Senator LAUTENBERG. I want to get to a more generic review, and that is, does the Ford Motor Company feel no obligation if it is selling the car even though it does not—and correct me if I am wrong, by the way, about what the representation is about the tires. Does the Ford Company remain removed from any responsibility for what happens to the tires?

Ms. PETRAUSKUS. Absolutely not. A customer comes in and buys a Ford vehicle, a Ford-branded vehicle, it expects that vehicle to have tires, and he chose our vehicle, so I really feel we have a responsibility for the overall performance of the vehicle, even though if you go into your glove box and you pull out the warranty manuals you will find one warranty manual from the car manufacturer and one warranty manual for the tire manufacturer, and there are long historical reasons for that, but our whole approach in this arena has been that at the end of the day we have to be responsible and responsive to our customers, and that is why we took the actions we did overseas.

We had unhappy customers. We were going to take care of them, and we were not going to spend a lot of time worrying about who had warranty responsibility.

Senator LAUTENBERG. I think it goes beyond that, and this question gets resolved at some later date, and that is, what is the responsibility? I normally ask Senator Specter. He is pretty much our resident expert on the law, but is there not a responsibility, when a product is sold, regardless of who manufactures the various parts, to represent, or to take the responsibility for the safety of the product?

Senator SPECTER. The answer, Senator Lautenberg, is in fact yes, there are express warranties which arise here and the documents refer to them. They are implied warranties of merchantability and fitness for purpose. Under the Uniform Commercial Code they are obligated under the laws of warranties to provide products of merchantable quality, which these were not fit for the purpose.

Dr. BAILEY. Senator, can I add there is a statute in effect here. Tires are treated differently than other components of vehicles. All the other components of a vehicle are the responsibility of the automobile manufacturer, but the tires are treated separately under that statute, and that is the responsibility of the tire manufacturer.

Senator LAUTENBERG. We cannot get away from the answer that Senator Specter just gave us. The fact is that they can define it as you would like, but you cannot sell a product that may be faulty without—and disown the responsibility that you inherit when you sell the product. That is pretty clear, and I think that probably in a court of law that would be the case.

Thanks, Mr. Chairman.
 Senator SHELBY. Senator Specter.
 Senator SPECTER. Thank you, Mr. Chairman.

OBLIGATION TO EVALUATE ACCIDENT DATA

It may be harsh, but candidly the testimony of the Firestone and Ford witnesses here today strains credulity. It is very difficult, really impossible to accept statements with all of the incidents which had occurred that Firestone and Ford did not know that there was a substantial defect, design defect in the manufacture in the face of the chronology and the numerous reports about tread separation.

When you parse and dissect the testimony which is presented here, you have Mr. Crigger testifying that finally there was an analysis on data not ordinarily used. Well, in 5 minutes I cannot question you, Mr. Crigger, on data which is not ordinarily used, but it would seem to me that in the face of what you have here, that every effort would have been made for every conceivable kind of analysis to have been made as opposed to somewhere in the long process you come to, quote, "an analysis on data not ordinarily used", and then you testified that in the majority of the situations they were underinflated.

Well, that does not tell us very much. How about the rest of the cases? The majority leaves a great many other situations, so it is not helpful to attribute underinflation if there are many incidents where underinflation was not a factor.

And Mr. Crigger, you testified that lawsuits are not a part of performance evaluation. That testimony candidly to me is shocking. When you have a lawsuit and you have a defective tire, as a matter of defense, these tires are submitted to your forensic experts to prepare for the litigation where you are being sued, and to ignore those instances is candidly incredible. As you testified, lawsuits are not a part of performance evaluation.

Mr. CRIGGER. Could I address that point, sir?

Senator SPECTER. You may.

Mr. CRIGGER. I think you may have misinterpreted. I was talking about performance evaluation of the line. It is clearly an investigation of the performance evaluation of the tire involved in that lawsuit, absolutely.

Senator SPECTER. Well, Mr. Crigger, did I misquote you? I wrote down, quote, "lawsuits are not a part of performance evaluation", close quote. Did I misquote you?

Mr. CRIGGER. No, sir, but the context was meant to be talking about the evaluation of the entire line of tires, like the 40 million tires that were made.

Senator SPECTER. Well, let us take it your way, the entire line of tires. Why not utilize that kind of information in evaluating the entire line of tires? After all, what we are looking for here is what is happening with all the rest of the tires. Do these defects which come up in a lawsuit not put you on alert that you have got a problem here which may exist in some other tire?

Mr. CRIGGER. Yes, sir. We said in hindsight we wish we were looking at lawsuits and all of these other things in conjunction with—

Senator SPECTER. We are not concerned about hindsight. Why did you not look at it at the time you had this tangible evidence of the problem?

Mr. CRIGGER. Normally it is the tangible evidence of indeed a problem, and the point of the lawsuit is to discover what was that problem, and as I indicated, it did not indicate a defect in the tire. The lawsuits, or many—I do not have the specific number for you now—indicated that there were improper repairs that were at fault, there were punctures at fault—

Senator SPECTER. Well, you can attribute a number of factors to a number of cases, but you had such an overwhelming number of reports on tread separation.

Well, let me move on here to Ford. Ms. Petrauskus, you testified that it was only on July 27, when you got the data as to what had been turned over to NHTSA, that Ford began to understand the nature of the problem, the design defect on tread separation.

Well, how about all of these other indicators? Didn't Ford have an obligation to make an independent evaluation, look here, as between Firestone and Ford the litigation may never end, and my legal judgment is that Ford is responsible for that total vehicle?

You may have a very good claim over against Firestone so that they will be obligated to indemnify you if there is anything left of Firestone, but with all the indicators that Ford had, why didn't Ford make an independent evaluation here very early in the process, instead of coming here today and saying, we did not know what happened until Firestone turned the materials over to NHTSA?

Ms. PETRAUSKUS. Senator, I believe we did have an obligation to make an independent inquiry, and I believe we can demonstrate that we made that independent inquiry. We looked at every single data base that was available to us, beginning in 1999, and we looked at NHTSA's data, we looked at our lawsuits that we were aware of, we looked at our claims data, we looked at our owner reports, and we looked at our warranty reports, and none of those, none of those, sir, showed the kind of dramatic difference in claims performance that we saw with regard to the Firestone data.

Throughout this period, sir, we asked Firestone to review their U.S. data base. The data base we saw on July 28 we had never seen before, and traditionally in the tire industry has been kept proprietary.

REQUEST FOR INTERNAL DEFECT DOCUMENTATION

Senator SPECTER. Well, my red light is on and I will not use too much more time, Mr. Chairman, but I would start with asking Ford and Firestone officials if you would be willing to make available to this subcommittee all, every last one of the documents which relate to the kinds of defects which you saw around the world.

Ms. PETRAUSKUS. Just to make sure I understand, we have provided all claims, all complaints, all warranty data to NHTSA. We have provided that data without asking for any confidential treatment for it. Is that the data you wish to have, sir?

Senator SHELBY. I think his question is, would you provide all information.

Senator SPECTER. We are going to have to go through these documents with a fine tooth comb to see what has been done here, and the problems about concealed documents are legendary in this kind of a situation.

Mr. Chairman, I asked a question on a voluntary basis, but it seems to me this subcommittee really would be best advised to issue subpoenas here, because when subpoenas are issued there is a legal obligation to produce and failure to do so constitutes obstruction of justice. If it is just voluntary it does not happen. But this is the kind of a chronology which just strains credulity. That is the nicest way I know of how to put it.

Mr. Chairman, I would like to ask Dr. Bailey just one or two questions, if I may.

Senator SHELBY. Go ahead.

NHTSA REQUESTS ADDITIONAL MOTOR SAFETY AUTHORITY

Senator SPECTER. Dr. Bailey, we heard Ms. Claybrook testify about your need for much more authority and ways to impose fines and to get documents on a daily basis. Would you take a look at what Ms. Claybrook has testified to and inform this subcommittee as soon as you can what you would like to have to have more teeth in your operation?

Dr. BAILEY. In fact, those are all on the record with Congress today. Those are four of the issues we would like to see come into law. That is, to increase our ability for penalties, compliance, and extend the recall years.

Senator SPECTER. You have already made recommendations on everything you would like?

Dr. BAILEY. Yes, sir, we have, in March.

Senator SHELBY. Would you reiterate that list for the record?

Dr. BAILEY. On March 24 NHTSA sent Congress legislation to amend the motor vehicle safety statutes. To date, no one has introduced legislation, but conversations are ongoing. It is possible we may have to address it as introduced by a request, because we feel they are very essential, particularly to the discussion we are having here today and to this investigation.

One is the modification of civil penalties as to increased penalties, which you heard at this point are at a rate at—\$925,000 is the max. We want to go up to at least \$4 million.

We want to improve our recall compliance. That means taxi companies, fleets would have to comply.

We would want to extend the recall limits up to 10 years.

And finally strengthen the compliance testing. You heard that we asked for certification for compliance, but we now want testing prior to that certification, to self-certification on the part of the manufacturers. Those are the four main points.

Senator SPECTER. Dr. Bailey, would you like to see the testimony which was reported this morning by our first panel, by Ms. Claybrook and also by Mr. Pittle, which would authorize Federal prosecutions for willful failure to inform the public, reckless disregard for the safety, such as has arisen in situations like this?

Dr. BAILEY. That is a legal question that I think I would like to take for the record, but I think clearly we would like to see information in the public domain, and particularly available to the Gov-

ernment, that would allow us to know when to do an investigation that could protect the American public.

Senator SPECTER. Well, that is a legal question, but you are the Administrator of the National Highway Traffic Safety Administration. I would like you to give some thought to it and to give the subcommittee an answer.

Dr. BAILEY. I will provide you that.

[The information follows:]

As Secretary Slater has stated, for egregious circumstances the Department of Transportation supports criminal penalty authority, appropriately placed in the motor vehicle safety statute, for those who knowingly and willfully violate the law.

Senator SHELBY. Senator Mikulski.

Senator MIKULSKI. Thank you very much, Mr. Chairman. I would just like to say to my colleagues what a wonderful, robust hearing, and the way we are working on a bipartisan basis is really what the American people expect of us, and I look forward to doing more like this.

Mr. Ono, let me first of all welcome you to the committee, and number one I would like to express my respect to you for being here. I would also like to express my appreciation for your very earnest effort to speak in English and to communicate to the committee. It is appreciated, and also the respect that you, yourself showed to the committee by even being willing to appear.

CORPORATE RESPONSIBILITY TO PUBLIC SAFETY

I have no doubt, sir, that your apology is sincere, yet however I think you would acknowledge that this is a very disturbing timetable and situation that we are finding. My questions to the Bridgestone/Firestone team that you brought, first of all I must say, in keeping with the testimony of the committee and the line of questioning by Senator Specter, the fact that you did not meet with NHTSA until August 8, and did not issue a recall until August 9, after years of problems internationally really do bother me.

I do not know about the legal definitions of failure to inform and failure to alert, but I know that there is an obligation of every human being to help one another if they see a sign of distress.

If I walked into a hotel room and found a prescription drug that somebody had left, and I would be worried that he was either a diabetic, or heart medication, I would be calling lost and found so that I could help them. If I am walking down the street and I see a vehicle coming towards a child or an adult, I am going to yell, look out, danger is coming.

Where was your sense of concern as a human being, and as well as a corporate entity, to yell, look out, America, these tires are coming apart? So I do not know about all of the legal definitions, but I do know you had a moral obligation, and I know that the committee will be pursuing it, and I fully support the line of direction that Senator Specter is recommending to the committee.

Now, Mr. Crigger, I am not going into repeating that, but Mr. Wyant, I have a question for you. So much of this seems to be at Decatur. You are Mr. Quality Control. What the hell was going on at that Decatur plant? What did you know? Who was standing sentry, and what kind of mechanisms did you have in place to observe this?

The problem begins at the point of manufacture. It then goes on to the vehicle. What goes on at Decatur? Is Decatur the only factory, and what did you have in place to prevent this?

Mr. WYANT. In the case of Decatur, I have to explain a little bit of background to make it understandable, and I am actually supporting what Mr. Crigger has said, so if you will bear with me for a moment. Our normal measures of measuring tire quality within the industry and within NHTSA and as occasionally reported to our customers like OEM's is the warranty adjustment data, and the reason for that is, you can see trends over time, because there is volume there and it is statistically significant.

Senator MIKULSKI. I appreciate that, sir, but I only have 10 minutes to ask questions. Do you have inspectors on the line?

Mr. WYANT. Pardon?

Senator MIKULSKI. Do you have inspectors on the line?

Mr. WYANT. Yes, we do. In the case of Decatur it is the same as in all our other plants. We inspect the products all the way from the raw materials through the quality control systems, through the product going out at the end of the plant, yes.

Senator MIKULSKI. Is this a defect in manufacturing or design?

Mr. WYANT. That is not determined. We made the recall without knowing that issue, and it is a key issue, and it is being investigated by the best minds in the country, if not the world.

Senator MIKULSKI. When did you start this investigation of best minds in the country?

Mr. WYANT. Pardon?

Senator MIKULSKI. When did you start the investigation of best minds in the country?

Mr. WYANT. I am going on memory here. It probably started somewhere around the end of July time period, I believe.

Senator MIKULSKI. Now, when these tires were coming apart in Saudi Arabia and Venezuela, didn't best minds—did you not want to mobilize the best minds in the country then?

Mr. WYANT. As I believe it was explained, that was a local circumstance, a performance issue within Saudi Arabia, including extremely—very high speeds, and that was deemed to be a customer satisfaction issue by the Ford Motor Company.

Senator MIKULSKI. Well, I am deeply concerned about, obviously there are defects that best minds in the country did not—the so-called best minds in the country did not go to work until July, after all of this began to unravel around the world much sooner. For whatever reasons, best minds in the country, I do not get the feeling that there was a sense of urgency over really standing sentry here.

Now, we are going to follow the lines of investigation that Senator Specter said, and I see my little yellow light is on so I am not going to pursue this at this minute, but I urge the committee to pursue this further.

NHTSA'S BUDGET AND AUTHORITY NEEDS

Dr. Bailey, if I could turn to you, please, and thank you for actually your work. I am going to ask you first about your budget. As I understand it, what we were able to move through the Senate floor because of our own constraints, your budget is \$105 million

below the President's request. As we look forward to conference, putting us aside and putting even OMB aside, could I ask you to tell us, what is it that you need to really do the job of the mission of the agency for this 21st Century?

The number of vehicles are increasing, speed on the road is increasing, the variety of vehicles is increasing. What will it take in terms of both money and staff for you to do your job?

Dr. BAILEY. As you know, we requested \$100 million more for the budget than what we are looking at today, which is about \$400 million. In fact, for safety assurance about \$12 million was requested in the President's budget. Specifically, we are hoping that we will be funded at that level, because as you heard, here today we are going to be required to complete this investigation in a timely manner, and I think considering the effort that is being expended at this time and it is on this investigation, we have to imagine our ability to control an investigation at this level, or if we were required to expand that.

Senator MIKULSKI. Well, what I would like to request is that you submit to the committee directly—I mean, you can get OMB's nod and all those clearances I know you have to go through, but I think it would be very helpful to the chairman and so on if we had a sense from you, what would it take to do the job and the number of people, knowing that this is not the time to really do add-ons, but so that you can really do that, and I think as we go through our conference and reconciliation that we could be of use to you.

Second, I would also invite for you to respond to Ms. Claybrook's set of recommendations on new standards, criminal penalties and so on, after you have had a chance to really review that to see what policy changes you would recommend that we pursue.

Third is this international warning. My passion is public health, and I know you are also keenly interested, so it is the early warnings, even whether they are in our own country or around the world, that I think is so important, whether it is the right to inform, but the right to alert.

One of your jobs is the need to alert. Could you share with us what you think we need to do especially to have a radar system for what is going on, or a CDC mechanism. You know the appropriate language for the highway community, the highway user community, but do you think that is an important policy change?

I mean, if we are going to have a national ballistic missile system to protect us against North Korean missiles, I would like to know what is the—or infectious disease from CDC, what can we do for this, to know what is going on around the world?

Dr. BAILEY. Clearly, it is an essential focus of ours as well. Let me just back up and say by the way, though, we clearly will provide you with our policy recommendations. All of those, as you heard the amendments are already underway. We are also looking to update the tire standards. So much of what you heard in earlier testimony is underway at NHTSA today, and I will certainly be pushing those policies.

As far as our information in a global marketplace, I think that would have been essential to us to have that information earlier, so we are at this point looking at our current regulatory authority as to whether or not it could be expanded so that we can obtain

that information in a timely manner. So you are right, we are going to know when to scream, "Look out!"

We are going to certainly work with Congress if a statutory remedy would be required to that end, because I do believe it is essential.

Senator MIKULSKI. Well, I think what we want to do is look to how we can help improve your statutory regulatory authority without going through a legislative debate that gets us into other quagmires often resolved in the Judiciary Committee.

[The information follows:]

This computer disc contains communications from the Department of Transportation to the Congress regarding additional funding and authority for motor vehicle defect investigations at the National Highway Traffic Safety Administration. Members of the Subcommittee on Transportation of the Senate Committee on Appropriations requested this information during the Hearing on September 6, 2000.

SEPTEMBER 12, 2000.

The Honorable RICHARD C. SHELBY,
*Chairman, Subcommittee on Transportation,
Committee on Appropriations, United States Senate, Washington, DC.*

DEAR MR. CHAIRMAN: This letter is to notify you of a change in the NHTSA fiscal year 2001 President's budget request and to request your approval of this change as you conference the fiscal year 2001 Transportation Appropriations Bill. The Administration requests an additional \$9 million for the Defects Investigation Program. This additional funding would bring total funding for this program in fiscal year 2001 to \$20 million.

The Administration is committed to enhancing the current defects investigation program. The additional \$9 million requested will be used to enhance testing, modernize information systems, improve the timeliness of ODI processing of the increasing number of complaints, and enhance public awareness of NHTSA's defects investigation program. Attached is more detailed information on the increased funding requested.

These funds will complement the \$1.8 million reallocated by NHTSA to the Bridgestone/Firestone investigation. In order not to increase the overall funding requested in the President's Budget, the Administration proposes \$9 million in reductions to other NHTSA research programs.

I appreciate your consideration of this request. If you have any questions, please contact me or NHTSA Administrator Sue Bailey at 202-366-1836. Identical letters have been sent to Chairman Frank Wolf, Senator Frank R. Lautenberg and the Honorable Martin Olav Sabo.

Sincerely,

RODNEY E. SLATER,
Secretary, Department of Transportation.

ATTACHMENT

To enhance the defects investigation program, NHTSA requests additional fiscal year 2001 funding of the following:

\$2.5M.—To provide for enhanced testing at the Vehicle Research and Test Center (VRTC) in East Liberty, Ohio, and possibly other test facilities. VRTC conducts most of the testing to support ODI's defect investigations. Funds are used to purchase vehicles and equipment necessary to conduct tests, to update instrumentation, to purchase time on the various test sites/equipment (VRTC rents laboratory space and must also pay for certain tests on equipment/sites owned by a private company), and to utilize contract support staff. ODI tries to complete its investigations within 16 months. However, investigations that involve complex testing frequently take as long as 2-4 years due to the shortage of testing resources. This funding will allow ODI to shorten this time period and thus enhance an already creditable process.

\$1.5M.—To provide funds to modernize and enhance the ODI database to incorporate analytical intelligence, integrate optical image retrievals, and hardware. Funds are necessary to complete a comprehensive user needs study, upgrade hardware and software, upgrade search capabilities, and to provide better access to statistics and data on equipment such as tires and child safety seats. In addition, ODI would be able to integrate the optical image consumer complaints system with the office network to allow retrieval of complaint images at each investigator's desktop.

\$1M.—To provide for internet access to ODI public files. Currently, optical images are made of ODI's public files and provided to the Technical Information Services office for use by the public. There is no means for the public to access these documents via the Internet, and this access has recently become in great demand due to the highly publicized Bridgestone/Firestone investigation. This funding would provide funds necessary to purchase the hardware, including a CDROM multi-disk player, web server, optical server, database software licenses, internet router, and the services of a data base manager and web site designer to make this data available to the public.

\$2M.—To enhance and improve procedures for tire testing. This effort is comprised of several tasks. First it entails a complete review of existing standards, industry practices, international practices, and other applicable standards. For FMVSS 109, review the strength, debanding, endurance and highspeed requirements. It will permit us to review and improve test procedures currently used to evaluate tires, with emphasis on consideration of replacing current laboratory tests with on-vehicle tests or other equivalent dynamic tests. It will permit development of new test procedures on belt separation, one of the most common failure modes of radial tires. It will permit evaluation and development of performance requirements for technological advances in tire safety, including low tire pressure warning systems. It will augment crash data collection to capture information regarding tire failure.

\$1.4M.—Improve the timeliness of ODI's processing of large amounts of information and process new information that is proposed to be required. An additional 30 people, 22 in ODI, 4 are the Vehicle Research and Test Center engineers/technicians and 4 legal staff are requested. ODI currently has 45 staff members.

The 22 new staff members proposed include eleven investigators (ODI currently has 17), five data entry and document control staff (ODI currently as 2), four screeners (ODI currently has 4), two clerical support (ODI currently has 2) and funds to upgrade hotline support. ODI needs additional staff due to the large increase in the number of complaints that ODI has received over the past year (complaints rose from under 30,000 to over 50,000), the complexity of motor vehicles, and the increase in the number of vehicles on the roads. This large increase in complaints was not projected at the time the 2001 budget was proposed. We expect complaint levels to rise even further with the media coverage of the Firestone recall. The \$1.4 million also includes an additional \$150,000 to enhance hotline operator awareness of automotive issues.

\$.5M.—Even with the increased media emphasis on the Firestone investigation, the public still does not know to report potential defects to NHTSA. NHTSA cannot improve the safety of consumers unless the information it uses to analyze problems is correct. As a step in correcting this, NHTSA is requesting legislative authority to mandate that automobile manufacturers share complaint information with NHTSA. A media campaign should also be conducted to ensure that the public realizes that complaint information needs to be provided to NHTSA. Given that this information is the basis for the NHTSA program, we must leave no stone unturned in ensuring that NHTSA has the best information possible. This would include print, direct mail, and TV. The dollars requested are consistent with costs of other media campaigns conducted by NHTSA.

\$.1M.—Allow additional NHTSA travel to visit crash sites and manufacturers sites to gather information necessary to support defects investigations. ODI's budget for travel is currently \$26,000. This would allow ODI investigators, the ones most familiar with the problem being analyzed, to see evidence first-hand.

\$.9M.—Total.

NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION—FISCAL YEAR 2001 BUDGET OFFSET

[Dollars in thousands]

| Research and analysis | Fiscal year 2001 | | Diff | Offset |
|---|------------------|----------|--------|--------|
| | Request | H/S mark | | |
| Crash Avoidance: Driver/Vehicle Performance | 20,531 | 7,969 | 12,563 | 9,000 |
| Total | | | | 9,000 |

Research and Analysis: (9,000) The Driver/Vehicle Performance Program would be reduced in the areas of advanced crash avoidance (4,000), human factors (4,000), and enhanced driving performance research (1,000).

SEPTEMBER 11, 2000.

The Honorable AL GORE,
President of the Senate, Washington, DC.

DEAR MR. PRESIDENT: I am pleased to transmit to you for introduction and referral to the appropriate committee a proposed bill

To amend title 49, United States Code, to require manufacturers of motor vehicles and items of motor vehicle equipment to obtain information and maintain records about potential safety defects in their foreign products that may affect the safety of vehicles and equipment in the United States, and for other purposes.

The bill includes two titles. Title I, "Motor Vehicle Safety," would amend chapter 301 of title 49, United States Code, the motor vehicle safety statute administered by the Department's National Highway Traffic Safety Administration (NHTSA). Title II, "Odometers," would amend chapter 327 of title 49, United States Code, the odometer requirements statute administered by NHTSA.

Parts of Title I and all of Title II are taken from a bill submitted by the Department for introduction on March 24, 2000. We continue to believe that these provisions will advance the cause of highway safety and commend them to your attention. The additional provisions represent a focused effort by the Department to further strengthen NHTSA as it moves aggressively to address the critical safety issues raised by the ongoing investigation of Firestone ATX, ATX II, and Wilderness AT tires. We believe that the provisions we are submitting will augment the administrative efforts the Department has been and will be taking to give NHTSA the tools it needs to expeditiously move ahead to address this issue.

This proposed legislation could affect receipts, in that it proposes increases in civil penalties for violations under the vehicle safety and odometer laws. Therefore, it is subject to the pay-as-you-go (PAYGO) requirement of the Omnibus Budget Reconciliation Act. The Office of Management and Budget estimates that the net effect of this proposal on receipts during fiscal year 2001 would be an increase of less than one million dollars.

The Office of Management and Budget advises that it has no objection, from the standpoint of the Administration's program, to the submission of this proposed legislation to Congress.

Sincerely,

RODNEY E. SLATER,
Secretary, Department of Transportation.

A BILL

To amend title 49, United States Code, to require manufacturers of motor vehicles and items of motor vehicle equipment to obtain information and maintain records about potential safety defects in their foreign products that may affect the safety of vehicles and equipment in the United States, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

TITLE I—MOTOR VEHICLE SAFETY

SEC. 101. (a) Subchapter I of Chapter 301 of title 49, United States Code, is amended by inserting at the end the following new section:

"SEC. 30106. INTERNATIONAL COOPERATION.

"(a) GENERAL AUTHORITY.—The Secretary of Transportation may cooperate internationally to enhance motor vehicle and traffic safety by exchanging information related to safety defects, noncompliances with motor vehicle safety standards and regulations, and other matters related to motor vehicle safety, conducting vehicle safety research, and updating, developing and promoting improved motor vehicle safety standards and enforcement procedures.

"(b) CONFIDENTIAL INFORMATION.—The Secretary may authorize the disclosure of confidential commercial information submitted to the National Highway Traffic Safety Administration, or incorporated into agency-prepared records, to foreign government officials who perform counterpart functions to the National Highway Traffic Safety Administration as part of cooperative law enforcement or regulatory efforts, provided that:

"(1) The foreign government agency has provided both a written statement establishing its authority to protect confidential commercial information from public disclosure and a written commitment not to disclose any information pro-

vided without the written permission of the sponsor or written confirmation by the National Highway Traffic Safety Administration that the information no longer has confidential status; and

“(2) The Secretary determines disclosure would be in the interest of motor vehicle safety.

“(c) NON-PUBLIC INFORMATION.—The Secretary may disclose nonpublic, predecisional documents concerning the National Highway Traffic Safety Administration’s or the other government agency’s regulations or other regulatory requirements, or other nonpublic information relevant to either agency’s activities, as part of cooperative regulatory activities, provided that:

“(1) The foreign government agency has the authority to protect such nonpublic documents from public disclosure and will not disclose any documents provided without the written confirmation by the National Highway Traffic Safety Administration that the documents no longer have nonpublic status; and

“(2) The Secretary determines that the exchange is reasonably necessary to facilitate cooperative regulatory activities.

“(d) LIMIT ON DISCLOSURE.—Any exchange under this section of confidential commercial information and nonpublic documents and information does not require that such records shall be made available to all members of the public.”

(b) The analysis for Chapter 301 is amended by the addition of the following after the entry for section 30105:

“30106. International Cooperation.”.

SEC. 102. Section 30115 of title 49, United States Code, is amended by inserting at the end the following: “A person shall not affix a certification label or tag to a motor vehicle or item of motor vehicle equipment unless the person has performed testing or other engineering analyses that demonstrate compliance with all applicable motor vehicle safety standards prescribed under this chapter.”.

SEC. 103. Sec. 30118 of title 49, United States Code, is amended as follows:

(a) In subsections (a), (b) and (c), by inserting “, original equipment” after “motor vehicle”; and

(b) In subsection (c), by designating the existing text as paragraph (1), by redesignating existing paragraphs (1) and (2) as subparagraphs (A) and (B), respectively, and by adding the following at the end:

“(2) A manufacturer shall have a duty to review and consider information regarding crashes or incidents in vehicles or equipment where there are fatalities, serious injuries, or fires, including such information received from foreign sources, to learn whether the vehicle or equipment contains a defect or does not comply with a motor vehicle safety standard, and to advise the Secretary if the manufacturer has reason to believe that a defect or non-compliance may exist.”.

SEC. 104. Section 30120(g)(1) of title 49, United States Code, is amended by—

(1) striking “8 calendar years” and substituting “10 calendar years”; and

(2) striking “3 calendar years” and substituting “5 calendar years”.

SEC. 105. Section 30120 of title 49, United States Code, as amended by section 104 of this Act, is amended by adding at the end the following:

“(j) LIMITATION ON SALE OR LEASE OF USED MOTOR VEHICLES.—

(1) A dealer may not sell a used motor vehicle, for purposes other than resale, or lease a used motor vehicle until the dealer informs the purchaser or lessee of any notifications of a defect or noncompliance pursuant to section 30118(b) or section 30118(c) of this title with respect to the vehicle that have not been remedied, and either

“(A) offers to have the defects or noncompliances remedied, or

“(B) gives the purchaser or lessee a written description of the defects or noncompliances, including all relevant information from any notification pursuant to subsections 30118(b) or 30118(c) of this title, and receives a written acknowledgment of the offer or description from the purchaser or lessee.

“(2) The requirements of paragraph (1) of this subsection shall apply after a period of time following issuance of notifications that the Secretary shall specify. The Secretary may extend this period with respect to particular notifications.

“(3) In this subsection, notwithstanding section 30102(a)(1) of this title,

“(A) ‘dealer’ means a person who sold at least 10 motor vehicles during the prior 12 months to purchasers that in good faith purchased the vehicles other than for resale; and

“(B) ‘used motor vehicle’ means a motor vehicle that has previously been purchased other than for resale.”.

SEC. 106. Section 30120 of title 49, United States Code, as amended by section 104 and 105 of this Act, is amended by adding at the end the following new subsection:

“(k) LIMITATION ON OPERATION BY OWNERS AND LESSORS OF SCHOOL BUSES AND VEHICLES USED TO TRANSPORT PASSENGERS FOR COMPENSATION.—

“(1) Subject to paragraph (2), a person who owns or leases a school bus or a motor vehicle used to transport passengers for compensation and who receives a notice of a defect or noncompliance pursuant to section 30118(b) or section 30118(c) of this title may not operate the vehicle to which the notice applies as a school bus or for compensation until the defect or noncompliance is remedied as required by this section.

“(2) The requirements of paragraph (1) shall apply after a period of time following issuance of such notifications that the Secretary shall specify. The Secretary may extend this period with respect to particular notifications.”.

SEC. 107. Section 30165(a) of title 49, United States Code, is amended—

(1) in the first sentence by—

(A) inserting “(1)” after “PENALTY.—” at the beginning of the sentence;

(B) inserting “or” after “30127,” and striking “or 30166”; and

(C) striking “\$1,000” and substituting “\$5,000”;

(2) by striking the third sentence; and

(3) by adding the following new paragraph:

“(2) A person who violates section 30166 of this title or a regulation prescribed under that section is liable to the United States Government for a civil penalty for failing or refusing to allow or perform an act required under that section or regulation. The maximum penalty under this paragraph is \$5,000 per violation per day. The maximum penalty under this paragraph for a related series of daily violations is \$500,000.”.

SEC. 108. Section 30165 is amended by adding at the end the following:

“(e) ADMINISTRATIVE PENALTIES.—Whenever on the basis of any information available the Secretary finds that any person has violated any of the sections in (a) above or a regulation prescribed under any of those sections, the Secretary may assess a civil penalty under this subsection. The penalty amounts shall not exceed those under (a). The maximum penalty under this subsection for a related series of violations is \$1,000,000.

SEC. 109. Section 30166 of title 49, United States Code, is amended by revising subsection (e) to read as follows:

“(e) RECORDS AND MAKING REPORTS.—

(1) The Secretary of Transportation reasonably may require a manufacturer of a motor vehicle or motor vehicle equipment to keep records, and a manufacturer, distributor, or dealer to make reports, to enable the Secretary to decide whether the manufacturer, distributor, or dealer has complied or is complying with this chapter or a regulation prescribed or order issued under this chapter. This subsection does not impose a recordkeeping requirement on a distributor or dealer in addition to those imposed under subsection (f) of this section and section 30117(b) of this title or a regulation prescribed or order issued under subsection (f) or section 30117(b).

“(2) The Secretary of Transportation shall by rule require a manufacturer of a motor vehicle or motor vehicle equipment to keep records and to make reports based on information it has received, upon receiving information, periodically, or in response to an order or specific requirement to make a report with regard to crashes or incidents in vehicles and equipment where there are fatalities, serious injuries or fires;

“(3) The Secretary of Transportation shall by rule require a manufacturer of a motor vehicle or motor vehicle equipment to keep records and to make reports, upon receiving information, periodically or in response to an order or specific requirement to make a report with regard to warranty or adjustment information related to actual or potential defects;

“(4) The Secretary of Transportation reasonably may require a manufacturer of a motor vehicle or motor vehicle equipment to provide to the Secretary of Transportation access to the manufacturer’s communications related to defects and recalls, to the same extent and in the same manner as accessed by one or more of the manufacturer’s dealers; and

“(5) The Secretary of Transportation reasonably may require a person in the business of providing automobile insurance or resolving claims under insurance policies, to keep records or to make reports, upon receiving information, periodically or in response to an order or specific requirement to make a report regarding crashes or incidents in vehicles and equipment where there are fatalities, serious injuries or fires including provision of the vehicle identification number,

insured's names and addresses and telephone numbers. This information shall be treated as confidential information by the Secretary.

SEC. 110. Section 30166 of title 49, United States Code, is amended by adding at the end the following:

“(1) DEFINITIONS.—In this section, notwithstanding section 30102 of this title,

“(1) ‘dealer’ means a person selling and distributing new motor vehicles or motor vehicle equipment, within or outside the United States, primarily to purchasers that in good faith purchase the vehicles or equipment other than for resale.

“(2) ‘distributor’ means a person primarily selling and distributing motor vehicles or motor vehicle equipment, within or outside the United States, for resale.

“(3) ‘manufacturer’

“(A) means a person—

“(i) manufacturing or assembling motor vehicles or motor vehicle equipment; or

“(ii) importing motor vehicles or motor vehicle equipment for resale, and

“(B) includes

“(i) persons incorporated within or with their principal place of business in the United States and their direct and indirect domestic and foreign subsidiaries and affiliates,

“(ii) persons with their principal place of business in a foreign country, including their direct or indirect domestic and foreign subsidiaries and affiliates, any of which export motor vehicles or motor vehicle equipment into the United States, and

“(iii) persons with their principal place of business in a foreign country, including their direct or indirect domestic and foreign subsidiaries and affiliates, any of which manufactures or assembles motor vehicles or motor vehicle equipment in the United States.

“(4) ‘owner’ means an owner within or outside the United States.

“(5) ‘purchaser’ means a purchaser within or outside the United States.

“(6) ‘person’ means any manufacturer, distributor or dealer as defined above and any other person within the United States that may have information related to this chapter.”

SEC. 111. Sections 103, 108, 109, and 109 of this Act shall take effect on the date that is 180 days after the date of enactment of this Act.

TITLE II—ODOMETERS

SEC. 201. Section 32709(a)(1) of title 49, United States Code, is amended by—

(1) striking “\$2,000” and substituting “\$5,000”; and

(2) striking “\$100,000” and substituting “\$1,000,000”.

SEC. 202. Section 32710(a) of title 49, United States Code, is amended by striking “\$1,500” and substituting “\$10,000”.

Senator MIKULSKI. Mr. Chairman, I know the hour is late. Thank you. I will just conclude my questions, because I know we are going to be pursuing this.

Senator SHELBY. We are going to continue on this investigation, absolutely.

ECONOMIC IMPACTS OF RECALL

To Mr. Crigger and Ms. Petrauskus, Ms. Claybrook mentioned here that companies do an economic analysis to determine whether to make modifications in their products, and surmises that such an analysis was done, or probably done relating to the Firestone tires and Explorer vehicles.

Can you tell the subcommittee whether such analysis was actually done relating to tire failure, tire pressure, the Explorer suspension system, or any combination thereof by either of your companies or under contract for your companies, and sir, identify yourself.

Mr. WYANT. Yes, sir. I am Bob Wyant. I am vice president for corporate quality for Bridgestone/Firestone. I am not sure I understand your question.

Senator SHELBY. Let me ask it again. Ms. Claybrook when she testified, mentioned that companies do an economic analysis to determine whether to make modifications to their products, and she surmised that such an analysis was done relating to, in this case, the Firestone tires. Was it in fact done?

Mr. WYANT. In terms of a recall decision?

Senator SHELBY. I am just speaking of an economic analysis that would include a recall decision.

Mr. WYANT. In short, no.

Senator SHELBY. And if not, why not?

Mr. WYANT. In my 36 years, I am not aware of being involved in—am not involved and have never been involved in any safety related dollar analysis decision process, period.

Senator SHELBY. Well, some people would say a calculus of expected profits versus potential cost of lawsuits. Was that made in this case?

Mr. CRIGGER. Nothing like that was done.

Senator SHELBY. Ms. Petrauskus, what about Ford?

Ms. PETRAUSKUS. Absolutely none. There was no such analysis made. If I might just, maybe to correct the record a little bit, there was earlier discussion about changes made.

Senator SHELBY. Modifications.

Ms. PETRAUSKUS. Modifications made during the development process and the engineering process for the explorer. One of the things I wanted to be absolutely clear on is, before the Explorer vehicle went into production it passed not just all of the Government's requirements but our own tough, very tough rollover requirements, and it did so at 26 psi tire pressure, and it did so at 35 psi tire pressure.

I just want to be sure there was no confusion on that score. Thank you.

FORD EXPLORER SUSPENSION REDESIGN

Senator SHELBY. I have another question to direct to you. It has also been brought to our attention that during the consumer satisfaction replacement of tires in Saudi Arabia and Venezuela, that Ford instituted a redesign of the Explorer suspension. If that is true, why have you not taken similar action in the United States?

Ms. PETRAUSKUS. That is not correct. In the case of Saudi Arabia, at the same time as we replaced the customer tires we did two other things. We put in place a training program for our dealers, and we reduced the top speed of the Explorer electronically to try to see if we could keep the speed down. So we reduced the top speed to the levels that we have in the United States. They had been higher in Saudi Arabia.

Senator SHELBY. Does that lead reasonable people to infer perhaps that the tire problem is exacerbated by the vehicle and the design?

Ms. PETRAUSKUS. All of the evidence—I need to answer your question about Venezuela, too, and I will in a moment.

All of the evidence we have in Saudi Arabia almost unequivocally seems to point to underinflation—but I am not talking about a little underinflation. I am not arguing about 20 versus 26 versus 30. I am talking about underinflation in the low teens—a lot of bad repair practices, and a lot of damage, external damage to the tire, the kind you would get going over sharp rocks and the like, because there is a lot of recreational use of these vehicles in the desert, and that in part was one of the things that led us to conclude we need to reduce the maximum speed levels down to the U.S. level.

In the case of Venezuela, the decision was made to put stiffer shock absorbers on the vehicles. These are the same we have used in Australia for some time. The good thing about these Australian shock absorbers is, they are stiffer and they do a much better job in terms of giving the customer a decent ride on washboard roads. It was a complaint we had. It was a want, a customer want we had from customers in Venezuela. We went ahead and decided to put it into production. There is absolutely no relationship between those shock absorbers, or the prior version, and tread separations and tire issues we have seen in Venezuela. We are absolutely confident of that.

Senator SHELBY. And in those lawsuits that were settled where the agreements are sealed, are you saying or would you say that there is no connection to anything that might come out of those?

Ms. PETRAUSKUS. If I might, I just want to be real clear in the case of Ford Motor Company I am unaware of documents, any documents that we sealed.

Now, what we do have is, when there is a settlement agreement the fact of the settlement and the amount of the settlement is kept private, but everything else, all of the day-to-day engineering documents, all of the complaint data, all of the things that relate directly to safety, and that we have talked about making public, none of that, none of that is protected information, and the reason there have been so many documents talked about in the press is we do not ask for confidential treatment, and they are all over town.

NHTSA'S SLOWNESS IN RESPONDING

Senator SHELBY. Dr. Bailey, I will try to be quick with this. Representatives from State Farm Insurance, which insures, as I understand, about 20 percent of drivers in the United States, informed your agency's office of defects investigations of a growing number of incidents of tire failure by the P-35, 75, R-15 Firestone, ATX tire mounted on 1991 to 1995 Ford Explorers in July of 1998.

NHTSA, however, did not act on this information until May 2000, or reportedly on subsequent phone conversations from State Farm to NHTSA. Why were these communications, these warnings, if you will, from State Farm seemingly ignored?

Dr. BAILEY. They were not ignored. When they were received they were analyzed in relationship to the population of tires that were produced, which was over 40 million at that time.

Those 21 complaints, those claims that were "noticed", and that is a quote from the original e-mail, that were "noticed", those claims ran over a period of almost 8 years, several years. So you can see over several years 21 complaints in a population of 40 million tires, it did not trigger an investigation, nor would it have.

Senator SHELBY. Let me follow up with this. If you are claiming or stating that those complaints perhaps were not enough to trigger an investigation, why did it open an investigation of model year 1991, 1993 Chrysler minivans after receiving, Dr. Bailey, only two complaints that seatbelts would open when in use, and did not this investigation lead to a recall of 1.1 million vehicles?

In other words, you acted on one thing at a smaller threshold and at a larger threshold, probably a lot more danger, perhaps, you did not act at all.

Dr. BAILEY. Let me again put it in perspective and say that we take in about 50,000 complaints a year. There are about 500 that deal with tires. There are only about 50 that deal with Firestone tires. There were only about five a year that dealt with these particular tires.

And so that we have it in context here, you can see that again when we are looking at a population of 47 million tires produced with less than 5 complaints a year about these specific tires in question, that would not necessarily trigger an investigation, again where there may be 500 complaints a year about other tires.

Let me also say, the difference between the Chrysler situation and the Firestone situation, is that we never expect a seatbelt or a child safety seat to fail. Therefore, one or two or three failures of something that is never supposed to fail is enough to trigger an investigation, whereas we know that tires that may be used for 40,000 miles, do fail. So we are putting it into the context of the difference between tires and safety mechanisms that are not ever intended to fail.

Senator SHELBY. To Ford and Bridgestone/Firestone, it has been mentioned here that, well, there is going to be a request by the committee for the documents, the internal documents related to Firestone and Ford and the safety and the warnings and everything. Will we have to subpoena those, and if so we will, or will you furnish those to the committee?

Mr. CRIGGER. We will cooperate fully with the committee.

Ms. PETRAUSKUS. We will be happy to provide whatever documentation the committee will require.

Senator SHELBY. Okay. I want to thank all of you for your testimony and your participation here. We will continue our investigation.

SUBCOMMITTEE RECESS

Thank you. The subcommittee is recessed.

[Whereupon, at 12:55 p.m., Wednesday, September 13, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

DEPARTMENT OF TRANSPORTATION AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2001

TUESDAY, SEPTEMBER 12, 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9:33 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Richard C. Shelby (chairman) presiding.

Present: Senators Shelby and Specter.

OVERSIGHT HEARING ON FREIGHT RAIL COMPETITION ISSUES

NONDEPARTMENTAL WITNESSES

STATEMENT OF ROBERT T. CROWE, VICE PRESIDENT, WALTER INDUSTRIES, INC., BIRMINGHAM, AL

OPENING STATEMENT OF SENATOR RICHARD C. SHELBY

Senator SHELBY. The committee will come to order. This oversight hearing of the Transportation Appropriations Subcommittee will now begin.

American railroads carry more freight than ever. According to the Association of American Railroads, 26 million carloads of freight were carried in 1998; however, the number of major U.S. railroads has declined dramatically over the last two decades, and this high volume of freight traffic is concentrated on a more streamlined rail system that is experiencing capacity constraints, as we all know.

Over the past couple of years I have had a number of meetings with rail-dependent companies, who consider themselves captive to one major railroad. They have no choice in who provides their rail service. These captive shippers, as they are called, feel that the level of service they are provided and the shipping rates they are charged reflect that lack of competition.

Some companies can point to specific examples of how lack of competition is affecting their and their customers' bottom line. A chemical company in the Gulf Coast region of Texas cites the ridiculous instance of paying the exact same rate to ship their product by water to a market in the Far East, almost 7,000 miles away, as they paid to ship by rail to Atlanta, less than 1,500 miles away. Their contract with the shipping company stipulates delivery with-

in 2 days of the targeted delivery date. The rail contract to Atlanta has a 4-day delivery window there.

A company might be willing to pay higher rates if they could be confident that their product would arrive at the destination within the time period specified in the service contract. Sadly, this is often not the case. Many companies have experienced severe service problems in the wake of recent mergers. In Alabama, my home State, two chemical companies reported to me that slow rail service in the wake of the Union Pacific/Southern Pacific merger led to a near shutdown of a major Alabama production plant, and did, in fact, shut down a production unit of specialty chemicals in McIntosh, Alabama, due to rail service failures.

Shippers have very few realistic forms of redress for poor performance. A company can appeal unreasonable rates or lack of competitive access before the Surface Transportation Board, if they can afford it. FMC Corporation, a diversified industrial conglomerate headquartered in Chicago, filed an appeal against a Class I railroad, based on unreasonable rates, and after 2½ years the STB ruled in FMC's favor. However, the legal costs of the drawn-out appeals process and the expense of economic modeling required by the STB cost the company \$6 million to file the appeal, more than the company might ever recover in awards.

I have called this hearing today to explore the issues of freight rail access, rail service, and shipping rates. I want to focus on whether there is sufficient level of competition and choice in the rail shipping and railroad industry. I know that some of today's witnesses will definitely answer no, we need more choice and better competitive options.

Farmers, small businesses, and their customers deserve good service and fair pricing, just as much as large companies do. Competition drives investment, increases capacity, reduces shipping rates, and fuels economic growth. I want to talk about ways that railroads, the shipping community, and the regulatory agency that oversees them, the Surface Transportation Board, can enhance and stimulate competition.

If railroads are unwilling to provide that service at a reasonable charge, I think that we should try to find ways to allow others to compete for that market. Small railroads and shippers help build and maintain communities. We know that. They are vital to the economies of American farms, small communities, and towns. Limited access, slow or erratic service, and non-competitive shipping rates discourage these smaller businesses, and can have real consequences on local economies. Railroads need to be more service oriented and more competitive.

I am looking forward to our day's witnesses here, and look forward to hearing them all. Our first panel will be the shippers. We will have Mr. Bobby Tom Crowe, Walter Industries, Birmingham; Mr. Eric Aasmundstad, representing the American Farm Bureau and the farmers of North Dakota; and Ms. Diane Duff, from the Alliance for Rail Competition. I want to welcome all of you here today. Mr. Crowe, do you want to start?

STATEMENT OF ROBERT T. CROWE

Mr. CROWE. Thank you, Mr. Chairman. My name is Bobby Tom Crowe. I am here representing the American Chemistry Council and the Alabama Chemical Manufacturers, and uniquely, Walter Industries is made up of a group of subsidiary corporations of manufacturers that stretch all across the United States. We also happen to own and operate a very active short-line railroad.

COMPETITIVE RAIL SERVICE

Mr. Chairman, I certainly commend this hearing and the committee encouraging the industry to come forward, and to comment, regard, and support competitive rail service in the United States.

As you know, the American Chemistry Council is the voice of U.S. chemical industry. The American Chemistry Council represents the chemical industry on public policy issues, coordinates the industry's research and testing programs, administers the industry's environmental, health, safety, performance improvement initiative that is known as the Responsible Care program.

I commend you for holding these hearings to encourage competition. Changes in the rail industry, marked by the series of non-competitive mergers, demand an examination of the current policy. It was the stated intent of the Staggers Act of 1980 to encourage competition among railroads. Rail competitiveness legislation must include several important revisions to balance the interest of rail customers with those of rail carriers and rail labor.

I am not here to bash or demagogue these issues. We all have a common goal, efficient, reliable, and reasonable-priced rail transportation, and encouraging competition between railroads is the way to achieve that goal. We need a responsive rail industry, not one that exploits major portions of its customer base, and deals very harshly with competitive shippers.

The Council's member companies compete on a national and global basis. Sixty-three percent of our manufacturing facilities are captive to a single railroad. This makes it difficult for us to reduce costs and get our products to market on a consistent and reliable basis. A better balance in the existing regulatory system is clearly needed.

Rail customers, therefore, recommend that six provisions be included in any rail competitive legislation: Clarify the rail transportation policy by requiring the STB to give greater weight to the need for increased competition; two, require all rail carriers to quote a rate between any two points where traffic originates, terminates, or may be reasonably interchanged without regard to whether the rate is for only part of the total movement; three, eliminate the requirement that evidence of anti-competitive abuse be produced in a request to the STB for competition in a terminal area; four, provide low-volume, captive, and all agricultural-related customers with the simple benchmark test for rate and service cases; five, codify the STB's decision to exclude evidence of product or geographic competition when determining market dominance; and six, abolish requirement that the STB determine revenue adequacy.

While each of these provisions is discussed fully in my written statement, I will now address three of these most important areas of concern.

BOTTLENECKS

Congress should require rail carriers to quote a rate between any two points where traffic originates, terminates, or may reasonably be interchanged. The STB has ruled that in most situations a railroad with such a bottleneck monopoly can foreclose competitive routing by other railroads. The STB will not even hear a challenge to the reasonableness of a rate for a bottleneck segment.

We believe that a carrier that controls a bottleneck should not be allowed to exploit its monopoly position. Instead, its pricing should be subject to the current statutory restrictions against charging unreasonable high rates where there is no effective competition.

Consistent with other deregulatory precedents, Congress should overturn the bottleneck decision. We are not asking you to dictate the rate, but if Congress lets the bottleneck decision stand, competition simply will not exist for most captive rail shippers.

COMPETITION IN TERMINAL AREAS

Congress should eliminate the requirement that a customer must prove anti-competitive abuse to obtain access to another railroad in an area served by more than one carrier. The Staggers Act allows such competition in a terminal area by means of either terminal switching, trackage rights, or reciprocal switching. The law has been interpreted to mean that a customer must establish anti-competitive abuse, so railroads are effectively protected against competition. We ask Congress to remove the anti-competitive abuse test that has been superimposed on the current statute.

MARKET DOMINANCE

Congress should codify the STB's decision to exclude evidence of product or geographic competition from the agency's market dominance determination. Market dominance is the threshold test for determining the agency's authority to hear rate cases. By law, market dominance means an absence of effective competition from other rail carriers or modes of transportation. There is no market dominance if a railroad proves that the rate is less than 180 percent of so-called variable costs of the movement.

For many years, however, the STB required a rail customer prove that it did not have the ability to use other product competition or access a similar product from another geographical region. This made what was originally intended to be only a threshold test into a lengthy, complicated, and overburdensome process.

In December 1998, as a result of rule-making proceedings, the STB determined that product and geographic competition should be removed as factors in the market dominance determinations. We are grateful that the STB heeded the complaints of the rail customers about its market dominance rules. We request that Congress simply codify the STB's recent decisions.

Mr. Chairman, members of the committee, and committee staff, some describe our six provisions as re-regulation. To the contrary, we do not want more regulation. We want cooperation, and to enforce the intent of the Staggers Act, but we do believe that the pro-competitive intent of that Act has been undermined and with protectionist decisions. We urge you to remove the barriers to competition and to adjust policies that are no longer appropriate in a consolidated rail industry. Then we will see a stronger rail industry that will be able to respond to customers.

Congress should also look into the concerns of rail labor, short-line railroads, and regional railroads when crafting rail competitiveness legislation. We look forward to working with you to accomplish this goal. We, again, do not need more regulation, but more cooperation. Historically, shippers have had to come to Congress to deal with railroads. We do not consider that as a request for greater regulation.

PREPARED STATEMENT

Thank you, Mr. Chairman, for providing this opportunity.
 Senator SHELBY. Yes, sir.
 [The statement follows:]

PREPARED STATEMENT OF ROBERT T. CROWE

EXECUTIVE SUMMARY

This testimony is on behalf of the American Chemistry Council. The American Chemistry Council is the voice of the U.S. Chemical Industry. The American Chemistry Council represents the chemical industry on public policy issues, coordinates the industry's research and testing programs, and administers the industry's environmental, health, and safety performance improvement initiative, known as Responsible Care®.

The testimony provides a brief summary of why rail customers engaged in the business of chemistry are concerned about rail transportation. It then reviews the need for changes in the existing law and provides specific recommendations for what those changes ought to be.

Below is a summary of the six provisions that we as rail customers support in legislation to revamp the rail industry:

1. *Policy*.—Clarify the rail transportation policy of the U.S. by requiring the Surface Transportation Board (STB) to give greater weight to the need for increased competition between and among rail carriers.

2. *Bottlenecks*.—Require rail carriers to quote a rate between any two points on the system where traffic originates, terminates or may reasonably be interchanged without regard to whether the rate is for only part of the total movement.

3. *Competition in Terminal Areas*.—Eliminate the requirement that evidence of anti-competitive conduct be produced when the STB determines outcome of requests to allow another railroad access to rail customer facilities within an area served by the tracks of more than one railroad.

4. *Relief for Certain Agricultural Shippers*.—Provide small, captive agricultural shippers with a simple benchmark test for rate and service cases.

5. *Market Dominance*.—Codify the STB's decision to exclude evidence of product or geographic competition when determining market dominance.

6. *Revenue Adequacy*.—Abolish the requirement that the Board determine on a regular basis which railroads are revenue-adequate.

Good afternoon Mister Chairman and members of the subcommittee. I am Bobby Tom Crowe. I am here today representing the American Chemistry Council. Our concern is the need for better rail transportation.

