPS Household Survey finds that only 4.9 percent of U.S. households object to advertising mail. And Simons Market Research finds that in the latest reported year, 68 percent of all adults in the U.S. bought something through direct marketing.

The mechanics of advising consumers, and providing an opportunity for them to opt in, are mind-boggling, especially in the short time allowed by this new legislation. For example many states will have to scrap existing opt out systems, prepare notifications, and build new (and probably expensive) opt in systems. We anticipate that the states will have little choice but to shut down this important resource under these circumstances. A delayed effective date will give states time to evaluate whether and how an opt in system can be effectively implemented.

Without a delay, auto manufacturers and thousands of dealers will no longer be able to reach finite markets for their products, which is our second point. This is not selling soap or candy, which everyone might use, but rather we are talking about marketing a sophisticated and comparatively expensive product to a narrow market of existing and potential customers. That marketing is vitally important to the auto industry. Not everyone is a prospect for a new car, as is demonstrated by the fact that 15 million car sales in a given year are made to over 100 million households.

And what of the many small businesses that have been created recently in the automobile industry and depend on make and year model information for their survival, like the producer of special accessories for specific cars and trucks? They will suffer as will any auto-oriented business, like a car dealership, that needs to reach specific groups of owners with special offers.

For those who use motor vehicle records for marketing, the need is very great. Without this information, manufacturers will have difficulty reaching their own owners. Yes, they start with a name and address from the sales record, but people move and sell their cars. Registration and title data is necessary to keep that information current and provide for important communications between seller and customer. It does so merely using name and address, and the make and year of car.

Our third point concerns the impact on our economy. The new language seriously damages the auto industry which has no alternative source for motor vehicle ownership information. That should be a concern, because the latest data available indicates that auto industry sales approximate \$650 billion each year and represent 25 percent of all retail sales. State taxes on motor vehicles amount to some \$41 billion each year, representing 11 percent of all taxes collected by states and that does not include sales tax on cars and trucks.

Surely an industry so important to the nation’s economy should not be impeded in following the marketing and survey practices it has so successfully used without problem for many years.

That is especially true when you consider that the auto industry, and its data providers like Polk, have used this information very responsibly since the first compilations in 1922. It is principally for these automotive clients that we purchase this public data from the states and take such great care to insure that we use it responsibly.

Finally, one of the reasons this legislation can hurt so many businesses and people is because it passed quickly, and allows extremely limited implementation time. When the Driver’s Privacy Protection Act was developed, discussions by staff with the private sector began more than a year before the bill’s passage. Over time, several versions of the bill were prepared to provide for many legitimate uses, avoiding unnecessary impact on business, and still offering citizens an easy way to withhold their names. Planning for this significant legislation—into which everyone had input—started in July, 1993 followed by a year of hearings and discussions until passage in the fall of 1994. Implementation was to be complete three years later in September, 1997. That total four year time frame was needed to delicately but decisively achieve the objectives. It is especially important to note that states were allowed a full three years—from 1994 to 1997—to pass legislation, build their systems, and notify owners of the impending change. I can assure you from personal knowledge that this was not too much time.

By contrast, the current plan was introduced last May and passed as Section 350 paragraph d) of the final appropriations bill in October, 1999. DPPA took 50 months to enact and implement but as a result of these major revisions, states are given only until June 1, 2000 to dismantle their existing systems and develop new ones.

We believe that nothing of this magnitude and of such importance to so many should become law so quickly without full investigation of the unintended consequences and adequate time to implement the requirements.

In closing, the facts are clear. A quick opt in for motor vehicle records will effectively be a shut off. It will definitely impact the automotive industry, an industry that has depended upon and carefully used this public information for over 70 years. If the auto industry is hampered, the repercussions may be felt in the nation's economy, considering the value of automotive sales and associated taxes. And until now, at this hearing, none of us has had an opportunity to air the many sides of this issue, nor is ample time being allowed for states to implement the results. We urge you to consider a delay in the implementation date to give all parties a fair and reasonable time to discuss the objectives, reach acceptable conclusions, and provide adequate time for states to comply.

THE POLK COMPANY,
April 10, 2000.

Hon. RICHARD C. SHELBY,
Chairman, Subcommittee on Transportation and Related Agencies, Committee on Appropriations, Washington, DC.

DEAR MR. CHAIRMAN: I would like to thank you for the opportunity to testify before the Subcommittee on Transportation and Related Agencies on April 4th regarding amendments to the Driver's Privacy Protection Act ("DPPA"). I am submitting this letter for the record in order to respond to two clusters of issues raised during the hearing.

Issue Cluster 1:

It was asserted during the hearing that all of the personal information contained in motor vehicle title and registration records and drivers' license records is sensitive and that the source of this personal information (i.e., the government) should be the primary determinant of the level of privacy protections that should be afforded to the information.

Issue Cluster 2:

It was asserted that opt-out systems are designed to fail and have consistently resulted in a failure to provide adequate privacy protections.

Response 1:

It was suggested during the hearing that all of the information contained in motor vehicle title and registration records and drivers' license records is very sensitive, and that this fact, coupled with this governmental source of this personally identifiable information, determines the level of privacy protections that should be afforded to the information.

In fact, just the opposite is true. Mostly, the information is traditionally public domain-type information—i.e., name and address information.

The Fourth Circuit most closely scrutinized the sensitivity of the information in "motor vehicle records" in a portion of their decision in *Condon v. Reno*, 155 F.3d 453 (4th Cir. 1998), that was left undisturbed by the U.S. Supreme Court. After analysis and discussion, they concluded: "In sum, the information found in motor vehicle records is not the sort of information to which individuals have a reasonable expectation of privacy." *Id.* at 465. Consequently, while, as the U.S. Supreme Court held in *Reno v. Condon* that Congress may chose to regulate the information found in motor vehicle records as "an article of commerce," it is not the type of information to which individuals have a reasonable expectation of privacy.

On the issue of the factors that have traditionally been considered in determining the level of privacy protections that should be afforded to personal information, it is the subject matter (i.e., sensitivity) and the use that is to be made of the information that customarily determines the type of privacy protections that should apply. That is why so many federal and state privacy laws permit some unrestricted uses of personal information but subject other uses to substantial regulation. The consumer reporting laws, for example, protect consumers from uses of personal information, even if obtained from public court records, when the use determines that person's eligibility for a job, or household credit or insurance.

Deciding whether or not to market a product or service to an individual has not been deemed to be a sufficiently important decision to merit substantial privacy protections. Federal privacy laws, for example, enacted after hearings and careful study, have repeatedly found that notice and opt-out suffices to allow consumers to

avoid marketing uses of their personal information. See, e.g., 18 U.S.C. 2710(b)(2)(D) (Video Privacy Protection Act), 47 U.S.C. 551(c)(2)(C) (cable TV subscriber privacy). The Safe Harbor Principles also recognize that data used in direct marketing is "not used for decisions that will significantly affect the individual."

Response 2:

Opt-out systems under the DPPA can provide adequate privacy protections.

Appropriately constructed and implemented opt-out systems have consistently been judged to provide strong privacy protections. Opt-out systems implemented under the DPPA have been successful in those states that have—

- 1. Provided a clear, detailed and conspicuous notice;
- 2. Devised a simple method by which consumers can exercise their opt-out rights;
- 3. Made the consumer's choice permanent, that is, until the consumer changes his/her mind; and
- 4. Reached all relevant data processors.

A robust notice explains the types of information that are being collected, how the information will be used, to whom the information may be disclosed, the purposes for which the information may be disclosed, and the consumers' rights with respect to the information.

In those states that have developed clear, detailed and conspicuous notices and effective, consumer-friendly mechanisms to implement opt-outs, consumers understand their rights and are able to exercise their right to choose. In these states, opt-out rates can exceed 30 percent. These kinds of opt-out rates reflect consumer choices which balance privacy interests with an interest in allowing their information to be used for various DPPA purposes, including marketing and surveys. Many consumers benefit from these marketing efforts and choose to receive marketing materials to make purchases of many useful products, including automobile safety-enhancing and fuel efficiency products.

Respectfully submitted,

LARRY G. MAJERUS,
Vice President, Government Relations.

STATEMENT OF ANNE FERRO, ADMINISTRATOR, MARYLAND MOTOR VEHICLE ADMINISTRATION

Senator SHELBY. Ms. Ferro.

Ms. FERRO. Thank you, Mr. Chairman, Senator Bennett. We appreciate—I do appreciate the opportunity to testify today.

I am Anne Ferro, the Administrator for Maryland.

Maryland is a bit different than some of the other States, and certainly, the AAMVA position you will hear today about the other States. Maryland has moved ahead with both an opt-out and an opt-in. So, perhaps, we are a good example of what can be accomplished, depending on which way leadership is going.

You will hear from AAMVA, and while Maryland is a very active member and supporter of AAMVA activities, on this issue, in particular, I would have to make sure you understand that our perspective is different.

A snapshot of Maryland. Maryland is a State of 3.5 million active drivers and 4 million active vehicle records. So, while relatively small in the scheme of 200 million driving records nationwide, we certainly have a sizable database to work with in moving ahead with a privacy provision.

Following the Federal enactment of a Privacy Act, Maryland leadership, both the General Assembly and the Governor, were successful in enacting a Maryland law, specifically requiring an opt-out system. That was enacted in April 1997. And we had to have it, of course, in compliance with the Federal Act by September 1997, and then, for Maryland's purposes, the extra pieces by October 1997. So, we moved rather quickly.

Implementation of that Act was somewhat expensive because of the time frame. It was about a \$1.5 million. But it certainly was doable within the context of the constraints that we had.

Now, Maryland's 1997 Privacy Act mirrored the Federal Privacy Act, insofar as we offered an opt-in—an opt-out approach—excuse me—but our record access remained open to law enforcement, Federal and State government, courts, insurance industry, private investigators, and the towing industry, and other specific emergency purposes. So, our regulations reflected that.

Now, in our testimony—you have a copy—the last two pages, the second to last page is a copy of the form that Maryland made available to the public. And the reason I brought it is, it is indicative of something that has already been reflected by your prior panel and yourself, Mr. Chairman. An opt-out system is confusing to the public.

Maryland's law, since 1943, has mandated an open record system. So, in fact, Maryland vehicle law made records open to the public from 1943 forward. When the Maryland General Assembly moved ahead with enacting an opt-out system that, for the first time ever, allowed Maryland citizens to close access to their records, the public went wild. They thought that, for the first time, Maryland was offering for sale, over-the-counter, their record. It had just not been an issue before.

Even at the Federal level, the attention had not been paid to the Federal Act. But the Maryland public, with the assistance of the Worldwide Web, perceived that, in fact, for the first time ever, Maryland was offering the sale of your vehicle record over-the-counter by picking up a tag of someone, as you mentioned, Senator Bennett, who was attractive, who happened to drive by.

That confusion, combined with the marketing industry's concerns—which again, the attempt in the 1997 Act was to balance the concerns between privacy, public safety and the very valid interests of commercial industry and the availability of mailing lists. That balance was proven to be somewhat skewed in actual implementation of an opt-out system.

What the commercial industry found was that Maryland's \$3.5 million—3.5 million-record driver database was no longer reflective of Maryland, because by virtue of an opt-out system, about 1 million of our citizens opted to close public access to their records—about a third.

Senator SHELBY. From everyone? Did everybody respond to—

Ms. FERRO. No, they did not.

Senator SHELBY. Okay.

Ms. FERRO. And that is a very good question to raise.

Maryland renews about 20 percent of its drivers every year. We have had the opt-out system on the books now for a little over 2 years. Everybody, at the time of renewal of their driver's license, as well as their vehicle, is offered the opportunity, verbally, "Would you like to close public access to your record?"

We also issued numerous press releases, and there was a great deal of coverage to the public, announcing, in September and October 1997 through the fall, that you, in fact, could call a toll-free number, 24 hours a day, 7 days a week, and yourself close access

to your records, so you did not have to wait for renewal, or you could submit this form.

Senator SHELBY. Would it not be easier Ms. Ferro for everybody, if the prohibition be that you could not sell their driver's license or use their information unless they opt-in?

Ms. FERRO. And that is, in fact, what we moved to.

Senator SHELBY. Okay.

Ms. FERRO. By virtue of that confusion that occurred—

Senator SHELBY. Because the other would confuse you.

Ms. FERRO. We went from opt-out to opt-in.

Senator SHELBY. Okay.

Ms. FERRO. And part of it was by virtue of that public outcry. And what we found was, while over two-and-a-half years, more than 45 percent of our recordholders really were literally asked the question over-the-counter, "Would you like to privatize your record?" in addition to being bombarded with forms that had the information on it, with access through the press releases and newspaper coverage, information on our web site that you could privatize your record any time you wanted—even with all of that availability of information, only 31 percent of our drivers actually privatized their records.

It defied what you would have expected. And I think it speaks right to Ms. Herman's point—people do not know when they need to be protected.

We offered it over-the-counter. Of course, we asked a lot of questions, "Would you like to register to vote? Would you like to be an organ donor?" But most importantly, this privacy question, a lot of people said, "Don't care," because they probably did not realize how important it was until something may have happened, as Ms. Herman pointed out.

So, in light of that confusion, Maryland's General Assembly did, in fact, in January—or the 1999 session, I should say, enacted, by April, an opt-in provision. And that will take effect July of this year.

Because Maryland already implemented much of the programming that was required under the opt-out provision, we have really made our major expense back in 1997. So, the move to the opt-in system is very simple. It is about a quarter of a million dollars, a lot of training to our employees, but our slogan to them is, "When in doubt, don't give it out."

So, we have been able to move ahead. And I just wanted to reinforce, I think, some of the—

Senator SHELBY. Can we use that slogan?

Ms. FERRO. Yes, you may. Please. Nothing we do is copyrighted.

Senator SHELBY. Thank you.

Ms. FERRO. It is yours. We would be honored.

PREPARED STATEMENT

So, in fact, I just wanted to speak from our own experience in Maryland. It is doable. We are relieved, in fact, and I see my light, to go to an opt-in system, and feel that that will offer more protection to our citizens.

Senator SHELBY. For the people.

Ms. FERRO. Yes.

[The statement follows:]

PREPARED STATEMENT OF ANNE S. FERRO

Mr. Chairman and Members of the Committee. I thank you for the opportunity to come before you today. I am Anne S. Ferro, Administrator of the Maryland Motor Vehicle Administration. I have been asked today to detail Maryland's efforts to make motor vehicle records private.

The Maryland Motor Vehicle Administration's (MVA) primary customers and business partners are the public, industry, employees and other government agencies. The MVA interacts directly with most of Maryland's residents, conducting approximately 7.5 million walk-in customer transactions annually and 10 million total transactions overall. The MVA's products include over 3.7 million vehicle registrations, 3.4 million driver licenses and identification cards, and 2.5 million emission tests.

The MVA collects almost \$900 million in revenue per year that is deposited into the state's Transportation Trust Fund. This revenue represents an average of 30 percent of the total Transportation Trust Fund and is redistributed to all modes within the Maryland Department of Transportation to fund major transportation initiatives and operating costs. Funds are also distributed to the state's General Fund and local governments. MVA's current operating budget is \$114.4 million.

MARYLAND'S 1997 PRIVACY INITIATIVE

Maryland driver and vehicle records maintained by the Motor Vehicle Administration (MVA) have been open to public access through the authority of the 2 State Motor Vehicle Act of 1943. The Federal Driver Privacy Protection Act of 1994 specifies that, beginning September 1, 1997, state motor vehicle agencies must offer record holders the opportunity to close their records to public use. Maryland implemented strong state initiatives in 1997 and 1999. The 1997 initiative (Chapter 338 of the Laws of 1997) allows Maryland citizens the opportunity to block access to their records for use in commercial mailings and to the public. (See Attachment I). This legislative initiative was the result of three years of deliberations and has resulted in 31 percent of Maryland drivers requesting that their records be privatized.

Under the current privacy law, citizens have options on whether their records are closed to individuals and whether they consent to having their addresses sold for merchandizing promotions. As of, March 26, 2000, the options taken by Maryland citizens were:

MVA Records Blocked Under 1997 Act

| | |
|--|-----------|
| Block public access and mail list purchases | 1,038,518 |
| Block public access; allow mail list purchases | 12,360 |
| Allow public access, block mail list purchases | 1,398 |

MARYLAND'S 1999 PRIVACY INITIATIVE

One unintended result of the 1997 legislation was the public confusion and perception that the General Assembly had opened all motor vehicle records to allow for their sale to marketers. The resulting legislative response was to fully close motor vehicle records through legislation enacted in 1999. Chapters 349 and 350 of the Laws of 1999 become effective July 2000. (A copy of this law has been provided to the committee staff) They prohibit disclosure of MVA records, unless the individual specifically consents to the disclosure in writing. (See Attachment II) Personal information covered by this statute includes: address, driver's license number, medical information, name, photograph, Social Security Number, or telephone number.

Briefly, Maryland law governing privacy authorizes the following:

- Closes all MVA records to the public and to mail list purchases, beginning July 2000. Only when a record holder opts for a file to remain open is it accessible to the public.
- Restricts access to personal information from Motor vehicle records except for certain permissible uses.
- Requires each entity accessing MVA records to retain a record for 5 years of the use and re-disclosure of the records. Any access to MVA records is subject to monitoring and audit by the MVA.
- Prohibits use of MVA records for telephone solicitations.
- Requires the MVA to establish regulations governing waivers of privacy.
- Allows access to the following users, consistent with federal law:
 - Applicants who provide written consent from the record holder.

- Employer or Insurer for holder of a Commercial Drivers' (CDL) License to obtain/verify information required under law.
- Government Agency (Federal, State and Local).
- Individual or his/her attorney. Insurer/Insurance Support Agency in connection with rating, Underwriting claims.
- Law Enforcement/courts.
- Legitimate business entity to verify personal information already provided to recover debt, and pursue legal remedies against the individual.
- Licensed Private Detective Agency or Security Guard Agency for purposes permitted by law.
- Motor Vehicle Driver Safety, Vehicle Theft, Vehicle Emissions, Alterations or Recalls.
- Private Toll Facility operations.
- For use in connection with court proceedings for process service investigation in anticipation of litigation and execution/enforcement of judgements and orders.
- Research/Statistical for purposes approved by MVA.
- Towing Company or Impound Facility.
- Operator of a taxicab, limousine, funeral vehicles for matters relating to public safety or emergency treatment for a member of the public.

FISCAL IMPACT OF MARYLAND PRIVACY ACT

The MVA currently sells certified and non-certified records for fees of \$10 and \$5, respectfully. Additionally, the MVA sells groups of records for a minimum fee of \$500, and \$.05 for each record over 10,000.

REVENUE SALE OF MVA RECORDS

[In millions of dollars]

| | 1997 | 1998 | 1999 |
|-----------------------------------|--------|--------|--------|
| Individual record purchases | \$12.9 | \$13.6 | \$14.0 |
| Direct mail purchases | .7 | .9 | .9 |

Individuals or entities that would still have authorized access under the exceptions provided for in the Maryland law purchase the majority of certified and non-certified records. However, the bill prohibits the sale of groups of records that are sold to marketers, surveyors and solicitors, unless the expressed written consent of the person in interest is received by the MVA.

It is expected that a few individuals will give consent to avail their driving and registration records for public inspection. As a result, the MVA estimates a \$.9m decrease in Transportation Trust Fund revenues beginning in fiscal year 2001. The cost of implementing the changes is an estimated \$235,000 in fiscal year 2001 necessary for computer programming and for replacing forms inventory to notify drivers and vehicle operators of the new privacy requirement. Therefore, the total fiscal impact of this initiative is over \$1.1 million loss to the Administration and the Trust Fund.

The MVA continues to work to guarantee full privacy of the records of Maryland citizens. We have the full support of Governor Glendening and the General Assembly. MVA has notified commercial business that the public records will no longer be available. MVA staff are being trained on major legislative changes; and all programming changes are scheduled to be in place by July 1, 2000.

Thank you for requesting Maryland's perspective on the matter of privatizing access to motor vehicle records. I would be pleased to answer any questions at this time.

As a result of new federal and state privacy laws, the Motor Vehicle Administration (MVA) is offering residents an opportunity to keep their MVA driver and motor vehicle records private. If you choose to keep your records private, this information will be restricted to government officials, law enforcement personnel and those who need it in connection with motor vehicle or driver safety, theft, emissions and manufacturer recalls. If you do not choose to keep your records private, this information will be given out upon request.

If you would like to keep your MVA records private, please call the toll-free number 1-888-MVA-DPPA (1-888-682-3772) or complete the information on the reverse side and return it to any MVA office or mail it to: MVA, DPPA, 6601 Ritchie Highway, NE, Glen Burnie, MD 21062.

Maryland Record Restriction Notice

Effective July 1, 2000 federal and state privacy laws prohibit the disclosure, except in certain circumstances, of Motor Vehicle Administration (MVA) records containing personal information without written permission from the individual who is the subject of the record.

To make your MVA records **public**, complete **Sections A and B, #1** of this form. Return the completed form to a MVA office or mail to: **Motor Vehicle Administration, 6601 Ritchie Highway, N.E., Glen Burnie, Maryland 21062, Attn. Driver Records Unit.**

If you provided a written request to make your MVA records public after July 1, 2000 and now want the records **private**, complete **Sections A and B, #2** of this form. Return the completed form to a MVA office or mail to: **Motor Vehicle Administration, 6601 Ritchie Highway, N.E., Glen Burnie, Maryland 21062, Attn. Driver Records Unit.**

STATEMENT OF ROGER CROSS, ADMINISTRATOR, WISCONSIN DIVISION OF MOTOR VEHICLES

Senator SHELBY. Mr. Cross.

Mr. CROSS. Good morning, Mr. Chairman and Senator Bennett.

My name is Roger Cross. I am the Administrator for the Wisconsin Division of Motor Vehicles. And I am here representing the American Association of Motor Vehicle Administrators, AAMVA. It is a voluntary organization representing motor vehicle administrators and highway safety officials in the United States and Canada.

Our members are responsible for administering the laws for motor vehicle operation, and we maintain driver history records of over 200 million vehicle operators in the United States, alone.

We share the concerns of Congress and the public to protect the privacy of personal information gathered and maintained by State agencies. I am pleased the State of Maryland is also here participating.

The focus of my testimony, though, is to be on the issues identified by 45 States that have to comply with the amendments to the DPPA by June 1, 2000. South Carolina, Oklahoma, and my State of Wisconsin have accelerated implementation deadlines as a result of the Supreme Court decision.

Motor vehicle officials take seriously our role as administrators of a consumer agency, a highway and traffic safety agency, and as administrators of the leading State government agency for identity verification.

Because of this multifaceted accountability, we are continually balancing the legitimate needs to access records for safety purposes against unauthorized release of information that may infringe on an individual's personal safety.

That is why AAMVA played an active role in shaping the original language of the DPPA in 1994. At that time, there was not 100 percent agreement among the States that the DPPA would provide the level of privacy protection that it purported. Many States questioned its constitutionality. In fact, Wisconsin was one of those States.

The recent U.S. Supreme Court decision in *Reno versus Condon* has clarified States' questions about the constitutionality of the DPPA. However, the passage of Section 350 has raised a host of new concerns for the States.

I will use the remainder of my time to identify some of the concerns States have expressed in complying with the amendments.

With regard to the new category of "Sensitive Personal Information," the AAMVA community is very pleased that Congress has authorized access to law enforcement, insurance companies, employers, and the courts. The information disclosed for those purposes has a direct impact on public and highway safety.

Subsection 350(c) amends permissible use 11 and requires States to receive express consent of the person prior to the release of individual records for secondary use. This amendment eliminated the opt-out provision.

The term "express consent" is not clearly defined and may create a non-uniform interpretation at the State level. The term "opt-in" has a uniform meaning among State agencies and industry partners alike. Typically, an individual opts in, in writing. Express con-

sent may be interpreted by States to mean either in writing, verbally or electronically.

In light of the burden placed on States to receive express consent, clarification would help ensure that the State practices are uniform.

Subsection 350(d) amends permissible use 12 and requires States to receive the express consent of an individual prior to inclusion of their record for bulk distribution for surveys, marketing and solicitations.

A survey of AAMVA's membership reflects that members are working diligently to comply with the implementation deadline. However, some States have determined that the costs associated with establishing a statewide opt-in system for a small number of participants would not be the best use of limited financial resources. Therefore, many States will simply close their records for marketing purposes.

The AAMVA community also seeks clarification of Subsection 350(e). The intent of this language is not clear. In seeking clarification of this subsection, Congressional staff explained to the Association that the intent of the language is "not to burden the individual to give express consent as a condition of the receipt of a motor vehicle record."

The problem with that interpretation is that the language never references the "individual." The language only references "the issuance of a motor vehicle record."

Some States' Attorneys General have expressed concern that this language would prevent a State from charging an administrative fee for records. If the intent is not to coerce individuals into giving consent, then that needs to be clearer, and AAMVA recommends redrafting the language in Subsection 350(e).

In late February, AAMVA wrote Secretary Slater to request written interpretation of the language found in Subsection 350(f). Our concerns relate to the fact that the State administrators were unclear what actions the Department would undertake if a State is found to be in noncompliance. In addition, the language includes reference to "grantee," which is not used elsewhere.

The motor vehicle community is seeking clarification on whether the language is referencing receipt of safety grants, such as are available under Section 402 or 410 of DOT appropriations.

Finally, the Association seeks clarification on behalf of its members on permissible access to the press. Many States have allowed access to the press under permissible use 14 of the DPPA. We would appreciate clarification on this issue.

AAMVA has compiled information on States' implementation strategies to date. We have also submitted an additional list of concerns States have expressed that require further clarification. Guidance on these issues will help ensure that States implement the provisions consistent with the subcommittee's intent.

PREPARED STATEMENT

We look forward to working with the subcommittee and staff to resolve these issues. I thank you for the opportunity to testify today and will respond to questions.

[The statement follows:]

PREPARED STATEMENT OF ROGER D. CROSS

Good morning Mr. Chairman and members of the Subcommittee. My name is Roger Cross. I am the Administrator for the Wisconsin Division of Motor Vehicles and I'm here representing the American Association of Motor Vehicle Administrators (AAMVA).

AAMVA is a voluntary association representing the motor vehicle administrators and highway safety officials in the United States and Canada. Our members are responsible for administering the laws for motor vehicle operation, and they maintain the driver history records of more than 200 million vehicle operators in the United States alone.

I know I speak on behalf of my fellow administrators when I say that we share the concern of Congress and the public to protect the privacy of personal information gathered and maintained by state agencies.

I am pleased that two other member jurisdictions of AAMVA, the States of California and Maryland are also participating in this morning's hearing. They represent two distinct perspectives on access to driver and motor vehicle records.

The focus of my testimony is on issues identified by the forty-five (45) states that have to comply with the amendments by June 1, 2000. South Carolina, Oklahoma and my State of Wisconsin have accelerated implementation deadlines as a result of the Supreme Court decision.

Motor vehicle officials take very seriously our role as administrators of a consumer protection agency, a highway and traffic safety agency, and as administrators of the leading state government agency for identity verification.

Because of this multifaceted accountability, we are continually balancing the legitimate needs to access records for safety purposes against the unauthorized release of information that may infringe on an individual's personal safety.

That's why AAMVA played an active role in shaping the original language of the DPPA in 1994. At that time, there was not 100 percent agreement among the states that the DPPA would provide the level of privacy protection that it purported. Many states questioned its constitutionality. In fact, Wisconsin was one of those states.

The recent U.S. Supreme Court decision in *Reno v. Condon* has clarified states' questions about the constitutionality of the DPPA. However, the passage of Section 350 has raised a host of new concerns for the states.

I will use the remainder of my time to identify some of the concerns states have expressed in complying with the amendments.

With regard to the new category of "sensitive personal information," the AAMVA community is very pleased that Congress has authorized access to law enforcement, insurance companies, employers, and the courts. The information disclosed for those purposes has a direct impact on public and highway safety.

Subsection 350(c) amends permissible use 11 and requires states to receive the express consent of the person prior to the release of individual records for secondary use. This amendment eliminated the "opt-out" provision.

The term "express consent" is not clearly defined and may create non-uniform interpretation at the state level. The term "opt in" has a uniform meaning among state agencies and industry partners alike. Typically, an individual "opts in" in writing. Express consent may be interpreted by states to mean either in writing, verbally or electronically.

In light of the burden placed on states to receive express consent, clarification would help ensure that state practices are more uniform.

Subsection 350(d) amends permissible use 12 and requires states to receive the express consent of the individual prior to inclusion of their record for bulk distribution for surveys, marketing and solicitations.

A survey of the AAMVA membership reflects that members are working diligently to comply with the implementation deadline. However, some states have determined that the costs associated with establishing a state-wide opt-in system, for a small number of participants, would not be the best use of limited financial resources available to these agencies. Therefore, many states will simply close their records for marketing purposes.

The AAMVA community also seeks clarification of subsection 350(e). The intent of this language is not clear. In seeking clarification of this subsection, congressional staff explained to the Association that the intent of the language is "not to burden the 'individual' to give express consent as a condition of receipt of a motor vehicle record."

The problem with that interpretation is that the language never references the "individual." The language only references the "issuance of a motor vehicle record."

Some states' Attorneys General have expressed concern that this language would prevent the state from charging an administrative fee for records. If the intent is

not to “coerce” individuals into giving consent, then that needs to be clearer. AAMVA recommends redrafting the language in subsection 350(e).

In late February, AAMVA wrote Secretary Slater to request written interpretation of the language found in Subsection 350(f). Our concerns relate to the fact that state administrators are unclear what actions the Department will undertake if a state is found to be in noncompliance. In addition, the language includes a reference to “grantee,” which is not used elsewhere.

The motor vehicle community is seeking clarification on whether the language is referencing receipt of safety grants such as are available under Section 402 and 410 of DOT appropriations.

Finally, the Association seeks clarification on behalf of its members on permissible access to the press. Many states have allowed access to the press under permissible use 14 of the DPPA. We would appreciate clarification on this issue.

AAMVA has compiled information on states’ implementation strategies to date. We have also submitted an additional list of concerns states have expressed that require further clarification. Guidance on these issues will help ensure that states implement the provisions consistent with the Subcommittee’s intent.

We look forward to working with the Subcommittee and staff to resolve these issues. I thank you for the opportunity to testify today and will respond to questions at the appropriate time.

QUESTIONS REGARDING IMPACT OF SECTION 350 IN IMPLEMENTING AMENDMENTS TO
DRIVER’S PRIVACY PROTECTION ACT

1. What is the impact on operation of National Motor Vehicle Title Information System (NMVTIS) or any other electronic system developed to exchange motor vehicle information through third-party providers?

2. What are private investigators allowed access to if request is not connected to an ongoing court case?

3. Does “motor vehicle record” as defined in H.R. 2084, section 350(a) include “all” motor vehicle records [which is how it is defined in the DPPA at section 2725(1)] or just the personal information contained within the motor vehicle records?

4. Are third parties acting on behalf of insurance companies still able to buy motor vehicle records in bulk if the information is used only for insurance purposes?

5. Will subsections (a) and (b) of Section 350 expire annually as they are tied to appropriations language?

6. If there is a missing signature to transfer title, can the jurisdictions rely on permissible use 14 to release personal information to the customer who is seeking to contact that person to obtain the required signature?

7. Are bulk sales permitted, without receiving express consent, for motor vehicle records (i.e., vehicle identification number, make, model) if no personal information is released?

8. Is it permissible to provide personal information from motor vehicle records to lawyers seeking clients to sue liable parties involved in accidents? These attorneys are called “ambulance chasers” and seek this information for business development purposes.

9. Is it permissible to disclose personal information to licensed security services that call the DMV to verify the owners of vehicles parked on their premises?

10. The walk-ins have caused a great deal of confusion for many jurisdictions. For instance, current practice is that if someone walks-in and supplies the DMV with the name, date of birth, and address of an individual, information will be provided to them without receiving “express consent” from the individual to whom the record applies. Is that practice permissible under the DPPA as amended?

**STATUS OF JURISDICTIONAL IMPLEMENTATION OF DPPA AMENDMENTS
ARISING AS A RESULT OF SECTION 350 OF P.L. 106-69**

| JURISDICTION | STATUS |
|----------------------|---|
| Alabama | Will resume the process to adopt administrative regulation. Recommendation is that vehicle records be closed at this point, but they are still deciding whether to implement opt-in. Public Safety is also still deciding for driver records. They do not currently release records to individuals. They don't have opt-out—they don't sell for bulk distribution. |
| Alaska | Alaska has legislation introduced to mirror changes from Shelby amendments (House Bill 324 and Senate Bill 232 introduced 2/2/2000). Driver records are private and confidential so these changes won't affect it. Vehicle records: 3 companies get them, contracts will be revised to specify that they can only be released for permissible DPPA uses. |
| Arizona | Arizona has a short legislative session. They didn't do anything because waiting for clarification. If necessary they will comply administratively and draft legislation later, but they need clarification. |
| Arkansas | No regular session in 2000. Must comply by 2001. |
| California | California law is much stricter than DPPA, records are not released for marketing or solicitations. When an individual request is made, the subject is contacted and provided opportunity to restrict access. |
| Colorado | Senate Bill 11 pending in legislature. In Colorado, they have broadened law to make it stricter. They have proposed even stricter standards to include accident reports as something they won't release. |
| Connecticut | House Bill 5893 introduced March 8, 2000 would implement opt-in and add term express consent to bulk sales as well as to two other uses authorized under DPPA currently permissible use #3). Connecticut already has an opt-in for individual look-ups. Also would allow distribution of photos for fraud prevention purposes, but only if express consent of the individual is obtained. |
| Delaware | Senate Bill 146 pending from 1999 would close records and provide for release only with express consent of individual. |
| District of Columbia | D.C. does not release records for marketing purposes. Vehicle and driver records are only released to casual requestors when accompanied by permission of the driver. |
| Florida | House Bill 1967 would implement opt-in system. Introduced 3/15/2000. Bill on committee agenda for April 3, 2000. |
| Georgia | GA law is much stricter than DPPA. They do not sell for bulk purchase, and casual requestors must have signed, notarized document authorizing access from the record holder. |
| Hawaii | Casual requestors cannot get personal information. Hawaii law specifies that the driver must give consent to release and can limit access to specific uses. |
| Idaho | Will implement opt-in. Governor approved Senate Bill 1435 and Senate Bill 1409 on March 22, 2000. |

| JURISDICTION | STATUS |
|---------------|--|
| Illinois | Driver records have been closed administratively. Undertaking comprehensive re-write to adopt legislatively, but already comply administratively. They have legislation in this session to restrict photos. Vehicle Records. Illinois has had no bulk sales for marketing for past 3 years. In Illinois, personal information is not released, unless allowed under permissible uses. When an individual request is made, there is a 10-day waiting period when the individual is alerted that someone has requested their record. |
| Indiana | Will implement opt-in. HB 1097 became Public Law 39-2000 on March 15, 2000. Never had opt-out for individual lookups because existing statute provided that information is released only for permissible uses under DPPA. Don't do bulk sales for marketing. Bulk sales permitted only for permissible uses. Have contracts with Polk, Experian, and Equifax for recalls, etc., but cannot be used for marketing. |
| Iowa | Will implement opt-in. Senate File 2313 pending before the Iowa legislature. All records private, unless someone wants to opt-in, which can be accomplished through a form. |
| Kansas | Kansas will do an opt-in by the deadline and comply administratively. Kansas law currently precludes use for marketing purposes. Disclosure of photos is also currently prohibited by statute, except for law enforcement. |
| Kentucky | Kentucky driver records are not released except for lawful purposes. Never implemented opt-out under DPPA. Casual requestors cannot get personal information, unless they have a release from the individual. Vehicle changed so they can only sell for purposes outlined in the law. Bulk sales for marketing will no longer be permitted. Casual requestors cannot get records without written release from individual. |
| Louisiana | Louisiana has closed their records administratively. Unless they come under the other disclosures of DPPA, they won't be released. Someone can get a record if they have a signed release from the individual. Bulk sales are closed. |
| Maine | Maine had an opt-out but they will go to an opt-in system. They will keep exceptions from the DPPA. Intention is to completely institute through rulemaking. Intend to make it by the deadline. They will also do some publicity. Have separate state law prohibiting disclosure of photos. SSNs always confidential. Title 29A, MRSA Sec. 1401. |
| Maryland | Maryland will implement opt-in. Records were closed prior to passage of Shelby amendments. |
| Massachusetts | Massachusetts records are not sold for bulk purchase so they will not implement an opt-in. |
| Michigan | House Bills 5227, 5230, and 5270 pending. They would prohibit bulk sales. Michigan never instituted an opt-out, so there are no casual sales. |
| | Highly sensitive info: Michigan has highly restrictive information, which already includes photo, SSN, medical. They have had two classes of personal information for 3 years. There must be a state law authorizing access to the highly restricted information. Photos can never be released except for law enforcement. Courts can also issue a court order to get it. Statutes are separated, so that's why three bills are being pursued. |

| JURISDICTION | STATUS |
|----------------|---|
| Minnesota | Minnesota legislature considering bill (Senate file 2992) to direct Commissioner to do whatever is necessary to comply with new requirements. |
| Mississippi | Vehicle: Don't think the changes will have an effect on them, since releases are compliant with DPPA as amended. Driver: They are not going to do opt-in, and will comply administratively. Unless you have a signed release, you won't be able to get a record. Closing bulk sales all together. |
| Missouri | Department has drafted language to coincide with federal legislation and is seeking a sponsor. In the midst of implementing administratively. They will define express consent as written consent from the person. Closing bulk sales all together. Senate Bill 538 (pre-filed 12/7/99), House Bill 1079 (introduced 1/5/2000), Senate Bill 565 (introduced 1/5/2000), and House Bill 2102 (introduced 3/6/2000) all pending. They propose to implement the opt-in in various forms. Department will pursue its own legislation. |
| Montana | No legislative session in 2000. Will comply in 2001. |
| Nebraska | Implemented opt-in. Creates new category of "sensitive personal information." LB 1317 signed into law by Governor on March 21, 2000. Effective June 1, 2000. |
| Nevada | No legislative session in 2000. Will comply in 2001. |
| New Hampshire | House Bill 1620 pending before Transportation Committee would implement opt-in for bulk sales. Goes further than Shelby amendments. |
| New Jersey | New Jersey is in compliance with Shelby amendments and does not need legislation. Individual records may be released with notarized written consent of the person whose record is being requested. |
| New Mexico | New Mexico cannot sell any part of its database for marketing or solicitation, or for contacting individuals. Only the individual or an employer can get individual records, as well as law enforcement. |
| New York | New York complies administratively. They have treated driver records as personal records all along. Have required every requestor to sign an agreement in order to get it stipulating what they will use it for. There is Assembly Bill A07413 pending—closes records to purposes 11 and 12 of DPPA, as amended by Shelby amendments. If nothing passes they still comply administratively. |
| North Carolina | North Carolina records are closed. Personal information contained in motor vehicle records at the North Carolina Division of Motor Vehicles was scheduled to be available to mass marketing companies beginning January 1, 2000. The North Carolina General Assembly enacted a law effective July 1, 1999 to prohibit release of personal information to mass marketing companies unless DMV has received prior permission from the citizen. All motor vehicle records maintained will remain closed to mass marketing companies unless a citizen would like that information to be released. |
| North Dakota | No legislative session in 2000. Will comply in 2001. |
| Ohio | Rulemaking under way currently to comply administratively. |
| Oklahoma | House Bill 2100 pending. Passed House, and referred in the Senate. Personal information is prohibited from being distributed under this legislation, except for law enforcement and among other state agencies and other DMVs. Attempting to create a form for individual request, as well as an authorization form for the covered entities under DPPA. May implement opt-in. |

| JURISDICTION | STATUS |
|----------------|--|
| Oregon | No legislative session in 2000. Will comply in 2001. |
| Pennsylvania | State statute is more stringent than DPPA. Records not distributed for marketing. Vehicle records are released only for recalls. Driver records released only for insurance Fair Credit Reporting Act, and employment purposes. |
| Rhode Island | Rhode Island does not sell bulk records for marketing. Will comply by June 1, 2000. |
| South Carolina | South Carolina will comply administratively. Records have been closed since Condon v. Reno. |
| South Dakota | They will close records except for authorized uses under DPPA, as amended. May restrict even further. Will hope to implement administratively by May 1. |
| Tennessee | They will close records administratively effective June 1, 2000. Right now, they have an opt-out. They will close records, and won't release for bulk or casual requestors unless someone completed an opt-in form to give them permission. Driver and vehicle records will both be under the same policy. Will propose legislative change in next session. |
| Texas | No legislative session in 2000. Will comply in 2001. |
| Utah | Utah Senate Bill 174 signed into law by Governor on 3/14/2000. Makes records of the Department private. Records may only be released in conformance with the DPPA as amended. Driver records not sold for marketing in bulk. Senate Bill 174 allows Utah to disseminate personal information from driver records only when it is determined to be in the interest of public safety, and according to the DPPA as amended. Information obtained may not be re-disclosed or used for advertising or solicitation purposes. |
| Vermont | In Vermont, individual lookups have and continue to require consent of the individual prior to release. Vermont does not release records for bulk sales for marketing. When a request for bulk information comes in, the Commissioner and AG's office review the request to ensure compliance with DPPA. Applies equally to driver and vehicle records. |
| Virginia | Virginia does not sell records in bulk for marketing purposes, and personal information is not released to casual requestors. VA Code Section 46.2-208 specifies when records may be released. Driver and vehicle information are considered to be privileged and subject to restricted release. |
| Washington | Washington did not adopt the opt-out provisions, and sensitive personal information is not disclosed, so they do not need to make any changes to comply. |
| West Virginia | They will implement administratively according to new Shelby requirements. Unless you opt-in, folks can't get anything. |
| Wisconsin | Wisconsin will close records for bulk sales as of April 13, 2000. Individual look-ups will require completion of a form specifying which use the request falls under. Written consent from the individual will be required for permissible use 11. |
| Wyoming | They will pull the federal statute and use AAMVA model law. They added signature to personal information. They will issue temporary rule for 120 days, then initiate formal rulemaking. |

Senator SHELBY. Thank you.