You are to be commended for holding this hearing. Congress needs to become more active in the debate about rail transportation.

The rail transportation debate has been described by some as "re-regulating" the rail industry. I must strongly state that nobody supports returning to rail regulation as it existed prior to the enactment of the Staggers Act of 1980. Customers of the rail industry need a strong and economically viable railroad system. Without such

a system, the country's economy will suffer and we would not be able to receive raw materials and market our products.

At the same time, we need a rail industry that is responsive to the needs of its customers. My company, as well as the other members of the American Chemistry Council, competes on a national and international basis. The competition we face on a daily basis means not only that we must seek ways to reduce costs, but we must also seek transportation options that get our products to market on a timely basis. There are occasions when shipments must reach a rail destination by a specified time to be loaded on an ocean-going ship or to be used by a customer on a time-sensitive basis. If these shipments are late we can lose sales or face other business consequences. These are the reasons that rail transportation must be provided on a basis that is responsive to the demands of the customer. It is for these reasons that a better balance in the existing regulatory system is needed.

In the United States, the business of chemistry employs some 1,000,000 high-tech, high-wage workers. In turn, these lead to the creation of 1.1 million jobs in other industries, bringing total U.S. jobs dependant on the chemical industry to 2.1 million. Our industry is the U.S. leading export sector and a substantial contributor to a positive U.S. balance of payments. The chemical industry depends heavily on railroads to safely and efficiently transport raw materials to chemical manufacturing facilities and to deliver a wide variety of finished products to destinations throughout the country. Railroads also transport chemical exports to Canada, Mexico, and U.S. ports.

According to data compiled by the Association of American Railroads, the chemical industry ships about 140 million tons of products by rail on an annual basis and spends about \$5 billion per year on rail freight charges, accounting for 15 percent of the revenue received by U.S. railroads. Most significant in terms of competitiveness, 63 percent of chemical manufacturing facilities are served by a single railroad. These monopolized facilities face high transportation costs and often suffer from inadequate rail service.

Recent rail transportation events have shaped the business environment. There is a growing awareness that transportation is not a separate, isolated function of the supply chain, but rather, an integral part of the production process. When talking about the transportation you must remember few other issues address such fundamental business components in corporate America. That is, rail transportation is about: Moving raw materials and products; Meeting customer demand; and Affecting the corporate bottom line.

Why are the railroads the only industry in this country to exercise monopoly control over their customers? The core issue is the lack of competition in the U.S. rail system. Legislation is needed to address the fundamental way railroads operate.

BACKGROUND FOR CHANGE

Four developments over the last twenty years have reduced the competitive transportation alternatives for many "captive" shippers.

Railroad Mergers and Consolidations

First, the railroad industry has consolidated from approximately 40 major railroads in 1980 to six major railroads today. There are two railroads in the west: the Burlington Northern Santa Fe and the Union Pacific; two in the east: the Norfolk Southern and the CSX; and two operating in the middle of the nation and in parts of the northeast: the Kansas City Southern and the combined Illinois Central/Canadian National. In their decisions approving railroad mergers, the STB and its predecessor, the Interstate Commerce Commission (ICC), have attempted to maintain for all shippers at least as many transportation options as they had prior to the merger, sometimes using trackage rights and other such agreements to achieve these results. But the Board's efforts have not always been successful.

"Tie In" Agreements with Shortline and Regional Carriers

Second, there has been a proliferation of short line and regional railroads since 1980 as the major railroads sold off parts of their systems. However, as the major railroads sold tracks to new short line and regional railroads, the sales agreements often included provisions requiring the short line to move its freight back to the railroad that sold the track, even where movement to a second railroad might be possible. These provisions were approved by the ICC and the STB and further protected by an agreement between the major railroads and the short line and regional railroads, which itself has been approved by the STB. Thus, competition that could have been created by when tracks were sold has instead been stifled. It is of interest, however, than in testimony before the STB in March, the American Shortline

and Regional Railroad Association advocated greater competition due to the higher level of consolidation that now prevails in the rail industry.

Lack of Competition in Terminal Areas

Third, in the mid-1980's the ICC adopted an interpretation of the Interstate Commerce Act that allows the railroads to prevent competition from occurring in terminal areas. Terminal areas are those places where the facilities of at least two rail carriers cross and therefore competitive alternatives could be available to rail customers if they were able to be served by more than one railroad. Under its interpretation in the 1986 *Midtec* case, the ICC determined that railroads could avoid competition in a terminal area unless a shipper or other railroad proves "anti-competitive abuse" by the railroad. No applicant seeking competition in a terminal area has ever been able to satisfy the STB's interpretation of "anti-competitive abuse". This "anti-competitive abuse" test is not contained in the Interstate Commerce Act as amended by the Staggers Act.

The Bottleneck Decision

Finally, and perhaps of most concern to railroad customers, is the STB's "bottleneck" decision, which is fundamental to the entire issue of competition in the rail industry. On February 10, 1999, the United States Court of Appeals for the Eighth Circuit, in *MidAmerican Energy Co. v. Surface Transportation Board*, upheld the December, 1996 decision of the STB that allows railroads to "exploit" their bottlenecks. The question of "bottlenecks" is now a public policy issue ripe for resolution by Congress.

That judicial decision in the bottleneck case is that under current law railroads can avoid competition and "exploit" their customers located on railroad bottlenecks. Under this decision, the railroads have been given the best of both worlds: the benefits of deregulation and the ability to "exploit" their monopoly facilities! This state of the law must be reversed by an act of Congress.

By way of background, "bottlenecks" are those sections of a transportation movement where only one railroad is available. Typically, for much of the remainder of the movement, competitive rail transportation options are available. "Bottlenecks" are a problem where one of the two railroads that could provide competition also controls the "bottleneck". Where the "bottleneck" carrier can provide service at the "origination" of the movement and at the "destination" of the movement, then the "bottleneck" carrier has every economic incentive to exclude the other railroad from participation in a part of the overall movement. Thus, the "bottleneck" railroad either will not provide a rate across only the "bottleneck" portion (thus preventing the customer access to the railroad competition that is available) or will quote a rate for its portion of the movement that is so high as to make the joint-line portion economically infeasible.

In December, 1996, the STB sided with the railroads in its "bottleneck" decision, succumbing to their unsubstantiated claims that they would fall into financial ruin if they could not "exploit" their customers across their bottleneck facilities. Captive rail shippers are outraged by this decision. If this decision stands, the railroad industry will be the only "network" industry that has been both deregulated, but allowed to continue to "exploit" its "essential facilities". This privilege was not extended to the airline industry, the telecommunications industry, the natural gas pipeline industry or the electric utility industry. In each of these cases, either Congress or the Federal regulatory agency has required these industries to allow competitive rates across their "bottleneck" facilities. Railroad customers demand to know why a different decision was made in the case of the railroads, why their interests have been dismissed and what standard is going to restrain the railroads "exploitation" of those over whom the railroads continue to enjoy monopoly power.

Railroad customers encourage Congress to adopt legislation overturning the "bottleneck" decision and requiring the railroad at least to quote a rate to customers across bottleneck facilities. Railroad customers are not even asking the Congress to dictate the rate, as has been in the case with respect to the telecommunications, pipeline and utility industries. If Congress lets this "bottleneck" decision stand, transportation competition simply will not exist for most captive rail shippers of bulk commodities.

In light of these four developments, most shippers of bulk commodities do not have access to transportation competition. The choice of these railroad customers is either to keep quiet and accept the transportation terms dictated to them by the railroads or to test the reasonableness of their rate at the STB. Unfortunately, as shown in a 1999 GAO study, the "rate reasonableness process" at the STB is so difficult, costly, time consuming and cumbersome that few railroad customers ever pur-

sue this remedy. This remedy, by the way, is the only rate relief remedy available to captive rail shippers.

On other matters, STB Chairman Linda Morgan indicated in a letter to Senator John McCain and Senator Kay Bailey Hutchinson, that the agency needs direction from Congress. That letter, dated December 21, 1998, identified a number of areas in which Congress should provide more direction. These requests for direction include: rail competition, revenue adequacy, and so-called "small" rate cases.

Unfortunately, the STB has chosen to ignore many of the policy mandates listed in Staggers. For example, the following are listed as rail policy in Staggers:

1. Rail policy should foster sound economic conditions and to ensure effective competition and coordination between rail carriers and other modes;
2. Rail policy should reduce regulatory barriers to entry into and exit from the industry; and
3. Rail policy should prohibit predatory pricing and practices, to avoid undue concentrations of market power, and to prohibit unlawful discrimination.

These policies need to be clarified legislatively and not with any new regulation of the industry. The Staggers Act provides the STB with policy to ensure a competitive, free-market environment for both large and smaller rail customers. It is time the policy is put into practice.

RECOMMENDATIONS

In light of the above, the American Chemistry Council supports rail competitiveness legislation that includes the six provisions summarized here:

1. *Policy*.—Clarify the rail transportation policy of the U.S. by requiring the Surface Transportation Board to give greater weight to the need for increased competition between and among rail carriers.

2. *Bottlenecks*.—Require rail carriers to quote a rate, upon request, between any two points on the system where traffic originates, terminates or may reasonably be interchanged without regard to whether the rate is for only part of the total movement.

3. *Competition in Terminal Areas*.—Eliminate the requirement that evidence of anti-competitive conduct be produced when the STB determines outcome of requests to allow another railroad access to rail customer facilities within an area served by the tracks of more than one railroad.

4. *Relief for Certain Agricultural Shippers*.—Provide small, captive agricultural shippers with a simple benchmark test for rate and service cases.

5. *Market Dominance*.—Codify the STB's decision to exclude evidence of product or geographic competition when determining market dominance.

6. *Revenue Adequacy*.—Abolish the requirement that the Board determine on a regular basis which railroads are revenue-adequate.

Each of these provisions is discussed in more detail below.

1. *Policy*.—Congress should clarify the U.S. rail transportation policy by requiring the STB to give greater weight to the need for increased competition between and among rail carriers.

The current rail transportation policy appears to clearly favor competition as the primary regulator of choice. Currently, the statute appropriately states that, among other factors, it is Federal policy:

- to allow, to the maximum extent possible, competition and the demand for services to establish reasonable rates for transportation by rail;
- to minimize the need for Federal regulatory control and to require fair and expeditious regulatory decisions when regulation is required;
- to promote a safe and efficient rail transportation system by allowing rail carriers to earn adequate revenues as determined by the Board;
- to ensure development of sound rail transportation system with effective competition among rail carriers and with other modes, to meet the needs of the public and the national defense;
- to foster sound economic conditions and to ensure effective competition and coordination between rail carriers and other modes;
- to maintain reasonable rates where there is an absence of effective competition;
- to reduce regulatory barriers to entry into and exit from the industry;
- to prohibit predatory pricing and practices, to avoid undue concentrations of market power, and to prohibit unlawful discrimination; and,
- to provide for the expeditious handling and resolution of all proceedings required or permitted to be brought under this part.

However, a review of the past 20 years of regulatory precedent demonstrates that rail regulators have given disproportionate emphasis to the provision that states that the STB is to allow rail carriers to earn adequate revenues. If Congress truly

intended for competition to be the regulator of choice—among rail carriers as well as with other modes—the priorities of this policy need to be clarified legislatively.

2. *Bottlenecks*.—Congress should require rail carriers, upon request, to quote a rate between any two points on the system where traffic originates, terminates or may reasonably be interchanged without regard to whether the rate is for only part of the total movement.

In the agency's 1996 "bottleneck" decision, the STB ruled that, in most situations, a rail carrier with a "bottleneck" monopoly can lawfully foreclose alternate and competitive rail routings by another carrier, where the "bottleneck" carrier can provide origin to destination service. Consider the example of a shipper that needs to move his goods 1,000 miles and is served by both Carrier A and Carrier B at his destination, but only Carrier A at his origin. Carrier B interchanges with Carrier A and can provide alternative and competitive rail service over 900 miles of the total movement from the interchange to the destination.

In the above example, even though Carrier B can provide competition over a large portion of the movement, the STB ruled that Carrier A can simply refuse to interchange with Carrier B for transportation from the interchange to the destination. The STB also ruled that it would not even consider a shipper's challenge to the lawfulness of a rate for this "bottleneck" segment. This means that there can be no review of the reasonableness of a rate for the 100 miles controlled by Carrier A in the above example.

The STB's bottleneck decision should be reversed legislatively, to restore to shippers the right to route over competitive routings at rates produced by the competitive market through existing interchanges, and to clarify that the STB can establish a maximum reasonable rate over a bottleneck segment. These changes would ensure that the monopoly bottleneck carrier couldn't take advantage of its pricing power to foreclose competition over the competitive portion of the route. They would permit competition to flourish where it can. These changes would not bring a return to the old "open routing" system, whereby carriers were required to keep even inefficient interchanges open and were required to charge the same rate over all possible routes. Rather, only interchanges already utilized by the carriers would qualify, and rates over various routes would vary as costs and competition demand. Where a carrier controls a bottleneck, its pricing initiative would only be subject to current statutory restrictions against charging unreasonably high rates where there is no effective competition.

Consistent with other congressional deregulatory precedent, railroad customers encourage Congress to adopt legislation overturning the "bottleneck" decision and requiring the railroad at least to quote a rate to customers across bottleneck facilities. Railroad customers are not asking Congress to dictate the rate, as has been in the case with respect to the telecommunication, pipeline and utility industries. If Congress lets this "bottleneck" decision stand, transportation competition simply will not exist for most captive rail shippers.

3. *Competition in Terminal Areas*.—Congress should eliminate the requirement that evidence of anti-competitive conduct be produced when the STB determines outcome of requests to allow another railroad access to rail customer facilities within an area served by the tracks of more than one railroad.

The 1980 Staggers Rail Act specifically allowed competition to occur within terminal areas by means of either "terminal trackage rights" or "reciprocal switching," but regulatory interpretation of the law has prevented this from occurring.

According to 49 USC § 11102. "Use of Terminal Facilities," the law clearly states that the Board may require terminal facilities—including mainline tracks for a reasonable distance outside a terminal—to be used by another rail carrier if it is "practicable" and "in the public interest" so long as it does not "substantially" impair the owner of those facilities to handle its own business. This is referred to as "trackage rights."

This section of the law also clearly states that the Board may require rail carriers in a terminal facility to transfer, or "switch," a customer's shipment to another rail carrier—under what is known as "reciprocal switching agreements,"—where such agreements are found to be "practicable and in the public interest," or "where such agreements are necessary to provide competitive rail service."

Railroads already can access each other's customers through either trackage rights or reciprocal switching agreements, and often do. However, the railroads decide unilaterally which customers within the reasonable distance of the terminal area can access such competition, and the competing railroads usually will only agree to an "even swap" of access to specific customers. As a result, most customers that fall within a "reasonable distance" or rail terminal facilities can not get competition through these provisions unless the regulator deems such action to be "practicable and in the public interest" or "necessary to provide competitive rail

service”—a function that was originally envisioned and anticipated within the 1980 Act as a means to encourage competition.

Unfortunately, regulators have interpreted the language of the statute to mean that a rail customer must prove that the railroad was undertaking anti-competitive abuse. Rather than affirming the pro-competitive intent of the law, the regulator has determined that trackage rights and reciprocal switching agreements will only be used when anti-competitive behavior can be proven to exist. Although this provision of the law was clearly intended as a means of encouraging an emergence of competition, instead the STB chose to protect the rail industry from competition. Therefore, rail customers are asking Congress to remove the “anti-competitive abuse test” that was superimposed on the current statute by regulators.

4. *Relief for Certain Agricultural Shippers.*—Provide low volume, captive agricultural shippers with a simple benchmark test for rate and service cases.

In the case of the low-volume agricultural shipper, a better test must be established to provide these customers with a quick and simple way to access relief from poor service and unreasonably high rates within the existing regulatory framework. The existing “small rate cases” provision does not work because it does not provide any clear indication of who would qualify, or establish a definitive simple rate or service benchmark.

Consider: STB’s guidelines established three factors that the Board will look at to determine the maximum rate for small shippers. Specifically, the Board reviews the profits that the carrier obtains from the challenged rate compared to: (1) The profits that railroads in general earn from comparable traffic; (2) The level of profits that the carrier would need to obtain from all of its potentially captive traffic in order to become “revenue adequate”; and (3) The profits that the defendant carrier earns on all of its potentially captive traffic. But the Board has never said how these comparison factors will be weighted or if they will even be utilized, so from a legal standpoint, a small shipper has no means of assessing the potential outcome of bringing a rate complaint.

In addition, there has never been a decision by the Board about what case would qualify as a “small case” so a shipper with a complaint doesn’t even know who can qualify to use these rules. One of the three comparison factors depends upon access to the confidential waybill sample data, and you can’t get access to the data until you file a complaint. Beyond the complexities of the STB’s guidelines, the process is lengthy and costly. The prospect of spending thousands of dollars—or even millions, and weeks—or even years—of time on a process that is unlikely to provide any real relief is not especially enticing, particularly in a fast paced marketplace where other business opportunities could be lost.

In STB Chairman Morgan’s letter of December 21, 1998, she specifically noted that, if Congress agrees with the assessment that the current guidelines could unreasonably impede access to the regulatory process and should be replaced by a single benchmark test, Congress could adopt specific “small” rate case standards.

Various members of the agricultural community have proposed a threshold under which it would be clear what rate and service circumstances would merit regulatory relief. This proposal would also establish the parameters for such relief, and in circumstances where all else fails, allow eligible facilities to sue for damages either in Federal court or before the STB.

5. *Market Dominance.*—Codify the STB’s decision to exclude evidence of product or geographic competition when determining market dominance.

According to the statute, “market dominance” means an absence of effective competition from other rail carriers or modes of transportation. In theory, a finding of “market dominance” gives the STB the authority to protect a captive shipper—one who has no alternative transportation choices—from excessively high rates. By law, if a rail carrier proves that the rate charged is less than 180 percent of out-of-pocket costs, then that carrier is determined to be not market dominant. Market dominance was intended by Congress to be merely a threshold test for determining the agency’s authority in hearing rate cases.

However, in implementing this part of the statute, regulators required a rail customer to prove that it did not have the ability to use another product (“product competition”) or access a similar product from another geographic region (“geographic competition”). The addition of determining product and geographic competition as part of market dominance made what was originally intended to be only a threshold test into a lengthy, complicated and overly burdensome process.

On December 21, 1998, as a result of a rulemaking proceeding, the STB determined that factors of product and geographic competition should be removed from the market dominance determinations. This provision would simply codify this decision.

Captive rail shippers are very grateful that the STB heeded the complaints of railroad customers and removed the consideration of "product" and "geographic" competition from the "market dominance" test. This provision would simply codify the STB's December 21, 1998 decision.

6. *Revenue Adequacy*.—Abolish the requirement that the Board determine on a regular basis which railroads are revenue adequate.

According to the STB, the revenue adequacy status of any particular railroad has little practical effect, and Congress may wish to consider legislatively abolishing the requirement that the Board determine on a regular basis which railroads are revenue adequate.

According to many financial analysts on Wall Street, the revenue adequacy status of any particular railroad is never even considered when determining the financial status of that railroad.

Finally, according to Dr. Alfred Kahn, the noted economist widely known as the "father of deregulation" for his work in deregulating the airline and trucking industries, the revenue adequacy test as currently applied by the Surface Transportation Board is nonsensical and should be abolished.

In short, the annual regulatory determination of revenue adequacy has little if any bearing on the realities of railroad economics unnecessarily polarizes the transportation community, and should be eliminated.

CONCLUSION

The chemical industry believes that any rail competitiveness legislation must include these provisions. These provisions do not "re-regulate" the rail industry; in fact, in most cases, they remove agency-imposed barriers to competition or adjust regulatory policies that are no longer appropriate in a consolidated industry. If these provisions are enacted, rail customers believe that we will see the growth of an inherently stronger rail industry that is responsive to customer needs and concerns. We look forward to working with you to accomplish just that.

STATEMENT OF ERIC AASMUNDSTAD, NORTH DAKOTA FARM BUREAU STATE PRESIDENT, AMERICAN FARM BUREAU FEDERATION

Senator SHELBY. Mr. Aasmundstad, go ahead.

Mr. AASMUNDSTAD. Good afternoon, Chairman Shelby. My name is Eric Aasmundstad. I am the President of the North Dakota Farm Bureau, and in addition to my duties as President of the North Dakota Farm Bureau, I am also a grain producer and custom harvest operator in North Central North Dakota. I am appearing here today representing the American Farm Bureau Federation, the nation's largest general farm organization.

NORTH DAKOTA LANDLOCKED

The area where I live in North Dakota is landlocked, and we are 100 percent dependent on over-land transport to the ports. The farmers there have every reason to be concerned about competitive transportation. It is impossible for the relatively small number of Americans who farm to feed the remaining majority of Americans who do not, in the absence of a viable transportation system.

Environmental advocates insist that we cannot expand and modernize the waterway transportation infrastructure in the upper Mississippi, which is so crucial to my area. Some of these same environmental advocates insist that the Corps of Engineers implement a so-called spring rise on the Missouri that will end commercial navigation on the Missouri, including export grain, and endanger commercial navigation on the main stem of the Mississippi. Still, other environmental advocates insist that the Corps of Engineers destroy the waterway navigation infrastructure that is critical to the competitiveness of grain producers in the Northwest.

Ironically, those who seek to end waterway navigation insist the freight can be moved on trucks and by rail when these alternative

modes are clearly unable to handle the additional freight. Add to this safety advocates who insist that highway safety must be served by reducing the number of hours a farmer can drive to deliver his grain to ever more distant river terminals and rail-loading facilities, coupled with the fact that our rural highways and bridges continue to deteriorate and Class I railroads continue to abandon rural rail lines. All these things considered together put a very, very heavy burden on the agricultural sector.

COMPETITION

Competition is important for all agricultural shippers. As a general rule, agricultural shippers are unable to command the market power to deal with a railroad company as effectively as a major coal mining company or electric utility.

We are often forced to deal with poor service, such as trains that are not delivered to a loading point in a timely manner, and it may not be picked up for days or weeks. Farmers and agricultural shippers must also absorb extremely high freight rates that railroad companies can demand due to their monopoly market power.

The real-world experience of American farmers demonstrates that competition would be helpful. Prior to the massive rail consolidation of the last 20 years, many agricultural areas were served by three or four railroads that could move grain and other bulk commodities. Today, only two railroads carry the vast bulk of the traffic that moves west of the Mississippi River, and in many areas, they do not compete with each other. Grain producers from western States pay very high freight rates to ship their grain.

STAGGERS ACT

Over the years, the ICC and the STB, which succeeded it, determined that the powers granted by the Staggers Act set that a shipping rate of 160 percent of a railroad's variable costs as full return for the railroad's cost to capital. Further, the Staggers Act determined the railroad rates greater than 180 percent of variable costs are excessive.

In a fact-finding proceeding conducted recently by the STB, the North Dakota Public Service Commission, the North Dakota Wheat Commission, and the North Dakota Grain Dealers Association submitted shipping cost figures to the STB in March 1998 regarding shipping rates from North Dakota to Portland, Oregon. According to that submission, shipping rates averaged from 229 percent to 257 percent of variable costs, using rate figures from the fourth quarter of 1995.

According to a quick survey of grain shippers in my state, BNSF now charges about \$1.20 per bushel to ship Hard Red Spring Wheat to Seattle. If you compare this per-bushel shipping price to the market being offered in my State of \$2.27 a bushel, you can see that farmers in my State are working several months a year to pay BNSF to ship their product.

Every penny in shipping costs that result from a lack of meaningful competition is born by farmers in the form of lower grain prices at the elevator where they sell their grain. We believe meaningful competition among rail service providers would help alleviate this problem.

I have spent a great deal of time here discussing the price, because the numbers are available that can help describe the problem. Service difficulties are more difficult to quantify and assign numbers to. Overtime costs elevator operators must incur when a railroad drops off cars late, and insists on picking them up loaded the next day, missing connection points with customers, and trains sometimes lost for days in shipping yards all have costs that are born by shippers, and ultimately by the farmers.

PAPER AND STEEL BARRIERS

Since many rural areas find themselves served by short-line or regional railroads, it is critically important for reforms to discourage paper and steel barriers. Paper barriers may prevent a short line or regional railroad from interchanging with any Class I other than the one that sold the track that now forms the short line's infrastructure as a condition of that sale.

These contractual barriers can take other forms as well. Steel barriers are more simple. Sometimes the class one that sold the short line or regional railroad's track simply removes any spurs or branches that would allow the smaller railroad to interchange with any other class one. Congress should prohibit such barriers to competition and instruct the STB to carry out that mandate. There are key reforms needed to ensure meaningful rail competition.

Competition is of paramount importance. Farm Bureau supports provisions of the Rail Competition and Service Improvement Act that requires incumbent railroads to offer access to competing railroads in terminal areas and allow shippers to seek rates from a competitor over so-called bottleneck rail segments. Many agricultural shippers find themselves captive to a single rail service provider.

PREPARED STATEMENT

One of the things our members, the folks I represent in North Dakota, feel that—one of the questions that have to be answered, should railroads be considered strictly a for-profit entity, owned and controlled by their stockholders, or should they be thought to provide an essential service, much as electric companies? That is the question we feel needs to be answered.

[The statement follows:]

PREPARED STATEMENT OF ERIC AASMUNDSTAD

Chairman Shelby and Members of the Subcommittee, I am Eric Aasmundstad, President of the North Dakota Farm Bureau. In addition to my duties as North Dakota Farm Bureau president, I am a grain producer and custom combine operator in north central North Dakota. I am appearing today representing the American Farm Bureau Federation, the nation's largest general farm organization, with nearly five million Farm Bureau families across the country.

Farmers have every reason to be concerned about competitive transportation. It is impossible for the relatively small number of Americans who farm to feed the remaining majority of Americans who do not, in the absence of a viable transportation system. Washington has failed to create competitive transportation options by reforming the outdated Jones Act, which effectively prohibits coastwise ocean transportation of agricultural products and allows operators of a small and inefficient U.S. flag fleet to maintain a monopoly on such transportation. Environmental advocates insist that we cannot expand and modernize the waterway transportation infrastructure on the Upper Mississippi. Some of these same environmental advocates insist that the Corps of Engineers implement a so-called spring rise on the Missouri

River that will end commercial navigation on the Missouri (including carrying export grain) and endanger commercial navigation on the mainstem of the Mississippi. Still other environmental advocates insist that the Corps of Engineers destroy the waterway navigation infrastructure that is critical to the competitiveness of grain producers in the Northwest.

Since 1997, the Dakota, Minnesota and Eastern (DM&E) Railroad has worked to improve and expand its lines, allowing it to move coal from the Powder River basin in Wyoming to its Mississippi River terminal in Minnesota. This will also allow DM&E to offer improved service to its agricultural shippers. According to USDA testimony on this matter, Surface Transportation Board (STB) Finance Docket No. 33407, Dakota, Minnesota & Eastern Railroad Corporation Construction Into the Powder River Basin, 11/30/98:

“DM&E’s shippers cannot compete effectively for (Pacific Northwest) traffic because the railroad is too slow—it takes 9 days to move across DM&E from end-to-end. Rebuilding the railroad will promise to cut this travel time from days to hours. In addition, connecting to the Iowa & Minnesota Rail Link near Owatonna, Minnesota, will allow DM&E-sourced corn to move to the processing plants of Iowa. With the ability ship to three major markets (river, processors, and Pacific Northwest), the basis price for agricultural producers should rise: some estimates suggest increases as high as \$.20 per bushel for both corn and wheat. If prices for wheat, corn and soybeans increased just \$.10 per bushel, then farm income in the DM&E service region could increase by more than \$90 million in a typical crop year.”

Mr. Chairman, with a strong endorsement like that, you might think the necessary regulatory approvals to rebuild and expand the DM&E would already be in hand, and heavy equipment would be humming in South Dakota and Minnesota. Unfortunately, that is not the case. Three years after beginning their regulatory efforts, DM&E and its investors are still awaiting an environmental impact statement (EIS) from the Surface Transportation Board that is long overdue and is estimated to run to some 3,000 pages. This draft EIS will incorporate input from five different Federal agencies, including the Coast Guard. I didn’t know the Coast Guard had anyone in South Dakota to notice what might be going on there, let alone pay attention to rail construction. In the meantime, the project is in danger of running out of money and out of time, and agricultural shippers in South Dakota and Minnesota are in danger of losing yet another transportation option.

Rural highways and bridges continue to deteriorate as Class I railroads continue to abandon rural rail lines. Ironically, those who seek to end waterway navigation insist the freight can be moved on trucks and by rail, when these alternative modes are clearly unable to handle the additional freight. Add to all this safety advocates who insist that highway safety must be served by reducing the number of hours a farmer can drive to deliver grain to ever-more distant river terminals and rail loading facilities.

Farm Bureau supports greater intermodal and intramodal competition and public policies that encourage competition. The AFBF Board of Directors approved priority issues for 2000 at its meeting in January. Among these priorities are: “Promote public policies that support a low-cost national transportation system to ensure international competitiveness of U.S. farm production.” A key aspect of accomplishing this broad goal is to seek public policies that create the largest possible number of competitive transportation options for agricultural shippers. Unfortunately, the public policy trend seems to be moving in the opposite direction.

Competition is important for small agricultural shippers. As a general rule, agricultural shippers are unable to command the market power to deal with a railroad company as effectively as a major coal mining company or electrical utility. We are often forced to deal with poor service, such as trains that are not delivered to the loading point in a timely manner or that may not be picked up for days or weeks. Farmers and agricultural shippers must also absorb extremely high freight rates that railroad companies can demand due to their monopoly market power.

We believe that the railroad landscape prior to the passage of the Staggers Act allowed for the possibility of competition. The Staggers Act brought about partial deregulation of the railroad industry and encouraged rail industry consolidation on a massive scale. AFBF policy approved by the delegates to the 81st AFBF Convention in January 2000 says, in part, “We oppose parallel mergers of rail systems and the granting of railroad abandonments which tend to lessen potential transportation competition.”

Most of the important mergers that have occurred over the last 15 years, including that which created the Burlington Northern Santa Fe, have reduced competitive shipping opportunities for many agricultural shippers. Farm Bureau opposed the 1996 merger in which the Union Pacific absorbed the Southern Pacific because of

concerns about competitive shipping opportunities for agricultural shippers. In each instance with these past mergers, shippers have been promised benefits that largely have yet to materialize. We are pleased that the Surface Transportation Board is undertaking a review of its rules for consideration of future rail mergers to determine if changes are needed. In this Board proceeding, Ex Parte 582, it is important that the Board create clear and unambiguous rules to ensure that competitive rail service options are preserved for shippers in all future mergers. Farm Bureau has provided the Board with preliminary comments in that rulemaking, and we look forward to continuing to participate in that process. For the information of the subcommittee, the pre-rulemaking Ex Parte 582 comment of the Farm Bureau is attached to my statement. But, as I will discuss later, we are concerned that Board action to encourage competition will be insufficient to guarantee competition. We believe passage of Farm Bureau-supported legislation like S. 621, the Railroad Competition and Service Improvement Act of 1999, will be necessary.

The real-world experience of American farmers demonstrates that competition would be helpful. Prior to massive rail consolidation of the last 20 years, many agricultural areas were served by three or four railroads that could move grains and other bulk commodities. Today, only two railroads carry the vast bulk of the traffic that moves west of the Mississippi River, and in many areas they do not compete with each other. Grain producers in western states pay very high rates to ship their grain. Over the years, the Interstate Commerce Commission—and the Surface Transportation Board that succeeded it—determined with the powers granted by the Staggers Act that a shipping rate of 160 percent of a railroad's variable costs (labor, transportation, fuel, etc.) is full return of the railroad's cost of capital. Further, the Staggers Act determined that railroad rates greater than 180 percent of variable cost are excessive.

In a fact-finding proceeding conducted recently by the STB, known as Ex Parte 575, the North Dakota Public Service Commission, the North Dakota Wheat Commission and the North Dakota Grain Dealers Association submitted shipping cost figures to the STB in March 1998 regarding shipping rates from North Dakota to Portland. According to that submission, shipping rates averaged from 229 percent to 257 percent of variable cost, using rate figures from the fourth quarter of 1995.

But rather than concentrate on economic theory like percentages of variable cost, one can look at prices to move rail cars from certain locations to major grain ports in the Pacific Northwest to learn the true cost of the lack of rail competition for farmers. Earlier this year, Burlington Northern charged \$3,792 to move a hopper car in a 52-car train carrying 3,260 bushels of grain from Plentywood, Montana 1,207 miles to Portland, Oregon. That is about \$1.13 per bushel for rail transportation cost. From Alliance, Nebraska, to Portland, Oregon, (1,473 miles) Burlington Northern charges \$3,325, or about \$.99 per bushel. Thus, we have the odd situation that Nebraska farmers shipping from Alliance pay less per bushel to move their grain farther than their Montana counterparts shipping from Plentywood. Why should Montana farmers pay \$.14 per bushel more to ship their grain more than 200 fewer miles than Nebraska farmers do? In this case, Nebraska farmers benefit to a limited degree from competition between railroads. Farm Bureau believes that all farmers, including those in Montana, should enjoy the benefit of competition, and Nebraska farmers should enjoy even greater benefits of competition than they enjoy now.

According to a quick survey of grain shippers in my state, BNSF now charges about \$1.20 per bushel to ship Hard Red Spring Wheat to Seattle. If you compare this per-bushel shipping price to the market being offered in my state (\$2.27 a bushel for wheat per Grainline.com on August 10), you can see that farmers in my state are working several months a year to pay BNSF to haul their grain to market. Every penny in shipping cost that results from a lack of meaningful competition is borne by farmers in the form of lower grain prices at the elevators where they sell their grain. We believe meaningful competition among rail service providers would help alleviate this problem.

I spend a great deal of time here discussing price because numbers are available that can help describe the problem. Service difficulties are more difficult to quantify and assign numbers to. Overtime costs elevator operators must incur when a railroad drops off cars late and insist on picking them up loaded the next day, missing connection points with customers, and trains sometimes lost for days in switching yards all have costs that are borne by shippers and ultimately by farmers.

There are key reforms needed to ensure meaningful rail competition. Competition is of paramount importance. Farm Bureau supports provisions of the Rail Competition and Service Improvement Act that requires incumbent railroads to offer access to competing railroads in terminal areas, and to allow shippers to seek rates from

a competitor over so-called "bottleneck" rail segments, where many agricultural shippers find themselves captive to a single rail service provider.

Since many rural areas find themselves served by shortline or regional railroads, it is critically important for reforms to discourage "paper" and "steel" barriers. "Paper" barriers may prevent a shortline or regional railroad from interchanging with any Class I other than the one that sold the track that now forms the shortline's infrastructure as a condition of that sale. These contractual barriers can take other forms as well. "Steel" barriers are more simple: sometimes the Class I that sold the shortline or regional railroad its track simply removes any spurs or branches that would allow that smaller railroad to interchange with any other Class I. Congress should prohibit such barriers to competition and instruct the Surface Transportation Board to carry out that mandate.

Thank you for your time and attention. I'd be happy to answer any questions you may have.

Senator SHELBY. Thank you. Ms. Duff, do you mind if Senator Burns—if you will defer to him. I wanted to ask you, though—

Senator BURNS. Yes. You better ask her—you do not want to get—

Senator SHELBY. I think you-all are on the same song book here—

Senator BURNS. Yes.

Senator SHELBY. The same page.

Senator BURNS. Mr. Chairman, thank you very much—

Senator SHELBY. Senator Burns, thank you.

Senator BURNS [continuing]. For inviting me here today. I will just submit my statement. I did want to—

Senator SHELBY. It is in the record, without objection.

Senator BURNS [continuing]. Sort of reinforce what Mr. Aasmundstad, down there, said.

STATEMENT OF SENATOR CONRAD BURNS

Senator BURNS. Keep in mind that we are talking about great distances in the West when we start working, when we start moving stuff, whether we are moving coal, or we are moving services or equipment into our State, because agriculture, we sell wholesale, we buy retail, and we pay the freight both ways. Right now, that freight is taking one big bite, especially in States where we are captive shipper. North Dakota has the same problem we did.

Now, I will tell you a little story about Wesby, Montana. Wesby, Montana used to be in North Dakota years ago, but they moved over into Montana, because of a freight weight situation. Now, we are thinking about moving it back, because you get the cheaper rates from North Dakota to Portland than we do in Montana. We can ship to North Dakota, and North Dakota can change engines and send it right back through the State, back to Portland, and we come out a little bit better. That is the way it was working for quite a while.

So we have legislation pending, and it has quite a lot of support around the country, and, of course, I do not think there is a chance that we get it done this year, but next year I think we will, and we need to pursue it for the simple reason that even though the railroads or the majors will tell you that rates have come down nationally, but in States where we are captive shippers, just the opposite is true.

About 3 years ago we got into a situation that has hurt agriculture more than anything else. We had a merger in the South-

west, and we had a virtual meltdown in Houston. We had cars tied up, and we had grain on the ground that never was shipped, that was never moved, and you combine that with the complete collapse, the financial collapse of five countries in the Pacific rim that take the majority of our production in the Northwest, and you combine those two, and we have never been able to recover from those situations. Some of that was caused by just the lack of service and the attitude towards service, and also our freight rates.

So I am going to submit my statement for the record today. I appreciate you having these hearings. There is concern, because the mergers in the railroads are not over. They are not over.

There are some pending out there, even though the Burlington Northern Santa Fe with the Canadian National, that is sort of on the back burner right now, I doubt if it will happen, but it is not for sure that there are not more mergers out there in the offing.

So I appreciate you having these hearings, and I appreciate the courtesy. Thank you, Ms. Duff, for doing that, and I would submit my statement for the record.

PREPARED STATEMENT

Senator SHELBY. The statement will be made a part of the record without objection.

[The statement follows:]

PREPARED STATEMENT OF SENATOR CONRAD BURNS

Thank you Mr. Chairman, I appreciate the opportunity to testify before your Subcommittee. The issue of rail competition is one I have been very active on over the last decade.

As you know, Congress passed the Staggers Act in 1980. At the time of enactment, there were over 40 major railroads. Today, we have only 4 major railroads. Within 20 years, rail competition in our nation was decimated. Today you will hear testimony that our nation's rail transportation environment is as healthy as ever. You will hear testimony that rail rates have decreased significantly under deregulation as provided by the Staggers Act.

What you won't hear from the rail industry is the growing numbers of markets that are becoming captive to railroads. Corporate consolidation has had severe implications for Montana's farmers and ranchers. The rail industry is no different. Montana is almost entirely captive to a single railroad.

What does that mean? Considering the cost and level of service provided in Montana, this means our farmers pay more than any other shipper in the nation for less than adequate service. Montana farmers are forced to wait until the railroads are ready to provide service while these same railroads rush to provide service to those areas where a competitive element exists. Meanwhile, Montana grain fills our elevators, and once full, the grain sits on the ground exposed to the elements until rail transportation is available.

Once that service is available, Montana farmers pay extremely high rates, higher than any other rate in the nation for this service. Mr. Chairman, the bottom line is that Montanans pay more for less. Now this is just one scenario—granted an extreme scenario—from one region of our nation.

Our nation's railroad transportation environment is not stable in its current state. Nationally, our rates have decreased since passage of the Staggers Act. However, regionally, farmers and other shippers raise concerns about inadequate service or forced high costs due to a lack of competitive presence. I expect this to evolve further.

Industry stability is absent. We can determine this not only by the recent merger attempt but also by the impact this announcement had on the entire industry. Immediately following the announcement by the Burlington Northern Santa Fe and Canadian National railroads, I was made aware of several other merger discussions. Alliance building within the railroad and airline economies in the face of competitor merger proposals is a fascinating process.

Also, we can consider the instability of the rail industry by the impact on rail service following the 1995 merger of the Union Pacific and the Southern Pacific. The Houston meltdown in 1998 had service impacts across the nation. Montana farmers were hit especially hard in a time of financial crisis that remains in existence today.

Through all of this, the Surface Transportation Board contends we have a very healthy rail industry. Given this inability to see the forest through the trees, I am particularly concerned about the STB's effectiveness as the adjudicating body between railroads and shippers.

Montana's grain producers as well as other small businesses have been facing tough transportation issues for nearly two decades. Montana is a classic case of what happens to shippers when you eliminate competitive transportation alternatives. Our rail rates go through the roof and our shippers end up subsidizing rail rates in regions where we do have competition.

Now, we're seeing the same thing happen in other regions around the nation. Montana has been down this road and I encourage members of this Committee to look at the problems we face in Montana as a precursor to what will happen in other regions.

The STB, based on their 1998 decision regarding the *McCarty Farms vs. Burlington Northern* case, has indicated to the producer that BNSF's rates are not excessive. I am concerned that after 17 years of adjudication, by using the STB's decision making process, those decisions may not be the right decisions.

Montana rail rates are the among the highest in the country. These rates significantly exceed 180 percent of variable cost, and the only way the STB can justify the rates as reasonable is to subscribe to the 'differential' pricing scheme of the railroads. Make no mistake about this scheme, it is 'discriminatory' pricing and it is only practiced by monopolies. It is unfair on its face and Congress needs to consider legislation such as S. 621 introduced by myself, along with Sens. Rockefeller, Dorgan and Roberts, that will help to introduce competition into this market like it has done with other monopolized markets such as telephone, electric utility, and pipeline transportation.

Montana's shippers pay some of the highest rates in the world while our neighbors pay a significantly lower cost for transportation. The price of regulatory freedom for monopolies, should not be borne by captive shippers.

The rail industry is unique. Other industries whether that be the airlines, utilities, or telephone companies have their own problems. But rail transportation is based solely on trackage rights. Competition is quickly becoming an unknown in rail transportation.

In Montana, we are truly dependent on the railroads to transport bulk commodities that could not be efficiently transported by any other means. Economic history can tell us what happens in an environment without competition. The free enterprise system is not based upon allowing monopolies to control markets. The provider rakes in the profits but the shipper continues to pay the cost in increased rates and a decrease in the quality of service.

Today's witness representing the railroads will suggest that Montana's rates are the result of an open and deregulated environment. If the problem is strictly based on market dominance, how can Montana's shippers have the highest freight costs in the nation. If ever there has been a victim of free-market economics, Montana's producers top that list.

It is apparent that the failure of the Surface Transportation Board to take proper action against the nation's rail industry has led to a problem of much larger scope—this is not just Montana's problem anymore—it is now a national problem. Therefore, it is important that Congress take action now to enforce the rights of our nation's producers and preserve the idea of competition while there remains an opportunity to preserve competition.

Agricultural shippers are the most vulnerable to predatory marketing by monopolistic practices of railroads. They are charged the freight rates by the grain merchandisers when they deliver their grain to market, but they don't pay the railroads, the merchandisers do. The most important point is that the farm producer unlike every other industry we know of in America, cannot pass the freight costs on to anyone else, they must simply eat it.

We do not need to re-regulate the railroads; rather we need to restore the balance between shippers and railroads that Congress intended to achieve originally in the Staggers Rail Act of 1980. I look forward to working with my colleagues to restore the competitive balance in the rail transportation industry and level the playing field for shippers.

Thank you, Mr. Chairman.

Senator SHELBY. Ms. Duff, thank you for deferring to the Senator, but he wanted to make sure that was your choice.

Ms. DUFF. Well, it was my pleasure to defer to the Senator.

Senator BURNS. We have been working together on a lot of this stuff.

Senator SHELBY. We have.

Senator BURNS. It was a pleasure.

Senator SHELBY. Before Senator Burns leaves, our staff has just reminded me, I just want to point out that he is a member of the Commerce Committee, a very active chairman of the subcommittee there. He knows a lot about these issues, you could tell.

It is my understanding, Senator Burns, that you are the co-sponsor of a rail reauthorization bill that addresses many of the service, rate, and access issues that we have been talking about today, is that correct?

Senator BURNS. Right. S-621.

Senator SHELBY. Where is that bill now?

Senator BURNS. Well, it is still in committee.

Senator SHELBY. It is still in committee.

Senator BURNS. I will try and convince the chairman.

Senator SHELBY. Okay. Thank you.

Senator BURNS. Okay.

STATEMENT OF DIANE DUFF, EXECUTIVE VICE PRESIDENT, ALLIANCE FOR RAIL COMPETITION

Senator SHELBY. Ms. Duff, your full statement will be made part of the record, without objection. You may proceed, as you wish. Thank you again for deferring to Senator Burns.

Ms. DUFF. Absolutely. Thank you very much, Senator Shelby, for focusing your attentions on the rail competition debate.

I am here today representing the Alliance for Rail Competition, which is a broad coalition of rail customers, including agriculture, coal and utilities, chemicals, and petro-chemicals, forest and paper products, steel, and other manufacturing industries that rely on rail transportation.

RAIL OVERSIGHT SYSTEM

As far as these rail customer constituencies are concerned, the rail oversight system is broken. Government regulators have spent too much time over the past 20 years trying to apply their views of what is fair, and not enough on accomplishing the mandate of deregulation, which would systematically replace government regulation with competitive choice as the most effective and unbiased arbiter.

Railroads may face some intermodal competition in some markets, but head-to-head competition among railroads has been virtually eliminated by 20 years of protectionist regulatory decisions, and dozens of mergers, all sanctioned by rail regulators.

This current state of affairs means that a large chunk of rail customers who have no modal alternatives are paying exorbitantly high rates for some of the worst service that the railroads have to offer. Furthermore, captive rail customers are rightfully fearful of the potential of railroad retaliation if they pursue either regulatory

or political intervention, so much so, that many refuse to enter into this debate at all.

RETALIATION TACTICS

Railroads have often employed subtle and not-so-subtle retaliation tactics to quiet customer complaints. In fact, railroads have such complete market control over these groups of customers that they can apply such rates or limit service in such ways as to put rail customers out of business, or at least, at further extreme disadvantage.

Railroads will tell you that today's policies benefit the public, because there is no other way to earn the revenues necessary to sustain their high fixed costs, low-return businesses. This is simply not true. Many, many industries with similar cost structures function quite successfully in highly competitive environments. They have figured out how to differentially price their services according to customer demands, rather than monopoly control.

The key is being willing to listen to your customers, providing the various tiers of services that will meet their needs, and pricing those services accordingly. For railroads to do this, they need to apply innovative solutions to their rampant service problems. Competition has regularly provided the necessary incentive for other former monopoly industries to do the exact same thing.

Unfortunately, the Federal agency put in place to prevent this kind of behavior has been somewhat of a paper tiger. I have no doubt that the members of the board believe that they are exercising the board's legal authority consistent with the will of Congress. After all, to date, neither of the authorizing committee chairman in either the House or the Senate have been particularly sympathetic to calls for competition among railroads.

Furthermore, I must give this board due credit for the things that it has done; for example, the market dominance decision that they promulgated in 1998 expedited service relief procedures, and, in fact, undertaking the current merger policy review that is under way. However, rail customers do not want to have a regulator determine what is fair, and they cannot afford the 2-year or more process that it takes. They want to be able to negotiate in a free market, where they have a choice, and the STB has done nothing to foster that kind of competitive choice among railroads.

In the next couple of weeks, the board will release its proposed merger policy rules, and then we will see whether the board will finally apply clear, specific guidelines for how to increase competition among railroads through its broad merger authority. No matter what the board does, however, Congress must determine the role of competition among railroads for the future.

Addressing concerns of customer choice via mergers can only do so much, and the board has repeatedly made it clear that it is not going to independently change current system-wide policies that limit competition within the existing industry framework.

BOARD GUIDELINES

Thus, I urge this committee to keep a close eye on the board's activities in the coming months. If the board does not provide clear guidelines for how it will exercise the broadest portion of its au-

thority to promote competition among railroads, then I suggest that this committee ought to consider the relative value of this agency, and provide annual funding for it accordingly. The rail customer community will keep you informed of our views on this process, while continuing our efforts to promote comprehensive rail policy reform.

I should add, also, that the Alliance for Rail Competition has consistently supported the provisions that Mr. Crowe outlined in his testimony earlier, but as we continue to look down the road at what the rail industry has made very clear is going to happen, and that is further mergers, resulting in likely a two-railroad monopoly system throughout North America, we need to really look very hard at what those provisions do in that sort of an environment and really question whether it is enough, and we will be doing that in the coming months.

PREPARED STATEMENT

Thank you again for having this hearing, and I appreciate the opportunity to testify.

Senator SHELBY. Thank you, Ms. Duff.
[The statement follows:]

PREPARED STATEMENT OF DIANE C. DUFF

Mr. Chairman and members of the subcommittee, thank you for holding this hearing today. Your time and attention are greatly appreciated by the rail customer community, which wants very much to work with this committee and others to bring responsible free market competition to the freight rail industry, and to put an end to rail monopoly control.

My name is Diane Duff, and I serve as the Executive Director of the Alliance for Rail Competition, also known as ARC. ARC is a membership organization dedicated to promoting rail-to-rail competition through legislative changes to rail policy. ARC's membership consists of corporate and other organizations representing the agriculture, coal and utilities, chemicals, petrochemicals, plastics, forest and paper, steel and other manufacturing industries. ARC also collaborates with the many trade associations and professional organizations that represent these industries. My testimony will attempt to succinctly cover a broad range of the elements involved in the debate regarding rail competition, including some of the policy recommendations supported by the rail customer community. Furthermore, I will make some suggestions to this committee regarding how to assess the performance of the Surface Transportation Board in future appropriations cycles.

I. THE RAILROAD INDUSTRY POST-DEREGULATION

The members of the Alliance for Rail Competition view rail deregulation—embodied in the Staggers Rail Act of 1980—as having had many beneficial effects. Deregulation freed the railroad industry from artificial regulatory constraints that had been financially devastating, and the removal of these restraints has led to improved productivity and increased profitability.

However, the monopoly characteristics that we see in today's rail industry certainly cannot be what Congress envisioned when the Staggers Rail Act was passed. Although rail deregulation provided railroads with financial assistance, the real purpose of deregulation was to allow competition to prevail—that is, true competition in an effective efficient and timely manner without creating interim monopoly power and bottlenecks.

Unfortunately, monopoly power and bottlenecks are the primary characteristics of today's rail industry. Since deregulation in 1980, the number of major Class I railroads has declined from approximately 42 to only four major railroads today. These four mega-railroads overwhelmingly dominate railroad traffic, generating 95 percent of the gross ton-miles and 94 percent of the revenues, controlling 90 percent of all U.S. coal movement; 70 percent of all grain movement and 88 percent of all originated chemical movement. This drastic level of consolidation has left rail customers

with only two major carriers operating in the East and two in the West, and has far exceeded the industry's need to minimize unit operating costs.

Railroads frequently claim that consolidation has not reduced rail customers' ability to gain access to more than one railroad, or even harmed those customers who have always been captive to one railroad, since those rail customers never had access to more than one carrier prior to these many mergers. However, the potential alternatives those captive shippers once had have been essentially eliminated because, in most cases, the captive rail customer's entire route or routes are now controlled by a single carrier. This highlights how little has been done by regulators to "maximize competition to the greatest extent possible," as directed by existing statute.

Rates.—When it comes to discussing rate levels and whether or not they are fair, it all depends on how dependent you are on the railroad for transportation. Those rail users that have some options—such as the proximity of a second railroad or another mode of transportation altogether—are the ones who have the competitive benefits intended by deregulation.

However, there remains a significant portion of the rail customer community that has no choice. For example: it is virtually impossible to move millions of tons of coal by truck; transporting bulk quantities of grains by truck over hundreds of miles is not economically feasible; and safety concerns limit the movement of many chemicals to rail. Of course, not all coal, chemical and grain traffic is captive—some companies moving these commodities are located in proximity to two railroads, or are close enough to a waterway to make barge transportation viable. But many, many companies that move these kinds of bulk commodities and cannot access more than one railroad are held hostage to railroad monopoly power. In general, we know that these captive rail customers are paying rates that are anywhere from 30 to 50 percent higher than the rates of their competitors that have some competitive transportation alternative. Under this scenario, rail transportation becomes one of the biggest—if not the biggest—cost associated with moving these low-value bulk commodities. As a result, these captive rail customers are put at a significant disadvantage in their own markets, and in a sense, a railroad can determine the economic success or failure these customers.

The Association of American Railroads asserts that rail freight rates have declined by more than 50 percent in constant dollars since 1980. However, I urge you to look behind the graphs and understand what these numbers really represent. The AAR data does not measure freight rates as the price paid to ship some quantity of the commodity in question. Instead, the railroads use a complex average of various statistics known as "revenue per ton-mile," a measure that is not comparable to the rates actually paid for rail transport. In fact, AAR's own data contradicts the use of revenue per ton-mile as a rate surrogate. Comparing revenue per ton-mile to the AAR Freight Rate Index shows that revenue per ton-mile overstates the decline in rates by more than 300 percent. Additionally, Commerce Department data shows that this discrepancy between rates and revenue per ton-mile continues today.

Furthermore, the revenue per ton-mile measurement has been falling steadily since at least 1935, regardless of the regulatory climate. This happens because revenue per ton-mile is driven by a complex set of factors, such as length of haul, commodity mix and shipment size which can, in combination, produce reductions in revenue per ton-mile even when the freight rate structure is otherwise unchanged, or even increases. Thus, much of the decline in revenue per ton-mile is a mathematical illusion. Railroad traffic has undergone dramatic structural changes, particularly in the past 20 years. First, unit trains—that have lower costs and revenues per ton-mile than other trains—are more widely used. Second, there has been significant growth in long-haul corridors that have lower costs and revenues than short distance movements. Third, more and more costs have been transferred to the rail customer in the form of cars and equipment, loading and unloading facilities, and other similar costs. In addition, the consequences of growing the "cheaper" varieties of freight—i.e. those low-value bulk commodities that have no real transportation alternatives—are that average revenue per ton-mile has declined, irrespective of changes in rates. The ploy of masking structural changes in the rail industry by employing revenue per ton-mile as a surrogate for rates creates the false illusion of rapidly decreasing freight charges.