I want to ask all of you this question: What is the purpose of a driver's license? Ms. Ferro.

Ms. FERRO. The purpose is fundamentally public safety.

Senator SHELBY. Sure. Mr. Majerus.

Mr. MAJERUS. In my experience—and not with the Polk Company, because we do not purchase driver's license information. But with my past experience, I think that—I think the other purpose is identification. And that—it has come to be the identity card in the State that is called upon when you wish to conduct a business transaction or to appear before a notary or whatever—that you are the person who the license says.

It is—everybody who goes to the airport knows that it is an identification tool if you want to get on an airplane. So, it is certainly, in addition to that, also, a strong identification tool.

Senator SHELBY. Mr. Cross.

Mr. CROSS. The purpose of the driver's license is—as Ms. Ferro said, is public safety, to assure that the people who are driving the roads are capable of driving, and of course, there is a revenue collection benefit, as well. But it has the effect of also becoming an identification card.

Senator SHELBY. Why do States collect personal information and snap photographs before issuing a driver's license? Ms. Ferro.

Ms. FERRO. To ensure that law enforcement—should you be a haphazard driver, in fact, to ensure that law enforcement can identify you at the time that they have a traffic stop, and ensure that it really is you.

Senator SHELBY. Mr. Cross.

Mr. CROSS. Yes. We collect, obviously, the address information for notification, if we should need to notify the driver of a change in their driving status. We also, obviously, use the photograph for identification purposes.

Senator SHELBY. For a government need, in a sense, is it not?

Mr. CROSS. Yes.

Senator SHELBY. If you were called upon. Mr. Majerus.

Mr. MAJERUS. I agree with that.

Senator SHELBY. You agree with that.

Should the U.S. Government sell census data for commercial purposes? Ms. Ferro.

Ms. FERRO. Let me—

Senator SHELBY. Just your opinion. I know it is not—

Ms. FERRO. All right. I will say, from Maryland's perspective—I will not say census data—motor vehicle data, if I may, on this point. Maryland has taken the position that, no, it should not; that it is for—

Senator SHELBY. Mr. Cross.

Mr. CROSS. Wisconsin will comply with DPPA and not sell the data. However, in bulk, I think it could be very useful—not with the personal identifiers.

Senator SHELBY. Mr. Majerus.

Mr. MAJERUS. I think census data is now only provided in demographic form. I do not believe it is provided on an individual household level. And whether they should do that or not, I will leave

that up to the Congress, because I know you debated that before you did the census.

I would point out, however, that some people do rely on that information and find it very valuable. And if the government decided not to do that, they would probably use other methods of modeling and profiling to accomplish the same objective.

Senator SHELBY. Yes. They would figure out some other way, but it would not be using information that is compelled by the government of all of us, as citizens, that we give to the government because we have to. If we do not, we will not get a driver's license, for example.

And second, we are compelled by law to do this, it is required in order to operate a vehicle. We have to give this information and so forth. But most people, I believe, do not realize that this information is being sold after it is extracted from them, for a profit, by the government.

Ms. Ferro.

Ms. FERRO. Well, I would affirm—based on our experience with an opt-out system, I would affirm your remarks. Prior to 1997, I would have said, “No. The public knows it is public, because they come in and buy them all the time, to the tune of \$10 million.”

Senator SHELBY. Okay.

Ms. FERRO. But clearly, the public was not aware of it.

Senator SHELBY. Okay. Mr. Cross, last year, members of the Conference Committee that we were on, from your State of Wisconsin, insisted that the States party to the South Carolina suit have 90 days from the date of the Supreme Court ruling to be in compliance with the DPPA.

Mr. CROSS. Yes.

Senator SHELBY. We did that. The U.S. Supreme Court, in a unanimous decision you are very familiar with—

Mr. CROSS. Very.

Senator SHELBY [continuing]. Did not take as long as they might have thought to reach a unanimous decision. Your State of Wisconsin, as well as all States, is required to comply with the amendments to the DPPA by April 13, I believe.

Mr. CROSS. That is correct.

Senator SHELBY. What is your department doing to come into compliance?

Mr. CROSS. We are, essentially, in compliance right now. What we did was we had a form that we had used—we were originally—when we were in compliance prior to our joining the lawsuit, we had the forms already made up.

What we did, of course, we had to modify them to take out permissible use 14, but we will essentially be in compliance. However, we are being in compliance by simply not having an opt-in phase, and simply shutting off all—all use of marketing.

Senator SHELBY. Ms. Ferro, in your testimony, you state that the costs of implementing an affirmative consent system is estimated to be \$235,000, due to computer programming and new forms. Would you characterize this as a nonrecurring cost, basically?

Ms. FERRO. Yes. The only recurring cost is system maintenance of about \$50,000 a year. I would say, there is a cost, also, in lost

revenue from sales of bulk mailing lists of \$900,000, but that has not been—

Senator SHELBY. I see.

Ms. FERRO. I am sorry.

Senator SHELBY. Mr. Majerus, at least seven States, including the State of California, our largest State in population, do not permit the disclosure of personal information for commercial purposes. Does this mean that you do not provide personal information to marketers about the residents of California at all, or do you do it in other ways?

Mr. MAJERUS. We do—we do purchase the information for commercial purposes in California. We purchase registration and title information for recall and statistics, and for—for compiling title histories that do not have name and address in them. So, we do purchase records for commercial purposes.

We do—we are not allowed to use those records for direct marketing or solicitation.

Senator SHELBY. Okay. Do you use it mainly for safety considerations?

Mr. MAJERUS. Recall—

Senator SHELBY. That is what I mean.

Mr. MAJERUS. Product recall goes much beyond safety nowadays. There—you know, there is one set of recalls that is mandated by the Federal Government. In some Administrations there is less mandated recalls and more voluntary recalls. There is other product recalls related to motor vehicles that are not safety-related.

And then, in more recent years, there are a number of environmental recalls that are—that happen. So, it goes—it is broader than just the safety issue anymore.

Senator SHELBY. Senator Bennett.

Senator BENNETT. Thank you, Mr. Chairman.

Mr. Majerus, you made a comment that I find interesting, and I would like you to expand on. You say if—if this information is not made available in the ways that it historically has been, that they—your customers—I gather, your customers—I did not get it all written down, exactly, so I may not have it exactly right, but you made the phrase, “they will do more mining for consumer information than they are doing now,” and that ironically, that may end up bringing up more information in—in a public way or in a way that some privacy advocates would be concerned about, than the present system would.

Would you expand on that? Because that is a very interesting kind of side effect. We live in a world of unintended consequences as we pass legislation here. And I just kind of caught that as you went by, that maybe the side effect in one area will be a lessening of privacy, because of more mining of this.

Can you tell us what you mean when you say, “do more mining”?

Mr. MAJERUS. I will use—I will use the—

Senator BENNETT. Did I get the phrase right?

Mr. MAJERUS. Yes. I will use the Chairman’s example in California, where we are unable to use vehicle-specific data for direct marketing. In those States, our clients have to use other data to try to achieve similar results.

As I pointed out in my testimony, first of all, it is more expensive and it is not as effective. But what they do is they compile other data, they look at other data, they do profiling, they try to make a relationship with the type of product that they are selling, and they collect, actually, more information on the consumer than they would before.

Privacy issues—

Senator BENNETT. What sources do they have for that, that would allow them to do that?

Mr. MAJERUS. Other sources within the industry. They may purchase data from other sources that collect information. Nowadays, everybody collects some. Not everybody sells it, but there are some that make it available for specific purposes.

I think privacy issues—I think it is careful to—or maybe we should recognize that privacy issues do not necessarily arrive from the source of the data, whether it is government data or whether it is private data, but on the subject matter, and whether the subject is sensitive, like, financial information, medical information, or other information that they consider—that the public considers very sensitive, and of course, the use of that data and how it is used in the end—whether it is used for honorable purposes or not.

Senator BENNETT. Let us go back to the first panel for just a minute, and Ms. Herman. Are there sources that could be used to achieve the goal of identity theft outside of government that might be stimulated by a change in the government's situation; that people would say, "Gee, I can get it someplace else"? In other words, are we going to exacerbate the kind of problem that she was talking about or not?

Mr. MAJERUS. That is possible. Again, it depends on how the data in the industry is protected and how careful the industry is who gathers that data and whether they make it available.

In some cases, they are very protective of that information. In most cases, they are very protective of that information. I am unaware of an incident where identity theft arose from somebody putting together a marketing list or getting marketing lists.

Quite the contrary, that we are occasionally contacted by people who want to know what type of information we have on them, because they feel that their identity theft was—or their identity may have been stolen, and they are wondering whether any of that information would get back to us in some way—whether it would be a change of address or something along those lines.

So, sometimes, that serves as a help to people who are concerned about their identity theft.

Senator BENNETT. Thank you. Thank you, Mr. Chairman.

Senator SHELBY. I want to thank all of you for appearing here today—both panels—and I appreciate your candor.

What I have heard here today convinces me that Congress did the right thing on the Transportation Appropriations bill last year, except we may not have gone far enough.

SUBCOMMITTEE RECESS

I am going to continue to work in this area, because I myself, think that this privacy belongs to the individual. And especially, where government compels you to provide this information, the

government, in my opinion, should not sell, barter or transfer that data.

Thank you, all. The meeting is recessed.

[Whereupon, at 11:48 a.m., Tuesday, April 4, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENT OF TRANSPORTATION AND RE-
LATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

TUESDAY, JULY 25, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:45 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Specter, Campbell, Lautenberg, Reid, and Murray.

**OVERSIGHT HEARING ON AVIATION CONSUMER SERVICE
AND DELAYS**

DEPARTMENT OF TRANSPORTATION

FEDERAL AVIATION ADMINISTRATION

STATEMENT OF HON. JANE GARVEY, ADMINISTRATOR

OFFICE OF INSPECTOR GENERAL

STATEMENT OF KENNETH MEAD, INSPECTOR GENERAL

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. The Committee will come to order. Good morning.

The subject of today's hearing is something that almost everyone in the audience has some expertise in. I expect that almost everyone in the room has experienced airline flight delays and questionable airline passenger service, or they are afraid to fly—one or the other.

I thought that having a hearing today toward the end of the summer storm season would allow us to discuss some of the issues and challenges facing travelers, the FAA and the airlines, while all three of these groups struggle with the frustrations and the inconveniences of summer air travel.

During these peak summer months when it seems that virtually every American is taking to the air to reach their next business meeting or vacation destination, complaints about airlines have never been greater. Passengers are complaining about flight delays, flight cancellations, missing connections and shoddy service.

It is difficult to open a newspaper or watch the news without hearing another horror story about air travel. Perhaps the only statistic more revealing than the rate of increase in the number and duration of flight delays is the increased number of consumer complaints about poor service.

But that is not to say that there has not been progress in this debate over the past few years. There is wide-spread acknowledgment that congestion, delayed flights, flight cancellations, missed connections and inconveniences to air passengers, caused at least in part by the failure to manage congestion, is a serious problem in America. For when it comes to getting to the bottom of the delays, the air is thicker with accusations than with aircraft.

While everyone agrees that there is a problem that must be addressed, the airlines, the FAA, and passengers have different views on what factors cause the delay problems.

That is why this subcommittee asked the DOT Inspector General to look into the cause of delays and cancellations.

However, we should not have to call in the Inspector General to find out what is causing delays.

The airlines blame the FAA and the air traffic controllers for mismanaging the National Airspace System. The FAA blames bad weather, aircraft equipment problems, and outdated technology.

The air traffic controllers point their finger at the airlines for scheduling so many flights at the same time during peak hours.

Passengers just know the simple truth, that air travel is costly, unpleasant and less reliable than they would like.

There is probably validity to all the points of views that I have related. But we need to get away from the blame game and get to a commonly accepted assessment of the problem and work expeditiously and cooperatively towards a solution.

Over time, new air traffic control system technologies will allow reduced separation standards and will ease congestion somewhat. But I think we should be aware of regarding technology as a panacea.

Rather, I believe we should view technology for what it is, a long-term tool to increase capacity on an incremental basis.

Other reforms are also needed. For example, with the influx of regional jet service, which fly faster than turbo-props, but slower than larger jets, perhaps we need to create new altitudes for those slower jets to fly in. In effect, establishing additional highways in the sky, fast lanes, slow lanes, high lanes, low lanes.

The way I see it, we need to focus on doing two things, increasing air space capacity and doing a better job of managing capacity during disruption, whatever the cause.

The other topic I want to touch on this morning is the state of customer service in the airline industry. One has to only open a major newspaper, or turn on the nightly news, or take a flight to realize that passenger treatment is an issue on the minds of the traveling public.

The Department of Transportation Inspector General has recently completed a 6-month review of the airlines customer service plans, and he will give us his views on their progress in that regard.

The subject of delays and customer service are closely related issues. If a flight is delayed for several hours or cancelled, chances are that passengers are going to have a pretty dismal view of that carrier's treatment of its customers.

Accordingly, if an airline makes a traveler's trip longer by losing baggage, subjecting passengers to surly gate or flight attendants, long lines or cardboard sandwiches for the in-flight meal, a short hop can seem like it lasted an eternity.

I think what starts the airlines and the traveling public off on the wrong foot is the hurry-up-and-wait mentality that pervades the travel experience. We are told to get to the airport at least an hour before flight time, only to wait in line to be processed.

We are told to be at the gate at least 20 minutes before flight time or our seat will be forfeited, only to wait in line to be herded onto the plane like domesticated farm animals.

We are told to be belted in our seats 5 minutes before scheduled departure, only to pull away from the gate and be held hostage until the airline's real schedule or the system can accommodate us.

When we get down to it, the passenger is a captive in the system from the moment he or she arrives at the airport. That is the nub of customer dissatisfaction and frustration with air travel, and why some of my constituents and colleagues believe it may take an act of Congress before many airlines will treat their customers with more respect and offer better, more reliable service.

I would note that some airlines do a better job than others in both of these areas. And perhaps the Inspector General will name some names this morning.

I would also note that some of the point-to-point carriers and the low-fare airlines offer better passenger treatment or do a better job of communicating to passengers what to expect and in recovering from disruptions to their flight schedules than the hub and spoke carriers.

That leads me to believe that we can do things better and that the airlines can treat passengers better. But that passengers or the Congress has not yet found the right way to get enough attention on these issues.

While all the network carriers compete on a non-priced basis for the high-fare passenger, what have the airlines done to help the non-business passenger? Ask any mother with small children how much they look forward to traveling the friendly skies. In the name of productivity, some have eliminated the outdated practice of allowing mothers and small children the option of pre-boarding the aircraft.

I guess it was inconvenient to the flight attendants or the first-class passengers. If eliminating that courtesy has made the departure more efficient and timely, the airline should look into streamlining the process even more.

Let us have the first-class and the titanium, millennium, premiere status frequent flyer board with a mother struggling with two car seats, a stroller to gate check, the diaper bag, and two little ones. I would hope that the airlines could find ways of expediting the boarding process without making travel anymore stressful.

I believe Senator Reid—Senator.

STATEMENT OF SENATOR HARRY REID

Senator REID. Thank you very much, Mr. Chairman. I appreciate your holding this hearing. This is very timely.

Mr. Chairman, I do not know about the rest of you, but every time that I realize that I have to go home, which is very often, the day before the flight is ready to take off, I start getting a little anxious.

I wonder—I am wondering if the plane is going to be there when I get there. And if the plane is there, are we going to have a crew there. And then are we going to be taken out to the airplane and left on the airplane at the gate. And then are we going to be taken from the gate and left out on the tarmac some place.

All these things with my almost 20 years of experience here cause me to be a little bit anxious when I get ready to go home.

In recent weeks, we have seen a series of news reports that made my feelings—I guess the feelings of most Americans, because what we are told in a report that has not been totally completed, the Inspector General has released an interim report indicating that passenger complaints to the Department increased 74 percent since last year. And complaints about delayed, cancelled and re-routed flights were up 115 percent, more than double last year.

The report also indicated that airlines have done a poor job communicating the reasons for delays and cancellations to the customers. According to the report, the information provided by the airlines was frequently inaccurate, incomplete or unreliable.

Last year, in response to Congressional pressure, which you played a key role—which you are to be commended, Mr. Chairman—the airlines announced plans for voluntary reform.

But these numbers and my personal experience indicate that things have not gotten better. More—more than likely they have gotten worse.

So something needs to be done. Mr. Chairman, I have introduced some legislation. I introduced legislation about an air rage bill. I want to make sure that the hard-working airline employees are treated fairly.

I have had—I had an experience on an airline—well, actually on two occasions where these people were—the flight attendants were treated physically bad. And this—there is untold numbers of reports about how badly they are treated.

The—my air rage is now law. And no longer can the public treat flight attendants and other airline personnel as they have in the past—mean, actually physically abuse them and expect nothing to happen.

Now, something will happen, both civilly and criminally. And that is the way it should be.

And I have also introduced—I have worked very hard on the appropriations committee and this will be the second year of funding of which you have been a part of that, Mr. Chairman, where we—we are making sure that the cabin air quality—the air that passengers breathe is clean and safe.

We do not know about that. You hear all kinds of conflicting reports. Johns Hopkins University is studying that to make sure that is the case.

I also introduced last year an air traveler's fair treatment—last week, an air traveler's fair treatment act, which is aimed at some of the most pressing issues like giving prompt and accurate notice of delays, setting uniform regulations for medical equipment training, giving customers greater access to fair ticket prices, and a number of other things.

I am also working—this is the first year we have gotten money—and, again, Mr. Chairman, you have worked with us on this—to have off-site baggage check-in so that somebody can go directly to the gate, their baggage is already checked in and it is safe. It is better. And it will relieve tremendous congestion at airports.

This is a study that has been going on. People believe it will work. And we have tested it, and it will work.

But, Mr. Chairman, in spite of these things that I have done and other members of Congress have done, I think it is time to step back and take a broader view of the underlying causes for this congestion and delay, and examine more fundamentally what the Federal Government can do to help address these underlying causes.

As you have already indicated, it is not all the fault of the airlines. And that is an understatement.

Hardly, any new airports are getting built. We built a new one in Denver, closed one in Denver—net gain of nothing.

We have—our highways are clogged to capacity. Our airlines—our airports, I'm sorry, are clogged to capacity.

We add no new airports, but we keep adding new flights. And I mentioned recently, Mr. Chairman, to an airline—some airline people, I think they should understand they are not in the airline business. They are in the transportation business.

And they need to take a look at helping in other ways. I think they could make money doing this.

Senator Moynihan and I have worked very hard to develop different ways of carrying people for distances up to 300 miles, airline travel is very inefficient, but yet we have people all over America traveling 300 miles or less by air.

What we need to do is do what they are—what Danby and Powell, a couple of scientists from MIT who were stuck in traffic in New York in the sixties—they said, "This is wrong." And, well, to make a long story short, Mr. Chairman, they developed what is called magnetic levitation.

The Federal Government helped fund that for a few years. We stopped funding it. That all went to Germany and Japan. Now, we are going to be buying the technology that should be ours and the equipment that we should be manufacturing here from Germany and Japan.

I think the airline business should help us, the Federal Government, take a look at getting into some of this, traveling between Las Vegas and L.A. That is less than 300 miles.

Those vehicles go 300 miles an hour. They are safe. They are non-polluting. And we should move to that type of travel, because our rail travel now is—even though Amtrak—I am a big supporter of Amtrak, it is very old-fashioned and we need to do better.

Air traffic controllers, understaffed, underworked—overworked, I am sorry—and at major airports often working with air traffic control systems that are obsolete and in dire need of repair and up-

grade. Some of the systems at our busiest airports are decades old, and we are installing stuff now even—that it has taken 20 years to get it ready to be installed—it is old before we put it in.

So when I am on an airplane, I recognize that the people who are making my flight safe are the air traffic controllers. These people are the unsung heroes of modern aircraft safety. I mean, I cannot stress enough how much I appreciate their hard work.

And the pilots, we do not hear much from the pilots, but they also are to be complimented. We need to get—and I am glad that you are going to have here, Mr. Chairman, someone from the air traffic control network to talk about air traffic control.

We need their input. We need pilots' inputs. We need input from the airline. And we, as the Federal Government, have to step up—step up to the plate and start spending more money. As you have indicated in your statement, we need—we need new traffic lanes through the air.

The State of Nevada, about over 40 percent of the State of Nevada, you cannot fly over. It is restricted military. We got to take some of these—take a look at this. If we can in Nevada and other places change that.

So let us step back and figure out what the FAA needs in order to do its job. The number of flights keep increasing. It is going to cost us, but the Senate has just passed some bills that we are cutting a lot of taxes, which is great. But maybe we should not cut taxes as much for some wealthy people; instead let us give some money to some of the people that will make it safer for all of us to fly.

We need to buy more simulators for air traffic controllers to help new controllers learn more quickly. Right now, new controllers are required to have more separation between planes on the runway, which contributes to delays, simply because they have not been trained enough through simulators.

We need to do a better job educating passengers about what is going on behind the scenes. Maybe we can think about putting up electronic weather maps in airport terminals so that passengers can see for themselves the weather fronts that might be keeping them on the ground.

Or maybe we can set up information kiosks so that they can better understand the kinds of mechanical or safety problems that might delay a flight or why a weather front in Cleveland would hold up a flight in Las Vegas.

Or maybe the Federal Government and the airline industry needs to widen its focus. Instead of thinking of themselves as only being in the airline business, as I mentioned, maybe we can start viewing ourselves as being in the transportation business and look at supplementing air travel through alternatives.

These are just some of my ideas, Mr. Chairman. My fundamental point is that the causes of gridlock at our airports are complex. I think we need to be creative in finding solutions, because what we are doing now is not working.

I commend, again, you for your interest. I am looking forward to working with this Committee to find ways to improve the quality of air travel.

And I ask your permission, Mr. Chairman, I have—the Senate is going to move off the morning hour at 10:30, and I have to be there to make sure that the Republicans treat everybody fair.

Senator SHELBY. Thank you, Senator Reid.
Senator Campbell.

STATEMENT OF SENATOR BEN NIGHTHORSE CAMPBELL

Senator CAMPBELL. Thank you, Mr. Chairman, for holding this very important hearing this morning. It could not have come at a better time. We all fly. I happen to fly home every week, as Senator Murray often does too. I often see her just as frustrated at the airport as I am.

And what is interesting is that people recognize us in the crowd will often come up and complain to us and say, “Senator can you not do something about this?”

I guess they are rather surprised when I tell them, “Wait a minute, you have got a story? Let me tell you my story.”

I guess they think somehow we get a better deal and that we can get on them when they are not flying for anybody else. But we—we face the same kind of complaints.

And I think the night before last, I have to tell you, was a good example. I thought I was going to have a bill that was going to be on the floor yesterday, so I went to the airport Sunday afternoon, where I saw Senator Murkowski and we got on a plane. Then we were told after we sat on the plane for about a half an hour, there was going to be a delay, because one oxygen mask on a portable oxygen bottle was missing on the plane. I guess the FAA regulations are that the whole plane has to be checked for oxygen leaks or something, if one little old mask is missing. And so they ended up cancelling the flight.

Senator Murkowski never did get on a flight that night and had to cancel a very important hearing, because he could not get here. I managed to get on what is called a red-eye, which we all hate, but often have to get on.

The only red-eye was going to leave Denver at 11:30. It got out of there about 1:00 in the morning, and I ended up getting here about 8:00 o'clock the next morning, just absolutely ringy as we all are when we have to catch those flights. So I am just as fed up and frustrated with the delays as anybody else that is flying.

Senator Reid mentioned a number of things that I assume were supposed to be in the purview of the FAA, whether it is pilot training, air separation, whether it is dealing with the virus loaded oxygen that we keep breathing on those airplanes, or air traffic controllers, and so on.

I do not think we can micro-manage all of that, very frankly, from Congress. And we should not. But clearly they are some of the things that people are beginning to worry about.

I am not opposed to flying. I happen to—I used to fly. I have about 600 hours in high-performance single. I am IFR-rated. I used to love to fly.

But very frankly, when I get done with this job I have already told my wife, I am going to take a note out of John Madden's book and buy a doggone bus where I have a pretty sure chance I am going to get there.

From where I take the mainline to Denver, I have to take a commuter for another hour, if I fly. It is a 6-hour drive. But on many occasions, I have ended up having to drive the 6 hours because I could not get on a plane.

If I had known when I first got to the airport in Denver the planes were going to cancel, I could have just got a car and taken off. The real problem is you sit around there when they say, "Well, one more half hour, or another hour we will have a definite decision."

And you keep—they keep milking the thing. You keep staying there and staying there and staying there until you eat up 3 or 4 hours when you could have been on the road at least driving to where you were going to go. So we all face that too.

And I guess while I am on this tirade, I might also say I wish they would change some of the comments they always make, you know, at the beginning of the flight—the flight attendants always say something, "In case of emergency," and then they go through this—this dialogue.

"In case of emergency," I am beginning to think is sort of code words for "In case we crash." And they say, you know, pull down the handle, turn the door to the side, throw the door out, all that kind of stuff. Have you ever seen one of those things after they crash?

I think they ought to change the whole rhetoric and be honest and say, "In case we crash, forget the door and start praying."

Thank you, Mr. Chairman.

Senator SHELBY. Senator Murray.

STATEMENT OF SENATOR PATTY MURRAY

Senator MURRAY. Mr. Chairman, I would like to thank you for having this hearing—

Senator SHELBY. You are welcome.

Senator MURRAY [continuing]. And thanks to our speakers today for coming to talk about an issue that obviously really makes most people irate. Senator Campbell and I have spent many hours in the airport together trying to get back to the west coast.

I travel 6,000—over 6,000 miles a week. And I have heard every comment and every frustration from travelers. Concerns have increased dramatically over the 8 years I have been doing this. I think there is a lot of fingers to point and I think the airlines themselves do need to make this commitment.

The comment I hear most often is if they would just tell us the truth. Senator Campbell just mentioned that. Why? Because if—if it is not going to be as busy as you say, we will find another way to get there.

This is probably the biggest frustration. People want safe ways to fly. But they would like to have the truth from the airlines, and I think that is critical.

But, Mr. Chairman, I think this hearing is important because it points out that this is more than the airlines' responsibility. We have a responsibility in Congress to make sure that we have the infrastructure in place to accommodate the ever-increasing number of Americans who are flying.

Modernizing air traffic control, making sure that strong competition is in place, and making sure the infrastructure exists is something we have to do. I think it is very important that this Committee in particular hears this topic and looks for ways that we can help solve this ever-increasing frustration that many Americans are facing. So thank you for having us here.

Senator SHELBY. Senator Lautenberg.

STATEMENT OF SENATOR FRANK R. LAUTENBERG

Senator LAUTENBERG. Thank you very much, Mr. Chairman. I am sorry for the delay, but conditions beyond our control prevented me from being on time.

Senator SHELBY. You must have been on an airplane.

Senator LAUTENBERG. I thought that would get at least a snicker.

Senator SHELBY. Well, it got one.

Senator LAUTENBERG. Okay. Thank you very much. I listened to my colleagues with great respect and with a degree of monotony because we are all going to say the same thing.

Just like our constituents across the country, we are not getting the kind of service we are paying for, and it is appropriate that we are meeting at this time. We just saw a published report on delays. And in this past month, June 2000, the number of monthly delays across the country topped 50,000 for the first time. The number more than doubled from the same level—from the level experienced, rather, 6 months earlier, December 1999.

And when I look at that card up there and I say, “Well, there is the report card.” Now, if I was the teacher or if the public was the teacher, what kind of grade do we think that the airlines and their partners in managing the aviation system would get.

It would not be a very good mark in my view when I see “offer the lowest fare available and notify customers of delays”—I do not know how many of you get phone calls that say, “Sorry, Mr. Smith, but your plane is delayed two hours.”

What I get is, “The flight is on time. We know that there are thunder storms, snow storms, lightning and dangerous conditions, tornadoes, but we expect to be taking off on time.”

And when you get there, you find out that you are in good company with lots of other disappointed people, so we are—this is not, Mr. Chairman, I am assured by your balanced view of things—I know this is not to be a vendetta.

But we are going to ask some questions and find out for the public why it is that the answers are so foggy and so often delayed.

The FAA tells us that the same time frame, the number of delays attributable to bad weather grew by almost 150 percent, but we also know that several airlines have struggled to keep up with the record demand for air travel in terms of having the right crew, the equipment in place at the right time to ensure that the flights take off on time.

And it is appropriate that this hearing combines two of the issues, delays and customer service. Nothing challenges the airlines’ ability to provide quality customer service like crowded airplanes, sitting on a taxi way for hours as a thunder storm passes overhead, but we also know that when it comes to providing quality customer service, the airlines can do a much better job.

Jane Garvey—we are happy to see our FAA administrator this morning—is going to be testifying on the topic of delays. And in her testimony, as usual, Ms. Garvey exhibits her candor and her commitment to improvement.

We appreciate that, to always be willing to speak out on the issue, because hiding them is not going to make them go away. As a matter of fact, sometimes we speak out and they do not go away. But we will have to work on it.

She points out that in the past the FAA has been criticized appropriately by the airlines for not treating them like customers. But I would point out that the inspector general, Ken Mead, who we often see telling us what is happening in the real world is also here this morning to testify that several of the airlines have taken the liberty of blaming the FAA for their own problems.

The I.G. has identified several instances in which several airlines have blamed delays on the FAA when, in fact, the causes were attributable to extremely bad weather, crew unavailability, or maintenance problems.

So while I appreciate the fact that the airlines would like to be treated more like customers, I would point out that airline passengers would like to be treated more like customers than cows by the airline. At a minimum, they do not want to be lied to.

Last year, Congress balked at the enacting of a passenger bill of rights. In my view, it was a mistake. Unfortunately, the leaders of the Senate Commerce Committee decided to accept a voluntary customer service commitment on the part of the airlines.

And it was later found out that of the 12 commitments the airlines made, only two of them were new. Ten of these so-called commitments or maybe commandments were already required in law or regulation.

The I.G. will testify this morning the performance of the airlines in meeting even the 10 long-standing customer service requirements is mixed at best.

Six months from now, the inspector general will be doing a follow up review of the airlines' performance on these commitments. I will not be here when my colleagues receive that review. But I hope that my colleagues will not flinch at moving passenger rights legislation, if the I.G. finds that the airlines have yet again failed to live up to their word.

I want to say something. I am not an opponent or a particular critic of airlines. They do a pretty darn good job. Our system is fundamentally safe. We get a lot of passengers moved through the place each and every day, almost each and every hour of the clock.

But the fact of the matter is that they are not very free with their information. They are not very generous with the way they treat cancelled flights or cancelled seats, which is a worse condition.

I have had a couple of those. And I do not speak for myself, because I represent the whole of New Jersey and the country when I am in this job of mine.

But cancelled flights, I got to a flight. It was 15 minutes to go. It was oversold and the seats are filled.

So I said, "Well, why do you not offer somebody a bonus to hop off." Well, they went through, they said no one would take it.

But they were not going to give me the bonus that they would have given to someone else, because there was someone sitting in the seat. Well, in my position, you do not make too much of a fuss, even though your blood is boiling. That is one of the reasons why I am retiring—make the airlines fulfill their promise.

Anyway, all estimates are that aviation traffic will continue to grow. A prosperous economy has brought us ever more crowded runways. Airlines experienced record high-load factors, even though the planes are packed full.

And I guarantee you that if I ask for a show of hands, there would be people here who would tell you that on a short flight between here, let us say, and New York—that includes Newark, that includes Westchester County—that many times the delays have been far longer than the air time, that the flight takes to get there.

And that is a terrible annoyance, frustration that lots of time it results in cancelled critical appointments, be it doctors, be it business, be it family—pick up a child coming out of school or something of that nature. It is not an acceptable condition.

In my region of the country, the growth in traffic will put an even greater strain on an already stressed system.

Mr. Chairman, I have got a considerable challenge representing the most delayed airport in the United States, Newark International. It has been the most delayed airport for each of the last 3 years and 9 of the last 12 years.

And I was commissioner of the port authority when that airport was being developed. And I am especially pleased that we have Ed Kragh here, a controller from New York. He is going to tell us things as he sees it.

I am interested in gathering his views, as well as those of Ms. Garvey and Mr. Mead on how we can specifically address the challenges related to the very congested air space, not only in the New York/New Jersey region, but across this country.

And I thank you very much, and I am sorry to take so long, Mr. Chairman.

Senator SHELBY. Thank you.

Our witnesses today are the Honorable Jane Garvey, Administrator, Federal Aviation Administration, U.S. Department of Transportation; the Honorable Kenneth Mead, Inspector General, U.S. Department of Transportation; Mr. Edward Kragh, Newark International Airport Air Traffic Controller, Secretary, Newark Local, National Air Traffic Controllers Association.

We welcome all of you here today. Your entire statement, all of them will be made part of the record in their entirety and if you would take a few minutes to sum them up.

We will start with Ms. Garvey.

Welcome, Ms. Garvey.

STATEMENT OF JANE GARVEY

Ms. GARVEY. Thank you very much, Mr. Chairman, Senator Lautenberg and members of the subcommittee.

AVIATION SAFETY

First of all, I do want to thank you for the opportunity to testify before you today. It is an important issue and we appreciate the Committee's great attention to the issue.

Let me state at the outset, and you may hear me say this again, that we at the FAA are willing to do whatever is within our power to improve the efficiency of the air traffic system, so long as safety is not compromised. That safety is of paramount importance, is clearly supported by everyone engaged in this discussion, in this debate.

2000 SUPPLEMENTAL FUNDING

Before I begin, I do want to publicly take this opportunity to thank the Subcommittee for its very strong support of our fiscal year 2000 supplemental funding request. Through your personal support, through your personal leadership, the \$75 million approved earlier this month will allow us to hire more safety inspectors, to replenish our inventory, and to restore the level of redundancy that is so important for our system.

Without your support and leadership this would not have been possible. And on behalf of everyone at the FAA, thank you.

DELAYS

Delays, as you all have said, have a significant financial, significant service consequences for the airlines and certainly result in understandable frustration for their passengers. There are many conditions that cause delay. I know the Inspector General will go into that in more detail. But everything from bad weather to inoperable runways, to airport capacity limitations, to equipment problems, crew problems and, yes, air traffic equipment outages and air traffic procedures.

Delays, while they will never be eliminated—and that is certainly true—but it certainly is our job, our challenge to minimize delays. I think it is a challenge for all of us, for us at the FAA, for the industry, for the unions, for the pilots, to work to minimize delays in whatever way possible—again, without compromising safety. I think it is important to say that sometimes delays are really a built-in safety mechanism. We do not want to lose sight of that.

You all have mentioned the great growth in the economy. And I think that is important. It is important to recognize really what has happened to air travel in this country. The deregulation of the airlines combined with what is an extraordinarily healthy economy has led to a huge increase in passenger air travel.

A 190 million more passengers are traveling now than 10 years ago. In addition, if you look at some of our busiest airport hubs, they are growing at 15 to 20 percent per year. That is significant. When the system is running at or near capacity as it has been, a large number of severe thunder storms can create havoc with our aviation system.

A few facts just from last month, during June we had severe thunder storms from Canada to Texas for 12 consecutive days. We had 19 days of bad weather compared to 5 in June 1999.

And on just 1 day, June 27, the National Weather Service issued a record 281 severe weather warnings. That has an impact.

SPRING/SUMMER PLAN

In light of the increases in delay, as this Committee knows, we joined together with the industry and, again, I want to note it is the industry, including the pilots and the unions as well as the airlines, to create the spring/summer 2000 initiative. The whole goal was to better manage air traffic during severe weather. We focused on maximizing the use of the available air space, on improving communication between the FAA and aviation system users, and expanding the use of new technology to help reduce delays.

And we were taking the approach that we had to approach this together. A little bit about how the plan works.

Every morning at the Air Traffic Control Center in Herndon, the strategic planning team comprised of command center traffic management specialists, airline representatives, and air traffic operation managers from field facilities agree on a common weather forecast. First, they have a telecommunication or teleconference at 5 a.m. in the morning; and a second one at 7 a.m. in the morning. And I will tell you that I have looked into these conferences and heard the communication among the airlines and the FAA, and the whole goal, again, is to come up with a strategic plan for the day.

It is particularly important on a bad weather day. It is a consensus plan. It is not dictated by the FAA. It is jointly developed by a team that knows it best.

Throughout the day, the team reviews the common weather forecast and as the conditions change, they update the plan every 2 hours until 10 p.m. in the evening. The key is better communication and the sharing of information.

So the critical question is: Is it working? How is this plan working? I think it is working in terms of communication. We have common weather information that is being disseminated. We have not had that before.

We are sharing real time arrival and departure capacity information at the major airports to allow airlines to change their flight plans in the event of severe weather.

Predictability is key for the airlines. Some airlines have told us that even with the increase in severe weather days, our collaborative efforts allow them to plan better and to execute operations in advance of the severe weather. That approach provides the predictability that the airlines need to manage their operation.

I will tell you that we are not fully there yet and there are areas that need improvement. For example, we are discovering that airlines have very different approaches to some of the problems that we are facing. Trying to negotiate a plan that everyone agrees to is sometimes a challenge. For our own house, that is the FAA, I sometimes feel that the field facilities are not playing full out. And really making sure that coordination from the Command Center is occurring all the way down to the individual field facilities is something that I think we need to constantly be focused on and to constantly work on. But I think overall the approach is the right approach. And if you ask the airlines, I think most of them would say that this is the right approach.

SOLUTIONS

I also want to stress that the spring/summer plan is a piece of a large solution. And again, I think the Committee has articulated this very well this morning. The delay problem is complex. The solutions must be multi-faceted.

It is going to take all aspects, all members of the industry coming together, airports, airlines and the FAA. For airports, they have a real challenge and that challenge is to work with communities to create coalitions to support the kind of runway capacity enhancements that are so needed. For the airlines, they really need to look at their own procedures, for their aircraft mix, and how they schedule flights. And certainly we, at the FAA, need to continue to successfully modernize our air traffic control system.

I think we have made great progress in the last 2 or 3 years, but I also think we need to stay very aggressively focused on that goal. Let me say that I would like to end where I began, and that is to say at the FAA, we will do everything we can to work with the airlines, to work with the unions and work with the industry to improve this system for the traveling public. Our focus should be and is on solutions.

One anecdote, one story, and that is several weeks ago, we came together with the airlines, with the unions to talk about some tactical strategies we could develop for the summer. The suggestion that came out of it was to focus on some choke-point areas, areas where we were having the most critical problems. I cannot tell you whether it was the union or the FAA or the industry that came up with that suggestion. But the point is it was a good suggestion. It was the coming together of all aspects of the community and saying let's figure out tactically what we can do.