Consider rates from another perspective. The U.S. Bureau of Labor Statistics Railroad Producer Price Index reveals that rail prices, as defined by the amount

customers pay for rail services, increased 48 percent from 1980 to 1996 whereas the AAR Revenue per ton-mile (RTM) statistic indicates a decrease of 18 percent.¹

Another way to see what's really happening with rates is to compare the rise of rail rates to the price of the commodity being transported. For example, when one looks at the rail rates versus the price of wheat shipped from Montana between 1975 and 2000, the rail price has risen from less than 20 percent of the price of wheat when there was limited rail-to-rail competition in the state to over 50 percent in 2000 when the BNSF today, has a total monopoly on rail movements from the state.

Captive rail customers' concerns about rail rates center on the inability of entire industries and/or regions that are captive to continue to compete in the world economy. If a railroad monopoly exists between the producer and the end-user of the commodity, the monopoly railroad has the ability and the will to exact, through its tariffs, all of the profit gained by efficiency and productivity. U.S. producers face competition all over the world for their products against many foreign competitors who do not face a monopoly railroad situation.

The U.S. General Accounting Office (1999) conducted a recent general survey of rail customers, yielding some telling results. They found that 81 percent of shippers want increased transportation competition and 75 percent believed that they were being charged unreasonable rates.

Service.—While rates are a serious concern for many shippers, of at least equal, if not greater, concern is the deteriorating quality of service that shippers—particularly captive shippers—receive. Massive amounts of testimony about service problems resulting from both the UP/SP service crisis in the West and the ongoing service problems associated with the division of Conrail between CSX and Norfolk Southern. Railroad service failures have cost the national economy billions of dollars. However, given the broad diversity of the rail customer community—and each customers' respective and differing service needs—it is very difficult to quantitatively portray the railroads' service performance in any meaningful way.

Railroads present performance measurements based on train speeds, the amount of time a train sits in a terminal area, and so forth, but again, the specific needs of any given rail customer make these averages somewhat irrelevant unless you're interested in the fluidity of the entire system. If I'm making regular movements of unit coal trains to a facility, my estimation of rail performance is likely to be consistency: are the unit trains arriving and departing on a stable and reliable schedule that allows me to maintain my coal stockpile at the optimum level? However, if I'm moving multiple car shipments of chemicals to various locations where my customers require those materials by a certain time, my rail service needs are likely to be quite different. Alternatively, if the price of wheat is favorable and I need to

¹R.L. Banks and Associates Inc. and Fieldston Company, Inc. (1998) "Rail Freight Rates in the Post-Staggers Era". Report prepared for the Alliance for Rail Competition, available on-line at <http://www.railcompetition.org>

move my wheat harvest to the West Coast for export, will the railroads provide the cars and locomotive power necessary to deliver that shipment to the port quickly enough so I can capture that price?

In short, railroad performance can really only be truly measured one customer at a time, and thus, anecdotal stories from customers who are captive to rail transportation become quite informative. For example, a Chicago-area agricultural processor purchasing \$30 million worth of rail services annually was quoted last year as saying, "If I could figure out a way to conduct our business without using railroads, I would absolutely without any hesitation stop doing business with them." Another rail customer was quoted, "There isn't one [railroad] today that is easy or convenient or just competent enough to warrant doing business with." With the consolidation of the railroad companies, he continued, "it is getting worse. As they get bigger we become relatively less important to them."²

The railroads have frequently blamed current rail customer complaints on the transitions that naturally take place after mergers. In truth, however, rail customers have been concerned about deteriorating service for years. Railroads have paid less and less attention to customer service, further demonstrated by the fact many of them have virtually eliminated their customer service departments over the last five years.

The bottom line is that, from the rail customer's perspective, the level of rates and the quality of service are directly linked to the shipper's ability to access competition. In other words, those rail customers that are the most captive pay the highest freight rates and get the worst service. Where there is competition, rates go down and the quality of service goes up; and when competition is absent, the opposite also is true.

In summary.—By most standards, the pro-competitive goals of rail deregulation have not been met. Competition among rail carriers is virtually nonexistent, and as a result, not a single North American railroad is meeting the current supply chain standards required by most American industry—nor is there any reasonable prospect of remarkable improvement. Certainly, some of the few remaining major railroads perform better than others. But after five or more years of constant service failures by one railroad or another, the perpetuation of distorted freight rates, and a continued emphasis on further consolidation rather than service, operational innovations and improvements, it is clear that railroad policy changes are needed.

II. THE ROLE OF REGULATORS

Unfortunately, the STB hasn't, up to now, felt that the rail customer's pain warranted encouraging competition to provide fairness in the marketplace for the constituency it is mandated to protect. Despite clear statutory language directing regulators to encourage competition to the maximum extent possible, regulators seem to have an overly narrow view of their responsibility to protect existing or encourage new competition among railroads. In all fairness, this narrow protectionist approach was not something that the Surface Transportation Board dreamed up when it was created in 1995. And furthermore, the STB has recently made some decisions that improve regulatory processes. Still consider the following damage that has already occurred over the past five years.

—The STB has approved mergers that have placed 94 percent of the entire U.S. rail transportation market in the hands of just four carriers, and those four carriers don't even compete with each other over significant portions of their respective territories. It's worth noting that the Department of Justice vehemently opposed the UP/SP merger, which the Board has often identified as having significant competitive benefits. Although the Board has imposed some conditions to mitigate the loss of the barest levels of competition, those conditions have been applicable only in limited areas, and have not attempted to improve competitive factors, or extend competitive access to those rail users that have historically been captive to one railroad. Since the Board's merger authority is so far-reaching, it seems that the Board could have taken a more aggressive approach to encouraging competition in previous merger transactions.

—The STB, and its predecessor, have consistently condoned the act of Class I carriers creating "paper barriers" when spinning off a branch line to form a shortline railroad. A paper barrier essentially prohibits the newly created "independent" shortline from interchanging traffic with any railroad but the parent carrier. As a result of paper barriers, the shortline and regional railroad community can also be captive to Class I carriers.

²"Getting Worse," Traffic World, Clayton Boyce, Editor. October 4, 1999.

—The STB determined that railroads are fully within their right to exploit customers located on a bottleneck. A “bottleneck” is a segment of rail track that serves either the point of origin or the point of destination in any given route. Because the bottleneck is controlled by one railroad, that railroad can force any customer that needs to move goods over that portion of track to use only that railroad’s services over the entire route, regardless of whether a second carrier may be available to provide competing service for a majority of that route.

Certainly, the Board should be given credit for its modest attempts to enhance competition, such as its 1998 decision to eliminate product and geographic competition factors from the market dominance determination process. But why shouldn’t its efforts have been more aggressive? And as the agency charged with regulatory oversight of the rail industry, why has the Board not requested additional authority to rectify what has clearly become an anti-competitive environment? Some rail customers have suggested that the Board has been overly influenced by the railroad industry.

This brings us to the Board’s ongoing Ex Parte proceeding intended to revise its merger policy procedures. There may be some differing views within the rail customer community regarding the necessity of the merger moratorium that is running concurrent with the Board’s policy review. Nonetheless, almost without exception, rail customers loudly applaud the Board’s efforts to revise its merger policy procedures. ARC will be judging the Board’s Notice of Proposed Rulemaking, due out the first week of October, based on the following criteria:

1. *Need*.—Does the proposed rulemaking recognize the need for competition to exist between rail carriers?

2. *Specificity*.—Does the proposed rulemaking provide clear and concise guidelines for enhancing competition?

3. *Comprehensiveness*.—Does the proposed rulemaking identify ways in which pro-competitive conditions can be applied throughout the industry?

In Summary.—The Board has made some small steps in the last two years to address the concerns of the rail customer community. However, the Board’s merger policy review is probably the best opportunity that it has to demonstrate that it is relevant in the effort to achieve the full intentions of rail deregulation. The Board must realize that the system is broken, and nothing shy of decisive congressional action that replaces government regulation with true market competition is likely to fix it.

III. THE APPROPRIATIONS COMMITTEE’S ROLE

ARC recognizes that congressional jurisdiction for rail policy reform lies largely with the Commerce Committee in the Senate, and the Transportation Committee in the House. But while the authorizing committees can decide to allow this controversial debate to linger, appropriators are faced each year with the dilemma of whether to continue funding the STB. Should the STB’s merger policy review not provide clear guidance for enhancing rail-to-rail competition in an expansive manner, it will have demonstrated a lack of relevancy to the principles of deregulation. In this regard, this committee ought to give serious consideration to specifically directing the use of funding or even eliminating funding altogether.

IV. THE CROSSROADS: WILL RAILROADS WORK WITH THEIR CUSTOMERS TO FIND THE SOLUTION?

The rail industry is at a crossroads that will determine whether it will continue to be a viable commercial service. The long-term viability of rail transportation depends solely on whether rail customers are able to choose among a variety of service levels, offered at economically competitive rates by more than one rail carrier.

Rail industry executives can work with rail customers in the policy arena to restructure rail operations to incorporate this kind of free market competition among rail carriers. Conversely, rail industry executives can cling to the misguided hope that their businesses will survive as long as they can extract maximum revenues from their customers that have no transportation choice. Thus far, rail executives have clearly chosen to continue down the latter path, fighting against the very customers whom they are supposed to serve.

What railroad executives refuse to acknowledge is that today’s captive customer is not likely to have the luxury to accept the railroads’ monopoly behavior in perpetuity. Consider:

—The restructuring of the electric utility industry is introducing new competitive pressures, and paired with the ongoing environmental debates about coal usage, more and more utility executives are looking at natural gas as the fuel of the future. Not a single coal-fired generation facility has been built in the last 20

years, and there are no new ones on the drawing board. Thus, as old coal-fired generators are retired, railroads will begin to see a serious revenue drain.

—Chemical industry executives have already undertaken massive build-out projects to gain access to competitive rail transportation. Others have begun to make new and relocation facility siting decisions based on competitive transportation alternatives, and some of those decisions are taking the facilities out of the U.S. altogether. Once again, railroads will eventually see dwindling revenues in the movement of chemicals and plastics.

—Grain traffic is already diverting to trucks when at all possible. But the emergence of high value specialty crops—such as peas, lentils, high protein wheats or high oil corns—that move in truck quantities are going to begin to take their toll on rail revenues generated by this sector.

Conventional railroad wisdom is that captive customers are needed to survive, and that any loss in revenues from its captive customer base will require it to make up for those losses elsewhere. Given the dynamic economy that rail customers face, railroads can be assured of revenue losses if they continue the monopolist's business strategy.

Restructuring the rail industry around a competitive framework, however, would put today's railroads back in the game.

While railroad traffic has increased somewhat in recent years—tonnage has climbed by about two percent annually during the 1990s—the industry continues in its long-term trend of declining market share. As shown below, over the past half century, the railroad industry's share of intercity tonnage has dropped from 47 percent of the market to 25 percent of the market.³ At the same time, the truck market share has increased from 26 percent to 49 percent. These trends have continued throughout the 1990s. Conversely, the "Economic Report of the President" reveals that from 1990 to 1997, the Index of Industrial Production increased by 3.8 percent annually—almost double the rate of growth in railroad tonnage. Of course, some production is consumed locally, but the data shows that railroads are not full participants in the country's incremental production.

[In percentage]

| Year | Railroad Market Share | Truck Market Share |
|------------|-----------------------|--------------------|
| 1950 | 46.7 | 26.1 |
| 1960 | 36.1 | 32.7 |
| 1970 | 31.1 | 36.2 |
| 1980 | 28.7 | 36.3 |
| 1990 | 27.1 | 40.3 |
| 1995 | 25.7 | 46.1 |
| 1998 | 25.1 | 48.6 |

Finding the Right Solution.—In this contentious environment, rail customers have fought for legislation that would make modest adjustments to the interpretation of the existing statute. Basing all recommendations on the intent of the original statutory language, rail customers have almost universally supported the following legislative provisions:

1. *Policy.*—Clarify the rail transportation policy of the U.S. by requiring the Surface Transportation Board to give greater weight to the need for increased competition between and among rail carriers.

2. *Bottlenecks.*—Require rail carriers to quote a rate, upon request, between any two points on the system where traffic originates, terminates or may reasonably be interchanged without regard to whether the rate is for only part of the total movement.

3. *Competition in Terminal Areas.*—Eliminate the requirement that evidence of anti-competitive conduct be produced when the STB determines outcome of requests to allow another railroad access to rail customer facilities within an area served by the tracks of more than one railroad.

4. *Relief for Certain Agricultural Shippers.*—Provide small, captive agricultural shippers with a simple benchmark test for rate and service cases.

³ Rosalyn A. Wilson, Eno foundation, *Transportation in America 1999*, 17th edition. Tonnage data includes railroads, trucks, oil pipelines, water carriers, and airlines.

5. *Market Dominance*.—Codify the STB's decision to exclude evidence of product or geographic competition when determining market dominance.

6. *Revenue Adequacy*.—Abolish the requirement that the Board determine on a regular basis which railroads are revenue-adequate.

However, throughout this year, representatives of the railroad industry have repeatedly stated their intention to continue pursuing mergers as a means of increasing operating "efficiency" and "promoting competition" at some point in the future. In fact, most observers—and even many rail executives—agree that additional mergers will eventually produce a North American rail system monopolized by two transcontinental railroads. In the face of such developments, are the modest provisions rail customers have embraced thus far really enough?

Under such circumstances, is it reasonable to expect that one rail system will compete for customers served by the other, and vice versa? Basic economic theory holds that, in the long run, dual monopolists decide that an activity such as competitive (marginal) pricing is self-defeating because the other supplier will match it. The same theory holds true for service innovations as well. Thus, even with the ability to ask for a bottleneck rate or for access to the second carrier in a terminal area, rail customers are likely to have little or no choice of prices and service levels should the rail industry consolidate further.

In the coming months, the rail customer community will be forced to come to terms with the implications of the railroad industry's end game, and determine its own vision for addressing that end game. As with any monopoly situation, the question will always be "how much access is necessary and appropriate to facilitate meaningful competition?" Thus, the solutions we pursue in the 107th Congress may be quite different than those we see today.

The Impact of Competition on Railroads.—As we consider the future of this evolving industry, it's important to understand that increased levels of competitive access can—and will—benefit all affected parties. Central to the debate over competition is whether railroads must have monopoly power in order to remain financially sound, and if not, how much access is necessary for the forces of free market competition to take hold.

Those who oppose the introduction of competition—and who wrongly refer to any form of competition interchangeably as either "reregulation" or "forced access"—base their opposition on a series of incorrect assumptions:

1. A competitive railroad marketplace cannot sustain the practice of differential pricing, because competition automatically drives all rail rates to equality.
2. Without differential pricing, the industry will not be able to earn sufficient revenues to cover their expenses or provide efficient service to shippers.
3. The reduction of revenues caused by eliminating differential pricing will keep railroads from investing in their infrastructure.

It may sound good, but the evidence suggests otherwise as discussed by Dr. Robert McCormick of Clemson University in a verified statement before the Surface Transportation Board, commissioned by the Chemical Manufacturers Association.

Differential Pricing.—Differential pricing exists for all competitive industries. However, competitive industries differentially price based upon the demand of the consumer. They do not isolate and then plunder one group of customers in favor of another group of customers as the railroads do.

Consider differential pricing in other industries, many with large fixed costs similar to the railroads:

- Hotels allocate certain numbers of rooms to as many as 20 different rate tiers.
- Telephone markets show similar patterns. There are time of day and bulk pricing features; weekends and nights are cheaper than weekdays. Large volume purchasers pay lower prices than small volume users.
- Literary works and movies are distributed in a way that is intended to charge higher prices to those who have a greater desire to read or see them immediately upon release, as opposed to those consumers who are willing to wait. In the case of books, there are hard cover vs. soft cover releases, and for movies, evening vs. matinee showings, theatre tiers, video sale, video rental.
- Airlines offer many levels of discounted seats that allow for different priorities of service and based on advance purchase.
- Electricity has special price tiers, such as peak load pricing, and "green power."

In fact, for its competitive intermodal traffic, BNSF already differentially prices based on demand of the consumer through tiered service packages that have delivery time components (delivery within 80–85 hours; 75–80 hours; 55–60 hours, and guaranteed delivery time with a full price refund).

In each example, these industries share the same features of railroads: large fixed costs that must be allocated across different users. Railroads are not unique, and in fact, these features are becoming more and more commonplace.

So if railroads can practice differential pricing in a truly competitive marketplace, then do the remaining assumptions hold water? No. Clearly, so long as railroads are well managed, those railroads can—at the very least—earn their cost of capital, which in turn allows them to continue investing in their infrastructure at least at the same rate as they do today.

To test our theory that railroads could compete without harming their financial picture, ARC commissioned an analysis based on real world economic behavior and using very conservative data from reliable data sources projecting growth of the key industries that rely on railroad transportation. What we found was that rather than bankrupting the railroad industry, competition would generate increased net revenues to the tune of \$500 million annually. Is this a windfall? Certainly not. But the point was not to predict exact revenues, but to identify likely trends if railroads were to be placed in a competitive environment.

As for their ability to invest, the evidence again shows that investment increases when competition is introduced. Telecommunications industry is the best example, because if forcing competition on a regulated industry is truly a prescription for disaster, then the telecommunications industry should be in a shambles—which it is not.

But let's focus on investment levels before and after competition was introduced. Did competition cause investors to withdraw financial capital from the industry? Absolutely not. In fact, investment increased dramatically. Rather than capital flight, there has been a continuous capital infusion into both the deregulated and regulated sectors.

And while there are not a plethora of examples within the rail industry itself, the experience of introducing competition in the Powder River Basin certainly reinforces the evidence compiled by the behavior of other industries.

V. SUMMARY

While financially healthy today, the railroad industry has achieved undue market power, has exercised it to the detriment of large portions of its customers, and has no incentive to change, despite evidence that a continuation of current behavior will result in a continuing long-run deterioration of revenues and erosion of customer base.

These trends are supported—if not actively, then through lack of action—by the Surface Transportation Board. The ongoing merger policy review remains the one opportunity for the Board to do something decisive to prevent further erosion of rail-to-rail competition and even begin to return some competition among railroads. If this opportunity is lost, the relevancy of the Board—and thus the need for continued funding—is called into question.

At this point in the evolution of the rail industry, however, no real solution exists without decisive congressional action. Rail customers will continue to petition Congress to take action as it has in so many other industries to ensure that the right level of access is available in order to develop and maintain a truly competitive marketplace.

Thank you again for the opportunity to testify. The rail customer community and I look forward to working with this subcommittee on these critical issues in the 107th Congress.

ADDENDUM 1: WHO ARE RAIL CUSTOMERS?

The Alliance for Rail Competition represents the diversity of the rail customer community. A brief description of the industries that rely on rail transportation and their specific concerns is summarized below.

Agriculture

Approximately two percent of all Americans are engaged in agriculture as their primary occupation. While it may seem a small number, that two-percent of the population manages to produce enough food and fiber to feed the rest of the country's population, as well as a good part of the rest of the world.

Railroads are an important mode of transportation for the Nation's agricultural shippers. In 1997, railroads moved 1.4 million carloads (126 million tons) of farm products and 1.3 million carloads (86 million tons) of food and kindred products. Although this volume is large, it amounted to only 13 percent of all rail traffic that year.

Railroads are most important in the movement of grain. Grain and oilseed shipments represent about 95 percent of all farm product traffic moving by rail. Since the late 1970's grain tonnages shipped by rail have increased by 23 percent. Railroads also move more grain than barges and as much as all commercial trucks. Rail-

roads account for about 40 percent of all grain shipped from commercial facilities. By comparison, trucks also haul about 40 percent of the grain shipped commercially and barges haul the remaining 20 percent.

Many agricultural shippers are small and face unique challenges in a changing global marketplace. Their exceedingly low profit margins paired with dramatic fluctuations in world economies already place them in a financially precarious environment that Congress has taken a special interest in addressing. These rail customers also have an irrevocable tie to the railroads because in many cases there is no alternative mode of transportation that makes logistical or economic sense.

Having said that, agricultural shippers in some parts of the United States are paying the highest rail freight rates in exchange for arguably the most sporadic and unreliable service. These shippers need a clearly defined means for securing reliable service at a reasonable rate. Agricultural shippers are also unique in that the party that bears the cost of rail transportation—the farmer—is not the party that negotiates the rate for that transportation—the grain elevator. Further, the farmer has no ability to pass on the costs associated with transportation to the customer.

Farmers throughout the western states, including Montana, Idaho, North and South Dakota, Washington, Oregon, Colorado and Nebraska, are paying anywhere from 225 to 300 percent or more of the railroads' revenue to variable cost. Any business in the world would be ecstatic to receive that kind of return on its cost. But even if you assume that the high cost of capital for railroads requires railroads to generate 180 percent revenue to variable cost—a profit margin of 80 percent—you're still talking about an additional return of 45 percent or more.

Maybe this doesn't sound unreasonable to you, but I urge you to keep in mind that this kind of profit is being extracted out of a group that is ill-equipped to afford it: the farmer. Consider this example: A bushel of spring wheat currently sells for approximately \$4.15. Roughly \$1.00 of that amount, or one-quarter of the price a farmer receives, goes to pay for rail transportation. Stated another way, the average wheat farmer is working for the railroads nearly three months out of the year. If Congress cares about the future of agriculture, and did not intend to place the railroads in a position where they can exploit every last nickel out of their customers, then changes must be made.

While rates are of great concern to many people in the agriculture industry, receiving reliable service is of equal concern. Crop harvests are naturally cyclical in nature, as opposed to other rail traffic that is more evenly balanced throughout the year. But the movement of grain is largely determined by the demand of the global marketplace. When prices in the marketplace are high, farmers want to move their grain, and vice versa. Yet railroad service—or lack of it—can and has prevented farmers from moving their grain when there is demand. It's important to point out that the agriculture community has long suffered from sporadic and unreliable rail service and so long as current policies are maintained, that situation is expected to continue for the foreseeable future.

Over the last 30 years, the agriculture industry has been subjected to an increasing degree of competition with foreign producers—in both domestic and foreign markets. As in all industries, free markets reward lower-cost producers, and also consistent with other industries, the agriculture industry must search for ways to trim costs in order to remain competitive.

That is why the debate over rail competition has become so important to this industry. For the agriculture industry to remain competitive, it can no longer afford to rely on a rail industry that operates as a virtual monopoly. As a critical underpinning of the national economy, the agriculture community's concerns deserve special consideration.

Chemicals and Plastics

The U.S. chemical industry (excluding plastic resins) employs some 955,000 high-tech, high-wage workers. In turn, these lead to the creation of 1.1 million jobs in other industries, bringing total U.S. jobs dependant on the chemical industry (excluding plastic resins) to 2.1 million. This industry is the leading export sector and a substantial contributor to a positive U.S. balance of payments. The chemical industry depends heavily on railroads to safely and efficiently transport raw materials to chemical manufacturing facilities and to deliver a wide variety of finished products to destinations throughout the country. Railroads also transport chemical exports to Canada, Mexico, and U.S. ports.

According to data compiled by the Association of American Railroads, the chemical industry ships about 110 million tons of products (excluding plastic resins) by rail on an annual basis and spends more than \$3.5 billion per year on rail freight charges, accounting for 11 percent of the revenue received by U.S. railroads. In many parts of the country, there are chemical manufacturing facilities served by a

single railroad, leading to high costs. The chemical industry, which has participated in a number of major STB rail proceedings, strongly supports rail competitiveness and specifically endorses the recommended legislative provisions discussed in my testimony.

The plastics industry directly employs more than 1.3 million workers. When taken into account the upstream industries, that is the supplying industries, the number of plastics industry employees rises to 2.3 million, nearly two percent of the U.S. workforce.

Recent rail transportation events have shaped the business environment of the plastics industry. There is a growing awareness that transportation is not a separate, isolated function of the supply chain, but rather, an integral part of the production process. When talking about the transportation of plastic pellets, you must remember few other issues address such fundamental business components in corporate America. That is, rail transportation is about: Moving raw materials and products; Meeting customer demand; and Affecting the corporate bottom line.

When addressing the importance of rail transportation to the chemical and plastics industries, economics plays a large part. As an example, for plastics:

- Transportation is the second highest cost component in raw material production (second only to feedstock);
- Transportation can account for up to 20 percent of the finished raw material cost;
- Approximately 60 billion pounds of plastics are shipped each year;
- The plastics industry pays over \$1 billion to the railroads each year;
- If a facility is captive, at the point of origin or destination, rates for the exact same rail movement can be 15–60 percent higher than from a competitively served facility.

Given the fact that 75 percent of plastics raw material producers are captive to one railroad, paying higher rates, and generally receiving poorer service—coupled with the fact that the railroads are the only industry in this country to exercise complete monopoly control over their customers—the time has come to start asking why the railroads are able to operate in this type of an environment.

The core issue is the lack of competition in the U.S. rail system. Legislation is needed to address the fundamental way railroads operate.

Forest Products and Paper

The forest, pulp, paper, paperboard, and wood products industry employs approximately 1.5 million people with a payroll of \$40.8 billion and ranks among the top 10 manufacturing employers in 46 states. It represents 7.8 percent of the manufacturing work force in the United States. Sales of forest and paper products exceed \$275 billion annually both here and abroad. For most producers, transportation costs are the third largest operating cost component after fiber and labor. These costs average between 5 percent to 25 percent of delivered product costs.

The forest products and paper industry is the fourth largest user of rail transportation in the United States and incurs \$2.9 billion in annual rail expenses which is approximately 9 percent of all rail revenues. Significantly, the industry's \$183 billion of domestic flows combined with the inland portion of its international flows makes the industry one of the largest commodity shippers in the country. Much of the industry's exports and the domestic sales are transported by rail. In fact, the forest products and paper industry moves an average of 24,000 carloads in any given week using proprietary short line railroads and all Class I railroads. The industry is responsible for 70 percent of all railroad boxcar traffic, including 19 million tons of recycled paper, and 95 percent of all centerbeam lumber car traffic. The industry also represents significant carload volumes consisting of inbound raw materials (such as logs, woodchips, coal and chemicals) and thousands of containers carrying finished goods for domestic and offshore distributors. In addition, the industry has a substantial investment in boxcars, tankcars, and other rail equipment.

Rail service problems are currently national in scope. While other transportation modes measure "on time" service in hours, railroads measure it in days. This type of service affects not only the performance of the major remaining railroads, but other connecting railroads and their shippers. For example:

- A forest products company has had a major customer in California insist upon replacing rail service with trucks where the infrastructure to do so does not exist.
- Another company, with four manufacturing operations located in East Texas, experienced service problems with shipments destined to southern California. Rail transit times increased from 14 days to as much as 45 days. Business was consequently lost to competitors as a result of this variable service.

- Delivery problems have caused mill inventories of finished goods to go up. This causes warehousing costs, increased emergency delivery costs, and, ultimately, higher inflation to the general public.
- Variable service, lengthened transit times, and captive pricing contributed to a mill closing by a large forest products company.

The forest products and paper industry needs efficient competitive transportation to be able to compete in a global economy. We are concerned with the changes in the competitive dynamics of the national rail structure and believe that in order to have a healthy transportation industry we need vigorous rail-to-rail competition. Without competition, there is no incentive for the railroads to improve and maintain low cost levels, consistent service levels, and an adequate supply of quality boxcar equipment. To address the issues of rail service, competition and access, the forest products and paper industry endorses the recommended legislative provisions discussed in my testimony. The forest products and paper industry also encourages rail policy to foster the growth of short line railroads through the elimination of “paper barriers” to enable the free interchange of traffic between and among all connecting railroads.

Mining and Utilities

Coal shippers, including both electric utility companies and coal producers, have major concerns with the current law governing the railroads. Coal is one of the largest commodities by volume moved by the nation's railroads. Currently, approximately 54 percent of the nation's supply of electricity is generated from coal, the vast majority of that coal moves by rail from the coal mine to the power plant and a significant portion of that coal has, for at least some portion of its movement, only one available railroad transportation option. Thus, a significant portion of the coal moved in the nation is “captive” to a single railroad for transportation. As such, the railroad customer, who is usually the electric utility that buys the coal at the “mine mouth” and is responsible for arranging the movement of the coal to the power plant, does not have the ability to negotiate the terms of its rail transportation in an open and competitive market.

Some characteristics of railroad coal movements are:

- electric generating plants are designed to use a specific type of coal and typically have relatively few options regarding the source of coal that can be used in the plant, which may have a design life of as much as 50 years or more; the source of coal is further restricted by the location of the plant and its access to rail transportation;
- most of the nation's electric generating plants were built before the railroad mergers of the last two decades severely restricted railroad transportation options;
- normally, the railroad customer (the utility) pays for the railroad cars that move the coal; either the utility or the coal producer pays for the railroad loading facility at the coal mine; and the railroad customer may be forced to pay other costs that traditionally have been considered to be costs to be borne by the railroad;
- coal is moved normally in “unit trains” of approximately 100 cars;
- the unit train movement of coal is highly efficient and extremely profitable for the railroads, particularly where the movement is “captive” and the railroad can demand a price above 180 percent revenue to variable cost ratio; and
- the railroad transportation cost of coal not only affects the cost of the production of electricity, but the price of coal at the mine mouth, which can, in turn, adversely affect the amount of severance tax that most coal producing states collect from the coal produced in their states.

The first choice of coal shippers is for their transportation arrangements to be negotiated in a competitive marketplace, as are their contracts for the purchase of coal and, increasingly, their contracts for the sale of electricity. Some electric generating facilities have transportation options and are not “captive” to a single railroad. Others have been able to achieve competitive railroad transportation options by financing the construction of connecting track (“building out”) to a competing railroad. The STB and its predecessor, the Interstate Commerce Commission (ICC), have allowed such “build outs” which have been very important, although costly, tools for achieving competitive transportation alternatives.

Transportation Intermediaries

The Transportation Intermediaries Association (TIA) is the leading organization for North American transportation intermediaries with over 700 member companies. TIA is the only organization representing transportation intermediaries of all disciplines. The members of TIA include: property brokers, domestic freight forwarders,

NVOCC's, intermodal marketing companies, perishable commodity brokers, logistics management firms, and motor carriers.

The 46 member companies of TIA who operate intermodal marketing companies (IMCs) urge Congress to support legislation that will promote increased competition and access for rail service for both large and small rail customers. Increased competition will result in improved customer service from the railroads—particularly for the small to medium size rail customers with whom our members do business. If Congress does not enact rail competition legislation, many small businesses will continue to suffer from poor service and find it increasingly difficult to remain in business due to the lack of safe, efficient transportation on our nation's railroads.

IMCs have also found it exceedingly difficult to even receive rail service for small to medium size customers. Without competition, railroads tend to service larger customers at the expense of the smaller one. TIA believes that Congress must rectify this situation and that all rail customers should be given an opportunity to operate in a competitive, free-market environment.

ADDENDUM 2: ANECDOTAL INFORMATION

Anecdote #1:

The operator of a Montana grain elevator, in the fall of 1998, became frustrated with the BNSF. He had ordered cars in September 1998 and the BNSF indicated they could deliver in October. October came and went, and soon November was drawing to a close.

When he got the BNSF on the telephone, they stated the cars he ordered would be available at his elevator on that Saturday. He hired the crews necessary to load the train, and on Saturday morning he waited. And he waited. At 2 p.m. he called the BNSF . . . and they stated that although they were sorry, they would not be able to deliver the cars for another week.

After an angry exchange, a grain elevator employee came into the office and said the train was coming down the track! Yet the rail operations people on the other end of the telephone line, were adamant that it would be another week.

Sure enough, it was their cars and they promptly loaded the train with grain and released the cars back to the BNSF on Sunday.

Two weeks and one day later, the BNSF finally picked up the train for shipment.

Anecdote #2:

Several lumber shippers in NW Montana and Northern Idaho, requested that the BN give them a contract rate similar to a large lumber shipper and wholesaler in the Pacific Northwest.

The BN refused, stating that these complaining shippers couldn't meet the requirements of that rate. The shippers asked what the requirements were and the BN stated they were confidential and they couldn't tell them because they were part of an on-going confidential transportation contract.

The shippers banded together and formally challenged the very next confidential contract the BN filed with the ICC on a movement of this shipper.

The BN lumber personnel stated to the complaining lumber shippers that they would never get this contract opened up for public review.

However, the ICC felt after review that the complaining lumber shippers were adversely affected and ultimately did open up the contract to confidential review by the complaining shippers. The result was that the BN had to reluctantly offer the same contract to the complaining group, which promptly exercised its rights to the contractual provisions. The BN stated at the time, that to offer this contract to lumber mills, would do violence to the lumber industry. The results have proven much different—the lumber mills as a group, are better able to compete against the big lumber wholesalers.

However, the BN promise to give the wholesalers a better deal than the lumber mills, did hold up.

Anecdote #3:

In 1987, MRL put in a confidential contract on wheat from Big Timber, Montana at a newly constructed grain transfer facility. The contract called for rebates (legal ones) to the shipper if the shipments met a minimum number of cars.

The contract allowed the new facility to be effective over an area previously not served by the MRL. However, the new facility was told after a year of operation that the BN had become upset with the fact that this facility was providing competition to BN points and therefore demanded that MRL not renew the contract. The effect of non-renewal was to put the facility out of business, which is what the BN wanted, because it could not draw grain more than 40 miles due to the lower rates on the BN.

Anecdote #4:

BN, in mid-1980s, presented a small grain shipper with a \$150,000 demurrage bill for shipments of piggyback from Montana into Portland.

In the mid-1980s in Billings, the BN intermodal folks had a great number of truck trailers arriving in Montana but leaving empty back to the West Coast. In the spirit of identifying a win-win situation, a small grain shipper in Billings, approached the BN intermodal folks with a proposal. If the BN provided the grain shipper with a low rate, they could fill the empty truck trailers with grain for shipment to Portland for unloading. This endeavor started to become very popular and soon the BN Intermodal facility in Billings was shipping a great number of piggyback movements from Billings to Portland.

The situation in Portland, however, soon became a mess. The grain houses in Portland have only so much capacity to unload piggyback movements and became hopelessly behind.

The BN Intermodal people, however, kept supplying more and more truck trailers for loading in Billings, and not knowing of the capacity problem in Portland, the shipper kept filling an ever-increasing number of trucks loaded with grain to Portland.

After about 6 months of delayed unloading, the BN embargoed the shipments but presented the shipper with a demurrage bill for \$150,000+ and turned the issue over to its Law department.

The shipper, after a year of wrangling with the BN (in which the BN threatened the shipper with financial ruin), finally convinced them that they were the ONLY ones who knew the transportation situation in Portland, and were the responsible party for embargo of shipments they knew had no chance of being unloaded. The BN subsequently settled the case for about \$3,000!

Anecdote #5:

A major Fortune 500 petrochemical rail customer shipping petroleum coke from Billings to Salt Lake City located on both BN and Montana Rail Link ships tens of thousands of tons each year wanted to route MRL, Montana Western, UP to Salt Lake City. It would save many miles of route, and a week in transit time.

In January 2000, Montana Western (located between UP and MRL) requested the rate from MRL. MRL cannot set the rates, but must ask the BNSF for permission even though the shipment on this route never went over the BNSF tracks. The BNSF has consistently refused to allow the movement and forces the rail customers and receivers in Salt Lake City to pay higher rates for poorer service and keep much larger inventories for more inconsistent deliveries.

Anecdote #6:

Over the past two years, the small to medium size intermodal marketing companies (IMCs) have been fighting railroad efforts to drive them from the marketplace in favor of their larger counterparts. These IMCs serve America's small businesses and provide them the ability to get their goods to market at an affordable price. Unfortunately, railroads seem only interested in dealing with a handful of the largest intermodal companies. Thus, some of the rail carriers erected artificial barriers in the form of guaranteed volume contract requirements that were so high as to prevent IMCs from using rail service.

For example, the Burlington Northern/Santa Fe Railroad in 1998 almost overnight raised their volume requirements from \$500,000 to \$5 million annually. As a result of these volume cap increases, as many as 60 percent of IMCs lost their contracts because they couldn't meet the new, unilaterally imposed BNSF levels.

Currently, Norfolk Southern is indicating that they will raise their annual requirements from 250 units to 1,200 units effective January 1, 2001. This would occur even though the railroad told the STB that the merger would take one million trucks a year off the road. If NS raises its volume requirements, small businesses will have no choice but to ship by truck—drastically raising transportation costs and jeopardizing their continued profitability.

Union Pacific Railroad has just announced new procedures for the disbursement of repositioned equipment during peak season in Los Angeles. The railroad plans to give priority treatment to eight IMCs, four of which are large IMCs, with only two smaller IMCs included. This action will have the ability to get repositioned equipment. This is a serious problem because equipment shortages are rampant during the peak season. There are currently 75 IMCs that operate in the United States. Why should eight IMCs that are chosen by the railroad be given priority treatment? In a free, competitive market, every competitor should be given an equal opportunity to succeed in their business. Why should rail carriers pick and choose whom the winners and losers will be?

Anecdote #7:

Arizona Chemical Company (AZ), a subsidiary of International Paper, is currently being pummeled by the monopoly power of Norfolk Southern (NS).

The rail contract AZ had with NS expired at the end of June, and was extended for a month so the parties could attempt to negotiate a new contract. However, NS decided to terminate allowances on all AZ traffic, effectively increasing its rates 21 percent on an overall basis. Although AZ indicated that it was willing to discuss rate increases, it would not do so unless NS was able to improve on its inadequate service and committed to undertake to measure its service. NS then advised AZ that this was unacceptable and that it would raise the rates essentially because it could do so. When AZ refused to sign the contract, NS then put in place, effective 8/1, what amounts to a 40 percent rate increase on AZ traffic.

AZ then refused to pay the increase, at which point NS threatened to put AZ on a cash basis, in which case it would not deliver or pickup cars unless AZ paid in advance via cash or certified check. Regrettably, since that would plainly disrupt or even threaten AZ operations, it had no choice except to pay the claimed balance due.

So, and notwithstanding that its service is woefully inadequate, NS was able to force a 40 percent rate increase down AZ's throat simply because it believes that AZ has no reasonable competitive alternative.

In an attempt to try to work this out, AZ representatives contacted Chairman Morgan's office and requested that they approach NS about this, suggesting that the Board advise NS that, if it really felt it was entitled to some rate increase, it should agree to submit the matter to mediation or arbitration under the Board's established procedures. To the Board's credit, it pursued the matter and spoke with representatives of NS. Unfortunately, those phone calls made by the Chairman's office ultimately had no effect, as NS apparently sought to excuse its actions by alleging that the increase was not related to the Conrail transaction or its service problems, that it was losing money on AZ's traffic and that AZ could have avoided the 40 percent increase by signing the 21 percent increase contract.

Anecdote #8:

FMC Corp. is one of the Union Pacific Railway's (UP) biggest customers, spending approximately \$90 million annually for rail service provided by the UP. In 1996, UP published considerably higher tariff rates for FMC commodities after FMC already had invested heavily in new loading and unloading facilities to improve UP productivity. Following a year of failed rate negotiations, FMC filed a complaint with the Surface Transportation Board on October 21, 1997. FMC's complaint involved 2 million tons of soda ash, phosphorus and similar commodities shipped in some 20,000 rail cars over a period of three years from FMC's Green River, Wyoming and Pocatello, Idaho facilities. According to FMC's analysis, the company was forced to pay rates that were as much as 600 percent above UP variable costs for providing the transportation—solely because the UP had monopoly power over FMC's traffic.

On May 12, 2000—2½ years after the initial filing, the STB concurred with FMC's position by determining that Union Pacific held monopoly control over 15 of the 16 challenged routes. Although it concurred with FMC on the merits of the case, the Board's decision effectively compensated FMC for only 20 percent of its total past costs (i.e., legal/expert costs + the difference between prescribed and tariff rates during the 3 year period of the case). Furthermore, the costs of UP's service meltdown and merger with Southern Pacific were considered as allowable UP costs, subtracting from their penalty. And future rates were based on a railroad designed for peak, rather than normal volume days.) These terms effectively eliminated the bulk of any economic benefits the company might have realized by winning the case. Nonetheless, Union Pacific has appealed the decision.

The case itself (not counting earlier negotiations) has lasted 34 months (filed on October 31, 1997) and, with appeals, there is still no finality to the STB's decision. Both parties continue to incur substantial legal and expert costs to bring this case to closure. To date FMC has spent over \$6 million on legal and expert resources to address procedural and substantive issues.

Anecdote #9:

Among the conditions applied by the STB to the UP/SP merger were several conditions directed specifically to the competitive harm that otherwise would have been suffered by 2-to-1 shippers. A condition granting extensive trackage rights over UP/SP lines to the BNSF railroad was imposed for the stated purpose of protecting most 2-to-1 shipper. Further, an "omnibus clause" was imposed to protect any 2-to-1 shipper not covered by those trackage rights, requiring UP and BNSF to enter into arrangements "under which, through trackage rights, haulage, ratemaking authority

or other mutually acceptable means, BNSF will be able to provide competitive service" to each 2-to-1 shipper covered by the clause.

However, the omnibus clause in practice has been proven to be of little value as demonstrated by the Board's decision in the Union Electric case, decided on May 31, 2000. Union Electric operates a coal-fired electric generating plant at Labadie, Franklin County, MO, which was accessed, prior to the UP/SP merger, by UP and by SP and by no other railroad. There is no dispute as to the 2-to-1 status of UE's Labadie plant. The question is whether Union Electric has a right to receive competitive service under the omnibus clause, and whether an addendum to an existing contract changes that contract so radically as to eliminate Union Electric's ability to make use of the omnibus clause.

According to the Board's decision: "The UP/UE contract at issue was entered into prior to the consummation of the merger by a 2-to-1 shipper, on the one hand, and UP, on the other hand; it was negotiated under the auspices of old 49 U.S.C. 10713; and it was in effect at the time the merger was consummated. It therefore follows that, at the time the merger was consummated, the contract modification condition applied to this contract. "The contract modification condition, however, applies only to contracts that were "in effect at the time the merger was consummated," Merger Dec. No. 57, slip op. at 9, and must be exercised "prior to the expiration of a contract" to which that condition applies," Merger Dec. No. 57, slip op. at 10. The ICC-WRPI-C-0080 contract was amended in 1999 by an "Addendum Three," and we agree with UP's assessment that this addendum amounted to "major surgery" on the underlying contract."

Thus, despite a fanfare of announcements about the Board's affirmation of 2-to-1 shipper rights, the STB actually ruled against the shipper by rejecting a request that UP be ordered to open Union Electric's contract for renegotiation—a pro-competitive condition the shipper thought had been imposed as part of the UP-SP merger approval.

BARRIERS TO COMPETITIVE ACCESS

Senator SHELBY. Mr. Crowe, our State, Alabama, is primarily served by two major railroads, CSX and Norfolk Southern. Does Walter Industries and your subsidiary short line, is that Jefferson Warrior—

Mr. CROWE. That is correct. It is Jefferson Warrior.

Senator SHELBY [continuing]. Have access to both of these major railroads?

Mr. CROWE. We do.

Senator SHELBY. Are you restricted in any way, by contract or so forth, with them?

Mr. CROWE. We experience a lot of barriers—

Senator SHELBY. Okay.

Mr. CROWE [continuing]. And a lot of difficulties with our short line.

Senator SHELBY. Explain some of that.

Mr. CROWE. Well, an example would be, we originate a lot of tonnage going out of our plants that are manufactured. We also bring much of our raw materials into our plants.

Senator SHELBY. You ship in and out, do you not?

Mr. CROWE. We ship in and out, and we do a lot of our own switching in our plants. The paper barriers, and problems like car bunching, and all these things, point to a less than cooperative attitude.

Senator SHELBY. Well, elaborate a little on paper barriers.

Mr. CROWE. Well, a paper barrier that we have experienced is that when we moved coke from our coke facility, even just across the road to U.S. Pipe, that uses foundry coke, we have some barriers and difficulties in gaining permission to cross Class I rail-

roads. These type barriers make it difficult to be timely. Also, when we—

Senator SHELBY. In other words, you mine coal, you produce coke, which is a manufactured process—

Mr. CROWE. Correct.

Senator SHELBY [continuing]. And then you move the coke, which is a by-product—

Mr. CROWE. That is correct.

Senator SHELBY [continuing]. To another industry, where you make pipe, is that correct—

Mr. CROWE. That is correct.

Senator SHELBY [continuing]. From a foundry, and you have to cross a Class I railroad.

Mr. CROWE. Yes. We have to cross Class I railroads, and in many cases it makes it very difficult to do this. The access ability to the Class Is and the difficulty that we experience is quite significant.

Senator SHELBY. Do you consider at the end of the day you are basically a captive shipper, in a sense?

Mr. CROWE. Oh, definitely. We are captive in many ways. As I stated earlier, from the standpoint of the raw materials that we receive for our chemical manufacturing and for our other manufacturing companies, as well as captive, to where our customers may be, in shipping out our finished product, we are captive both going and coming, and that makes it very difficult.

LIMITED TRANSPORTATION CHOICES

Senator SHELBY. Okay. Mr. Aasmundstad, I appreciate your joining us today. This is not the middle of the wheat harvest in North Dakota, is it?

Mr. AASMUNDSTAD. Yes, it is.

Senator SHELBY. It is?

Mr. AASMUNDSTAD. Yes, it is.

Senator SHELBY. We should get you back there. What is the market for your wheat? In other words, walk us through, if you would, the process of getting the grain from the field to the market, and what you have to do in your State.

Mr. AASMUNDSTAD. Well—

Senator SHELBY. Does that make sense to you?

Mr. AASMUNDSTAD. Sure. It varies greatly. Everything is naturally trucked from the field to storage facilities, whether they be on the farm or whether they are a grain-purchasing company. Many times during harvest, and I have to qualify, not so much the last couple of years, because the quality and the quantity of our crop has been very low, but in years previous, and with no reason to see any difference now with a quality crop, many times there have been—the elevators are virtually plugged, due to the lack of cars.

Another thing that is very troubling in moving our grain up there, being the captive shippers, is, as Ms. Duff explained, the competitive disadvantage that a railroad could bring about between one grain purchaser and another by showing favoritism.

Senator SHELBY. Does that go on?

Mr. AASMUNDSTAD. You bet.

Senator SHELBY. Give us an example of that.

Mr. AASMUNDSTAD. A large grain purchasing business definitely has a competitive advantage over, say, a small local shipper, and the fact that they have to bid to the merge.

There have been cases where that the small shippers, if they want cars at a specified time, have to bid what amounts to a restrictive fee over normal freight rates to receive those cars when they—receive a guarantee. That makes it very, very hard for the small shippers to survive.

Senator SHELBY. Is shipping by rail the only practical way to—

Mr. AASMUNDSTAD. It is the only practical way to do it. We are from 300 to 400 miles away from any river port of the Great Lakes, and you cannot ship it by truck competitively.

Senator SHELBY. Do you have access to more than one railroad for the people in North Dakota?

Mr. AASMUNDSTAD. We have a few short lines. There again, the problem—

Senator SHELBY. No main shippers.

Mr. AASMUNDSTAD. No. One.

Senator SHELBY. Are the grain producers, in your opinion, more cut off from transportation options than other industries, or some other industries?

Mr. AASMUNDSTAD. Well, I think they are. Mainly, other industries have a vehicle to pass costs along. We do not. As Senator Burns said, we sell wholesale by retail, and with some of the regulations proposed dealing with truck traffic and truck safety, it is going to be virtually impossible for a lot of people to afford.

You cannot hire two drivers to drive a truck, it is economically impossible to do. The other thing that we are looking at is, we have to move further and further, move our grain further and further. We bear the costs of repairing our State highways, our county roads, that just cannot bear any more heavy truck traffic.

Senator SHELBY. Ms. Duff, your alliance, your organization represents a number of U.S. manufacturing industries. Do not these companies have other shipping options besides rail, or would you explain?

Ms. DUFF. It is often kind of amazing to a lot of people to consider that large chemical companies or large utilities are being held captive by a railroad, and that they do not have any opportunity to really negotiate out of that.

The fact is that you really are only buying rail service on a facility-by-facility basis, and so long as that facility has one railroad, it does not matter how big your company is, you are still stuck with dealing with that one railroad.

Now, some companies that are large enough have managed to leverage that size in their negotiation with railroads, but it is really so modest. They are still put at a disadvantage to those other people in their own industries that have competitive options. So they can improve it in some regards, but overall they are held captive, and there is not a lot that they can do about it.

DEFINING "CAPTIVE SHIPPERS"

Senator SHELBY. How do you define yourself captive shipper, the term captive shipper? Is this different from what the railroad industry defines as captive?

Ms. DUFF. Well, it probably is different.

Senator SHELBY. Yes. Go ahead.

Ms. DUFF. It is always a moving target. What we have tried to do—

Senator SHELBY. It is how you look at it, is it not?

Ms. DUFF. What we have tried to do for consistency sake is rely on the statutory definition of captive, which is, if you are paying a rate of 180 percent of revenue to variable costs or higher, then you are captive. The reality is, if you have one railroad that goes to your facility, you are captive, and there has been no real effective way to make that count.

If you have options with trucks or barges, then you are not captive, and most people who have those options are not involved in the Alliance for Rail Competition, or even in this debate, and it is very easy for them to say, "Hey, my rail service is fine." Surprisingly, the railroads are performing better in areas where they actually have to work to save their customers.

Senator SHELBY. It is my understanding that the American Chemistry Council states that 63 percent of their member companies are captive to service by a single railroad. Do you know if other industries have a similar high percentage of captive shippers?

Ms. DUFF. We did a commodity study in 1997, updated in 1998, and the coal, chemical, and grain industries are the top three captive revenue producers for the railroads. The coal industry is producing \$3.5 billion for the railroads in captive revenues. Those are movements that are moving at a 180 percent of revenue to variable cost or higher. The chemical industry is moving at about \$2.5 billion, and the grain industry at just shy of a billion dollars. So all three of those industries are contributing heavily on a captive rate basis.

Senator SHELBY. Ms. Duff, I have been told that railroad shipping rates, when measured in revenue-per-ton mile, have fallen since the Staggers Act was brought about. If this is the case, then why do we hear so many complaints about shipping rates?

Ms. DUFF. Well, revenue—

Senator SHELBY. Do you understand what I am getting at?

Ms. DUFF. I do.

Senator SHELBY. Is that how you measure it?

Ms. DUFF. Well, it is how you can measure it—

Senator SHELBY. How you can measure it.

Ms. DUFF [continuing]. But revenue-per-ton mile is not the same thing as a rate. You do not pay a revenue-per-ton mile. First, it is important to understand that revenues—

Senator SHELBY. Are you talking about apples and oranges?

Ms. DUFF. Absolutely. Revenue-per-ton mile, as a measurement, has been steadily declining since at least 1935. So that as a measurement alone has very little to do with the regulatory climate.

Second of all, that measurement is basically a complex average of a number of different factors, so as the rail industry changes its characteristics, it is natural that that revenue-per-ton mile measurement would decline regardless of what is happening with rates. Rates could stay the same or even go up, and the revenue-per-ton mile would be declining.

Senator SHELBY. It has been alluded to that the United States could, I am not sure we will, but we could end up with two major railroads in this country. What would happen then? What would be the effect on manufacturers and shippers? All of you.

Ms. DUFF. Well, I would just start off by saying that in effect right now rail customers are faced with regional two-rail monopoly situations. We have two operating in the east and two operating in the west. Basically, a two-railroad system spread over the entirety of North America further eliminates the potential for competition that currently exists running down the middle of the country, and I think that it really calls into question a lot of the issues that we have been debating about bottlenecks and terminal access, for example.

There is very little evidence to show that rail customers are going to be willing to come to the board for relief. Bottleneck rates might be granted, but there is no reason why those rates are going to be any better than what is happening right now, and there is no reason why the board is necessarily going to grant access in a terminal area.

So I think that what we will see is continued long-term thinking on captive industries' part, where they are going to start looking at the structure of what their businesses are, and making some significant changes to get out from underneath the rail monopoly.

Senator SHELBY. Okay. Do you have any comments, sir?

Mr. AASMUNDSTAD. Yes. If we end up with a two-railroad system in this country it is going to be absolutely devastating to the agricultural industry from the point I brought up earlier that if the two-railroad system or the surviving railroad in the system shows any favoritism at all to a shipper, and I am not calling a farmer a shipper, the farmers are at the end of the food chain on this, but to an agricultural product purchaser, they could have very heavy dictate on who survives and who does not in the agricultural industry from farmers right to the purchasers of the raw products.

Senator SHELBY. Choose winners and losers.

Mr. AASMUNDSTAD. You bet they could, because they will have the ability to move the product.

Senator SHELBY. Mr. Crowe?

Mr. CROWE. I have concluded my comments, Mr. Chairman, and we appreciate the opportunity to be with you. Alabama manufacturers and manufacturers throughout the country are looking to the Congress to bring about some behavioral modifications that are direly needed. It is very expensive to go before hearings and to conduct extensive hearings, and we must now come to the Congress to bring about some vital reform in this area.

RAIL SERVICE PERFORMANCE AND MARKET SHARE

Senator SHELBY. Let me just share this with all of you. I am sure you have seen this before. An April, 1999, GAO report on railroad regulation showed that the railroads market share of freight movements versus truck traffic, river and canal traffic, and other transportation modes, the data show the percentage of rail traffic staying relatively constant, while truck traffic had increased dramatically from 25 to 30 percent of total traffic carried between 1990 and

1997. Is that a factor in lack of competition or competitive access driving that, or what is?

Ms. DUFF. Well, I think it is a reflection on the performance of the rail industry. Everybody who has really—that used to use railroads, that had a choice with other modes, have pretty much systematically turned to trucks or other modes of transportation where that opportunity was allowed for.

There are a number of different measurements. I have heard the ATA talk about trucks are carrying 87 percent of the nation's freight. If you look at the industrial productivity measurement, that has been increasing by 3.8 percent, whereas rail tonnages have been increasing by something like two percent, so less than half. These are all statistics that really reinforce the idea that railroads are not carrying the amount of freight that they should.

I think the railroads would argue that that is a factor of the competitive stance that they are in. The fact is, they are not competing, they are not providing the kind of service, and as a result, our entire transportation infrastructure is suffering as a result.

Senator SHELBY. I want to thank all of you on the first panel for your participation here today. I do not know what the answer is, but at least we are talking about it, and we are holding hearings. Thank you. I thank all of you.

Ms. DUFF. Thank you.

Senator SHELBY. Thank you. Our second panel, we have Mr. Edward Hamberger, President and Chief Executive Officer, Association of American Railroads; Mr. Frank Turner, President of the American Short Line and Regional Railroad Association. Gentlemen, if you-all will come up. Your written testimony will be made part of the record, without objection, and you may proceed as you wish. Mr. Hamberger, do you want to proceed first?

STATEMENT OF EDWARD HAMBERGER, PRESIDENT AND CHIEF EXECUTIVE OFFICER, ASSOCIATION OF AMERICAN RAILROADS

Mr. HAMBERGER. Indeed.

Thank you, Mr. Chairman. On behalf of the Association of American Railroads and our member companies, I appreciate the opportunity to be here to give you our views on the issue of competition in the freight railroad industry. You have been kind enough to make my written statement a part of the record, and in that statement we deal with the issue of competition in the traditional fashion. We walk down and point out that there is, indeed, pervasive rail-to-rail competition. One of the members of the first panel acknowledged that he has rail-to-rail competition.

INTERMODAL COMPETITION

We point out that there is intermodal competition from our friends in the barge and towing industry, and, of course, our friends, and also customers in the trucking industry. Of course, we point out that, notwithstanding, there are some who believe that there is no such thing as product and geographic competition. There is product and geographic competition out there affecting choices and acting as competitive forces on the rail industry.

COMPETITION FROM COUNTERVAILING MARKET POWER

Finally, Ms. Duff was kind enough to acknowledge that, indeed, there is competition from countervailing market power. Now, we disagree as to how pervasive that is. We believe that countervailing market power is exercised by many of our particularly larger customers, but it is out there, and we do agree on that.

I guess the most compelling statistic I would point to from that testimony is that while we carry 40 percent of the nation's ton miles in freight, we collect only 10 percent of the freight revenue dollar. That gets me to—what I would like to do today, Mr. Chairman, if I might, is look at this issue of competition in terms a little bit different, and that is in terms of what you deal with every day, in terms of money—money, revenue, investment capital, where it is, how it is spent, what the impact is, and who, indeed, should be responsible for spending it.

ADEQUATE INFRASTRUCTURE INVESTMENT

This subcommittee more than any other knows the significance of an adequate infrastructure investment. You know in the programs that you administer what happens when there is not adequate expansion of capacity, when there is deferred maintenance, when technology does not keep pace. Unfortunately, we in the freight rail industry also know what happens when those things occur, and that is why since 1980 we have spent \$266 billion, money earned in the private sector, \$266 billion to improve our infrastructure.

That has made us the most capital-intensive industry in the country. Last year alone we spent \$6.6 billion in capital investment, out of a total for the industry of \$33 billion in total revenue, almost 20 percent of the total revenue reinvested back into the industry.

Again, in terms that you deal with in other modes, that would be equal to a \$2.04 expenditure for every gallon of diesel fuel we burned last year. That is a heck of an excise tax, \$2.04, and that is not going to stop there. We estimate that we are going to have to reinvest ourselves twice over in the next 20 years.

Now, what has been the result of all this investment? We think, quite simply, according to the World Bank, it has made us the best freight rail system in the world, the lowest rates, and the best service, according to the Lou Thompson, of the World Bank.

Our customers benefit from this investment, because we have improved productivity 171 percent since 1980. Rates, according to the GAO, have fallen on an average of over 4 percent per year since 1980.

Our employees have benefitted, because accident rates have gone down 70 percent. Last year was our safest on record by some measures, and the first 6 months of 2000 are on track to be even better.

The economy benefits, because our customers in the chemical industry experience a 99.99 percent rate of safe transportation of hazardous materials from origin to destination without incident. Of course, the economy, as a whole, has benefitted. According to a Brookings Institute study just released, the benefit to the American

economy each year since the Staggers Act has been \$12.3 billion in improved productivity and lower prices.

And yes, railroads, too, have benefitted. We have gained market share incrementally from 35 percent in 1980 to 40 percent, and we have climbed out of the abysmal 1 to 2 percent rate of return on investment, up to a modest, if not robust, 9.4 percent last year. That puts us, I should point out, still behind the rest of the American economy.

In 12 of the last 15 years we have ranked in the lowest quarter of the Fortune 500 companies in terms of return on equity. Remember that this is the industry which is the most capital intensive in the country, and which routinely spends 15 to 20 percent of its revenues on capital investment.

Now, we have before you, the Congress, a whole series of proposals coming forward under different names, First Access, Competitive Access, Open Access. We call them re-regulation, because we think that's what they amount to. But no matter what you call them, they all have one thing in common, the net result is an outflow of capital from the freight railroad industry to a select customer base.

We would lose anywhere from \$1.3 billion to \$2.4 billion, depending on the proposal and depending on your estimate, but everyone agrees that there would be a net outflow of money out of the railroad industry, and a loss of ability to make capital investments. If we lose that ability to invest capital, we will have no choice but to, as the Wall Street folks say, harvest. We would disinvest. We will have deferred maintenance. Safety, unfortunately, would go the wrong direction. Service would get worse. Productivity would decline.

I submit to you, Mr. Chairman, that that brings us back to how I started, to the work of this subcommittee, and what you deal with every day, and that is money, because I predict that if any of these proposals pass, that in the not too distant future you will have another panel of shippers and customers up here, and what they will not be talking about then is competition or bottleneck, they will be talking about the need to get a couple billion dollars more in Function 400 to reinvest in the freight rail industry.

I would say that there are really only two sources of investment capital. Either it comes from the private sector or it comes from the government. Right now the private sector has been shouldering that responsibility, and I believe with admirable results.

PREPARED STATEMENT

The real question before you, stripped of all the veneers, is who should be responsible for railroad investment. Should we continue the current system, where the private sector shoulders that responsibility, or by re-regulating the industry, shift that responsibility to the taxpayer? I admire Mr. Aasmundstad for putting that on the table as well. Who should have that responsibility, the private sector or the public sector? We strongly urge you to remember the lessons of the past, and keep that responsibility in the private sector. Thank you for the opportunity to be here.

[The statement follows:]

PREPARED STATEMENT OF EDWARD R. HAMBERGER

I would like to thank you for providing me with this opportunity to address this committee about freight rail competition issues. This topic is especially appropriate now, just weeks from the 20th anniversary of the Staggers Rail Act of 1980. Indeed, now is an excellent time to look back on what has transpired since the passage of the Staggers Act, and review how that legislation has allowed the rail industry to become a competitive factor in the transportation marketplace. Moreover, we should look at what our nation could face if the tremendous gains made possible by the deregulation embodied by Staggers were reversed through short-sighted reregulation. If the railroads are to continue to provide low cost and efficient transportation, pursue service enhancements, and continue to realize dramatic safety improvements, they must be free to operate effectively in the competitive marketplace.

CURRENT REGULATORY ENVIRONMENT

The story of the rail industry's stagnation under the scheme of pervasive regulation in effect prior to the Staggers Rail Act of 1980 and its dramatic revitalization since Staggers is well known. In enacting the Staggers Act, Congress recognized that railroads faced intense competition from trucks and other modes for most categories of freight traffic, but that prevailing regulation precluded railroads from earning revenues sufficient to maintain and replace the rail infrastructure and thus thwarted the industry's ability to compete. Survival of the railroad industry required a new regulatory scheme that allowed railroads to establish their own routes, tailor their rates to market conditions and differentiate rates on the basis of demand.

The reforms that Congress enacted and President Carter signed into law have been an unqualified success. The pricing and routing freedoms of the Staggers Act have enabled railroads to rationalize their systems, reinvest in productive rail infrastructure, generate higher levels of service and dramatically increase productivity, resulting in lower rates for shippers. The regulatory system relies on competition in the marketplace to govern rail rates and service and at the same time provides a regulatory safety net for those instances where there is no effective competition for rail transportation.

RAILROAD COMPETITION

There are some observers who claim that railroads have too much market power. They often point to the number of Class I railroads to prove their point. But the fact is that neither the absolute number of railroads nor the number of railroads of a particular size is a true measure of the intensity of competition. Competition can be meaningfully assessed only with reference to the strength of the competitive options available to particular shippers. These options can take many forms.

Rail-to-rail competition is one such option for many shippers. The nation's more than 550 freight railroads form a highly interdependent and highly efficient national rail system that actively and effectively competes for existing and potential traffic. Shippers are continually exercising their options to play one railroad off against another.

Railroads compete not just among themselves, but in the larger market for freight transportation services. As such, they face extensive competition from trucks, water carriers, and/or pipelines for their traffic. The rail share of intercity freight traffic is a stark reminder of the intensity of this competition. Measured in ton-miles, rail's share of intercity traffic fell steadily for decades, from around 75 percent in the late 1920s to 35 percent in 1978. Only since deregulation has rail market share begun to inch upward; it currently stands at about 40 percent. The intensity of intermodal competition is illustrated even more vividly by the railroads' market share of intercity freight revenue. Though railroads currently account for 40 percent of total intercity ton-miles, they are able to generate only 10 percent of intercity freight revenue, and the rail revenue share has continued to fall.

Rail customers can also take advantage of product competition, which refers to the ability of shippers and receivers to substitute one product for another in their production process. Coal transported to electric utilities is a good example. Although utility coal is the railroads' most important commodity, some 44 percent of the electricity generated by utilities in this country is produced from fuel sources other than coal and, in fact, competes against coal-fired generation.

Geographic competition, which refers to the ability of shippers and consignees to buy from or sell in any number of geographic areas, also constrains railroads in many markets. Suppose, for example, an exporter requires grain for shipment

abroad. The exporter could buy grain from sources in any number of different states, playing each source—and the railroad(s) serving it—against the others.

And, of course, railroad customers frequently possess extensive countervailing market power. This is particularly true of large, sophisticated companies with multiple locations. These companies can obtain price or service concessions by shifting or threatening to shift traffic among plants—causing the railroads that serve them to compete against each other. Indeed, many individual rail customers rival or exceed the size of the entire rail industry.

RAILROAD RATES

The competitive forces unleashed by the Staggers Act have resulted in sharply lower rail rates. In fact, from 1981 to 1999, rail rates (as measured by revenue per ton-mile) have fallen 28 percent in current dollars, and 57 percent in inflation-adjusted terms. This trend in falling revenue per ton-mile was not isolated to only a few commodities: each of the major two-digit Standard Transportation Commodity Code groupings enjoyed declines expressed in both constant and current dollars, although the impact varied among individual commodity categories. This broad, sharp decline in rail rates is evidence of the competitive market constraints railroads face.

Source: AAR

To place the post-Staggers railroad rate declines in perspective, the chart at right compares railroad revenue per ton-mile (in constant dollars) with the average retail electricity rates per kilowatt hour and the average expenditure per new automobile. The 57 percent decline in the railroad measure from 1981 to 1999 is in contrast to the 28 decline in electricity rates and the 41 percent increase in new car prices.

**Average Rail Revenue Per Ton-Mile vs.
Average Electricity Retail Cents Per Kilowatt-hour vs.
Average Expenditure Per New Car
(Constant Dollars, 1981 = 100)**

Sources: AAR, Energy Information Administration, International Trade Administration

Numerous independent studies which examine the behavior of railroad freight rates have consistently concluded that rail rates have fallen. For example, a study released just last week by the American Enterprise Institute/Brookings Institution Joint Center for Regulatory Studies (AEI/Brookings) noted that economic efficiency grounds do not justify increasing rail competition. The study cited rail customer benefits worth \$12 billion per year in lower rail rates and improvements in service time and reliability during the first decade of deregulation, and that shippers continue to benefit from lower rates. The authors also found that increased rail-to-rail competition had no impact on changes in service reliability or average service time.

In its April 1999 report entitled *Railroad Regulation: Changes in Railroad Rates and Service Quality Since 1990*, the U.S. General Accounting Office concluded that "railroad rates have generally fallen both overall as well as for specific commodities" since 1990. GAO noted that its results are consistent with Surface Transportation Board (STB) calculations that found that average rail rates fell 4.1 percent annually in real terms from 1990 to 1996, and that rate reductions vary by commodity.

In a series of late 1998 staff papers, economists at North Dakota State University studied the behavior of grain rates in recent years. They noted that "while rate increases have been a major concern for shippers, most of these concerns have been unfounded. In fact, several studies have indicated that as a result of deregulation, cost savings have accrued and rail rates have fallen in real terms." The researchers also found that "[I]n the period prior to the [Staggers Rail Act], most rail rates were generally increasing in real terms. However, in the period following [Staggers], most rail rates decreased in real terms by 52 percent (ranging from 40-71 percent across commodities)."

And when viewed from a global perspective, U.S. freight railroads stand unequaled. The World Bank's Railways Adviser recently stated that, "Because of a marketbased approach involving minimal government intervention, today's U.S. freight railroads add up to a network that, comparing the total cost to shippers and taxpayers, gives the world's most cost-effective rail freight service. Unsubsidized U.S. freight rail rates are not only the lowest of any market economy, they have been falling every year since 1980, even though U.S. labor costs are high."

RAILROAD INVESTMENT

There was little doubt at the time of the Staggers Act that inadequate investment by the nation's railroads had been a major factor contributing to their poor financial health and unsatisfactory service. As Congress explained, "The simple fact of the matter is that the railroad industry is a capital-intensive industry which for decades has had inadequate earnings to maintain its plant and facilities at a level necessary to achieve improved services." Indeed, in 1980, Congress acknowledged the enor-

mous capital shortfall (\$16 to \$20 billion by 1985) of the railroad industry, even after billions of dollars of Federal funding had flowed into the bankrupt North-eastern railroads.

Railroading is a capital intensive business: large capital expenditures are needed to maintain plant and equipment, to upgrade facilities as technology and markets change, and to expand capacity. Moreover, the amount of capital required to sustain the railroad industry is extremely high compared to American industry, in general, and among the railroad industry's most prominent competitors.

As shown in the table below, data for Fortune 500 firms in selected industries that are major rail shippers or competitors reveal that on the basis of total assets required per dollar of revenue produced, railroads have significantly higher asset needs—\$2.57 of assets for each dollar of revenue produced. The 15 chemical companies among the Fortune 500, for instance, have only \$1.42 in assets for each dollar of revenue produced and the 37 utilities average only \$2.23 in assets, while the two trucking firms average only 50 cents in assets per dollar of revenue. In aggregate, the 127 industrial firms in the sectors listed had, on average, \$1.46 in assets per dollar in revenue—just 57 percent of the railroad figure.

RATIO OF ASSETS TO REVENUES

[Dollars in billions]

| Industry | Num-ber of Firms | Total Reve-nues | Total Assetsa | Ratio of Assets to Revenues |
|------------------------------------|------------------|-----------------|---------------|-----------------------------|
| Chemicals | 15 | \$114.4 | \$162.1 | 1.42 |
| Food | 22 | 178.6 | 116.2 | 0.65 |
| Forest & Paper Products | 11 | 106.3 | 134.0 | 1.26 |
| Industrial & Farm Equipment | 11 | 81.2 | 88.3 | 1.09 |
| Metals | 8 | 44.2 | 54.6 | 1.24 |
| Mining, Crude Oil Production | 3 | 17.0 | 24.6 | 1.45 |
| Motor Vehicles & Parts | 14 | 452.8 | 634.6 | 1.40 |
| Railroads | 4 | 36.4 | 93.6 | 2.57 |
| Trucking | 2 | 8.8 | 4.4 | 0.50 |
| Gas & Electric Utilities | 37 | 266.3 | 594.8 | 2.23 |
| Total | 127 | 1,306.0 | 1,907.2 | 1.46 |

Prior to Staggers, the inadequacy of capital expenditures fed upon itself—lower investment led to lower quality service, which led to a decline in traffic volume and lower revenues that made further investment impossible. In contrast, deregulation under the Staggers Act has been highly successful in promoting reinvestment in railroad infrastructure. Even as railroads have shed unproductive assets, they have invested in new productive assets. Capital expenditures per mile of road owned were more than \$66,000 in 1999, almost two and a half times the comparable inflation-adjusted 1983 figure. Overall, new capital investment in roadway, structures and equipment by the nation's Class I railroads in 1999 alone was over \$6.6 billion (nearly 20 percent of rail industry revenue) with an additional \$12.9 billion in maintenance expenses related to roadway, structures and equipment expenditures. After accounting for depreciation, railroads spent \$16.2 billion in 1999 alone on their infrastructure and equipment. This extraordinary level of funding—equal to 48 percent of industry operating revenues in 1999—is required year after year to provide the high quality assets necessary for the rail industry to operate efficiently, and has made the nation's railroads stronger and more effective competitors. Importantly, unlike other transportation modes, railroads rely on private financing, not government funds, to pay for their infrastructure investments. In fact, if the funds railroads spent on their infrastructure in 1999 were raised through a fuel tax, railroads would have had to pay approximately \$2.04 per gallon—an amount equivalent to four to ten times the tax paid by competing modes.

RAILROAD PRODUCTIVITY

These investments have contributed to dramatic improvements in railroad productivity. According to the U.S. Bureau of Labor Statistics, railroad productivity has exceeded that of nearly every other U.S. industry. Revenue ton-miles per constant dollar of operating expense is a useful overall productivity gauge. By this measure, which incorporates all cost components that contribute to rail operations, overall rail productivity rose 171 percent in the post-Staggers period, compared to just 10 percent in the comparable pre-Staggers period.

Since Staggers, nearly every rail input has seen enormous productivity gains. From 1981-1999, rail labor productivity rose 287 percent, locomotive productivity rose 113 percent, track productivity rose 130 percent, freight car productivity rose 92 percent, and fuel efficiency rose 58 percent. In each case, post-Staggers productivity improvements were far greater (usually two to three times higher) than during the comparable pre-Staggers period.

RAILROAD PROFITABILITY

Rail profitability has improved to moderate levels since deregulation. Even with their improvements, though, railroad earnings are still not sufficient to cover all costs of rail operations and generate an adequate return on investment. Until it earns its cost of capital on a consistent basis, the long-term viability of the rail industry will continue to be threatened.

Return on equity (ROE) is a commonly used indicator of short-term profitability. According to Fortune 500 data, in the 15 years from 1985 to 1999, overall railroad ROE was less than the Fortune 500 average each year; in all but three years, the railroad ROE was in the lowest quartile; and in eight of the 15 years, 92 percent or more of other industries generated returns that exceeded those of the railroads. Standard & Poor's data show similar results: nearly three-fourths of the time, railroad ROE is lower than the ROE for a variety of industries that are major rail shippers. In most cases, railroad ROE is strikingly lower.

Artificial and unrealistic restrictions that impede a railroad's opportunity to generate sufficient returns are likely to severely compromise the carrier's ability to retain and attract the capital it needs to sustain its investment and operations over the long term. Access to capital is more important than ever to the railroad industry for two reasons. First, the railroads were able to increase their profitability since Staggers in the face of strong competition from trucks and declining rates only through increased productivity. Those productivity gains, however, were achieved through measures that have largely been exhausted or through one-time events—as some have put it, by harvesting the “low-hanging fruit.” Future productivity gains will likely need to be “purchased” with additional, large-scale strategic infrastructure investments.

Second, new investment is also needed to meet increasing shipper demand for transportation service. Rail traffic as measured by revenue ton-miles has increased by 57 percent since 1980. Part of this growth has been fueled by the increasing globalization of commerce and the resulting increase in demand for high-volume, long-haul transportation that is well suited to railroads. The railroad industry has reached the point where further significant traffic growth will not be possible without investments that expand capacity.

Increasing demand for transportation is having an effect on all aspects of the nation's transportation system, not just the railroads. Trucks, which still dominate the surface transportation of freight, face capacity constraints of their own. Driver shortages persist and there continues to be political debate surrounding the public funding of increased highway capacity. The nation's port facilities also are finding themselves increasingly pressed for funds to accommodate an explosion in intermodal cargo traffic. It is clear that transportation capacity will have to increase as

the economy expands. The railroads can contribute to meeting these increased capacity needs through private capital—unlike motor carriers that rely on public funding of highway construction and expansion—but only if the regulatory structure gives the railroads an incentive to make the necessary investments. In order to promote necessary investment in infrastructure, railroads must have the opportunity to earn competitive returns and to that end they need the pricing flexibility afforded by the present regulatory system.

CUSTOMER SERVICE

Railroads are taking action to improve their service. They have spent heavily on infrastructure (\$140 billion in the 1990s alone, paid for with private funds, not funds appropriated by this Committee). In addition, railroads have entered into agreements with two major customer groups—the National Grain and Feed Association and the National Mining Association. The agreements entail voluntary, private-sector efforts to solve problems by working together. The parties involved all recognize that private sector solutions are preferable to government intervention.

In January 1999, freight railroads became the first industry to publish weekly performance measures, giving customers access to updated information on location-specific performance measures that serve as indicators of how well traffic is moving through a railroad's system.

There are also several other initiatives underway. One is the “Chicago Plan.” Last spring, under the auspices of the Association of American Railroads, freight railroads convened an industry-wide planning group to address service reliability in Chicago, the most important rail hub. The freight railroads have also initiated a long list of technological programs to enhance customer service and performance, including Automatic Equipment Identification, Interline Service Management, and NetREDI—an Internet service—to provide an easy way for customers to track their shipments. Railroads are also aggressively pursuing opportunities involving e-commerce to help make customer interaction with railroads more efficient and beneficial.

While every American has benefited enormously from the efficiencies, cost savings and rate reductions brought about by rail deregulation, railroads are committed to continual improvement to the benefit of their customers and the economy.

SAFETY

Another critical benefit of the deregulatory era has been a pronounced increase in safety. The chart below illustrates the extraordinary railroad safety achievements resulting from an emphasis on safety management and from safety-related investments. Accidents per million train-miles have been driven down 53 percent from 1981–1999, while injuries and illnesses per hundred employees (per year) have been forced down by 66 percent. The past five years have been the safest in the industry's history. Rail industry employee injury rates are lower than employee casualty rates of workers in factories, mines and even some retail industries, and lower than rates in the truck, transit and aviation industries.

**Accidents Per Million Train-Miles
Injuries and Illnesses Per 100 Employee-Equivalents
(All Railroads)**

Source: Federal Railroad Administration

All of us want to see these safety improvements continue. One way to jeopardize them, however, would be to limit the ability of railroads to earn enough to cover the costs of their systems. In the 1970s, oppressive regulation prevented railroads from doing just that. One consequence of that unfortunate reality was billions of dollars of deferred maintenance, a problem that took the railroads years to overcome. Railroads, their employees, and the communities they serve cannot afford a return to a time when insufficient earnings brought about by misguided regulation prevented railroads from dedicating the necessary resources to maintain their world-best standards.

EXISTING REMEDIES

Most shippers have multiple competitive options in today's transportation market that effectively constrain or discipline rail prices. But in those instances where genuine competitive issues exist, Congress has provided and the Board has implemented effective remedies to protect shippers from abuse of market power or anti-competitive behavior.

Remedies for unreasonably high rates are available if it can be shown that there is no effective competition to constrain rail rates—i.e., where the challenged rate exceeds the statutory jurisdictional threshold (currently 180 percent of variable costs) and where the railroad does not face effective competition for the issue traffic. Upon finding a rate unreasonably high, the Board is authorized to award reparations and/or to prescribe maximum reasonable rates for the future. To determine the reasonableness of a rate, the STB uses a "stand-alone cost" (SAC) test, which applies the principles of demand-based differential pricing to cap rail rates at the level that would be charged by a hypothetical "stand-alone railroad" providing head-to-head rail competition for the traffic at issue.

In enacting the ICC Termination Act, Congress responded to shipper concerns over the length and complexity of rate reasonableness proceedings. To expedite relief, Congress mandated that rate cases be completed within 16 months, and the STB has implemented simplified guidelines and procedures to speed up handling of certain cases. Recognizing that there is still dissatisfaction among some small rail shippers, the rail industry has recommended several modifications to existing regulatory procedures to further streamline the process.

PROPOSALS TO REREGULATE RAILROADS

Despite the existence of remedies for any actual abuse of railroad market power and the vital role railroads play in the nation's economy, some groups seek to reinstate pervasive economic regulation of the railroads. These groups call for jetti-

soning the deregulatory system that has served the nation well and replacing it with a system in which regulators would again have ultimate authority over important facets of rail operations. You won't hear these groups calling their proposals "reregulation," of course, but that is precisely what it is. Their proposals are not new thinking: they have been periodically advocated, and rejected by Congress, for good reason, in the past.

The end result of most proposals to reregulate railroads is the same: they would have the government force railroads to lower their rates to certain favored shippers—at the expense of other rail shippers, rail investors and the public at large. And if those groups advocating reregulation had their way, the government would take such action without requiring any showing of anti-competitive conduct by railroads, without showing that railroads had actually abused their market power, without showing that railroad profits are excessive, and without any opportunity for railroads to cover their costs or make the heavy investments necessary to maintain their systems.

THE DANGERS OF RAIL REREGULATION

Proposals to reregulate the railroads primarily focus on artificially manufacturing rail-to-rail competition. As noted earlier, however, railroads already face extensive competition for the vast majority of their business, including cases where a shipper or receiver is served by only one railroad. Moreover, the present level of rail-to-rail competition reflects private sector decisions as to which markets will sustain more than one railroad and which will not. Stated another way, it is not economically feasible for there to be two railroads serving every shipper because that level of competition is not sustainable. Trying to mandate more rail-to-rail competition than the marketplace will support would reduce competition, not enhance it, because it would prevent railroads from covering the full cost of providing service across their systems.

This is so because of the cost and demand characteristics railroads face. On the cost side, railroads have extremely high fixed costs (e.g., the track structure and related facilities) that must be covered regardless of traffic level. On the demand side, rail shippers differ widely in terms of their willingness to pay for rail service. On one extreme, some rail traffic can easily shift to truck or other alternatives, and would do so if railroads charged much over their variable cost of moving that traffic. On the other extreme, some rail traffic is less easily diverted to other modes and has fewer competitive alternatives; this traffic can be charged higher markups to reflect the attendant higher demand for rail service.

Given this demand structure, railroads would lose customers if they were required to charge all traffic the same markup over variable costs. Instead, railroads price their services on the basis of demand, with those shippers with the greatest demand for rail service paying higher markups than shippers with lower demand. This way, railroads cover their variable costs and realize varying contributions to fixed costs from various customers.

This kind of "differential pricing" is practiced by businesses in every segment of the economy, from auto dealers (expensive cars carry higher margins) and airlines (a business traveler who buys a ticket at the last minute pays more than a vacationer who buys a ticket in advance) to movie theaters (matinees are cheaper than evening shows) and utilities (industrial users pay lower rates than homeowners). The Staggers Act explicitly recognizes differential pricing as essential to the rail industry's financial viability.

Differential pricing benefit all shippers because lower rates to some shippers generate revenue (which helps to cover fixed costs) which otherwise would not be realized. Indeed, given their demand structure, only by pricing in accordance with demand (with reasonable regulatory ceilings on maximum rates) can railroads efficiently recover all of their costs, serve the largest number of rail customers, and maintain the viability of the nation's rail system.

Unfortunately, proposals to reregulate the railroads would gut the use of differential pricing by railroads. Manufactured rail-to-rail competition would artificially drive down rail rates toward variable cost. There would no longer be a sufficient mix of high demand-high margin and low demand-low margin traffic to enable railroads to earn the total markups they need to cover their full costs. Specifically, the aforementioned AEI/Brookings study found that artificially manufactured rail competition would result in a drain to the railroads of \$1.3 billion annually. The study also concluded that this huge loss of revenue to the railroads would provide no benefit to the economy, since it would merely be a transfer from railroads to rail customers. Rail industry analysis of specific reregulation proposals has revealed that more than \$2.4 billion annually in railroad revenue would be lost. Because the rev-

enue loss would not be accompanied by compensating reductions in expenses, most or all of the industry's net income would disappear. Railroads would have to cut their costs by shrinking the size and/or the quality of their rail networks. Such an outcome is completely at odds with the needs of our growing economy and America's global competitiveness.

RAILROADS DO NOT HAVE EXCESSIVE MARKET POWER

The call for greater rail regulation relies on the false assumption that railroads have undue market power. Real-world evidence proves otherwise:

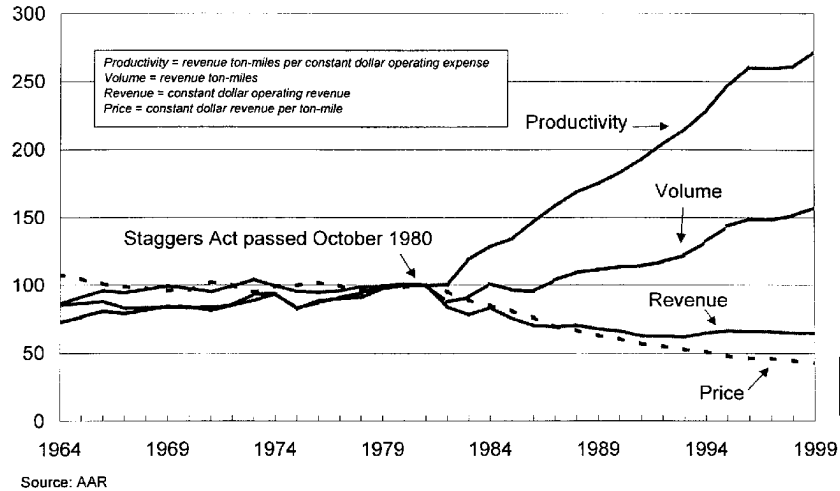

- Prices.*—The exercise of market power rarely involves sharply lower prices. Rail revenue per ton-mile has actually fallen substantially—by 28 percent in nominal terms and 57 percent in inflation-adjusted terms—from 1981 to 1999.
- Costs.*—If railroads had excessive market power, incentives to reduce costs and use productive inputs efficiently would be suppressed. Yet, according to the Bureau of Labor Statistics, rail productivity gains in the past decade are among the very highest in all of American industry, and rail costs per unit of traffic have plunged.
- Innovation.*—If railroads had excessive market power, they would have reduced incentives to invest in innovative products and processes. But unit trains, double-stacking intermodal freight cars, grain car reservation systems, AC locomotives, modern dispatching centers, improved safety equipment, e-commerce, and a variety of other innovations attest to the railroads' competitive incentives.
- Profits.*—If railroads had excessive market power, they would be able to earn more than a competitive rate of return. In fact, railroads consistently fail to earn their cost of capital and rail profitability ranks in the bottom quartile among all U.S. industries.
- Market Share.*—If railroads had excessive market power, they would not have steadily lost market share for decades. The ongoing struggle by railroads to retain the meager market share gains they have made over the past ten years is stark evidence of the intensity of the competition they face from other modes. For example, only about 15 percent of total U.S. electricity generation is accounted for by coal-fired plants served just by a single railroad. Likewise, U.S. Department of Agriculture data indicate that trucks have supplanted railroads as the primary transportation mode for grain. And the chemical industry's own figures show that railroads account for just 20 percent of chemical transportation tonnage.

CONCLUSION

The railroad industry is committed to sincere and productive participation in regulatory and private sector initiatives concerned with service, safety, and other areas of rail operations. The current regulatory regime balances competition with regulation in a way that protects shippers from abuse, while allowing railroads to stand or fall based on their response to the competitive pressures of the free market. The chart below demonstrates the tremendous gains railroads have made under the current regulatory regime. Unfortunately, many of the proposals to reregulate the rail industry would replace the current system with one in which regulation would be far more costly and far less effective.

In summary, the economic reality is that the railroad industry faces pervasive competition in the transportation marketplace and that the current regulatory structure has allowed the railroads to remain viable in that marketplace. Going forward, railroads need the continued flexibility that deregulation has offered in order to efficiently handle the future transportation needs of our growing economy and sustain our nation's international competitiveness.

Class I Railroad Performance: 1964-1999
(1981 = 100)

**STATEMENT OF FRANK K. TURNER, PRESIDENT, AMERICAN SHORT
LINE AND REGIONAL RAILROAD ASSOCIATION**

Senator SHELBY. Mr. Turner.

Mr. TURNER. Thank you, Mr. Chairman. My name is Frank K. Turner. I am President of the American Short Line and Regional Railroad Association. I certainly appreciate the opportunity to testify at this hearing today.

SHORT LINE MEMBERS

I am here today representing short line members, more than 400 short line and regional railroad members located in every state of the United States. Mr. Chairman, 13 members of your subcommittee have between them 138 short line railroads operating almost 10,000 miles of track. The majority of this track is in rural areas where rail service could have been abandoned by class one railroads if short line operators had not purchased these lines.

In your own State of Alabama, Mr. Chairman, there are 17 short line railroads operating over 500 miles of track. Without these companies, 16 cities, from Florence, in northeastern Alabama, to Beatrice, in southwestern Alabama, would lose the only rail service they have. Small railroads can serve their shippers best in a competitive rail environment. We are an essential part of the national rail network.

Short line and regional railroads, and the shippers and communities that depend on them for service, are deeply affected by the ongoing restructuring of the North American railroad industry. Class one railroads have consolidated aggressively since the Staggers Act. Only six large class one railroads remain in North America today, down from more than 40 class one railroads in 1980. The number of competitors has been reduced and so has the number of competitive options.

This is troubling, because the fundamental premise of the Staggers Act, as has been pointed out, was meaningful competition. When the industry reaches the point that most shippers have only one choice of a rail company to deal with, that fundamental premise of the Staggers Act becomes questionable. Small railroads can and should be a part of the way to enhance railroad competition in America. If small railroads can move certain traffic more efficient than class one railroads, then the system should allow it.

If small railroads can ease congestion on overcrowded class one mainlines, the system should allow it. If small railroads can take truck traffic off of the highways, then the system should allow it. More often than not, the system does not allow it.

SERVICE

Another critical issue is service, which has been pointed out. Services suffered in the aftermath of recent mergers. Small railroads simply cannot deliver good service to their customers if they don't get good service from their connections. The Service Transportation Board is considerably considering changing the rules that govern class one rail mergers. The Short Line Association has urged the board to add new conditions, with teeth in them, to preserve competitive options and ensure good service for small railroads affected by a proposed class one merger.

SHORT LINE AND REGIONAL BILL OF RIGHTS

The Short Line Association has proposed a short line and regional railroad bill of rights, and urge the board to include it as a condition of board approval of any future class one merger or consolidation transaction.

The short line and regional railroad's bill of rights is as follows: One, the right to compensation for service failures; second, the right to interchange and routing freedom; third, the right to competitive and non-discriminatory pricing; and fourth, the right to fair and non-discriminatory car supply. I have attached a copy of this, of our filing, and the STB proceedings to my testimony for the record.

We are hopeful that it will require the kind of actions that we have outlined in our bill of rights. However, the board's new rules will apply only if there are more class one railroad mergers in the future. Unfortunately, the small railroads have competitive and service problems with their class one partners today, which the board's new merger rules will not affect.

We have tried to address these issues through industry-wide negotiations. The process began 2 years ago with encouragement from the STB under Chairman Linda Morgan's leadership. On September 10, 1998, we signed the Railroad Industrial Agreement between the short line and regional railroads, and class ones. The RIA, as it is known, contains provisions that are intended to address a wide range of rate and service issues.

TRACKAGE RIGHTS AND HAULAGE RIGHTS

Two key provisions allow small railroads to gain access to new trackage rights or haulage rights agreements under certain cir-

cumstances or to get paper barriers set aside to develop new business. The RIA was a milestone 2 years ago. It was the first privately negotiated industrial-wide agreement for railroads, and it tried to address some of the critical issues.

Unfortunately, so far, the results have been rather disappointing. There have been far fewer success stories than I had hoped. My short line members tell me most of their ideas are either met by silence or delay. Although, progress has been slow, we do not want to abandon private negotiations. Chairman Morgan recently wrote to Mr. Ed Hamberger and myself requesting an update on how the RIA is working, and urging the railroads to consider whether changes are needed. In fact, representatives of the Short Line Association and class one railroads are sitting down this Thursday to do just that.

The small railroads are going to raise their concerns that the RIA is not working as it was intended, and it needs to be strengthened and be expanded. I hope the class one railroad's representatives will be receptive to this. We will be reporting back to Chairman Morgan in October. If no progress has been made, we will seek a more regulatory solution.

FUNDING TO MAINTAIN AND UPGRADE FACILITIES

Another huge issue for small railroads is the problem of finding funding to maintain and upgrade our facilities. We are often playing a catchup on light-density lines after years of deferred maintenance. The class one's new generation of heavier capacity freight cars, now built to 286,000 weight standards, require upgrade of "R" track, ties, ballasts, and bridges.

A new study by Zeta-Tech Associates established a need of \$6.8 billion for small railroads to upgrade their track and facilities to handle these new heavier 286,000-pound freight cars. I have attached a copy of the Zeta-Tech study conclusions to my testimony for the record.

Class one railroads received almost all the productivity savings generated by the new 286 cars. The benefits come from huge volumes that allow class ones to run fewer trains, thus reducing fuel costs and locomotive costs. Short lines typically receive and move the 286 cars in single car lots, not unit trains. We get the burden, but not the benefit.

Congressman Spencer Bacchus has introduced a bill to the House of Representatives to deal with this problem. HR-4746 will take the 4.3 cents per gallon tax railroads currently pay on diesel fuel, a holdover from the days of deficit reduction, and use it to fund small railroad infrastructure upgrades until the tax is repealed.

Based on the huge needs identified by the Zeta-Tech study, this seems to be a very appropriate use for the funds that are currently being paid into the general funds by the railroads, but provide no benefit to the railroad infrastructure. The Bacchus bill will provide much needed infrastructure help for small railroads. This would help them be more competitive and provide better service for our shippers.

PREPARED STATEMENT

In conclusion, short line and regional railroads have serious concerns about competition and service in the railroad industry. We are trying to address these through industry-wide negotiations with our class one partners, and through the rule-making procedures at the Surface Transportation Board. We hope our negotiations are successful, and we hope the STB makes the kind of changes that let short lines enhance competition and solve network service problems. If we are not successful in these arenas, we will look to Congress for more meaningful action. Thank you, sir.

[The statement follows:]

PREPARED STATEMENT OF FRANK K. TURNER

Chairman Shelby, and members of the Subcommittee, I am Frank K. Turner, President of the American Short Line and Regional Railroad Association. I appreciate the opportunity to testify at this hearing on issues related to freight rail competition and the Surface Transportation Board's response to these issues.

I am here today representing ASLRRA's members—more than 400 short line and regional railroads located in every state in the U.S. Short line and regional railroads are an important part of the rail network. Today we own, maintain and operate 29 percent of the railroad track in the U.S.—almost 50,000 miles of track. We employ 11 percent of the rail workforce and receive 9 percent of rail freight revenue. The number of short line and regional railroads in this country has more than doubled since the Staggers Rail Act of 1980.

Just to put our position in perspective, Mr. Chairman, the 13 Members of your Subcommittee have between them 138 short line railroads operating almost 10,000 miles of track. The majority of this track is in rural areas where rail service would have been abandoned by the Class I railroads if short line operators had not purchased these lines.

In your own state of Alabama, Mr. Chairman, there are 17 short line railroads operating 540 miles of track. Absent these companies, 16 cities from Florence in northeastern Alabama to Beatrice in southwestern Alabama would lose the only rail service they have.

Small railroads can serve their shippers best in a competitive rail environment. We are an essential part of the national rail network. Small railroads originate or terminate roughly one quarter of the total carloads that move over the larger Class I rail systems. Many of the lines we operate are light density lines at the fringes of the network. In many cases these were branch lines that were candidates for abandonment by their former Class I owner. Rail service was preserved when these lines were sold to a new short line operator. By keeping these lines alive, we have kept shippers connected to the national rail network. Many of these lines serve rural areas.

Short line and regional railroads, and the shippers and communities that depend on them for service, are deeply affected by the ongoing restructuring of the North American railroad industry. The Class I railroads have consolidated aggressively since the Staggers Act. Only six large Class I railroads remain in North America today, down from more than 40 Class I railroads in 1980. As the number of competitors has been reduced, so have the number of competitive options.

This is troubling, because a fundamental premise of the Staggers Act was that meaningful competition was supposed to take the place of regulation. This approach works only so long as a competitive rail transportation marketplace actually does exist and function. That requires competitive options and alternative routes and meaningful choices between rate offerings and service providers. When the rail industry reaches the point that most shippers have only one choice of rail company to deal with, that fundamental premise of the Staggers Act becomes questionable.

Small railroads can and should be a part of the way we enhance railroad competition in America. If individual small railroads can move certain traffic more efficiently than the Class I's then the system should allow it. If individual small railroads can ease congestion on overcrowded Class I main lines then the system should allow it. If individual small railroads can take truckload traffic off the highways then the system should allow it.

More often than not, the system does not allow it. This is not only bad for competition and bad for service, but it does not make sense economically. At the end of the day, the Class I main lines handle the overwhelming majority of all the traffic

generated by the short lines. To take that traffic 100 miles out of its way on its own line so as to squeeze out an incremental piece of revenue does not make economic sense. That 100-mile diversion means that some existing traffic will be lost to more efficient truckers and virtually no new traffic will be won back to the rails. The railroads' market share has been stuck in the mid-thirty percent range for many years and will be stuck there for many years to come if it sticks to these same practices.

Another critical issue is service. Service has suffered in the aftermath of the recent mergers. Most of the freight that originates or terminates on small railroads must be interchanged with a Class I railroad in the course of its journey. Small railroads simply cannot deliver good service to their customers if they don't get good service from their connections.

The Surface Transportation Board is currently considering changing its rules that govern Class I rail mergers. In that proceeding, ASLRRRA has urged the Board to add new conditions, with teeth in them, to affirmatively preserve competitive options and ensure good service for small railroads affected by a proposed Class I merger. ASLRRRA has proposed a "Short Line and Regional Railroad Bill of Rights," and urged the Board to include it as a condition of Board approval of any future Class I merger or consolidation transaction.

The "Short Line and Regional Railroad Bill of Rights" conditions deal with issues of service, interchange and routing, pricing, and car supply. To give a very quick overview, they provide that, in the merger context, small railroads should have: 1. The right to compensation for service failures; 2. The right to interchange and routing freedom; 3. The right to competitive and nondiscriminatory pricing; and 4. The right to fair and nondiscriminatory car supply.

I have attached a copy of ASLRRRA's filing in STB Ex Parte No. 582 (Sub-No. 1) to my testimony, for the record. It contains more detail on the conditions we are requesting and the language of the rule changes we have asked the Board to consider.

The Board's new merger rules can go a long way toward addressing the serious competitive and service issues that small railroads face. The Board will release its proposed rule in October, and we are hopeful the proposed rule will require the kind of actions we have outlined in our "Bill of Rights."

That is just part of the puzzle, however, because the Board's new rules will apply only if there are more Class I rail mergers in the future. Unfortunately, however, the small railroads have competitive and service problems with their Class I partners today, which the Board's new merger rules won't affect.

We have tried to address these important issues through private, industry-wide negotiations. This process began two years ago, with encouragement from the Surface Transportation Board under Chairman Linda Morgan's leadership. On September 10, 1998, the ASLRRRA and AAR signed the Railroad Industry Agreement between the short line and regional railroads and the Class I's. The RIA contains provisions that are intended to address a wide range of rate and service issues. Two key provisions allow small railroads to gain access to new trackage rights or haulage agreements under certain circumstances, or to get "paper barriers" set aside, to develop new business. The RIA was a milestone two years ago. It was the first privately negotiated, industry-wide agreement for railroads, and it tried to address some critical issues. Unfortunately, results so far have been rather disappointing. There have been far fewer success stories than I had hoped. My short line members tell me that most of their ideas are met by either silence or delay, and that by the time the few deals that have been done are completed the potential traffic has often long since moved to another mode.

Although progress has been almost nonexistent, we do not want to abandon private negotiations. Chairman Morgan has recently written a letter to Ed Hamberger and myself, requesting an update on how the RIA is working, and urging the railroads to sit down to discuss if changes are needed. In fact, representatives of ASLRRRA and the Class I railroads are sitting down this Thursday to do just that. The small railroads are going to raise their concerns that the RIA is not working as it was intended to, and that it needs to be strengthened and perhaps expanded. I hope we will find the Class I railroad representatives receptive to our concerns. We will be reporting back to Chairman Morgan in October. If no progress has been made toward addressing our competitive and service concerns in the negotiations, we may need to seek a more regulatory solution.

Another huge issue for small railroads, which affects our ability to provide efficient and competitive service, is the problem of finding sufficient funding to maintain and upgrade our lines and facilities. We are often playing "catch-up" on our light density lines after years of deferred maintenance. The Class I's new generation of heavier, higher capacity freight cars, now built to a 286,000-lb. weight standard,

require upgrade of our track, ties, ballast and bridges. A new study by ZETA-TECH Associates, Inc. established a need of \$6.8 billion for small railroads to upgrade their track and facilities to handle these new, heavier 286,000-lb. freight cars. I have attached a copy of the ZETA-TECH study's conclusions to my testimony, for the record.

Two important points need to be stressed. First, the Class I railroads receive all the productivity savings generated by the new 286 cars. These benefits derive from huge volumes that allow the Class I's to run fewer trains, thus reducing fuel costs, labor costs and locomotive costs. The short lines typically receive and move freight in carloads, not in 100-car unit trains. Yet the cost to upgrade their track to handle these cars is no less expensive.

Second, while this is a one-time fix for small railroads, it is one that becomes increasingly expensive to fix the longer it is ignored. Left unrehabilitated, these lines will gradually lose their business as their shippers are forced to move to truck or to new locations on Class I railroads. Once that occurs, these lines will deteriorate and ultimately be abandoned and no amount of Federal funding will be able to bring them back.

Recognizing the need for action now, Congressman Spencer Bachus has introduced a bill in the House of Representatives to deal with this problem. H.R. 4746 would take the 4.3 cents per gallon tax that railroads currently pay on their diesel fuel, a hold-over from the days of deficit reduction, and use it to fund small railroad infrastructure upgrades until such time as that tax is repealed by Congress. Based on the huge needs identified by the ZETA-TECH study, this seems like a very appropriate use for funds that currently are being paid into the general fund by railroads and yet provide no benefit to the railroad industry. The Bachus bill would provide much-needed infrastructure help for small railroads. This in turn would help them be more competitive and provide better service for their shippers.

In conclusion, the short line and regional railroads have serious concerns about competition and service in the railroad industry. We are trying to address these through industry-wide negotiations with our Class I partners, and through the rule making procedure at the Surface Transportation Board. We hope our negotiations are successful, and we hope the STB makes the kind of changes that let short line railroads enhance competition and solve network service problems. If we are not successful in these arenas we will look to the Congress for more meaningful action.

Thank you.

ATTACHMENT 1

COMMENTS OF THE AMERICAN SHORT LINE AND REGIONAL RAILROAD ASSOCIATION

The American Short Line and Regional Railroad Association (ASLRRRA) is submitting these comments on behalf of its 418 short line and regional railroad members in response to the Advance Notice of Proposed Rulemaking (ANPRM) in the above-captioned proceeding (Decision served March 31, 2000). In that Decision, the Surface Transportation Board (STB or Board) invited comments from interested parties on modifications to its regulations at 49 CFR Part 1180 Subpart A governing proposals for major rail consolidations.

The American Short Line and Regional Railroad Association (ASLRRRA) is a non-profit trade association incorporated in the District of Columbia. ASLRRRA represents the interests of its short line and regional railroad members in legislative and regulatory matters. Short line and regional railroads are an important and growing component of the railroad industry. Today, they operate and maintain 29 percent of the American railroad industry's route mileage (approximately 50,000 miles of track), and account for 9 percent of the rail industry's freight revenue and 11 percent of railroad employment.

ASLRRRA and its members are interested parties and submit these Comments to suggest changes to the Board's rules governing major rail acquisition transactions. The Board's rules applicable to railroad acquisition, control, merger, consolidation project, trackage rights, and lease procedures are found at 49 CFR Part 1180 Subpart A (49 CFR 1180.0-1180.9). Within the railroad acquisition rules, four types of transactions are defined. The first is major. A major transaction is defined as follows: "A major transaction is a control or merger involving two or more class I railroads." 49 CFR 1180.2(a). The ANPRM deals only with the railroad acquisition rules applicable to major (i.e. class I) acquisition transactions and those are the sole focus of ASLRRRA's Comments.

Short line and regional railroads, and the shippers and communities that depend on them for service, are deeply affected by the ongoing restructuring of the North American railroad industry. Since the Staggers Act of 1980 transformed the regu-

latory landscape, the industry has been thoroughly changed by the sale of hundreds of light density branch lines to new operators and a continuing series of class I railroad mergers involving the retained high density main lines. As expressed in ASLRRRA President Frank K. Turner's testimony before the Board on March 8, 2000 in the Ex Parte No. 582 public hearing: "In the rail industry, the big have gotten much bigger, while the small have grown greatly in number."

The direction of these changes was clearly consistent with the intent of Congress when it enacted the Staggers Act in 1980. Back then, the industry was struggling to survive after years of stagnation under a heavy-handed regulatory regime. In the late 1970's, over a quarter of the track in the United States was being operated by railroad companies in bankruptcy. Clearly, radical restructuring was needed to increase efficiency, eliminate redundancy and trim excess capacity. That is exactly what happened. In the process, some lines with light traffic density were abandoned while others were sold. The class I railroads consolidated aggressively, to the point that only six large railroads remain in the U.S. and Canada today, down from more than 40 class I railroads in 1980. Gateways were closed, and many joint rates were cancelled in blanket fashion. These changes have led to increased efficiencies, but this progress has come at a price.

Today questions are being raised about whether the pendulum has swung too far. Many short line and regional railroads are concerned that competitive options within the railroad industry have become too restricted.¹ Many shippers share this concern. This is important because a fundamental premise of the Staggers Act was that for U.S. railroads, regulatory restrictions would be lessened or eliminated, but only where meaningful competition existed to discipline rates and service. A competitive transportation marketplace was viewed as a good substitute for regulation. This approach works only so long as that competitive transportation marketplace actually does exist and function. That transportation marketplace requires competitive options and alternative routes and meaningful choices between rate offerings and service providers. When the rail industry reaches the point that most shippers have only one choice of rail company to deal with, that fundamental premise of the Staggers Act no longer works. We are dangerously close to that point.

ASLRRRA does not favor re-regulation. The railroad industry has "been there, and done that." History clarifies the very real danger attached to extensive government regulation of our business. We do not want to go back to the "bad old days." That is why it is critically important that competitive options be retained and strengthened.

The Board's rules regarding major railroad mergers are a good place to start. The Board's current rules were put in place by the Board's predecessor agency, the Interstate Commerce Commission (ICC) in 1982, following passage of the Staggers Act. Quite properly, considering the time of their adoption, the rules seem to lean in favor of rail consolidations. The "general policy statement for merger or control of at least two Class I railroads," begins:

"The Surface Transportation Board encourages private industry initiative that leads to the rationalization of the nation's rail facilities and reduction of its excess capacity. One means of accomplishing these ends is rail consolidation." 49 CFR 1180.1 (a).

Later, the current rules discuss public interest considerations, and the balancing test that the Board performs to determine whether a transaction is in the public interest. The potential benefits are described:

"Both the consolidated carrier and the public can benefit from a consolidation if the result is a financially sound competitor better able to provide adequate service on demand. This beneficial result can occur if the consolidated carrier is able to realize operating efficiencies and increased marketing opportunities. Since consolidations can lead to a reduction in redundant facilities and thereby to an increase in traffic density on underused lines, operating efficiencies may be realized. Furthermore, consolidations are the only feasible way for rail carriers to enter many new markets other than by contractual arrangement, such as for joint use of rail facilities or run-through trains. In some markets where there is sufficient existing rail capacity the construction of new rail line is prohibitively expensive and does not represent a feasible means of entry into the market." 49 CFR 1180.1 (c)(1).

The other half of the balancing test equation, the potential harm, is discussed next. The rules describe potential harm in two areas: reduction of competition and

¹Some ASLRRRA-member railroads are participating individually in this rulemaking proceeding. Others probably would have participated individually if they were not fearful of the reaction of their class I connection.

harm to essential services. 49 CFR 1180.1 (c)(2). In both, the rules reflect the Board's (and ICC's) approach of "protecting competition, not competitors."

" . . . While the reduction in the number of competitors serving a market is not in itself harmful, a lessening of competition resulting from the elimination of a competitor may be contrary to the public interest . . ." 49 CFR 1180.1(c)(2)(i).

"Consolidations often result in shifts of market patterns. Sometimes the carrier losing its share of the market may not be able to withstand the loss of traffic. In assessing the probable impacts, the Board's concern is the preservation of essential services, not the survival of particular carriers. A service is essential if there is a sufficient public need for the service and adequate alternative transportation is not available." 49 CFR 1180.1(c)(2)(ii).