PREPARED STATEMENT

We now have 21 recommendations that grew out of that session. And I think that is the right approach—doing it collaboratively, with—and in cooperation and the recognition that all of us own a piece of this solution.

Thank you very much, Mr. Chairman.
[The statement follows:]

PREPARED STATEMENT OF HON. JANE F. GARVEY

Chairman Shelby, Senator Lautenberg, Members of the Subcommittee: I would like to thank you for the opportunity to testify before you today on the important topic of airline delays. We welcome this Committee's interest in this serious issue. Let me state at the onset that we at the FAA are willing to do whatever is within our power to improve the efficiency of the air traffic system, so long as safety is not compromised. That safety is, and should remain, of paramount importance is clearly supported by all parties to the debate.

Before I begin, I want to take this opportunity to thank the subcommittee for its strong support of the FAA' fiscal year 2000 supplemental funding request. Through your personal support and leadership, the \$75 million approved earlier this month will allow the FAA to continue the service, reliability, and performance of our air traffic control system (ATC) to the level the industry and the American public expect. Without your support, this would not have been possible.

Delays have significant financial, scheduling, and service consequences for airlines and result in understandable frustration for their passengers. The issue of delays is very complex. There are many conditions that cause delay; bad weather, inoperable runways, airport capacity limitations, aircraft equipment problems, maintenance and crew problems, and, yes, air traffic equipment outages and air traffic pro-

cedures. Delays will never be eliminated, but it is the job of the FAA to work to minimize delays to the greatest extent possible, without compromising safety. I will acknowledge at the outset that, in the past, FAA has been criticized, with some justification, for not fully appreciating the total reliance of airlines on air traffic control. No other industry is as totally dependent on the Federal Government action to produce a product. Airlines felt that the air traffic control team should be more sensitive to the carriers' complete reliance on their efforts and that the airlines should be thought of and treated more like customers rather than users of the system.

In light of the increases in delays, and the need to establish a collaborative planning process between the FAA and users of the National Airspace System (NAS), President Clinton announced on March 10 the creation of our Spring/Summer 2000 plan for reducing aviation delays. At the heart of this initiative is a collaborative plan developed by industry, labor, and Government to better manage air traffic during severe weather. It maximizes the use of available air space, improves communications between FAA and aviation system users, and expands the use of new technology to help reduce delays. Decision-support tools and information sharing are absolutely essential to the success of the Spring/Summer 2000 plan.

Here is how the plan works:

Every morning at the Air Traffic Control System Command Center in Herndon the Strategic Planning Team, comprised of Command Center traffic management specialists, airline representatives, and ATC operations managers from field facilities, report at 5:00 Eastern time. The team agrees on a common weather forecast by 6 a.m. This is a first—previously the FAA and the airlines worked from separate forecasts, which could be different and often were.

By 7 a.m. the team has developed and released the day's first Strategic Plan of Operations, which includes collaborative measures designed to respond to predicted constraints in the National Airspace System. Constraints can include weather, airport construction projects, aircraft incidents, and any equipment failures. This is a consensus plan, not dictated, but jointly developed by a team that knows it best.

Throughout the day the team reviews the common weather forecast, and, as conditions change, updates the plan every two hours until 10 p.m. Eastern time.

Perhaps the most important decision-support tool for the group is the Flight Schedule Monitor. This collaborative decisionmaking tool provides a shared database of current flight information that allows the Command Center and the airlines to be on the same planning page.

We know this approach is making a difference. Some airlines have informed me that even with the increase in severe weather days so far this year, our collaborative efforts enabled them to better plan and execute operations in advance of the severe weather. This is the key to our Spring/Summer plan.

While our Spring/Summer plan represents a new approach to air traffic management, we need to keep this in perspective. I do not want to suggest that this new approach will eliminate delays. That is not possible. What we are doing is providing the basis to better manage delays through continuous communication and collaboration. This approach provides the predictability that the airlines need in order to manage their operations. Predictability is key.

I also want to say that some airlines take different approaches to predictions of severe weather. The FAA is not only working with many challenging issues, such as weather, airport capacity, and airline scheduling. We are also working in an environment in which our customers are in fierce competition with each other. Collaboration is not always easy in such a competitive industry.

While I am satisfied that FAA is stepping up to the plate, acknowledging our shortfalls and working in a productive and collaborative way to deal with them, air traffic control faces significant challenges in both the short and long term. The advent of regional jets offers more service and competition opportunities to airlines and communities. Regional jets, however, are using the same runways and flying at the same altitudes as larger aircraft and put more demand on the system than the turboprops they are replacing. This has the effect of reducing controller options, especially during peak periods. For example, one air traffic procedure controllers use with turboprops that has served to increase capacity is land and hold short (LAHSO), which is not an option for regional jets at certain airports. Regional jets, as compared to smaller turboprop aircraft, require a longer distance to stop. They can land, but cannot hold short of intersecting runways that are also in use. They are also slower on take off. Thus, when larger, faster turbojets are taking off behind them, ensuring aircraft separation becomes more challenging. Also in the enroute environment, regional jets, which operate more slowly than the new fleet of commercial aircraft, create a mix of speeds at altitude that will get more complex as the number of regional jets increase.

A further factor that complicates air traffic control, and one over which the FAA has no control, is that of airline scheduling and airport capacity. At the risk of stating the obvious, air traffic is a dynamic situation. Every procedural enhancement, every step forward in modernization, every improvement in efficiency, cannot be measured in a static environment, but is evaluated in light of daily changes in weather, runway availability, and airline schedules. Consequently, the installation of an Instrument Landing System (ILS), enhanced radar, or a reduction of miles in trail requirements may not necessarily translate into a reduction of airline delays, even if efficiencies are achieved. The FAA clearly has an important role to play in the reduction of airline delays, but this responsibility is shared with airlines and airports. True progress can only be realized when all three players accept their roles and work in cooperation with each other.

As Members of this Committee know, the issue of airport capacity is very politically sensitive. Whether local communities are discussing new runways, new terminals, or new airports, the debate is always heartfelt and emotional. While FAA will continue to make those improvements to the NAS that are within our control, improving how the aircraft are controlled in the air does not necessarily ensure them a speedy decent to the runway. Hard choices will have to be made at all levels of government with communities across the country to ensure that we have the infrastructure in place to accommodate anticipated demand.

Notwithstanding the airport capacity issue, FAA's longer-term role, and one in which we are currently engaged, is enhancing the system for a new era. This effort includes redesign of our nation's airspace and air traffic control (ATC) automation. The National Airspace Redesign is expected to take approximately eight years to be implemented across the entire country, but tangible benefits are expected in the eastern portion of the United States within five years. The most congested and complicated airspace is east of the Mississippi River. Because this airspace poses the most challenges, it is the initial focus of our redesign. Our goal is to establish comprehensive processes and procedures to ensure adaptable and flexible airspace that meet the demands of the future NAS. Equally important are the procedural changes we are making on a continual basis as the opportunities arise. For example, we have begun the use of military airspace to facilitate the north-south flow of air traffic along the east coast.

Another important aspect in our effort to improve the management of the air traffic control system is modernization. As Members of this Committee know, we are well into a successful modernization plan. I have stated in the past that our modernization efforts are essentially divided into three areas. The first category is to sustain our current system by replacing aging equipment and renewing the infrastructure (the Display System Replacement (DSR) and Airport Surface Detection Equipment). The second category will add safety features, including weather related enhancements (improved enroute surveillance and improved weather on Standard Terminal Automation Replacement Systems—STARS). The final category will improve system capacity and efficiency (Free Flight Phase I). Taken as a whole, modernization will improve the controller's ability to manage increasing levels of traffic. Decision support tools are being developed to facilitate more efficient routings and shorten airborne time. The reliability of the system is also being increased, thereby increasing confidence in system. We continue to develop technologies and equipment that will result in safe reductions in aircraft separation.

I am very confident about our modernization program. Our incremental approach to modernization ensures that we resolve problems at an early stage in project development. This attitude, which highlights our lessons learned from past FAA practice, means that we are acknowledging and dealing with problems when it is more cost effective and easier to do so. Some benefits of this approach are that all HOST computers have been replaced, we have completed the transition to DSR at our air route traffic control centers, and Free Flight Phase I technologies are beginning to provide benefits to the aviation community.

In conclusion, I would like to say that from my air traffic management team, to my modernization team, to our airport folks, the FAA recognizes our responsibilities and our challenges when it comes to aviation delays. We are working aggressively and cooperatively to meet them. Mr. Chairman, I will be happy to answer any questions.

STATEMENT OF KENNETH MEAD

Senator SHELBY. Mr. Mead.

Mr. MEAD. Yes, thank you, Mr. Chairman.

Senator Lautenberg, I hope when you retire you will continue to write in from time to time about your experiences in the world of transportation.

Senator LAUTENBERG. I plan to.

Senator SHELBY. He is not going to write to us, though, is he?

Senator LAUTENBERG. I am going to write to my Senator.

Senator SHELBY. Okay.

Mr. MEAD. We have two reports here. One was requested by this Committee and deals with flight delays and cancellations.

DELAYS AND CANCELLATIONS

The other, which was issued a couple of weeks ago, has to do with the customer service commitments. As you know, the A.T.A. and 14 of its member airlines pledged to improve customer service and voluntarily signed the Airline Customer Service Commitment, which is displayed over here.

This was in lieu of legislation. It includes 12 provisions, which each airline was supposed to implement and did implement through plans. Each airline was supposed to have a plan, in other words.

But two of the twelve provisions notifying customers of delays and cancellations and meeting customers' essential needs during long on-board aircraft delays—were in direct response to the growth in delays and cancellations.

Now, I would like to cover our delay and cancellation report before addressing—

Senator SHELBY. Go ahead.

Mr. MEAD [continuing]. A couple of these commitments.

A major finding of our review and something that I think needs very urgent attention in the short term—we found that there is the absence of a system for collecting causal data and reporting a reasonably complete picture of the causes of delays and cancellations from pre-gate departure to arrival at the gate.

The AIR-21 legislation, which Congress passed earlier this year requires this, but there has been little progress in implementing it.

AIR TRAFFIC CONTROL SYSTEM

Meanwhile, what is happening is that the air carriers are blaming much of the cause for delays not on scheduling, but on what they see as an antiquated air traffic control system that does not keep pace with the demand.

FAA points primarily to flight volume and weather—I think, in the neighborhood of 80 percent in that category. And then they say, "Well, we have new equipment." And that is in direct contradiction to what the airlines are saying.

For its part, the Bureau of Transportation Statistics, which also keeps delay and arrival data, does not keep any causal data, but they consider a flight as departing on time as long as it pushes back from the gate within 15 minutes of its scheduled departure time.

Senator SHELBY. Say that again.

Mr. MEAD. All right. This—this is anomalous.

Senator SHELBY. I know.

Mr. MEAD. The Bureau of Transportation Statistics, which also keeps delay data, considers a flight as departing on time if it leaves the gate, pushes back from the gate within 15 minutes of its scheduled departure time, even though you may end up sitting on the runway for three more hours.

So you are telling the consumer that they left on time. The consumer knows they did not leave on time, because they are sitting on the runway.

Senator SHELBY. Who came up with that rationalization? Who came up with that?

Mr. MEAD. I do not know who the author of that was.

Senator SHELBY. Are they still working? He should not be.

Can you find out for us just to find out who came up with that? I would like to share that with my colleagues.

Well, go ahead, Mr. Mead.

MEASURING PERFORMANCE

Mr. MEAD. Yes, and the point in mentioning that is that a system that is measuring performance—

Senator SHELBY. Yes.

Mr. MEAD [continuing]. Through measures such as that is destined not to succeed.

FAA causal data do not cover delays or cancellations due to air carrier activities, such as aircraft maintenance, lack of a plane, or lack of a flight crew. In other words, we do not have a complete picture of the data.

And if there is no plane, that flight is going to be delayed, one way or the other. But FAA does not keep track of that.

Now, the airlines do track these causes and it becomes a very complicated task when you—

Senator SHELBY. Why—what does not FAA do it—

Mr. MEAD. I am—

Senator SHELBY [continuing]. Or require them to do it for FAA?

Mr. MEAD. I think they should.

Senator SHELBY. Ms. Garvey, would you get in on that?

Ms. GARVEY. I do not want to interrupt his testimony, but—

Senator SHELBY. That—

Ms. GARVEY [continuing]. We—the rationale for the FAA has always been to focus on those pieces of the system that we can control so that we can improve the operation, but I will wait until Mr. Mead is finished.

Senator SHELBY. Okay.

Ms. GARVEY. But we are doing some—some other things.

Senator SHELBY. Okay.

CONSISTENT AND COMPLETE DATA

Mr. MEAD. The lack of consistent and complete data has only created confusion and finger-pointing. And the traveling public is caught somewhere in between on the delayed or cancelled flight.

The issue boils down—in our view, Mr. Chairman, to what can reasonably be expected of the air traffic control system in airports. And this is both a short- and long-term issue. And there is no silver bullet solution.

But what is feasible in the way of relief can only be addressed if there is a common language between the airlines and the FAA and an agreed upon system for defining the various causes of delays, and tracking the approximate and underlying causes of those delays from both pre-gate departure, all the way to arrival.

And until we do that, it is going to be very difficult to target effective solutions.

We need to know how much of the problem can be fixed in the short- and the long-term by ATC equipment, and how much cannot be fixed by ATC equipment.

DELAYS AND CANCELLATIONS

That will be the guide to solutions, including any necessary adjustments to flight schedules. That is why the AIR-21 provision should be implemented without further delay.

Moving to the highlights of what we found in our delay and cancellation work, FAA identified a 58 percent increase in delays between 1995 and 1999. Flight cancellations grew at an even faster rate than delays, increasing 68 percent over that 5-year period.

Total flight operations increased 8.3 percent. This means, Mr. Chairman, that one in every five commercial flights, 20 percent, roughly 1.1 million were late in arriving with an average delay of almost 50 minutes. Nearly 3 percent of the flights were cancelled in 1999. And if you were on one of those, you were on one of 154,000 flights.

Delays are getting longer. Most delays occur on the ground.

TAXI-OUT TIMES

At the 28 largest U.S. airports, flights experiencing taxi-out times of 1 hour or more increased 130 percent, from about 17,000 in 1995 to 40,000 in 1999.

Flights with taxi-out times of 2, 3 and 4 hours increased by huge margins of 186, 216 and 251 percent respectively. Because some of these flights pushed back from the gate within 15 minutes, they were under the rules considered on-time departures.

FLIGHT TIMES

I also want to point out that the true extent of delays are masked by increases in scheduled flight times. Between 1988 and 1999, the 10 carriers reporting to the Bureau of Transportation Statistics increased their scheduled flight times on over 80 percent of roughly 2,000 domestic routes. And 390 of those routes experienced scheduled flight increases of 10 to 27 minutes on average over the past decades.

The reasons the airlines are doing this is understandable. The schedules are increased to compensate for anticipated longer ground and air times. And the reason I mention this is because the number of arrival delays would have increased by over 25 percent in 1999 if the air carriers' scheduled flight times had remained at the 1988 levels.

We think that measures of the system's performance should consider both the scheduled or built-in delays as well as those delays that occur over and above those that are scheduled.

CUSTOMER COMMITMENT

I would like to move to the customer commitment, sir. Flight problems such as delays and cancellations are the number one air travel complaint.

Customer care and baggage complaints are the next two. Altogether, they comprise about 70 percent of the complaints. The complaints doubled in 1999 over 1998. And they are doubling again this year.

The Internet is partly responsible for this. It is a lot easier to complain today than it was. But I think if people just point to the Internet and say, "Well, that is why," they are doing so at their peril.

I think it is important for everybody to understand what these commitments do and do not do. They address matters such as improved communication, offering the lowest fares available over the phone, and that is an important distinction, timely return of delayed baggage, and allowing reservations to be held or cancelled without penalty.

The commitment, though, does not directly address the underlying sources of consumer dissatisfaction, such as extensive flight delays, baggage not showing up on arrival. The commitment on on-time baggage delivery, really is not on-time baggage delivery; that commitment is to return bags within 24 hours that did not show up on time.

That would—it is not exactly the most artful way of expressing—

Senator SHELBY. It sounds like again they are gaming the system. In other words, they are not really telling the truth in the statistic.

Mr. MEAD. Well, I think they could have described that particular commitment title with greater clarity.

Senator SHELBY. Absolutely.

Mr. MEAD. The commitments also do not address, directly, long check-in lines and high fares in certain markets. In our view, until those factors are addressed, you are going to continue to experience widespread discontent in the system.

What we found in our testing—and our people are going out to the airports and on the airlines, so they are experiencing this firsthand—we found that the airlines are actually making a genuine and clear commitment to paying greater attention to customer service.

But the bottom line results are mixed and the airlines have a long way to go to restore consumer confidence.

NOTIFYING CUSTOMERS OF DELAYS AND CANCELLATIONS

I would like to just mention what we were finding with the two commitments that pertain to delays and then close off. The commitment about notifying customers of known delays and cancellations—we found that for the most part, the airlines were really making a significant effort at ensuring that there would be greater communication between the pilots, between the gate agents and so forth, but we found major room for improvement in the accuracy and reliability and timeliness of what was being communicated.

We found several airlines repeatedly pointing to the air traffic control system as the reason for delays, even in cases of extremely bad weather, crew unavailability, or maintenance problems. In fact, in some cases, we were told the flight was leaving on time, and there was no plane.

The way we checked out these things is we would hear what the gate agent was saying and then our staff would run up to the air traffic control tower to find out exactly what was happening. And we tied together the two stories.

We also found a disconnect between what the airlines are saying in their plans and what they say in their contracts of carriage. The contract of carriage is a legally binding document.

With one exception, all the plans say, "We will provide accommodations for passengers put in an overnight status due to airline operations." Now, the airlines define what is due to airline operations.

But my point is only two airlines say that they will provide overnight accommodation in their contracts of carriage.

Instead, what the contract of carriage says is, "We will do it if the passenger is diverted to another airport." So for those contracts of carriage, in the next 6 months, we would like to see them incorporate more of what is in the plans.

Senator SHELBY. I wonder who reads those.

Mr. MEAD. Well, my staff is reading them because they have to.

Senator SHELBY. Yes. Well, that answers my question.

MEETING CUSTOMER'S NEEDS

Mr. MEAD. The other one is the meeting of a customer's essential needs during long on-aircraft delays. During our initial visits, less than half the airlines had comprehensive customer service contingency plans for dealing with these at all the airports they serve.

They now advise us, and we are checking it out, that they do have them in place. But the provision and the plans use general terms, such as the airline will provide "food," will make "every reasonable effort" when the delay is "for an extended period of time," for an "emergency."

PREPARED STATEMENT

And these terms are obviously not self-defining. So we think the airlines need to do a better job of providing the consumer with a clearer understanding of what to expect.

And I think I will just close off there, sir.

Senator SHELBY. Thank you.

[The statement follows:]

PREPARED STATEMENT OF KENNETH M. MEAD

AIR CARRIER FLIGHT DELAYS AND CUSTOMER SERVICE

Mr. Chairman and Members of the Subcommittee: We appreciate the opportunity to discuss airline flight delays and cancellations, and airline efforts to improve customer service. Concerned over increasing complaints in air travel, compounded by the continued growth in flight delays and cancellations, Congress considered whether to enact a "passenger bill of rights."

Congress, the Department of Transportation (DOT), and the Air Transport Association (ATA) agreed that, for the time being, legislation would not be necessary. Instead, ATA and 14 of its member airlines (Airlines) executed a document on June

17, 1999, known as the Airline Customer Service Commitment. The Commitment includes 12 provisions. Two of these provisions (notifying customers of known delays and meeting customers' essential needs during on-aircraft delays) are in response to the growth in flight delays and cancellations.

The Airlines Commit to:

- 1. Offer the lowest fare available
- 2. Notify customers of known delays, cancellations, and diversions
- 3. On-time baggage delivery
- 4. Support an increase in the baggage liability limit
- 5. Allow reservations to be held or canceled
- 6. Provide prompt ticket refunds
- 7. Properly accommodate disabled and special needs passengers
- 8. Meet customers' essential needs during long on-aircraft delays
- 9. Handle "bumped" passengers with fairness and consistency
- 10. Disclose travel itinerary, cancellation policies, frequent flyer rules, and aircraft configuration
- 11. Ensure good customer service from code-share partners
- 12. Be more responsive to customer complaints

At the request of the Chairman, we reviewed the amount of flight delays occurring in the National Airspace System as well as the systems for tracking delays and cancellations and their causes. The results are in our Report on Air Carrier Flight Delays and Cancellations, which we are submitting for the record. The Airlines cooperated fully with us during our reviews. Today, I would like to address growth in flight delays and cancellations, and our interim results on the Airlines' implementation of the Commitment and Plans.

GROWTH IN AIR CARRIER FLIGHT DELAYS AND CANCELLATIONS

Mr. Chairman, a major finding of our review, and one on which we believe urgent attention is required, is the absence of a system for collecting causal data and reporting a reasonably complete picture of the causes of delays and cancellations from pre-gate departure to arrival. The Wendell H. Ford Aviation Investment and Reform Act for the 21st Century requires such a system, but there has been insufficient progress.

Meanwhile, air carriers blame much of the cause for delays on what they see as an antiquated air traffic control (ATC) system that has failed to keep pace with demand. The Federal Aviation Administration (FAA) points primarily to weather and flight volume. The lack of consistent and complete data has only fueled this debate—with the traveling public experiencing the result of delayed or canceled flights. We found that FAA causal data do not cover delays due to air carrier activities, such as aircraft maintenance, or lack of an aircraft or flight crew. Most of the air carriers maintain their own causal information for internal purposes, but their information is generally not consistent with the information collected by FAA.

The issue boils down to what can reasonably be expected of the ATC system and airports. For those in search of solutions, this is both a short- and long-term issue, and there is no "silver bullet" solution to reducing delays and cancellations. The Airlines do not view scheduling practices as the core problem; it is their expectation that a modern ATC system and airports should be able to handle the load. What is feasible in the way of relief—short- and long-term—can only be addressed with a common language between the Airlines and FAA and an agreed-upon system for tracking the proximate and underlying causes of delays and cancellations from pre-gate departure through all stages of flight. Our major conclusions are summarized below.

—*Flight Delays and Cancellations Have Increased Significantly Since 1995.*—Both the Bureau of Transportation Statistics (BTS) and FAA reported increases in flight delays between 1995 and 1999. However, there is a large variance between BTS and FAA delay totals because they use different systems to define and track delays. BTS tracks only gate departure and arrival of a flight, while FAA tracks the intervening ground and airborne phases.

According to BTS data, delays increased 11 percent (1,863,265 to 2,076,443) during this time period. Likewise, FAA data identified an even larger increase of 58 percent (236,802 to 374,116). During this same period, total flight operations increased 8.3 percent, from approximately 64 million to 69.3 million.

We also found that the number of delays continues to increase in 2000. Overall, there were about 12 percent more FAA-reported delays and over 5 percent more BTS-reported delays during the first 5 months of 2000 than during the same period in 1999.

Flight cancellations between 1995 and 1999 grew at an even faster pace than flight delays, increasing 68 percent (91,905 to 154,311). Some high traffic routes had cancellation rates three to five times higher than the 1999 national average. Increases have continued this year, with the first 5 months of 2000 experiencing over 5 percent more cancellations than in the same period in 1999.

—*Flight Delays Are Also Getting Longer.*—Not only are there more delays, but those occurring are longer. The length of delays reported by BTS and FAA increased 16 to 18 percent, respectively. According to BTS data, the average arrival delay increased to over 50 minutes in 1999 from 42 minutes in 1995. We also found substantial differences among the top 28 airports, with average delay times ranging from 70 minutes at Baltimore to 25 minutes at Las Vegas.

—*Most Delays Occur on the Ground.*—We found that most delays took place on the ground in the form of longer taxi-out and taxi-in times. Our analysis of BTS data found that 82 percent of the increase in gate-to-gate times between 1995 and 1999 was due to longer taxi-out and taxi-in times, with the remaining 18 percent involving longer flight times.

Also at the 28 largest U.S. airports, the number of flights experiencing taxi-out times of 1 hour or more (flights in which the aircraft has departed the gate but remained for extended periods of time on the ground awaiting taking off) increased 130 percent between 1995 and 1999, from 17,164 to 39,523. More significant, at these 28 major airports, the number of flights with taxi-out times of 2, 3, and 4 hours increased by huge percentages of 186, 216 and 251 respectively during the same period. Push-back from the gate within 15 minutes of scheduled departure counts as an on-time departure for BTS reports, even if a flight remains on the taxiway for an hour or more.

—*Lengthening of Scheduled Flight Times Masks True Growth of Delays.*—Between 1988 and 1999, the 10 major air carriers reporting to BTS increased their scheduled flight times on over 80 percent of their domestic routes (1,660 of 2,036 routes). By increasing the schedule time, the actual extent of delays through the system is underreported. For example, the number of arrival delays would have increased by nearly 25 percent in 1999 if the air carriers scheduled flight times had remained at their 1988 levels. We estimate that, from 1988 through 1999, these schedule changes added nearly 130 million minutes of travel time for air passengers.

In an effort to measure the true growth in flight delays and the resulting impact on consumers and air carriers, we developed the Consumer Flight Delay Indicator (CFDI). This indicator calculates the average delay time per flight flown by the 10 major air carriers and takes into account both scheduled and unscheduled delays. Using 1988 as the base year, we found that the CFDI rate in 1999 was 16:18 minutes. This represents a 42 percent increase from 1995 when the CFDI was 11:24 minutes.

—*DOT Lacks a Uniform Methodology for Tracking Delays.*—We found major differences in the methodologies used by FAA and BTS to determine flight delays. These differences can lead to somewhat confusing results. FAA collects data on flight delays via the Operations Network (OPSNET). OPSNET data come from FAA personnel who manually record aircraft that were delayed by more than 15 minutes after coming under FAA's control, i.e., the pilot's request to taxi out. As such, an aircraft could wait an hour or more at the gate or ramp area before requesting clearance to taxi. So long as the flight, once under FAA's control, took off within 15 minutes of the airport's standard taxi-out time, the flight would be considered an on-time departure.

Conversely, the major air carriers submit monthly flight data to BTS. According to BTS, a flight is counted as "on time" if it departed or arrived within 15 minutes of scheduled gate departure and arrival times shown in the airline's reservation system. Using this definition, an aircraft could wait an hour or more on the airport taxiway for takeoff and be reported by BTS as having departed on time if it left the gate within 15 minutes of its scheduled departure.

—*Although Actions Are Underway, Much Work Remains.*—Partly in response to the increase in delays and cancellations as well as the number of complaints, FAA along with representatives of the airline industry conducted an extensive evaluation in 1999 aimed at improving its management of air traffic. As a result of the evaluation, FAA and the industry identified 165 near-term action items to relieve delays including: (1) limiting locally initiated ground stops to 30 minutes; (2) providing estimates to air carriers of the time a ground stop will end

and the cause for this action; and (3) ensuring that local facilities coordinate miles-in-trail restrictions¹ through the National Air Traffic Control System Command Center. According to FAA, most of the action items have been implemented.

FAA also recognizes the need for a common system for tracking delays, cancellations, and their causes. As a result, the agency has been working closely with the major air carriers in developing the Aviation System Performance Metric (ASPM). ASPM, which became operational at 21 airports in April 2000, establishes a uniform set of metrics on which to measure delays during each flight segment, i.e., gate departure, taxi-out, en route, taxi-in, gate arrival, and overall flight time.

FAA officials noted that ASPM will initially be used to help identify and track delays and cancellations as well as measure ATC performance. They also noted their intent to eventually include causal information in ASPM, which will be critical in helping FAA and the air carriers identify areas for improvement, such as changes in traffic management practices, funding for equipment and airport enhancements, and airspace redesign.

—*Causal Data on Flight Delays and Cancellations Are Woefully Incomplete.*—Beyond the methodologies used to determine flight delays, we also found causal data varied significantly—with no one system possessing a complete picture of the causes of flight delays and cancellations. For example, BTS does not collect causal data for delays or cancellations. FAA only collects causal data on delays reported through OPSNET, but maintains no comparable information on cancellations. Moreover, FAA causal codes do not cover delays due to air carrier activities, such as aircraft maintenance, boarding of passengers, or fueling. While most of the air carriers maintain causal information for internal purposes on both delays and cancellations, those causes are associated primarily with gate departure delays, and generally are not consistent with the causal information collected by FAA.

PRELIMINARY RESULTS ON IMPLEMENTATION OF THE AIRLINES' COMMITMENT AND PLANS ARE MIXED

The Growth in Delays and Cancellations Has Led to Increases in Customer Dissatisfaction With Air Carrier Customer Service.—The Airlines are at the 6-month point in implementing their Plans designed to restore and improve customer service. We reported our preliminary results in our Interim Report on Airline Customer Service Commitment.²

—*The Commitment Does Not Address Underlying Reasons for Customer Dissatisfaction.*—The Commitment addresses such matters as improved communication with passengers, quoting the lowest available airfare, timely return of misrouted or delayed baggage, allowing reservations to be held or canceled without penalty, providing prompt ticket refunds, and meeting passengers' essential needs during long on-board delays. However, the Commitment does not directly address underlying reasons for customer dissatisfaction, such as extensive flight delays, baggage not showing up on arrival, long check-in lines, and high fares in certain markets. In our opinion, until these areas are effectively addressed by the Airlines, FAA, and others, there will continue to be discontent among air travelers.

—*Airlines Have a Long Way to Go to Restore Customer Confidence.*—In our initial observations and testing, we found the Airlines are making a clear and genuine effort at strengthening the attention paid to customer service, but bottom-line results are mixed, and the Airlines have a long way to go to restore customer confidence.

For instance, at least 2 of the 12 provisions cover airline service when flights are delayed or canceled. These two provisions address notifying customers of known delays, cancellations and diversions, and meeting customers' essential needs during long on-aircraft delays. We found the Airlines were making a significant effort, both at the airport and on-board aircraft, to improve the frequency of communication with customers about delays and cancellations. These improvements include investments in various communication technologies and media as well as more frequent announcements to customers. However, we also found major room for improvement in the accuracy, reliability, and timeliness

¹ Miles-in-trail is an ATC tool that intentionally paces traffic by increasing spacing between aircraft to keep volume at manageable levels. This spacing between aircraft is different from FAA's safety separation standards requirement of 5 nautical miles laterally or 2,000 feet in altitude, in sectors of high-altitude traffic.

² Report Number AV-2000-102 issued June 27, 2000.

of the Airlines' communications to customers about the status of flights. For example, several Airlines pointed to the air traffic control system as the reason for delays, even in cases of extremely bad weather, crew unavailability, or maintenance problems.

We also found a disconnect between what the Airlines specified in their Plans and what is in their contracts of carriage. With one exception, all the Plans specify that the Airlines will provide accommodations for passengers put in an overnight status due to Airline operations. However only two Airlines explicitly provide for this in their contracts of carriage. Most Airlines' contracts of carriage only provide for accommodations if the passenger is diverted to another airport and put in an overnight status at that other airport. It is unclear if the passengers' rights to the services provided in the Airlines' Plans are enforceable if those rights are not specified in the Airlines' contracts of carriage.

Likewise, accommodating passengers during on-aircraft delays is a major challenge faced by the Airlines. We found that less than half the Airlines had comprehensive customer service contingency plans in place, at all the airports they served, for handling delays due to severe weather or Airline service irregularities (e.g., unscheduled equipment maintenance or crew shortages). This provision also does not specify in any detail the efforts that will be made to get passengers off the aircraft when delayed for extended periods, either before departure or after arrival. The provision uses general terms such as "food," "every reasonable effort," "for an extended period of time," or "emergency." These terms should be clearly defined to provide the passenger with a clear understanding of what to expect.

Our detailed observations on the Airline's efforts to implement the Commitment and needed initiatives to enhance the success of Customer Service Plans are included later in this testimony.

BACKGROUND

FAA estimates that delays to commercial aviation cost the airlines over \$3 billion a year and projects that delays throughout the system will continue to increase as the demand for passenger travel rises. Moreover, passengers are directly affected by the inconvenience of delays in terms of missed flight connections, missed business meetings, and lost personal time. Over the last year, the news media reported a growing debate on flight delays and their causes. One large U.S. airline claimed that it lost as much as \$120 million in the first half of 1999 because of air traffic control (ATC) delays and canceled flights. FAA contended that few delays resulted from ATC equipment problems, and attributed the bulk of all delays to poor weather.

Domestic air carriers³ that account for at least one percent of domestic scheduled passenger revenues submit monthly Airline Service Quality Performance Reports to the DOT's Bureau of Transportation Statistics (BTS). For this report, a flight is counted as "on time" if it departed or arrived within 15 minutes of scheduled gate departure and arrival times shown in the airline's reservation system.

FAA collects data on flight delays via the Operations Network (OPSNET). OPSNET data come from observations by FAA personnel who manually record aircraft that were delayed for 15 minutes or more after coming under FAA's control, i.e., the pilot's request to taxi out. Delays attributable to an air carrier's operations, such as aircraft and flight crew problems, are not included in OPSNET, nor are canceled flights (regardless of the reason).

A key reason for differing data maintained by FAA and BTS is in how each uses the information it collects. For FAA, delay information serves to measure system-wide ATC performance as well as to identify areas for improvement. For BTS, measuring delays (and subsequent ranking of air carriers by on-time arrival performance) serves as a source of air travel information to consumers and helps ensure more accurate reporting of flight schedules by the air carriers.

Flight Delays and Cancellations Have Increased Significantly

Both BTS and FAA reported increases in all types of flight delays between 1995 and 1999. For instance, according to BTS data, delays increased 11 percent (1,863,265 to 2,076,443) during this time period. Likewise, FAA data identified an even larger increase of 58 percent (236,802 to 374,116). Figure 1 illustrates FAA-reported delays from 1995 to 1999. During this same period, both flight operations

³Those 10 reporting air carriers are Alaska Airlines, America West Airlines, American Airlines, Continental Airlines, Delta Air Lines, Northwest Airlines, Southwest Airlines, Trans World Airlines, United Airlines, and U.S. Airways.

and enplanements were increasing, on average, 2 and 4 percent per year, respectively.

FIGURE 1.—Growth in FAA-Reported Flight Delays

| Year | No. of delays |
|------|---------------|
| 1995 | 236,802 |
| 1996 | 271,507 |
| 1997 | 245,259 |
| 1998 | 306,234 |
| 1999 | 374,116 |

We found that the number of delays continues to increase in 2000. Overall, there were about 12 percent more FAA-reported delays and over 5 percent more BTS-reported delays during the first 5 months of 2000 than during the same period in 1999. The number of canceled flights the 10 major air carriers reported to BTS increased 68 percent, from 91,905 to 154,311, between 1995 and 1999. Increases have continued this year, with the first 5 months of 2000 experiencing over 5 percent more cancellations than the same period in 1999.

Length of Delays Also Increased, Ranging From 16 to 18 Percent

Not only were there more delays in 1999 than in 1995, but the length of delays also increased. Table 1 lists the average duration of FAA OPSNET delays (i.e., departure, en route, and arrival) and BTS arrival delays from 1995 to 1999.⁴ Overall, the length of FAA OPSNET delays increased 16 percent, while BTS arrival delays increased 18 percent.

TABLE 1.—DURATION OF FAA OPSNET AND BTS ARRIVAL DELAYS

[In minutes]

| Year | FAA OPSNET Delays | BTS Arrival Delays |
|------------------------|-------------------|--------------------|
| 1995 | 37:34 | 42:41 |
| 1996 | 40:41 | 46:12 |
| 1997 | 37:45 | 44:40 |
| 1998 | 41:04 | 49:19 |
| 1999 | 43:30 | 50:26 |
| Percent change 1995–99 | 16 | 18 |

Most Delays Occur on the Ground During Departure

We found that most delays took place on the ground. FAA’s analysis of flights to and from 55 major U.S. airports found that ground delays represented approximately 83 percent of the total delay time in 1999. This percentage is supported by our own analysis of BTS data. Specifically, we determined that 82 percent of the increase in gate-to-gate⁵ times between 1995 and 1999 was due to longer taxi-out and taxi-in times, with the remaining 18 percent involving longer en route times. This represents a noticeable shift from 1996, when only 60 percent of the increase in gate-to-gate times (over 1995) was due to longer ground times.

We also found that the number of flights that experienced taxi-out times of 1 hour or more (e.g., the aircraft departed the gate but remained for extended periods of time on the ground awaiting takeoff) had increased 130 percent, as noted in Figure 2. Of even greater concern for passengers is the number of flights with taxi-out times of 2, 3, or 4 hours, which increased at an even faster pace, i.e., 186, 216, and 251 percent, respectively, between 1995 and 1999.

FIGURE 2.—Flights with Taxi-Out Times of 1 Hour or More at 28 Largest Airports

| Year | No. of flights |
|------|----------------|
| 1995 | 17,164 |
| 1996 | 25,417 |
| 1997 | 22,535 |

⁴These averages are based on delays of 15 minutes or more, since 15 minutes is the cut-off point used by both BTS and FAA in determining a delay.

⁵Also referred to as “block” time, gate-to-gate time covers the period between gate departure and gate arrival.

| Year | No. of flights |
|------------|----------------|
| 1998 | 29,970 |
| 1999 | 39,523 |

Actual Extent of Delays Is Much Greater, and Is Masked By Increases in Scheduled Flight Times

To compensate for longer ground and air times, the air carriers have increased their flight schedules on nearly 82 percent (1,660 of 2,036) of domestic routes between 1988⁶ and 1999. Overall, we identified 390 domestic routes, comprising 793,586 flights in 1999, which experienced schedule increases of approximately 10 to 27 minutes (on average) over the last 11 years. By increasing their scheduled flight times, however, the actual extent of delays throughout the system—as tracked by BTS—is underreported. For example, the number of arrival delays reported to BTS would have been nearly 25 percent higher in 1999 if flight schedules had remained at their 1988 levels. Overall, we calculate that scheduled delays added nearly 130 million minutes of travel time for air passengers from 1988 through 1999.

In an effort to measure the actual growth in flight delays, taking into account both scheduled and unscheduled delays, we developed the Consumer Flight Delay Indicator (CFDI). This indicator calculates the average delay time per flight flown by the 10 major air carriers. Using 1988 as the base year, we found that the CFDI rate in 1999 was 16:18 minutes.⁷ This represents a 42 percent increase from 1995, when the CFDI was 11:24 minutes, as indicated by Figure 3.

FIGURE 3.—OIG's Consumer Flight Delay Indicator

[1995–99 (Based Year 1988)]

| Year | Minutes |
|------------|---------|
| 1995 | 11:24 |
| 1996 | 14:30 |
| 1997 | 13:18 |
| 1998 | 14:30 |
| 1999 | 16:18 |

DOT Lacks a Uniform Methodology for Tracking Delays

We found major differences in the methodologies used by FAA and BTS to record and track flight delays. As a consequence, FAA and BTS differ as to what they consider a delay and how such delays are calculated. For example, FAA tracks delays on the taxiway and runway (departure) and airborne (en route and arrival). BTS tracks delays at the departure or arrival gates. The two agencies also have little in common with respect to how they calculate delays. As a consequence, these differing methodologies can lead to somewhat confusing (if not misleading) results as shown in the two examples.

Example 1.—On November 2, 1999, United Airlines flight 645 from Newark to O'Hare left the gate 68 minutes after the scheduled departure time due to mechanical problems. Because this delay took place at the gate, it incurred a departure delay as defined by BTS. Once repaired, however, the flight took off within 24 minutes of receiving FAA's clearance to taxi. Because the total time period between the request for taxi and wheels off did not exceed the allotted taxi-out time of 29 minutes at Newark, FAA did not record a departure delay.

Example 2.—On November 1, 1999, American Airlines flight 1599 from Newark to O'Hare departed the gate at the scheduled time. As such, it achieved an on-time departure as defined by BTS. Because of an FAA ground delay, the aircraft remained in the ramp/taxiway an additional 113 minutes before takeoff. FAA, therefore, recorded a departure delay since the elapsed period far exceeded Newark's allotted taxi-out time of 29 minutes.