Finally, the rules discuss conditions. For major rail merger transactions, the statute gives the Board extensive authority to impose conditions, 49 USC 11324(c). The current rules state:

"The Board has broad authority to impose conditions on consolidations, including those that might be useful in ameliorating potential anticompetitive effects of a consolidation. However, the Board recognizes that conditions may lessen the benefits of a consolidation to both the carrier and the public. Therefore, the Board will not normally impose conditions on a consolidation to protect a carrier unless essential services are affected and the condition: (i) is shown to be related to the impact of the consolidation; (ii) is designed to enable shippers to receive adequate service; (iii) would not pose unreasonable operating or other problems for the consolidated carrier; and (iv) would not frustrate the ability of the consolidated carrier to obtain the anticipated public benefits . . ." 49 CFR 1180.1(d)

ASLRRRA agrees with the Board's Decision, which states at page 3 that although the current merger regulations were a proper and reasoned response to the serious problems affecting railroads and their customers at that time, the goals of that merger policy have largely been achieved. Today the focus must be on improving service to customers. Rail infrastructure has been pared down to the point that some tracks and yards are congested and straining at capacity. Preserving viable options within the rail industry is imperative to enhance service, sustain competition, allow choices for shippers and avoid reregulation.

New STB class I merger rules can go a long way toward accomplishing this goal. ASLRRRA recognizes that there are many different groups of stakeholders and diverse points of view that the Board must balance as it considers this important revision of its Class I merger rules. ASLRRRA believes that its suggested changes (below) can be incorporated within the scope of the larger rule changes that the Board will consider. In ASLRRRA's view, this will be consistent with the aims of this Ex Parte No. 582 (Sub-No. 1) rulemaking proceeding, and positive for the railroad industry as a whole. That is the spirit in which the following rule changes are suggested.

ASLRRRA presented a "Short Line and Regional Railroad Bill of Rights" in Frank Turner's March 8, 2000 Statement (attached). As part of its review of the railroad acquisition rules applicable to major transactions, ASLRRRA urges the Board to implement the Bill of Rights by including the following provisions relating to the concerns of small railroads within the new rules it adopts.

The general policy statement for merger or control of at least two class I railroads begins with a general statement at 49 CFR 1180.1(a). ASLRRRA suggests that it be redrafted to include the following statement:

49 CFR 1180.1(a)

"The Board places high priority on preserving and enhancing competition within the railroad industry. Small railroads play an important role in feeding traffic to the national rail network and providing service and competitive options for shippers. As the rail network nears capacity in some areas, small railroads can help bypass congested areas to keep freight moving. Small railroads offer capacity for future traffic growth. Their important role in the national rail network should be preserved and their procompetitive role ensured as part of any class I rail consolidation."

In the discussion of public interest considerations for class I merger transactions at 49 CFR 1180.1(c), the following statement should be included:

49 CFR 1180.1(c)

"In determining whether a transaction is in the public interest, the Board performs a balancing test. It weighs the potential benefits to applicants, the railroad network, shippers and the public against the potential harm to the railroad network, shippers and the public. The Board will consider whether the benefits claimed by applicants could be realized by means other than the proposed consolidation that

would result in less potential harm to the railroad network, shippers and the public; and will consider imposition of conditions to lessen such potential harm.”

In discussing the potential benefits to be considered at 49 CFR 1180.1(c)(1), the following language should be included:

49 CFR 1180.1(c)(1)

“A consolidation will be considered to benefit the railroad network, shippers and the public only if applicants clearly demonstrate that competition will be enhanced and service will not suffer. Conditions will be imposed to ensure that competition is enhanced and to provide a remedy if service does suffer.”

In discussing the other half of the balancing test equation, the potential harm at 49 CFR 1180.1(c)(2) the following should be included:

49 CFR 1180.1(c)(2)

“A consolidation would ill serve the public interest if the result would be harm to competition, restriction or elimination of competitive options within the rail network, or deterioration in service. The Board will impose conditions as necessary to preserve and enhance competition and enforce maintenance of service levels.”

The section discussing conditions at 49 CFR 1180.1(d) should specifically include the items of the “Short Line and Regional Railroad Bill of Rights.”

49 CFR 1180.1(d)

“The Board has broad authority to impose conditions on consolidations, including those that might be useful in preserving competitive options within the rail network that might be compromised or lessened by the consolidation, and ensuring that adequate service levels will be maintained. The Board recognizes that imposition of conditions may be essential in future consolidations in order to achieve these goals. In regard to ensuring the important role of small railroads within the rail network, the Board will impose the following four conditions unless the applicants demonstrate convincingly that imposition of one or more of these conditions would pose unreasonable operating or other problems for the consolidated carrier and would substantially frustrate the ability of the consolidated carrier to obtain the anticipated public benefits. These conditions will be imposed in order to protect competition, not particular competitors. Therefore, in order to minimize unreasonable burdens on small companies, the Board will impose these conditions presumptively, on its own motion. Class II and class III railroads will not be required to file individual responsive applications and will not be required to pay filing fees in connection with imposition of these conditions.

Conditions for the benefit of class II and class III railroads.—(1) Class II and class III railroads that connect to the consolidated carrier have the right to compensation by the consolidated carrier for service failures related to the consolidation. In addition, when the consolidated carrier cannot provide an acceptable level of service post-transaction, connecting class II and class III railroads should be allowed to perform additional services as necessary to provide acceptable service to shippers.

(2) Class II and class III railroads have the right to interchange and routing freedom. Contractual barriers affecting class II and class III railroads that connect with the consolidated carrier that prohibit or disadvantage full interchange rights, competitive routes and/or rates must be immediately removed by the consolidated carrier, and none imposed in the future. The consolidated carrier must maintain competitive joint rates through existing gateways. Also, class II and class III railroads should be free to interchange with all other carriers in a terminal area without pricing or operational disadvantage. Any pricing or operational restrictions which disadvantage connecting class II or class III railroads must be immediately removed by the consolidated carrier, and none imposed in the future.

(3) Class II and class III railroads that connect to the consolidated carrier have the right to competitive and nondiscriminatory rates and pricing. Rates and pricing of the consolidated carrier that do not meet this standard will be promptly corrected by the consolidated carrier upon request by a connecting class II or class III railroad.

(4) Class II and class III railroads that connect to the consolidated carrier have the right to fair and nondiscriminatory car supply. Car supply issues regarding this standard will be promptly addressed by the consolidated carrier upon request by a connecting class II or class III railroad.

Implementation.—The Board strongly encourages the consolidated carrier to work out any issues regarding these conditions with its connecting class II and class III carriers in a mutually agreeable fashion without resorting to the Board for interpretation or enforcement. However, if needed, the Board will put in place an expedited

and cost-effective remedy process to be initiated by complaint filed with the Board by a connecting class II or class III carrier.”

The section of the current rules discussing supporting information to be provided by applicants, 49 CFR 1180.6, should have language added to specifically require that the application filed in a major transaction must include the following information:

49 CFR 1180.6

“The effect of the proposed transaction upon class II and class III carriers that connect with applicants.”

The section of the current rules dealing with market analyses, 49 CFR 1180.7, requires applicants to prepare impact analyses in major transactions. This section should have language added to specifically require that the impact analyses prepared and filed by applicants in connection with a major transaction must include the following information:

49 CFR 1180.7

“An impact analysis must include the effect of the proposed transaction upon class II and class III carriers that connect with applicants.”

These rule changes, adopted by the Board as part of its revision of the class I merger rules, will be a giant step forward and will put the Board’s rules in tune with today’s railroading reality. The rail network must affirmatively preserve competitive options and ensure good service in order to remain viable. Small railroads will play an essential part if they are not prevented from doing so. Including the conditions enumerated in the “Short Line and Regional Railroad Bill of Rights” will put a stop to the erosion of competition and service caused by recent mergers. ASLRRRA urges the Board to revise its rules to include the changes suggested above, and include the “Short Line and Regional Railroad Bill of Rights” as a condition of its approval of any future class I merger or consolidation transaction.

ATTACHMENT 2

AN ESTIMATION OF THE INVESTMENT IN TRACK AND STRUCTURES NEEDED TO HANDLE
286,000 LB. RAIL CARS

EXECUTIVE SUMMARY

The short line and regional railroad industry in America operates about 50,000 of the 170,000 track miles making up the U.S. railroad network, and accounts for just under \$3 billion of the approximately \$35 billion in railroad industry gross revenues.

With \$3 billion in revenue for 50,000 track miles, the short lines and regionals have only about \$60,000 per track mile in annual revenue, compared with an average of \$269,000 per mile for large (Class I) railroads in America. Nevertheless, they must maintain a physical plant capable of handling the heaviest freight cars allowed in interchange on North American railroads.

The weight limit for general interchange is in the process of being raised from 263,000 lbs. to 286,000 lbs. The short line and regional railroads have voiced considerable concern about the potential cost of upgrading their fixed plant (track and bridges) to handle cars of this weight. For this reason, the American Short Line and Regional Railroad Association asked ZETA-TECH to estimate the cost to the industry of improving its track and bridges to safely handle heavier cars.

ZETA-TECH surveyed 46 of the 550 short line and regional railroads, with 4,742 miles of track. Detailed information was collected on track and bridge condition, track components, annual tonnage, and operating speed. This information was entered into a database, and ZETA-TECH developed a series of logic matrices to determine when each combination of track components, condition, tonnage, and operating speed was adequate to handle 286,000 lb. cars.

The product of the analysis was an estimate of the total quantity of rail to be replaced, ties to be inserted, ballast to be installed, and bridges to be repaired or replaced, on the 4,742 miles comprising the sample of railroads. These results were then extended to the entire short line industry, to produce the results shown in Table A.

TABLE A.—CALCULATED COST OF UPGRADING SHORT LINE AND REGIONAL RAILROADS TO HANDLE 286,000 LB. CARS

| Component | Required investment per mile | Total cost (sample) | Total cost (industry) |
|-------------------------|------------------------------|---------------------|-----------------------|
| Rail | \$75,106 | \$356,150,175 | \$3,754,182,002 |
| Ties | 16,372 | 77,636,048 | 818,362,236 |
| Ballast/Surfacing | 2,657 | 12,597,440 | 132,789,720 |
| Turnouts | 7,882 | 37,377,454 | 393,996,056 |
| Bridges | 35,236 | 167,085,889 | 1,761,253,773 |
| Total | 137,253 | 650,847,006 | 6,860,583,787 |
| Track Mileage | | 4,742 | 49,985 |

PAPER BARRIERS

Senator SHELBY. Mr. Turner, just briefly for the non-railroad people like me, what role specifically do the short line and regional railroads play in our competitive national system? In other words, are the connections, this is where you connect to the main—

Mr. TURNER. Yes. Mr. Chairman, we are a feeder line to the main trunk lines of the national—

Senator SHELBY. Give me an example in my home state, please.

Mr. TURNER. Well, let us say the short line to Alabama and Eastern that runs from Sylacauga, that runs out to Sylacauga, they bring in a lot of limestone and all that, and they deliver it into Birmingham, to CSX, for nationwide service.

Senator SHELBY. Okay. Mr. Hamberger, do you feel that the class one railroads have a vested interest in the health and vitality of smaller railroads, and if so, why?

Mr. HAMBERGER. Absolutely, Mr. Chairman. That is why we sat down and negotiated the deal, the agreement that we did, the Rail Industry Agreement, in September 1998, and why we have had ongoing meetings, both at the CEO level and at the working level, if you will, between the Short Line Regional Rail Association, and the AAR, and our members. We are meeting again Thursday, as Mr. Turner indicated, and it is important because about 10 percent of the overall traffic moves on short-line railroads. Frank represents not just the short line—

Senator SHELBY. This is nationwide, now.

Mr. HAMBERGER. Yes, sir.

Senator SHELBY. Okay. That is a good bit of traffic.

Mr. HAMBERGER. Yes, sir, it is.

Mr. TURNER. Well, you are talking revenue, when you are saying—

Mr. HAMBERGER. Right.

Mr. TURNER [continuing]. But actually more cars than that move over them. About one out of every four or five railroad cars, 20 to 25 percent of every railroad car moves from either—originates or terminates on the short line, but we only get 9 percent of the revenue.

Mr. HAMBERGER. Right. So it is obviously a very important part of being able to maintain service throughout the network, yes.

Senator SHELBY. Mr. Turner, this past spring your organization testified before the Surface Transportation Board and called for what you call a short line and regional railroad bill of rights. You specifically called, or they did, for the end of paper barriers—

Mr. TURNER. That is correct, sir.

Senator SHELBY [continuing]. Which we have talked about here—

Mr. TURNER. Yes.

Senator SHELBY [continuing]. Which restrict short-line railroads' ability to make a choice between competing class one railroads. Explain that.

Mr. TURNER. Well, the first thing, when many of these railroads came into existence as a result of the Staggers Act of the 1980s, these were lines that were secondary main lines, or branch lines that were probably going to be candidates for abandonment, but yet there was still some traffic on them. The railroads wanted to shed themselves of this and go to more of a core operation. So they sold these lines to—

Senator SHELBY. To run to big lines, in other words.

Mr. TURNER. That is right. To the main line.

Senator SHELBY. Sure.

Mr. TURNER. We can go back to somewhere like Sylacauga, or somewhere like that, that they would sell these branch lines, and then allow an operator to take over and develop the traffic, which they have done a great job.

Senator SHELBY. Well, we have a short line railroad in my State, from Meridian, Mississippi, to the paper mill over there at Butler.

Mr. TURNER. Yes, sir. You do. It runs from Meridian to Linden—

Senator SHELBY. That is right.

Mr. TURNER [continuing]. And then on to Myrtle Wood.

Senator SHELBY. That is right.

Mr. TURNER. That was one of our members.

Senator SHELBY. Sure.

Mr. TURNER. That is a little bit different. That was a short line that was owned by the James River Paper Company, and the James River Paper Company decided to get out of the railroad business, so they sold it to an operator. There are no paper barriers. There is some restriction as to delivery of some traffic to some of the interchanges, but that is not a typical short line that was born in the mid-eighties.

Senator SHELBY. How many short line railroads do we have in my State, roughly?

Mr. TURNER. You have 17.

Senator SHELBY. How many do we have nationwide?

Mr. TURNER. We have over 500.

Senator SHELBY. Okay.

Mr. TURNER. Some of these are switching carriers inside of paper plants and things like that, but in your case, there are 17 short lines in your State.

PROBLEMS IN WAKE OF MAJOR MERGERS

Senator SHELBY. Mr. Hamberger, in the wake of the mergers, some of the big recent railroad mergers, there have been some

problems with implementing the Conrail split between CSX and Norfolk Southern. There are several bills pending in both the House and Senate regarding reauthorization of the Surface Transportation Board that detail plans to improve rail competition and service. Is it appropriate, in your opinion, for Congress to take a more active role in these issues, particularly, since some of the rail mergers have created, according to shippers and others, serious problems for themselves and their customers?

Mr. HAMBERGER. Let me say, Mr. Chairman, I have never been in the position to tell Congress what is appropriate to do or not to do.

Senator SHELBY. I said in your opinion.

Mr. HAMBERGER. Yes, sir. Obviously, it is appropriate for Congress—

Senator SHELBY. You represent the Association of American Railroads.

Mr. HAMBERGER. Yes, sir. It is appropriate for Congress to have oversight and take a look at any issue it deems appropriate, and that is an appropriate issue to take a look at. I hope that when Congress takes a look at it, they will take a look at it through the prism of what I talked about earlier today, and that is, what is best for the rail network.

Now, yes, there have been some problems as a result of the Conrail transaction, but I—

Senator SHELBY. What is best for the rail network or what is best for the American people?

Mr. HAMBERGER. I would suggest to you that the two are very closely aligned, and what is best for the rail network is, indeed, what is best for the North American economy.

Senator SHELBY. That is what it has to be.

Mr. HAMBERGER. Yes, sir. Absolutely. The Surface Transportation Board, when it approved the Conrail transaction, established a Conrail Transaction Council, which I believe was meeting monthly. It just recently began to meet bimonthly every other month, because the issues have begun to dissipate. I think right after the merger last July 1, the effective date, the meetings were perhaps a little bit more vigorous, shall we say, as service issues were discussed, but it is my understanding, and as I look at the metrics of cars on line, and velocity, both the CSX and Norfolk Southern have made tremendous strides in getting the operational aspect of that transaction put together.

PAPER BARRIERS

If I might just follow on one thing, and that is paper barriers. Arguments in this town seem to be won and lost sometimes on how you define the debate, and the paper barrier is nothing more and nothing less than a contractual obligation. In fact, in the railroad industry agreement we define it as a contractual obligation, incurred when short line carriers acquired lines from larger connecting carriers. In most cases, those obligations were in there as part of the up-front capital costs of buying the line.

Senator SHELBY. Explain what you mean.

Mr. HAMBERGER. In other words, you would come in and the class one would be selling the short line from "A" to "B," and in-

stead of charging “x” dollars, it would charge a substantial discount because of the agreement that the traffic that would continue to originate on that short line would continue to—

Senator SHELBY. Feed into—

Mr. HAMBERGER [continuing]. Feed into that Class I. So it is a price of buying the short line. So it is not really something that we went out there and said we are going to stop you from doing something, it was an arms-length negotiation—

Senator SHELBY. Well, what about where it is a situation that the short line existed prior to the Staggers Act?

Mr. HAMBERGER. It is my understanding that the paper barriers, as Frank said, they are not in—

Senator SHELBY. They do not apply.

Mr. HAMBERGER. Right.

Senator SHELBY. They do not apply.

Mr. HAMBERGER. Right. But the railroad could have been sold to the Class I prior to the Staggers Act.

Senator SHELBY. Okay.

Mr. HAMBERGER. There was some of that. So it is really—and the thing I was trying to drive at is not only how it came about, but that in this agreement we recognize the importance of growing the rail network, and so we have agreed, the Class Is have agreed that where new traffic originates, the paper barrier would not stand in the way of that new traffic, that if the Class I could not handle it, or if it was not the most efficient routing, the paper barrier would not stand in the way of that new traffic.

Mr. TURNER. Mr. Chairman, could I respond to that—

Senator SHELBY. Sure.

Mr. TURNER [continuing]. Very quickly? The first thing, this was in the mid-eighties, and since then, as I have mentioned, we have had 40 Class I railroads, you know, in 1980, and a lot of routes have been closed, and routes have been changed, and all that, so the whole terrain is different. We recognize that that is a contractual agreement, and if we cannot reach a way to remove this internally, we are going to have to look elsewhere for assistance to make this a national rail network, not one that is hindered by these paper barriers.

OPEN ACCESS

Senator SHELBY. Let me ask you both something. Other industries, as we know, and we know they are not railroads, such as the telecommunications industry, allow competitors to use their networks and infrastructure for a fee, not free now, but for a fee.

Some people have proposed that this be required in the railroad industry, and I have been told that Australia is committed to providing open access among the country's railroads. I believe this policy was instituted about 5 years ago, and it is overseen by the National Competition Council. Do you have any comments on that, Mr. Hamberger?

Mr. HAMBERGER. Well, I do.

Senator SHELBY. Okay.

Mr. HAMBERGER. Let me address that in two ways, if I might.

Senator SHELBY. I have not proposed that. I am just throwing it out.

Mr. HAMBERGER. Mr. Chairman, I am struggling here to find—
 Mr. TURNER. Well, while he is doing that. We have that. We do have haulage rights and provisions for trackage rights in this country today. We do. I mean we have CSX operating over on Norfolk Southern track, and vice-versa.

Senator SHELBY. I knew you would find some of that.

Mr. HAMBERGER. I was going to answer, too. Thank you, Frank. Exactly. What is being proposed for the telecommunications and utility industries, we already have.

Senator SHELBY. You already have.

Mr. HAMBERGER. We have to accept traffic that is presented to us to carry. What I was looking for here is a study that we have—

Senator SHELBY. But you get a fee from them for using your railroad, do you not?

Mr. HAMBERGER. Well, you have to negotiate a rate. Yes, sir.

Senator SHELBY. In other words, if I had a railroad you could not just ride on it for free, could you?

Mr. HAMBERGER. That is correct.

Mr. TURNER. We had a study done by Mercer Management, several case studies, going throughout the world, and the bottom line is, let me just get to the bottom line, that as country after country has examined what is the best model for privatizing their railroads, they have come to the conclusion that the United States system is the best. Mexico, in our own hemisphere most recently, 2 years ago privatized three major railroads, and after years of investigation, decided that the U.S. system was the best.

The case study that we have from Australia, and you are exactly correct in that it provides for open access, the results are that open access has not improved rail's market share or induced new private investment, a key point, that implementing the interstate open access has resulted in significant additional costs for incumbent railroads, due to loss of coordination between rail operations and infrastructure, and because of the establishment of large bureaucracies. And finally, maintaining rail economies of scales is important to keeping rail competitive with truck, and positioning the rail network to be financially self-sustaining.

Much the same track record in Britain, where the government has had to step in because of disagreements between the company owning the track and the company leading the locomotives.

Senator SHELBY. We have been joined by Senator Specter, who has been in another committee. Senator Specter, do you have any comments or questions for these two gentlemen?

Senator SPECTER. Well, having come in at the end of their testimony, I only have seven questions for Mr. Turner and eight for Mr. Hamberger. I would like them sworn first, Mr. Chairman—

Senator SHELBY. All right.

Senator SPECTER [continuing]. Before I proceed.

Senator SHELBY. Do you really want them sworn?

Senator SPECTER. No. If they will affirm, it will be sufficient. On a serious vein, I want to compliment you, Mr. Chairman, on convening this hearing. This is a very, very important subject, one which affects Pennsylvania very, very decisively, with what has happened with the division of Conrail and the truckers and rail-

road issue, problems which have affected my State for many, many years.

The big anti-trust case back in the late fifties, early sixties, involved a battle between truckers and the railroads, and we still have to try to find a way, so I appreciate your activism. This is not quite as big a turnout as you got for Ford-Firestone, but it is very important.

Senator SHELBY. You know, we started Ford-Firestone last week, and it has now moved from this committee to the House Commerce Committee, back to our Commerce committee.

Senator SPECTER. They are still not catching up with you, Senator Shelby.

Senator SHELBY. Gentlemen, thank you for coming. Our third panel would be the regulatory authority, Ms. Linda J. Morgan, Chairman, Surface Transportation Board. Ms. Morgan, welcome to the committee. Your written statement will be made a part of the record in its entirety. You may proceed as you wish. I am sure you have heard their testimony, have you not, all the panels.

Ms. MORGAN. I have, indeed. I have been here since the beginning, Mr. Chairman.

Senator SHELBY. Thank you.

SURFACE TRANSPORTATION BOARD

STATEMENT OF LINDA J. MORGAN, CHAIRMAN

Ms. MORGAN. Mr. Chairman and Senator Specter, I am appearing at the request of the committee to discuss competition in the railroad industry. I will make my oral remarks brief. I have submitted written testimony that you are kindly including in the record in its entirety. My written testimony reviews concerns raised about the rail sector and how the Board has responded.

MERGER PROBLEMS

One of the issues that concerns shippers and that has concerned me involves the service problems experienced throughout the railroad industry in connection with the recent round of mergers. I have not been satisfied with where the industry's service record has been, but I believe that the board has been a positive force in helping, both on a formal and an informal basis, to fix problems that have arisen, while averting new ones. This was true during the service crisis in the West, and it remains true today, as we work to continue stabilizing service in the East, and our recent action, which was affirmed in court, imposing a 15-month moratorium while we revisit the Board's merger policy and rules, was important to ensure that existing service problems were not further aggravated.

OTHER ISSUES

The Board has also been a positive force in driving substantive changes in response to concerns brought to our attention. After our 1998 hearings on access and competition, for example, we changed the rules for rate complaints to make the process simpler, less burdensome, and more accessible for shippers—the so-called market dominance decision that was referenced earlier. The railroads have challenged our decision in court, but I am confident that the court will find that we have acted properly. We also changed our rules so that a shipper receiving poor service could obtain relief by using another carrier. And more recently, following up on our 4 days of hearings on major rail mergers, we are reexamining our merger policy and rules.

There are other issues that certain interested parties believe have not yet been fully addressed. In prior congressional testimony and in my 1998 letter to Chairman McCain and Subcommittee Chairman Hutchison, which is appended to my written testimony, I have indicated that legislation would be necessary to address those issues if Congress wanted to address them.

PREPARED STATEMENT

My position on those issues remains the same today as it has been in the past. The Board has stepped up to the plate and has responded creatively and aggressively in addressing issues that it can address within its authority.

I would be happy to answer any questions.
[The statement follows:]

PREPARED STATEMENT OF LINDA J. MORGAN

My name is Linda J. Morgan, Chairman of the Surface Transportation Board (Board). I am appearing at the request of the Committee to discuss competition in the railroad industry. Over the past 3 years, I have testified about that issue and related matters on several occasions, before both the Senate Committee on Commerce, Science, and Transportation and the House Committee on Transportation and Infrastructure. Additionally, responding to the concerns of Members of the Senate Commerce Committee, and in particular Committee Chairman McCain and Subcommittee Chairman Hutchison, in the spring of 1998, we held 15 hours of agency hearings on access and competition in the railroad industry, at which over 60 witnesses testified, and we took various actions in response. More recently, in March of this year the Board held 4 days of hearings, in which over 120 witnesses participated, on major rail consolidations and the future structure of the railroad industry, after which we imposed a 15-month moratorium on major rail mergers so that we could institute a proceeding, which is now pending, to reexamine our rail merger policy and rules.

I. THE BOARD'S RAIL ACCESS AND COMPETITION PROCEEDING

At our 1998 hearings, rail-dependent shippers complained that, as a result of consolidation in the industry, their competitive options had not been expanded, and that available remedies, particularly for service failures and rate relief, were burdensome, costly, and unresponsive. In an effort to address those concerns, the Board pursued a mix of regulatory action and private-sector initiatives directed by the Board.

In particular, at the Board's urging, railroads met among themselves and with customers and other interested groups to pursue certain private-sector responses. As a result, the large and small railroads entered into an agreement intended to ensure more effective utilization of smaller railroads in addressing the concerns raised by shippers, and I recently sent a letter to both groups requesting that they initiate further discussions to strengthen that agreement. In addition, the large railroads set up a series of meetings with shippers throughout the Nation to address customer service issues, which produced among other things an agreement by large railroads to publicize, for the first time, carrier-specific performance data, building upon data that the Board had itself been collecting for service monitoring purposes. Also, with the Board's prodding, grain shippers and coal shippers separately reached agreement with the rail industry on private-sector mechanisms for resolving disputes.

On the regulatory front, the Board changed its "market dominance" rules in order to make the procedures less cumbersome for shippers in pursuing rate relief at the agency. Specifically, our decision eliminated the review of product and geographic competition from the determination of whether a railroad has market dominance over the transportation at issue. This decision has been appealed in court, and oral argument will be held in the court in November. The Board also adopted new rules establishing ways to provide shippers that have concerns about poor service with the opportunity to obtain service from an alternate carrier.

Finally, on December 21, 1998, I wrote a letter to Chairman McCain and Senator Hutchison (attached as Appendix A) following up on our rail access and competition hearings. I summarized the Board's activities as to matters within its authority, described above, and suggested actions that Congress might wish to take, in areas in which the Board lacks authority, to address concerns that had been raised.

II. RAILROAD MERGERS

A. The Recent Round of Rail Mergers.—Although mergers and other changes in corporate structure have been going on in the rail industry for many decades, there has been substantial rail merger activity since the Staggers Rail Act of 1980 was passed, reflecting what has been occurring throughout the Nation's economy. In 1976, there were, by our calculations, 30 independent "Class I" (larger railroad) sys-

tems; nine of those systems have since then dropped down to Class II or III (smaller railroad) status because the revenue thresholds for Class I status were raised substantially some years ago; two large carriers went into bankruptcy; and the remaining 19 systems have been reduced to 7 independent systems in the past 24 years. This merger activity has not occurred because the Board (or the ICC) has sought out mergers. When two railroads file a merger application, we apply certain statutory standards to the proposal presented to us and approve the merger if it is in the public interest based on those standards and the record compiled.

Under the rules developed in the late 1970s and early 1980s, four major rail mergers have been approved since I became Chairman in 1995. These mergers were approved, however, only after the Board imposed many significant competitive and other conditions. From a competitive perspective, the conditions attached to the merger approvals have assured that no shipper's service options were reduced to one-carrier service as a result of a merger. The conditions also have provided for substantial post-merger oversight and monitoring that have permitted us to review both competitive and operational issues that have arisen. Additionally, they have provided for the protection of employees and the mitigation of environmental impacts, and our recent decisions have provided for the compilation of a "safety integration plan" that draws on the resources of the Board, the Federal Railroad Administration, and the involved carriers and employees. With respect to the service problems that have been associated with recent mergers, the Board, I believe, has been a positive force in restoring service and addressing service problems. And importantly, the merger approval, oversight, and monitoring process has evolved and been strengthened throughout this last round of mergers to reflect concerns raised and lessons learned.

In varying degrees, each of these mergers has had the support of segments of the shipping public, as well as that of employees and various localities, and each was considered by many of the interested parties to be in the public interest. A variety of shippers actively supported the Burlington Northern/Santa Fe (BNSF) merger, the inherently procompetitive Conrail acquisition, and the recent Canadian National/Illinois Central (CN/IC) merger. And the Union Pacific/Southern Pacific merger, which segments of the shipping community opposed while others supported it, was necessary, the Board believed, not only to prop up the failing Southern Pacific, but also to permit the development of a rail system in the West with enough of a presence to compete with the newly merged BNSF.

I know that certain shippers have taken the view that recent mergers have inhibited competition. But based on the record developed, in approving these four mergers, the Board (and, earlier, the ICC) concluded that, with the significant conditions imposed, they would not diminish competition and in fact could enhance competition; they would produce significant transportation benefits; and they were otherwise in the public interest. The Board will continue to exercise its oversight authority in accordance with those objectives, and in this regard, we currently have three comprehensive merger oversight proceedings under way, in which we are monitoring the effectiveness of our competitive and other conditions. And we continue to be active in monitoring service performance and addressing service problems.

B. The Railroad Merger Moratorium.—On December 20, 1999, BNSF and CN notified the Board that they intended to file an application, on or shortly after March 20, 2000, seeking Board approval to bring their railroad systems under common control. Given the aggressive consolidation and associated disruptions that had occurred in the railroad industry during the past several years, and the likelihood that the BNSF/CN proposal would set off yet another full, and likely final, round of major rail consolidations, the Board issued an order on December 28, 1999, waiving the so-called "one case at a time" rule for the BNSF/CN proceeding and stating that, if the BNSF/CN proceeding went forward, the Board would consider not only the direct impacts of that combination, but also evidence of the cumulative impacts and crossover effects that would likely occur as other railroads developed strategic responses in reaction to the proposed combined new system. In addition, given the prospect of significant further consolidation within the railroad industry, and the Board's concern that the railroad industry and the shipping public had not yet recovered from the service disruptions associated with the previous round of mergers, the Board issued an order on January 24, 2000, opening a proceeding (STB Ex Parte No. 582) to obtain public views on the subject of major rail consolidations and the present and future structure of the North American rail industry.

As part of the Ex Parte No. 582 proceeding, the Board took written and oral testimony from all sectors associated with the rail industry, including large and small rail carriers; large and small shippers representing various commodity groups; intermodal and third party transportation providers; rail employees; state and local interests; financial analysts and economists; and Members of Congress and other fed-

eral agencies. The overwhelming weight of the testimony, particularly the testimony taken over the 4 days of oral hearings, was that the rail community is suffering from “merger fatigue;” that, given the experience with past merger implementation, along with the current state of service in the industry, more mergers at this time would aggravate service problems; that the Board’s existing policies and procedures are not appropriate for what could likely be the final round of mergers; and that fundamental changes to the merger rules and policies are needed before any new mergers move forward.

The Board agreed, concluding in a decision issued on March 17 (attached as Appendix B) that the industry is not ready and the merger rules are not appropriate for what will likely be the final round of restructuring of the North American railroad industry that may well result in two transcontinental railroads. To avoid the service disruptions—beyond those already being experienced—that could have developed throughout the rail industry from further consolidation at this time, and to allow a broad reexamination of its merger rules and policies, the Board put a 15-month hold on the filing of any new mergers.

The moratorium was challenged in court, and on July 14, only a month after the oral argument, the court, by a 2–1 decision, upheld the agency’s action. Although the dissent concluded that the statute requires the Board to handle any application that a railroad wants to file within specified time frames, the court majority saw the case as we did: it understood that we need new rules to address the service and competitive issues associated with future mergers; it recognized that we could not effectively review new mergers at the same time as we are revisiting the rules; and it found that we therefore have the authority to impose a moratorium to fulfill our broad statutory obligation to determine whether specific merger proposals are in the public interest. Given the concerns over the service and competitive issues that would be implicated if new mergers were to move forward now, the court found that

“forcing the Board to [consider new applications] before it has had an opportunity to determine where the public interest lies would defeat altogether the purpose of the agency’s review, whereas allowing the Board to focus for a reasonable time upon revising its [merger] criteria would likely enable the Board to continue to meet its deadlines once it resumes processing applications.”

Shortly after the court issued its ruling, BNSF and CN withdrew their merger proposal.

C. The Board’s Rulemaking to Revisit its Rail Merger Policy and Rules.—The Board has issued an advance notice of proposed rulemaking (ANPR) to initiate the process of reexamining its merger rules and policy. On October 3, the Board expects to issue a notice of proposed rulemaking (NPR), and, after reviewing comments on the NPR, it will issue final rules by June 11, 2001. I cannot say too much about the proceeding, as it is still pending, but I can summarize the key observations that the agency made as it decided to start the process. First, the industry has changed since the existing merger policy and rules were approved. It is now more consolidated after the last round of mergers, and the benefits associated with prior mergers related to reduction in excess capacity and efficiencies are not likely to result to the same degree from future mergers; we thus need to look at merger benefits differently for the future. Second, with future merger proposals likely leading to the final round of consolidation, the combined systems would be much larger, and the risks associated with failure would increase substantially. With greater consolidation, problems could be broader in scope and harder to fix, and there may be fewer alternatives to which we can turn; we must make sure that the benefits clearly outweigh any potential harm. Third, we have learned that service problems can occur with mergers even when carriers plan and focus on service; we must look for new and better ways to guard against and offset merger-related service problems and to deal with them when they occur.

And after having reviewed comments from over 100 parties filed in response to the ANPR from a variety of interests, I can say that there clearly will be changes made to our merger policy and rules. As we have already indicated, in reviewing future merger proposals, we will look at downstream effects, that is, we will consider the likely responses of other carriers as the Board reviews a particular merger application in the future. And in considering whether a future merger proposal is in the public interest, that is whether the benefits outweigh the potential harm, we are considering how to define and determine benefits, including a review of such issues as whether we should require future mergers to enhance competition, whether we should look at the extent to which benefits could be realized by other means, and whether there should be a more specific accounting of the benefits and accountability for benefits claimed. We also are reviewing how to define potential harm, including competitive and service harm, and how potential harm might be mitigated

and offset. Furthermore, we are looking at how we address service issues, in particular how we look at service improvement as a merger benefit, and how we ensure service accountability, guard against service failure as a transaction is being implemented, and provide for resolution of service problems if they occur. Finally, we will need to address other related matters, such as safety, employee concerns, smaller railroad issues, and cross-border matters such as trade and defense.

III. RAIL SERVICE ISSUES

Over the past few years, we have used our general oversight and specific legal authority, reporting, and specific merger-related monitoring to promote service improvement and resolve service problems. Among other things, we took unprecedented actions to address the rail service crisis in the West. We have required carriers to develop and publicize detailed plans for managing consolidations and for addressing service issues. We have directed an unprecedented amount of carrier reporting (both public and confidential) about carrier service. Board representatives are continually in communication with carrier management about general service issues, and they work closely on an ongoing basis with carriers and shippers to address individual service problems on an informal basis.

I know that carriers have experienced substantial service problems notwithstanding our efforts, but I believe that we have been a positive and constructive force. With regard to the rail crisis in the West, for example, under the umbrella of a 9-month emergency service order, the Board required substantial and heretofore unprecedented operational reporting, engaged in substantial and heretofore unprecedented operational monitoring, and redirected operations in a focused and constructive way. The Board was successful in working on an informal basis with affected shippers to resolve service problems, and it was careful not to take actions that might have helped some shippers or regions but inadvertently hurt others. And the Board proceeded in such a way as not to undermine, but rather to encourage, important private-sector initiatives that facilitated and were integral to service recovery, such as the unprecedented creation of the joint dispatching center near Houston, TX, and the significant upgrading of infrastructure designed to prevent future service problems. And in connection with the Conrail acquisition in the East, we have engaged in extensive pre- and post-implementation monitoring, including the review of significant operational metrics and plans, and have continued to work constructively with carriers and with shippers to resolve service problems.

IV. RAIL RATE ISSUES

Since it was created nearly 5 years ago, the Board has tackled several important rail rate matters, and in this regard it has been responsive to shipper and other concerns in accordance with the law. In particular, we have been committed to resolving formal and informal shipper complaints expeditiously, clarifying applicable standards for resolution of formal complaints, and leveling the playing field to ensure that the formal process is not used simply to delay final resolution.

In particular, the Board has established deadlines for rate cases and procedures to expedite the decisional process, and decisions resolving large rail rate complaints have refined the standards for developing the record in these cases. A few of the rate cases have been made possible by the Board's judicially-approved decisions in the "bottleneck" cases, which construed the statute as permitting challenges to bottleneck rates (rates for a segment of a through movement that is served by a single carrier) whenever the shipper has a contract over the non-bottleneck segment. As I have already noted, we recently modified the market dominance rules to streamline the process for handling rate complaints, and I feel confident that this action will be upheld by the court in the appeal brought by the railroads. The "constrained market pricing" (CMP) procedure for determining whether or not a rate is reasonable is now a well accepted way of measuring rate reasonableness for larger rate cases. Shippers have won substantial relief in major rate cases that have been decided by the Board. Some new large rate cases are pending, and several others have been settled without involvement of the Board.

The Board has also adopted simplified rules for small rail rate cases. However, no such cases have been brought to date under these rules. Concerns remain that those rules are still too complex. In my letter to Chairman McCain and Senator Hutchison, I explained that the Board's rules reflect the statute and the standards that must be balanced, but I also recommended that Congress consider adopting a single benchmark test or some other simplified procedure for small rate cases to address process concerns.

V. SUMMARY

I believe that the Board has compiled a solid record of responding in significant ways to concerns raised about the rail sector through “common sense government,” promoting private-sector initiative and resolution where appropriate and undertaking vigilant government oversight and action where necessary in accordance with the law. The focus of any action affecting the rail sector should be on how best to achieve adequate rail service at reasonable rates for all users. At the same time, we need to ensure an appropriate level of capital reinvestment so that carriers are able to provide adequate service with a rail system that can be sustained and is able to grow to meet the needs of the public. We have learned that the rail system is fragile, and there is little margin for error. Any decision that we make now will have a profound impact on the transportation system of the future.

This concludes my written testimony. As I stated earlier, I am including a copy of my December 1998 letter to the leadership of the Senate Commerce Committee and the Board’s March 17 rail merger moratorium decision.

ATTACHMENT 1

SURFACE TRANSPORTATION BOARD,
Washington, DC, December 21, 1998.

The Honorable JOHN MCCAIN,
Chairman, Committee on Commerce, Science, and Transportation,
U.S. Senate, Washington, DC.

The Honorable KAY BAILEY HUTCHISON,
Chairman, Subcommittee on Surface Transportation and Merchant Marine,
U.S. Senate, Washington, DC.

Dear CHAIRMAN MCCAIN AND CHAIRMAN HUTCHISON: In our letter of June 30, 1998, Vice Chairman Owen and I reported to you on the Board’s recent informational hearings to examine issues of rail access and competition in today’s railroad industry. After summarizing the testimony, the Board responses to the testimony (including the Board’s April 17 decision, copy attached hereto as Addendum A), and further actions that might be taken by Congress, our letter reported on certain ongoing private-sector initiatives. The purpose of this follow-up letter is to inform you of the outcome of the Board’s proceedings and the private-sector initiatives undertaken as a result of the hearings; and to suggest possible ways in which related issues that are still outstanding might be addressed.

1. *Board Proceedings*.—As we pointed out in our prior letter, the Board initiated rulemaking proceedings addressing market dominance and service inadequacies. The Board has completed those proceedings. In *Market Dominance Determinations—Product and Geographic Competition*, STB Ex Parte No. 627 (STB served Dec. 21, 1998), the Board repealed the product and geographic competition tests of the market dominance rules. This change applies to both large and small rail rate cases. In *Relief for Service Inadequacies*, STB Ex Parte No. 628 (STB served Dec. 21, 1998), the Board issued rules giving shippers and smaller railroads opportunities to obtain service from alternate carriers during periods of poor service, using either the emergency service or the access provisions of the law. Copies of these decisions are attached as Addenda B and C.

2. *Railroad Industry Discussions*.—One of the issues that arose at the Board’s hearings was the desire of smaller railroads to eliminate industry restrictions on their ability to compete. The Board directed the railroads to address this issue through private-sector discussions. As our earlier letter noted, the large and small railroads separately indicated that they were having some difficulties in reaching agreement, but the Board encouraged them to continue their dialogue, and indicated that it would take action, as appropriate, if they did not reach agreement. We are pleased to report that in September, an agreement was reached, portions of which were formally approved by the Board. A copy of the Board’s press release announcing the agreement is attached as Addendum D.

3. *AAR/NGFA Agreement*.—In our June 30 letter, we advised you that, consistent with the Board’s preference that private parties seek non-litigative dispute resolution mechanisms, the railroads were meeting with the National Grain and Feed Association (NGFA) in an effort to arrive at an agreement on a mandatory arbitration program to resolve certain disputes. The Association of American Railroads (AAR) and the NGFA recently announced such an agreement. A copy of the AAR/NGFA press release describing the agreement is attached as Addendum E.

4. *Formalized Dialogue Among Railroads and Shippers*.—Another issue that arose at the Board’s hearings involved the concern of some shippers that railroads had

not been adequately communicating with them. To address this concern, the Board directed railroads to establish formalized dialogue with their shippers and their employees, particularly about service issues in general, small shipper issues, and any other relevant matters. The railroads have organized and conducted discrete and formalized meetings with various shippers and shipper groups throughout the Nation. The meetings, which have been attended by Chairman Morgan, were held in Chicago, IL; Houston, TX; Atlanta, GA; Newark, NJ; and Portland, OR. AAR's letter to the Board describing the meetings and the follow-up actions to be taken—including, among other things, issuance of performance reports by each of the large railroads, development of a plan for facilitating interline movements, and continuation of the outreach meetings—is attached as Addendum F. The Board, which supports the continued dialogue that the AAR letter promises, will be closely monitoring all of these follow-up steps. In addition to the AAR letter, a letter from various shippers regarding those meetings, and Chairman Morgan's response to that letter, are attached as Addenda G and H.

5. *Additional Railroad/Shipper Discussions.*—Other shipper concerns that were raised at the Board's hearings involved railroad "revenue adequacy" and the Board's competitive access rules in general. Concluding that each of these issues could be better addressed initially in a private-sector rather than governmental forum, the Board directed railroads to meet with shipper groups to address the issues under the auspices of an Administrative Law Judge. Although extensive meetings were conducted, the parties could not reach agreement on these issues. Attached as Addendum I are copies of the reports that the parties submitted to the Board on their recommendations as to these issues.

Revenue Adequacy.—Although the concept of revenue adequacy has thus far had minimal real-world impact, the existing judicially approved revenue adequacy measurement, which focuses on a railroad's return on investment, has been a source of controversy. Based on suggestions from railroad and shipper representatives at the Ex Parte No. 575 hearing, the Board directed railroads to meet with shippers with a view toward selecting a panel of three disinterested experts to make recommendations as to an appropriate revenue adequacy standard, and to name a panel and report back to the Board by May 15, 1998. The panel was then to report back with final recommendations on July 15, 1998.

Shippers opposed this approach, contending that it would be expensive and inefficient for them to pay part of the costs of the expert panel, while also paying for litigation associated with the conduct of the proceeding before the panel and the Board (and, presumably, if either side wanted to litigate further, the courts). Ultimately, most of the participating shippers recommended that the Board itself initiate a new rulemaking looking to adoption of a revenue adequacy approach that would permit the Board to consider a variety of financial indicators in determining whether railroads are revenue adequate.¹ By contrast, contending that the multiple indicator approach advanced by the shippers would not provide enough certainty or predictability, the railroads supported the expert neutral panel approach.

Competitive Access.—The Board directed railroads and shippers to attempt to find common ground, and to meet, negotiate, and report back to the Board by August 3, 1998. After extensive meetings, the parties reached an impasse. The principal areas of concern involved the definition of terminal areas; the scope of reciprocal switching; appropriate compensation to an incumbent carrier; and, perhaps most fundamentally, whether access to other carriers ought to be required only when an incumbent carrier has acted in some sort of an anticompetitive way, or whether it ought to be provided whenever additional competition is determined to be in the public interest.

6. *Possible Resolutions of Revenue Adequacy, Competitive Access, and Small Rate Case Issues.*—The Board appreciates the opportunity to assist Congress in addressing the transportation issues that face the Nation during these important times and believes that it has appropriately addressed matters of concern within the scope of the authority given to it by Congress. Nevertheless, it is likely that certain legislative proposals will be discussed in Congress during the next session. Following are some thoughts on some of the issues as to which legislative proposals are likely.

Revenue Adequacy.—The revenue adequacy issue, in our view, has unnecessarily polarized the transportation community. The underlying policy objective—that the Board's regulatory approach among other goals permit railroads to earn adequate revenues—is a laudable one that should be retained. As we see it, however, and as we have testified before, the revenue adequacy status of any particular railroad has little practical effect. Revenue adequacy is not a factor in maximum rate cases pros-

¹The shippers indicated that, given the Board's own resources and their own priorities, they would not object if the Board deferred this rulemaking until a later date.

ecuted under the “stand-alone cost” (SAC) methodology. It is not a factor in construction, merger, or abandonment proceedings. Revenue adequacy does play a small role in rate cases brought under the “small case” guidelines, but to date, no such cases have been brought. Therefore, Congress may wish to consider legislatively abolishing the requirement that the Board determine on a regular basis which railroads are revenue adequate.

That is not to say that Congress should abandon the concept of revenue adequacy. As we have testified before, in order to oversee the industry, the Board needs to have some indication of how the industry is faring financially. Moreover, revenue adequacy is one of the non-SAC constraints in the Board’s “constrained market pricing” (CMP) methodology for handling larger maximum rate cases. Although, thus far, all railroad rate cases brought under CMP have been handled under SAC procedures, if a “revenue adequacy” case were brought, the Board would need a basis on which to address it.

For those reasons, and because Congress may not wish to abolish the revenue adequacy requirement immediately, the questions that have been raised about the Board’s current revenue adequacy methodology cannot be ignored. With its credibility on the issue under challenge by several shippers, however, the Board, with its limited resources, does not plan to undertake the shippers’ proposed rulemaking at this time. Rather, given the benefits, the Board continues to support the expert panel approach that was suggested by both shipper and railroad interests during the Board’s Ex Parte No. 575 hearings. The shippers are correct that someone would need to provide funding for the expert panel; that costs rise as layers of litigation are added to the regulatory process; and that it is the Board, and not a private expert panel, that is charged with establishing regulatory procedures. Nevertheless, the Board is willing to make a commitment to give great deference to the expert panel, which would be a competent body that would be perceived as neutral if selected after agreement among the private parties. If the private parties were also to give the expert panel deference, rather than to litigate should they disagree with its (and the Board’s) conclusions, then not only would the parties’ confidence in the objectivity of the process likely be enhanced, but the overall costs also would likely be contained.

Competitive Access.—In its Ex Parte No. 575 decision served April 17, 1998, the Board addressed in some detail the implications of the competitive access debate. The differences between the railroads and the shippers on the Board’s competitive access rules are fundamental, and they raise basic policy issues—concerning the appropriate role of competition, differential pricing, and how railroads earn revenues and structure their services—that are more appropriately resolved by Congress than by an administrative agency. Moreover, the so-called “bottleneck cases,” which involve issues related to competitive access, are still being reviewed in court. For those reasons, although the Board has moved aggressively to adopt the new rules described above to open up access during times of poor service, the Board does not plan to initiate administrative action to otherwise revisit the competitive access rules at this time.²

Small Rate Cases.—As you know, the Board has adopted small rate case guidelines, which apply in cases in which CMP cannot be practicably used. Under these small case guidelines, the Board reviews the profits that the carrier obtains from the challenged rate from three perspectives: it compares them with the profits that railroads in general earn from comparable traffic; it compares them with the level of profits that the carrier would need to obtain from all of its potentially captive traffic in order to become “revenue adequate”; and it compares them with the profits that the defendant carrier earns on all of its potentially captive traffic. Taken to-

²Should Congress choose to review the issue, we would note, as we did in our April 17 decision, that the shape and condition of the rail system that open access would produce is a significant but unresolved issue. Certain shippers assume that the replacement of differential pricing by purely competitive pricing would reduce the rates paid by shippers, and that added competition would result in increased infrastructure investment. The railroads, by contrast, argue that, because their traffic base would shrink, the rates paid by those shippers that would continue to receive service would actually increase, even as overall revenues received by railroads would decline, because the overall traffic base from which costs could be recovered would be reduced. Additionally, as the Board noted in the April 17 decision, carriers could be expected to seek to maintain an adequate rate of return by cutting their costs, which could include shedding unprofitable lines and reducing new investment in infrastructure. Thus, while certain shipper representatives believe that an open access system would ensure better service, concern has been raised that, unless smaller railroads were able to fill in service gaps that could be created, open access could produce a smaller rail system that would serve fewer shippers, and a different mix of customers, than are served today, with different types and levels of, and perhaps more selectively provided, service.

gether, these three comparisons are designed to permit carriers to price “differentially” as provided under the law, in a way that will promote their financial health, while still protecting individual shippers from bearing an unfair share of a particular carrier’s revenue needs. Although the procedures may sound complex, in fact the information needed to make this sort of a case is readily available at reasonable cost. Moreover, the Board concluded, after reviewing many years of debate, that these guidelines are the only procedures that have been identified that readily address each of the concerns that the Board must consider under the statute.

Nevertheless, we are aware that certain shippers are concerned that, for small cases, anything other than a single benchmark test could unreasonably impede access to the regulatory process. If Congress agrees, it could adopt specific small rate case standards. As an example, it could provide that, for certain types of cases, all rates above a specified revenue-to-variable cost ratio, or series of ratios, would be considered unreasonable. If this approach were to follow the tenets of the existing statute, the specifics of such an approach—for example, the cases to which it would apply, and the level or levels at which rates might be capped—would have to balance issues such as differential pricing and railroad revenue need against the fairness in requiring captive shippers to pay substantially higher prices than competitive shippers.

7. *The Override of Railroad Collective Bargaining Agreements.*—Another matter that may be presented to Congress next year is the question of limiting the authority of arbitrators under the standard labor conditions imposed by the Interstate Commerce Commission (ICC) or the Board to modify existing collective bargaining agreements (CBAs) in the process of implementing approved rail consolidations. This process has become extremely controversial since a decision of the Supreme Court in 1991. That decision, *Norfolk & Western Ry. v. American Train Dispatchers Ass’n*, 499 U.S. 117 (1991) (N&W), held that the exemption from all other laws to carry out approved rail consolidations provided by former 49 U.S.C. 11341(a) and carried forward as 49 U.S.C. 11321(a) extends to existing CBAs and operates automatically to permit the override of CBA provisions as necessary for implementation of an approved rail consolidation.

Present practice for implementing Board-approved rail consolidations is for the unions and the railroads involved to negotiate agreements to enable implementation of the Board-approved transaction. If they are unable to agree, the matter is submitted to an arbitrator selected by the parties or the National Mediation Board if the parties cannot agree on the choice of an arbitrator. Because the arbitrator is acting under section 11321(a), he or she has the authority and the obligation to modify existing CBAs as necessary to carry out the transaction.

In the recent Conrail Acquisition³ decision, at the request of the various labor organizations, the Board specifically declined to make a finding in its decision approving the transaction that overriding provisions in Conrail CBAs was necessary to carry out the transaction. Rather, the Board specifically left the determination of necessity to the process of negotiation and, if necessary, arbitration. Even more recently, in the Carmen⁴ decision, the Board elaborated on the limitations on arbitrators’ authority to modify CBAs as permitted by the Supreme Court’s N&W decision. In Carmen the Board held that overrides of CBAs by arbitrators are limited, among other things, to the override authority exercised by arbitrators during the period 1940–1980, an era marked by labor/management peace regarding the implementation of rail consolidations. A copy of the Carmen decision is attached as Addendum J.

Nonetheless, the Board is aware that labor representatives oppose, and are understandably dissatisfied with, any provision or action that permits overriding any existing CBA provisions. If Congress were to agree with their position, given the Supreme Court decision in N&W, some modification of section 11321(a) so as to exclude CBAs, or some other legislative expression, could address labor’s concerns in this area.

8. *Conclusion.*—Again, we appreciate the confidence that Congress has shown by allowing us to play a role in this important process, and we remain committed to providing a forum for constructive dialogue and appropriate regulatory relief. If we

SERVICE DATE—LATE RELEASE MARCH 17, 2000

SURFACE TRANSPORTATION BOARD DECISION

STB EX PARTE NO. 582

PUBLIC VIEWS ON MAJOR RAIL CONSOLIDATIONS

DECIDED: MARCH 16, 2000

OVERVIEW

This proceeding was triggered by a notice filed on December 20, 1999, indicating that another major railroad merger application was imminent.¹ The railroad industry has consolidated aggressively in recent years; now that Consolidated Rail Corporation (Conrail) has been divided between CSX and NS, only six large railroads remain in the United States and Canada.² In an order issued on December 28, 1999,³ we stated that, if the BNSF/CN proceeding went forward, we would consider not only the direct impacts of that combination, but also evidence of the cumulative impacts and crossover effects that would likely occur as other railroads developed strategic responses in reaction to the proposed combined new system. Additionally, given the prospect of significant further consolidation within the railroad industry, and our concern that the railroad industry and the shipping public have not yet recovered from the service disruptions associated with the previous round of mergers, we opened this proceeding to obtain public views on the subject of major rail consolidations and the present and future structure of the North American rail industry.