For instance, FAA calculates a delayed departure as the difference between the time a pilot requests FAA clearance to taxi and the time an aircraft's wheels lift off the runway, minus the airport's standard unimpeded taxi-out time. In comparison, BTS calculates a delayed departure as the difference between scheduled and actual departure time from the gate.

Causal Data on Flight Delays and Cancellations Are Incomplete

There is significant disagreement within the aviation community as to the causes of flight delays and cancellations. Air carriers, for example, blame FAA and weather for most delays. In contrast, FAA points to weather and flight volume as the main

⁶ 1988 is the first complete year of data from the 10 major air carriers.

⁷ We calculated that 10 of 28 major U.S. airports had CFDIs equal to or greater than 20 minutes in 1999.

factors. Moreover, the lack of consistent and complete data on the causes of delays and cancellations has only fueled this debate. In conducting our audit, we found no system that provides a complete picture of the causes of flight delays and cancellations. FAA causal codes do not cover delays due to air carrier activities, such as aircraft maintenance, boarding of passengers, or fueling. While most of the carriers maintain causal information for internal purposes on both delays and cancellations, those causes are associated primarily with gate departure delays, and generally are not consistent with the causal information collected by FAA. Until this inconsistency is resolved, FAA and the air carriers will continue to blame one another, and the decision-makers' ability to address the underlying causes such as runway capacity, air traffic control equipment and procedures, weather, and airline scheduling practices will be hindered.

Increase in Flight Delays and Cancellations Fuel Customer Dissatisfaction

Over the last several years, DOT has ranked flight problems (delays, cancellations and missed connections) as the number one air traveler complaint, with customer care (such as the treatment of delayed passengers) and baggage complaints ranked as either number two or number three. As depicted in Figure 4, 1999 data show that these three types of complaints account for nearly 70 percent of all complaints received by DOT against U.S. and foreign air carriers. This trend continues for the first 5 months of 2000, with flight problems, customer care and baggage complaints accounting for over 70 percent of all complaints received by DOT against U.S. and foreign air carriers.

FIGURE 4.—*Air Travel Consumer Report*

| [1999 Complaints] | |
|---|----------------|
| <i>Complaints</i> | <i>Percent</i> |
| Flight Problems | 35 |
| Customer care | 20 |
| Baggage | 14 |
| Reservations, ticketing, and boarding | 8 |
| Refunds | 7 |
| Other | 16 |

Preliminary Results on Implementation of the Commitment and Plans Are Mixed

The Commitment and the Airlines' Plans for implementing it were essentially a commitment to place substantially greater emphasis, attention and resources on customer service. The Airlines realized they needed to improve the way they treat passengers and that good customer service begins with the successful execution of, and continuous improvement to, existing customer service policies and procedures, programs and plans, as well as systems and technologies.

In developing the Commitment, the Airlines included two provisions that constituted new policy. The provision to either hold a reservation without payment for 24 hours or (at the Airline's choice) cancel a paid reservation within 24 hours without penalty is a new service the Airlines are providing. Another new provision was to support the increase in the baggage liability limit from \$1,250 to \$2,500, which became effective January 18, 2000.

As for the remaining 10 provisions in the Commitment, the Airlines agreed to focus on better execution of customer service policies and procedures, many required by law or regulation, required under the Airlines' contracts of carriage, or part of Airline operating policy. A few of these provisions had subsets that provided new policies such as notifying customers in a timely manner of the best available information regarding known delays, cancellations and diversions; making every reasonable effort to return checked bags within 24 hours; issuing an annual report on frequent flyer redemption programs; and providing information regarding aircraft configuration (seat width and legroom).

Our interim results are based on visits to the Airlines' corporate headquarters and other key facilities, and review of Airline policies and procedures before and after implementation of the Commitment. This allowed us to evaluate what impact the formal Commitment had on the Airlines' customer service. We also reviewed the Airlines' Plans and contracts of carriage to determine whether the provisions of the Commitment have been incorporated into these documents. To date, we have visited over 30 domestic airports to observe and test portions of the individual Airlines' Plans that are in place. We are continuing to test the effectiveness of the Commitment and will provide our results in our final report. To date, our preliminary results have identified areas that appear to be working well, as well as areas for improvement, as illustrated in the following examples.

—*Offer the lowest fare available.*—The Airlines agreed to offer, through their telephone reservation systems, the lowest fare available for which the customer is eligible. However, Airlines did not commit to guaranteeing the customer that the quoted fare is the lowest fare the Airline has to offer. There may be lower fares available through the Airlines' Internet sites that are not available through the Airlines' telephone reservation systems.

We found six Airlines enhanced the provision by (1) offering the lowest fare for reservations made at their city ticket offices and airport customer service counters, not just through the Airlines' telephone reservation systems; or (2) requiring their reservation agents to query customers about the flexibility of their itinerary in terms of travel dates, airports and travel times to find the lowest fare available; or (3) notifying the customer through an on-hold message that lower fares may be available through other distribution sources and during different travel times.

Ongoing testing of this provision shows that Airline telephone agents were usually offering the lowest available fare for which we were eligible, but there were a sufficient number of exceptions to this that it is an area to which the Airlines should pay special attention. The problems we identified were not deliberate on the part of the Airlines, but were due to employees not following established procedures.

—*Notify customers of known delays, cancellations, and diversions.*—For the most part, we found the Airlines were making a significant effort, both at the airport and on-board aircraft, to improve the frequency of communication with customers about delays and cancellations. These improvements include investments in various communication technologies and media as well as more frequent announcements to customers. For example, six airlines have procedures in place to contact passengers at their home, work, pager, or cellular telephone number about known delays and cancellations. However, we also found major room for improvement in the accuracy, reliability, and timeliness of the Airlines' communications to customers about the status of flights. For example, several Airlines pointed to the air traffic control system as the reason for delays, even in cases of extremely bad weather, crew unavailability, or maintenance problems.

We also found flight monitors and gate displays in the boarding areas showed the flights as on-time although, at the time of the flight, it was evident there would be a delay because (1) there was no aircraft at the gate, or (2) the flight was scheduled to leave in 5 minutes and passenger boarding had not begun. During some of our tests, when queried, the gate agent told us the flight was scheduled to leave on-time when in fact, we knew from FAA air traffic control that it was delayed.

The Airlines and FAA must move beyond finger-pointing, and work towards greater cooperation in identifying and addressing the causes for flight delays and cancellations. FAA and the carriers need to move forward and establish a common framework for documenting and identifying the causes of delays and cancellations. The need for this was recently demonstrated by a lengthy delay at a major U.S. airport when some passengers were on-board aircraft from 4 to 8 hours. FAA and the Airline have different views on what happened and why. This illustrates the need for better communications and systems for documenting the cause of delays.

We also found a disconnect between what the Airlines specified in their Plans and what is in their contracts of carriage. With one exception, all the Plans specify that the Airlines will provide accommodations for passengers put in an overnight status due to Airline operations. However only two Airlines explicitly provide for this in their contracts of carriage. Most Airlines' contracts of carriage only provide for accommodations if the passenger is diverted to another airport and put in an overnight status at that other airport. It is unclear if the passengers' rights to the services provided in the Airlines' Plans are enforceable if those rights are not specified in the Airlines' contracts of carriage.

We suggested the Airlines improve the lines of communication and streamline the flow of accurate and reliable information between (1) FAA and the Airlines' Operations Control Centers, and (2) the Airlines' Operations Control Centers and frontline personnel who deal directly with passengers. We also suggested that the Airlines consider making their contracts of carriage consistent with their Plans to clarify the customers' rights when put in an overnight situation due to delays, cancellations, or diversions.

—*On-time baggage delivery.*—Passengers expect to find their checked baggage upon arrival at their destination airports, but this provision actually deals with the delivery of misrouted or delayed baggage. The Airlines committed to return

the misrouted or delayed bag to the passenger “within 24 hours.” We have found examples where Airlines have invested in advanced baggage scanning technologies to facilitate the return of baggage or increased staff resources for processing claims. However, we also found that the Airlines were not consistent in their Plans when defining what constituted “within 24 hours.” For instance, some Airlines started the 24-hour clock when a passenger filed a missing bag claim and others only after the bag arrived at the destination airport.

The Airlines should consider committing to returning unclaimed and lost checked baggage to customers within 24 hours of receipt of a customer’s claim. The filing of a claim is when a customer would reasonably expect the 24 hours to begin. Also, those Airlines that have not already done so should consider providing a toll-free telephone number for customers to call to check on the status of their bags.

—*Allow reservations to be held or canceled.*—This is a completely new customer service commitment, which allows the customer either to hold a telephone reservation without payment for 24 hours or (at the Airline’s option) cancel a paid reservation without penalty for up to 24 hours. This provision should be very popular with passengers who book nonrefundable tickets, because it allows customers to check for lower fares and time to coordinate their travel without losing a quoted fare.

Our ongoing testing shows that, with a few exceptions, the Airlines were living up to this commitment in practice. However, where a ticket purchase was required, the reservation agents typically did not tell us that we could receive a full refund if the reservation was canceled within 24 hours. Therefore, we suggested that the Airlines requiring a ticket purchase affirmatively notify passengers that if they cancel the reservation within 24 hours they can receive a full refund without a penalty, even on otherwise nonrefundable tickets.

—*Provide prompt ticket refunds.*—By agreeing to this provision, the Airlines have, in essence, agreed to comply with existing Federal regulations and requirements. The 7-day refund requirement for credit card purchases has been in effect for nearly 20 years and is governed by Federal regulations. The 20-day refund requirement for cash purchases has been in effect for over 16 years. With the exception of one Airline, our ongoing testing did not show compliance problems with this provision.

—*Meet customers’ essential needs during long on-aircraft delays.*—During our initial visits to the Airlines, less than half had comprehensive customer service contingency plans in place for handling extended delays on-board aircraft at all the airports they served. Subsequent to our initial visits, the Airlines have all stated that comprehensive customer service contingency plans are in place for addressing delays, cancellations and diversions. Over the next several months, at the airports we visit, we will determine whether the (1) Airlines’ customer service contingency plans are in place, (2) Airlines’ customer service personnel are knowledgeable of contingency plan procedures, and (3) contingency plans have been coordinated with the local airport authorities and FAA.

This provision also does not specify in any detail the efforts that will be made to get passengers off the aircraft when delayed for extended periods, either before departure or after arrival. The provision uses general terms such as “food,” “every reasonable effort,” “for an extended period of time,” or “emergency.” These terms should be clearly defined to provide the passenger with a clear understanding of what to expect.

We have found examples where Airlines have invested in air stairs for deplaning passengers when an aircraft is delayed on the ground but does not have access to a terminal gate; secured additional food and beverage supplies for service at the departure gates or on-board flights experiencing extended delays; or made arrangements with medical consulting services to resolve medical emergencies that occur on-board an aircraft.

—*Handle “bumped” passengers with fairness and consistency.*—The requirement that the Airlines establish and disclose to the customer policies and procedures regarding denied boardings has been in effect for over 17 years. One critical element of disclosure is the Airlines’ check-in time requirements that passengers must meet in order to avoid being “bumped.” This is important because the last passenger to check in is generally the first to be denied a seat if a flight is oversold.

We found several inconsistencies and ambiguities between the check-in times identified in the Airlines’ Plans, and those identified on the Airlines’ contracts of carriage, ticket jackets, or other written instruments, such as the customer’s receipt and itinerary for electronic tickets. For example, in its contract of carriage, one Airline requires passengers to check in 10 minutes prior to the

flight's scheduled departure, but on the customer's receipt and itinerary for electronic tickets, the check-in time states 20 minutes prior to the flight's scheduled departure, making it unclear to passengers which check-in time must be met in order to avoid losing their seats and being "bumped" from the flight without compensation.

—*Be more responsive to customer complaints.*—The provision requires the Airlines to respond to complaints within 60 days; it does not require resolution of the complaint within the 60-day period, nor that when resolved, the disposition will be satisfactory to the customer. Our testing of this provision found the Airlines were responding to written complaints in accordance with their internal policies, generally less than 60 days. In addition, the replies we reviewed were responsive to the customer complaint and not merely an acknowledgement that the complaint had been received.

Airline Performance Measurement Systems and Non-Airline-Employee Training Are Needed

A key to the success of the Plans is the need for each Airline to have a credible tracking system for compliance with its Plan, buttressed by performance goals and measures. The Airlines also need to train non-Airline employees on customer service issues contained in the Plans, since these individuals are often mistaken for Airline employees.

The Airlines need to have performance measurement systems in place to ensure the success of the Commitment and Plans. Therefore, the success of the Customer Service Plans is dependent upon each Airline having a tracking system for compliance with each provision and the implementing Plan. We found that most of the Airlines originally did not have such a system in place, but we received assurances that the needed systems would be established.

In our work between now and December, we intend to determine whether the Airlines have followed through on their assurances and these performance measurement systems are in place. The expectation, for example, is that each Airline will have in place a tracking system to ensure the lowest eligible fare is offered, that misrouted and delayed baggage is returned within 24 hours, that refunds are paid within the requisite timeframe, and that communication systems for advising passengers of flight status are working properly, and generating reliable and timely information. So far, however, our testing has shown that most of the Airlines have come up short in putting a tracking system in place to ensure that misrouted and delayed baggage is returned to the passenger within 24 hours.

Another area the Airlines need to address to improve customer service is the training of non-Airline employees who interact with customers at the airport such as skycaps, security screeners or wheelchair providers. The Airlines must ensure non-Airline employees who interact with their passengers are adequately trained on the Airlines' Plans, policies and procedures for customer service.

When these personnel perform customer service functions covered directly by the Airlines' Commitment, the public cannot reasonably be expected to differentiate between those who work for the Airlines and those who do not. Therefore, it is critical to the success of the Commitment and Plans for these personnel to be properly trained. However, 5 of the 14 Airlines told us they did not intend to train non-airline personnel on their Plans' procedures. This is unfortunate. For example, it is critical that the Airlines ensure that non-Airline personnel performing passenger security screening service on behalf of the Airlines understand the Airlines' policies and procedures in their Plans for accommodating persons with disabilities.

The Terms in the Airlines' Contracts of Carriage Can Be More Restrictive Than the Terms in Their Plans

The Commitment and the Airlines' Plans, while conveying promises of customer service standards, do not necessarily translate into legally enforceable passenger rights. Rather, each air carrier has an underlying contract of carriage which, under Federal regulations, provides the terms and conditions of passenger rights and air carrier liabilities. The contract of carriage is legally binding between the air carrier and the passenger.

Because of their clear enforceability, the Airlines' contracts of carriage have become an important issue in the customer service debate. Our results indicate that, in general, the Airlines have not modified their contracts of carriage to reflect all items in their Plans. Although 1 Airline incorporated its Plan in its entirety into the contract of carriage, 3 Airlines (as of April 20, 2000) have not changed their contracts of carriage at all since they agreed to the Commitment, and the remaining 10 Airlines have changed their contracts of carriage to some extent. This means, for example, that the provisions for returning misrouted baggage within 24 hours and

holding a reservation for 24 hours without payment are not in some contracts of carriage.

At present, it remains uncertain whether an Airline's Plan is binding and enforceable on the Airline. In fact, one Airline, in its Plan, has stated that the Plan does not create contractual or legal rights. To resolve this question, the Airlines could incorporate their Plans in their contracts of carriage. However, based on our results thus far, we are concerned that, without direction to the contrary, this would leave open the possibility that the contracts of carriage may be more restrictive to the consumer than envisioned in the Commitment or the Plans.

In some cases, we found the modifications made to the contracts of carriage included restrictions not found in the Commitment or the Plans. For example:

—One Airline, in its Plan, states that it would accommodate passengers required to stay overnight for delays and cancellations caused by the Airline's operations. However, in its contract of carriage the terms are more limited—the Airline provides accommodations if the passenger is diverted to another airport and put in an overnight status at the other airport.

—One Airline, in modifying its contract of carriage to implement the provision to hold a reservation without payment for 24 hours, limited the benefit to passengers calling from the United States for travel within the United States. However, the Commitment does not make this distinction.

Customer service is likely to become more of a competitive market force as air carriers strengthen and implement plans to provide better service. Over time, where there is competition in the air markets served, measures to improve customer service should serve as a catalyst for other Airlines to introduce initiatives to improve their customer service in order to remain competitive. However, inclusion of the Plans' provisions in the Airlines' contracts of carriage will become more important if an environment develops where there is less competitive pressure to maintain or improve customer service.

Implications for DOT's Capacity to Oversee and Enforce Air Carrier Customers' Rights

DOT is congressionally mandated to oversee and enforce air travel consumer protection requirements, some of which are covered by the Commitment, and the Airlines' Plans and contracts of carriage. These include compensation rules for bumped passengers, rules governing the accommodation of disabled air travelers, ticket refund provisions, and baggage liability requirements. The Office of the Assistant General Counsel for Aviation Enforcement and Proceedings, including its Aviation Consumer Protection Division, carries out this mission. This office is also responsible for enforcing other aviation economic requirements, such as legal issues that arise regarding air carrier fitness determinations and competition.

DOT, in preparing and justifying budget requests for this office, and Congress, in reviewing those requests, should look closely at this office's capacity to fulfill its mission and be responsive in a timely way to consumer complaints. In 1985, this office had a staff of 40; in 1995, it was down to 20; and by 2000, it had a staff of 17 to oversee and enforce aviation consumer protection rules as well as carry out its other responsibilities.

In fact, staffing has declined during a period of air traffic growth, complaints have increased from 7,665 in 1997 to 20,495⁸ in 1999, additional requirements have been established (such as the Air Carrier Access Act and the Aviation Disaster Family Assistance Act), and recently, the Commitment emerged as an important element in protecting passenger rights. An issue that office will face soon is whether policies contained in the Commitment and the Airlines' Plans are enforceable if they are not also contained in the Airlines' contracts of carriage.

We believe there is cause for concern whether the oversight and enforcement expectations for the Office of Aviation Enforcement and Proceedings significantly exceed the office's capacity to handle the workload in a responsive manner.

Although Actions Are Underway, Much Work Remains

Partly in response to the increase in delays and cancellations as well as the number of complaints, FAA along with representatives of the airline industry conducted an extensive evaluation in 1999 aimed at improving its management of air traffic. As a result of the evaluation, FAA and the industry identified 165 near-term action items to relieve delays, including: (1) limiting locally initiated ground stops to 30 minutes; (2) providing estimates to air carriers of the time a ground stop will end and the cause for this action; and (3) ensuring that local facilities coordinate miles-

⁸Total aviation consumer complaints filed with DOT for the entire industry (U.S. airlines, foreign airlines, tour operators, etc.).

in-trail restrictions⁹ through the National Air Traffic Control System Command Center. According to FAA, most of the action items have been implemented.

FAA's evaluation also spurred a number of other initiatives. For example, FAA is deploying several traffic management tools, including the Flight Schedule Monitor, Collaborative Convective Forecast Product, and Departure Spacing Program. FAA has also established a web site (www.fly.faa.gov) that provides consumers real-time information on air carrier delays at the Nation's 40 largest airports. The web site is also linked to other information sources, such as the status of the National Airspace System, which shows all the ground delays and stops FAA has in place across the Nation at that time.

FAA also recognizes the need for a common system for tracking delays, cancellations, and their causes. As a result, the agency has been working with the major air carriers in developing the Aviation System Performance Metric (ASPM). ASPM, which became operational in April 2000, establishes a uniform set of metrics on which to measure delays during each flight segment, i.e., gate departure, taxi-out, en route, taxi-in, gate arrival, and overall flight time. ASPM also provides FAA and the participating air carriers with next day reports via the Internet on delays occurring at individual airports, on routes and flights, and within the overall system. FAA officials noted that ASPM will initially be used to help identify and track delays and cancellations as well as measure ATC performance. They also noted their intent to eventually include causal information in ASPM, which will be critical in helping FAA and the air carriers identify areas for improvement, such as changes in traffic management practices, funding for equipment and airport enhancements, and airspace redesign.

Likewise, the need for good causal data was recently reinforced by Congress in The Wendell H. Ford Aviation Investment and Reform Act for the 21st Century. This Act directs the Secretary of Transportation to modify existing regulations governing air carrier data submissions to DOT ". . . to disclose more fully to the public the nature and source of delays and cancellations experienced by air travelers." The Act also requires the establishment of a task force (including officials of FAA, air carriers, and consumer groups) to develop categories for reporting causal information on flight delays and cancellations.

Notwithstanding these efforts, much work remains to be done if delays and cancellations are to be addressed in a meaningful way. A good starting point is the development of a uniform system through which all components of DOT and the air carriers will be able to track flight delays and cancellations as well as measure ATC performance. In addition to this system, more comprehensive information is needed on the various causes of flight delays and cancellations not just those currently recorded by FAA or the air carriers. Finally, the Department needs to reassess the information it provides consumers, especially in the area of departure delays. The current emphasis on gate departure and arrival delays does not reflect the full extent of delays, much of which is occurring on the ground in the form of longer taxi-out times or is being underreported due to expanded flight schedules.

The issues are complex and there are no easy or quick solutions. The long-term solutions for enhancing capacity and improving customer service involve a number of steps including getting better data for decision makers to use in improving the use of our airspace, making more efficient use of existing and new runways, and exploring alternative airline scheduling practices.

Mr. Chairman, this concludes my statement. I would be happy to answer any questions you might have.

⁹Miles-in-trail is an ATC tool that intentionally paces traffic by increasing spacing between aircraft to keep volume at manageable levels. This spacing between aircraft should not be confused with the FAA safety separation standards requirement of 5 nautical miles laterally or 2,000 feet in altitude, in sectors of high-altitude traffic.

NONDEPARTMENTAL WITNESS

STATEMENT OF EDWARD KRAGH, NEWARK INTERNATIONAL AIRPORT AIR TRAFFIC CONTROLLER, SECRETARY, NEWARK LOCAL, NA- TIONAL AIR TRAFFIC CONTROLLERS ASSOCIATION

Senator SHELBY. Mr. Edward Kragh.

Mr. KRAGH. Good morning, Chairman Shelby, Senator Lautenberg, members of the Committee. Thanks for the opportunity to testify this morning.

My name is Ed Kragh. And I am a controller at Newark Airport. I am also the Secretary of NATCA at Newark. And the NATCA is the exclusive representative of over 15,000 air traffic controllers serving the FAA, Department of Defense and the private sector.

AIRLINE DELAYS

Airline delays, as we all know, are at an all-time high. Passenger frustration is over the top.

And predictably when something goes wrong, the finger pointing, as you mentioned, blame game begins. To that end, the airlines have embarked on a well-financed campaign of misinformation blaming air traffic control for their delays.

Everybody has said today, it is unproductive and unfair for one segment of the aviation industry to place responsibility entirely on another.

It is simply untrue to say that air traffic control is primarily at fault for the hundreds of thousands of delays each year.

Safety is the controller's sole function. This should not be compromised to accommodate more passengers, more flights, or more profits for the airlines.

We go to enormous lengths to personally ensure uneventful passage for millions of flyers each year. Controllers do not have an incentive to delay or hinder air traffic. Our motivation is to move aircraft as safely and efficiently as possible.

The longer a delayed aircraft is in our airspace, or for myself at the tower, occupies concrete on the ground, the more difficult our jobs become.

The sole function of controllers is to ensure the safety of the flying public. And this should not be compromised to accommodate more passengers, more flights or more profits.

We are talking about delays. And delays represent a multi-faceted problem. They must be treated as a comprehensive, ongoing circumstance that offers no single or easy solution.

For the obvious contributors to delays are heavy demands, which we see in the summer time increases; and scheduling decisions by airlines, which exceed airport capacity; bad weather; implementation of new controller equipment; and an antiquated system.

CROWDED SKIES

Let us talk about our crowded skies. Our domestic air traffic control system is the largest, most complex and demanding in the world. It is also the safest. And this is no doubt due in large measure to the dedication and professionalism of the controllers workforce.

Today, we are under extreme pressure to squeeze more planes into an already congested airspace.

AIRPORT DELAYS

Newark Airport has had the dubious distinction, as Senator Lautenberg mentioned, of suffering the most air traffic delays of any airport—my figures show it was 6 of the last 7 years. I believe you—you stated that it was 9 of the last 12 years—nothing that we are particularly proud of.

Yet during the same period we speak of, Newark is only ranked from the 15th to the 20th busiest facility in the country. We will likely suffer more delays this year than Dallas/Fort Worth, Chicago O'Hare or Atlanta International, each of which will handle almost double the amount of operations at Newark.

This begs the question, why is Newark number one? And the answer is simply airport capacity.

Any airport's capacity to handle air traffic is a function of its size, the layout of the runways, the air traffic patterns for arrivals and departures and the time frame in which a surge of traffic or traffic peaks must be dealt with by controllers, due to airline scheduling.

By comparison with other major airports, Newark is small. Chicago O'Hare has over 62,000 feet of available runway; Newark, only about 27,000 feet.

Chicago has about 900,000 operations annually; Newark approximately 463,000. Newark is bound on all sides by major highways, railroads and the Newark Bay, making further airport expansion a daunting proposition.

A second reason we are speaking about delays is unrealistic hub scheduling. The inefficient hub and spoke system used by airlines to schedule flights is a major source of delays.

Flight departure and arrival scheduling is at the sole discretion and control of the airlines, not Congress, not the FAA, and certainly not air traffic controllers.

Airlines want to reduce operating costs and maximize revenue, without regard for other airlines' schedules already slated for prime times, terminal air space or airport capacity.

This past Sunday's the last shift that I worked before coming down here at Newark Airport was a beautiful, sunny day. And during the peak departure time of—between 6 and 7 p.m., there were about 25 departure delays.

Weather conditions, as I mentioned, were perfect. There were no equipment problems. Yet the airline scheduling exceeded the airport capacity and thus delays resulted.

As long as the airlines continue to overbook our runways, especially during peak hours, air traffic delays will continue. Passengers will wait.

Cramming extra flights into an already taxed system only creates congestion in the terminal airspace, on the runways and at the gates.

Even if controllers today had the most up-to-date equipment, air traffic delays would not be eliminated. Controllers would simply be able to keep better track of the aircraft.

WEATHER

A third and truly primary cause of delays is weather. Now, Ms. Garvey mentioned, some weather data from June, about 12 consecutive severe weather nights. I can tell you that I worked 10 of the 12 of those, and it was not an enjoyable situation.

Inclement weather has—and will continue to—play a significant role in air traffic delays, accounting for approximately 75 percent.

Planes fly on a complex set of invisible highways in the sky, with intersections, speed limits, separation requirements, and so on. When storms or inclement weather cause blockage or closing of one or many of these unseen highways, air traffic bottlenecks just like it does on the interstate at rush hour.

Controllers must then reroute this traffic. And it can take hours to recover from a brief shutdown of one air route.

I might interject here something that Senator Reid mentioned I thought was an interesting idea. He had an idea about—and I am paraphrasing from his comments—but he mentioned information kiosks for passengers to—to see weather information that is current across the country.

Often, airline complaints or any complaint that anyone has is often due to their misunderstanding of what is actually going on. It is certainly—maybe the airlines could be more forthcoming about that information, but if passengers could see for themselves the weather that they are going to need to fly through and around, that might help to keep complaints down.

Speaking about Newark and its airport capacity, the centerlines of our main parallel runways lie only 900 feet apart. When weather is reduced below 1,000 feet of cloud ceiling or less than 3 miles of visibility, we have to revert to air traffic rules that dictate that these two runways be treated as a single runway. And that reduces airport capacity significantly.

Senator SHELBY. How often is that?

Mr. KRAGH. That specific instance is not as frequent as the type of summer storm delays that we encounter—probably 2 or 3 times a month is what we are talking about for reduced weather minimum.

Senator SHELBY. And what is the average period of time that you had to reduce two runways to one—

Mr. KRAGH. I do not have those specific figures.

Senator SHELBY. Okay.

Mr. KRAGH. But if a storm moves right over the airport or fog or low cloud ceilings move in, however long the weather takes to move out.

Senator SHELBY. Yes. Okay.

Mr. KRAGH. That is usually not longer than a day or perhaps a shift, affecting possibly two or three departure pushes, as we call them.

ARRIVALS AND DEPARTURES

One of the significant inhibitors to capacity at Newark is the fact that both arrivals and departures use a single stream flow into and out of the airport.

These patterns are necessary in the current airspace designation, because of the proximity of Newark, LaGuardia, Teterboro, and Kennedy Airports.

Almost all of the arrivals from wherever they are coming from in the country, except for a handful of propeller aircraft, funnel into one line at Newark for the main landing runway.

During heavy arrival push, each arrival clears the runway just as the next crosses the airport boundary. There is not a lot of room for error in our job at Newark. And I am sure my colleagues at other airports can attest to that.

All the departures at Newark, except again for a few props, depart from one runway. And they fly the same heading, the same pattern.

This prohibits us from using any of the reduced departure separation procedures, which are available, for instance, when two departures would take off on diverging endings.

This is due again to airspace constraints, with the proximity of the other airports. But it is also done in the interest of noise abatement, and as Senator Lautenberg can attest to, noise abatement is a very—

Senator LAUTENBERG. Testy issue.

Mr. KRAGH. And I am sure you receive just as many complaints about that as you do about other airline issues.

MODERNIZATION

Finally, modernization, NATCA has strongly and has always advocated modernization of the air traffic control system.

In fact, the union has been successful in making key points and today works with the agency on projects previously stalled or headed for failure.

Collaboration and teamwork have been instrumental in ensuring the success of well-documented DSR, which is a center radar, and STARS, a terminal radar, modernization projects.

It is no overstatement to say that NATCA has been instrumental in turning the agency around. We may now be assured the 21st century will see many viable, effective advances that work with controllers and pilots, not against them.

Yet, while new equipment is a necessary step for ensuring safe, efficient travel in the future, it will not solve the problem of airline-created delays.

DELAYS

In summary, without expanding domestic airspace and airport capacity, delays will not only continue to increase, but they will reach the point of gridlock in the foreseeable future.

Something must be done now to address the issue, because it is only going to get worse. It is time to stop pointing fingers, further dividing a splintered industry.

Teamwork and collaboration are needed to develop and implement long-term solutions and procedural changes to alleviate air traffic delays. And I think everybody agrees on that point.

PREPARED STATEMENT

Thank you very much, Mr. Chairman. I will be pleased to respond to any questions you have.

Senator SHELBY. Thank you.

[The statement follows:]

PREPARED STATEMENT OF EDWARD KRAGH

Good morning Chairman Shelby, Senator Lautenberg, and members of the Subcommittee. Thank you for this opportunity to testify on the problems contributing to aviation delays. My name is Edward Kragh and I am a Federal Aviation Administration (FAA) air traffic controller at Newark International Airport in New Jersey. I am also Secretary of the National Air Traffic Controllers Association (NATCA) local at Newark tower, NATCA is the exclusive representative of over 15,000 air traffic controllers serving the FAA, Department of Defense and private sector.

Airline delays, as we all know, are at an all time high. Passenger frustration is over the top. And, predictably, when something goes wrong, the finger pointing and the blame game begins. To that end, the airlines have embarked on a well financed campaign of misinformation blaming air traffic control for their delays. It is unproductive and unfair for one segment of the aviation industry to place responsibility entirely on another. It is simply untrue to say that air traffic control is primarily at fault for the hundreds of thousands of delays each year.

Safety is the controller's sole function and this should not be compromised to accommodate more passengers, more flights, or more profits for the airlines. We go to enormous lengths to personally ensure uneventful passage for millions of flyers each year. Controllers have no incentive to delay or hinder air traffic. Our motivation is to move aircraft as efficiently, safely and quickly as possible. The longer a delayed aircraft is in our airspace or occupies concrete on the ground, the more difficult our jobs become. However, the sole function of controllers is to ensure the safety of the flying public, and this should not be compromised to accommodate more passengers, more flights or more profits for the airlines.

Delays represent a multi-faceted problem. They must be treated as a comprehensive, ongoing circumstance that offers no single or easy solution. The obvious contributors to delays are heavy demand by travelers, scheduling decisions by airlines, bad weather, implementation of new air traffic controller equipment, an antiquated system, plus policy and complex procedures.

As you see, many delay factors are OUTSIDE our control.

First, let's review our crowded skies.

Our domestic air traffic control system is the largest, most complex and demanding in the world. It is also the safest. This is, no doubt, due in large measure to the dedication and professionalism of the controller workforce. Today, we are under extreme pressures to squeeze more planes into an already congested airspace.

Newark has had the dubious distinction of suffering the most air traffic delays of any airport in the United States for 6 of the last 7 years. Yet, during this same period Newark has only ranged from the 15th to 20th busiest facility in the country. This year we will handle approximately 463,000 operations, yet we will most likely suffer more delays than either Dallas/Ft. Worth, Chicago O'Hare, or Atlanta International, each of which will handle almost double the amount of operations. This begs the question "Why Newark?" The answer is simply airport capacity.

An airport's capacity to handle air traffic is a function of its size, the layout of its runways, the air traffic patterns, both arriving and departing, and the time frame in which a surge of traffic must be dealt with due to airline scheduling. By comparison with other major airports, Newark is small. Chicago O'Hare has over 62,000 feet of available runway, Newark only about 27,000 feet. Chicago has about 900,000 operations annually, Newark has approximately 463,000 operations. Newark is bound on all sides by major highways, railroads and the Newark Bay, making further expansion of the whole airport a daunting proposition.

A second reason for delays is UNREALISTIC HUB SCHEDULING.

The inefficient hub and spoke system used by airlines to schedule flights is a major source of delays. Flight departure and arrival scheduling is at the sole discre-

tion and control of the individual airline—NOT Congress, NOT the FAA, and NOT the traffic controllers.

To maximize profits, airlines intentionally overload the system. You show me a major HUB airport, and I'll show you over-scheduling. Airlines want to reduce operating costs and maximize revenue, without regard for other airlines' schedules already slated for prime times, terminal airspace or airport capacity.

It is like trying to cram 10 pounds of sand into a 5-pound bag. All scheduled flights will not be able to depart or arrive on time.

Yesterday, at Newark airport, during peak time between 6 p.m. and 7 p.m., there were approximately 25 delayed departures. Weather conditions were perfect and there were no equipment problems. Yet, airline scheduling exceeded airport capacity and thus resulted in delays,

As long as airlines continue to overbook runways, especially during peak hours, air traffic delays will continue and passengers will wait. Cramming extra flights into an already taxed system only creates congestion in the terminal airspace, on the runways and at the gates. Even if controllers TODAY had the most up-to-date equipment, air traffic delays would not be eliminated. Controllers would simply be able to keep better track of the planes.

A third and truly primary cause of delays is WEATHER.

Inclement weather has, and will continue, to play a significant role in air traffic delays—accounting for approximately 75 percent. Unfortunately, nobody but Mother Nature has any control here.

Planes fly on a complex set of invisible "highways in the sky" with intersections, speed limits, separation requirements, and so on. When storms or inclement weather causes blockage or closing of one or many of these unseen highways, air traffic bottlenecks just like it does on the interstate at rush hour. Controllers must then reroute this traffic. It can take hours to recover from a brief shut down of one air route.

At Newark, the centerlines of the main parallel runways lie only 900 feet apart. When weather is reduced below 1000 feet of cloud ceiling or less than three miles of visibility, air traffic rules dictate that runways this close together must be treated as a single runway. Thus, airport capacity is severely reduced.

Separation Procedures Affect Delays.

One of the significant inhibitors to capacity at Newark is the fact that both arrivals and departures use a single stream flow into and out of the airport. These patterns are necessary in the current airspace designation because of the proximity of Newark, Teterboro, LaGuardia, and Kennedy airports. Almost all arrivals, except for a handful of props, funnel into one line for the main landing runway. During a heavy arrival push, each arrival clears the runway just as the next crosses the airport boundary. All departures, except again for a few props, depart from one runway, flying the same heading. This prohibits us from using any of the reduced departure separation which is available when two departures will fly diverging courses. This is due again to airspace constraints, but it is done also in the interest of noise abatement for the communities bordering the field.

Finally, MODERNIZATION—A thinly veiled attempt by airlines to promote privatization of the FAA.

NATCA has STRONGLY advocated modernization of the a traffic control system. In fact, the union has been successful in making key points and, today, works with the agency on projects previously stalled or headed for failure. Collaboration and teamwork have been instrumental in ensuring the success of well-documented DSR and STARS modernization projects. It is no over-statement to say NATCA has been instrumental in turning the agency around. We may now be assured the 21st century will see many viable, effective advances that work with controllers and pilots—not against them. Yet, while new equipment is a necessary step for ensuring safe, efficient travel in the future, it will not solve the problem of airline-created delays.

In summary, without expanding domestic airspace and airport capacity, delays will not only continue to increase but they will reach the point of gridlock in the foreseeable future. Something must be done now to address the issue because it is only going to get worse. It is time to stop pointing fingers, further dividing a splintered industry.

Teamwork and collaboration are needed to develop and implement long-term solutions and procedural changes to alleviate air traffic delays. On that point, I believe we all agree. Perhaps we can use it as the starting point for a longer, more fruitful examination, and ultimately to solutions.

Thank you, Mr. Chairman. I would be pleased to respond to your questions.

GROWTH IN CAPACITY

Senator SHELBY. Mr. Mead, I note that total FAA aircraft operations, the work load of the air traffic control system, have grown only 8 percent in the past 5 years, yet cancellations are up over 60 percent; taxi times of over an hour and up, 130 percent; and delays are up over 50 percent. Those numbers seem to indicate that something is out of sync between the air traffic workload and the delay in cancellation problems we have been talking about here.

Is it unreasonable, Mr. Mead, to expect that we should be able to increase the capacity in the air traffic control system by 8 percent over a 5-year period? Is it unreasonable?

Mr. MEAD. No, sir. If that was spread evenly throughout the ATC system, I think would be a—

Senator SHELBY. But that is your caveat right there, is it not?

Mr. MEAD. That is exactly right.

Senator SHELBY. If it is spread evenly?

Mr. MEAD. That is exactly right. That—

Senator SHELBY. It is not going to be spread evenly, so explain.

8.3 PERCENT GROWTH

Mr. MEAD. Yes, I think there are two factors at play here. One is this 8.3 percent growth, which just to translate it into numbers, from—about 122 million operations in 1990, about 125 million in 1999.

Now, in 1995, there were about 115 million, which meant it dropped. It actually dropped from between 1990 and 1995.

Now, the 8.3 percent over that 5-year period is not spread evenly over the system. Some places it is much, much higher. And I think one factor here is the scheduling.

And one of the points I was trying to make in the testimony is that that is why we have to sort through exactly what the causes are because going down the slope of trying to deal with scheduling and make scheduling adjustments, at least from a Federal Government point of view, is a very tough order.

AIR TRAFFIC CONTROL EQUIPMENT

I believe a second factor is air traffic control equipment, sir. Air traffic control equipment, there is a lot of new equipment in the system, but it is not the new equipment that was promised, like the advanced automation system from some years ago, the wide-area augmentation system for satellites, the backroom software for the STARS acquisition. And you could go on.

But there is a lot of new equipment in the system, but it is not exactly equipment that is going to enhance capacity.

DELAY DATA

Senator SHELBY. Mr. Mead, is there any value to the consumer in the current delay reporting system that we have? We are all consumers. We all travel. But is there really any value to the consumer in the current delay reporting system we have been talking about. I do not see any.

Mr. MEAD. No. I think the arrival numbers are quite meaningful, but I do not believe the departure statistics are or the FAA system

is. I think all these systems need to be married together and we have to come up with a common agreement. It is not only confusing to the consumer. It is somewhat misleading to the consumer.

Senator SHELBY. Somewhat misleading—

Mr. MEAD. It is not just—

Senator SHELBY. It is clearly misleading, is it not? I mean, we have been talking about how they report statistics up here earlier.

They do not count different things. I do not know who wrote the rules, but we have got to go back to the truth. Basically, the consumer needs the truth. We need to know the truth about what the airlines are doing, how they report, how they game the system or do not game the system.

And I think the FAA and you, as the Inspector General, working with us can really make a difference there.

Ms. GARVEY, do you want to comment on that?

Ms. GARVEY. Mr. Chairman, I would agree and in fact, I agree very much with the Inspector General's statement that really the information that we have right now is not helpful for consumers.

Senator SHELBY. It is really not truthful information, is it?

Ms. GARVEY. Well, it is certainly misleading.

Senator SHELBY. If it is misleading, it is not the truth.

Ms. GARVEY. I do want to speak to one effort that we began last winter and this is in cooperation with the airlines. And to their credit, they have come forward and said, "Look, we have got to really understand the delay issue better than we do now."

We have been, since last winter, collecting data at the top 20 airports that is going to serve as our baseline. The Inspector General has been very helpful in that effort as well. So we really will have at the end of this summer, I think, the beginnings of a baseline. We then need to develop a methodology so we can track the causes of those delays, which will be more challenging.

But you are absolutely right. We have got to get a better handle on what really are the causes and what are the definitions.

TELLING THE CONSUMER THE TRUTH

Senator SHELBY. Ms. Garvey, you are the Administrator for the Federal Aviation Administration. You are right in the mix of this, because of your job. How difficult will it be for the FAA and the air carriers to agree, if you can, to a common set of delay causing categories?

In other words, tell the American people the truth, the consumer the truth. I think that if we started out with the truth, then we will know what to build on, would we not?

Ms. GARVEY. Absolutely.

Senator SHELBY. How difficult is it going to be to get to the truth?

Ms. GARVEY. In all honesty, I think that is going to be a challenge.

Senator SHELBY. Why? You are the Administrator of FAA. Tell us how we can help you get to the truth.

Ms. GARVEY. Well, actually I think you have been very helpful.

Senator SHELBY. Yes.

Ms. GARVEY. And I will tell you that I do think the efforts that have been underway just in collecting the baseline information at

the top 20 airports, that is the first step. And I think we are all in sync with that. I will tell you I think there is so much at stake. I think everyone recognizes that. So while I do not want to underestimate the challenge, I think it is absolutely a solvable challenge. And one we can meet. But we are going to have to do it together.

REPORTING FLIGHT CANCELLATIONS AND DELAYS

Senator SHELBY. Mr. Mead, the I.G. interim report indicates that flight cancellations and delays are the primary source of passenger dissatisfaction. The number of flight cancellations and delays has risen over the last 5 years. And the number of on-board—on-board flight delays of one hour or longer increased 130 percent at the 28 largest airports in the United States.

Mr. Mead, what is causing the increases in extended delays here? How can you get your hand on this? How can we help you?

Mr. MEAD. I would like to first answer this and I imagine my colleague from Newark here has some observations on that too.

One reason this is occurring is because we have a lot of flights scheduled to leave at peak hours. There is an incentive to push away from the gate, because that way you show up as leaving on time—and get into the queue.

Senator SHELBY. But that is misleading to the people.

Mr. MEAD. Yes, it is. So you have these long lines of planes.

And once you get in that line, you do not want to get out of it, because you lose your place in the queue.

Senator SHELBY. Sure.

Mr. MEAD. So there you are sitting in this aluminum tube for a couple of hours.

And I do not want to discount the influence of weather, but I do think it is a very important phenomena to point to what is happening at peak hours in terms of scheduling—

Senator SHELBY. Sure.

Mr. MEAD [continuing]. And also the incentives to get that plane out into the ramp area.

And I wanted to mention just one other example. I mentioned the BTS example about leaving—

Senator SHELBY. Yes.

Mr. MEAD [continuing]. Pushing back from the gate within 15 minutes, but consider another scenario. You do not push back from the gate within 15 minutes. In other words, you sit there in the terminal for 2 hours because the airline decides not to leave.

Then after a 2-hour delay, your plane backs away from the—

Senator SHELBY. The airline decides not to leave, now—

Mr. MEAD. Right. The airline decides not to leave.

Senator SHELBY. Why? Waiting on another flight maybe?

Mr. MEAD. They may wait on another flight. There could be any one of a number of reasons. But finally the plane backs away from the gate. So it will show up as a late departure, because it left more than 15 minutes after its scheduled departure. Now, assume further that the flight transits to the wheels up point on the runway within a normal time and then takes off. That flight will be recorded as on-time by FAA, even though there has been a 2-hour delay, and from the consumer's point of view, they are still 2 hours late.

Senator SHELBY. Absolutely.
Senator Lautenberg.

SYSTEM CAPACITY—NEWARK

Senator LAUTENBERG. Thanks very much, Mr. Chairman.

As I listen to this very well-done testimony, I have got to ask the question. Is there a point at which we cannot increase the capacity of the system to go beyond a particular volume of traffic, or is it unlimited? Can we fill the skies with more airplanes?

I often ride in the second seat in a smaller airplane. And I want to tell you we have TCAS in the airplane, a system that is even broader. I hear traffic, traffic, traffic constantly. And I travel in a fairly congested area.

But is there a point in time and capacity that we can no longer satisfy the need? When you hear about planes leaving—I came down here for the Million Mom March the Saturday night before that Sunday. I got on a shuttle out of New York. And it was a 6:00 o'clock flight. We arrived here almost midnight.

We—the flight—we flew two-thirds of the way down and then could not land. Weather came in, turned around and went back. After sitting in—on the runway for 2 hours, then on the second flight, another hour delay—6—almost 6 hours.

So do any of you want to volunteer an opinion on that?

Mr. KRAGH. Yes, sir. To speak of Newark as a microcosm of the system as far as airports go, I spoke earlier about the expansion of the Newark Airport being an almost impossible task at this point. You would have to move major highways and major infrastructure. There is definitely a terminal capacity, so to speak, a place where you cannot go beyond. Because each airport would have—the surrounding communities would have to be dealt with. I mean, there is a fine balance between how much traffic we are going to fit in a certain departure pattern, or as I said we could fan the departures out and get a lot more planes out, but the surrounding communities would not stand for that.

Now, we talk about a system at Newark where we are shoveling 10 pounds of sand into a 5-pound bag. That is the first hour. For the next 4 hours, we are only putting 2 pounds of sand in the 5-pound bags. We have got airline scheduling that is surrounding the peak hours, 7 a.m., 8 a.m., and for the rest of the morning shift, we have 20, 30 departures an hour, which can be dealt with very easily.

How—of course, the airlines have to serve their customer and supposedly the customer wants to depart at those times, but does everybody want to be in a long line? I mean, it is the same thing with rush hour traffic in the morning. Mr. Mead suggested to me that there is a finite end to this. There is a point you come to where you cannot fit anymore planes into that type of a system. We need to spread the schedule out into the hours where there are no planes departing.

DEPARTING TIMES

Senator LAUTENBERG. Well, it talks about a lot of creative thinking that can be done. I do not think that airplanes ought to be able to leave the gate and it is just like the supermarket. When you call

into the tower or the flight service unit, you get a number and that number says you will be called upon when there is 20 minutes or less—if that is the appropriate time—before you take off.

Meanwhile, the passengers can be treated like human beings, instead of stuck in there with no capacity to make phone calls, et cetera. And if I had not written a law that passed here in 1987, smoking—you know—can you imagine what it would be like now, sitting there for 2 hours? The pilot says, “Well, we are going to turn the smoking lamp on,” right when—

Senator SHELBY. Thank you. Thank you.

Ms. GARVEY. Thank you.

Senator LAUTENBERG [continuing]. And watching everybody gag and smoke and—so there is that fundamental question, what—why cannot we improve it? I think the insulting behavior—and, again, I think the airlines are great, but they are now at a point where having made over \$10 billion pre-tax last year, they are motivated by profits and it is a business and so it should be.

But the customer does not always come first. The profits come first. The shareholders—the stock price comes first. And you cannot operate a commodity like airlines in that way.

And, frankly, I think you have made the case. The Chairman must be weary of hearing it from me, but—

Senator SHELBY. No. No. No.

Mr. KRAGH. Senator, the case is—

Senator SHELBY. Yes.

Mr. KRAGH There is such a time when the sort of a take a number system that you spoke of occurs and that is during winter operations. If Newark Airport or any airport had snow on the runways, everybody understands that the capacity of the airport is severely reduced. And at that time, the airports capitulate with air traffic and they say we are going to go into a slot-type of a system.

Senator LAUTENBERG. Yes.

Mr. KRAGH. So during times like that, the airlines seem to understand there is a finite capacity.

USE OF HIGH SPEED RAIL SERVICE

Senator LAUTENBERG. It could—it could be done. The problem is it would not enable or permit the airlines to flood the terminal and flood the concrete.

I mean, maybe they ought to have the people get on line out in the concrete and get on the airplane when it is time to go. As bizarre as these systems sound, the situation presently is more bizarre.

But it does say one thing, my friends. Everybody has to realize—and I am not—I did not grow up from a railroad family, but I am being railroaded here by our inability to face up to one way to solve part of the problem, and that is to take the inefficient legs that are 200 miles or 300 miles and say, wherever we can, have high-speed rail service at a considerably lower cost than just the \$3 billion lost from—from delays and that says okay, you get on in New York and you are in Washington in less than 2 hours.

Believe me, there would be—terrible news a Concorde just crashed into a hotel in Paris. Sorry to make that announcement. Do you know anything? That is awful.

But getting back to the railroad system, we have a proposal to put \$10 billion into railroads that could greatly relieve the aviation system. And while some of the airlines might not like the reduced revenue opportunity, they could do better more efficiently, I predict, make more money—bringing it down to the bottom line—by servicing the system in a way that has the customers happy about it.

I love to fly. I fly a lot, as I said, in a second seat. I fly in big airplanes, little airplanes. And it—I marvel at man's capacity to have created this instrument, but we—we need help. And the only way to get real help, I think, is to try to relieve some of the capacity requirements that we have.

CONCORDE ACCIDENT

Is there any other news on that Concorde?

Senator SHELBY. Ms. Garvey, do you know anything?

Ms. GARVEY. Just pretty much what you said, Senator, that an Air France Concorde crashed in Paris at 11 a.m. this morning. No further news at this point.

Senator SHELBY. 11 a.m. our time?

Ms. GARVEY. I believe it is our time.

Senator SHELBY. Our time.

Ms. GARVEY. 11:09, our time, I believe.

Senator SHELBY. Senator Campbell.

CAUSE AND IMPACT OF DELAYS

Senator CAMPBELL. Thank you, Mr. Chairman. That is tragic news. I am sure we will be hearing more of it, if people have lost their lives in that crash.

Let me talk a little bit about the delays too. I know that the most common are weather and mechanical, but certainly some that United Airlines is going through now apparently is from not training enough pilots to replace the ones that are retiring, as I understand it.

And certainly, the limited capacity that Mr. Kragh spoke about, too many aircraft and one runway, I understand that.

I come from a pretty tough country to fly in, the Rocky Mountains, as you know it, we get 100 mile-an-hour winds. My gosh, we get tornadoes and snow. We get ice that will build up an inch a minute, and certainly some high winds too.

There is a saying among pilots—I am sure you have heard this—that sometimes even the birds will not fly. And I have to tell you that when weather is that bad, I have no problem with cancellations. I want to stay alive and if the birds will not fly, I do not want to either.

But most of the time, the complaints we get are that the—what the airlines tells people why they are cancelled is not always the truth. They are sometimes told that they are cancelling because of weather. And as I understand it, they have to reimburse if—or they have to make some compensation, buy them a meal or a room if they have to stay overnight, something of that nature if it is weather. But not if it is mechanical—or no, it is the other way around.

If it is mechanical, they have to reimburse them. If it is weather, they are not. Is that correct?

Mr. Mead, yes.

Mr. MEAD. Sir, yes, this is a gray area. As a matter of fact, one of the commitments—the one to notify customers of known delays—cancellations, and diversions—that has a sub element that you disclose to people what your policies will be relative to accommodating them, if they get delayed.

And the contract of carriage, which is the legal document that governs your flight and what happens if you get delayed, that usually says that they will only put you up overnight if, in fact, you are diverted to another airport.

The plans that the airlines have implemented pursuant to this voluntary commitment go further, and they say we will accommodate you overnight if the delay is occasioned by our own operation.

But we do not know what “our own operations” means. It is not defined. And it is something that the airlines can define themselves.

But one of the points we make in our report is we would like to see greater clarity brought to that, and we would like to see the contracts of carriage expanded to provide accommodations overnight.

PASSENGER RIGHTS BILLS

Senator CAMPBELL. Well, one of the complaints we get, of course, is people say that they were told they—the airline—the aircraft was cancelled because of weather, and they were sure it was not, so that the carrier did not have to put them up for the night. I am sure you have heard that kind of complaint too.

Let me ask Ms. Garvey, there—there is a bill in now, I understand, on the House side that basically says if the plane is on the runway for over an hour and half, it has to return to the gate. Have you seen that bill or—

Ms. GARVEY. I have not seen that bill specifically. I know there are a number of passenger rights bills that have been introduced, and I know that Mr. Mead has suggested and we would agree that the airlines have until December to implement the voluntary program. We think letting that run its course, letting the Inspector General do its report would be useful.

But we certainly know there is great interest in these issues.

Senator CAMPBELL. Yes. Well, and certainly sitting out there 9 hours like one plane did, we saw that in the news, a number of lawsuits followed that, as you know.

Ms. GARVEY. Yes. Yes.

COSTS OF DELAYS

Senator CAMPBELL. There is also the cost of lost income to people. I have a letter here—in fact, Mr. Chairman. It is from Pacific Coast Beauty Products, into the record. This is an example of a man who spends \$50,000 a year on airline tickets for his business, but has lost a considerable amount more than that because of the delays—they delayed flights, and he was unable to get to a certain place to sign a timely contract, things of that nature.

And do we have any statistics on the accumulated loss in terms of millions or billions from the delays in the last year?

Ms. GARVEY. We do not have that kind of information at the FAA, but—

Senator CAMPBELL. Mr. Mead, do you have any information like that?

Mr. MEAD. Yes, I do.

Senator CAMPBELL. Tell the Committee about it.

Mr. MEAD. Here is just some ballparks. It is an estimate of what it costs the air carriers first, \$3.3 billion in 1999. When—

Senator CAMPBELL. This is the air carriers?

Mr. MEAD. That is the air carriers. And when you put in the passengers, you add—add another \$4 billion.

Senator CAMPBELL. In—

Mr. MEAD. In 1999.

Senator CAMPBELL. Roughly \$7 billion then you are saying?

Mr. MEAD. Yes. We estimate that the delays cost the 10 major carriers about \$3.3 billion in 1999, and I would say about another \$4 billion for the consumers.

Senator CAMPBELL. Those consumers that lose that money, of course, have no recourse either, as I understand it, is that correct?

Ms. GARVEY. That is correct.

Senator CAMPBELL. Thank you, Mr. Chairman. I have no further questions.

Senator SHELBY. Senator Specter.

UNITED AND U.S. AIRWAYS MERGER

Senator SPECTER. Thank you very much, Mr. Chairman. The issue of airlines' delay is obviously a very important one for many reasons.

There is a proposed merger acquisition, as everyone knows, with United and U.S. Airways. In a fairly exhaustive study revealed Sunday, July 16, 2000, the New York Times laid findings about delays in on-time arrivals, and among the 10 major airlines listed, the line with the most delays, fewest on-time arrivals was United.

And on a category of the most delayed regularly scheduled flights, of the four selected, D.C. to Seattle; Phoenix to Ft. Lauderdale; Denver to St. Louis; Chicago to Seattle. United had four of the most delayed flights.

The question that I have posed to United officials, including their CEO in our hearings is why should there be a merger when the number one airline is going to take on the number six airline, when United's house is not in order.

In addition to the matter of delays, which is the subject of this hearing, the New York Times survey also found that United lost the most baggage because their computers did not communicate with each other.

I would be interested in your views, Ms. Garvey. You are not the antitrust division, but I would be interested in your views from your position as to whether you think it is advisable to have a merger of United and U.S. Airways when United's house is so badly out of order at the present time.

Ms. GARVEY. Senator, you are right. I mean, certainly the Justice Department and the Department of Transportation are very fo-

cused on that and are asking exactly the same questions that you have asked and are focused very much on what are the impacts to the consumer. And ultimately, that has to be the driving factor, are these benefits positive for the consumer?

Senator SPECTER. Well, the——

Ms. GARVEY. From our perspective, from the FAA's perspective, what we focus on is the whole issue of safety. Are the elements of safety in place? Do they have the right kind of training? Do they have the right kind of maintenance systems and so forth? From our perspective, United and U.S. Airways certainly in the areas of safety, they have been very focused on that. They have some excellent people and I think have some very good standards.

But I think certainly the consumer issues that you are raising are exactly the same question that the Department of Transportation and the Justice Department are focused on. You have the right questions.

Senator SPECTER. Well, the Department of Justice is going to look at lessening of competition, which is——

Ms. GARVEY. Yes.

Senator SPECTER [continuing]. A different subject than on-time arrivals or consumer—customer complaints, et cetera.

Ms. GARVEY. Well, that is true—that is true.

Senator SPECTER. To what extent will the Department of Transportation be involved in the ultimate decision by the Federal Government as to whether or not to oppose the merger?

Ms. GARVEY. I think the Department of Transportation, particularly the Secretary, will play a very key role. Although I am not part of those discussions—I do understand that both the Secretary's lawyers and his key staff people are in very close communication with Justice. Justice, as you said, is focused on the competition piece, which is important to the consumer. And we are bringing or the Department of Transportation is bringing their expertise around some of the consumer issues, as well. I think the Secretary will play a very key role in those discussions.

FACTORS IMPACTING AIRLINE MERGERS

Senator SPECTER. So you are saying that the consumer issues like on-time arrivals will be a factor in the Federal Government's decision as to whether or not to oppose the merger?

Ms. GARVEY. Well, I certainly do not like to speak for the Secretary, but I would absolutely believe that all of those issues will be folded into this discussion and very much focused on. I think ultimately——

Senator SPECTER. On-time—on-time arrivals, baggage, computers——

Ms. GARVEY. Just generally——

Mr. MEAD. I think you——

Senator SPECTER. Let me finish the question. The computers communicating, the whole picture as part of the government's position on the merger, yes or no, Mr. Mead?

Mr. MEAD. I think you have raised an interesting question and frankly I think the answer will be that those factors have not been considered in the past, and that this is a kind of—rather a de novo matter.

Normally, in a merger, the issue you consider are more or less economic and competitive. Will this route be served? Will fares be oligopsonistic or monopolistic? Those types of considerations.

I think you raise a very good question. This issue came up in the railroad mergers as a result of the declining service that went beyond just what their rates were.

And I do not feel comfortable telling you that the Department will be considering these factors in their merger considerations, sir.

Senator SPECTER. You say you do or you do not feel—

Mr. MEAD. I do not feel comfortable telling you that the Department will be considering these factors.

Senator SPECTER. Well—

Mr. MEAD. Do I think they should, is another question.

Senator SPECTER. Do you think they might? Do you think they should—de novo, maybe break a little ground here?

Mr. MEAD. Yes, sir, I do. Yes, sir, I do. I believe that the circumstances of the last 4 or 5 years have been instructive, that there are factors that are important here that go way beyond just how much you are going to pay for a ticket and whether there is going to be service from point A to destination B.

Senator SPECTER. And certainly a factor in what you pay, if part of what you pay is lost time—or part of what you pay is lost time from your baggage non-arrival, or part of what you pay is all of the attendant inconveniences, which are a dollar and cents matter for loss of time and to do other things. If a professional is traveling, part of the pay is for the ticket. Another part of the pay is for his time lost if Senator Lautenberg loses 5 hours on a trip at the minimum rate, \$5.15 an hour, that is over \$25 lost.

If you are a high-priced lawyer, those 5 hours would be \$1,000 an hour, \$5,000. So Senators do not figure too highly on that scale, but that certainly is part of the pay factor.

STARS AT PHILADELPHIA AIRPORT

Ms. Garvey, on the subject of delays and the STARS system coming into Philadelphia—something you and I have talked about on a number of occasions—I have become very concerned about air traffic controllers and have gone into that dark room. And I am sure Senator Shelby has, too.

And you see those dots on the sky. And you think of yourself in one of those planes, which is a dot on the sky. And then suddenly it all turns black, and there is a loss of communication.

And I appreciate the fact that you sent people to Philadelphia very promptly, but that whole system is antiquated at best, and I would be interested to know if we are going to meet that schedule of September 2002 or might possibly move it up to August 31?

Ms. GARVEY. Well, August 31 would be wonderful. Senator, let me—let me just—

Senator SPECTER. Do you think you can do that?

Ms. GARVEY. We will certainly try. Let me—

Senator SPECTER. How about August 30th? Senator—Senator Shelby taught me how to negotiate.

Senator SHELBY. No. No.

Ms. GARVEY. Right. That is very good negotiating.

Senator SPECTER. He is a good lawyer. [Laughter.]

Ms. GARVEY. I do want to go back to something that that Ed mentioned a little bit earlier and that is the terrific role that the controllers have played with STARS. I think we have really turned that program around. Your help, both in working with the individual controllers in—in Philadelphia has been extraordinarily helpful. But we are on the right track with STARS. We have got the early displays in two of our facilities and working out a lot of the kinks there. And that is going very well. We have been able to put the full STARS into the—into England for the Defense Department and that, too, we are learning a great deal from and is going well.

So I am still confident that we are going to meet that schedule and we are working very hard with the controllers on it.

Senator SPECTER. Well, I am glad to hear that. And I compliment you on your responsiveness in the past. Thank you very much.

MERGER IMPACT ON CUSTOMER SERVICE

Senator SHELBY. Thank you, Senator Specter.

Mr. Mead, just to follow up on—on an area that Senator Specter was getting into. Do you have any thoughts right now about the—how the pending proposed mergers would affect customer service? It has got to in time.

Mr. MEAD. Well, I guess the best response to your question, sir, is to point to what the statistics show.

Currently, if the two airlines merge, the merged entity would be rated last in the category of mishandled bags, involuntary denied boarding and customer complaints. And that is based on May 2000 data.

AIR TRAFFIC SLOWDOWN IN CHICAGO

Senator SHELBY. Ms. Garvey, I am going to refer to a July 21 Chicago Tribune article, reporting that—and I will quote—“The FFA, Thursday, July the 20th, broadened its investigation of an air traffic slowdown near O’Hare International Airport earlier this week and promised to severely punish agency employees suspected of intentionally forcing hundreds of airlines—airline flights nationwide to be delayed or cancelled.”

I am still quoting from the article, “FAA officials say they are trying to determine whether the slowdown was the result of a job action on the part of a disgruntled—of disgruntled controllers, or caused by unusual weather phenomena.

“Delays at O’Hare ran up to three hours and whether—and neither FAA nor airport officials could attribute the problem to bad weather.”

I understand this is something that you have asked the Inspector General to look into, Ms. Garvey, is that right? Can you shed any light on this?

Ms. GARVEY. Well, let me first of all say that what happened at Chicago really made me heartsick.

Senator SHELBY. Yes.

Ms. GARVEY. I mean that just should not occur. And there are two groups of people I care a lot about in that incident.

One, obviously, are the travelers, and they were inconvenienced if the facts bear out to be true.

Senator SHELBY. Yes. One of the busiest airports in the country.

Ms. GARVEY. Absolutely. But the second group of people is—you know, we have got air traffic controllers that are the best in the world.

Senator SHELBY. I know.

Ms. GARVEY. I was really encouraged to——

Senator SHELBY. Well, we have been impressed with Mr. Kragh, with——

Ms. GARVEY. Right, very much so. And so I think anything that reflects on what is a whole organization in a negative way is obviously something of great concern, and——

Senator SHELBY. You got to get rid of those kind; they will ruin the whole group.

Ms. GARVEY. Because it is a great group. I will tell you that I called on Mr. Mead, and he was immediately responsive, asked if he would join with us in the investigation and add his good expertise and the force of his office to the investigation. We have a terrific team out there. They are doing the investigation. We want to get to the facts. I want to be fair to everybody involved. I certainly do not want to jump to conclusions without the facts.

Senator SHELBY. Yes.

Ms. GARVEY. We are getting an additional briefing on Wednesday of this week to know sort of exactly where we are. And we will certainly take the appropriate action, but——

Senator SHELBY. You keep the Committee informed.

Ms. GARVEY. We will absolutely keep the Committee informed. In fact, we will be calling folks on Thursday, just to let you know where we are, so——

Mr. MEAD. Mr. Chairman, there is something important that Administrator Garvey said that I do not think should be lost in the record.

And that is that in this instance, a Committee of Congress, or the Office of Inspector General on its initiative, or some external complaint, is not what inspired our involvement in supporting the FAA in this review or investigation.

It was the Administrator and her senior people that initiated the request. And we are joining with——

Senator SHELBY. That is good.

Mr. MEAD [continuing]. Some of her senior people. And I think that ties back into a point you made when you opened up the hearing about the Inspector General should not always have to initiate these things.

And this is, I think, a good example of where we did not.

Senator SHELBY. Where the Administrator and her office initiated this?

Mr. MEAD. Yes, sir. I think that is a real credit to her.

Senator SHELBY. You are to be commended for that, Ms. Garvey.

Ms. GARVEY. Thank you.

Senator SHELBY. You are hands-on. And this is an example of where you have to be hands-on. And we will look forward to see what happens on this.

Ms. GARVEY. Thank you.

Senator SHELBY. We have a number of questions for the record by me and some other members that had other hearings this morning. And we look forward to your responses on that.

SUBCOMMITTEE RECESS

Senator SHELBY. The subcommittee is recessed.
[Whereupon, at 11:45 a.m., Tuesday, July 25, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

**DEPARTMENT OF TRANSPORTATION AND RE-
LATED AGENCIES APPROPRIATIONS FOR
FISCAL YEAR 2001**

WEDNESDAY, SEPTEMBER 6, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:05 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby, Domenici, Specter, Gorton, Lautenberg, Byrd, Mikulski, and Kohl.

**OVERSIGHT HEARING ON THE FIRESTONE ATX AND
WILDERNESS AT TIRE RECALL**

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. The hearing will come to order.

Why are we here this morning? If we are here this morning to hear Ford say this is only a tire issue, then this is a waste of a lot of people's time. If we are here this morning to hear NHTSA say that they did their job under the controlling statutes, then this Senator is going to be disappointed in the job that they are doing. And if we are here this morning to hear Firestone tell us that there is not something wrong with these tires, then we step through the looking glass.

I will tell you why we are here this morning. We are here this morning because in July 1998 a State Farm Insurance Company analyst notified NHTSA'S Office of Defects Investigation of a growing number of incidents of Firestone tire failure when mounted on 1991 through 1995 Ford Explorers, and nothing was done.

We are here this morning because in 1998 a Saudi Arabian Ford-affiliated dealer wrote to Ford indicating that they had notified Ford of problems with the Wilderness AT tires, and no one notified NHTSA.

We are here this morning because in March 1999 a Ford internal memorandum stated, and I quote, "Firestone Legal has some major reservations about the plan to notify customers in the Middle East", end quote, and expressed the concern that the U.S. Department of Transportation would have to be notified because the same tires were sold in the United States, yet no one told NHTSA.

We are here because Firestone and Ford watched as the number of warranty claims escalated beginning in 1995. Again no one raised a red flag.

And we are here because NHTSA received a growing number of consumer complaints of tread separation on these Firestone tires starting in 1998, yet NHTSA failed to initiate an investigation.

We are also here because finally—yes, finally, the news media broke the story in Texas in February 2000. NHTSA consumer complaints shot through the roof and the problem could no longer be contained, or perhaps concealed.

We are here because you can hardly read a newspaper or turn on the television without another shoe dropping on this story, and we are here because the process of identifying this substantial safety issue did not work quickly enough, even though, I submit, it should have.

We are here because Ford and Firestone had at a minimum a moral obligation to make sure that the products they sell to the American public and other people in other countries are safe, and yet they both failed to bring this issue to the consumers' and the Federal Government's attention, at the cost of dozens of lives, I am afraid, and we are here to get some answers today.

PREPARED STATEMENT

I trust our witnesses will help us understand how things could have gone so long without action, and how Government, industry, and consumers can make sure that this never happens again. I ask unanimous consent that my written statement be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR RICHARD C. SHELBY

This hearing is called to order. It's hard to spend more than a few minutes talking with my constituents, watching the television, or reading a paper without Firestone tires being mentioned. I hope the witnesses testifying before the Committee this morning will shed some light on how this could have happened and why it took so long for the problem to be identified. I believe that American consumers have a reasonable expectation that if tires are failing, the manufacturers, the automobile companies, and the Federal Government will take every step to protect them from becoming another highway traffic fatality.

I would like to know how it could take us 10 years, dozens of lives, numerous lawsuits, substantial consumer complaints, tire replacements overseas, and repeated expressions of concern by an insurance company before any action was taken to initiate an investigation into the safety of a product being used by millions of American families. Simply put—the American people deserve better.

I would be disappointed if NHTSA claims that this issue was identified promptly. I would be disappointed if Firestone/Bridgestone representatives claim that there is not a problem with Firestone ATX, ATX II, or Wilderness AT tires after thousands of their products lie in tatters on our nation's highways. I would be disappointed Ford Motor Company representatives claim that this is solely a tire problem after they have been equipping Ford Explorer on virtually a sole source basis for the life of the vehicle, have heard repeatedly from their consumers about these tire problems, and have tacitly ignored the human cost caused by the combination of these tires on their sport utility vehicles.

This is a brief summary of what we know:

- Ford Explorers have been equipped with Firestone ATX, ATX II, or Wilderness AT tires since the introduction of the vehicle.
- Starting around 1996, lawsuits filed against Bridgestone/Firestone. All cases settled, except for one which went to trial and in which the jury sided with Firestone.

- In 1998, a Saudi Arabian Ford-affiliated dealer wrote to Ford indicating that they had notified Ford of problems with the Wilderness AT tires.
- From 1996 to 1999, Ford replaced Firestone tires in a dozen foreign countries including Saudi Arabia and Venezuela.
- By May 2, 2000, NHTSA has received a number of complaints regarding Firestone tread separation, especially after a Houston television news story. NHTSA tallied a cumulative total of 90 consumer complaints and determined 4 deaths involved tire failure. NHTSA Office of Defects Investigations opens a preliminary evaluation of ATX, ATX II, and Wilderness tires.
- As of August 3, NHTSA has received 193 complaints regarding tread separation. Firestone offers free inspections of its tires.
- Between August 3 and 7, Sears and other leading tire retailers suspend the sale of tires covered under the scope of government inquiry.
- On August 9, Firestone initiates voluntarily recalls of 15 inch ATX, ATX II, and Wilderness tires produced at its Decatur, IL plant. 14.5 million tires are covered by the recall, although Firestone estimates that only 6.5 million of these tires are still in use. The company estimates that there are 3.8 million ATX or ATX II tires and 2.7 million Wilderness tires that need to be removed from the road.
- On August 9, Ford changes its PSI recommendation from 26 to a range between 26 and 30. Firestone continues to insist that the proper PSI is 30.
- As of August 10, NHTSA has received 270 consumer complaints and revised the number of deaths associated with tread separation to 46 (double estimate of previous week.)
- As of August 15, NHTSA has received over 750 complaints and is aware of at least 62 fatalities and over 100 injuries alleged to be related to a tire failure.
- By August 31, NHTSA has received over 1,400 complaints, including 88 reported fatalities related to these tires.

It seems to me that alarm bells were ringing, but that the people in a position to do something weren't listening. I don't know whether there is enough evidence to show who failed to respond first, but it sure looks like several critical players were, at the very least, covering their ears.

Tires are literally where the rubber meets the road with regard to highway safety, and I believe more should have been done to inform and protect consumers. Consumers have a legitimate expectation that tires certified by NHTSA and manufactured by premier brand name tire manufacturers should not fail if properly maintained, pressurized, and repaired. Clearly, the incidence of failure with the Firestone ATX, ATX II and Wilderness AT tires leads me to believe that expectation has not been met and I fear that there may have even been a conscious effort to shield this failure.

I trust our witnesses today will help us understand how things could have gone so long without action—and how government, industry, and consumers can make sure that this never happens again.

Senator SHELBY. Senator Byrd, do you have an opening statement?

STATEMENT OF SENATOR ROBERT C. BYRD

Senator BYRD. Mr. Chairman, last year the American people drove over 2.6 trillion miles on the Nation's 8.3 million miles of urban and rural highways. More than in any other country of the world the American public travels by automobile along a highway system that is the lifeblood of our economy. When our citizens get in their cars every morning they expect two things: (1) they expect the roads to be safe, and (2) they expect their vehicles to be safe. They do not view safety as a luxury. They view it as a necessity.

So when the American people learn that safety may be compromised, they worry. When they learn further that companies may be knowingly endangering their safety, they become angry. This hearing this morning is not just about the topic of safety. It is also about the topic of honesty. It is about when certain companies knew about defective tires, and when those companies chose to do something about defective tires.

This issue of timing is elemental to this inquiry. Eighty-eight lives have already been lost due to the defects that have surfaced with these Firestone tires. Just this past weekend another Ford Explorer with a shredded tire rolled over on the highway, injuring six people and killing a 10-year-old boy. He may well have been the 89th fatality.

The courts, not this subcommittee, will determine who is really at fault for all these deaths, but I am glad this subcommittee is meeting this morning to address the relevant issues to this matter that are in the jurisdiction of this subcommittee.

I congratulate you, Mr. Chairman, for holding the hearing. These hearings include issues like whether Ford and Bridgestone have been responsive and forthcoming with Federal safety officials, and whether those Federal officials have been proactive or reactive, or unactive or inactive when it has come to guaranteeing the safety of the traveling public.

In my home State of West Virginia thousands of citizens are engaged in very dangerous professions each day, whether it is coal mining, one of the most dangerous professions anywhere, or working in our chemical plants or in our timber industry, or on our railroads.

The citizens face danger from the moment they punch in in the morning to the moment they punch out in the evening, and we are responsible for seeing to it that they do not face additional danger when they get into their cars at the beginning of the day and when they get into their cars at the end of their shift and seek to return to their families.

I hope that the inquiry this morning will point us on the path towards better ensuring the safety of our citizens.

Thank you.

Senator SHELBY. Senator Lautenberg.

STATEMENT OF SENATOR FRANK R. LAUTENBERG

Senator LAUTENBERG. Thanks, Mr. Chairman. My apologies for being late—I was dealing with another safety issue—but I am pleased that you have convened this subcommittee this morning to throw some additional light on this deadliest recall in American automotive history.

The problems that have surfaced with Bridgestone/Firestone tires and the Ford Explorer vehicle have caused a great deal of anxiety and concern across the country, and I hear from my constituents in New Jersey as well as other people who just feel ill at ease knowing very well that a tire may give out in the vehicle that they are riding in, endangering themselves and their families.

I am sure you have heard it already, but 88 lives have been lost. Over the course of the last month thousands of American households have discovered that their lives can be at risk for no reason of their own as they leave their driveway.

There are a great many complex issues we should address this morning, but there are three particular questions that I think we have got to focus on at a minimum. First, we have got to ask whether both Bridgestone, Firestone, and Ford have acted responsibly through this ordeal.

There is no question that both companies are now making grand efforts to satisfy consumers who are demanding safety replacement tires. However, we need to ask whether both companies were equally concerned for their consumers when they are settling dozens of lawsuits stemming from deaths and injuries due to defective tires and insisting as part of the settlements that no documents or information be made public.

Even today, the National Highway Traffic Safety Administration has identified 1.4 million additional tires that they believe Firestone ought to voluntarily recall. To date, Firestone has refused to do so, despite the fact that some of these tires have the worst record of tread separation than the 6½ million tires that have already been recalled.

Second, when reviewing this tire problem we have got to look at the related issue of vehicle roll-overs. Roll-overs caused nearly 10,000 deaths each year, roughly a quarter of all highway fatalities. Back in 1992, when I was chairman of this subcommittee, we aggressively encouraged NHTSA to move forward with its proposed regulation setting a standard to limit the propensity of vehicles to roll over.

Since that time, consumers have purchased more and more sports utility vehicles, vehicles that are even more prone to roll over than conventional cars. Regrettably, NHTSA abandoned its effort to set a roll-over standard for these vehicles. Today, we read in the press that Ford may have deliberately recommended a lower tire inflation pressure so as to minimize propensity of its Ford Explorers to roll over. Some have speculated that this lower inflation pressure may be exacerbating the tread separation problem, and I think while I am not an automotive engineer, one need not be, I think we have got to use this occasion to refocus our attention to this roll-over problem and ask whether the time has come for stronger Federal regulation to be published.

And third, we must review whether NHTSA has had adequate legal authorities, funding, and the motivation to guarantee the safety of the driving public. We know from press accounts that the manufacturers knew of this tire problem well before it came to the attention of the regulators. Indeed, tires were being recalled in other countries without the knowledge of NHTSA officials.

Under current law there is no requirement for manufacturers to pass along their record of complaints to NHTSA. The manufacturers are only required to alert NHTSA of a problem when they have determined themselves that a safety problem exists. Even today, Firestone has not conceded that the tires that have been recalled are defective, so clearly it is not an adequate situation to allow the manufacturers to make their own determination as to when NHTSA should be notified.

I believe also, Mr. Chairman, we need to make measures to strengthen NHTSA's hand in gathering information from all available sources to identify defects earlier. Once press accounts came out regarding the problems with these tires the number of incidents reported to NHTSA skyrocketed. We have got to ask why NHTSA did not have access to these reports earlier, and what we need to do to compel a better reporting system on the part of the

manufacturers to those Federal authorities that are responsible with ensuring our safety.

I thank you, Mr. Chairman.

Senator SHELBY. Senator Gorton.

STATEMENT OF SENATOR SLADE GORTON

Senator GORTON. Mr. Chairman, you and Senators Byrd and Lautenberg have properly focused attention on a number of questions before us at this time. The adequacy of oversight on this problem and the promptness of the response to this problem of the National Highway Traffic Safety Administration is one the response of Ford Motor Company, particularly as the principal users of the tires and the way in which they dealt with consumer complaints and their own knowledge of danger related to them and the responsibilities of the manufacturer, Bridgestone/Firestone, each of those is vitally important.

I would like to add two more considerations, however, to this hearing. One relates to my own constituents who are driving automobiles, SUV's particularly, with these tires on them and the fact that the manufacturer has set a staged recall under which those of us in less hot climates have to continue to drive on these tires for a considerable period of time and replace them on our own, rather than having this recall be prompt, immediate, and broadbased, even though that requires the manufacturers to supply tires manufactured by others rather than by themselves.

Second, the confusion to all of the users of these tires Nationwide as to how they deal with the tires for the hopefully very short period of time they are going to use them. Ford said the proper pressure was 26 pounds per square inch before the recall. Now it has given a range of 26 to 30. Bridgestone/Firestone continues to say it ought to be 30 pounds per square inch.

We called Ford dealer Koons, College Park Ford, in College Park, Maryland. He said it should be 26 on the front tires and 35 pounds per square inch on the rear tires. Now, that is a range from 26 to 35, with three different answers from three different groups.

Consumers deserve better than that. There ought to be one answer to that question for what I hope is the relatively short period of time remaining before all of them are off the road and are dealt with more safely, so I think we not only have to look backwards at fault here, we have to look forward as to how prompt this response is for everyone and what people should be doing right now, today, to at least have the maximum degree of safety.

Senator SHELBY. Senator Mikulski.

STATEMENT OF SENATOR BARBARA A. MIKULSKI

Senator MIKULSKI. Thank you very much, Mr. Chairman. I would like to thank you and Senator Lautenberg and Senator Byrd for organizing this hearing. I know that the interest of security and safety have always been number one in your own priorities and, really, that is what the American people expect of us in a democracy. The safety and security of our people have always been a national priority.

That is why we have a whole national security system. That is why we have the Center for Disease Control to be on alert if infec-

tion is making its way into our country, and we have our Border Patrol also to see about what other problems are coming into our country, and yet where has been the alerts right now for something as known internationally as the failure of these tires to perform?

The American people have a right to know about risk. They have a right to know about danger. They have a right to know from both our Federal agencies and those who manufacture products where are the risks, and they have a right to be protected. How can we protect them from these dangers, or at least protect them with the information so that they can take their own action?

That is why we are holding this hearing today. People have a right to know. They have a right to be protected. They have a right to expect from their elected officials that we are standing sentry on this, so as we proceed with this hearing, both listening to Firestone and Bridgestone and also to our Federal regulators and the advocacy groups who take this interest, I want to have the answers to the questions about what are the alerts that we should have been paying attention to, what are the early warning mechanisms, both here and around the world, that would alert us to this? Who knew about these dangers, when did they know it, and what the heck did they do about it?

Now, our national security has a radar system that tells us when risk, or that we are facing risk in our own country. The Centers for Disease Control know when there is an international alert about an infectious disease so that we can notify every State health department to take the action to be able to alert people and protect them.