As part of this proceeding, we took written and oral testimony from all sectors associated with the rail industry: large and small rail carriers; large and small shippers representing various commodity groups; intermodal and third party transportation providers; rail employees; state and local interests; financial analysts and economists; and Members of Congress and other federal agencies. Certain parties expressed support for a radical overhaul of the entire regulatory scheme; some parties expressed support for a “business-as-usual” approach to rail regulation in general and rail mergers in particular; still others took the view that no more rail mergers should be permitted under any circumstances. But the overwhelming weight of the testimony, particularly the oral testimony, was that, at a minimum, our merger policy must be reexamined—and must be reexamined now—before any new major mergers are processed. Because we conclude that the rail community is not in a position to now undertake what will likely be the final round of restructuring of the North American railroad industry, and because our current rules are simply not appropriate for addressing the broad concerns associated with reviewing business deals geared to produce two transcontinental railroads, we agree.

¹In particular, The Burlington Northern and Santa Fe Railway Company and Canadian National Railway Company filed a notice of intent to file, on approximately March 20, 2000, an application seeking Board authorization under 49 U.S.C. 11323–25 and 49 CFR part 1180 for a major transaction (referred to as the BNSF/CN transaction) under which the two railroads would be brought under common control.

²The six are: The Burlington Northern and Santa Fe Railway Company (BNSF); Union Pacific Railroad Company (UP); CSX Transportation, Inc. (CSX); Norfolk Southern Railway Company (NS); Canadian National Railway Company (CN); and Canadian Pacific Railway Company (CP). Two smaller U.S. Class I railroads (Grand Trunk Western Railroad Incorporated and Illinois Central Railroad Company (IC)) are affiliated with CN. A third smaller U.S. Class I railroad (Soo Line Railroad Company) is affiliated with CP. A fourth smaller U.S. Class I railroad (The Kansas City Southern Railway Company (KCS)) remains independent but has entered into a comprehensive alliance with CN and IC.

³*Canadian National Railway Company, Grand Trunk Western Railroad Incorporated, Illinois Central Railroad Company, Burlington Northern Santa Fe Corporation, and The Burlington Northern and Santa Fe Railway Company—Common Control*, STB Finance Docket No. 33842, Decision Nos. 1 & 1A (STB served Dec. 28, 1999) (published in the Federal Register on Jan. 4, 2000, at 65 FR 318).

We recognize that the Government is not in the business of drawing railroad maps, and we are not attempting to do so in this proceeding. We are also aware that the law that we administer generally contemplates private initiatives that are then subjected to regulatory scrutiny. But we are required to take actions and to fashion regulations that advance our mandate—under which we are to approve mergers only to the extent consistent with the public interest, and under which we are to promote a safe and sound rail system that runs smoothly and efficiently to provide service for rail customers—in a manner that is consistent with the overall rail transportation policy established by Congress.⁴ Not only would it be impracticable for us to try to act on a final round of mergers while we are in the process of developing new merger rules, it would also be disruptive to the rail system and to rail service that remains well below acceptable levels in many areas. The disruption would go far beyond the specific interests of BNSF and CN and the carriers that compete with them;⁵ it could irreparably damage the entire industry, to the detriment of the interests of shippers, rail employees, and the national economy and defense.

Therefore, through this decision, we are announcing that, over the next 15 months, we will initiate and complete a proceeding that will provide new merger rules. To permit the development of the new rules, and to ensure that the industry has had the opportunity to fully recover from service problems associated with recent mergers without the distractions associated with consideration of additional mergers, we will maintain the status quo by ordering a suspension of all merger activity, categorized as major transactions, until after the final merger rules are issued, or a total period of 15 months.⁶

BACKGROUND

As indicated, our hearing was triggered by the announcement that BNSF and CN seek to merge. This announcement came as the rail sector and the shipping public have been struggling to recover from the disruptions associated with the most recent round of mergers. Those consolidations regrettably have been accompanied by a number of serious service problems, and, while service levels have shown improvement in certain areas, overall, service is clearly not where it should be. Promised customer benefits have not yet been fully realized, and carrier relationships with customers, rail employees, and local communities have been strained. The performance of railroad stock market equities has been trending downward since the service problems developed in the East, taking a particularly sharp turn downward immediately after the BNSF/CN merger proposal was announced. If it continues, the downturn in the stock value, reflecting a loss of investor confidence, could threaten the capital investment that is needed by the rail industry to ensure that service improvements and growth can be sustained.

BNSF and CN have argued that their consolidation proposal should be examined on its own merits now, because it is a good one that will produce benefits for the shipping public. But regardless of the merits of the BNSF/CN proposal standing alone, many parties expressed concern that, if the BNSF/CN proceeding goes forward, that proposal will not go forward alone. Indeed, the Class I railroads have clearly stated that they would find it necessary to respond in kind, and there is a substantial possibility that, absent decisive action on our part, in the very near future, we will likely be left with the prospect of only two large railroads serving North America. We at the Board, like members of the shipping public, are seriously concerned about the competitive consequences of this level of industry restructuring, and, in any event, about whether it would be in the public interest at this time,

⁴The merger provisions of 49 U.S.C. 11324 direct the Board to consider the public interest in general and, in particular, the adequacy of transportation to the public; inclusion of other rail carriers in particular mergers; and financial, employee, and competitive issues. The rail transportation policy of 49 U.S.C. 10101, which guides us in our regulatory activities, directs us, among other things, to promote safety, efficiency, good working conditions, an economically sound and competitive rail transportation system, and the needs of the public and the national defense.

⁵We fully understand that our mandate is to protect competition, not particular competitors.

⁶In particular, within 20 days, we will issue an advance notice of proposed rulemaking (ANPR) suggesting areas in which new merger rules can be developed addressing the concerns that have been raised. (We are not in a position to propose specific rules at this time because, while several parties raised broad issues of concern, specific rule changes were not the focus of our hearing.) We will provide a total of approximately 60 days for comments and replies to the ANPR, and then, within an additional 120 days, we will issue a notice of proposed rulemaking (NPR). We will provide a total of 100 days for comments, replies, and rebuttal with respect to the NPR, and then, within an additional 150 days, we will issue final rules (a total of approximately 15 months from now).

while the industry is still recovering from service difficulties and other disruptions associated with the last round of major rail consolidations. And so we held a hearing to help us address the important issues relating to major rail consolidations and the present and future structure of the North American railroad industry.

At the hearing, several significant themes kept recurring. We heard from Members of Congress, federal and state government agencies, shippers, and employees about poor service; the threat that another round of proposed mergers would further degrade service; and the need to let some time pass so that railroads, their employees, and their customers can catch their breath before the industry embarks upon what will likely be the final round of mergers. We heard from shippers and Members of Congress about the threat that another round of mergers would pose to competition in the industry, and we heard from a significant number of participants about the need for new rules to govern future mergers. We heard from Department of Transportation Secretary Rodney Slater that the BNSF/CN transaction should not be reviewed under a “business as usual” approach. And we heard from railroads and from members of the financial community about the financial instability of the industry, which could be further threatened by a new round of major mergers. We will discuss each of those issues.

THE TESTIMONY

1. *Service Instability.*—Rail mergers are pursued to increase efficiency and to improve service. At least at the beginning, however, service disruptions have accompanied the implementation of recent large mergers, and many shippers have experienced substantial adverse impacts in connection with the last round of mergers, beginning with the combination of the BN and SF systems, proceeding with the UP acquisition of the Southern Pacific (SP) system, and ending with the acquisition and division of Conrail by CSX and NS.⁷ The overwhelming testimony at our hearing indicated that the shipping public has still not recovered from those disruptions. Shippers described the problems that they faced, and that many continue to face, as a result of their inability to obtain reliable service. Railroad chief executive officers (CEOs) involved in the last round of mergers testified how difficult merger implementation can be, even with the best planning and with the experiences of prior mergers to guide them. Small railroads testified that their ability to participate in the transportation business has been threatened by poor service. A senior rail equity research analyst whose firm is not representing any railroad in the newly initiated round of rail merger negotiations reported on a survey that he had conducted of large institutional investors that he advises. He testified that poor service is partially responsible for the lack of investor confidence in the railroad industry, and that many investors do not want further mergers at this time, nor do they want the legislative changes (which they view as reregulation) that they fear further mergers will precipitate.⁸ And the regular service performance reports provided by the railroad industry indicate that, while service is improving on some fronts, overall, it is still below where it needs to be.

That is why many of the shippers testifying—both large and small—asked us not to permit any further mergers at this time, and certainly not without a change in the way in which we evaluate mergers. Similar sentiments were expressed by Members of Congress, representatives of small railroads, and representatives of railroad employees.⁹ Even the CEOs of the large eastern railroads stated that initiation of

⁷We have also recently approved CN’s application to control IC, but that transaction, which is largely end-to-end, has not yet been fully implemented.

⁸Representatives of investment firms that are advising the applicants in the BNSF/CN proceeding (who also do not want what they describe as reregulation) pointed out that there is no way to know definitively what is driving rail stock prices downward, and that the drop in rail stock prices could simply be related to many of the same factors that are depressing the stocks of companies in other “old economy” industries. We do not doubt that the drop in rail stock prices is attributable to many sources, but it is clear that the current service disruptions and the announcement of the proposed BNSF/CN transaction have played a role. We believe that the potential for further disruption that would accompany the initiation of a final round of mergers at this time concern investors, who do not currently view railroad mergers as a positive because, overall, these mergers have not yet produced the good financial results that were promised.

⁹Clinton Miller, testifying on behalf of the United Transportation Union (the largest railroad union), alluded to both employee dislocations and service disruptions in support of his request for a hold on further mergers. Mark Filipovic of the International Association of Machinists expressed the view that recent mergers did not produce what was promised for railroads, shippers, or employees. Michael Wolly, representing three unions, requested a hold on further mergers until the issues associated with employee dislocations are resolved. And a number of the representatives of rail employees expressed concern about the fact that, under the BNSF/CN proposal, a major U.S. railroad would become foreign-controlled.

a new round of mergers would require them to focus on structural and management changes necessary to protect their own positions in the market, rather than on improving their below-par service. In short, in light of the service issues attending prior mergers and looming over future mergers, we heard widespread concern that any major consolidations at this time would not be in the national interest.

2. *Competitive Issues.*—For several years, parties involved with the railroad industry have engaged in debate over competitive issues. Many shippers are of the view that prior consolidations have left large railroads with too much market power, and they seek various remedies to “level the playing field.” In our hearing, there were repeated expressions—even from shippers with substantial market power, such as United Parcel Service and General Motors—of the view that the rail industry is becoming too concentrated.

Various remedies were suggested to address this concern about concentration. Some shippers asked us to revisit the issues that we studied in-depth 2 years ago in our proceeding in Review of Rail Access and Competition Issues, STB Ex Parte No. 575. They would like us to change the rules in a variety of ways so as to promote more rail-to-rail competition throughout the industry. But short of a complete overhaul of the existing regulatory system (which the financial analysts and economists testifying at the hearing suggested could introduce an additional level of uncertainty and risk into the industry, thereby harming shippers by lowering aggregate rail investment below those levels necessary for railroads to maintain and improve service), a significant number of shippers stated that we need to adopt new merger rules to ensure that competition will not be curtailed further in the event that the industry seeks to merge itself into a duopoly.

3. *New Merger Rules.*—Thus, for a variety of reasons—some related to service, some related to competition, and some, such as those expressed by Transportation Secretary Slater and representatives of rail employees, related to safety—there was substantial support at our hearing for a broad review of and revision to the rules governing major rail mergers. We agree.

Our existing merger policy guidelines were adopted by the Interstate Commerce Commission soon after passage of the Staggers Act of 1980. At that time, good government required a merger policy that, while recognizing the importance of competition, would encourage railroads to formulate proposals that would help rationalize excess capacity in the industry.

The goals of that merger policy have largely been achieved. It does not appear that there are significant public interest benefits to be realized from further downsizing or rationalizing of rail route systems, as there is little of that activity left to do. Looking forward, the key problem faced by railroads—how to improve profitability through enhancing the service provided to their customers—is linked to adding to insufficient infrastructure, not to eliminating excess capacity.

The testimony convinces us that our rules need to be reexamined. Given the current transportation environment, and with the prospect of a transportation system composed of as few as two transcontinental railroads, we may wish to revisit our approach to competitive issues such as the “one-lump theory” and the “three-to-two” question; downstream effects; the important role of smaller railroads in the rail network; service performance issues; how we should look at the types of benefits to be considered in the balancing test, and how we monitor benefits; how we should view alternatives to merger, such as alliances; employee issues such as “cramdown;” and the international trade and foreign control issues that would be raised by any CN or CP proposal to combine with any large U.S. railroad. As Transportation Secretary Slater pointed out, the sheer size of these potential new mergers poses unique risks and leaves no margin for error: if these mergers were to fail, or lead to service problems, the effects could be devastating for both the rail industry and the shippers that depend on rail service. We must be sure that our merger review process takes these risks into account.

DISCUSSION AND CONCLUSIONS

Accordingly, we have concluded that we must revisit our merger rules, and that in the meantime we must maintain the status quo by directing large railroads to suspend merger activity pending the development of new rules. We understand those parties that argue that each case should be viewed on its own merits without regard to the prospect of future consolidation, but we cannot close our eyes to the fact that the mere consideration of any major merger now would likely generate re-

sponsive proposals that, if approved, could result in a North American duopoly.¹⁰ Before proceeding down that path, we must make sure that we have the appropriate guidelines in place to assure that we can properly assess and fully protect the public interest in each individual case.

In their oral testimony, the CEOs of BNSF and CN recognized the argument that certain new requirements may need to be imposed on future merger proposals, but nevertheless urged us to proceed with consideration of their merger proposal now, developing any new requirements in the context of their application proceeding. We realize that administrative agencies can choose to develop new rules either by rule-making or in individual adjudications, but in choosing which course to take, we consider what makes sense. Here, it simply makes no sense to attempt to develop new merger rules in the middle of what could likely be the final round of major railroad mergers.¹¹ New merger rules will be a major undertaking, and we will not know what the rules will look like until the process is over. Yet, under the BNSF/CN approach, we could be reviewing merger proposals involving at least four, and possibly all six, of the large North American railroads before we have had an opportunity to reexamine and reformulate our merger policy. The evidentiary filings in such cases are massive, and yet none of the parties would know what they would be expected to show until new rules are formulated. And then, at the end, once the rules are known, it is not only possible, but quite likely, that the merger process would have to start all over again. Thus, while BNSF and CN may see some benefit to themselves from such a procedure, the process would be inherently uncertain, could lead to substantial instability in the industry, and thus does not represent good government.

There are very serious risks associated with proceeding with individual merger proposals at this time, before we have new rules in place. The disruption that has beset the railroad industry in connection with the last round of mergers could reach unprecedented levels. Carriers whose management should be focused on fixing their service problems would instead be fixated on finding merger partners, defending their proposals, and responding in the regulatory arena to other carriers' proposals. Investors, who have forsaken the railroad industry in favor of businesses that they have come to believe may have more favorable future prospects, could devalue the industry further. And railroads could find it more difficult to finance the capital improvements necessary to provide the better service that is key to their financial revitalization. In short, the already fragile rail industry could be further destabilized.

We understand BNSF/CN's view that holding up their merger application proceeding would itself be viewed negatively by the financial markets as creating uncertainty. We disagree, as we do not see how anything could be more uncertain than moving forward without appropriate rules in place at the beginning to govern the proceeding, particularly at a time when uncertainty already surrounds the rail sector. Furthermore, investors have come to view rail mergers in a less than positive financial light, and we can see proceeding with the BNSF/CN proposal at this time as only adding to that negative environment. In this regard, we should note that there is clearly sentiment within the financial community—from those analysts who closely followed our hearing—that a delay in merger activity, while new rules are developed, would tend to reduce uncertainty for rail investors, help to stabilize rail financial markets, and provide an impetus for increasing rail share prices.¹²

¹⁰The CEOs for BNSF and CN have stated that there is no reason why their merger should necessarily instigate any responsive action by any other railroad. But recent history shows otherwise; indeed, the UP takeover of the SP was a response to the BNSF merger. And CEOs of the other major railroads have stated that they would look to future mergers of their own as strategic responses to the BNSF/CN transaction. Indeed, Richard Davidson, CEO of UP, stated that his company strongly considered a merger with CP as a response to the recent CN takeover of the IC, but ultimately concluded that it would be better off focusing on issues other than mergers under the circumstances prevailing at that time. Given the size of the BNSF/CN transaction, we have no reason to doubt the assertions of the CEOs of the major railroads that if it goes forward, they would have no choice but to seek their own merger partners, and that in a short time, we could be faced with the prospect of a North American duopoly.

¹¹We should note that the representatives of the Departments of Agriculture and Defense expressed the view that we should permit no major mergers at this time. Moreover, Transportation Secretary Slater urged us to make numerous and potentially complex changes to our merger rules that, if they are to be applied evenly to all future mergers, could not be practically effected in the middle of individual merger proceedings.

¹²For example, a Credit Suisse First Boston Corporation rail stock analyst, in a March 6, 2000 note to investors, stated that our hearing might "provide some upside for the stocks if it appears that the risk of industry consolidation will be pushed further into the future by the Surface Transportation Board." Another analyst, from ING Barings, in a March 14, 2000 note to investors, predicted that the Board would impose a merger moratorium, and that, as a result, "the industry is full of many buying opportunities," including the shares of BNSF. A March 13,

Notwithstanding the serious potential public harms that could result from going forward, BNSF and CN argue that they will suffer if consideration of their merger proposal is delayed.¹³ Unless they expect to escape the new rules that will apply to everyone else, however, and to hold other mergers at bay until their own is completed, we do not see how their transaction will not be adversely affected by the disruption that it would produce throughout the industry. BNSF and CN suggest that it is not fair to “penalize” them for the failures of others.¹⁴ But our action here addresses industrywide concerns that involve all railroads (including BNSF and CN), and in any event, should not in any way be construed to be punitive.

Under 49 U.S.C. 11324, we must consider the public interest in addressing rail mergers, taking into account, at a minimum, adequacy of transportation to the public; including other rail carriers in the area involved; competitive effects; financial impacts on the involved carriers; and impacts on employees. In addition, the rail transportation policy set out in 49 U.S.C. 10101 directs us, among other things, to promote safety, efficiency, good working conditions, an economically sound and competitive rail transportation system, and the needs of the public and the national defense. For the reasons we have discussed, we believe that we can best advance all of these objectives by promptly initiating a rulemaking proceeding to adopt new rules, as appropriate, and providing a short period for parties to adjust to the new rules before proceeding with merger proposals. This approach should provide a degree of stability for what is now a very fragile industry and permit vital public interest issues to be addressed on an evenhanded basis for all merger proposals. To go forward with any individual merger proceeding in the meantime would be unfair to customers, carriers, employees, and affected communities, and would disrupt and distract the industry to the detriment of all of the public interest concerns that we are charged with advancing.

We recognize that our action here is unprecedented. But these are not ordinary circumstances, and we see no way of adequately protecting the public interest short of the steps we have outlined here. Congress has directed us to take such actions as are necessary to carry out our statutory mandate, 49 U.S.C. 721(a), and has expressly authorized us to take injunctive-type action to prevent irreparable harm, 49 U.S.C. 721(b)(4).¹⁵ After considering all of the circumstances, as elucidated through our extensive hearings, we find that changes in our merger regulations are nec-

2000 report by a J.P. Morgan analyst expressed the view that “rail stocks would react positively to” what the analyst believed was a likely “mid-term” (up to 2 years) hold on further mergers. A Donaldson, Lufkin, and Jenrette rail analyst, in a March 14, 2000 note to investors, explained that rampant pessimism has resulted in rail securities that “are selling at near recessionary levels. It is a reversal of some of this pressure that is exactly what we’d expect if we are allowed to gain some sense of the regulatory and structural outlook for the industry as a result of last week’s STB hearings.” A Morgan Stanley Dean Witter stock analyst, in a March 8, 2000 note to investors, suggested that a decision by the Board to delay the merger process would remove some near-term uncertainty and lead to near-term strength in a number of railroad stock prices, including those of BNSF and CN. Finally, the Chairman and CEO of Wasserstein, Parella & Co., in a March 10, 2000 letter to Chairman Morgan, explained that his firm “feels strongly that allowing the proposed merger to proceed would place the entire industry in jeopardy,” since “the specter of another round of rail mergers [at this time], which Wall Street is convinced this transaction will precipitate, will accelerate the flight of capital” from the industry. He concludes that the prospect of moving forward with the BN/CN transaction at this time “is a serious threat to the industry’s financial health, well being and long-term prospects.”

¹³BNSF and CN also argue that delay will defer the public benefits, such as new single-line service, associated with their merger. But there are various alternatives to merger that can approximate those benefits. Indeed, CN and its partner IC currently participate in an alliance with KCS, a smaller Class I carrier, that provides all parties many of the benefits of a merger. We note that both General Motors and United Parcel Service (two of the largest customers of CN and BNSF), which would presumably reap the largest benefit from the new single-line service these railroads promise, have testified in no uncertain terms that they do not want a merger to go forward at this time, as has KCS, whose CEO stated that the carrier would not survive as an independent carrier if the BNSF/CN proposal is implemented.

¹⁴We note that the BNSF merger, which was characterized by many, when it was initially proposed, as a manageable “end-to-end” merger, had its own share of integration problems, and there was some testimony at the hearing concerning service issues on the CN/IC system, which has not yet been fully integrated.

¹⁵The legislative history accompanying section 721(b)(4) explains that the provision “explicitly authorizes the [Board] to issue unilateral emergency injunctive orders to prevent irreparable harm. This power has been asserted and used by the [Interstate Commerce Commission] in the past, although not specifically granted by statute. The Committee intends to confirm the scope of the former ICC power in this regard. . . .” H.R. Rep. No. 311, 104th Cong., 1st Sess. 124 (1995).

essary now and that no major rail merger proposals should be filed, or will be considered, until new merger rules have been established.¹⁶

This action will not significantly affect either the quality of the human environment or the conservation of energy resources.

It is ordered:

1. Class I railroads are directed to suspend activity relating to any railroad transaction that would be categorized as a major transaction under 49 CFR 1180.2, pending development of new rules by the Board, as outlined in this decision. No filings relating to such a transaction will be accepted for 15 months.

2. This decision is effective on the date of service.

By the Board, Chairman Morgan, Vice Chairman Burkes, and Commissioner Clyburn. Chairman Morgan, Vice Chairman Burkes, and Commissioner Clyburn commented with separate expressions.

Chairman Morgan, commenting:

This decision has been one of the most difficult ones that I have had to make since becoming a member of the Surface Transportation Board and the Interstate Commerce Commission before it. The Board's action here directing the suspension of all rail merger activity for a period of time is particularly difficult for me because, as my record demonstrates, I do not believe that the government should intervene into free market processes without a very good reason for doing so. And I also believe that parties should get fair and expeditious consideration of matters brought to the Board. But the current problems facing the rail sector are so extraordinary that an unprecedented response is necessary. Given the financial and service instability that exists in the rail sector as a result of the most recent round of major railroad consolidations, I cannot in good conscience allow further actions to occur that I believe would run the risk of creating more disruption and instability to the clear permanent detriment of the Nation's transportation system, rail employees, rail customers, and communities across the country.

In this regard, once I decided that a time-out from mergers was necessary, I proposed a 2-year waiting period before merger applications could be filed. I firmly believe that a period of that length is necessary to accomplish all of the goals set forth in the Board's decision. A lesser time, in my opinion, will simply block the BNSF/CN proposal without fully achieving the immediate and lasting stability for which I am striving by taking this unprecedented action. Nevertheless, although a 2-year period would do more to allow a thorough reexamination of our merger rules and would permit the rail sector to adapt to those rules and achieve a firm level of stability before processing any more major rail consolidation proposals, overall our action here is clearly on the right track.

While certain interests have favored moving forward with the proposed BNSF/CN transaction when filed, many others have been opposed to moving forward with any further consolidation at this time, and certainly not until our merger rules are revisited. In balancing all of these concerns in determining what action would be in the greater public interest here, I have focused on the long-term, as well as short-term, effects of our actions, and on my concern about what would be for the greater good of all railroads, rail customers, rail employees and communities across the country. In view of the instability in the rail sector, the great risk of further harm from continued instability and disruption, and the need to promote the greater public good, it is my strong belief that processing mergers at this time and for a significant period thereafter would not be in the public interest.

Vice Chairman Burkes, Commenting:

This decision sets in motion a 15-month rulemaking proceeding to reevaluate the Board's merger guidelines and imposes a suspension on all major merger activity during this period. This upcoming proceeding will be extremely important. Much has changed in the railroad industry in the nearly twenty years since the majority of our current rules were established. I believe that it is long past time to step back and revisit those standards.

The BNSF/CN merger announcement may have triggered this proceeding, but it is long since overdue. However, it is unfortunate that it was not held prior to their announcement. Consequently, in addition to substantive merger rules issues, the application and timing of a rulemaking proceeding have also become issues.

¹⁶ Accordingly, for the reasons expressed herein, we hereby suspend the "Notice of Intent to File" filed in Canadian National Railway Company, Grand Trunk Western Railroad Incorporated, Illinois Central Railroad Company, Burlington Northern Santa Fe Corporation, and The Burlington Northern and Santa Fe Railway Company—Common Control, STB Finance Docket No. 33842, until such time as new merger rules have been promulgated and the period set forth in this Decision has expired.

In this proceeding, we have established a 15-month period to develop new merger rules. Although this is almost double the period of time associated with the Board's last two major rulemaking proceedings (Ex Parte Nos. 627 and 628), the issues here are significant and complex and will require additional time. Although this proceeding could be completed in a much shorter time period, 15 months should be more than adequate for a thorough review of our merger rules.

Several parties have argued for a longer suspension period or moratorium, i.e., two or more years. I believe this would be much too long of a period of time. After we have issued our final merger rules, there would be a minimum of an additional year before any additional major railroad mergers could be approved. Moreover, the evidence indicates that railroad service has started to improve after the disruptions resulting from the past mergers and it is clear that those problems started long before the BNSF/CN announcement. In addition, a longer period could add to uncertainty for shippers who are considering building or relocating facilities or planning to enter into long term contracts.

In terms of application, I believe that the new railroad merger guidelines should apply to the proposed BNSF/CN merger and all future major railroad mergers. I also believe that, in fairness to BNSF and CN, and to all parties, it is important to resolve these issues in a timely manner.

Commissioner Clyburn, Commenting:

I stated in my opening remarks to Ex Parte 582 that this proceeding could be a defining moment concerning rail consolidation issues. Four full days of listening intently to comments from all sectors of the rail industry has only strengthened this belief. We have heard testimony from large railroads, small railroads, large and small shippers of all types of commodities, rail labor, economists, government agencies and Members of Congress. While diverse ideas regarding how the Board should address future consolidations emerged from the testimony, it was abundantly clear, however, that the time has come for a thorough review of the Board's current merger rules. Some did suggest that we proceed with future consolidation utilizing the same regulatory framework that currently exists, while some others have suggested that we "take a breath" and impose a moratorium on filing merger applications for two years, three years, or an indefinite period of time.

It is clear to me that the rail industry has changed dramatically within the past twenty years since the passage of the Staggers Rail Act of 1980. Rail consolidations have created a new paradigm in which we must now operate. Therefore, I support the Board's decision to institute the 15 month rulemaking process to revise our merger rules and suspend major merger transactions during this time. Others have called for longer periods of time to attempt to address uncertainties—real, perceived, or otherwise. However, my support of the 15 month suspension is based solely on what I believe to be an appropriate time frame in which the Board Members and staff can address, appropriately, the plethora of complex issues the industry currently faces without unnecessarily suspending merger applications. I believe our approach is a reasonable one.

Senator SHELBY. Senator SPECTER.

Senator SPECTER. Thank you very much, Mr. Chairman, and thank you for deferring for me for a question or two at the outset.

CONRAIL ACQUISITION

Chairman Morgan, you said that you were not satisfied, and then after the words "not satisfied," followed by what you were not satisfied about, at this juncture, what is your view of the desirability? If you had it to do all over again, would you like to see Conrail divided between Norfolk Southern and CSX?

Ms. MORGAN. I would not undo my decision with respect to the Conrail acquisition. I believe that the decision that we made was the right one. There was a full record of support for that acquisition. There were some who did not support it, as you know, but there was an overwhelming record for support, and I believe we made the right decision. We have had integration problems that have resulted in service difficulties for shippers, and the Board has been actively involved in resolving those, in monitoring those and resolving them.

INTEGRATION PROBLEMS

Senator SPECTER. Well, you said there was a full record of support. I would say there was a substantial record for opposition as well. And you talk about integration problems. Are you satisfied with the progress which has been made on those so-called integration problems?

Ms. MORGAN. Well, I wish that we had not had the problems that we have had, but I think now we are at a position where we are seeing service improvement that is sticking. We are seeing more reliable service, more stable service in the East. Is it where I would like it to be? No, not yet. Do I wish that the problems had not occurred? Yes.

Senator SPECTER. It is not where you would like it to be yet. Do you have a time frame as to when you think you could get it to where you would like it to be?

Ms. MORGAN. Well, I think each day I want it to be better than it was the day before, so it is—

Senator SPECTER. Well, that is obvious, but how long is it going to take to work out the problems?

Ms. MORGAN. Well, I think we are at a critical point—we are going into the Fall Peak period now, which is a heavy season in the rail industry, and that will certainly test both systems in terms of whether they are ready to handle the increased traffic. That will occur over the next couple of months, and that will tell us the state of the systems.

I believe both systems going into the Fall Peak are in good shape to handle the Fall Peak. They have done a lot of planning, and we have worked very closely with them, but the test will be the Fall Peak, and that will tell us where the systems stand.

CSX

Senator SPECTER. With respect to this problem about, illustratively, a shipper wants to move freight from Philadelphia to Chicago, and only, say, CSX goes to Pittsburgh, would you support a provision which would require CSX to give a rate, Philadelphia to Pittsburgh, so that the customer might have a choice from Norfolk Southern and CSX from Pittsburgh to Chicago?

Ms. MORGAN. Well, again, that is part of the discussion that we have had here today regarding what my statute would allow me to do, and what customers would like to have happen. The way my statute works now, I do not add a competitor upon demand, and there are shippers who would like that to occur, but that is not the statute that I implement today. If Congress wants that—

SENATE BILL 621

Senator SPECTER. Senate Bill 621, introduced by Senator Rockefeller—

Ms. MORGAN. Yes.

Senator SPECTER [continuing]. Would provide that.

Ms. MORGAN. Yes.

Senator SPECTER. My question to you was, do you think that is a provision which ought to become law?

Ms. MORGAN. Well, I think that what needs to be decided by Congress is whether the changes that that bill would make would lead to the kind of rail network that we will be comfortable with—that is clearly a fundamental change in the policy that we have in place today. Congress made a decision about the policy that we should have. That is what I am implementing. If changes are made in that policy, it will have impacts. There may be winners and losers, and Congress just needs to understand that before it makes its decision.

Senator SPECTER. Well, twice I have tried to get an answer from you as to whether you think that would be a good change. Let me make a third effort.

Ms. MORGAN. Well, I have answered that in the past. If you are asking me, do I with certainty today—

Senator SPECTER. You may have answered it in the past, there may have been discussions before I got here, but I was not here before I got here, and I do not know what you did in the past, and I would like an answer to the simple question, do you think that there ought to be a compulsion for, say, CSX to provide transit from Philadelphia to Pittsburgh so that the customer could have the choice between CSX and Norfolk Southern for the balance of the ride to Chicago.

Ms. MORGAN. If you are asking me, which I think you are, as a general policy matter, every place there is a shipper that is only served by one carrier, one rail carrier, if the policy should be to add another carrier to serve that customer, that is a change in the policy that we have in place today, and if you are asking me, am I certain that that will result in the kind of rail network that we can all be comfortable with, I cannot tell you that I am. I think it requires more study and more careful thought before we make that kind of fundamental change in the Staggers Act. I have testified to that previously, and I am here today to say that.

Senator SPECTER. I take that to be a no.

Ms. MORGAN. It is not necessarily a no. It is—

Senator SPECTER. A tentative no?

Ms. MORGAN. No, it is not a yes.

Senator SPECTER. Well, I thank you for that. That certainly does clarify the matter considerably.

Senator SHELBY. Senator Specter, let me see if I understand what—from, say, Philadelphia to Pittsburgh, you are talking about just back-to-back competition? I do not see anything wrong with that.

Senator SPECTER. Well, Philadelphia to Pittsburgh, as I understand it maybe hypothetically, but I understand it, CSX has the sole line, but from Pittsburgh to Chicago, Norfolk Southern can compete with CSX, so Senator Rockefeller has an idea, and I think it is a good idea, that requires that CSX give a customer a rate. This is a lot like deregulation of electricity, where I was very surprised at the start to hear that electrical companies could come and use somebody else's lines, but that is what is going on in America today, and if CSX has the only line to Pittsburgh, then they get the transit all the way to Chicago, and I would like to see Norfolk Southern in a position to compete from the Pittsburgh to Chicago

line. That is my second choice. My first choice is to have Conrail do it, Senator Shelby.

Senator SHELBY. I remember.

ANTI-COMPETITIVE CONDUCT

Senator SPECTER. But that is my second choice. I believe that I have Ms. Morgan's view on it. Let me ask you one other provision of Senator Rockefeller's bill, which eliminates the requirement that evidence of anti-competitive conduct be produced when the Surface Transportation Board decides a case to allow another railroad access to customer facilities within an area served by the tracks of more than one railroad.

Ms. MORGAN. That is the so-called open access provision. Again, that is in line with my earlier discussion with you. That would be adding competition in a way that I do not believe that the current law provides, and, in fact, the courts have, in reviewing our decisions, clearly stated that we do not implement, at this point, an open access statute. So the statute would need to be changed, if that—obviously if you wanted to get that—

Senator SPECTER. Well, Congress can change it. We all know that. Ms. Morgan, why not structure the system so that you give the customer an opportunity to get competition between Norfolk Southern and CSX from Pittsburgh to Chicago? As long as CSX has the only line from Philadelphia to Pittsburgh, customers are shut out. Why not open up that competitive opportunity from Pittsburgh to Chicago, between Norfolk Southern and CSX?

Ms. MORGAN. Well—

Senator SPECTER. Senator Shelby has asked the question a lot better than I did by five little words: Does current law inhibit competition?

Ms. MORGAN. Well, I can answer both of them—

Senator SPECTER. That is great.

Ms. MORGAN [continuing]. Both of the questions.

Senator SPECTER. Answer mine first.

Ms. MORGAN. When Congress passed the Staggers Act of 1980, it assumed that there would be captive shippers, and as part of the policy determination that it made in reforming how the railroads were regulated, it was assumed that there would be a rate structure that would recognize that there would be captive shippers and competitive shippers.

As part of that, there are certain provisions and policies that lead us to the kinds of decisions that now certain people are uncomfortable with, whether it be the bottleneck decision that you referenced, or opening up terminals without determining whether there is anti-competitive conduct.

Clearly, when Congress made the decision in 1980, it studied it and made the determination that that was the right policy at the time. I think if Congress wants to revisit that policy, that is fine, and my answer to your question earlier is that that review is fine, but certain questions need to be asked and answered comfortably for everyone.

Now, the question you asked, which is, does the statute inhibit competition, I get back to the premise, which is if the premise is that we do not have enough competition unless every person that

is now served by one railroad would be served by two railroads, well then our statute does not provide for that.

If on the other hand people are comfortable that there are “captive shippers,” which is what the Staggers Act assumes, then I believe the Board has fulfilled those responsibilities and reflected the competitive policy.

Senator SHELBY. If you are basically interested in competition, which I think that we are, in certain areas you do not have competition, is this not true?

Ms. MORGAN. But again, as I said, when the Congress passed the Staggers Act—

Senator SHELBY. I understand what Congress did, but we are talking about what the reality is.

Ms. MORGAN. Well, again, but then I get—

Senator SHELBY. Before we deregulated the railroads, there had to be, and I was in the House then, and I was on the Commerce Committee, in which we dealt with the Staggers Act, we talked about competition, among other things, and I believe you have to have competition in lieu of regulation. I will take competition in lieu of regulation any day or night, but I believe we have to have competition of some kind—some kind. That is my own opinion.

Senator SPECTER. Before Ms. Morgan answered the last question I asked her a question as to the policy considerations, as to why not give the Pittsburgh to Chicago run competition, and it seems to me that it is very, very sad, and I hope we are able to act on Senator Rockefeller’s legislation.

My sense is that we have had way too many problems arising from the division by CSX and Norfolk Southern of Conrail. I think it has not worked out well at all, and I think Congress has to be much more active in making these policy decisions.

If Chairman Morgan would care to review her testimony and go to the thrust of my questions and start looking for a public policy reason, why should CSX have sole control of the Philadelphia to Chicago run, when there could be an arrangement where CSX would have to offer up Philadelphia to Pittsburgh, and then there could be competition. What are the pros and cons, policy-wise?

I would think that the Chairman of the Surface Transportation Board could give us a public policy reason beyond saying, “Well, this is what the Staggers Act did, and if Congress wants to do it, they can do it, and the evidence is not sufficient, and no, that is not a no, but it is not a yes,” but besides saying yes or no, I want to figure out what is best for America.

Ms. MORGAN. I am in agreement with you on that.

Senator SPECTER. Okay. Well, take a look at my questions and your answers and see if you might be a little more responsive, but I support what Senator Rockefeller is trying to do, Mr. Chairman, and I again thank you for your vigilance in focusing this hearing on a long, hot afternoon.

Senator SHELBY. Thank you. I have a statement from Senator Bond, who is tied up on another appropriations matter that will be made a part of the record, he is for competition here, as part of this hearing.

Chairman Morgan, in December 1998, you wrote to the Senate Commerce Committee and said that the Surface Transportation

Board does not have the authority to increase competition among railroads. Is this still true?

Ms. MORGAN. Yes, it is, and it follows on some of your questions earlier.

Senator SHELBY. Okay. What additional changes are needed? They would be statutory changes, would they not?

Ms. MORGAN. Yes. Again, getting back to your earlier question.

Senator SHELBY. Could you do it through Board policy, or would you need statutory language?

Ms. MORGAN. Well, as I indicated earlier, we have taken several actions at the Board, which we believe have pushed the statute in the right direction and pushed the limits of the statute, and we have been upheld so far, but, again, if the Congress is interested in adding a competitor where a customer is served by only one railroad, that is a change in policy and that would require a change in the law. That is the gist of the—

Senator SHELBY. I alluded earlier to the GAO's February, 1999—

Ms. MORGAN. Yes.

Senator SHELBY [continuing]. Report, which concluded that 70 percent of shippers surveyed, quote, "Believe that time, complexity, and cost of filing complaints or barriers" often preclude them from seeking rate relief. Is the complaint process broken, Ms. Morgan?

Ms. MORGAN. Well, let me first of all say that we have worked very hard at the Board to streamline the process. We have put deadlines on the process, we have clarified standards, we have resolved cases that have been around longer than they should have.

Senator SHELBY. Does it cost much, though? Is it too laborious a process?

Ms. MORGAN. Well, I think any time you get into a litigious situation, it is unfortunately cumbersome and costly. That is just the nature of the business.

Senator SHELBY. Is there any way you can minimize the costs to reflect the size of the company bringing the complaint? In other words, smaller companies have smaller resources. You know what I am talking about.

Ms. MORGAN. Yes. Well, we have standards that apply to large rate cases and we have standards that apply to small rate cases.

Senator SHELBY. Okay. You are already into that some.

Ms. MORGAN. Right.

Senator SHELBY. Okay. On March 7 through 10 of this year, the Surface Transportation Board, that you chair, held a series of public hearings about major rail consolidations and the future of the rail network. The hearings focused on the board's merger policy and the downstream service effects which Class I railroad mergers have had on rail service.

The Senate Appropriations Committee has included language in this year's appropriation bill that will require the STB to prepare a report, one, that identify the concerns that were raised in the March 2000, hearings; two, details the actions that the Board will take to address those concerns; and three, indicates where the STB lacks the statutory authority to effectively address these concerns.

Will the Board be able to comply with this requirement and provide the merger report to this committee by April 1, 2001?

Ms. MORGAN. Well, the merger rulemaking process is still under way. We will not have issued final rules until June 2001, so it will be difficult for me to report to you before those rules come out about what we are in the process of completing.

Senator SHELBY. Would you report as soon as you can——

Ms. MORGAN. Yes.

Senator SHELBY [continuing]. More than——

Ms. MORGAN. I will be able to do that, yes, if that was the instruction.

Senator SHELBY. Chairman Morgan, the bottleneck decision, the STB's 1999 bottleneck decision allows a railroad to refuse to quote a rate for shipping over a segment of a route where there is competing service available if any part of that total route to be shipped is served by only one carrier.

Why did the STB believe the bottleneck decision was appropriate? Does not this decision have the effect of stifling competition, since shippers may not be able to even get a competing railroad's rate quote? That has baffled a lot of people.

Ms. MORGAN. Yes. I understand that. First of all, let me just say that in that decision we did provide some relief for the shippers. It is not all of what they sought, but we did provide some relief, and we have been upheld, not only on the part where we did not provide what they wanted, but also on the part where we did.

But having said that, we viewed that decision as a balancing of several interests in the statute. We balanced the rate and route initiative that is provided to the railroads under the statute against other interests in the statute, and we have been upheld in that balancing process.

Senator SHELBY. Ms. Morgan, you have been encouraging the railroads to work together toward a privately negotiated railroad industry agreement to deal with access restrictions and other issues that have been raised by the short lines and regional railroads regarding their treatment by the major railroads. We have been talking about this.

Ms. MORGAN. Yes.

Senator SHELBY. As I understand it, the privately negotiated agreement has been in the works for some time, and last month you wrote to the railroads again urging them to refocus on reaching some consensus on these issues. How is the process moving along? Why do you believe that the Class I railroads and short lines will be able to reconcile their differences this time around, when they have not before?

Ms. MORGAN. Well, first of all——

Senator SHELBY. Realistically, where are we?

Ms. MORGAN. Well, first of all, I think it was important that the smaller railroads and the larger railroads did come to an agreement under the umbrella of the Board's directive. That was an important step.

Senator SHELBY. Are you optimistic now?

Ms. MORGAN. I am always optimistic——

Senator SHELBY. I know, but are you optimistic?

Ms. MORGAN [continuing]. Or I would not be in this position.

Senator SHELBY. But in view of what has gone on in the past.

Ms. MORGAN. Well, I think what has gone on in the past is that they have been able to enter into——

Senator SHELBY. Okay.

Ms. MORGAN [continuing]. An agreement, and I am hopeful that that same spirit will lead to further private sector resolution.

Senator SHELBY. Ms. Morgan, lastly, the Staggers Act allows for competition in a rail terminal area by means of either what they call terminal trackage rights or reciprocal switching. Can you cite some instances where an STB decision has required a railroad to grant competing railroad terminal trackage rights or reciprocal switching rights?

Ms. MORGAN. Well, in the——

Senator SHELBY. If so, how successful have they been?

Ms. MORGAN. Well, in the context of the merger proceedings, we have provided for trackage rights relief, and so forth. Outside of the merger context, we have not provided relief. The Board has had a few cases, one case that I remember specifically, where that relief was denied.

SUBCOMMITTEE RECESS

Senator SHELBY. We have a vote on the floor in a few minutes. I appreciate your testimony and I appreciate your indulgence. I am hoping you are going to be able to work out a lot of these problems that we have been hearing today. Thank you. The committee is recessed.

Ms. MORGAN. Thank you.

Senator SHELBY. Thank you.

[Whereupon, at 3:45 p.m., Tuesday, September 12, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

QUESTIONS SUBMITTED TO THE OFFICE OF THE SECRETARY

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

DOT POLITICAL APPOINTEES

Question. Please provide the number of political appointees currently on board funded in the Department of Transportation and Related Agencies appropriations bill at the Department and break them out by agency. In addition, please provide a timetable for filling any of the vacant political positions up to the statutory cap. Please provide a listing of the number of political appointees, grade level and current salary and compare over the last five years.

Answer. Listed below is information on the number of political appointees currently on board funded in the Department of Transportation and related agencies appropriations bill, the timetable for filling vacant political positions, and information for the past five years on the number of political appointees, grade level and current salary.

Department of Transportation Political Appointees

| <i>Agency name</i> | <i>Currently on board as of 4/15/2000</i> |
|--|---|
| Office of the Secretary (OST) | 48 |
| Office of the Inspector General (OIG) | 1 |
| United States Coast Guard (USCG) | 6 |
| Transportation Administrative Service Center (TASC) | 7 |
| Federal Aviation Administration (FAA) | 6 |
| Federal Highway Administration (FHWA) | 7 |
| Federal Motor Carrier Safety Administration (FMCSA) | 6 |
| National Highway Traffic Safety Administration (NHTSA) | 6 |
| Federal Railroad Administration (FRA) | 4 |

Department of Transportation Political Appointees—Continued

| <i>Agency name</i> | <i>Currently on board as of 4/15/2000</i> |
|---|---|
| Federal Transit Administration (FTA) | 3 |
| Saint Lawrence Seaway Development Corporation (SLSDC) | 1 |
| Research and Special Programs Administration (RSPA) | 4 |
| Bureau of Transportation Statistics (BTS) | 1 |
| Surface Transportation Board (STB) | 3 |
| Total | 84 |

DEPARTMENT OF TRANSPORTATION TIMETABLE FOR FILLING VACANT POLITICAL POSITIONS

| Title | Recruitment of 4/15/2000 | Estimated appt. date |

EGYPT AIR TRAGEDY AND THE ALASKA AIRLINES FLIGHT 261 TRAGEDY

Question. Please describe the Office of the Secretary's involvement in the response to the Egypt Air tragedy and the Alaska Airlines flight 261 tragedy? Include in the description the incremental cost to the department of that involvement.

Answer. The Office of Aviation Enforcement and Proceedings has program responsibility for enforcing airline compliance with the Aviation Disaster Family Assistant Act, Foreign Air Carrier Family Support Act, and the Department's Passenger Manifest Rule. Accordingly, that office made inquiries regarding carrier compliance with those requirements immediately upon learning of the respective tragedies and its review in one case continues. As of April 15, 2000, that office had devoted approximately 20 hours of GS-15 attorney time and 2 hours of SES attorney time toward its compliance efforts in those cases, which equates to an incremental cost of \$1,179.

CONSULTING SERVICE

Question. On page 8 of the justification, please provide details on the consulting service for the General Counsel's Office.

Answer. To carry out Departmental responsibilities under the Accessibility for All America initiative, consultants will be needed to B (1) supplement in house staff in conducting complex investigations concerning alleged Air Carrier Access Act (ACAA) violations in a manner similar to that used by the Civil Rights Division of the Department of Justice in Americans with Disabilities Act (ADA) cases; (2) act as expert witnesses, not available inside the government, to testify in enforcement pro-

ceedings; and (3) develop and operate a clearinghouse to facilitate consumer outreach activities. It should be noted that under section 707 of the recently-enacted Wendel H. Ford Aviation Investment and Reform Act for the 21st Century the Department is required, among other things, to investigate each disability-related complaint it receives against any airline and conduct outreach efforts, including the dissemination of appropriate technical assistance manuals, to provide guidance to airlines and disabled passengers in understanding their respective rights and responsibilities under the ACAA.

OFFICE OF THE SECRETARY TRAVEL COSTS

Question. Please provide details on the Office of the Secretary travel costs that are anticipated to be paid by the modes.

Answer. No travel in the Office of the Secretary is anticipated to be paid by other modes.

S&E TASC EXPENSES

Question. Please provide the details on \$7.355 million OST contribution to TASC.

Answer. The estimate under the Salaries and Expenses appropriation is composed of: \$927,000 for OST operational share of the Docket System; \$570,000 for the cost of various activities coordinated through the Chief Information Office (CIO) and \$5,858,000 requested under the Assistant Secretary for Administration for the balance of OST's administrative expenses which are assessed to OST as a portion of the TASC bill. The composition of the administrative expenses that paid for under the Assistant Secretary for Administration includes: worklife wellness, facilities service center, information services, space management, security operations, information systems management consulting, telecommunication services, acquisition services, and human resource services.

S&E CONTRACT COSTS

Question. Please provide details on other anticipated contract cost in the Office of the Secretary.

Answer. The majority of the offices that are funded within the Salaries and Expenses Appropriation have costs which are coded to the "Other Services" object class. This object class captures many types of charges that are for everyday kinds of purchases such as subscriptions and training. The majority of the \$10,002,000 though is associated with contracts and reimbursable agreements. These items are described throughout the OST narrative justifications. The requested contracts include everything from funding Departmental IT Architecture in the CIO's office (\$1,100,000) to reimbursing FTA for OST's accounting services (\$950,000).

STAFFING IN THE OFFICE OF INTERMODALISM

Question. Please provide details on total current on-board personnel and costs related to the Office of Intermodalism.

Answer. Listed below are the total on-board personnel and fiscal year 2000 salaries related to the Office of Intermodalism:

| Title | Grade | Salary |
|--|-------|-----------|
| Associate Deputy Secretary and Director, Office of Intermodalism | ES-5 | \$114,500 |
| Deputy Director | ES-3 | 126,825 |
| Program Analyst Officer | GS-15 | 110,028 |
| Senior Transportation Specialist | GS-15 | 95,923 |
| Special Assistant to Director | GS-15 | 87,459 |
| Transportation Specialist—Planning | GS-13 | 81,546 |
| Transportation Specialist—Freight | GS-13 | 71,954 |
| Senior Office Assistant | GS-12 | 59,758 |
| Scheduling Advance Assistant | GS-11 | 45,572 |
| Secretary | GS-9 | 38,840 |

The total fiscal year 2000 administrative costs associated with personnel in the Office of Intermodalism are as follows:

| | |
|------------------------------------|-----------|
| Personnel Costs and Benefits | \$935,218 |
| Travel Budget | 51,500 |
| Other Services | 5,922 |

| | |
|---|---------|
| Supplies and Materials | 1,750 |
| Total Fiscal Year 2000 Administrative Costs | 994,390 |

In fiscal year 2001, it is requested that this office be funded at \$1,317,000 under the Federal Highway Administration's Federal-Aid Highways account.

OFFICE OF INTELLIGENCE AND SECURITY

Question. Does every cabinet office have an Office of Intelligence and Security? Please describe the corresponding capability in other cabinet offices to the degree it exists.

Answer. Most, but probably not all Cabinet offices have an Intelligence Office, but all have a Security Office or Director. Those departments with national security responsibilities, and especially those whose interests are threatened by terrorist actions, have a direct need for current intelligence. Additionally, departments such as Transportation, which are directly involved in international negotiations, require the continuous, time-sensitive intelligence reporting provided by the Office of Intelligence and Security (OIS)

Question. How are travel advisories transmitted to the public: which agencies develop the advisory and which transmit the travel advisories?

Answer. The Department of Transportation maintains a telephone travel advisory line [800-221-0673] to provide notice of threats to transportation systems and the traveling public worldwide. The Office of Intelligence and Security also issues a Transportation Security Information Report (TSIR), as needed, on a variety of issues relating to transportation, but these reports are not specifically travel advisories. The TSIR is developed by OIS and transmitted by email to the department's operating administrations through the Security Working Group (SWG). The SWG in turn sends the TSIR to their field elements and modal security officials by email or fax.

Question. The budget justification describes the Office of Intelligence and Security as the Secretary's primary representative to the intelligence and law enforcement communities. Please discuss the relationship between the substantial and corresponding capabilities in the Federal Aviation Administration and the Coast Guard to the intelligence and law enforcement communities.

Answer. The FAA and USCG each have routine and on-going liaison and exchange with the intelligence and law enforcement communities. Those relationships focus on the individual aviation and maritime security requirements of those agencies, but do not address the broad range of all the other modes of transportation. The Aviation Security Improvement Act of 1990 (ASIA >90) specifically identified the need to raise the level of attention that these transportation security matters received to the Office of the Secretary.

Question. Please describe the current reimbursable or detailee support of the Office of Intelligence and Security.

Answer. Current reimbursable support include one representative from the Central Intelligence Agency and five Coast Guard detailees.

Question. Please detail the level of travel by the Office of Intelligence and Security that is paid for by appropriations to the Coast Guard or the Federal Aviation Administration.

Answer. There is no travel by the Office of Intelligence and Security that is paid for by appropriations to the Coast Guard or the Federal Aviation Administration.

Question. Does the FAA and the Coast Guard also support compliance efforts with ASIA 90, or is that solely the responsibility of the Office of Intelligence and Security?

Answer. The implementation of ASIA >90 is a joint effort between FAA and OIS. The USCG has no compliance requirements related to ASIA >90.

Question. Does the FAA and the Coast Guard also support industry directed efforts to address specific information-related protection issues?

Answer. Other than for regulatory purposes, neither the FAA nor the Coast Guard support industry directed efforts to address specific information-related protection issues.

Question. Doesn't the FAA and the Coast Guard have similar costs to those outlined in the Office of Intelligence and Security justification for funding required to update the intelligence division's method of access to classified material at CIA?

Answer. Yes, the FAA is making a similar transition to upgrade their classified access and OIS has worked with them and the intelligence community to provide a cost effective solution to both organizations. USCG already has a more robust capability through their military requirements, but is also required to upgrade their systems in keeping with a change in the Intelink and CTLink systems.

Question. Do any other offices or modes have costs related to the critical infrastructure protection initiative outlined on page 18 of the OST justification? What other modes and offices are involved in this initiative?