Why, then, when internationally there was the collapse of these tires going on in Venezuela, Saudi Arabia, 15 other countries taking action, the manufacturer chose not to notify the U.S. Government, and the U.S. Government did not have the same radar system we have for national security, or did not have the same kind of mechanisms in place to alert us to infectious disease?

Now, we are as much at risk from faulty tires, and in fact I do not know when I am going to be exposed to Ebola, but I do know that I get in my car every day to travel here from Baltimore, so I want to be sure, then, that we have these mechanisms in place.

We look forward to this testimony to really get at the facts and at the same time put the mechanisms in place, but I am deeply disturbed that something that is a manufactured product did not have the same early warning and alerts that we have for a foe penetrating America's borders, or an infectious disease.

So Mr. Chairman, I look forward to the testimony, and the hearing.

Senator SHELBY. Senator Specter.

STATEMENT OF SENATOR ARLEN SPECTER

Senator SPECTER. Thank you, Mr. Chairman. First, I commend you, Mr. Chairman, for scheduling this hearing so promptly. I know you returned late last night from oversight responsibilities you have as chairman of the Intelligence Committee, and this is a very, very important hearing, with the first focus trying to see to it that safety is assured at this moment for all those who are in

jeopardy because of these tires, and beyond that to prevent the recurrence of this situation for the future.

To do that we are going to have to conduct some very incisive investigation to find out how we got here. Every day, all of us entrust our lives to our tires. Yesterday I was on the Pennsylvania turnpike going 65 miles an hour, relying on my tires, concerned about who might be coming in an opposite direction where they might have Bridgestone/Firestone tires, so the safety issue is one which affects absolutely all Americans.

When you, Mr. Chairman, said that at a minimum there was a moral obligation on the part of Firestone, that states a very minimum obligation. Their obligation is to act responsibly and when corporate officials know there is a danger which might cause the loss of life or serious bodily injury and they permit that situation to continue, that is a reckless disregard for the life of another, and that is equated in the law with malice, and that rises to the level of second degree murder, where individuals knowingly allow a danger to exist which results in the death of another.

This regrettably is not an infrequent occurrence in corporate America today as to what happens when there are dangerous products which are put up for public consumption, but with the number of deaths involved here, and with the automobiles being involved and the reliance that each of us places on our tires every day, it has been brought home with a very high level of drama to the American people, and the people of the world.

So far most of what is known is from the media, and we need to get the hard evidence, but the media reports that in Saudi Arabia there was a recall of tires but it was kept secret from the American Government and from the American people. How in the world can corporate officials allow a danger to go forward in the United States when they are looking after the Saudis?

We know from the media that Venezuela is considering criminal prosecution against the corporate officials who were involved in this matter on homicide charges. Well, Venezuela may have some problems on extradition, but the United States does not have any problems in terms of a Federal or State prosecution if, in fact, what we read about turns out to be true, and we have this reckless disregard for the lives of others.

I do not know about the press reports, but it is worth commenting that the media reports have said that the president of Ford is not going to testify. We have another Ford executive here today. Well, it seems to me that we ought to hear in the Congress from the top officials who are responsible for what is going on.

It is hard to turn on my television set these days without seeing the president of Ford on TV making a commercial announcement. It is pretty hard to squeeze in with all the other commercial announcements we have in the political campaign, but if any official of any company thinks that they are not going to appear before a congressional committee, they ought to check their rules about subpoenas, and we ought not to be reluctant at all to issue subpoenas to bring those people in.

And today in the Washington Post I read about a document—it is nice to read about documents in the Washington Post, contrasted with having the companies turn those matters over to the Appro-

priations Committee which is holding this hearing, but we have a duty to get the documents, and this is a long paper chase. The trial lawyers engage in it all the time, and I know the very high regard my colleagues, especially Senator Domenici, has for trial lawyers who undertake these paper chases to get these documents but we will not find out all the facts until we get all of the documents.

So, Mr. Chairman, I think we have begun a very long, important, and difficult process here which has enormous implications for the American people and the people of the world. All of us rely on our automobiles and therefore on our tires, and in terms of what the manufacturers and corporate executives do to subject consumers to these kinds of risks, so I am delighted you have started these hearings just a few hours after your return to Andrews, and that we will conduct the kind of incisive investigation and hearings necessary to correct this very major problem.

Thank you, Mr. Chairman.

Senator SHELBY. Senator Domenici.

STATEMENT OF SENATOR PETE V. DOMENICI

Senator DOMENICI. First, I want to thank you, Mr. Chairman, thanks for calling these hearings. I hope those that are going to testify today understand that each of us at the outset have to say a few words. They will soon find that we are really interested in finding out what they know and what happened.

I agree with almost each statement as I hear it, that Senators would very much like to get to the bottom of how this happened, who was told, and when. I would like to know why were some told in advance of others. With that I will just tell you about my little State of New Mexico.

Many of you know that New Mexico has pretty hot weather, yet I learned that we were not among the States for early recall because we were not hot enough. Somebody called to their attention the kind of weather we have, and then New Mexico did go back up into the list where they could perhaps get some tires into the hands of those people that were entitled to a recall.

I will tell you, however, in the city of Santa Fe there are 400 people waiting for replacement tires on the list at one dealership. Nobody knows how long that will take to get through the list. Can you imagine what the people are going through in terms of the mental anguish as they wait?

I surmise that thousands of them are going to buy tires with their own money, and I think that leads to an interesting question. Should we ask whether or not they are going to recompense these people who, out of fear of waiting too long, have gone out and bought some other tires? Are they just going to be left there to have two sets of tires, or will something be done about that?

I am interested in knowing how the companies intend to handle situations like the ones I am describing. As everyone knows, there is one thing we have not spoken of that we should all be concerned about, and that is, this is back-to-school time, right in the middle of parents getting all geared up to take their kids to soccer games, to take them to school. Here we have just put upon top of them this anguish about their car and tires, especially if it happens to

be one of the cars we are talking about as being most susceptible to this problem.

I do not know where this all ends, but I want to close by suggesting to all of those involved on the corporate side, the end will come quicker, smoother, and be better, the sooner you tell us what happened. The sooner you tell us how this all occurred in an honest, bona fide tones, in words that will not be disputed by someone else, the better off the companies are, and certainly from the standpoint of doing our job, the better off we will be and things will come to a conclusion. It has got to come to a conclusion, and we hope the best possible conclusion. If you start today by not fudging the facts, not putting them off on somebody else, but clearly telling us just exactly what happened.

Now, I close by saying I do not know what Senator Specter had in mind when he spoke of trial lawyers, but I used to be one. I have not been doing that for a long, long time, and sometimes I feel very deficient sitting alongside of you, since you have been such a great prosecutor.

Thank you very much, Mr. Chairman.

Senator SHELBY. Thank you.

Senator Specter raised the point, and I think it is a valid one. The CEO of Ford is not here. They have sent, I understand, the executive vice president instead. I would rather have both of the most senior executives here, and I think it is the least they could do testifying here before the U.S. Senate.

Our first panel this morning includes Joan Claybrook, president of Common Cause, and David Pittle, senior vice president and technical director, Consumers Union.

Our second panel will include Dr. Sue Bailey, the Administrator of NHTSA, Mr. Masatoshi Ono, Chairman and CEO, and Mr. Gary Crigger, executive vice president of Bridgestone/Firestone, and Helen Petrauskus, vice president of environmental and safety engineering for Ford Motor Company.

Ms. Claybrook and Mr. Pittle, your written testimony will be made a part of the record in its entirety. You can proceed as you wish, Ms. Claybrook.

STATEMENT OF JOAN CLAYBROOK, PRESIDENT, PUBLIC CITIZEN

Ms. CLAYBROOK. Thank you, Mr. Chairman. It is a pleasure to be here today. I am Joan Claybrook, president of Public Citizen, a national public interest organization founded by Ralph Nader in 1971, and I am pleased to accept your invitation to testify about the Firestone tire that has resulted in 88 people being killed as of last week—the data from the Department of Transportation—and 250 people being injured.

I was the Administrator of the National Highway Traffic Safety Administration when the Firestone 500 tire defect occurred, and I brought a picture just to show you that it is quite similar. This is not a problem that this company has not faced before.

Much has been written in the last month about the lethal combination of Ford Explorers and Firestone tires. This is a design defect that is exacerbated by the fact that Ford required a low inflation pressure because of roll-over problems with these vehicles. Firestone tires inflated at 26 psi overheat with heavy highway use,

causing the tread to separate and the SUV's to crash, not infrequently rolling over and causing catastrophic and fatal injuries.

I would note that with the 500 tire, which also shredded, they were on cars and they did not tend to roll over. There is no margin of safety in the design here, where you have a bad tire and a vehicle vulnerable to roll-over, and that is a major reason why we are having so many injuries and deaths. The tragedy is teaching the public as well as policymakers a number of lessons, and I would like to comment on five issues, briefly, and make five recommendations for more effective enforcement of the Nation's motor vehicle safety defect laws.

SAFETY PROBLEMS COVERED UP

First, Ford and Firestone covered up the safety problems with the tire/SUV combination for a decade. The coverups will continue without corrective action by the National Highway Traffic Safety Administration. Rather than go through a long chronology I will just say that—

Senator MIKULSKI. Ms. Claybrook, there is a buzz in the room. Would you pull your microphone much closer?

Ms. CLAYBROOK. Can you hear me now?

Senator MIKULSKI. Yes.

Ms. CLAYBROOK. Ford first offered this vehicle, the Ford Explorer with Firestone tires, for sale in March 1990, and Ford internal documents show that the engineers recommended changes to the vehicle design after it rolled over in company tests prior to production of the vehicle, and there were a few changes made, but the track width was not made wider, and the suspension was not corrected as recommended.

Instead, Ford, which sets the specifications for the tires manufactured by Firestone, decided to remove the air from the tires, lowering it to 26 psi, and if you look, I brought some tires here which I will mention in a few minutes, but if you look at the psi molded into the side of the tire, the maximum load carried is 35 psi recommended by Firestone.

The Firestone—excuse me. Within a year of introduction, lawsuits against Ford and Firestone were filed for tire failures that resulted in crashes and roll-overs. At last five cases were filed by 1993, and many others followed in the 1990's. Almost all were settled, and they were settled with gag orders, orders prohibiting the lawyers and the families from disclosing information about the cases or documenting it to the public or the Department of Transportation.

When lawsuits are filed against a company about a safety defect again and again, the company organizes an internal investigation to assemble the information and analysis of the information. Top company officials are kept informed about lawsuits against the company, particularly as they accumulate. There is no question that the companies knew they had a problem, but they kept it secret.

Just one example has come to light through the press. In 1996, several State agencies in Arizona began having problems with Firestone tires on Explorers and, according to news reports, these agencies demanded new tires. Firestone conducted an investigation,

tested the tires, and asserted that the tires had been abused or underinflated, and this has been the mantra for the problem.

In 1998, as many of you mentioned, Ford and Firestone were in discussions about tire failures abroad and did, in fact, conduct recalls, or Ford did conduct recalls abroad, and the memo that has just come out shows that at least Firestone believed that there was a legal obligation on behalf of the company if they did a recall abroad they had to notify the Department of Transportation, and I believe that that is accurate.

There is a legal argument that the Department of Transportation has no extraterritorial authority, but this was a company in the United States, or two companies doing an action abroad with the identical tire and identical vehicle manufactured and sold here that they were recalling abroad.

And as you mentioned also last week, Indecu, the Venezuelan regulatory agency, said that Firestone and Ford, quote, "met to plan out ways of a situation that was affecting their commercial interest at the price of causing damage, destruction, and death", and is recommending possible criminal enforcement for involuntary manslaughter.

NHTSA NEEDS ADDITIONAL LEGISLATIVE AUTHORITY

Incidentally, there are a number of parallels between the 1978 recall and Firestone 500. I would say that one of them is that the information was kept secret from the Department of Transportation for a long time. My second point is, NHTSA needs additional legislative authority to ensure the manufacturers obey the law, report safety defects, and recall unsafe products.

The agency has sent forward some legislation which I think is excellent, but it needs to be improved. They want to increase civil penalties. Right now the maximum civil penalties for this agency is \$925,000 for any company that refuses to recall a product. That is a joke. The maximum penalty for each violation is \$1,000. It should be changed to \$10,000, which it is at the Environmental Protection Agency.

There is no violation for withholding documents per day. I am sure Senator Specter, as a former prosecutor, is aware that you do a per-day violation. At NHTSA it is per document, so if a document is withheld forever, there is just one penalty of \$1,000.

As in the Food and Drug Administration there should be criminal penalties for knowing and willful refusal to recall a defective part or withholding information. This was recommended after the 1978 recall.

As recommended in NHTSA's proposed bill, the company should be required to test its products before self-certification. Right now, companies do not have to do a test before they self-certify compliance with the agency standards.

The statute of limitations right now is 8 years for a vehicle and 3 years for a tire, for NHTSA to be able to mandate a recall. It should be extended to 10 years for vehicles and 5 years for tires. There has been a substantial change since the 1970's when this was enacted in the length the tires are used on the highway.

I have already mentioned the issue about sending notices to NHTSA for foreign recalls. The agency's budget needs to be larger.

Ninety-four percent of the deaths occur on the highway, and yet NHTSA has a tiny percentage of the transportation budget. Although it has been increased substantially in recent years, for which I thank this subcommittee very much, it is still 30 percent below in real dollars what it was when I left the agency in 1980, and the enforcement budget is about one-half of the 1980 budget. There are fewer than 20 engineer investigators who work on safety defects for the entire United States of America.

ATX TIRE RECALL SHOULD BE EXPANDED

Third, Firestone and Ford should recall all of the ATX, ATX II and Wilderness tires to protect the public from this catastrophic defect, and all data and information should be made public to restore the public trust, and Senator Domenici has said this.

By the way, Senator Domenici, in your State you have a huge number of deaths and injuries. Are you aware of that?

Senator DOMENICI. Yes, I am.

Ms. CLAYBROOK. According to the Department of Transportation, 13 injuries and 9 deaths in your State, and I think that shows that you certainly should have been included in the recall early on. Much of the data that Ford has based its analysis of the claims data, which is how this recall was defined, is still not public, and for example, it does not—there is no indication of how many tires were made at which plant.

This seems to be a wear-related issue, that is that as the tires were on the road longer they are more likely to have the problem, and the data was as of the end of April 2000, so there is a lot of information that has developed since then that should be available for this analysis. It also only uses claims data that is for claims of injury, death, or property damage. It does not include warranty claims or adjustment data, and it does not include information that has come in since, now known by NHTSA.

NHTSA has last week analyzed the data that it has from complaints and lawsuits and injuries from Firestone and Ford and determined that the recall should be extended to another 1.4 million tires, and that additional ones are being investigated as well.

There is every indication that this problem is a design defect that affects all the tire produced. In the Firestone 500 case the company at first asserted that only 400,000 tires were defective from the Decatur plant, and then on further evaluation it was realized that there were 14 million tires that should be subject to the recall.

Also, an analysis that was released last Friday of 90 lawsuits that have been filed in this issue showed that about 37 percent of them covered the nonrecalled tires, and I have here today two tires. This is the 15-inch tire and this is the 16-inch tire, and you can see that the tread separation is about the same with both. The 16 is not being recalled, the 15 is, and you can examine those for yourself to see how similar the tires are.

There are also a number of documents that Senator Domenici mentioned. We should have all the information. There are a number of documents that are still secret. The companies asked for confidentiality at NHTSA on a number of documents that I think should be made public, and also the gag order documents protective order documents should be made available. The agency has sub-

poena power. It can get the information from the gag orders, and I would urge that that occur.

NHTSA'S DEFECTS INVESTIGATION PROGRAM

Fourth, NHTSA has failed to discover this defect because it lacks a proactive program to discover safety defects. I believe the agency was caught flat-footed because it rarely pushes companies to do recalls in an aggressive way. The manufacturers rolled the dice in this case and covered it up. They usually win, and in this case they did not.

NHTSA has no early warning system in place and has not been proactive in using available sources of information. They should routinely get information from auto repair facilities, which we did in the 1970's, complete owners and national State and local fleets, from lawyers representing deceased and injured family members who find out about defects in discovery through cross-examination of the manufacturers, from insurance company data, which the chairman has already mentioned comes in to them from time to time but is not aggressively sought, and you have already mentioned State Farm, which I will not elaborate on any more.

The agency should require, as does the EPA, that a company notify the agency if it gets 25 complaints about a particular make or model defect, and it should require, as does the CPSC, that a company notify the agency if there are three or more lawsuits filed against it on the same subject. These efforts would give the agency an early warning system. They would have their finger on the pulse beat of what is happening out there on the highway.

In short, NHTSA has not been the tough cop on the regulatory beat, and when it is the companies are more safety conscious, the public is protected and, in the end, there is less work for all parties. The Firestone/Ford case shows what happens when safety is not job 1 in this industry or in the Government.

SAFETY STANDARDS

My fifth recommendation is that essential safety standards are severely out of date, were scrapped during the Reagan years, or prohibited because of industry lobbying to change the law.

I will go through these very briefly. The tire safety standard is 32 years old, and is not effective for testing radial tires. It was written during the days of the bias ply tire. Both Ford and General Motors have recently stated they favor improving this standard.

Number 2, the uniform tire quality grading standard is molded on the tire for tread wear traction and heat resistance does not apply to SUV tires. It only applies to car tires. It should be expanded to do so. The roof crush standard is 30 years old. I do have an example from the morning paper which you probably have all read which shows what happens to the roof when one of these vehicles rolls over. The roof just crushes in, and I also have a picture of one that is not quite as crushed in. This is not necessary.

Let me tell you what the standard says. It is a static standard, and it says that if you place weight on the roof of the vehicle that is one-and-a-half times the unloaded weight of the vehicle, it passes the test. There is no dynamic test. You do not have to roll the vehicle over in any way, and of course this has caused a number of the

deaths. A dynamic roll-over standard should be adopted, a roof crush standard.

A roll-over standard has not existed in this agency. It has been a topic for 15 years, since Representative Timothy Wirth submitted a petition in 1985, and others have followed. In 1991, the Congress required NHTSA to conduct a roll-over prevention rulemaking. It made an initial effort to put in a consumer information requirement and a proposal, then the Appropriations Committee said there should be a study at the National Academy of Sciences. That study was finished in 1996.

Finally, the agency a couple of months ago proposed another one, a static standard, which is a very simple standard. The auto companies say it is not adequate, so once again another study has been proposed. This bill is now in conference.

Our coalition of consumer health and insurer groups and insurers favors dropping the study and letting NHTSA issue this test as a first effort. The consumers have said to the Harris Poll that 62 percent want such information, but we also want a rollover prevention standard. As has been mentioned, 25 percent of all highway deaths occur in rollovers, and SUV's have a particular susceptibility.

The agency should issue a rule for a tire inflation indicator, as I proposed 22 years ago, on the dashboard that just alerts the consumer if their tires are low on inflation. The companies complain that people do not properly inflate their tires, but most people do not know, and those little measuring tools that people have are often inaccurate.

Tire manufacturing information are molded into the blackwall inside of the tires. It should be on the outside whitewall of the tires so that the consumer does not have to crawl under the tire to find out if the tire has been recalled, and right now that is what they are having to do, and it is a simple thing to do.

The tire reserve load consumer information requirement was eliminated in the eighties. It should be reestablished to inform consumers of the maximum rated low capacity of the vehicle so they can know when they should inflate their tires to the maximum load rating, which is molded into the side wall. The agency should be alert in this case as to whether its current requirement of 5 years for record retention is sufficient, given that this is a decade-long case.

I have three minor pieces of legislation that I would also recommend. One is that independent tire dealers should have to report the names and addresses of buyers to the manufacturer. That was eliminated in 1982. Second, the current law requires tire owners to return their tires within 60 days of a recall or 60 days of availability of the tire. It is not fair for car buyers. I think it should stay in the law. It is very confusing.

And finally, the current prohibition in the law on the NHTSA rule requiring a continuous buzzer alert. It stops NHTSA from requiring a continuous buzzer. It can only be 4 to 8 seconds. Ford Motor Company, I commend them, it has a longer buzzer for roll-over crashes. That is critical.

Thank you very much, Mr. Chairman, for tolerating my long statement.

[The statement follows:]

PREPARED STATEMENT OF JOAN CLAYBROOK

Mr. Chairman and Members of the Committee: I am pleased to accept your invitation to testify today on the Firestone tire defect that has killed at least 88 and injured 250 people, most of them in Ford Explorers. I am President of Public Citizen, a national public interest organization founded by Ralph Nader in 1971 with 150,000 members nationwide. I served as Administrator of the National Highway Traffic Safety Administration from 1977 to 1981. This agency is responsible for administering the recall of the Firestone tires. The Firestone 500 recall occurred when I was Administrator.

Much has been written in the past month about the lethal combination of Ford Explorers and Firestone tires. This is a design defect exacerbated by the fact that Ford required a low inflation pressure because of rollover problems with these vehicles. Firestone tires inflated at 26 psi overheat with highway use, causing the tread to separate and the SUVs to crash, not infrequently rolling over and causing catastrophic and fatal injuries. This tragedy is teaching the public as well as policymakers a number of lessons. I would like to comment on five issues and make recommendations for more effective enforcement of the nation's motor vehicle safety defect laws.

Ford and Firestone covered up safety problems with the tire/SUV combination for a decade. Coverups will continue without corrective action by NHTSA.

The Ford Explorer was first offered for sale in March 1990. Ford internal documents show the company engineers recommended changes to the vehicle design after it rolled over in company tests prior to introduction, but other than a few minor changes, the suspension and track width were not changed. Instead, Ford, which sets the specifications for the manufacture of its tires, decided to remove air from the tires, lowering the recommended psi to 26. The Firestone recommended psi molded into the tire for maximum load is 35 psi.

Within a year of introduction, lawsuits against Ford and Firestone were filed for tire failures that resulted in crashes and rollovers. At least five cases were filed by 1993, and many others followed in the early 1990s. Almost all were settled, and settled with gag orders prohibiting the attorneys and the families from disclosing information about the cases or their documentation to the public or DOT. When lawsuits are filed against a company about a safety defect, the company organizes an internal investigation to assemble information and analysis about the allegations. Top company officials are kept informed about all lawsuits against the company, particularly when they accumulate concerning one problem. There is no question the companies knew they had a problem. But they kept it secret.

In 1996, several state agencies in Arizona began having major problems with Firestone tires on Explorers. According to news reports, various agencies demanded new tires, and Firestone conducted an investigation of the complaints, tested the tires and asserted that the tires had been abused or under-inflated.

In 1998, Ford and Firestone were in discussions about tire failures with Middle Eastern, Asian and South American countries. Tires were tested and analyzed. Ford eventually decided to conduct its own recall without Firestone and replace the tires in the various countries in 1999 and 2000. It also instructed Firestone to add a nylon ply to the tires it manufactured in Venezuela for additional strength and it made suspension changes to the Explorer. Ford did not specify adding the nylon ply for U.S.-made Firestone tires nor did it change the Explorer suspension at this time. In May, a top Ford official in Venezuela was quoted in the press as saying the company was replacing the tires because in Venezuela "the highways allow drivers to travel at high speeds for a sustained period of time, leading to the loosening of the rolling surface of the tire, its consequent blowout and the accident."

Last week, the Venezuelan safety regulatory agency, Indecu, concluded after an investigation that Firestone and Ford "met to plan ways out of a situation that was affecting their commercial interests, at the price of causing damage, destruction and death," and is recommending possible criminal enforcement for involuntary manslaughter. Neither Ford nor Firestone informed the National Highway Traffic Safety Administration of this recall, euphemistically labeled a "No Charge Service Program Award Notification."

Incidentally, there are a number of parallels between this recall in 2000 and the 1978 recall of the Firestone 500. Most particularly, there was a documented coverup by Firestone of the 500 defect, spurred by the lack of a Firestone replacement tire. When the coverup was disclosed, the top management of the company was replaced as Firestone was severely damaged in reputation and economically. But a key dif-

ference is that the Firestone 500 was used on passenger cars, which rarely rolled over with tire failure. NHTSA documented 41 deaths with the 500, a recall, involving seven million tires.

Once again, when confronted with accusations about the performance of the tire, Firestone has misleadingly claimed owner abuse (i.e. under-inflation, rough use or improper repairs).

The National Highway Traffic Safety Administration needs additional legislative authority to assure that manufacturers obey the law, report safety defects and recall unsafe products.

To prevent coverups of safety defects in the future, the National Traffic and Motor Vehicle Safety Act should be amended. In March 2000 the agency sent legislation to the Congress which would make some improvements, but additional authority is needed. The Congress should:

a. Increase civil penalties for failure to recall a defective vehicle or part or withholding information from the agency. Now the maximum penalty is \$925,000, hardly a deterrent for multinational corporations. The penalty for each violation should be increased from \$1,000 to \$10,000 (as at the Environmental Protection Agency); the violation for withholding documents should be per day rather than per document as it is now (no matter how long it is withheld). There should be no maximum penalty.

b. As in the Food and Drug Administration and the Environmental Protection Agency laws, there should be criminal penalties for knowing and willful refusal to recall a defective vehicle or part or for withholding information that results in deaths and injuries. Chairman John Moss, after reviewing the Firestone 500 debacle, recommended criminal penalties be added to the NHTSA statute.

c. As recommended by NHTSA's proposed bill, a company should be required by law to test its products before self-certifying for compliance with the agency's standards. Such testing is not now required by law.

d. The statute of limitations for NHTSA to mandate a recall is now eight years for vehicles and three years for tires from the date of manufacture. It should be extended, as the agency recommends, to 10 years for vehicles and five years for tires.

e. There is disagreement about whether the current law requiring manufacturers to send NHTSA copies of all notices sent to dealers and owners about a defect is applicable in this case. Ford sent notices to foreign dealers about a defect in a product made and sold in the U.S. and also sold abroad. Does the fact that the notice was sent to foreign dealers negate Ford's responsibility to notify NHTSA? I don't think so, but certainly the law should be clarified that this is a company's responsibility in this age of globalization.

f. NHTSA's budget needs to be larger, particularly for enforcement. Ninety-four percent of transportation deaths occur on the highway, yet NHTSA has only a tiny percentage of the Transportation budget. Although it has been increased in recent years, and I thank this Subcommittee for that, it is still 30 percent below, in real dollars, what it was when I left the agency at the beginning of 1981. Its enforcement budget is about one-half of the 1980 budget. It has fewer than 20 engineer/investigators working on vehicle safety defects for the entire country.

The Firestone/Ford recall should be expanded to cover all ATX, ATX II and Wilderness tires to protect the public from this catastrophic defect, and all data and information should be made public to restore public trust.

Much of the data on which Ford based its analysis of Firestone claims data is still not public and subject to outside scrutiny (such as how many tires were made at each plant and when—an important factor since the defect appears to emerge after two to four years of use), and it is based on information through April 2000. None of the recent information that has been pouring into the companies and NHTSA as the public is getting informed about the problem is included. It also covers only claims data—claims for compensation for injury or property damage. It does not cover warranty claims or adjustment data for tire failures. It also does not cover any information known to Ford (although there will be duplication between Ford and Firestone data). It also does not cover new information now known by NHTSA about claims.

NHTSA last week analyzed data (complaints, lawsuits, injuries, including information submitted to date from Ford and Firestone) and determined that the recall should be enlarged to cover another 1.4 million tires. NHTSA said it is still investigating to determine if the recall should be enlarged further. It issued a consumer advisory because Firestone refused to enlarge the recall, an indication of Firestone's attitude toward a safety defect that gives the consumer no warning and can result in death and severe injury when the vehicle is operated normally. This same attitude was evident in Firestone's offer made on August 16 in public newspaper ads

that it would reimburse owners who bought other tires, but the offer ended on August 16. Had it not been for a temporary restraining order issued by a federal judge in Louisville preventing the company from discontinuing the one-day offer, Firestone might have faced a massive consumer revolt, picket lines, more consumer lawsuits and more disputes with its largest customer, Ford Motor Company, which is pressing to get the tires replaced quickly with tires from other manufacturers as well as Firestone.

There is every indication that this problem is a design defect that affects all the tires produced. In the Firestone 500 case, the company at first asserted that only 400,000 tires were defective, those produced in the Decatur plant. But during NHTSA's investigation, as more data was available and company documents were secured and analyzed, we found that the tread separation on the 500 was a design performance defect. The company knew about it for at least three years and never informed NHTSA, and it was at the same time making running changes on the production line to correct the problem in new tires.

There are other indications that the companies should expand the recall. An analysis released last Friday of about 90 lawsuits or claims about to be filed showed that 37 percent covered non-recalled tires. In several of the foreign recalls, 16-inch tires were included (but are not recalled in the U.S.).

There are a number of documents and data that are still secret, either in submissions by the companies to NHTSA or gag orders in lawsuits that should be made public. This may be painful for the companies, but it is essential given the broad public debate about this defect and the need for the companies to regain public trust. This information will probably leak out over time anyway, so it makes sense to release it now.

NHTSA failed to discover this defect because it lacks a proactive program to discover safety defects.

a. NHTSA was caught flatfooted because it rarely pushes companies to obey the law. The Department allowed GM to resist recalling its 5 million defectively designed pickup trucks with side-saddle gas tanks that explode in side-impact crashes, and Ford to resist recalling its vehicles equipped with ignition modules that frequently failed, causing vehicles to stall. It allowed Chrysler to label its correction of its minivans with defective rear-door latches that pop open in rear crashes, (throwing occupants outside), a "service campaign" and not a safety recall. And it rarely imposes penalties when it learns companies have slithered around its request to produce documents.

The auto manufacturers have rolled the dice in this coverup and usually win. This time they are the losers as the media spotlight forces the story of the sorry state of manufacturer compliance with the law and safety defect enforcement into the public consciousness.

b. NHTSA also has no early warning system in place and has not been proactive in using sources of information that are on the pulse-beat of current information about vehicle performance. They can and should routinely get information from: auto repair facilities; fleet owners, including national, state and local fleets; lawyers representing deceased and injured family members who find out about defects through discovery and cross examination of manufacturers; insurance company data; and also from the companies themselves.

In this case, State Farm Insurance Co., the nation's largest insurer, sent an E-mail and called NHTSA in 1998 about 21 cases of Firestone tire tread separations, but the agency ignored it. Another 30 cases were sent in 1999, and the agency ignored them as well. How could this happen? How often does the agency check complaints dutifully filed by consumers through its hotline and in letters to spot trends? They are all on a computer list by make, model, and alleged defect. Even if this happens routinely, it's not enough—as this case illustrates, because most consumers don't bother contacting government agencies.

The agency should require, as does EPA, that a company notify the agency if it gets 25 complaints about the same alleged defect, and require, as does CPSC, that the company notify the agency if three or more lawsuits alleging the same safety defect are filed.

The agency has also used a highly inappropriate system for evaluating whether a safety defect exists, looking at statistical data which are rarely adequate. If it cannot establish a statistical basis, the agency does not find a defect. The courts have held in a number of cases that if a safety element of the vehicle fails and can kill or injure, there is a failure of safety performance sufficient to find a defect, and there is no need to find dead bodies on the highway first.

In short, NHTSA has not been the tough cop on the regulatory beat. When it is, the companies are more safety-conscious, the public is protected, and in the end it

is less work for all parties. The Firestone/Ford case shows what happens when safety is not Job 1 in the companies or in the government.

Essential safety standards are severely out of date, were scrapped or delayed in the Reagan years, or are prohibited by law because of industry lobbying.

a. The tire safety standard is 32 years old and not fully effective for testing radial tires. Both Ford and GM have recently stated they favor an improved standard. The current standard tests for strength, endurance and how well the tire remains on the rim. Radial tires last much longer than bias ply tires and should be subjected to a tougher standard.

b. The Uniform Tire Quality Grading standard applies only to car tires, not truck/SUV tires. It is a consumer information requirement rating tread wear, traction and heat resistance with the rating molded into the tire. It should be expanded to cover truck/SUV tires.

c. The roof crush standard is 30 years old. It is a static standard requiring weight to be placed on the roof of the vehicle (applied to SUVs beginning in model year 1994) equal to 1.5 times the maximum unloaded weight of the vehicle. In many of the Ford Explorer/Firestone rollover cases, the roof crushes into the vehicle, severely enhancing the likelihood of injury and death. A dynamic rollover crash worthiness standard should be issued addressing roof crush, door lock and hinges, side glazing materials and head protection. Crash protection in rollovers must include effective safety belts with pretensioners.

d. The first petition to NHTSA for a rollover prevention standard was filed by Representative Timothy Wirth 15 years ago. Others followed. In 1991 the Congress required NHTSA to conduct a rollover prevention rulemaking. The agency made an initial effort at developing a safety standard, but then dropped it and instead proposed a consumer information requirement. The auto industry then got the Appropriations Committee to prohibit issuance of a consumer information rule until after a study by the National Academy of Sciences about the usefulness and presentation of consumer information. Finally in May 2000 the agency proposed to conduct New Car Assessment tests for rollover based on a static measurement of track width and center of gravity height, but once again the manufacturers objected and the Appropriations Committee has placed a requirement for yet another study by the NAS before it could be issued. This bill is now in conference.

Our coalition of consumer and health groups and insurers favors dropping the study and letting NHTSA issue the consumer information test. A 1998 Harris poll conducted for Advocates For Highway and Auto Safety show 62 percent of the public wants such information. But we also want a rollover prevention standard. It is long overdue. About 9,500 highway deaths annually occur in rollover crashes—almost 25 percent of all highway deaths. This problem must be addressed, particularly with the advent of SUVs with their susceptibility to rollover.

e. The agency should issue a rule for a tire inflation indicator on the dashboard, as I proposed 22 years ago. It was eliminated by the Reagan administration. The companies complain that tires are not properly inflated but then lobby to undercut consumers' ability to properly maintain their tires with accurate information.

f. The tire manufacturing information now molded into the blackwall of the tire should be placed on the whitewall or outside of the tire so a consumer doesn't have to crawl under the car to find it. This was part of my rulemaking plan more than 20 years ago, but it was never issued after I left.

g. The tire reserve load consumer information requirement eliminated in the Reagan years should be reestablished to inform consumers of the maximum rated load capacity of the vehicle, so they know when they should inflate their tires for maximum load carrying.

h. The agency should be alert in this case to whether its requirement for record retention of only five years should be extended, since the critical evidence in this case extends over a decade.

i. Three elements of legislation are needed that are relevant to this case:

First, the 1982 legislation eliminating the responsibility of independent tire dealers to report the names and addresses of tire purchasers to the manufacturer for notification in the event of a recall should be changed back to requiring such record-keeping as during the period from 1970 until 1982. Independent dealers with computers today can readily supply such names to the manufacturer. The current law only requires the independent dealer to give the consumer a card to mail themselves. A 1986 NHTSA report showed only 11 percent responded. Thus, in this case, most buyers from independent dealers will not be notified by mail.

Second, the current law requires tire owners to return the tire within 60 days of a recall notification (which, I presume means if a manufacturer has no contact information, a consumer would have to rely on news reports) or 60 days after tire avail-

ability. Car owners in recalls don't have this limitation. It is confusing enough to get tires replaced without this added complexity. It should be eliminated.

Third, the current prohibition in the law on a NHTSA rule requiring a continuous buzzer to alert occupants to buckle up should be eliminated. Among car companies, only Ford, I believe, now has a continuous buzzer. The current law only permits NHTSA to require a four to eight second buzzer. Belt use is essential in rollovers. It should be encouraged in every way, including when the vehicle is in use.

Thank you Mr. Chairman for the opportunity to testify on this important subject today.

NEW MEXICO FIRESTONE TIRE ACCIDENTS

Senator DOMENICI. Mr. Chairman, I wonder since New Mexico was mentioned, if I could just give you the authentic totals, it takes just two paragraphs. According to the NHTSA the tires have been blamed for 10 accidents in my State, 9 deaths. That is in New Mexico, including a husband, wife, and her unborn child who died when their Ford utility vehicle flipped four times and crashed outside of the little town of San Antonio, New Mexico. Of these accidents, 9 out of 10 involved Ford Explorers, and 7 out of 10 resulted in the vehicle rolling over more than one time; 5 of 7 of the rollover accidents caused fatalities.

So that is a State with a population of about 1.6 million. Clearly, if that occurred across this Nation it would be absolutely enormous.

STATEMENT OF DAVID R. PITTLE, SENIOR VICE PRESIDENT AND TECHNICAL DIRECTOR, CONSUMERS UNION

ACCOMPANIED BY:

DAVID CHAMPION, DIRECTOR, AUTO TEST CENTER, CONSUMERS UNION

SALLY GREENBERG, SENIOR PRODUCT SAFETY COUNSEL, CONSUMERS UNION

Senator SHELBY. Mr. Pittle.

Mr. PITTLE. Thank you, Mr. Chairman, distinguished members of the committee. Good morning. My name is David Pittle, and I am the technical director of Consumers' Union, publisher of Consumer Reports magazine. We applaud you for holding this hearing to discuss two serious consumer issues, one being the recall of the Bridgestone/Firestone tires on Ford light trucks and other sports utility vehicles, and to discuss in some detail NHTSA's proposed information program for comparing the emergency handling and stability of SUV's.

Senator SHELBY. Mr. Pittle, could you bring the mike a little closer to you?

Mr. PITTLE. Sure.

With me today are David Champion, director of Consumers Union 327-acre auto test center in Connecticut, and Sally Greenberg, senior product safety counsel here in Washington.

CU conducts comprehensive tests of more than 40 new motor vehicles each year and provides consumers with ratings about the performance, handling, efficiency, comfort, stability, and safety of these vehicles. CU also tests tires each year for their breaking, handling, cornering, and tractioning characteristics on new, wet, snow-covered and ice-covered surfaces. We do not conduct long-term durability tests of the kind done by NHTSA.

Each month an estimated 17 million consumers read and consider our published test reports, ratings, and buying advice as they

ponder their choices. Product safety has long been an overriding concern for CU and, in particular, roll-over stability, and over the past decade has become a top priority for the car-buying public as well.

We have learned from more than six decades of conducting unbiased laboratory tests and consumer use tests that products that look alike do not always act alike. That principle certainly holds true for motor vehicles and automotive replacement parts. To make sound buying decisions the American consumer needs reliable objective information about product performance and quality to help him or her make a rational choice from among competing products.

To many consumers, that also means buying safe products, ones that protect their families and do not present unreasonable risk. Here, the American consumer must be able to rely on NHTSA to set adequate safety standards and ensure their automotive products offered for sale meet those standards. Furthermore, if a product is found to be unsafe and defective it must be recalled promptly and effectively.

In short, NHTSA is the only economically disinterested entity that stands between the consumer and injury from an unsafe auto product. As charged by Congress, it is uniquely and singularly dedicated to protecting the public from automotive hazards often not seen, not measured, and not understood by the average consumer, but in the end consumers ultimately rely on Congress first to ensure that NHTSA has the resources and authority it needs to protect the public, second to use its oversight power to ensure the agency is fulfilling its mandate, and third to allow the agency to set safety regulations without being derailed because industry voices objections.

Against this background we would like to offer you several observations and recommendations this morning regarding the recall.

BRIDGESTONE/FIRESTONE RECALL

CU, like motorists across the country, was chagrined to learn that since 1992 there have been more than 50 lawsuits and possibly as many as 100 lawsuits related to the Firestone tire subject to the current recall. Many of the lawsuits were settled with protective orders in place, with the effect that critical safety information has been kept from the public.

The Senate has before it S. 957, Senator Kohl's bill, which requires courts to consider the impact on public health and safety before considering, or during consideration of the granting of such protective orders. CU believes that when a lawsuit is settled, information affecting public safety should never be allowed to be sealed and thereby kept from the public. If NHTSA does not now have the power to subpoena information affecting public safety within the confines of these protective orders, Congress should correct that shortcoming in their authority.

Ms. Claybrook says that is in place. That ought to be clarified. There is a lot of finger-pointing in both directions, and in the meantime nothing happens. The ever-increasing extent of the Firestone recall and allegations of previous protective orders shine a bright light on the charges and dangers that these orders have on the public health and safety. One cannot help but believe that if

this information had been opened to NHTSA and the press earlier, many of the tragic deaths and injuries from these tires would have been avoided.

LAW REGARDING FOREIGN NOTIFICATION UNCLEAR

Second, car and tire manufacturers are required to report to NHTSA within a few days when they discover an auto safety problem, but the law may be unclear for safety recalls that involve vehicles outside the United States. I do not know, but if there is an ambiguity in the way the statute can be read, that ambiguity should be clarified as soon as possible by Congress.

American consumers were understandably angered upon learning that the same vehicles they were driving and similar tires to the ones they were driving on were previously and quietly subject to safety recalls in other countries. We believe manufacturers must be required to share such recall information with NHTSA. Congress should either make changes to the statute, or direct NHTSA to amend its regulations to ensure that recalls in foreign countries are brought to NHTSA's attention promptly.

Third, Congress should take the opportunity to ensure that there are adequate deterrents to nonreporting of safety information by passing the administration's legislation calling for heavier fines for failure to report. We urge the committee to evaluate what level of fine will serve as a realistic deterrent to companies that manufacture products falling underneath its jurisdiction and that fail to report safety defects, recognizing that many of them are multibillion corporations.

CU believes NHTSA's legislation filed last year to increase the fines for failure to report is a step in the right direction. We are concerned that the levels are still too low to be an effective deterrent.

ROLLOVER TESTING

I would like to address the NHTSA proposal on roll-over information. That is a very important thing. CU has been involved in the roll-over testing and the controversy for many years. It is no surprise that these tire failures occurring on an SUV ultimately wind up in a crash that is a roll-over and the number of deaths is quite high, and that is unacceptably high.

While members of this committee may be aware that sports utility vehicles tend to roll over at a much higher rate than passenger cars, the motoring public does not sufficiently understand the full impact of this problem. Since 1973, CU has been conducting emergency avoidance maneuver testing of all vehicles, and since 1988 has been running avoidance maneuver tests to evaluate the stability of SUV's and other light trucks.

Both involve dynamic testing. That is, driving a vehicle through emergency maneuvers to evaluate its performance. In 1988, CU petitioned NHTSA to use a dynamic or driving test to set a safety standard for vehicle stability. NHTSA granted our petition, but gave up in 1994, stating that the resulting tests would impose too high a cost on SUV design.

In 1996, CU once again petitioned NHTSA, this time asking the agency to develop a dynamic test to evaluate the emergency han-

dling of SUV's, require that all SUV's be put through that test, and to make the test results available to consumers. NHTSA granted our petition in 1997, and thereby raised expectations that it would develop a dynamic test. Sadly, it did not.

CU's comments to NHTSA's proposal, submitted just 2 weeks ago, notes that after conducting a series of dynamic tests on just 12 vehicles NHTSA backed away from dynamic tests. Instead, it is proposing the use of a static measure known as the static stability factor as the basis on which to rate vehicles.

In our comments CU said, quote, "While we believe any information that helps educate consumers about roll-over has merit, after a thorough analysis of NHTSA's proposal we cannot, unfortunately, endorse NHTSA's decision to use only the static stability factor to measure rollover propensity," close quote, and we continued, quote, "CU believes that the value of the static stability factor to consumers is preferable to consumers having no information at all.

At the very least, it clarifies the fundamental differences between categories of vehicles, but it is not a satisfactory regulatory response to an important issue of auto safety. It is too crude a measure to reliably distinguish among models within the same class of vehicles," close quote.

Ladies and gentlemen, consumers are crying out for this kind of information. They are being promoted to buy these cars, and yet they cannot distinguish the unseen roll-over propensity of them. We urge NHTSA to continue to try to develop a dynamic test, and we have submitted a full copy of our comments to NHTSA to committee staff and ask that it be included in the record.

We have always been concerned about Congress preventing NHTSA from taking action that the agency deems necessary to promote highway safety. Nonetheless, when Senator Shelby introduced an amendment to the transportation appropriations bill to delay NHTSA's action until the National Academy of Sciences studied whether static stability factor is the best stability measure, we were at least pleased that the amendment also directed the NAS to study the benefits of dynamic testing, which we consider to be the most important factor, and to include consumer representatives in the NAS study.

Our own view is that dynamic test is the proper path to take, and we would only hope that any trip to the National Academy of Sciences is a short one.

In summary, CU believes that we are at a crossroads, and we need a change in direction. We are pleased that NHTSA finally has an Administrator. Dr. Bailey brings fresh leadership and an impressive set of credentials with a spirit of service to the consumer back at the agency.

We are also pleased that the committee, and particularly the chairman, has expressed a sincere interest in setting the agency back on a proper course, and no matter what you hear about public confidence in Government, consumers need and deserve a strong auto safety agency that has the will to act on their behalf. They need stronger standards, more vigorous attention to injury data, and a relentless commitment to recalling defective products.

Consumers Union stands ready to work with you and the committee members to bring about the sorely needed changes. Thank you.

[The statement follows:]

PREPARED STATEMENT OF R. DAVID PITTLE

Mr. Chairman, distinguished members of the Committee, good morning. My name is David Pittle, and I am the Technical Director and Senior Vice-President of Consumers Union (CU), publisher of Consumer Reports. We applaud you for holding this hearing to discuss two very important consumer safety issues: (1) the recall of Bridgestone/Firestone tires on Ford light trucks and other sport utility vehicles (SUVs), and (2) NHTSA's proposed information program for comparing the emergency handling and stability of SUVs. With me are David Champion, Director of Consumers Union's 327-acre Auto Test Center in Connecticut, and Sally Greenberg, CU's Senior Product Safety Counsel here in Washington.

CU conducts comprehensive tests of more than 40 new vehicles each year and provides consumers with ratings about the performance, handling, efficiency, comfort, stability, and safety of these vehicles. CU also tests tires each year for their braking, handling, cornering, and traction characteristics on dry, wet, snow-covered, and ice-covered surfaces. We do not conduct long-term durability tests of the kind done by the National Highway Traffic Safety Administration. Each month, an estimated seventeen million consumers read and consider our published test reports, product ratings and buying advice as they ponder their choices.

Product safety has long been an overriding concern for CU, and over the past decade, has become a top priority for the car-buying public as well. We have learned from more than six decades of conducting unbiased laboratory tests and consumer use tests that products that look alike don't always act alike. This principle certainly holds true for motor vehicles and automotive replacement parts.

To make sound buying decisions, the American consumer needs reliable, objective information about product performance and quality to help him or her make a rational choice from among competing products. To many consumers, that also means buying safe products, ones that protect their families and do not present unreasonable risks. Here, the American car-buying public must be able to rely on NHTSA to set adequate safety standards and insure that automotive products offered for sale meet those safety standards. Furthermore, if a product is found to be unsafe, it must be recalled promptly and effectively. In short, NHTSA is the only economically disinterested entity that stands between the consumer and an unsafe product. As charged by Congress, it is uniquely and singularly dedicated to protecting the public from automotive hazards often not seen, not measured, and not understood by the average consumer.

But in the end, consumers ultimately rely on Congress, first, to insure that NHTSA has the resources and the authority it needs to protect the public; second, to use its oversight power to insure that the agency is fulfilling its mandate; and third, to allow the agency to set safety regulations without being derailed because industry voices objections. Against this background, we offer the following observations and recommendations.

BRIDGESTONE/FIRESTONE RECALL

1. CU, like motorists across the country, was chagrined to learn that since 1992 there have been more than 50 lawsuits, and possibly as many as 100 lawsuits, related to the Firestone tires subject to the current recall. Many of those lawsuits were settled with protective orders in place, with the effect that critical safety information has been kept from the public. The Senate has had before it S. 957, Senator Kohl's bill, which requires courts to consider the impact on public health and safety before granting such protective orders. CU believes that when a lawsuit is settled, information affecting public safety should never be allowed to be sealed and thereby kept from the public. If NHTSA doesn't now have the power to subpoena information affecting public safety within the confines of these protective orders, Congress should correct that shortcoming in their authority. The ever-increasing extent of the Firestone recall and allegations of previous protective orders shine a bright light on the dangers of these orders to the public's health and safety. One cannot help believing that if this information had been open to NHTSA and the press, many of the tragic deaths and injuries from these tires would have been avoided.

2. Car and tire manufacturers are required to report to NHTSA within a few days of when they discover an automotive safety problem. But the law may be unclear for safety recalls that involve vehicles outside the United States. If there is ambi-

guity in the way the statute can be read, that ambiguity should be clarified by Congress. American consumers were understandably angered upon learning that the same vehicles they were driving, and similar tires to those they were driving on, were previously—and quietly—subject to safety recalls in other countries. We believe manufacturers must be required to share such recall information with NHTSA. Congress should either make changes to the statute or direct NHTSA to amend its regulations to insure that recalls in foreign countries are brought to NHTSA's attention.

3. Congress should take this opportunity to insure there are adequate deterrents to nonreporting of safety information by passing the Administration's legislation calling for heavier fines for failure to report. We urge the Committee to evaluate what level of fine would serve as a realistic deterrent to companies that manufacture products falling under NHTSA's jurisdiction and fail to report safety defects—recognizing that many of them are multi-billion-dollar corporations. CU believes NHTSA's legislation filed last year to increase fines for failure to report a safety defect, raising the penalty from \$1,000 to \$5,000 for each violation, and raising the maximum penalty from \$800,000 to \$1 million, is a step in the right direction. We are concerned, however, that these levels are still too low to be effective as a deterrent to non-reporting of defects.

4. There are valuable lessons to be learned from the Firestone recall, and now is the time to put those lessons to use in preventing future problems. We urge Congress to direct NHTSA to establish a far more proactive and coordinated outreach program to acquire available injury information.

a. NHTSA should reach out to repair shops to learn about problems with motor vehicles and automotive products.

b. NHTSA should better track information that comes in through its Auto Safety Hotline.

c. NHTSA's staff should vigorously track private lawsuits to determine whether there is a disproportionate number of suits filed on certain products.

d. NHTSA should improve its data collecting capabilities related to dangerous or defective products; State Farm Insurance reported that it had informed NHTSA that it had received 21 damage reports on Firestone tires. Yet, NHTSA has said in media reports that it has no record of receiving that information. NHTSA needs gather the kind of data State Farm provided in a far more systematic fashion.

e. NHTSA should upgrade the requirements of its durability testing of tires.

NHTSA PROPOSAL ON ROLLOVER INFORMATION

CU notes that the vast majority of the Firestone tire failures have occurred on the Ford Explorer, a sport utility vehicle, and that many crashes reportedly involve the vehicle rolling over after tire failure. While members of this Committee may be aware that sport utility vehicles tend to roll over at a much higher rate than passenger cars, the motoring public does not sufficiently understand the full impact of this problem. Since 1973, CU has been conducting emergency avoidance maneuver testing of all vehicles, and, since 1988, we have been running stability tests for all SUVs and other light trucks we evaluate. Both involve dynamic testing; i.e., driving a vehicle through emergency maneuvers to evaluate its performance.

In 1988, CU petitioned NHTSA to use a dynamic or driving test to set a safety standard for vehicle stability. NHTSA granted CU's petition, but gave up in 1994, stating that the resulting tests would impose significant costs to SUV design. In 1996, CU once again petitioned NHTSA, this time asking the agency to (1) develop a dynamic test to evaluate the emergency handling of SUVs, (2) require that all SUVs be put through that test, and (3) make the test results available to consumers.

NHTSA granted our petition in 1997 and thereby raised expectations that it would develop a dynamic test. CU's comments to NHTSA's proposal, submitted just two weeks ago, notes that after conducting a series of dynamic tests on just 12 vehicles, NHTSA backed away from dynamic testing, instead recommending the use of a static measure known as SSF, as the basis on which to rate vehicles. In our comments, CU said:

While we believe any information that helps educate consumers about rollover has merit, after a thorough analysis of NHTSA's proposal, we cannot, unfortunately, endorse NHTSA's decision to use only the Static Stability Factor (SSF) to measure vehicle rollover propensity

And continued:

CU believes that the value of SSF to consumers is preferable to consumers having no information at all. At the very least, it clarifies the fun-

damental differences among categories of vehicles. But it is not a satisfactory regulatory response to an important issue of auto safety. It is too crude a measure to reliably distinguish among models within the same class of vehicles.

We urged NHTSA to continue trying to develop a dynamic test. We have submitted a full copy of our comments to NHTSA to the Committee staff and ask that it be included in the record.

We always have concerns about Congress preventing NHTSA from taking action that the agency deems necessary to promote highway safety. Nevertheless, when Senator Shelby introduced his amendment in the Transportation Appropriations bill to delay NHTSA's action until the National Academy of Sciences (NAS) studied whether SSF is the best stability measure, with Senator Hollings joining him, we were pleased that the amendment also directed the NAS to study the benefits of dynamic testing and to include consumer representatives in the NAS study.

In summary, CU believes we are all at a crossroads, and we need a change of direction. We feel pleased that NHTSA finally has an administrator. Dr. Bailey brings fresh leadership and an impressive set of credentials to put the spirit of service to the consumer back in the agency. We are also pleased that the Committee, and in particular the chairman, has expressed a sincere interest in setting the agency back on a proper course. And no matter what you hear about public confidence in government, consumers need and deserve a strong auto safety agency that has the will to act on their behalf. They need stronger standards, more vigorous attention to injury data, and a relentless commitment to recalling defective products. Consumers Union stands ready to work with you to bring about these sorely needed changes.

POSSIBLE PREVENTIVE MEASURES

Senator SHELBY. Ms. Claybrook, I will try to be brief to give other people a chance to question.

How could this have been prevented. What we have in front of us today is loss of life, the loss of property, but lives more than anything and, obvious to me, a concealment of information that should have been brought out to the public, who ultimately are the consumers, and that is all of us and our families. How could that be prevented?

Ms. CLAYBROOK. Well, first of all I believe the regulatory agency does need to be more proactive. I think it needs much tougher penalties. I think if it has criminal penalties, the executives of these companies are going to think twice before they allow this to happen again. That is my view. Criminal penalties are a very harsh penalty. They are better not used in most cases, I think, but if they are there to be used I think that they are a real deterrent.

And then finally I think that the American Bar Association and the courts of this country ought to prohibit gag orders, because the trial lawyers are put in a terribly awkward position. They are trying to service their client. An offer for settlement is made. The client is ill, desperate, harmed, and they want a settlement, and so there has to be an acceptance of that by the trial lawyer in most cases when it is offered, so the public is not served by that, and I believe it ought to be.

PATTERN OF INJURY DATA NOT RECOGNIZED

Mr. PITTLE. Prior to coming to Consumers Union I was a commissioner at the Consumer Products Safety Commission for 9 years and we, when we set the agency up in 1973, did our best to inspire our staff to take an aggressive search for injury data. You do not wait for it to trickle in and come in the mailbox or over the transom.

I think that is what has been happening to NHTSA over the last few years. I have observed an agency that has lost its will and lost its way. It needs strong leadership at the top to demand that they go out and look for this information, go to auto repair shops, go to tire repair shops. Insurance agencies use the information that the trial lawyers have available. You have to go looking for it. If you wait for it to come you will wait until you find 88 deaths and 1,400 incidents. This should have been picked up a long time ago if the agency was more aggressive.

Senator SHELBY. But the real dynamic here was brought out by this young analyst with State Farm Insurance who was keeping tabs of all this information, was it not?

Ms. CLAYBROOK. He was not keeping tabs. He happened upon it. He happened upon it, and as he processed his paper every day he saw another one, and then another one, and he realized that, but he not only contacted the agency by sending an e-mail with this, he called them up, and he did it—in 1978 he sent them 21 cases—I am sorry, in 1998 he sent them 21 cases. In 1999 he sent them 30 cases, so now they have 51 cases as of 1999 in the agency, sent from the largest insurance company in America for autos.

Senator SHELBY. Mr. Pittle, what did NHTSA do with this information that this gentleman sent them?

Mr. PITTLE. I only know what I read in the press. They say they never got it.

Ms. CLAYBROOK. They got it. They just did not analyze it.

Mr. PITTLE. Whatever they did, nothing got out.

Senator SHELBY. They did not act on it, anyway.

Mr. PITTLE. They did not act on it, and that is what—I am going to go back to the point, you are in the role, and you have the position to speak to the head of the agency to say, we want this agency to be sitting here with the consumer talking about safety problems. I am sorry that she is not here at the table with us, because that is where I would see a disinterested auto safety agency, here with the consumers.

Senator SHELBY. Proactive means they will protect the lives of Americans, does it not?

Mr. PITTLE. Yes. That is the best chance we have.

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thanks, Mr. Chairman.

Ms. Claybrook, you in your little demonstration here showed that tire size has little to do with separation, at least in the example that you have presented.

IS RECALL BROAD ENOUGH?

Why would NHTSA not, or why would the company not want to participate as long as they are doing it actively in a recall to call in the larger tires, or whatever size it is that is off the recall, the present recall list, and why would not, should not NHTSA—I do not know whether we are going to hear about that a little bit later—insist that that take place?

Ms. CLAYBROOK. Well, first of all NHTSA is doing a further investigation of all the data. They first asked for information from the companies in May 2000, and they are only just getting the in-

formation in. It has now been 3½ months, so they have to look at the data.

They also have due process requirements. They have to analyze it. They have to make an initial determination of a defect. They have to have a public hearing. The company has to be able to respond and then make a final determination of the defects, so they have a due process burden that they have to carry, and that is appropriate. I agree with that.

So what the agency did last week I applaud. They asked Firestone to recall another 1.4 million tires beyond the 6.5 million. Firestone refused, and so the agency put out a consumer advisory.

Now, this is the first consumer advisory I know of issued by the agency in 15 or 20 years, and consumer advisories are a very effective way of both alerting the public as well as getting more information, and so I applaud them for doing that.

The reason the company did not do a larger recall, you will have to ask Ford and Firestone. My understanding is that Ford took the Firestone claims data, the injury and property damage data, and analyzed it and defined the recall that is now underway, the 6.5 million recall, by the correlation of the injuries and claims to particular tire sizes, but that claims data was as of the May 1. A lot of information has come in since, but also, importantly, it did not include warranty and adjustment data.

Adjustments are when somebody complains, they bring in a bad tire and there is an adjustment made at the dealership. You get half-price off, or whatever it is, and I believe that looking at other data is important to coming to a conclusion, but to me the basic issue is that it is a design defect, and when it is a design defect it covers all the tires.

Senator LAUTENBERG. Mr. Pittle, do other vehicle owners with nonrecalled Firestone tires, have you seen any evidence that there may be some concerns about other brands, or other models besides the ones—

Mr. PITTLE. I have not seen it expressed either through injury data or through our testing, which of course the brand, that would not show up.

DYNAMIC ROLLOVER TEST NEEDED

I have seen a continued concern about being able to evaluate the roll-over propensity of vehicles sitting in the showroom. I want to go back to that, because this is really the combination of two unfortunate situations coming together. We have a vehicle that has a high center of gravity that is linked up with a tire that has a tendency to blow out, and when a tire with a high center of gravity blows out it is going to have a greater tendency to roll over and cause serious injury or death.

And what consumers really want to know is, how do you separate—they know that—I mean, I can tell you that whether you are testing refrigerators, automobiles, or televisions, they all can look alike, very similar, but they act differently, and they each have different characteristics, and the ones that are more prone to roll over, have less competent handling characteristics, you cannot tell by looking at it. You have to test it dynamically to see how it will perform.

It is much akin to trying to decide how something will taste by reading the ingredient list. You really cannot do that. You have got to put it to the test, and that is what NHTSA has to get back on track to do, get back to dynamic testing development.

Senator LAUTENBERG. I wonder whether we are at a point in time when after seeing this disagreement between Ford and Firestone about whether or not—pointing fingers at one another, whether or not there should be a receipt, some kind of an alert or an alarm that goes out pointing out what the risk is with tire inflation.

PUBLIC INFORMATION ABOUT TIRE SAFETY

I can bet you anything that even this day, with all the publicity we have seen, including Mr. Nasser's appearances on television, plenty of people do not just know what to do, do not know about the problem that their families may be facing. How do we get that information out there in a sensible way now and prospectively? Should there be warning labels just like you might see on cigarettes, or the right to know about chemical factories in the neighborhood? The right to know ought to be an integral part of what it is that these products represent by way of a threat to safety.

Ms. CLAYBROOK. Well, I would certainly suggest anyone who has these tires drive more slowly. One of the issues here is that the speed limit has gone up from 55 miles an hour to 65 and 70 miles an hour, so people are going faster. They buy these vehicles to go on vacations and trips often, so they are driving 4, 5, 6 hours at a time. The tires get very hot, and when the tires get hot, that is when the tread separation is likely to occur.

And this heat build-up, that is the reason this issue of the climate was first mentioned, because in colder weather the heat is dissipated faster. In hot weather it is not dissipated faster. In addition, these are truck tires. Truck tires were really designed for pick-up trucks, and these are tires that are now on vehicles that people use in the same way they use cars.

I would say Ford Motor Company does put the specifications for these tires on paper, and require certain specifications for the tires and the tire manufacturer then manufactures them, so there is not a disconnect in the sense of not knowing what this tire is when it is bought by the vehicle manufacturer, and the vehicle manufacturer tests them and so do the tire manufacturers, and the vehicle manufacturer tests them on the vehicle.

That is the reason that they decided to lower it to 26 psi, because they tested it with a higher psi and the vehicle rolled over, so then they decided to lower the psi, the pounds per square inch inflation of the tires.

Senator LAUTENBERG. Thank you, Mr. Chairman.

Senator SHELBY. Senator Specter.

Senator SPECTER. Thank you, Mr. Chairman.

FOREIGN COUNTRIES' RESPONSE TO DEFECTS AND RECALL

Ms. Claybrook, you testified that the Venezuelan authorities are considering prosecution for involuntary manslaughter. That, in my judgment, would be grossly insufficient.

Involuntary manslaughter is an offense where there is gross negligence. That does not comprehend conduct where there is knowledge that there is a defect which could cause the death of another. Where that knowledge is present in advance, that is equated in common law with malice, which is sufficient to constitute a charge of second degree murder.

I know you are not responsible for what Venezuela does, but I think that point ought to be emphasized, that this is not a matter of negligence or gross negligence, which would give rise to a charge of involuntary manslaughter.

Ms. CLAYBROOK. Senator Specter, I would just say there is a question, and of course with translation it is somewhat difficult for us to be sure of exactly what the authority is under Venezuelan law, so my feeling is, although I do not know this for a fact, is that that is probably what they thought they had the authority to do.

Senator SPECTER. Ms. Claybrook, you testified that criminal penalties ought not to be ordinarily used in matters of defective products. How about this case, where key Ford officials and key Firestone officials knew about the defect, evident by having products recalled from Saudi Arabia? Is this the kind of a matter, in your judgment, that a criminal penalty would be appropriate?

Ms. CLAYBROOK. I think that it is. I think there should be a full investigation, of course, and complete documentation, which there certainly is not at this time, but I certainly think that it should be the subject of consideration.

Senator SPECTER. Mr. Pittle, I note you nodding in the affirmative.

Mr. PITTLE. Well, I am just thinking—

Senator SPECTER. Excuse me, I have not come to my question, but I do not want to take an affirmative nod into the record without giving you a chance to answer.

EFFECTIVE DETERRANTS

You testified that a fine on a failure to report is not an effective deterrent. I think that is pretty obvious. Do you think a second degree murder prosecution against the officials at Ford and Firestone who were shown to have known that these defects were present and failed to act to recall these defective products would be an effective deterrent?

Mr. PITTLE. I think that would be an effective deterrent, yes.

Senator SPECTER. I note an affirmative nod on what Ms. Claybrook was testifying to, when I asked her the question as to whether she thought this was an appropriate case for criminal prosecution. Do you agree with her?

Mr. PITTLE. I was nodding to my own memory of my own experience in this area, and I was not nodding specifically to her response.

Senator SPECTER. Good. We will give you a chance to answer the question verbally and vocally.

Mr. PITTLE. When I was at the Product Safety Commission we found on a number of occasions in which we had the authority to impose criminal penalties, when there was evidence that a manufacturer knew about and did not recall a serious hazard, we ran into situations where when the rubber meets the road—not a good

analogy in this case—it would find that the U.S. Attorney might say, this is not a very strong, exciting, big enough case, I think I am not going to bring it, or you would find—

Senator SPECTER. Well, never mind those cases. How about this case?

Mr. PITTLE. I think this case is clearly big enough, serious enough, broad enough and, depending upon what the investigation brings out about the facts leading up to where we are now, that it would go forward.

Senator SPECTER. There is a very heated debate in the Congress about the issue of punitive damages, and my experience both as a civil defense lawyer and as a representing plaintiff's, and before that as a district attorney in Philadelphia, where you have the criminal sanctions, but my experience has shown that punitive damages do not amount to much because the awards, which look gigantic in the newspapers, do not hold up.

I know of a case where Ford Motor Company had a defective brake mechanism which they knew existed and did not recall, and a 3-year-old child was killed when a truck backed over the child and the verdict was \$153 million, since reduced to \$69 million, and on appeal that—it doubtless will be reduced further, and it takes the most extraordinary kind of litigation effort to carry one of those cases forward, and there is no doubt that when you talk about punitive damages it is cost effective for the company not to fix the product.

CRIMINAL PROSECUTION

You have the famous Pinto case, where the documents which were finally discovered and disclosed, that here again Ford calculated that it was cheaper to pay the damages than it was to repair the vehicle.

That sort of a situation, it seems to me, just cries out for criminal prosecution with cases established of knowing what has happened.

Ms. CLAYBROOK. Senator Specter, if I could comment on the Pinto case, there was actually a criminal prosecution in that case by a local prosecutor in Indiana who lost the case, and I think for lack of resources, utter lack of resources, because that was the only way a criminal prosecution could be brought in the case, because there was no Federal authority to bring a criminal prosecution for refusal and failure to recall.

Senator SPECTER. Ms. Claybrook, do you think that, in your list of recommendations for legislative changes, that there ought to be Federal legislation establishing criminal liability, homicide, or murder in the second degree, for reckless disregard of the safety of others on products which move in interstate commerce?

Ms. CLAYBROOK. I do.

Senator SPECTER. Thank you very much. Thank you, Mr. Chairman.

Senator SHELBY. Senator Byrd.

Senator BYRD. Thank you, Mr. Chairman. Ms. Claybrook, I have known you for many years. Sometimes we have been in adversarial positions, but I compliment you on your statement today and on your recommendations. You have been very helpful to me when we

were acting on the zero-tolerance, under-age drinking and driving amendment, and I want to publicly thank you for that.

You were the NHTSA Administrator during the largest tire recall, the Firestone 500 recall. You stated that in both cases Firestone has withheld information. Do you believe this is a problem that is peculiar to Firestone, or is it shared by other tire manufacturers?

Ms. CLAYBROOK. I do not think it is peculiar to Firestone. I certainly think that it occurs with some frequency at the Department of Transportation as to other manufacturers. There has been clearly withholding of information by companies, and I think the reasons why are that they have not had sufficient penalties. They have not had civil penalties. They have not had criminal penalties. They have not had penalties of withholding documents per day as opposed to just for each document.

If you look at a comparison of a case developed by the Department of Transportation, NHTSA on a particular recall, and then you look at the file of a really first class trial attorney who has gone after documents in a similar case, you will see that the trial attorney has many more documents and understanding of the case and the internal decisionmaking process of the company than does the Department of Transportation, and the reason why is because the court can sanction the company and the agency cannot, and often does not.

Senator BYRD. What about the auto manufacturers?

Ms. CLAYBROOK. I was including them in that statement.

SAFETY OF SUVs

Senator BYRD. Do you believe that sports utility vehicles can be reengineered to be safer for the occupants, or are they inherently unsafe because of the gravity problem?

Ms. CLAYBROOK. I think they can be reengineered, and I understand that the Ford Explorer is being reengineered for the year 2002. The chairman of Ford has said that—he acknowledged about 3 or 4 months ago that these vehicles did have to be redesigned, and I compliment him and the company on being up front about that.

These are cash cows for these companies. They bring in huge profits, and generally the auto companies' view is that what sold yesterday will sell tomorrow until we know it does not, and then we will change it, and I think much of their resistance to not changing the vehicle design is because they have been so popular, but I think this case in many ways has informed the American public that they are susceptible to roll-over and they need to be redesigned, and I think it is going to push every company to do that.

And if there is any solace for the families of the people who have died and been injured, it is that I think it is going to spur some major change, but I do not think it ought to just be within the companies. I think the Department of Transportation ought to issue a roll-over standard that is a dynamic testing standard that makes it clear that these vehicles are not going to be these unknown killers unnecessarily.

Senator BYRD. Ms. Claybrook, your testimony is very forthright. You are very knowledgeable, and I want to compliment you and thank you for your statement, and also thank you, Mr. Pittle.

Thank you, Mr. Chairman.

Senator SHELBY. Senator Domenici.

Senator DOMENICI. Mr. Chairman, I very much would like to hear from some of the company witnesses, and I want to thank both of the witnesses.

PUBLIC SAFETY NEEDS TO BE STRENGTHENED

From my standpoint it was not only the companies you have told us here today that need to do some fixing up, but our own agency obviously is very weak. Either that, or we do not understand the situation, but it would seem to me that safety—trying to protect the public in terms of automobiles and tires—from what you have told us, seems not to be a very important part of the life of this agency in charge of safety.

Now, maybe the companies do a great job. Perhaps they do, I think considering how many vehicles are made every year and how many are bought and how many are on the roads. I am not suggesting we take over the companies one iota, but we must have—this has to be a case of indicating we have got to strengthen the agency, and we have got to focus in on this particular one and see what we can do to get it repaired and to move on from there.

So I thank both of you. It has been a very enlightening morning.

Senator SHELBY. Senator Mikulski.

Senator MIKULSKI. Thank you, Mr. Chairman. I know the time is moving along. I really am going to ask Ms. Claybrook one question, acknowledging the wonderful role that Mr. Pittle has played in both his role at the Consumer Products Safety Commission, which I am an appropriator of, as well as now.

Ms. Claybrook, we really had an unfortunate historic situation here. In 1970 Ralph Nader wrote his book, *Unsafe at Any Speed*. And 30 years later, people driving these vehicles and on these tires continue to be unsafe at any speed, and there have been 15 accidents in Maryland, no deaths, but every accident is a tragedy or a death waiting to happen.

NEED FOR EFFECTIVE QUALITY INSPECTION AND CERTIFICATION

Let me go to my question. First, thank you, because of telling me about the early warning. It is an issue I want to take up with Dr. Bailey, but here is the question. Right now in my home State of Maryland, to protect the food supply of the American people we have inspectors at the chicken factory right now who are getting ready the wonderful delicacies that come out of Maryland to feed the Nation. The fact is that we have inspectors in the factory, on the line, worried about salmonella and all the other kinds of things, and they are there to protect the American people.

My question, then, goes to this. What are the inspectors at an automobile car manufacturing plant? Do we have mandatory inspection? Do we have mandatory reporting that comes out of that? Do we have this? If we can bring inspectors to look at our chicken parts, should we bring in inspectors to look at our auto parts?

Ms. CLAYBROOK. The way that the National Motor Vehicle Safety Act is constructed, the companies self-certify they are in compliance with the standards. If the agency has reason to believe, or is concerned, it can send inspectors. It has authority to send inspectors, but there are no routine, regular inspectors out there on the line, but what the agency does is, it takes the product and it randomly buys them from dealers, so the companies do not know where they are buying it, and they test them to assure that they are, in fact, in compliance with the standards, and I will have to say that most of the time they are.

Part of the problem in this case is the standard is so old and insufficient that it passed the standard. This tire passed the standard in 1997, and so the standards are out of date. They need to be updated.

I would not necessarily change the system. The one recommendation the Department has made and I endorse is that there be a statutory requirement that before they can self-certify they have to have tested, and they have to have test results that show that they have complied, and the Department can then ask for those tests any time they want.

Senator MIKULSKI. So you would not put in inspectors in the factories?

Ms. CLAYBROOK. I do not think so.

Senator MIKULSKI. Again, would you have mandatory submission of quality control reports and then spot inspection other than retail sampling?

Ms. CLAYBROOK. I think the Department would be completely overwhelmed. As I said, there are only about 20 people in the agency who work on defects, I think or engineers or investigators, and the agency would have to be vastly enlarged in order to have that capacity. I think the better way to do it is to have the statutory requirement that they must do tests to certify their compliance, so any time the agency—

Senator MIKULSKI. And severe penalties if they submit deceptive or faulty—

Ms. CLAYBROOK. And any time the agency wants they can ask for these tests and look at these tests, and if there is falsification of the tests, then they are in real trouble, and I do not think there would be in most cases anyway.

Senator MIKULSKI. Thank you very much.

Thank you, Mr. Chairman.

Senator BYRD. And with new and updated standards.

Ms. CLAYBROOK. A new and updated standard for tire safety, right.

Senator SHELBY. Senator Kohl.

Senator KOHL. Thank you, Mr. Chairman. I have a statement and a question for both of you. In the wake of these reports about faulty tires and the accidents that they have most certainly caused, there has been a great deal of blame-laying about why this information took so long to get out into the public domain.

EFFECT OF GAG ORDERS

One thing I believe is abundantly clear. Many of these cases were settled in and out of court with confidentiality agreements,

which agreements kept information, crucial information about millions of defective tires, behind closed doors and away from the public.

The question is, first, is there any doubt in your minds that the secrecy orders led to more injuries, accidents, and deaths, and second, I have a bill with bipartisan support that would make the secrecy orders much tougher to get when health and safety issues are at stake.

In the wake of these tragedies, do you believe that this bill should be unanimously supported and voted upon?

Ms. CLAYBROOK. Well, first of all I do believe that gag orders kept this information secret inappropriately, and resulted in the death and injury of lots of people. I think these orders are unethical. I think among other things the American Bar Association ought to declare them as unethical.

As you know, we supported your legislation. My only concern is that I do not favor the Federal Government telling State courts what to do, and I am very concerned about that.

The other issue is that every time your bill starts to come up they want to put a whole bunch of other things that undercut the tort system on top of your bill, so there is some complexity there, as you know, but certainly I do not believe that these protective orders ought to be allowed.

Senator KOHL. Mr. Pittle.

Mr. PITTLE. That is Consumers Union's view as well. We think that these gag orders have clearly led to the withholding of information that if it had been made public this hearing would have occurred months ago, maybe years ago, and the injuries and deaths that have occurred during the interim would not have occurred, and Consumers Union does support the abolition of gag orders and agreements where public safety information is sealed away and left to be out of view while the product goes on and injures or kills more people.

Senator KOHL. Well, we are committed to getting this legislation passed if not this year, next, and I trust we will have your full support and cooperation in this effort, and I thank you so much.

Senator SHELBY. I want to thank both of you for appearing here and giving your testimony, and I appreciate having been able to work with both of you on it.

On our second panel, we will have Mr. Ono, the chief executive officer of Bridgestone/Firestone, and he will be making the opening statement and then will be replaced by Gary Crigger, the executive vice president of Bridgestone/Firestone.

We also have Helen Petrauskus, vice president, environmental and safety engineering, who will be testifying for Ford Motor Company, and Dr. Sue Bailey, the Administrator of NHTSA will testify on behalf of the Federal Government.

We welcome all of you to the hearing. Mr. Ono, if you will take the mike closer to you, people will be able to hear you. If you will, sir. It is not too sensitive. Mr. Ono, your written statement will be made a part of the record, and you can proceed as you wish. Welcome.

STATEMENT OF MASATOSHI ONO, CHAIRMAN AND CHIEF EXECUTIVE OFFICER, BRIDGESTONE/FIRESTONE, INC.

ACCOMPANIED BY:

GARY CRIGGER, EXECUTIVE VICE PRESIDENT, BUSINESS AND PLANNING, BRIDGESTONE/FIRESTONE, INC.

BOB WYANT, VICE PRESIDENT, QUALITY ASSURANCE, BRIDGESTONE/FIRESTONE, INC.

Mr. ONO. Chairman Shelby and members of the subcommittee, thank you for providing me with this opportunity to appear before you here today. I have my speech so that I may deliver in English. However, I must use a translator, and two of my senior executives will respond to your questions. I have never made a public appearance like this before, so I am more than a little bit nervous.

As the chief executive officer, I come before you to apologize to you and especially the American people, especially the families who have lost loved ones in these terrible roll-over accidents. Also, I come to accept full and personal responsibility on behalf of Bridgestone/Firestone for the events that led to this hearing.

Whenever people are hurt or fatally injured in automobile accidents it is tragic. Whenever people are injured while riding on Firestone tires, it is cause for great concern among Bridgestone/Firestone management and our 35,000 American employees.

On August 8 we met with the National Highway Traffic Safety Administration. We reviewed what we knew at that time about the performance of the tires which are associated with the tread separation and accidents primarily on the Ford Explorer vehicles. On the following day, August 9, Bridgestone/Firestone announced a voluntary safety recall of 6.5 million tires. Since that time, our highest priorities have been to complete the recall as quickly as possible and to determine the root cause of the tire failures.

At this time, we have replaced nearly 2 million of the tires. We have been maximizing worldwide production of replacements for tires that have been recalled. To speed up the process we are using our competitors' tires and airlifting additional replacement tires, and these shipments will continue as long as necessary.

We have a team working around the clock, using all our available resources to try and determine the root causes for the tire problem. We are reviewing every aspect of our manufacturing and quality control processes. This includes microscopic examination of many recalled tires.

In addition, we are working with Ford Motor Company and their experts to thoroughly examine every possible cause. Unfortunately, I am not able to give you a conclusive cause at this time. However, you have my word that we will continue until we find the cause.

While we search for the root cause we are also undertaking the following actions. First, we will appoint an outside, independent investigator to assist in tire analysis and determine the root cause of the tire problem we have experienced. We are taking this action to help assure you and the public that the Firestone tires are reliable now and in the future.

Second, we will fully cooperate with this committee about the safety as well as problems that have occurred with our tires. We will release data and information in order to assure consumer safety with our products.

Third, we are accelerating the roll-out of a Nation-wide consumer education program. The program will be run through more than 7,000 company stores and Firestone dealers. It will provide consumers with information on proper tire maintenance through the use of in-store videos, showroom displays, brochures, windshield tags, and tire pressure gauges.

Fourth, we pledge to continue working with the NHTSA towards developing early understanding and complete reporting of accidents, and developing approaches that make it easier for drivers to determine tire pressure.

With your permission, I would now like to ask two of my senior executives to join me so that we can more efficiently respond to your questions. Mr. Gary Crigger is executive vice president, business planning, and Mr. Bob Wyant, vice president of quality assurance.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF MASATOSHI ONO

Chairman Shelby and members of the subcommittee: as chief executive officer, I come before you to apologize to you, the American people and especially to the families who have lost loved ones in these terrible rollover accidents. I also come to accept full and personal responsibility on behalf of Bridgestone/Firestone for the events that led to this hearing. Whenever people are hurt or fatally injured in automobile accidents, it is tragic. Whenever people are injured while riding on Firestone tires, it is cause for great concern among Bridgestone/Firestone management and our 35,000 American employees.

On August 8, we met with the National Highway Traffic Safety Administration. We reviewed what we knew—at that time—about the performance of the tires which are associated with tread separations and accidents primarily on the Ford Explorer vehicle. On the following day, August 9, Bridgestone/Firestone announced a voluntary safety recall of 6.5 million tires.

Since that time, our highest priorities have been to complete the recall as quickly as possible and to determine the root cause of the tire failures.

At this time we have replaced nearly two million of the recalled tires. We have maximized worldwide production of replacements for tires that have been recalled. To speed up the process, we are using our competitors' tires and air lifting additional replacement tires and these shipments will continue as long as necessary.

We have a team working around the clock using all our available resources to try and determine the root causes for the tire problem. We are reviewing every aspect of our manufacturing and quality control processes. This includes microscopic examination of many recalled tires. In addition, we are working with Ford Motor Company and experts to thoroughly examine every possible cause.

Unfortunately, I am not able to give you a conclusive cause at this time. However, you have my word that we will continue until we find the cause.

While we search for the root cause, we are also undertaking the following actions:

First, we will appoint an outside independent investigator to assist in tire analysis and determine the root cause of the tire problem we have experienced. We are taking this action to help assure you and the public that Firestone tires are reliable now and in the future.

Second, we will fully cooperate with this committee about the safety as well as problems that have occurred with our tires. We will release data and information in order to assure consumer safety with our products.