Answer. No other offices or modes have costs specifically related to the critical infrastructure protection initiative outlined on page 18 of the OST justification. The \$900,000 requested is to continue threat and vulnerability assessments of critical transportation information systems, develop systems to rapidly disseminate and share vulnerability and threat information, and develop and establish an information sharing and analysis center (ISAC) in cooperation with the Sector Coordinator as mandated by PDD-63. The vulnerability assessments will begin with the nation's rail information and communication systems and eventually move on to the rest of the nation's critical transportation infrastructures. These analyses will build upon those physical vulnerability assessments already completed. No other modes are conducting comprehensive vulnerability and risk analyses in the same effort or manner as OST/OIS. Modal administrations are instead focusing on protecting their own mission critical systems, with the exception of RSPA as described below. In addition, other modes may be conducting awareness training for personnel to enhance security awareness internal to their modes; however, none are working with the private sector on a Vulnerability Awareness and Education Program as directed by PDD-63 for the Transportation Infrastructure as a whole.

The Research and Special Programs Administration requests \$3.4 million in fiscal year 2001 for a new Transportation Infrastructure Assurance R&D. Of this \$3.4 million, \$1 million will be used for Intermodal Terminal Security in support of the Department to develop and demonstrate technologies, concepts and procedures for improving the security of intermodal freight and the network upon which it travels. This includes conducting threat assessments of the transportation's physical and information infrastructure at selected ports and facilities to develop "test beds" as platforms for demonstration of security concerns related to intermodal transportation. This effort is particular to certain ports and facilities and those threats and vulnerabilities associated with them; it does not involve a comprehensive vulnerability and risk analyses of the information systems of any one critical transportation system as a whole.

Question. Do any other offices or modes have costs related to the chemical/biological agent detection initiative outlined on page 18 of the OST justification? What other modes and offices are involved in this initiative? Could this initiative be handled centrally by either the FAA or the FTA or could the OST participation be funded by reimbursable arrangement with either or both the FAA and /or FTA?

Answer. The Research and Special Programs Administration (RSPA) research and development budget contains \$2M for detection of chemical and biological agents. The RSPA request was developed in conjunction with OIS, and does not overlap it. RSPA's request is focused on research into advanced detection technologies, while OIS's is focused on test and evaluation of detectors already developed for other applications. OIS's proposal offers the highest probability of identifying readily deployable detectors in the shortest period of time. Existing detection technologies, however, typically reflect DOD requirements—e.g., open field detection with a relatively high tolerance for false alarms. The enclosed nature of transportation terminals combined with high probability of disruption (and even danger) associated with false alarms in this environment indicate the need for substantial testing and, perhaps, some development work to optimize promising technologies.

Question. In the new or expanded initiatives for the CIO, \$900,000 is slated to the CIO involvement in securing IT systems. In addition, \$900,000 is slated in the Office of Intelligence and Security for continuing "the assessment of critical transportation information systems. . ." If the CIO can do the job for the same amount as it takes the office of Intelligence and Security to continue to evaluate, would not the effort be better handled by one office or, alternatively, by the individual modes specifically maintaining such systems? In short, what office has primary responsibility for this effort and what is the Department's strategy for addressing the security of critical transportation information systems?

Answer. The CIO's request for \$900,000 is strictly for securing internal DOT IT systems. The Office Intelligence and Security's request for \$900,000 is for IT vulnerability assessments of transportation systems that DOT does not own but requires to ensure a thorough evaluation of the national transportation infrastructure. DOT has already completed the physical portion of the assessment. The more difficult vulnerability and threat assessments of critical information systems remains to be completed, as well as the need to develop systems to rapidly disseminate and share threat information with the private sector. As directed by PDD-63, The Director, Office of Intelligence and Security has been designated by the Secretary of Transportation to serve as the Sector Liaison Official.

INCREASED BANDWIDTH

Question. The CIO justification details \$15,000 for increased bandwidth. What is the out year funding requirement for providing the necessary improvements to the existing infrastructure at OST?

Answer. The cost to increase bandwidth is a one-time cost. Therefore, there will be no additional out year funding requirements associated with the \$15,000 request for increased bandwidth.

TRAVEL MANAGEMENT SYSTEM

Question. What deficiency and what capability does the new travel management system described on page 29 that is not covered by the old system?

Answer. The activity described on page 29 relates to routine upgrades and help desk support needed to maintain the existing travel management system until it is replaced by a new system. Consequently, this does not refer to a particular deficiency in the old system, but continued maintenance. Since the contract for the existing system expires this fiscal year, DOT plans to conduct a formal solicitation to determine whether there are alternative systems available to offer streamlined travel management support at a reasonable cost.

INFLATION UNDER THE ASSISTANT SECRETARY FOR ADMINISTRATION

Question. What are the costs that are inflated on page 30 of the justification?

Answer. The other costs that were increased for inflation under the Assistant Secretary for Administration include such items as rent, contracts and supplies and materials. Inflation of \$179,000 in other costs and the \$1,000 in travel costs was calculated at 1.4 percent.

EMPLOYEE DEVELOPMENT COSTS

Question. How were the employee development costs detailed on page 31 of the justification covered in fiscal year 2000?

Answer. One of the goals of DOT is to invest at least 2 percent of payroll in employee development. The \$1.6 million represents the additional amount needed for OST to achieve this level of investment. In the past employee development was not a separate line item, and in fiscal year 2000 funds for employee development were included as a part of Other Services, e.g., Acquisition Training, payments to TASC, administrative and management services. In fiscal year 2000, employee development costs were minimal with only \$31,900 specifically identified for training.

ELECTRONIC POSTING

Question. How were the electronic posting costs covered detailed on page 31 of the justification covered in fiscal year 2000?

Answer. There were no resources available for this activity in fiscal year 2000. Fiscal year 2001 will be the first year for this activity.

REIMBURSABLE POSITIONS

Question. What positions are slated for reimbursement on page 30 of the justification and what is the justification for using reimbursement as opposed to direct appropriation for those positions?

Answer. The composition of the reimbursable positions included on page 30 consist of 11 positions which support the Consolidated Personnel Payroll Management Information System (CPMIS), the Integrated Personnel and Payroll System (IPPS), and the Management Information Reporting System (MIR). These are Departmental systems and the operating administrations share in the costs based on population serviced. Prior to January 2000, this function was housed in the Transportation Administrative Service Center (TASC). The transfer of this function from TASC to the Office of the Secretary was necessary due to a Congressionally imposed limitation contained in the FAA's section of the fiscal year 2000 Department of Transportation Appropriations Act that limits FAA's obligations for TASC services. In addition to these positions, there are seven other reimbursable positions located within the Administrative Law Judges Office which are primarily supported by the Federal Highway Administration, the Federal Aviation Administration and the Research and Special Programs Administration. The Administrative Law Judges Office facilitates transportation-related cases for the three operating administrations.

WORKFORCE IMPROVEMENTS

Question. What are the workforce improvement initiatives included in the \$21,000 request on page 33 of the justification?

Answer. The workplace improvement initiatives for fiscal year 2001 will focus on worklife improvements and labor management partnerships. Worklife programs continue to be a source of employee satisfaction and increased productivity and in order to maintain and enhance our program, funding is required to communicate to employees the various worklife options available at DOT. Approximately \$6,000 is needed for development and publication costs of worklife materials including a telecommuting guide "Everything You Need to Know about Telecommuting" and a Leave Administration Handbook. In order to inform employees throughout the country of worklife programs, a satellite broadcast is planned which will focus on the administration and delivery of childcare programs. The projected cost of the broadcast is \$6,000. In the area of partnership, in fiscal year 1999 and fiscal year 2000 the Department completed Phase I and II of the labor-management climate assessments along with a DOT Labor Relations Strategic Plan. The resultant action plan will focus on integrating those into a labor-management partnership handbook as well as providing site-specific assistance and training across DOT. Costs associated with these efforts will be approximately \$9,000.

EMPLOYEE DEVELOPMENT

Question. Please outline the employee development goals and deliverables associated with the request on page 33 of the justification. If the framework was developed in 1997, what additional work needs to be done in this area? Is this initiative focused specifically on OST employees, and if not, what funding is requested for the modes implementation of the framework?

Answer. As the Department prepares for tomorrow's workforce through workforce planning, it is essential that we invest in the development of new employees who will replace those who retire, and that we prepare the remaining workforce to master changing conditions so that they can do the jobs of tomorrow as well. This investment in learning will include identifying and developing options for using technology to enhance learning and skill development, and it will be used to create an information resource integrating distance learning into an array of training options. Funds will be used to support employees in getting the necessary competencies identified during the workforce planning process and to apply learning to individual and organizational performance.

The Learning and Development Framework promotes a standard, ONE DOT method of addressing learning and development activities and contains a comprehensive explanation of DOT policies, standards, and requirements associated with result-oriented learning. In order to fully embrace the intent of this Framework, DOT must create a culture that places a high value on skillful employees, managers and leaders, and we must make the necessary investment to do so. Such a culture is not, at present, universally established at DOT.

CONTRACTUAL RENTAL PAYMENTS

Question. What are the actual contract or anticipated costs for the rental payments detailed on page 35 of the justification?

Answer. Based on monthly General Services Administration fees charged to government agencies to cover costs associated with government-leased office space, the anticipated contractor costs for rental payments will total approximately \$319,000.

PUBLIC AFFAIRS AND S&E TRAVEL

Question. What are the travel costs outlined on page 36 of the justification used for? What is the consolidated OST travel request? Why is it not advisable to appropriate one lump sum for OST for OST travel rather than appropriating individual travel allotments to the individual offices in OST?

Answer. When the Secretary travels, he needs Public Affairs support to place Secretarial appearances and to handle logistics. He also needs on-site Public Affairs support in arranging briefings for media interviews while on travel. Finally, he needs on-site Public Affairs support during his travels to serve as a link to the OST Headquarters Public Affairs Office and the public affairs offices in the agencies.

As shown on page S&E 7 of OST's justification, the S&E account request for travel totals \$636,000. This does not include various amounts requested under the TPR&D account, the Office of Civil Rights, the Minority Business Outreach or under the Essential Air Service and Rural Airport Improvement Fund accounts. The Office of the Secretary has not requested individual travel allotments in each OST office.

The request is for a consolidated appropriation. The budget only displays the plans per office as requested by the Subcommittee.

OFFICE OF CIVIL RIGHTS

Question. Please discuss why travel is the most efficient means of processing investigations by the Office of Civil Rights and the selection process by which claims would be identified for in-person investigation by the office.

Answer. Obtaining testimony through face-to-face interviews provides the best results and ensures that investigations are legally sufficient, technically adequate and completed in a timely manner. Less expensive techniques such as telephone interviews and the exchange of written interrogatories through the mails significantly reduce the quality and timeliness of the investigative process.

DOCR's six Regional Directors determine which claims are to be investigated on-site and which claims are to be processed using "desk investigation" techniques. Generally, the more simple, single issue-single basis complaints can be processed using "desk investigation" techniques, which include telephone interviews, interrogatories through the mails, etc. The more complex, multiple issue-multiple bases complaints will usually be processed through on-site investigations. Also, those claims that present unique, precedent-setting or sensitive matters, such as sexual harassment and hostile work environment allegations, are best processed through on-site investigations.

Question. How is the current work load slated to be covered by the proposed contract mediators being handled (page CR-7 of the justification)?

Answer. The proposed contract mediators are being handled in the same manner as our collateral duty mediators. The Equal Employment Specialist who will manage our Alternative Dispute Resolution (ADR) Program will determine when mediation is appropriate. The first option will be to use our own collateral duty mediators. However, since there are currently 1,150 active formal complaints, we do not anticipate that our collateral duty mediators will be able to handle all the requests for mediation. We would then turn to contract mediators to handle the remaining requests for mediation.

Question. What is the training request for the Office of Civil Rights investigators?

Answer. In November 1999, the EEOC issued new requirements to the Federal Sector Discrimination Complaint Processing Regulations, 29 C.F.R. 1614. The recent regulatory changes affected all aspects of the internal EEO complaint process, requiring that DOT's internal policies and procedures governing discrimination complaint processing be revised. Therefore, receiving training to stay abreast of these new requirements is essential for our investigators. In addition, the Office of Civil Rights will hold an annual Civil Rights Investigators' training conference to remain current on the recent regulatory changes, to update technical compliance skills and knowledge, and to review internal DOT compliance policies and procedures. The training request will also be used for professional development and to attend EEOC Technical Assistance Seminars to update the investigators on the latest developments and changes to the Federal Sector Discrimination Complaints Processing Regulations, 29 C.F.R. 1614, et al.

Question. What part of the \$500,000 for automated tracking systems outlined on page CR-7 of the justification is to buy new systems?

Answer. None of the \$500,000 is to buy new systems. The \$500,000 will be used as follows: \$350,000 will be used for the enhancement/expansion of the three current tracking systems, i.e., the internal Case Management System (CMS), the Disadvantaged Business Enterprises (DBEs) Appeals System, and the external case tracking system (XTRAK); \$100,000 will be used for a System Administrator to maintain the three automated tracking systems; and, \$50,000 will be used for the Section 508 Compliance Project, which requires DOCR to be in compliance with Section 508 of the Rehabilitation Act of 1973.

Question. What is the pre-complaint stage noted on page CR-7 of the justification for CMS? When was CMS procured, installed and operational? What capability is the Office of Civil Rights seeking that it currently lacks in the request for CMS?

Answer. Regulations promulgated by the Equal Employment Opportunity Commission require that the pre-complaint stage (also known as the "informal stage") of the EEO process be satisfied before an aggrieved person files a formal complaint. The complainant must contact an EEO Counselor in the relevant Operating Administration (OA) and participate in the pre-complaint process during which attempts could be made to resolve the concerns raised. The CMS was developed, installed, and operational during fiscal year 1996. Currently, CMS tracks only the formal complaint process, which begins after the pre-complaint/informal stage and ends prior to the post-determination (EEOC/legal) stage and access to the system are available

only by DOCR, which is responsible for the formal complaint process. Thus, CMS does not provide a single data source for tracking and monitoring the entire EEO complaint process. The fiscal year 2001 enhancement to CMS will create a comprehensive EEO case management system that will save time, cut costs, and improve the efficiency of the EEO process by expanding the scope to incorporate both the pre-complaint stage (including Alternative Dispute Resolution) and post-determination (EEOC/legal) stages and allowing data input, access, and report generation by the Operating Administrations civil rights and legal offices.

Question. How is system administration currently being handled for the three automated tracking systems for the Office of Civil Rights?

Answer. Currently, limited system administration functions are handled by a limited staff resource. The Office of Civil Rights does not have the staff resources necessary for a system administrator to provide dedicated support for technical assistance, to correct problems, and to generate reports.

Question. Has the Department explored funding a DOT civil rights web site by reimbursable agreement with the modes or having the largest civil rights case generator in the Department provide an umbrella web site for the Department?

Answer. Yes, we have explored this concept with the modes. The Office of Civil Rights is anticipating that once this basic web-site is operating that the modes will then contribute to sophisticated improvements to the web-site, which would greatly enhance communications among the civil rights offices.

Question. Why is the request for final agency decision writing flat while every other request for the office anticipates a growing workload? Does the Department anticipate that a low percentage of final decisions will be forthcoming from the anticipated higher caseload?

Answer. On November 9, 1999, the U. S. Equal Employment Opportunity Commission (EEOC) revised the Federal Sector Discrimination Complaint Processing Regulations, 29 C.F.R. 1614. One key change made to the regulations delegated to EEOC Administrative Judges the authority to issue final decisions following an administrative hearing. Prior to this change, Administrative Judges could only issue recommended decisions to agencies, who would then issue final agency decisions adopting, amending or rejecting the recommended decisions. Considering this change, we anticipated that a greater number of complainants would opt to have their cases heard and decided by an EEOC Administrative Judge rather than request that the agency issue a final agency decision. Thus, we projected that there would be fewer final agency decisions written by the agency.

Question. What was the aggregate Office of Civil Rights travel request for fiscal year 1998, fiscal year 1999, and fiscal year 2000? What is the aggregate Office of Civil Rights travel request for fiscal year 2001?

Answer. The Office of Civil Rights travel request was \$141,000 in fiscal year 1998, \$186,000 in fiscal year 1999, \$195,000 in fiscal year 2000 and \$278,000 in fiscal year 2001.

Question. What obsolete equipment is slated for replacement on page CR-9?

Answer. The Office of Civil Rights plans to spend approximately \$50,000 on replacing obsolete and unserviceable office equipment. Several regional offices will be replacing copier machines and computer equipment that they have had since 1995. Investigators will need replacement laptop computers for their off-site interviews. Headquarters anticipates the need for replacement equipment as well.

MINORITY BUSINESS OUTREACH

Question. What are the requested FTE and travel funds anticipated for the office of Minority Business Outreach?

Answer. The Minority Business Outreach (MBO) line of business within the Office of Small and Disadvantaged Business Utilization (OSDBU) requested \$3 million dollars for fiscal year 2001 for contractual support to assist small, women-owned, Native American and other disadvantaged business firms in securing contracts and subcontracts resulting from transportation-related Federal support. It also supports partnerships under cooperative agreements with minority educational institutions (comprised of historically black, Hispanic and Native American colleges and universities), trade associations, and chambers of commerce.

No FTE's are requested for this activity. \$75,000 in travel funds are requested in fiscal year 2001 the same level as fiscal year 2000. The requested travel funds are for staff to monitor and manage the Office's three main lines of business: Advocacy, Outreach and Financial Services and to participate in various small and disadvantaged business enterprise (S/DBE) conferences and seminars. The funding also provides funds for transportation for the Minority Business Resource Center (MBRC) Advisory Committee meetings which are held annually.

DEPARTMENT WIDE ADVISORY COMMITTEE TRAVEL

Question. What funds are requested for advisory committee travel department wide? Please break out this cost by individual advisory committee?

Answer. The estimated fiscal year 2001 cost for advisory committee members' travel, is as follows:

| | |
|--|----------------|
| Advisory Council on Transportation Statistics | \$4,000 |
| Aviation Rulemaking Advisory Committee | 4,500 |
| Commercial Fishing Vessel Safety Advisory Committee | 43,000 |
| ITS-America | 30,000 |
| Merchant Marine Personnel Advisory Committee | 25,000 |
| Minority Business Resource Center Advisory Committee | 4,800 |
| National Boating Safety Advisory Council | 35,000 |
| Navigation Safety Advisory Council | 28,000 |
| Adv. Board to the St. Lawrence Seaway Development Corp | 11,500 |
| Technical Hazardous Liquid Pipeline Safety Committee | 9,500 |
| Technical Pipeline Safety Standards Committee | 11,000 |
| Marine Transportation | 200,000 |
| Great Lakes Pilotage | 15,000 |
| Total | 421,300 |

Note: This travel estimate is included under DOT's total planned advisory committee request of \$1,133,100.

TPR&D OTHER ADMINISTRATIVE COSTS

Question. Doesn't requesting the "other administrative costs" detailed on page TPR&D to be funded through TASC shift that costs to the modal administrations and OST indirectly rather than reflecting those costs as part of the TPR&D budget? If this mechanism is appropriate for "other administrative costs," isn't it equally appropriate for the entire cost of TPR&D?

Answer. No shifting of TASC costs to the modal administrations or OST indirect payments were reflected in the request. Administrative costs within the TPR&D budget are divided into three categories as shown on page TPR&D-6. They are Personnel Compensation & Benefits, TASC Payments, and Other Administrative Costs. The "other administrative costs" as detailed on page TPR&D-19 have nothing to do with the TASC provided services of printing, graphics, facilities management, etc., but rather are other direct costs of travel, supplies, subscriptions, and equipment used in direct support of TPR&D funded personnel, studies and projects.

RURAL TRANSPORTATION INITIATIVE

Question. Please provide copies of any white papers or other products developed by the Policy Office resulting from the leadership described on pages TPR&D-10 and 11 of the justification relating to the Rural Transportation Initiative.

Answer. Attached are copies of the Secretary of Transportation's Serving Rural America Rural Transportation Initiative dated May 1999, the U.S. Department of Transportation Serving Rural America Rural Program Guide, and Rural Transportation, An Annotated Bibliography, February 1999, prepared jointly by USDA and the Department.

[CLERK'S NOTE.—The above mentioned materials can be found in the sub-committee files.]

MODERNIZATION OF AVIATION DATA SYSTEMS

Question. Why is the modernization of aviation data systems requested in OST (page TPR&D B 17) as opposed to being the responsibility of BTS?

Answer. OST is the most intensive analytical user of aviation data within the Department. As such, OST depends heavily upon aviation data to administer all of its aviation responsibilities. Some of the current data systems date back to the pre-de-regulation era and do not adequately reflect the present environment within the U.S. and international aviation industries. Because of their intensive use of the data and their constant awareness of aviation issues, OST users are in the best position to determine what new data or data changes are needed to provide them with the critical information necessary to administer the Department's aviation programs. At the same time, OST is working closely with BTS, the Administrator of the aviation databases, to ensure that the transition to the new aviation data environment will be effective and efficient.

DOCKET MANAGEMENT SYSTEM

Question. Why is the full text search capability being requested as an appropriation as opposed to being incorporated as a cost to be allocated to the users of the system? Wouldn't the primary beneficiaries of such a capability be the legal representatives of the industry seeking to support or oppose various proceedings related to the filings?

Answer. The Department of Transportation requests full-text search capability for the DMS as an appropriation because it does not have the statutory authority to levy user fees for system usage.

In addition, the beneficiaries are much more than just the legal representatives of industry. DMS experienced over 1.6 million on-line hits in fiscal year 1999. Those using the DMS include large manufacturers; transportation providers; state and local governments; labor organizations; community planners; and safety, environmental and other public interest groups. It is also important to note that people who could make effective use of this service include DOT employees, other Federal agency employees, and Congressional staff. DMS provides these customers with easy and convenient opportunities to fully participate in DOT rulemaking and adjudicatory processes. Better participation means that more effective public policy decisions are made.

OVERFLIGHT USER FEES

Question. How much revenue has been collected from overflight user fees to date in fiscal year 2000? Has the Department re-estimated the anticipated revenues from these fees for fiscal year 2000 or 01 due to this experience?

Answer. The Department has not collected any user fees to date. The Department has not re-estimated the anticipated revenues at this time. The FAA still anticipates collecting \$5 million in fiscal year 2000 and \$22.1 million in fiscal year 2001 as shown in the budget request.

ESSENTIAL AIR SERVICE EMPLOYEE EXPENSES

Question. Please provide a salary and administrative cost history for the EAS program for the past five fiscal years.

Answer.

| | Fiscal years— | | | | |
|------------------------------|---------------|------|------|-------|-------|
| | 1997 | 1998 | 1999 | 2000 | 2001 |
| Personnel Compensation | | 710 | 767 | 800 | 840 |
| Benefits | | 140 | 112 | 117 | 125 |
| Travel | | 10 | 15 | 6 | 15 |
| Other services | | 5 | 67 | 140 | 220 |
| Supplies and materials | | 10 | 15 | 2 | 10 |
| Equipment | | 10 | 17 | 5 | 10 |
| Total | | 885 | 993 | 1,070 | 1,220 |

COMMUTER RULE

Question. What has the "commuter rule's" impact on EAS service provider fleet mix done to the cost of providing EAS service subsidy?

Answer. It is difficult to isolate with precision the effects of the Commuter Safety Rule on subsidy costs as the airline industry is a very dynamic one. However our best analysis is that there are basically three ways in which the effects come into play. First, the additional costs of training, hiring additional personnel such as pilots, mechanics, dispatchers, trained weather observers, etc. are legitimately passed on to the EAS program in the form of higher unit costs with no concomitant increase in revenues. Thus the contracts for currently subsidized EAS communities require increased subsidy when they come up for renewal.

Second, The commuter rule and the resulting higher operational costs, have forced carriers serving about 10 communities that had previously served them on a subsidy-free basis to file notice to suspend those subsidy-free services. In those cases we must prohibit the carrier from suspending service and compensate it for any losses that it can document.

Finally, the higher level of safety mandated by the "commuter rule" has forced the rapid retirement of the 19-seat aircraft, mainly the Beech 1900, and the Fairchild Metro II and Metro III aircraft. Since newer replacement aircraft are much more expensive to acquire and operate, this has resulted in fewer carriers participating in the EAS program.

AIRLINE OPERATIONS AT LOVE FIELD

Question. On February 1, 2000, the United States Court of Appeals for the Fifth Circuit upheld Departmental orders holding that operations at Love Field in Dallas, TX, are governed by the Wright and Shelby Amendments and not by local agreements. As a result, nonstop service in any size aircraft can be operated at Love Field to points in Mississippi, Alabama, and Kansas and jets with 56 or fewer seats can be operated from Love Field to any destination. Considering the history of litigation brought against any party attempting to offer service at Love Field:

I hope that the Department will continue its actions to halt any further interference with flights authorized by Federal law. Are you proceeding to prevent any additional state court challenges? What is the status of the Federal court proceeding?

Considering the behavior of those dominating this market, are you closely monitoring actions that they may take to drive competitors out of Love Field? Will you act quickly to address all forms of anti-competitive behavior directed at these new operations?

Now that the Court of Appeals has confirmed that jets with 56 seats or less can operate from Love Field to any destination, will you take the appropriate steps to ensure that new carriers at Love Field can operate to all airports within the United States?

What would you estimate that it has cost the American taxpayer to enforce the Federal laws concerning airline service at Love Field?

Answer. The Department intends to continue its efforts to block interference with the Love Field flights authorized by Federal law. At the Department's request, the Justice Department filed a Federal district court suit against the City of Fort Worth and American Airlines to block them from using on-going state court proceedings to stop airlines from operating longhaul Love Field flights. The Justice Department recently filed motions for summary judgment and a permanent injunction against the defendants in this case. In the Federal court case, Fort Worth has asked the Supreme Court to review the Fifth Circuit decision. The Dallas-Fort Worth International Airport Board and American are also likely to seek Supreme Court review. The Government will vigorously oppose these petitions. American and Fort Worth have represented that they will not seek to block the longhaul Love Field services authorized by Federal law while the Supreme Court is considering the petitions for review.

The Department will be monitoring American Airlines' competitive responses to new service at Love Field. The Department will address any anti-competitive behavior directed at new Love Field services. The Department is firmly committed to assuring that all airlines have a fair opportunity to compete in the marketplace while avoiding any unnecessary interference with vigorous competition.

As noted, the Department has taken steps to ensure that airlines can operate the Love Field services authorized by Federal law and will take further action if necessary.

The Department is unable to provide an estimate of the cost of enforcing the Federal laws governing Love Field service that would be useful. The Department does not record the time spent by employees on different projects. Estimating the cost would be difficult because several employees in different offices of the Department were involved in the enforcement efforts, as were attorneys from two different divisions of the Justice Department.

ALLEGED ANTI-COMPETITIVE PRACTICES

Question. The Committee is advised that in May of 1999 information was submitted to the Department of Transportation by AirTran Airlines alleging that anti-competitive practices are being directed against the airline at its Atlanta hub and elsewhere. AirTran requested that the Department exercise its authority by conducting a review of these allegations. Please advise whether that review has been initiated and, if so, what the status of that review is currently.

Answer. To improve our understanding of the issues raised by AirTran, we have had discussions with AirTran and Delta representatives, and have conducted an extensive informal review of Delta's competitive responses to AirTran's operations at

Atlanta. As part of its ongoing review process, the Department has requested Delta provide information in response to questions about specific conduct.

DOT'S PERFORMANCE AND BUDGET LINKAGE

Question. How are the agency's annual performance goals linked to the agency's mission, strategic goals, and program activities in its budget request?

Answer. The Department's performance planning process fully links the agency's annual performance goals to its mission, strategic goals, and program activities in its budget request. The following hierarchical model is used by the Department to link activities to outcomes based upon agency mission and strategy: Mission—Strategic Goal—Strategic Outcome—Performance Measure—Annual Performance Goal—Program Activity. The following illustration demonstrates this linkage. The Department's basic enabling law, codified at 49 U.S.C. 101(a), includes safety as a core Departmental mission; thus transportation safety is one of the five overall Departmental strategic goals. Six strategic outcomes provide more specific expressions of how this strategic goal will be achieved—one of which is "Reduce the number of transportation-related deaths." An array of performance measures supports this general strategic outcome; and several operating administrations within the Department worked to achieve these measures. For example, NHTSA, FHWA, FMCSA, FAA, and Coast Guard, worked together on an array of programs to encourage safer operator behavior, safer vehicle technologies, safer transportation infrastructure, and better safety response systems. Achievements for a specific fiscal year are established as annual performance goals for these organizations, to chart their performance relative to these performance measures. In the fiscal year 1999 DOT Performance Report, provided to Congress on March 31, 2000, an appendix arrayed operating administration program activities by strategic goal, displaying how requested budgetary resources linked to each. This information, and separate operating administration performance plans, became an integral part of the justification material in the office of the secretary's and operating administrations' budget requests for fiscal year 1999, and in subsequent years since.

Question. Could you describe the process used to link your performance goals to your budget activities?

Answer. At the beginning of the budget formulation process, the Secretary meets with top management from all of the operating administrations. Funding initiatives proposed by the operating administrations are evaluated and prioritized based on their relative contribution toward meeting the Department's outcome goals. The highest priority initiatives are included in the Department's annual budget request to OMB. It should be noted that the Department's performance goals are to a large extent outcome goals. As such, one goal is supported by many budget activities. For example, our goal to reduce highway fatalities and injuries is supported by the programs of the National Highway Traffic Safety Administration and the Federal Motor Carrier Safety Administration, safety funding and highway infrastructure improvements by the Federal Highway Administration and safety messages delivered by all Departmental leaders.

Question. What difficulties, if any, did you encounter, and what lessons did you learn?

Answer. The major difficulty encountered in introducing a performance-based budget process was in changing the Department's overall thought process in producing budget justifications that explain not just what an operating administration plans to do with the resources requested, but also describes expected results to be achieved according to specific agency performance goals. This budget process has been used for the last two years and the quality of the analysis has improved significantly in this second year. A key lesson is that it takes time and constant attention to make performance budgeting work.

DOT'S PERFORMANCE MEASURES AND BUDGET LINKAGE

Question. Does the agency's Performance Plan link performance measures to its budget?

Answer. Yes. Appendix II of the Department's fiscal year 2001 Performance Plan contains a summary table of estimated obligation amounts for each operating administration, and program activities within each administration's budget request.

Question. Does each account have performance measures?

Answer. Yes. Please refer to the notes at the end of Appendix II to DOT's fiscal year 2001 Performance Plan.

DOT'S PERFORMANCE PLANNING AND BUDGET STRUCTURE

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification?

Answer. The account and activity structure in the budget varies by operating administration, but generally it is not organized by outcome area but rather by grouping similar kinds of activities, or activities with a common funding mechanism. Given the relationship between program activities and outcomes—multiple programs promote single outcomes and single programs promote multiple outcomes—perfect alignment is not possible. Improvements in the existing structure will be recommended as it becomes apparent that they would be useful.

Question. Do you plan to propose any changes to your account structure for fiscal year 2000?

Answer. The fiscal year 2000 budget proposed, and Congress approved, consolidation of two Federal Railroad Administration accounts into a new Safety and Operations account. This change better reflected the nature and the interrelationships of the existing Office of the Administrator and Railroad Safety accounts. This is reflected in DOT's fiscal year 2001 Performance Plan, Appendix II.

Question. Will you propose any changes to the program activities described under that account structure?

Answer. No.

DOT PERFORMANCE MEASURES AND DATA

Question. How were performance measures chosen?

Answer. Performance measures were chosen to provide the information needed to determine if DOT programs are achieving the desired strategic outcome goals. Data availability was also a consideration. If developing a database for a candidate performance measure appeared to require excessive cost and time, an alternative measure was selected.

Question. How did the agency balance the cost of data collection and verification with the need for reliable and valid performance data?

Answer. The cost of data collection and verification was one of the factors considered in selecting performance measures. DOT's hope is to incrementally improve data so that cost can be minimized over time.

Question. Does your plan include performance measures for which reliable data are not likely to be available in time for your first performance report in March 2000?

Answer. DOT's performance report/plan uses established data systems for most of its performance information. Most of these systems can provide preliminary results that are both timely and sufficiently accurate for communicating in our GPRA Program Performance Report. The number of measures without data is minimal. The Department has data for 97 percent of its 1999 measures. The remaining 3 percent consisted of three performance goals for which data were not available in time for the first performance report. The states and the Environmental Protection Agency provide the data for these three goals (pavement condition, highway congestion and mobile source emissions). In last year's "dry run" report, the Department had data for only 63 percent of its goals. The "dry run" taught valuable lessons about where data problems existed, allowing the Department to target the areas of most concern and ensure their readiness for March 2000.

KEY DOT PERFORMANCE GOALS

Question. What are the key performance goals from your fiscal year 1999 Annual Performance Plan that you recommend this subcommittee use to track program results?

Answer. The answer to this question must be prefaced with the observation that all DOT Performance Plan performance goals and measures are important, since they broadly represent many additional performance goals and measures in each of the eleven departmental operating administrations. The following subset of fiscal year 1999 Performance Plan output or outcome measures are important in tracking overall DOT performance toward the five strategic goals:

Safety.—Transportation-related fatalities (outcome); Transportation-related injuries (outcome); and Transportation Incidents (outcome).

Mobility.—Highway Pavement Condition (output); Highway Congestion (outcome); Aviation Delay (outcome); Impediments to Port Commerce (outcome); Amtrak Ridership (outcome); and Transit Ridership (outcome).

Economic Growth and Trade.—Flight Route Flexibility (output); and International Air Service (outcome).

Human and Natural Environment.—Mobile Source Emissions (outcome); Wetland Protection and Recovery (output); Aircraft Noise Exposure (outcome); Maritime Oil Spills (outcome); and Hazardous Material Spills (outcome).

National Security.—Sealift Capacity (outcome); Coast Guard Military Readiness (output); and Drug Interdiction (outcome).

Critical Infrastructure Protection (output—not established as a measure until fiscal year 2000, but added due to its enduring importance in providing a proper answer to this question).

Question. For each key annual goal, indicate whether you consider it to be an output measure (“how much”) or an outcome measure (“how well”).

Answer. As explained in detail in each major subdivision of DOT’s fiscal year 1999 Performance Report, and as assessed by the General Accounting Office (see its report to the Senate Committee on Commerce, Science, and Transportation, and House Committees on Transportation and Infrastructure (GAO/RCED–98–180R), the majority of DOT’s performance goals are outcome-oriented. Furthermore, each performance goal and related performance measure is rationally related to eventual achievement of longer-term strategic goals or objectives. See the previous question for how each key measure is characterized.

Question. State the long-term (fiscal year 2003) general goal and objective from the agency Strategic Plan to which the annual goal is linked.

Answer. Please refer to the following table. [Attachment 1]

Attachment 1**STRATEGIC GOAL: SAFETY**

Promote the public health and safety by working toward the elimination of transportation-related deaths, injuries, and property damage.

| <i>Outcome Goal</i> | <i>DOT-Wide and Other Indicators</i> |
|---|--|
| Reduce the number of transportation-related deaths. | <ul style="list-style-type: none"> ▪ Total number of transportation-related fatalities, with a CY 1995 baseline of 44,407. ▪ Percentage of highway fatalities that are alcohol-related. ▪ Number of fatalities involving large trucks. ▪ Number of recreational boating fatalities. ▪ Percentage of front occupants using seat belts. ▪ Number of fatal general aviation accidents. |
| Reduce the number and severity of transportation-related injuries. | <ul style="list-style-type: none"> ▪ Total number of transportation-related injuries, with a CY 1995 baseline of 3,494,965. ▪ Number of injured persons involving large trucks. |
| Reduce the rate of transportation-related fatalities per passenger-mile-traveled and per ton-mile of total freight shipped (or vehicle miles traveled). | <ul style="list-style-type: none"> ▪ Total number of transportation-related fatalities per 100 million passenger-miles-traveled, with a CY 1995 baseline of 1.026. ▪ Total number of transportation-related fatalities per 100 million ton-miles shipped, with a CY 1995 baseline of 0.168. ▪ Fatalities per 100 million vehicle miles of travel. ▪ Fatal aviation accidents (U.S. commercial air carriers) per 100,000 flight hours. ▪ Rail-related fatalities per million train-miles. ▪ Transit fatalities per 100 million passenger miles traveled |
| Reduce the rate and severity of transportation-related injuries per passenger-mile-traveled and per ton-mile (or vehicle miles traveled). | <ul style="list-style-type: none"> ▪ Total number of transportation-related injuries per 100 million passenger-miles-traveled, with a CY 1995 baseline of 81.606 ▪ Total number of transportation-related injuries per 100 million ton-miles shipped, with a CY 1995 baseline of 3,620. ▪ Injured persons per 100 million vehicle miles of travel. ▪ Transit injured persons per 100 million passenger miles traveled |
| Reduce the number of reportable transportation incidents and their related economic costs. | <ul style="list-style-type: none"> ▪ Total number of reported transportation incidents, with a CY 1995 baseline of 6,732,003. ▪ Number of serious hazardous materials incidents in transportation. ▪ Number of pipeline incidents caused by outside force damage. |

STRATEGIC GOAL: MOBILITY

Shape America's future by ensuring a transportation system that is accessible, integrated, efficient, and offers flexibility of choices.

| Outcome Goal | Performance Indicator |
|--|---|
| Improve the structural integrity of the transportation system. | <ul style="list-style-type: none"> ▪ Percent of National Highway System pavement with acceptable ride quality. ▪ Percent deficient bridges on the National Highway System. ▪ Percent of airport runway pavements in satisfactory condition. ▪ Percent availability of marine aids to navigation. ▪ Percent availability of locks and related navigation facilities of the St. Lawrence Seaway. ▪ Average condition of bus and rail transit fleet. |
| Balance new physical capacity with the operational efficiency of the nation's transportation infrastructure. | <ul style="list-style-type: none"> ▪ Assessment of integration for Intelligent Transportation Systems (ITS) in metropolitan areas. ▪ System capacity attributable to airport infrastructure at the 50 busiest airports. ▪ Number of intercity and commuter trains scheduled in congested segments of Washington DC/Boston corridor. ▪ Amtrak customer satisfaction index (CSI). |
| Increase intermodal physical, information, and service connectivity. | <ul style="list-style-type: none"> ▪ Number of identified impediments to the flow of commerce through ports and terminals. |
| Increase access to the transportation system for the movement of all people and freight. | <ul style="list-style-type: none"> ▪ Percent of transit facilities that are Americans with Disabilities Act compliant. ▪ Number of aviation landing approaches using GPS technology. |
| Provide preventive measures and expeditious response to natural and man made disasters in partnership with other agencies to ensure that we provide for the rapid recovery of the transportation system. | <ul style="list-style-type: none"> ▪ Hours of delay per 1,000 vehicle miles traveled on Federal-aid highways |

STRATEGIC GOAL: ECONOMIC GROWTH AND TRADE

Advance America's economic growth and competitiveness domestically and internationally through efficient and flexible transportation.

| <i>Outcome Goal</i> | <i>Performance Indicator</i> |
|--|--|
| Reduce the average time for delivery of people, goods, and services to their destinations | <ul style="list-style-type: none"> ▪ Percent of flight operations safely flown off ATC-preferred routes. ▪ Amtrak trip-time between New York and Boston. |
| Improve the reliability of the delivery of people, goods, and services to their destinations. | <ul style="list-style-type: none"> ▪ Days critical waterways are closed due to ice |
| Reduce trade barriers, support economic deregulation, and promote competition in domestic and international markets in transportation-related services. | <ul style="list-style-type: none"> ▪ Number of passengers (in millions) in international markets with open aviation agreements |
| Improve the U.S. international competitive position by facilitating the export of domestic transportation goods and services. | <ul style="list-style-type: none"> ▪ Gross tons of commercial vessels under construction in U.S. shipyards. |
| Accelerate desirable, sustainable, and cost-beneficial regional and local economic development through major transportation investments. | <ul style="list-style-type: none"> ▪ Miles of the Appalachian Development Highway System completed |
| Increase the education and public awareness of individuals in transportation-related fields. | <ul style="list-style-type: none"> ▪ Number of transportation related degrees awarded by university programs sponsored by DOT. ▪ Number of students reached by the Garrett A. Morgan Technology and Transportation Futures program. |
| Expand opportunities and promote economic growth for all businesses, especially by encouraging and assisting small, women-owned, Native American and disadvantaged businesses to participate in DOT and DOT-assisted contracts and grants. | <ul style="list-style-type: none"> ▪ Percent of dollar value DOT contracts awarded to women-owned businesses and small disadvantaged business, in accordance with statutory goal. ▪ Number of employment sites that are made accessible by Job Access and Reverse Commute transportation services. |

STRATEGIC GOAL: HUMAN AND NATURAL ENVIRONMENT**Protect and enhance communities and the natural environment affected by transportation.**

| Outcome Goal | Performance Indicators |
|---|---|
| Improve the sustainability and livability of communities through investments in transportation facilities. | <ul style="list-style-type: none"> ▪ People living within .25 miles of transit stops offering service frequency of 15 minutes or less. |
| Reduce the amount of transportation-related pollutants and greenhouse gases released into the environment. | <ul style="list-style-type: none"> ▪ Mobile source emissions. ▪ Rate of oil spills by maritime sources. ▪ Average quantity of liquid hazardous material spilled from pipeline. ▪ Average quantity of liquid hazardous materials spilled from all modes except pipeline. ▪ Metric tons (in millions) of carbon equivalent emissions from transportation sources |
| Improve the natural environment and communities affected by DOT-owned facilities and equipment. | <ul style="list-style-type: none"> ▪ Percentage of DOT facilities identified for clean-up that need no further action. |
| Reduce the adverse effects of siting, construction and operation of transportation facilities on the natural environment and communities, particularly disadvantaged communities. | <ul style="list-style-type: none"> ▪ Number of residents exposed to significant aircraft noise (65dB or higher). ▪ Ratio of wetland replacement resulting from Federal-aid highway projects. ▪ Time to resolve environmental justice complaints. |
| Improve the condition of our living marine resources. | <ul style="list-style-type: none"> ▪ Observed compliance with Federal fisheries regulations. |

STRATEGIC GOAL: NATIONAL SECURITY

Advance the nation's vital security interests in support of national strategies such as the National Security Strategy and National Drug Control Strategy by ensuring that the transportation system is secure and available for defense mobility and that our borders are safe from illegal intrusion.

| <i>Outcome Goal</i> | <i>Performance Indicator</i> |
|--|--|
| Reduce the vulnerability and consequences of intentional harm to the transportation system and its users. | <ul style="list-style-type: none"> ▪ Detection rate for weapons and explosives in airports. ▪ Of those who need to act, percent that receive threat information within 24 hours. |
| Ensure readiness and capability of all modes of commercial transportation to meet national security needs. | <ul style="list-style-type: none"> ▪ Intermodal capacity available. ▪ Merchant Mariners available for mobilization. |
| Ensure transportation physical and information infrastructure and technology are adequate to facilitate military logistics during mobility, training exercises, and mobilization. | <ul style="list-style-type: none"> ▪ Percentage of strategic port facilities available when requested. |

DOT OUTCOME MEASURES AND MANAGING FOR RESULTS

Question. In developing your Annual Performance Plan, what efforts did your agency undertake to ensure that the goals in the plan include a significant number of outcome measures?

Answer. The agency makes a decision at the beginning of each fiscal year's performance planning process to use outcome measures wherever possible. Output measures are used only if a good outcome measure for a strategic outcome goal cannot be identified.

Question. Do you believe your program managers understand the difference between goals that measure workload (output) and goals that measure effectiveness (outcome)?

Answer. Yes. The Department of Transportation has made great strides over the past several years in ensuring that program managers focus on outcomes.

Question. What are some examples of customer satisfaction measures that you intend to use? Please include examples of both internal and external customers.

Answer. The Department has identified customer service management as one of its key Corporate Management Strategies in its Performance Plan, and is currently developing a customer satisfaction measurement program. When it is implemented, it will measure both internal and external customer satisfaction. Some of the customer groups that will be included in the measurement program include the traveling public, transportation workers, grant recipients, and DOT information users.

DOT PERFORMANCE BUDGETING

Question. How were the measurable goals of your fiscal year 1999 Annual Performance Plan used to develop your fiscal year 1999 budget?

Answer. Program performance was considered throughout the budget formulation process for the Department's fiscal year 1999 budget. For example, the Department requested \$975 million—an 18 percent increase—for aviation safety programs, including initiatives designed to help achieve the Department's goal of reducing aviation fatalities by 80 percent by 2007. And the Administration's ambitious goals for drug interdiction, based on two years of record level seizures by the Coast Guard, were reflected in the increased funding requested for Coast Guard's operating expenses. These are programs with demonstrated successes, and specific expected levels of performance in fiscal year 1999.

Question. If a proposed budget number is changed, up or down, by this committee, will you be able to indicate to us the likely impact the change would have on the level of program performance and the achievement of various goals?

Answer. Yes. For each of the last two years, the Department has submitted revisions to its goals based on appropriations action.

DOT PERFORMANCE MANAGEMENT

Question. Do you have the technological capability of measuring and reporting program performance throughout the year on a regular basis, so that the agency can be properly managed to achieve the desired results?

Answer. In some cases we do and in others we don't. In the instances where we rely on data reported by states, it is more difficult and costly to receive performance data on a regular basis.

Question. If so, who has access to the information—senior management only, or mid- and lower-level program managers too?

Answer. To the extent that information is available, it is available to multiple management levels. The best examples can be found in the two largest operating agencies of the Department: FAA and Coast Guard. Operating data are garnered and aggregated at intervals throughout the fiscal year, and are visible by managers throughout both organizations.

Question. Are you able to gain access easily to various performance-related data located throughout your various information systems?

Answer. Unfortunately, no. See Appendix I to DOT's fiscal year 1999 Performance Report and fiscal year 2001 Performance Plan.

DOT BUDGET ACCOUNT STRUCTURE

Question. The Government Performance and Results Act requires that your agency's Annual Performance Plan establish performance goals to define the level of performance to be achieved by each program activity set forth in your budget. Many agencies have indicated that their present budget account structure makes it difficult to link dollars to results in a clear and meaningful way. Have you faced such difficulty?

Answer. Generally, no. In general, DOT's and operating administrations' budgetary accounts and program and financing schedules are sufficiently straightforward for properly relating funding to performance. To the degree that issues arise, it is generally where one activity creates progress toward multiple outcomes. For instance, an investment in transportation infrastructure has impacts not only on mobility, but also in safety, and economic growth. Another example is found in investments in capital equipment for the Coast Guard, where ships, aircraft, and command and control investments contribute to many different outcomes.

Question. Would the linkages be clearer if your budget account structure were modified?

Answer. At this point, the Department does not recommend making changes in the budget account structure. But, as the Department continues to evolve and refine overall long-term strategy and annual performance plans, it may become apparent that changing some aspect of the Department's budget account structure will allow more efficient operations, and greater simplicity and clarity in presenting resource requests to Congress, and in reporting performance results from those investments.

Question. If so, how would you propose to modify it and why do you believe such modification would be more useful both to your agency and to this committee than the present structure?

Answer. See the previous answer.

Question. How would such modification strengthen accountability for program performance in the use of budgeted dollars?

Answer. See the previous answer.

LINKING PERFORMANCE MEASUREMENT SYSTEMS TO FINANCIAL SYSTEMS

Question. Spending significant resources on performance measurement systems appears to be a wasteful exercise if this information is not linked to: (1) real data about what it costs to perform various government functions; and (2) how to allocate agency resources to perform these functions. Could you comment on your agency's cost accounting expertise and plans to link GPRA to the budget process?

Answer. The majority of cost accounting expertise at DOT resides within the individual modal administrations. For example, FAA is in the process of developing a cost accounting system, which will be fully implemented by 2002. As a new departmental accounting system is installed over the next few years, it will significantly enhance DOT's managerial cost accounting capability. The new system will enable DOT's modal administrations to apply cost accounting standards to specific functions.

Question. Under one of the new accounting standards recommended by the Federal Accounting Standards Advisory Board (FASAB) and issued by OMB, this year for the first time all federal agencies are required to have a system of Managerial Cost Accounting. The clearly preferred methodology for such a system, as stated in that standard, is the one known as "Activity-Based Costing," whereby the full cost is calculated for each of the activities of an agency. What is the status of your agency's implementation of the Managerial Cost Accounting requirement, and are you using Activity-Based Costing?

Answer. DOT is aggressively implementing a new financial management system known as "DELPHI" which contains Activity Based Costing functionality. Current implementation plans are that the last operating administration will be converted to DELPHI in June, 2001. During fiscal year 2002, the department will be able to fully implement this new functionality to improve overall departmental financial and performance management systems.

Question. Will you be able in the future to show to this committee the full and accurate cost of each activity of each program, including in those calculations such items as administration, employee benefits, and depreciation?

Answer. Yes.

Question. By doing so, would we then be able to see more precisely the relationship between the dollars spent on a program, the true costs of the activities conducted by the program, and the results of these activities?

Answer. Yes. But it is also important to remember that DOT largely has outcome, not output, goals. Many variables may affect the achievement of these goals. DOT does not in all cases control all the variables that influence program outcomes and therefore does not always have complete control over the ultimate achievement of the department's strategic goals or objectives.

Question. Will you be able to show us the per-unit cost of each activity and result?

Answer. DOT will be better able to show the per-unit cost of activity inputs. Cost of achieving results is more difficult to pin down, since many of DOT's partners and

stakeholders have influence equal to or greater than the department in achieving strategic goals or objectives.

Question. To what extent do the dollars associated with any particular performance goal reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. In most cases, program and modal overhead costs are reflected in the dollars associated with specific performance goals. For example, \$449 million is requested for the maritime search and rescue program, to help achieve the Department's goal of saving at least 85 percent of all mariners who are in imminent danger. This sum includes operating expenses; acquisition, construction and improvements; and research and development, as well as an allocated portion of the Coast Guard's administrative expenses for staff functions such as procurement, personnel, legal, and executive leadership of the organization. Overall, about 98 percent of the estimated obligations for fiscal year 2001 are considered part of the direct program level, and are allocated based on the primary purpose of the program. The remaining two percent are indirect costs, including primarily Coast Guard retired pay, FAA staff offices for operations, and OST salaries and expenses.

PERFORMANCE PLANNING AND REGULATORY REFORM

Question. Please identify any significant regulatory reform measures that have been put in place by your agency in conjunction with the development of the agency's performance plan.

Answer. The Department is committed to improving the rulemaking process and to minimizing the regulatory burden on the transportation community. This commitment is documented in the Corporate Management Strategies section of the performance plan and report. In 1999, the Department implemented electronic participation in rulemaking and met with industry and the general public to identify what could be done to improve the rulemaking process. These efforts will continue in fiscal year 2000 and 2001.

EXTERNAL INFLUENCES ON DOT PERFORMANCE

Question. Does your fiscal year 1999 performance plan—briefly or by reference to your strategic plan—identify any external factors that could influence goal achievement?

Answer. Yes.

Question. If so, what steps have you identified to prepare, anticipate and plan for such influences?

Answer. Although DOT cannot control its operating environment, by clearly identifying the factors that need to be considered in developing and implementing programs, managers are prepared to meet the challenges presented. For example, one external factor that is expected to have a significant influence on transportation is the growth of the elderly population. This is being considered by DOT management in the selection of initiatives that focus on ways to make travel for this group safer and easier, e.g., easier to read signing, changes in passenger boarding and alighting time for aviation, rail and transit vehicles.

Question. What impact might external factors have on your resource estimates?

Answer. External factors can have a significant impact on resource estimates. For example, a major environmental catastrophe—such as a hurricane, earthquake or oil spill—could significantly impact resource requirements.

PROGRAMMATIC OVERLAP OR DUPLICATION

Question. Through the development of the Performance Plan, has the agency identified overlapping functions or program duplication?

Answer. No. The authorization and appropriations structure of the department and its operating administrations are such that no duplication or overlap exists. However, the Department has closely evaluated responsibilities where coordination is necessary. An example of this is the recent program evaluation on hazardous materials.

Question. If so, does the Performance Plan identify the overlap or duplication?

Answer. See previous question.

MANAGEMENT CHALLENGES AND PERFORMANCE REPORTING

Question. Should agencies address management challenges and potential duplication and overlapping functions in their GPRA plans, and if so, how?

Answer. Yes. DOT has gone to great lengths to integrate the department's and operating administrations' approach to addressing management issues in conjunc-

tion with achieving strategic objectives. In the few areas where results have not met expectations, the Department is undertaking reviews of performance strategies and will find better ways to achieve stated outcomes.

AGENCY DECISIONMAKING

Question. To what extent has GPRA been used by agency leadership to guide decision-making?

Answer. DOT has a history of using performance measurement in managing programs, particularly measures of the safety, condition, and performance of the transportation system. GPRA has expanded the use of performance measures and has led to two key advances: the integration of program performance measures into a single DOT performance plan, and a closer linkage of performance measures to the budget process. For example, NHTSA has tied individual program performance to intermediate outcomes, e.g., increasing seat belt use; and to overall outcomes, e.g., reducing fatalities and injuries. These “top level” outcomes are also integrated into the Department’s Performance Plan. Budget justifications, in turn, have used performance measures to justify the allocation of resources and the specific results that programs seek.

Question. Will this use increase in the future and if so, in what ways?

Answer. As DOT employees gain more experience in managing for results, and in linking resources to outcomes, the thought processes underpinning the Results Act will become more a part of daily activity. As a result, overall DOT performance is expected to continuously improve.

AGENCY PERFORMANCE AND THE APPROPRIATIONS PROCESS

Question. Future funding decisions will take into consideration actual performance compared to expected or target performance. Given that: to what extent are your performance measures sufficiently mature to allow for these kinds of uses?