Third, we are accelerating the rollout of a nationwide consumer education program. The program will be run through more than 7,000 company stores and Firestone dealers. It will provide consumers with information on proper tire maintenance through the use of in-store videos, showroom displays, brochures, windshield tags and tire pressure gauges.

Fourth, we pledge to continue working with NHTSA toward developing early understandings and complete reporting of accidents and developing approaches that make it easier for drivers to determine tire pressure.

In closing, this year Firestone is observing its 100th anniversary. It is a proud history. Henry Ford used Firestone tires on the original model-T. For 100 years, mil-

lions of families have placed their trust and faith in the good people of Firestone. We feel a heavy responsibility to make certain that we are worthy still of your continued trust and confidence.

With your permission, I would now like to ask two of my senior executives to join me so that we can more efficiently respond to your questions. Mr. Gary Crigger is executive vice president, business planning and Mr. Bob Wyant is vice president, quality assurance.

Thank you.

STATEMENT OF HELEN PETRAUSKU, VICE PRESIDENT, ENVIRONMENTAL AND SAFETY ENGINEERING, FORD MOTOR COMPANY

Senator SHELBY. Ms. Petrauskus, you are appearing on behalf of Ford, right?

Ms. PETRAUSKUS. Yes, I am.

Senator SHELBY. You may proceed.

Ms. PETRAUSKUS. Good morning, Mr. Chairman, members of the committee. Since we at Ford first found out about the problem of tread separation we have been guided by three principles. First, we will do whatever we can to guarantee our customer safety. We are committed not only to their physical safety but to their feelings of security when they are driving their vehicles. We, too, are deeply troubled by the fact that there are defective tires on some of our vehicles.

Second, we are working hard to replace bad tires with good tires, and that includes making sure we understand the scope of the problem and finding the specific cause of the problem, and then finally we will continue to be open about any data, statistics, information that we have, and we will share it with you as soon as we know it.

Mr. Chairman, you chastised me not to come in here and tell you that this is a tire issue, and I am not going to do that, but I do want to talk about the safety of the Explorer, and the first chart I have shows the Explorer safety record, and it is a safety record that is based on the best and the only Federal safety data base for serious accidents, or in this case fatalities. Literally every fatality that occurs on the Nation's highways is reflected on that data base, and I wish those fatalities could be zero, but they are not.

What I want to show you is for the 10-year history of the Explorer since it was first introduced it is safer in all accident types, compared to other sport utility vehicles, by a substantial amount, and what is most important in the issues we have been talking about today, it is safer from a roll-over standpoint by a substantial amount compared to other sport utility vehicles.

Jerry, if I could have the next slide just quickly.

So if we compare based on this best data base that our country has, the safety performance of the Explorer, and we find ourselves looking at it in kind of a cold-blooded way, the number of fatalities that take place per 100 million miles of driving, what we find is there are 1.6 fatalities per 100 million miles driven for the average passenger car, and we find for the average SUV that number is 1.3, and for the Explorer that number is 1.0, and we want to do everything we can to make it lower. It is a very safe vehicle.

Let me just add to that, that of the Explorers we produced we have millions, probably 2½, between 2½ and 3 million Goodyear tires installed on these Explorers over this period of time, and they have the same specification as the Firestone tire, including the

same specification for recommended tire pressure, and they have not experienced problems and, indeed, Explorers equipped with nonrecalled tires have not exhibited those problems.

Having said all that, the most important thing now is that we strongly support Firestone's decision to recall the 15-inch ATX and the Decatur, Illinois-built Wilderness AT tires. Based on the Firestone data that we have, we believe these are the problem tires, and in our written statement we have submitted a more detailed analysis.

In terms of customer focus, our top priority is to replace faulty tires as fast as possible. As of September 1 over 1½ million tires have been replaced.

We have worked with the entire tire industry, the worldwide tire industry, not just Bridgestone/Firestone but all the other tire producers around the world, to increase their production of 15-inch tires, and they will do so at the rate of about 250,000 tires a month by the end of this month, and we have suspended production at three of our assembly plants so that those trucks with new tires that were headed for our plants could head for our dealerships and bring tires to our customers faster. In this regard, we have engaged about 3,300 Ford and Lincoln Mercury dealers to participate in this.

Let me turn to the overseas action. When reports of tread separations in Saudi Arabia first came to our attention we asked Firestone to investigate. They concluded that the tire failures were due to external causes such as poor repairs, road hazard damage, and extreme operating conditions. Given the problems our customers were having, we, Ford, decided to replace the tires with a more puncture-resistant tire.

Another market in which we have experienced tire problems is Venezuela. Our ability to understand that situation is complicated by the fact that about three-quarters of the tires that we used in Venezuela were locally produced, as opposed to shipped from the United States. Again, Firestone concluded that the tread separations were caused by poor repairs, road hazard damage, and operating conditions. In May, we, Ford, began replacing all these Firestone tires.

Concern about the safety of all of our customers, including our U.S. customers, drove us to look aggressively for evidence of a defect in the United States at the very same time we were taking actions overseas. As early as April of last year, we were searching all of the available data files available to us, and by that I mean all of our own complaint records, all of our own warranty records as well as the Government records.

We asked Firestone to check all of their records, and we had new tires tested under three separate, very severe test conditions to try to cause the tread separation to happen, and then I think very importantly last fall we kicked off a tire evaluation program in Texas, Nevada, and Arizona.

In all of this we found no defect. Our first evidence of a defect came when NHTSA opened its investigation and required Firestone to assemble and provide data on property damage, personal injury, and lawsuits, and Ford insisted on obtaining that data as well.

When we received that data on July 27, we quickly analyzed it and identified the problem tires that were recalled on August 9.

The chart we have there shows you and summarizes our analysis, and what that analysis shows is, if we look at property damage claims, injury claims on a per-tire basis and adjust it for the volume of tires that are in use, we see very significant differences in the performance of the tires that were recalled as opposed to the ones that were not recalled.

In conclusion, our mission remains to replace bad tires with good tires as quickly as possible. The safety, the trust, the peace of mind of our customers is paramount to Ford Motor Company.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF HELEN PETRAUSKAS

Good morning, Mr. Chairman, members of the Committee. I am Helen Petruskas, Vice President of Environmental and Safety Engineering. I have been with Ford Motor Company for almost 30 years.

I am deeply troubled by the fact that there are defective tires on some of our vehicles. As you know, Firestone manufactured and warranted these tires. However, because so many of these tires were used as original equipment on Ford products, we have taken extraordinary steps to support this recall and ensure the safety of our customers. Ford Motor Company is absolutely committed to doing the right thing to protect our customers and to maintain their trust.

Throughout this period, we have been guided by three principles. First, we will do whatever we can to guarantee our customers' safety. We are committed not only to their physical safety, but also their feelings of security when driving our vehicles. Second, we are working hard to find and replace bad tires with good tires. That includes making sure that we understand the scope of the problem and finding the cause of the problem. Third, we will continue to be open about any data, statistics or information that we have, and will share anything new as soon as we know it.

ACTIONS WE HAVE TAKEN

Now, let's talk about the actions Ford has taken to support the recall and why we believe these are the right actions.

First, this is a tire issue, not a vehicle issue. We have millions of Goodyear tires on 1995 through 1997 Explorers—the same specification tire operating under the same conditions—and they haven't experienced these problems.

Furthermore, the Explorer is one of the safest SUVs on the road. Proof of this is our exemplary safety record over the last decade. The most recent data from the Department of Transportation show that the Explorer has a lower fatality rate than both the average passenger car and competitive SUV, as shown in Attachment 1. Additionally, Explorer's fatality rate in rollover accidents is 26 percent lower than other compact SUVs (Attachment 2).

Second, we strongly support Firestone's decision to recall 15 inch ATX and Decatur-built Wilderness AT tires. Based on the Firestone data we have, we've determined that these tires are problem tires. We have made a detailed analysis of the Firestone claims data (which is the only comprehensive data covering this matter). We have made our analysis available to our customers, to the public, to Firestone, to the media and to NHTSA. The chart in attachment 3 clearly shows the problem tires. As you can see, they are the Firestone ATX and ATXII tires, and the Decatur, Illinois-built Wilderness AT tires, all in the size P235/75 R15—the 15 inch size.

A more detailed explanation of our analysis of Firestone's claims data is included in our attachments. As you can see in Attachment 4, the P235/75R15 clearly had a significantly higher number of claims than other tire sizes, at 2,030 claims, compared to the next highest tire size, with 137 claims. The claims were broken out by complaint, as shown in attachments 5 and 6. Of the total 2,030 claims, 1,424 claims were related to tread separation.

We looked at the claims rate for the 15 inch ATX and Wilderness tires in the 1996 production year—the only year both products were produced in significant volumes. The ATX claims rate for tread separation was eleven times higher than the Wilderness claims rate (Attachment 7).

To better understand the population of bad Wilderness tires, we looked at the tread separation claims rate by plant and production year, as shown in Attachment

8. The Decatur, Illinois plant clearly showed a different pattern than other Firestone plants. For example, in the 1996 production year, the Decatur plant had a 66.3 claims rate (per million tires) compared with a 6.6 claims rate for other plants.

We looked at the data in even more detail, analyzing claims by time in service at claim date, tire production year, and plant. Again, the P235/75R15 ATX and Wilderness tires produced at the Decatur plant showed a clear defect trend (Attachments 9 through 11). And, we did look at both 15 inch and 16 inch tires for tread separation claims between 1995 and 1999 (Attachment 3). Again, the 15 inch ATX and Wilderness tires manufactured at Decatur showed significantly higher claims rates than other Firestone plants. As you can see from the chart, the claims rate for the Wilderness AT 16 inch tire has been extremely low—0 for Decatur and 2.3 at other plants.

This is how we isolated the bad tires. What we still don't know is why these tires fail. We are working hard on that.

CUSTOMER FOCUS

As I said, our top priority is to replace faulty tires as fast as possible. I'd like to highlight a few of the many things we have done to support Firestone's recall and speed replacement. As of September 1, 2000, about 1.5 million tires have been replaced—about 23 percent of the total population of affected tires. We worked with the tire industry to increase production of 15-inch tires by more than 250,000 tires per month by the end of September. We have suspended production at three assembly plants, adding approximately 70,000 tires to the replacement population. We have engaged 3,100 Ford and Lincoln-Mercury dealers to perform tire replacements.

We've also made a major effort to communicate information about the Firestone recall to our customers. For example, we have opened an additional call center to deal specifically with inquiries on the tire recall. We are using our website to provide detailed information on the recall action. And we are running national and local newspaper and television ads to alert customers to the recall and show them how to tell if their vehicles are affected.

OVERSEAS ACTIONS

I would also like to comment on our actions overseas. When reports of tread separation in Gulf Coast Countries came to our attention, we asked Firestone to investigate. They concluded that the tire failures were due to external causes, such as poor repairs, road hazard damage, and extreme operating conditions. Given the problems our customers were having, we decided to replace the tires with a more puncture resistant tire.

Another market where we have experienced tire problems is Venezuela. The situation in Venezuela is complicated by the fact that about three-quarters of the tires were locally produced. Again, Firestone concluded that the tread separations were caused by poor repairs, road hazard damage, and extreme operating conditions. In May, we began replacing all the Firestone tires on Ford Explorers and certain light trucks in Venezuela.

Concern about the safety of all of our customers, including our U.S. customers, drove us to look aggressively for evidence of a defect in the U.S. at the same time we were taking actions overseas. I share this with you, not to finger point at Firestone, but simply to tell you what we did. As early as April of 1999, we were searching all available data bases—our own and the government's. We asked Firestone to check its records. And we had new tires tested under three separate, severe test conditions to try to cause tread separation to happen. Last Fall, we kicked off a tire inspection test program in the Southwest of the U.S. No defect trend was found.

When NHTSA opened their investigation, and required Firestone to assemble and provide data on property damage, personal injury, and lawsuits, Ford insisted on obtaining the data as well. When we received the data late in July, we quickly analyzed it and identified the problem tires that were recalled August 9.

It has been standard practice in the automotive industry that tires are the only part of the vehicle not warranted by the vehicle manufacturer. They are the only part for which vehicle manufacturers do not receive field performance data.

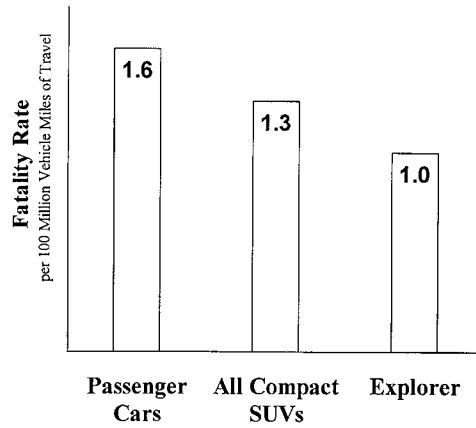

Through all this, we were always open and sought only to find the facts and do the right thing for our customers.

CONCLUSION

Our mission remains to replace bad tires with good tires as quickly as possible. The safety, trust and peace of mind of our consumers are paramount to Ford Motor Company.

**STATEMENT OF HON. SUE BAILEY, M.D., ADMINISTRATOR, NATIONAL
HIGHWAY TRAFFIC SAFETY ADMINISTRATION, DEPARTMENT OF
TRANSPORTATION**

Senator SHELBY. Dr. Bailey.

Dr. BAILEY. Mr. Chairman, members of the committee, I am pleased to appear before you this morning—

Senator SHELBY. Would you bring the mike towards you a little more?

Dr. BAILEY [continuing]. To address the investigation of Firestone ATX, ATX-2, and Wilderness tires. Secretary Slater refers to safety as the North Star of the Department of Transportation, and under his leadership we are committed to preventing deaths and injuries in motor vehicle crashes. Our program to investigate safety defects is the key part of that mission. I will give you a quick overview of the agency's authority to investigate safety defects and describe the procedures that the agency follows and outline the Firestone investigation.

First, our authority. Congress passed the basic motor vehicle safety law 34 years ago in 1966 and amended the law in 1974 to establish the current notification and remedy provisions. In brief, the law provides that if a manufacturer decides one of its products contains a defect that relates to safety, the manufacturer must notify the agency and owners to provide a remedy at no cost to the owners.

When the agency's screening process identifies a possible safety defect, the Office of Defects Investigation takes steps to open an investigation as a preliminary evaluation (PE). We inform the manufacturer and the public at this time.

If our review at the end of a PE suggests that further investigation is warranted, we move the investigation to a second stage.

That is the engineering analysis (EA) stage, and that is where we are at this point. In that phase we do appropriate test surveys and obtain additional information from the manufacturer. After the EA phase of the investigation, additional steps may ultimately be taken, which would lead the administrator to decide that a defect exists and order the manufacturer to recall. If necessary, we could go to court to enforce that action.

Our investigation of Firestone has reached the engineering analysis stage. Firestone originally began producing the tires under investigation in 1991 and by the end of 1999 approximately 47 million have been produced. It is important to see this in context, because by that time NHTSA had received 46 reports scattered over a 9-year period involving just these tires. The tires were on a variety of vehicles, primarily on Ford Explorers.

In view of the large number of tires that had been produced, a variety of possible causes of tire failure and the fact that all types of tires can and do fail in use, the reports that we received did not warrant opening a defect investigation regarding these tires at that time, again nearly a 10-year period, 46 complaints. Furthermore, the informal submission by State Farm in 1998 of 21 claims also was over a period of several years and included a population of 40-million plus tires, so that also did not trigger an investigation.

The situation changed rapidly following the airing of a news story at KHOU in Houston on February 7 that dramatized the question of tire safety. In addition to highlighting two fatalities, the story alluded to a number of other crashes and fatalities. Upon learning of the story, we contacted the station to obtain more details about the incidents. They have not given us at this time the information that we had requested, but the growing publicity generated other reports to us, including several provided by other media outlets and plaintiffs' attorneys.

Over the next few weeks we were able to verify many of the reports and opened a preliminary evaluation on May 2. At that time, the agency was aware of 90 complaints, including reports of 33 crashes and four fatalities.

Information accumulated rapidly as a result of the investigation and the attendant publicity. By August 1 we had 193 complaints alleging tread separations on these tires with 21 reported fatalities.

In a meeting of August 4 we suggested that Firestone consider recalling the tires. On August 9, Firestone announced that it would recall 14.4 million tires. As of August 31 we have 1,400 complaints with reports of 88 fatalities and 250 injuries.

NHTSA is continuing its investigation to determine whether additional tires need to be recalled. If we discover information that indicates a problem in any other tires we will move promptly to urge Firestone to expand its recall. We are closely monitoring the recall to ensure that Ford and Firestone promptly replace all defective tires.

Our review of data from Firestone has already disclosed that other tire models and sizes of tires under investigation have rates of tread separation as high or higher than the tires that Firestone is recalling. For that reason, on August 30 we recommended to Firestone that it expand its recall to include these additional tires. When Firestone declined to expand the recall, we issued a con-

sumer advisory on September 1 to advise owners of these tires and to take actions to assure their safety.

We now know that in September 1999 Ford asked Firestone to replace Wilderness tires mounted on Explorers that had been sold in the States around the Arabian Gulf, primarily Saudi Arabia. Similar actions were taken in the year 2000 in Venezuela, Colombia, Ecuador, Malaysia, and Thailand.

Ford would have been required to notify NHTSA of such an action if it had occurred in the United States, but our regulations do not apply to actions taken outside the United States. Ford thus had no obligation to advise NHTSA when it took these actions. If we find that we need additional legislative authority to require manufacturers to provide such information we will seek to obtain it.

A number of claims and several lawsuits have been filed against Ford and Firestone before we became aware of any trend that would indicate a potential defect. Our current regulations do not require the manufacturers to give us information about claims or litigation, and we are also exploring, therefore, measures that will allow us to track claims and litigation information routinely.

Mr. Chairman, I want to assure you this investigation is the highest priority at NHTSA. We will remain focused on the investigation and closely monitor the current recall campaign. We will also seek any expansion of the campaign that may be necessary. I want to conclude by expressing my thanks for your holding this hearing, and I will be willing to answer any questions.

[The statement follows:]

PREPARED STATEMENT OF SUE BAILEY

Mr. Chairman and Members of the Committee: I am pleased to appear before you this morning to address the investigation and recall of Firestone ATX, ATX II and Wilderness AT tires. This is the first subject on which I have appeared before Congress as Administrator of the National Highway Traffic Safety Administration (NHTSA), and I welcome the opportunity to address this important issue.

The agency's mission is to prevent deaths and injuries in motor vehicle crashes. Our program to investigate safety defects is a key part of that mission. I will give you a quick overview of the agency's authority to investigate safety defects, describe the procedures that the agency follows in its investigations, outline the Firestone investigation in that context, and share with you some of my observations about the investigative process.

OVERVIEW

First, our authority: Congress passed the basic motor vehicle safety law 34 years ago, in 1966, and amended the law in 1974 to establish the current notification and remedy provisions. In brief, the law provides that if a manufacturer decides that one of its products contains a defect that relates to motor vehicle safety, the manufacturer must notify the agency and owners and provide a remedy at no cost to the owners. When the defect is in a tire sold as original equipment on a new vehicle, the tire manufacturer is the responsible manufacturer, as opposed to the vehicle manufacturer, and the remedy may either be to repair or replace the tire.

The law gives us authority to investigate possible defects, to decide whether a defect exists, and to order a manufacturer to provide a remedy for any defect. If a manufacturer refuses to provide a remedy, the law authorizes us to go to court to compel it to do so. This is seldom necessary. In all but very rare cases, manufacturers agree to remedy the defect without our having to reach a final decision. In a typical year, we open between 80 and 100 defect investigations, of which more than half result in recalls. In addition, manufacturers conduct an average of 200 defect recalls each year that are not influenced by NHTSA investigations.

INVESTIGATIVE PROCEDURES

We receive complaints from a wide variety of sources about possible defects in motor vehicles and motor vehicle equipment. The sources include our toll-free consumer hotline, our web page, e-mail, phone calls, and letters. We enter all complaints into a database which is continuously screened by a team of five investigators in the agency's Office of Defects Investigation (ODI) to identify potential defect trends. In an average year, we receive between 40,000 and 50,000 complaints from these sources.

When the screening process identifies a potential problem, ODI takes steps to open an investigation as a "Preliminary Evaluation" (PE). We inform the manufacturer and the public at this time, and begin the process of gathering information from the manufacturer and other appropriate sources. We give the manufacturer an opportunity to present its views. Preliminary Evaluations are generally resolved within four months from the date of their opening. They may be closed if we determine that further information is not warranted, or if the manufacturer decides to conduct a recall.

If our review of information at the end of a PE suggests that further investigation is warranted, we move the investigation to a second stage, the Engineering Analysis (EA), in which we conduct a more detailed and complete analysis of the character and scope of the alleged defect. The EA supplements the information collected during the preliminary evaluation with appropriate inspections, tests, surveys, and additional information from the manufacturer. ODI attempts to resolve all EAs within one year from the date they are opened.

At the conclusion of the EA, we may close an investigation because the additional information does not support a finding that a defect exists or because the manufacturer decides to conduct a recall. If ODI continues to believe that the data indicate a defect, the Associate Administrator for Safety Assurance may convene a panel of experts from the agency to review the information. The manufacturer is notified that a panel is being convened and of the panel's result, and is given an opportunity to present new analysis or new data.

If the panel concurs with ODI, the next step is to send a "recall request letter" to the manufacturer. If the manufacturer declines to conduct a recall in response to this letter, the Associate Administrator may issue an "Initial Decision" that a safety-related defect exists. An Initial Decision is followed by a public meeting, at which the manufacturer and interested members of the public can present information and arguments on the issue, as well as written materials. The entire investigative record is then presented to the NHTSA Administrator, who may issue a "Final Decision" that a safety defect exists and order the manufacturer to conduct a recall. If necessary, the agency will then go to court to enforce such an order.

THE FIRESTONE ATX/WILDERNESS RECALL

With this description of our investigative procedures as context, I will turn now to the Firestone investigation.

Firestone originally began producing the tires under investigation in 1991. By the end of 1999, approximately 47 million had been produced. By that time, NHTSA had received 46 reports scattered over 9 years about incidents involving these tires. The tires were on a variety of vehicles, primarily on Ford Explorer sport utility vehicles. In view of the large number of tires that had been produced, the variety of possible causes of tire failure (road hazards, excessive wear, etc.), and the fact that all types of tires can fail in use, the reports that we received did not indicate a problem that would warrant opening a defect investigation regarding these tires. The informal submission by State Farm in 1998 of 21 claims over an eight-year period also did not provide such an indication.

The situation changed rapidly following the airing of a news story by KHOU in Houston on February 7, 2000, that dramatized the question of the tires' safety. In addition to highlighting two fatalities, the KHOU story alluded to a number of other crashes and fatalities.

Upon learning of the KHOU story, we contacted the station to obtain more details about the incidents. They have not given us the information we requested, but the growing publicity generated other reports to us, including several provided by other media outlets and by plaintiffs' attorneys. Over the next few weeks, we were able to verify many of these reports. We opened a Preliminary Evaluation on May 2. At that time, the agency was aware of 90 complaints, including reports of 33 crashes, and 4 fatalities. On May 8 and 10, we sent Ford and Firestone extensive Information Requests asking for information about the tires. At that point NHTSA began a constant communication with both companies, which continues today.

Information accumulated rapidly as a result of the investigation and attendant publicity. By August 1, we had 193 complaints alleging tread separations on these tires, with 21 reported fatalities. In a meeting on August 4, we suggested that Firestone consider recalling the tires. By August 9, when Firestone announced that it was recalling the ATX and ATX II tires, and Wilderness AT tires produced at its Decatur, Illinois, plant, we had over 300 complaints, with 46 reported fatalities. The number has continued to grow. As of August 31, we have 1,400 complaints with reports of 88 fatalities and 250 injuries.

Firestone has recalled all of the ATX and ATX II tires of the P235/75R15 size manufactured since 1991. It has also recalled Wilderness AT tires of that size made at its Decatur, Illinois, plant, for a total of 14.4 million tires out of the 47 million tires covered by our investigation. Firestone estimates that approximately 6.5 million of the 14.4 million tires included in the recall are still on the road. Ford and Firestone are taking a number of measures to provide replacement tires.

NHTSA is continuing its investigation to ensure that the scope of the recall is proper and that all unsafe tires are recalled. At our request, Firestone and Ford have given us voluminous information about the tires, and we have sent follow-up requests for additional information to both companies and to Goodyear Tire and Rubber Company, for a peer comparison. We are continuing to monitor the recall to ensure that all defective tires are replaced promptly.

Our review of data from Firestone has already disclosed that other tire models and sizes of the tires under investigation have rates of tread separation as high or higher than the tires that Firestone is recalling. On August 30, we recommended to Firestone that it expand its recall to include these tires. When Firestone declined to expand the recall, we issued a consumer advisory on September 1 to advise owners of these tires to take actions to assure their safety.

OBSERVATIONS

We now know that in September 1999 Ford conducted a campaign (referred to by Ford as an "Owner Notification Program") to replace Wilderness tires mounted on Ford Explorers that had been sold in the states around the Arabian Gulf (primarily Saudi Arabia). Similar actions were taken in Venezuela in May 2000 and in Columbia, Ecuador, Malaysia, and Thailand. Ford would have been required to notify NHTSA of such an owner notification program if it had occurred in the United States, but our regulations do not apply to actions taken outside the United States. Ford thus had no obligation to advise NHTSA when it took these actions. If we find that we need additional legislative authority to require manufacturers to provide such information, we will seek to obtain it.

A number of claims, and several lawsuits, had been filed against Ford and Firestone before we became aware of any trend that would indicate a potential defect. We received no information about those events from the companies or from the plaintiffs' attorneys. Our current regulations do not require the manufacturers to give us information about claims or litigation. The existing law gives us broad authority to seek information from vehicle and equipment manufacturers during the course of an investigation. We are exploring measures that would allow us to track claims and litigation information routinely.

Mr. Chairman, I want to assure you that this investigation is the highest priority in NHTSA. We will remain focused on the investigation, closely monitor the current recall campaign, and seek any expansion of the campaign that may be necessary.

Mr. Chairman, I want to conclude by expressing my thanks to you for holding this hearing. I will be glad to answer any questions you may have.

WAS BRIDGESTONE/FIRESTONE AWARE OF DEFECTS?

Senator SHELBY. Mr. Crigger, do you want to join Mr. Ono, and is there someone else you want to bring up?

I would pose this question to Bridgestone/Firestone. You settled several lawsuits involving Firestone tires, the ones we have been talking about, as early as 1996. Did that not make you aware that there were issues with the tires, problems with the tires and if not, why not? And did that cause you in any way to review the failure rate of the tires, the design, or the manufacturer of the tires?

Mr. CRIGGER. Senator, those individual cases, those individual lawsuits were all individually investigated by our tire engineers doing forensic analysis on the tire, and in those cases we found in

the preponderance of outcomes that the tires were failed because of punctures, improper repairs, overloads, or other kinds of outside influences. As you know, the tire operates on the road all the time and is subject to all of that kind of impact and other trauma, so nothing we learned there led us to believe there was a defect of any kind with the tire.

Senator SHELBY. Did you not have reason to believe that the Firestone tire problems that we have been talking about could have been a defect in the manufacture?

Mr. CRIGGER. Sir, I am not saying there is never a defect in the manufacture. I am not saying that at all. I am saying that in the individual cases that were reviewed one by one as they came to us, or became apparent, that is not what we found. I wish there had been some indication from that, that we could have done something that would have been different from where we are today.

Senator SHELBY. What does it take to put someone, a company like Bridgestone/Firestone or any other big company on notice that perhaps they have got a defective product out there? You have got lawsuits, you have got people killed, injured and so forth, not one, not two, but a lot of them. You settled those lawsuits, or most of them, and you put a gag order on them. It is a sealed settlement with a gag order. Does that not tell you something, that something is probably wrong with your product? What does it take?

Mr. CRIGGER. Sir, my understanding is that the confidentiality orders applied only to trade secret and formulations and these kinds of matters and, of course, the judge had to agree that those were trade secrets, or industry trade secrets. In reviewing the cases, there was nothing to indicate that there was a tire defect.

We understood that we have millions of these tires on the road, over 40 million of this particular Wilderness type, ATX type tire, and individual cases do occur and, as tragic as they are and, believe me, each one affects the members of the Firestone family dealer—

Senator SHELBY. But Mr. Crigger, this is not just a random situation. This is a pattern, is it not, tied to this particular tire and tied to this vehicle, and so forth, not one, not two, but dozens or hundreds.

Mr. CRIGGER. Sir, that pattern only became apparent this year, when we were looking particularly in the July and August time period doing the analysis, some of which has been referred to here by Ford. We were doing that joint analysis with them on data that would not normally have been used to evaluate tire performance.

PROVIDING DOCUMENTS TO NHTSA

Senator SHELBY. Has there been a request by NHTSA for all your internal documents related to the problems with this tire?

Mr. CRIGGER. Yes. We have complied with NHTSA's request for such documents.

Senator SHELBY. When was this?

Mr. CRIGGER. During the preliminary evaluation.

Senator SHELBY. But that has not been made public in any way. This is just between you and the governmental agency, is that right, Dr. Bailey?

Dr. BAILEY. At this time, right.

Senator SHELBY. Have you received all of those documents?

Dr. BAILEY. Yes. They have been forthcoming. We have received virtually all of the documents.

Senator SHELBY. Have those documents been evaluated?

Dr. BAILEY. That is part of the evaluation that is ongoing.

Senator SHELBY. So there has not been yet.

Dr. BAILEY. Many of them have been. That is why we have information that encouraged us to do the advisory to the consumers.

Senator SHELBY. Dr. Bailey have you also requested from Ford documents and memos dealing with this issue?

Dr. BAILEY. Absolutely.

Senator SHELBY. Have they complied?

Dr. BAILEY. They have complied as well.

Senator SHELBY. And is this investigation going on now to evaluate these documents?

Dr. BAILEY. Yes. The evaluation is going on. We are in the engineering analysis phase of the evaluation, so there is additional work that we continue to evaluate the data.

Senator SHELBY. Dr. Bailey, does it concern you in your capacity as head of NHTSA that Bridgestone/Firestone and Ford, I believe, concealed a lot of this information rather than tell the public?

Dr. BAILEY. The manufacturer has a responsibility, once they detect a defect, to notify us. We will also be looking at the timing of that notification and other aspects of the case that are undergoing investigation now, so yes, of course it is a concern.

FIRESTONE TIRES ON FORD VEHICLES IN SAUDI ARABIA

Senator SHELBY. I think it was in the paper today, one of the papers if not all of them, about the Ford internal memo—I am sure you are familiar with that—that said Ford Legal has some major reservations about the plan to notify customers in the Middle East. Now, on your own volition, did someone at Ford notify NHTSA regarding this problem that they had?

Ms. PETRAUSKUS. We did not.

Senator SHELBY. Yes or no?

Ms. PETRAUSKUS. No, we did not notify NHTSA at the time. We sent letters to our dealers announcing that we would replace the Firestone tires our customers had with Goodyear tires. Our decision—and I might add, if I may, Mr. Chairman, by coincidence the day before, the day before the memorandum you referred to we received a letter from Bridgestone/Firestone telling us that in their view there was nothing defective about the tires we had in the Mideast, nothing defective, and that the U.S. performance of those tires was very good.

The reason they had sent us the letter is because we asked for it. We wanted, as we were taking the action in the Middle East we wanted to be sure that there was no application of this issue to the United States, so we looked at our own information, we looked at the Government's information, and we asked Firestone for their information. Ultimately, what we decided to do, because Firestone declined to cover these tires under their warranty, and I am talking about the Middle East now, for the very reasons that Mr. Crigger has mentioned, we had unhappy customers. We went to Goodyear and used their tires.

Mr. CRIGGER. I would just like to add that we had a joint survey of the tires in question in Saudi Arabia with Ford, and the investigation of those tires showed that the majority of them had been run underinflated. I believe Ms. Petrauskus has talked about that anecdotally as well. There were instances of them being deflated, run in the sand, and there were punctures. There was nothing for us to believe the tire itself was defective.

TIRE MANUFACTURING DIFFERENCES

Senator SHELBY. Let me ask you this, Mr. Crigger. Are your tires, these two tires we are talking about, are they designed and manufactured differently, drastically or in some ways differently, say, from Michelin or Goodyear or any of the other tires manufactured? In other words, is that a different engineering process, or is the tire manufactured the same?

Mr. CRIGGER. That would be a question that would be better for me if I could have our quality assurance person—

Senator SHELBY. Is the manufacturing of the Firestone tires that are in question here basically different from the manufacturer of similar tires by other companies, and if so, how, and why?

Mr. WYANT. There would be certain generic relationships between the manufacturer of the tire, such as the molding process and parts of the tire assembly process, but within the tire industry there are many, many trade secrets.

Senator SHELBY. I understand that. I am talking about the basic manufacturing, though.

Mr. WYANT. Basic, basic would be very similar, of course.

Dr. BAILEY. Mr. Chairman, could I just add that NHTSA does what we call a peer analysis, and we have requested information from Goodyear, for instance, so that we can look at the comparables that I think you are discussing.

Senator SHELBY. Mr. Crigger, when the number of claims of a product is out of line in your tire or other products you make at Bridgestone/Firestone, does that alert you that something is wrong? Let us say you are making these tires, and you make other tires, and I am sure you do, and you are having complaints with, say, two product lines, a lot more as compared to seven others, does that not alert you that something is wrong there?

Mr. CRIGGER. Mr. Chairman, unfortunately here in hindsight I wish it did, and we now are indeed looking at claims, and some of these other factors in the evaluation of tire performance, but prior to this case tires were evaluated in performance based on testing that was done prior to their release, and on a continuing basis based on adjustment data, which is warranty claims data that is reviewed on the basis of customer comebacks and field research, looking at tires that are coming back from the field, and none of those indicators pointed to any kind of a problem with the tire line we are talking about here.

After we did additional work, indeed, in conjunction with the preliminary evaluation and pulled in information that would not normally be part of tire performance evaluation, because claims and lawsuits are not considered to be representative throughout a line, they are considered to be individual cases that occur for a variety of reasons, so they have never been part of performance evaluation.

As I said earlier, I wish they had here, because that is a part of the analysis that turned us into looking at this particular problem and taking the action that we did.

Senator SHELBY. Senator Lautenberg.

Senator LAUTENBERG. Thanks, Mr. Chairman.

SUV'S AND OTHER PASSENGER CARS RELATIVE SAFETY

Ms. Petrauskus, in your comparison of fatality rates, the chart that had passenger cars and Explorers, the Explorer fatality rate was on the same measure significantly lower than passenger cars. I wonder if you have got any information, any data that tells you how many people died in cars as a result of collisions with SUV's.

Ms. PETRAUSKUS. That data are available, because one of the things that NHTSA does in the way they maintain the data—and I do not happen to have it with me, but it provides detail both on multiple collisions and has pretty good information in terms of the various sizes of vehicles involved.

Senator LAUTENBERG. Well, we are going to get to the principal tire question, but one of the things that is raised about the Explorer is the fact that the bumper heights and other factors, weight, et cetera, are less likely to produce a fatality in a collision with a passenger car than you would normally get between two passenger cars.

Ms. PETRAUSKUS. Senator, I think the issue you raise is, while not related to the subject of this hearing is an important one, and that is the whole question of compatibility and how—what is it that we can do, while still giving customers a choice of vehicles, to help assure, when different kinds of vehicles strike one another, when vehicles weighing different weights—what can we do to improve or reduce the risk to people in both vehicles involved in the accident.

Senator LAUTENBERG. Well, it also could relate to tire problems if there is a separation and a crash occurs between a passenger car and an SUV that has been rendered somewhat disabled by the loss of the tire tread, so if you could help us, if that information is available—Dr. Bailey, does NHTSA have that?

Dr. BAILEY. I would take that for the record and provide you that information.

[The information follows:]

NHTSA does not have complete information on the outcome of crashes between passenger vehicles and SUV's where the SUV was disabled by the loss of tire tread. The following the information from the Fatality Analysis Reporting System lists the number of occupant fatalities in two-vehicle crashes by vehicle type.

OCCUPANTS FATALITIES IN TWO-VEHICLE CRASHES

[FARS 1995–1999]

| YEAR | OCCUPANTS VEHICLE TYPE | KILLED | OCCUPANTS VEHICLE TYPE | KILLED | TOTAL |
|------|------------------------|--------|------------------------|--------|-------|
| 1995 | PASSENGER CAR | | PASSENGER CAR | | 4,277 |
| 1995 | UTILITY VEHICLES | | UTILITY VEHICLES | | 29 |
| 1995 | PASSENGER CAR | 762 | UTILITY VEHICLES | 193 | 955 |
| 1996 | PASSENGER CAR | | PASSENGER CAR | | 4,209 |
| 1996 | UTILITY VEHICLES | | UTILITY VEHICLES | | 29 |
| 1996 | PASSENGER CAR | 892 | UTILITY VEHICLES | 241 | 1,133 |

OCCUPANTS FATALITIES IN TWO-VEHICLE CRASHES—Continued

[FARS 1995–1999]

| YEAR | OCCUPANTS VEHICLE TYPE | KILLED | OCCUPANTS VEHICLE TYPE | KILLED | TOTAL |
|------|------------------------|--------|------------------------|--------|-------|
| 1997 | PASSENGER CAR | | PASSENGER CAR | | 4,146 |
| 1997 | UTILITY VEHICLES | | UTILITY VEHICLES | | 39 |
| 1997 | PASSENGER CAR | 966 | UTILITY VEHICLES | 246 | 1,212 |
| 1998 | PASSENGER CAR | | PASSENGER CAR | | 3,800 |
| 1998 | UTILITY VEHICLES | | UTILITY VEHICLES | | 47 |
| 1998 | PASSENGER CAR | 1,049 | UTILITY VEHICLES | 254 | 1,303 |
| 1999 | PASSENGER CAR | | PASSENGER CAR | | 3,585 |
| 1999 | UTILITY VEHICLES | | UTILITY VEHICLES | | 68 |
| 1999 | PASSENGER CAR | 1,025 | UTILITY VEHICLES | 275 | 1,300 |

Senator LAUTENBERG. Thank you.

CAR MANUFACTURER'S SAFETY RESPONSIBILITY

Dr. Bailey, you said in your statement whether it is just reporting a fact or whether it was an editorial comment, the fact is that the automobile manufacturer is not responsible for tire problems, the car manufacturer. Am I correct, the fact that that is in your testimony?

Dr. BAILEY. Yes, sir, that is correct.

Senator LAUTENBERG. Now, what do you think about that? Are you simply stating a fact, or is that an opinion of NHTSA's and yours?

Dr. BAILEY. It is a fact that at the time there was no obligation to report that. That is something we are looking at today.

Senator LAUTENBERG. Well, it goes deeper than reporting. It says, when the defect is in the tire sold as original equipment in a vehicle, a new manufacturer, the tire manufacturer is responsible as opposed to a vehicle manufacturer, and thusly the remedy may be either to repair or replace the tire.

But that absolves the automobile manufacturer of selling a product that they may have information about that represents a danger, and I wonder whether, in your judgment, that is a good way to do it, or is there something in overriding law that says, listen, you cannot—even if you are not responsible for wear and tear on the product, which is often the disclaimer when tires are sold, you know, normal wear and tear, et cetera. But when a product is sold that is known to be dangerous, I wonder if that does not change the condition of the manufacturer's responsibility.

Dr. BAILEY. Senator, are you referring to the overseas information or to their responsibility to notify NHTSA of a defect?

Senator LAUTENBERG. Well, there are two parts of this. One is to notify NHTSA, the other is to clearly notify the public and protect the public, and I am looking for what it is we can do. We will get to NHTSA's responsibility, but what can we do to protect the public?

Dr. BAILEY. Well, again I want to clarify that if a defect is known by a manufacturer, they have 5 days in which to notify NHTSA.

Senator LAUTENBERG. Maybe we will have to ask Ms. Petrauskus.

Ms. PETRAUSKUS. Just using our experience in Saudi Arabia as an example, at the time we took the action to replace the Firestone tire with Goodyear tires we did not believe there was any defect in the Firestone tires, but let me just say we did not want those tires—the reason we did it was, we had unhappy customers, so putting aside our legal obligation to our customers under some warranty, we felt we needed to give them different tires because they were unhappy with the ones they had and, again, we took the action, even though we believed and saw with our own eyes the same things that Mr. Crigger reported.