Answer. The department has devised the best set of performance measures based on current knowledge of which departmental activities and outputs most strongly influence progress toward achieving strategic goals or objectives. These measures can and will be improved upon in the ensuing years. DOT’s performance data illustrate to senior decision makers what things are going well, and where the areas of improvement lie; where strategies need re-examination, or where different levels of resources need to be applied; and to guide overall resource allocations during the annual budget process. Program evaluations are utilized to confirm the linkage between activities and effects. Additionally, the department will continue to set performance goals sufficiently high so that not every one of them will be attained.

Question. Are there any factors, such as inexperience in making estimates for certain activities or lack of data that might affect the accuracy of resource estimates?

Answer. DOT exerts influence over highly complex human and technological systems, throughout many levels of government and with the private sector. Resource estimates, and performance estimates, will always be subject to some level of uncertainty. But, the Department expects that some uncertainties will be reduced over time as performance, budgeting, management, and financial systems become better integrated.

WAIVERS OF REQUIREMENTS

Question. Are you requesting any waivers of non-statutory administrative requirements?

Answer. DOT has a waiver policy/process in place that allows DOT employees to request waivers to existing, internal administrative procedures that officials within the Department have the authority to waive. The DOT Waiver Policy was developed in 1998 in response to the President’s Executive Memorandum of 4/21/98, “Streamlining the Granting of Waivers”. All employee waivers that have been requested are listed on the DOT Waiver Website (waiver.dot.gov) by Operating Administration (OA) and each OA has a point of contact for waivers. The Department now has 74 waivers posted, 56 of those are from the USCG. Examples of some of the waivers posted include: eliminating or reducing paperwork for payroll/personnel functions; changes in delegated approval levels for organizational changes; modifications to requirements regarding USCG uniforms; and modifications to procurement requirements.

Question. Specifically, are you requesting any relaxation of transfer or reprogramming controls in return for specific accountability commitments?

Answer. No. We have no such plans at this time.

DOT STRATEGIC PLANNING

Question. Based on your fiscal year 1999 performance plan, do you see any need for any substantive revisions in your strategic plan issued on September 30, 1997?

Answer. As provided by the Government Performance and Results Act, DOT is in the midst of updating the department's strategic plan referred to in the question. A new Strategic Plan will be published later this year.

FUTURE PERFORMANCE REPORTING

Question. The Department is to be commended for the concise and efficient performance report and performance plan. The document is quite useful and the presentation is clear and well organized. In future publications of the Performance Report and Performance Plan, please provide the immediate three year prior goal targets and actual results as well as the current fiscal year target and the prospective target for the next fiscal year. Please provide for the record, the 1997, 1998, and 1999 goals and actual results as well as the target for the current fiscal year and the prospective target for fiscal year 2001 in a table that simply lists the strategic goal, the individual (sub-goals) under that strategic goal (performance progress reports) and the requested information by year.

Answer. As data on actual results are obtained, the department will publish these in annual performance reports. In the meantime, please refer to the following table, which is extracted from the DOT fiscal year 1999 Performance Report and fiscal year 2001 Performance Plan. Note that there were no specific GPRA goals in 1997 and 1998. [Attachment II]

QUESTIONS SUBMITTED TO THE FEDERAL AVIATION ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

TOWER AND CENTER OPERATIONS

Question. Please provide a table outlining total operations handled by towers and en route center controllers over the past ten years. Please also include the numbers of controllers in each category with the operations numbers.

Answer. The following table provides the information requested.

TOTAL OPERATIONS BY TOWERS AND CENTERS

| Fiscal year | Centers | | Towers | | |
|-------------|------------------|----------------------------|--------------------|-----------------------|-------------|
| | Aircraft handled | Block update (BU) staffing | Airport operations | Instrument operations | BU staffing |
| 1990 | 37,464,206 | 6,680 | 63,668,880 | 46,866,201 | 7,965 |
| 1991 | 36,137,766 | 6,912 | 61,485,577 | 45,042,293 | 8,064 |
| 1992 | 36,474,871 | 6,945 | 61,471,727 | 45,643,834 | 8,202 |
| 1993 | 37,419,173 | 6,775 | 60,108,153 | 45,699,597 | 8,195 |

TOTAL OPERATIONS BY TOWERS AND CENTERS—Continued

| Fiscal year | Centers | | Towers | | |
|-------------|------------------|----------------------------|--------------------|-----------------------|-------------|
| | Aircraft handled | Block update (BU) staffing | Airport operations | Instrument operations | BU staffing |
| 1994 | 38,839,795 | 6,632 | 60,298,149 | 46,733,058 | 8,321 |
| 1995 | 40,149,335 | 6,452 | 57,973,853 | 47,048,407 | 8,162 |
| 1996 | 40,419,365 | 6,331 | 54,409,886 | 46,628,546 | 8,029 |
| 1997 | 41,375,392 | 6,425 | 53,256,154 | 48,128,137 | 8,163 |
| 1998 | 43,196,004 | 6,639 | 52,987,600 | 49,272,910 | 8,327 |
| 1999 | 44,654,427 | 6,607 | 55,068,646 | 51,110,257 | 8,295 |

WENDELL H. FORD AVIATION INVESTMENT AND REFORM ACT FOR THE 21ST CENTURY

Question. Given the FAA reauthorization legislation the President just signed, please provide a revised budget request for FAA operations constrained to the overall Budget Authority (BA) and Outlay constraints of the President's overall BA and Outlays levels for the FAA in the aggregate. To the extent that additional funds are desired by the administration for FAA operations above the levels permitted by the President's budget request (BA and Outlays) less the FAA reauthorization bill's protected accounts, please reflect offsets from other Transportation accounts. Failure to provide such a revised budget request in the immediate aftermath of the President's endorsement of the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (FAIR-21) approach will constitute a tacit approval of making up any resource shortfall with corresponding reductions in the FAA operations appropriation.

Answer. The levels of funding provided in FAIR-21 are authorization levels. Since no direct spending is provided in FAIR-21, actual budgetary resources, including obligation limitations, are provided by annual appropriations acts. FAIR-21 did not amend the Congressional Budget Act, nor did it create new discretionary spending categories such as were created in the Transportation Efficiency Act for the 21st Century (TEA-21). In addition, the "protected accounts" referred to in the question are changes made in both House and Senate floor procedures for action on future Transportation and Related Agencies Appropriation Bills. These procedures only apply to the standing rules of House and Senate and do not impact the levels requested by the President for the FAA, nor do they influence whether or not the President would sign or veto an appropriations bill. Due to the reasons stated above, there is no plan to amend the President's fiscal year 2001 budget request for the FAA.

AIR TRANSPORTATION OVERSIGHT SYSTEM

Question. Last June the General Accounting Office (GAO) issued a report on FAA's new safety inspection program called the Air Transportation Oversight System (ATOS). While GAO supported ATOS in principle it found several problems with the way it was being implemented. These included lack of adequate advance training and guidance for inspectors, lack of sufficient travel funds, and the incompatibility of the ATOS database with the tracking system FAA has spent nearly \$100 million developing over the past several years. As a result, GAO recommended that ATOS not be extended to other airlines until these problems are remedied. What progress has FAA made in addressing these problems, and what are your plans for further expanding ATOS to cover more airlines?

Answer. The lack of adequate advance training and guidance for inspectors has been addressed. The ATOS Certificate Management Office (CMO) has developed and delivered several three-day ATOS standardization seminars designed for principal inspectors and data evaluation program managers. These seminars have been lauded by participants for their content and ability to convey the intent of ATOS and the processes the Agency uses to inspect air carriers. In addition, the ATOS CMO developed a one-day seminar for the other 500 ATOS certificate management team members. As for enhanced guidance, in December 1999, the ATOS CMO published guidance for developing comprehensive surveillance plans, for planning, conducting, and reporting both safety attribute inspections and element performance inspections, for ensuring data quality, and for surveillance reporting. All of this

guidance is available on the ATOS Web site. This new guidance greatly enhances the understanding of ATOS implementation.

The Flight Standards ATOS CMO has been working to secure additional funding. The budget plans through fiscal year 2002 have identified appropriate levels of funding to accommodate ATOS travel requirements.

All of the issues will be addressed before the Flight Standards Service extends ATOS to other airlines. The ATOS CMO has addressed many of the problems incurred in the Phase 1 version of ATOS and an effort is underway to complete the development of all eight modules of the ATOS model. As a result of these efforts, and dependant upon the ATOS funding situation, the tentative plan for ATOS expansion is slated for fiscal year 2003.

Question. In particular, how have you addressed the database incompatibility problem, and how will you ensure that such lack of internal coordination will not occur again?

Answer. There is an effort currently underway to link the ATOS data with the Safety Performance Analysis System and to accommodate an ATOS data query capability. This effort is slated for completion in June 2000. In addition, the ATOS CMO is establishing processes to ensure it is coordinated on and therefore cognizant of all automation issues related to ATOS.

CONTRACT TOWERS

Question. We worked last year to fashion a very good Department of Transportation (DOT) bill and the President signed it. Now, we understand DOT may propose to cut off funding for nearly half the contract towers across the country in a couple of months. The contract tower program is very important from an aviation safety perspective and it is providing significant ATC cost savings. In fact, audits by the DOT Inspector General validate the important benefits of the program and suggest that it might make sense to expand it. I am baffled DOT is even considering a funding reduction and want you to explain why DOT may propose action that could adversely affect aviation safety and will penalize a program that is solidly justified from a benefit/cost standpoint.

Answer. Withdrawing Federal funding from contract towers without commercial services was one of many options being considered in response to the agency's budgetary shortfalls. This option is no longer under consideration.

Question. Please provide the number of operations handled at contract towers by year over the past ten years. In addition, please provide the number of controllers at contract towers by year over the same period.

Answer. The approximate number of operations handled at contract towers, by year, over the past ten years are listed below.

| Fiscal year | Operations | Federal contract tower (FCT) staffing ¹ |
|-------------------------|------------|--|
| 1990 ² | 1,187,023 | |
| 1991 | 1,560,433 | |
| 1992 | 1,666,935 | |
| 1993 | 1,648,008 | |
| 1994 | 1,884,369 | 195 |
| 1995 | 4,446,574 | 456 |
| 1996 | 7,499,099 | 664 |
| 1997 | 10,413,335 | 837 |
| 1998 | 12,270,742 | 838 |
| 1999 | 13,0737,42 | 864 |

¹ Staffing numbers for contract towers were not formally kept prior to 1994, when the program was nationalized.

² Database information is available beginning with January 1990. Therefore, fiscal year 1990 only is for January through September 1990.

OVERFLIGHT FEE COLLECTIONS

Question. How much is anticipated for collection in overflight user fees in fiscal year 2000 and in fiscal year 2001?

Answer. The fiscal year 2001 President's budget assumes collections of \$5.1 million in fiscal year 2000 and \$22.1 million in fiscal year 2001.

FUNDING FOR DEVELOPMENT OF GLOBAL POSITIONING SYSTEM (GPS) APPROACHES

Question. Please provide the breakout of FAA operations funding associated with development of GPS approaches?

Answer. FAA Operations funding for development of GPS approaches is \$6,044,000. The breakout follows:

| | | |
|-------------|------------------------------------|-------------|
| 11xx | PC&B/Overtime/Flight Time | \$3,311,394 |
| 12xx | PC&B/PCS/Flight Time | 693,991 |
| 21xx | Travel/PCS | 28,700 |
| 22xx | PCS | 4,500 |
| 25xx | Contract Service/Flight Time | 1,720,425 |
| 26xx | Supplies/Flight time | 284,990 |
| Total | | 6,044,000 |

AIRPORT SECURITY COSTS

Question. Please provide a breakout of airport security and related costs included in the FAA Operations, Facilities and Equipment (F&E), and Airport Improvement Program (AIP) requests.

Answer. The breakout of airport security and related costs in fiscal year 2001 for FAA Operations, F&E, and AIP appropriations are as follows:

| | |
|---|---------------|
| Operations | \$144,328,000 |
| F&E: | |
| Activity 5 | 2,500,000 |
| Explosives Detection Technology | 97,500,000 |
| Facility Security Risk Management | 19,339,000 |
| Aviation Safety Analysis System | 2,109,000 |
| F&E Total | 121,448,000 |
| AIP: Grants in Aid to Airports | 16,000,000 |

FULL-TIME EMPLOYMENT

Question. Please breakout the reimbursements/allocations of full-time permanent employment for the three years listed on page 9 of the justification by office.

Answer. The information is listed below.

| Appropriation | Fiscal year | | |
|---|------------------------|--------------------------|--------------------------|
| | 1999 actual employment | 2000 estimate employment | 2001 estimate employment |
| <i>Operations:</i> | | | |
| <i>Air Traffic Services:</i> | | | |
| Air Traffic | 24,087 | 23,795 | 23,795 |
| NAS Logistics ¹ | 1,070 | 1,060 | 466 |
| Systems Maintenance | 9,259 | 9,142 | 9,344 |
| ARS | 166 | 182 | 182 |
| Flight Inspection ¹ | 610 | 610 | 392 |
| Subtotal, Air Traffic Services | 35,192 | 34,789 | 34,179 |
| <i>Aviation Regulation & Certification:</i> | | | |
| Flight Standards | 4,605 | 4,557 | 4,597 |

| Research, Engr. & Devel | 361 | 411 | 411 |
| Grants-in-Aids for Airports | | 485 | 503 |
| Aviation Insurance | 3 | 3 | 3 |
| Total, Direct | 48,289 | 48,031 | 47,760 |
| Total, Reimbursable ¹ | 363 | 513 | 1,345 |
| Total, FAA | 48,652 | 48,544 | 49,105 |

¹ Employment Levels for NAS Logistics and Flight inspection decrease in fiscal year 2001, and Reimbursable levels increase, due to the proposal to transfer aircraft. Maintenance and Logistics Center operations into the Franchise Fund.

AVIATION RULEMAKING ADVISORY COMMITTEE

Question. FAA has had a history of being slow in issuing rules to safeguard aviation safety. Examples include the updating of rules governing aviation repair station, and the use of flight data recorder information. In 1991, the Aviation Rulemaking Advisory Committee (ARAC) was founded to move rules through the rulemaking process more quickly. Has ARAC met this goal? Are any steps to better achieve the stated goal being considered?

Answer. The ARAC was chartered to provide advice and recommendations to the FAA's rulemaking activity with respect to aviation related issues. Because ARAC provides advice and recommendation based on consensus from the aviation industry the process of rulemaking, in some instances, is expedited. The incorporation of the ARAC's recommendations into proposed rulemaking often results in fewer comments being received during the notice of proposed rulemaking (NPRM) comment period. For example the training and qualifications issues group of the ARAC forwarded to the FAA a recommendation regarding certification requirements for aircraft dispatchers. The FAA accepted the recommendations and subsequently published an NPRM incorporating ARAC's recommendation. As a result, the NPRM received only four comments in support of the NPRM thereby expediting the rulemaking process because the FAA did not have to expend resources addressing the comments and possibly change the proposed rule based on the comments.

However, the activities of ARAC do not circumvent the normal coordination process or public rulemaking procedures. In the development of an ARAC recommendation or the development of a proposed rule by the FAA, a considerable amount of resources are expended in order to ensure that issues are thoroughly analyzed and consensus is reached. The ARAC has found that attempts to reach consensus in certain areas can be time-consuming, given the diverse interests of the public. In fact, some ARAC working groups have been deliberating for several years. In those kinds of instances, the FAA has allowed the ARAC to forward recommendations without draft rulemaking documents. In addition, the FAA has adopted the policy of chartering some ARAC tasks to state specifically that consensus recommendations need not include draft rulemaking documents. Instead, the ARAC may request a consensus technical report.

The FAA continues to streamline the rulemaking process and has gained efficiencies, however, staffing remains an issue. The FAA plans to issue approximately 50 priority rulemaking projects, 250 exemptions, and process 30 petitions for rule-making requests this year. The Agency's five-year plan contains over 250 rule-making projects that are critical to enhancing aviation safety.

COST FREE FACILITIES

Question. The FAA has recently reversed its decades-old practice of paying below-market rates for FAA facilities located on airport property, opting to force airport sponsors to furnish space to the Agency without cost. What consideration has the Agency given to the effect this change will have on the financial situation at airports—particularly smaller airports—that have grown to rely on this rental revenue over the past several decades?

Answer. There will be no change for many airports since these airports did not charge rent to FAA for cost-free facilities. Other airports will need to address the revenue change and for the most part, the loss of revenue for individual airports is in the thousands of dollars, while the impact to the FAA could be much more significant. In addition, it is important to note that the cost-free provisions are based in statute. The FAA's actions are intended to fairly, equitably, and consistently apply these statutory requirements.

Section 47107(a)(12) of title 49, United States Code, states "the airport owner or operator will provide, without charge to Government, property interests of the sponsor in land or water areas or buildings that the Secretary decides are desirable for, and that will be used for, constructing at Government expense, facilities for carrying out activities related to air traffic control or navigation." This requirement has been in statutes beginning with the Federal Airport Act of 1946 and included in each similar legislation including the Airport and Airway Development Act of 1970 and the Airport and Airway Improvement Act of 1982.

Up until the early 1980's the FAA received such facilities on a cost-free basis except in those instances in which the airport constructed a facility on our behalf. Since the statute provides that the construction of the facility must be at Government expense, the FAA entered into leases to reimburse airports for the capital costs for the construction. Since the early 1980's, however, the statutory provision has not been applied consistently, but the FAA has continued to receive facilities rent free at many airports.

In addressing this inconsistency in the application of the requirement, the FAA recognized that many airports would not be able to absorb the loss of revenue readily. FAA took care to minimize the immediate financial effect on airports in a manner consistent with our responsibilities as a steward of Federal taxpayer dollars. First, FAA will be applying its rights to rent-free space only at the expiration of existing leases involving the payment of rent for property interests that would qualify for rent-free treatment. Since the FAA and the airport negotiated these leases in good faith, the FAA will take no action to terminate these leases before their expiration. Second, even for airports with leases expiring, the FAA delayed implementation of the enforcement of the statutory requirements until the beginning of fiscal year 2001, to provide airports with adequate time to deal with the reduction in their cash flow. Thus, for airports with leases that expired in fiscal year 1999, FAA personnel are authorized to negotiate one-year extensions, with rental payments as a transitional measure, directed to achieving full compliance with statutory requirements.

Finally, the statutory provision does not give the FAA an unlimited right to occupy airport property without compensation. The airport is entitled to compensation for utilities and janitorial services provided to the FAA. The FAA may also enter into a lease agreement with the airport sponsor under which the sponsor performs alterations of space and reimbursed by the FAA. The provision only applies to air traffic, weather-reporting and air navigation facilities. Other FAA operations would pay rent.

Question. If airports are unable to absorb these costs, they will be forced to pass them on to other airport users because AIP grant assurance require airports (Airport Advisory Number 24) to have a fee and rental structure that make the airport as self-sustaining as possible. Has the FAA studied the impact of this change on other airport users?

Answer. The requirement for the provision of cost-free land and building space is based on statute. Section 47107(a)(12) of title 49, United States Code, states "the airport owner or operator will provide, without charge to Government, property interests of the sponsor in land or water areas or buildings that the Secretary decides are desirable for, and that will be used for, constructing at Government expense,

facilities for carrying out activities related to air traffic control or navigation.” The self-sustaining provision is contained in the same statute.

For many airports, there will be no change, as these airports did not charge rent to FAA for cost-free facilities. Other airports will need to address the revenue change. However, it should be noted that since the assurances have been inconsistently applied, many of these airports have received Federal funds over the past 10–20 years. Also for the most part, the loss of revenue for individual airports is in the thousands of dollars, while the impact to the FAA’s budget could be much more significant.

Question. If this change is adopted, won’t the FAA face the perverse incentive to locate the facilities appropriately located off airport property—such as Terminal Radar Approach Control (TRACONS)—on airport property to save money at the expense of airports? Has the FAA studied the effect this would have on airport traffic, airport master development plans, and airport operations?

Answer. The statutory provisions in Section 47107(a)(12) of title 49, United States Code, cover essentially two areas: cost-free land or cost-free space in existing buildings. Generally, the FAA has not sought space in airport buildings—either on a free or reimbursable basis, but only cost-free land. Airports normally provide cost-free land for FAA to construct its facilities. Since there has been no change in the FAA’s access to cost-free land, there would be no additional incentive to locate facilities on the airport that could be located off airport.

There should be no effect on airport traffic, airport master development plans and airport operations. If FAA needs to locate some facilities on the airport, it will be due to operational necessity and not to save money. Many facilities such as airport towers, landing aids, and weather sensors must be located on airport property.

UNIVERSAL ACCESS SYSTEM

Question. Section 102(b) of the FAA Reauthorization Bill authorized \$8 million for the voluntary purchase and installation of Universal Access Systems (UAS). The legislative history directs the FAA to work with organizations representing airports and airline pilots to rapidly deploy the continuously—updated data needed on approved flight crew members that will allow universal access systems to properly operate. It also directs the Agency to partner with industry to develop the universal data and standards needed to make such security systems quickly available, and utilize digital networks that are designed for airport sponsors and therefore maximize the incentives to deploy universal security systems on a voluntary basis. Does FAA have an official position on the direction suggested on this issue in the FAA Reauthorization legislation?

Answer. The FAA is encouraging voluntary participation in a UAS through cooperative agreements between airports and air carriers. Using funds previously appropriated, FAA tasked the joint government-industry UAS working group of the Aviation Security Advisory Committee (ASAC) to develop the standards and protocols for a UAS. A test program using an airline central database and two participating airports was successful. The UAS working group went on to complete an implementation plan and a few airports have linked to the central database. However, opposition to wide implementation of UAS was expressed in the working group. The ASAC subsequently voted to retire the working group at its meeting on May 13, 1999. FAA remains willing to assist airport operators that may request AIP funds for the installation of UAS.

TRAINING

Question. What cuts have been made in the training activity at the FAA Academy in Oklahoma City? What cuts have been made in other FAA training programs? Please provide a table with the anticipated 2000 budget request training levels for all FAA training activities and the resulting training level in that fiscal year, as well as the anticipated fiscal year 2001 budget request for training levels for all FAA training activities.

Answer. Some FAA training activities, including air traffic training at the Academy, have been cut this year due to the budget shortfalls the Agency is facing. The only major cut that has been imposed at the Academy is in the Air Traffic training program. Additional training funds for the Air Traffic program at the Academy is included in the supplemental funding requested by the President. The fiscal year 2000 current estimate for training reflects the appropriation below the request level. Absent the \$77 million supplemental request, training is expected to be about \$4 million less than the request level. The following table displays the amounts assumed in fiscal year 2000 request, current fiscal year 2000 estimate, and amounts in the 2001 President’s budget.

FEDERAL AVIATION ADMINISTRATION OPERATIONS APPROPRIATION TRAINING COSTS

| LOB | Total training program | | |
|---|--------------------------|--|---------------------------|
| | Fiscal year 2000 request | Current fiscal year 2000 estimate ¹ | Fiscal year 2001 estimate |
| Air Traffic Services: | | | |
| Air Traffic | \$41,638,000 | \$38,952,000 | \$48,500,000 |
| NAS Logistics | 296,842 | 506,074 | 516,196 |

| Total, Operations | 158,817,910 | 154,719,760 | 196,291,119 |

¹ Excludes Administration's \$77 million supplement request.

CONTRACT TOWERS

Question. Last year, before the House Appropriations Subcommittee, Administrator Garvey and Acting Administrator Belger testified that the fiscal year 2000 budget request envisioned \$20 million in savings. Has the FAA achieved those \$20 million in savings as outlined in the House testimony last year? The FAA also noted that the contract tower program avoids some "\$30 million a year in costs that we would otherwise incur if we were operating those facilities." What is the status of the report to the Committee relating to the contract tower program that the FAA has been delinquent on for so long. Please indicate which offices that need to sign off on that report have failed to clear the report.

Answer. Providing air traffic control service at low activity towers via contract support has generated savings of approximately \$250,000 per tower or \$30 million per year. The fiscal year 2000 and the fiscal year 2001 budgets utilize these savings

to meet increased air traffic staffing requirements in other areas. The report to the Committee is in internal coordination.

COST SAVINGS

Question. Last year, the FAA Administrator testified in the same hearing, "I think it is absolutely critical and important (to contain costs). We are putting every measure that we can in place to contain costs—we always have to be looking at ways to keep those costs down. As Ken Mead and others have said, it is particularly challenging when you have a budget that is made up primarily of personnel costs. We have to recognize that as we look at some of the efficiencies. I put a lot of hope on the kind of efficiencies we have talked about in our contract negotiations and our agreed-upon contract with National Air Traffic Controller Association (NATCA). Asking people to take on more responsibilities as well as some of the other efficiencies that we have talked about are very important." To date, the subcommittee is unaware of any significant cost savings that have emerged at the FAA due to increased efficiencies. Please provide a list and quantify them for the Subcommittee. In addition, the Subcommittee views the cost control measures that the FAA has taken to be on the order of one time annual savings—cutting training, travel, slowing hiring or replacement personnel. What savings has the FAA instituted that have significant efficiencies in the out years? Please provide a list and quantify the out years savings.

Answer. During fiscal year 2000, the FAA has taken several actions to operate within the reduced funding levels provided for the Operations appropriation. First, a hiring freeze has been imposed, which the Agency estimates will result in staffing levels about 800 below the fiscal year 1999 levels and over 2,300 below the levels estimated in the fiscal year 2000 President's budget. There are some delays in hiring taking place, particularly in Airway Facilities and Aviation Regulation and Certification, but the savings associated with the delays, which are one-time, are over and above the savings mentioned above.

In addition to the staffing reductions, the agency has made reductions to travel, contracts, supplies, and equipment. None of these reductions should be considered one-time. There are no funds included in the fiscal year 2001 budget to restore these reductions so they will carry-over into future years just as cuts in prior years have. The reductions will be offset by whatever programmatic increases are approved through the appropriation process, but the programmatic increases included in the budget are not restorations, they are expansions of current initiatives or new requirements.

As mentioned in the question, most of the Operations appropriation goes toward payroll costs. These costs represent about 75 percent of total Operations costs. As a result, staffing represents the major component of any effort to reduce costs. The Agency has significantly reduced staffing since fiscal year 1992. The Agency has also reduced our non-payroll costs since fiscal year 1992 after accounting for inflation and added costs for such things as contract weather, contract towers, contract maintenance, charting, and the Canine program.

SAVINGS IN THE OPERATIONS APPROPRIATION

[In thousands of dollars]

| Item | Amount saved in fiscal year 2000 (from 99 levels) | Out year sav- ings/year (from 92 levels) |
|---|--|---|
| Staffing Reductions (includes Contract Tower and Flight Service Stations) | 145,497 | 434,336 |
| Travel and Transportation Reductions | 5,600 | 52,100 |
| Rents, Communications, and Utilities | | 43,773 |
| Supplies | 3,600 | 19,700 |
| Contracts | 3,300 | ¹ 55,500 |
| Equipment | 26,600 | 33,800 |
| Total | 184,597 | 639,209 |

¹ Represents savings after adjusting contractual cost for the new requirements/initiatives that the Agency must now pay for.

ONBOARD STAFFING

Question. Please provide a listing by line of business and by major organization within each line of business, comparing the current onboard staffing levels to those shown in the fiscal year 1999 column, the fiscal year 2000 column, and the fiscal year 2001 of the President's budget.

Answer. The listing is provided below.

| Appropriation | Feb. 2000 onboard employment | Fiscal year 1999 actual employment | Fiscal year 2000 col. of fiscal year 2001 Pres. budget | Fiscal year 2001 col. of fiscal year 2001 Pres. budget |
|--|------------------------------------|--|--|--|
| Operations: | | | | |

Question. Also provide a listing of the use of the FAA G-IV aircraft, the cost of the operation of the aircraft by trip, and the overhead costs attributed to that aircraft for hangering and maintenance as well as the marginal maintenance and staffing costs directly attributable to that aircraft.

Answer. Below are the overhead costs attributed to the aircraft in fiscal year 1999.

| | |
|----------------------------|------------------|
| Hangering | \$280,404 |
| Maintenance | 714,649 |
| Marginal Maintenance | 376,282 |
| Direct Staffing | 336,609 |
| Total | 1,707,944 |

FAA'S USAGE OF G-IV AIRCRAFT BY TRIP

| Date | Agency | Passenger | Flight hours | Rate | Total |
|-------------------------|-----------|-------------------------|--------------|-------|-----------|
| Transportation Flights: | | | | | |

TRANSIT SUBSIDY BENEFIT PROGRAM

Question. Please provide data on the transit subsidy benefit program consistent with the information provided on page 470 of the fiscal year 2000 House report but also provide for fiscal year 2001 the anticipated cost of the transit benefit for employees making more than \$50,000 a year in salary by metropolitan area.

Answer. The tables follow.

ESTIMATED COSTS FOR FAA PARTICIPATION IN THE TRANSIT BENEFIT PROGRAM—FISCAL YEARS 1995–2000

| Fiscal year | Headquarters | Regions | Admin. Ex. ¹ | Total |
|-------------|--------------|-----------|-------------------------|-------------|
| 1995 | \$1,141,454 | \$137,046 | \$51,964 | \$1,330,464 |
| 1996 | 1,210,360 | 225,408 | 59,506 | 1,495,274 |
| 1997 | 1,313,022 | 274,406 | 94,181 | 1,681,609 |
| 1998 | 1,486,887 | 309,165 | 83,804 | 1,879,856 |
| 1999 | 1,529,804 | 320,095 | 102,460 | 1,952,359 |
| 2000 | 1,513,358 | 458,669 | 112,603 | 2,084,630 |

¹ The Admin. Ex. (administrative expense) is for headquarters only.

Note.—The 2000 data are projections. The headquarters and regions costs are based primarily on actual data for the period (October through February).

| Seattle | 139 |
| Salt Lake City | 25 |
| Boston | 39 |
| Miami | 9 |
| Total | 2,429 |

¹ Based on data for January and February

Note.—The anticipated fiscal year 2001 cost of transit benefits provided to employees in the Washington, DC metro area who make more than \$50,000 in annual salary will be approximately \$890,604. This estimate was determined by researching the Washington, DC, FAA Headquarters transit benefit program database. This database provides a copy of each person's application for these benefits. There are approximately 1,919 FAA transit benefit applicants in the Washington, DC area. After reviewing 46 percent of all the applications, it was determined that 59.5 percent of FAA employees who use this program are GS-12 or above.

OTHER SERVICES—OPERATIONS

Question. Please provide a breakdown of your fiscal year 2001 “other services” request, similar in format to last year’s House report on page 480–481.

Answer. The table follows.

OTHER SERVICES—OPERATIONS APPROPRIATION

[In thousands of dollars]

| | Fiscal year | | |
|--|----------------|------------------|------------------|
| | 1999 actual | 2000 estimate | 2001 estimate |
| A-76 contractual services | 66 | 94 | 134 |
| AAC—engineering design and support | | | |
| Accident prevention program | | | |
| Aeronautical charting services ¹ | 34,412 | 33,178 | 36,226 |
| Aircraft airworthiness composite and major repairs | | | |
| Aircraft/simulator rental ² | 5,605 | 5,270 | 9,070 |
| Audio visual services | 21 | 23 | 24 |
| Automated flight inspection system (AFIS) | | | |
| Automation support contract | 14,300 | 16,611 | 20,537 |
| Aviation safety analysis system (ASAS) | | | |
| Center weather services—FAA/NOAA | 7,265 | 7,800 | 8,200 |
| Challenge 2000 | 4,541 | 4,749 | 6,866 |
| Contract maintenance ³ | 81,157 | 48,393 | 136,430 |
| Contract physicians | 215 | 215 | 215 |
| Contractual data processing service ⁴ | 25,570 | 26,046 | 44,217 |
| Contractual studies | 6,676 | 7,195 | 13,168 |
| Contractual time-sharing teleprocessing services | 1,523 | 2,586 | 2,631 |
| Contractual training services ⁵ | 19,621 | 19,310 | 26,050 |
| Effective secretarial services (ESS) | 33 | | |
| Employee assistance program services | 1,485 | 1,600 | 1,600 |
| Employee involvement program services | | | |
| Federal law enforcement training | | | |
| Flight/nonflight training ² | 23,267 | 21,723 | 33,850 |
| Flight standards district office data entry support Contract | 692 | 100 | 100 |
| Flight training | 2,530 | 2,767 | 2,657 |
| General working agreement at Transportation Systems Center | 20,138 | 17,611 | 19,678 |

| Total, Other Services | 659,607 | 625,260 | 827,525 |

¹ Aeronautical charting services increase for fiscal year 2001, as requested in the budget submission, is for maintenance of digital aeronautical radar maps, and NASR Maintenance support.

² Aircraft/simulator rental and Flight/nonflight training increases from fiscal year 2000 to fiscal year 2001 are due to AVR's technical training required increases include in the budget request.

³ Contract maintenance, Leased Telecommunications and NAS Supply Support increases from fiscal year 2000 to fiscal year 2001 are due to operationally required increases included in the budget request to fund new NAS systems coming on line.

⁴ Contractual data processing service increase for fiscal year 2001, as requested in the budget submission, is for fielding a new electronic mail system to replace the agency's obsolete lotus cc:mail system and to implement a secure and standardized E-mail System.

⁵ Contract training services increase reflects the air traffic budget request to expand computer based instructions and on-the-job-training.

⁶ Information Security increase for fiscal year 2001, as requested in the budget submission, is to support the establishment and operation of a FAA information security program.

⁷ This line item includes miscellaneous items not identified by a descriptive object class code.

⁸ Operation of contract air traffic control towers decrease from fiscal year 2000 to fiscal year 2001 is due to the FAA's discontinuance of the non-beneficial contract towers program as reflected in the Budget request.

⁹ Repair, maintenance and inspection of equipment and buildings increase from fiscal year 2000 to fiscal year 2001 is required for maintenance of unstaffed facilities and infrastructure sustainment, as requested in the budget submission.

¹⁰ Traffic management system/Enhanced traffic management systems increase funds the operation and maintenance of the Airspace Redesign and Analysis Laboratory, as requested in the budget.

¹¹ Vulnerability assessments increase reflects a continuance of the need for conducting vulnerability assessments and development action plans into 2001 as shown in the budget request.

SPECIAL PAYS

Question. Please provide a description of FAA special pays, a breakdown, and line of business delineation for each of fiscal years 1999 through 2001, similar in format to that shown on pages 483-486 of last year's House hearing record.

Answer. Under FAA personnel reform, FAA has implemented changes to the premium pay rules to prohibit payment of Sunday pay and night differential unless employees actually work the time for which the premium pay is paid. The new agreement with the NATCA has changed a number of pay provisions. For controllers and field supervisors and managers in terminals and centers, the 5 percent operational differential provision of the Air Traffic Revitalization Act has been eliminated, and replaced with a corresponding increase in base pay of 4.1 percent. A Controller-in-Charge (CIC) payment has been established, which pays a premium of 10 percent of base pay for time in which controllers are assigned CIC duties. Other special pay categories include:

Overtime pay (up to 150 percent) paid for time worked in excess of eight hours in one day, 40 hours in a week, or 80 hours in a pay period. Overtime rates vary depending on position and coverage under the Fair Labor Standards Act. This is mandatory under FAA policy adopted from 5 United States Code 5542 unless employees receive compensatory time in lieu of overtime.

Sunday pay (25 percent) paid for hours worked on Sunday. This is mandatory under FAA policy adopted from 5 United States Code 5546.

Holiday pay (100 percent) paid for up to eight hours of work on a federal holiday. This is mandatory under FAA policy adopted from 5 United States Code 5546.

Night Differential (10 percent) paid for hours of work between 6 p.m. and 6 a.m. This is mandatory under FAA policy adopted from 5 United States Code 5545.

Hazardous pay (up to 25 percent) paid for all hours in a shift during which the work involves exposure to hazards, physical hardships, or working conditions of an unusual nature. Premium pay rate varies depending on the types of hazard, hardship, or working condition under a schedule issued by the Office of Personnel Management. This is mandatory under FAA policy adopted from 5 United States Code 5545.

Standby pay (up to 25 percent) paid as a percentage of an employee's basic rate of pay to employees whose positions require them to remain at their duty station in a standby status. This is discretionary under FAA policy adopted from 5 United States Code 5545 in lieu of overtime pay for standby time.

Operational responsibility differential (5 percent) paid for all hours in a pay status to flight service specialists and airway facilities technicians involved in direct operation of the air traffic system, to flight test pilots, and to certain Academy instructors.

Currency differential (1.6 percent) paid for all hours in a pay status for non-operational controllers who maintain currency in controlling traffic.

Missed meal break premium (50 percent of pay for one-half hour) paid to controllers required to work during the fourth to sixth hour of their shift without an uninterrupted 30 minute meal break.

Interim Incentive Pay Program: quarterly payments of 10 percent of an employee's basic rate of pay, paid to employees who are assigned to a facility and position covered by the Interim Incentive Pay program. Payments are intended to address chronic recruitment and retention problems at a small number of critical facilities, and will end at the time a new compensation system for covered employees is implemented. These payments are discretionary under authority granted by Public Law 104-50.

A chart follows, which shows total FAA special pay for fiscal year 1999 and estimated special pay for fiscal year 2000 and fiscal year 2001.

FEDERAL AVIATION ADMINISTRATION OPERATIONS APPROPRIATION SPECIAL PAY

[In thousands of dollars]

| | Fiscal year | | |
|--|-------------|--------|--------|
| | 1999 | 2000 | 2001 |
| Operational Resp. Differential Pay | 44,893 | 29,607 | 31,094 |

| Total Special Pay | 223,264 | 55,842 | 45 | 3,682 | 2,319 | 431 | 31 | 2,335 | 287,949 |

Note: effective in FY 2000, Airports is funded from the AIP obligation limitation.

FULL-TIME EQUIVALENT (FTE) COSTS

Question. Please update the data on agency-wide average FTE costs shown on page 495 of last year's House hearing record by providing data for fiscal years 1997 through 2001.

Answer. For the Operations Appropriation, the costs per FTE for fiscal years 1997 through 2001 are as follows.

| <i>Fiscal year</i> | <i>Amount</i> |
|---------------------|---------------|
| 1997 actual | \$80,430 |
| 1998 actual | 83,750 |
| 1999 actual | 90,410 |
| 2000 estimate | 99,110 |
| 2001 estimate | 107,200 |

Note.—The figures displayed above were calculated excluding Workers' Compensation and permanent change-of-station costs.

EMPLOYEE SEPARATIONS

Question. Please update the table on employee separations, by office, as shown on page 498 of last year's House hearing record, by providing data from fiscal year 1999 and to date in fiscal year 2000.

Answer. The table is shown below.

| Activity | 9/30/98 EOY | Gains/ (Separations) | 9/30/99 EOY | Gains/ (Separations) | 2/29/00 Current |
|--|----------------|-------------------------|----------------|-------------------------|--------------------|
| Air Traffic Services: | | | | | |
| Controllers | 17,756 | (117) | 17,639 | (143) | 17,496 |
| Field Maintenance | 8,455 | (273) | 8,182 | (238) | 7,944 |
| Other | 9,500 | (129) | 9,371 | (33) | 9,338 |
| Aviation Regulation & Certification | 6,181 | (200) | 5,981 | (162) | 5,819 |
| Civil Aviation Security | 1,160 | (24) | 1,136 | (12) | 1,124 |
| Airports | 482 | (5) | 477 | (14) | 463 |
| Research & Acquisitions | 739 | (166) | 573 | (49) | 524 |
| Administration | 1,353 | (64) | 1,289 | (33) | 1,256 |
| Staff Offices | 567 | (20) | 547 | 31 | 578 |
| Commercial Space Transportation | 29 | 2 | 31 | 1 | 32 |
| Subtotal | 46,222 | (996) | 45,226 | (652) | 44,574 |
| Facilities and Equipment | 2,161 | 538 | 2,699 | (29) | 2,670 |
| RE&D | 592 | (231) | 361 | 36 | 397 |
| Aviation Insurance | 3 | | 3 | (1) | 2 |
| Total FAA Direct | 48,978 | (689) | 48,289 | (646) | 47,643 |

Note.—Even though "Administration" doesn't exist in fiscal year 2000, the Feb 2000 employment for ABA, AHR, and ARC are being shown under that line for comparison purposes.

OPERATIONS POSITIONS

Question. Please update the table from page 503–507 of last year's House record, showing number of positions assigned to each of your offices and regions, similar in format from years past.

Answer. The table is provided below.

FAA DISTRIBUTION OF FULL TIME EQUIVALENTS (FTE'S) OPERATIONS APPROPRIATION (DIRECT)

| Office | Fiscal year | | |
|---|------------------|------------------|------------------|
| | 1999 estimate | 2000 estimate | 2001 estimate |

¹ U.S. commercial air carriers (domestic and international) and regional/commuters total scheduled passenger traffic.

² Preliminary.

LETTER OF INTENT COMMITMENTS

Question. Please provide a table outlining the letter of intent commitments (LOI) made to date by the FAA and the impact for all the relevant fiscal years from fiscal year 1997 through fiscal year 2003.

Answer. The following table depicts total LOI payment schedules by fiscal year, including fiscal year 1997 through fiscal year 2003.

AIP LETTERS OF INTENT—LOI APPROVALS BY YEAR—ALL

| Year | Discretionary | Entitlement | Total |
|------------|---------------|--------------|---------------|
| 1997 | \$150,560,983 | \$38,379,384 | \$188,940,367 |
| 1998 | 127,868,716 | 43,818,541 | 171,687,257 |
| 1999 | 113,741,601 | 48,478,257 | 162,219,858 |
| 2000 | 156,393,300 | 49,640,722 | 206,034,022 |
| 2001 | 140,691,025 | 47,277,696 | 187,968,721 |
| 2002 | 138,953,300 | 44,673,374 | 183,626,674 |
| 2003 | 102,150,300 | 40,341,528 | 142,491,828 |

WORKLOAD INDICATORS

Question. Please update the workload measures for the tables on pages 527–536 of last year's House hearing record by adding the data or the estimate for the next fiscal year, without deleting the first reporting fiscal year on each individual table.

Answer. The charts follow:

Workload Indicators

| | Fiscal Year | | | | |
|--|-------------|-------|-------|-------|-------|
| | 1997 | 1998 | 1999 | 2000 | 2001 |
| Forecast Made in March 1996: | | | | | |
| Domestic Aviation Fuel Consumption (Billions of Gallons) | 14.4 | 15.0 | 15.5 | 16.0 | 16.5 |
| Revenue Passenger Miles (Billions) | 595.7 | 628.0 | 655.0 | 682.9 | 712.4 |
| General Aviation Hours Flown (Millions) | 23.4 | 23.7 | 23.9 | 24.1 | 24.5 |
| IFR Aircraft Handled (Millions) | 42.2 | 43.4 | 44.4 | 45.3 | 46.3 |
| Total Operations at Airports with FAA and Contract Towers (Millions) | 64.5 | 65.7 | 66.7 | 67.6 | 68.6 |
| Instrument Operations Handled by FAA and Contract Towers (Millions) | 49.1 | 50.2 | 51.1 | 52.0 | 52.8 |
| Forecast Made in March 1997: | | | | | |
| Domestic Aviation Fuel Consumption (Billions of Gallons) | 14.2 | 14.7 | 15.3 | 15.9 | 16.5 |

ACCIDENT AND FATALITY RATES

Question. Please update the line graph showing the rate of accidents per 100,000 departures for part 121 air carriers shown on page 554, the table on page 556, and the table on page 558 relating to general aviation accidents from last year's House hearing record.

Answer. The table and line graphs follow.

PART 121 CASUALTIES

| | 1997 | 1998 | 1999 |
|---------------|------|------|------|
| Fatal | 8 | 1 | 12 |
| Serious | 38 | 28 | 57 |
| Minor | 128 | 87 | 158 |

Part 121 Fatal Accident Rates For U.S. Air Carriers
(Per 100,000 Flight Hours)
(1990-1999)

General Aviation Fatal Accident Rates
(Per 100,000 Flight Hours)
(1988-1999)

ADVISORY COMMITTEES

Question. Please provide information on FAA's advisory committees including the name of the committee, its purpose, and the estimated fiscal year 2001 cost as well as the actual fiscal year 2000 cost.

Answer. The following chart displays each committee, its purpose, and the estimated fiscal year 2001 cost as well as the actual year 2000 cost.

| Name | Purpose | Fiscal year | |
|--|---|-------------|---------------|
| | | 2000 cost | 2001 estimate |
| Air Traffic Procedures Advisory Committee. | Reviews air traffic control procedures and practices. | \$44,361 | \$50,026 |
| RTCA, Inc., (Utilized as an Advisory Committee). | Advances the art and science of aviation and aviation electronic systems. | 300,000 | 380,000 |
| Aviation Security Advisory Committee | Examines all areas of civil aviation security with the aim of increasing safety for the traveling public. | 89,000 | 60,000 |
| Aviation Rulemaking Advisory Committee. | Provides advice and recommendations on FAA's rulemaking activities. | 110,000 | 105,000 |
| Research, Engineering, and Development Advisory Committee. | Provides advice on aviation research needs. | 150,000 | 183,000 |
| Commercial Space Transportation Advisory Committee. | Provides advice on all aspects of U.S. commercial space transportation activities. | 41,200 | 41,850 |
| Aging Transport Systems Rulemaking Advisory Committee. | Provides advice on the aging transport airplane systems. | 50,000 | 50,000 |
| Total | 784,561 | 869,876 | |

FEDERALLY FUNDED RESEARCH AND DEVELOPMENT CENTER (FFRDC) SERVICES

Question. The Committee is aware that the FAA has expressed an intention to sole source contract for FFRDC services. Please provide the rationale for a sole source contract and a summary of the services with estimated cost for each broad category of services anticipated under a sole source contract. Concerns have been expressed that the current use of the FFRDC by the FAA is more akin to a Systems Engineering and Technical Assistance (SETA) contract than an actual independent expert capability. What is the FAA position as relates to the need for FFRDC services as opposed to SETA capabilities?

Answer. In September 1990, as the result of a Memorandum of Agreement with the MITRE Corporation, the FAA sponsored MITRE to operate a FFRDC. The Sponsoring Agreement was renewed on April 9, 1996 effective for the five-year period ending April 8, 2001. MITRE operates the FAA's FFRDC as an identifiable, separate operating unit.

The current eight-year research and development contract with MITRE Corporation for the operation of the FFRDC was awarded in December 1992 and expires on November 30, 2000. Prior to extending the contract or agreement with an FFRDC, acquisition directives require that the sponsoring agency conduct a comprehensive review of the use and continued need for the FFRDC. Based on the results of the recently completed comprehensive review, it has been reaffirmed that a strong need exists for continued support by the Center for Advanced Aviation System Development (CAASD). CAASD performs studies, analysis and concept formulation for continued advanced aviation research for the Capital Investment Plan (CIP) and National Airspace System (NAS). Work assignments are approved by the FFRDC Executive Board (FEB) and are contained in annual Product Based Work Plans (PBWPs). Support for the following FAA programs is included:

- Free Flight Phase 1
- Communications Navigation Surveillance Operational Capability
- Navigation Architecture
- NAS Architecture Implementation
- Near Term Procedural Enhancements
- Airspace Design and Analysis
- User Performance Planning and Research

- NAS Integration
- NAS Infrastructure Management

Only work that is appropriate to be performed by a research and development FFRDC is authorized and approved for incorporation in the annual CAASD work plan. Support that is appropriately performed by a technical assistance contractor or any other contractor is not approved for performance by CAASD. The fiscal year 2000 PBWP is currently under development.

A market analysis was conducted in accordance with the requirements of the FAA's Acquisition Management System (AMS) to determine the availability of the needed research and analysis services. Evaluation criteria included demonstrated technical capability in all of the following areas: operations research, computer science, electrical and mechanical engineering; demonstrated experience in highly specialized simulation and computer modeling techniques and facilities to model improvements across a broad spectrum of NAS systems and operations; demonstrated capability to provide the main technical linkage between the operational and the development requirements of FAA organizations; demonstrated capability to support the FAA in rapidly and effectively formulating new programs to meet emerging operational needs; demonstrated capability to provide rapid response to safety issues affecting the aviation community, and Congressional interests and mandates; prior experience in support services for the FAA communications system, including current programs that require digital technology applications; demonstrated capability to provide services related to the major operational functions of aircraft separation and flight planning, and the problem of ATC system capacity; and background knowledge in behavioral science and/or human performance as related to the major NAS areas. These capabilities are required of any source selected for operation of the FFRDC, because all too often, multiple capabilities are needed quickly to meet program needs.

As a result of this market analysis, it was concluded that MITRE is the only responsible source that can provide a comprehensive and synergistic approach in all required areas. MITRE has the demonstrated capability to meet the interrelated system requirements in the functional areas and furnish the experienced professional staff needed to complete ongoing CIP and NAS programs.

The FAA has taken steps to promote the use of subcontractors, where appropriate, in specialized technical areas that are in support of the major task assignments. The FAA has also taken action to award other major contracts in support of the NAS on a full and open competitive basis.

These competitively awarded contracts include the NAS Implementation Support Contract (NISC), Technical Support Services Contract, the System Engineering Technical Assistance Contract, various Communications, Navigation and Surveillance Technical Assistance Contracts, and the Air Traffic Systems Development Technical Assistance Contract. The level of services called for in these contracts, however, do not entail anywhere near the complexity of needed skills and knowledge provided by the CAASD in requisite functional areas of expertise.

RTCA CHARTER

Question. Please provide a summary of the RTCA charter, the organizational and management structure, and a current list of members.

Answer. FAA Order (1110.77M) constitutes the charter for the utilization of RTCA, Inc. as an advisory committee. It describes the objectives and scope of activities (to seek solutions to problems involving the application of technology to aeronautical operations that impact the future air traffic management system); the organization (comprised of a general membership, a chairman, a board of directors, a Program Management Committee (PMC), a president and a vice president); administration (FAA key officials are members of the RTCA policy board, the PMC oversees the establishment and workings of the special committees, meetings are scheduled, held, and conducted in accordance with provisions of the Federal Advisory Committee Act). The charter also addresses public participation and availability of records.

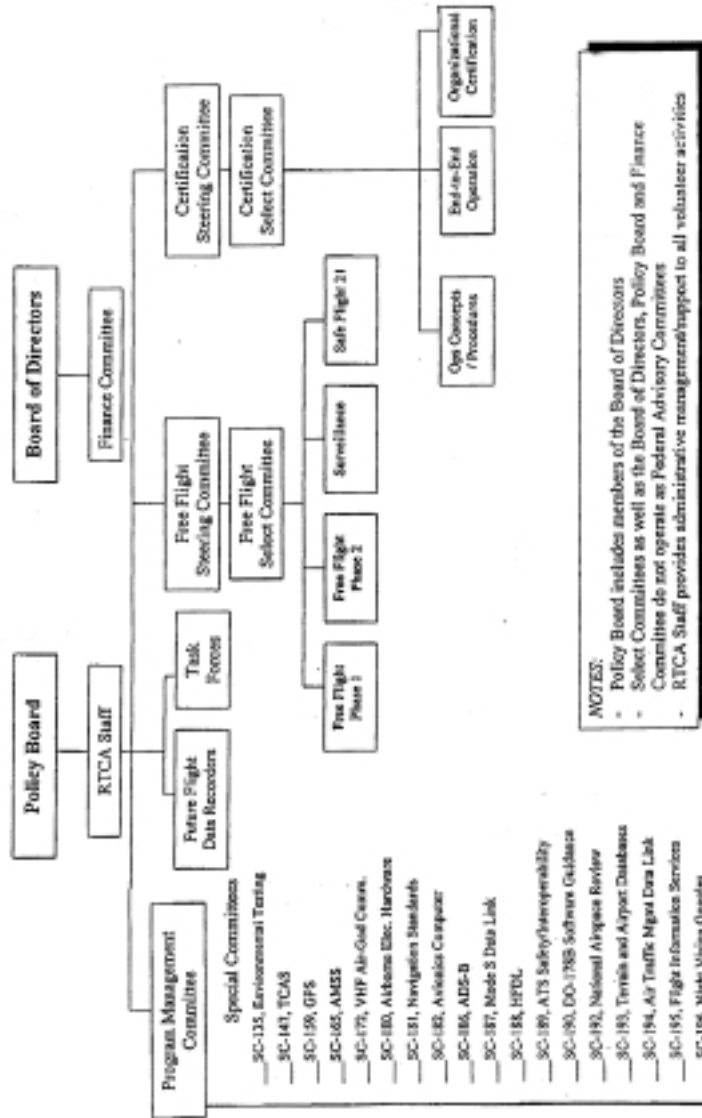

RTCA, Inc. also has its own charter as a not-for-profit corporation. Within its charter, the stated objectives address the scientific and educational purpose of the corporation, which is to advance the art and science of aviation and aviation electronic systems for the benefit of the public. The RTCA specific objective list includes those also contained in the FAA Order; they are:

- “coalesce aviation system user and provider technical requirements in a manner that helps government and industry meet their mutual objectives and responsibilities;

- analyze and recommend solutions to the system technical issues that aviation faces as it continues to pursue increased safety, system capacity and efficiency;
- develop consensus on the application of pertinent technology to fulfill user and provider requirements, including development of minimum operational performance standards for electronic systems and equipment that support aviation;
- assist in developing the appropriate technical material upon which positions for the International Civil Aviation Organization, the International Telecommunications Union, and other appropriate international organizations can be based; as well as
- conduct the Corporation’s affairs in a manner such that its integrity remains beyond challenge.”

The RTCA management and organizational structure is depicted in the following chart. It shows the relationship between the Policy Board, the Program Management Committee and Special Committee activities, as well as the Steering and Select Committee activities.

The current list of members also follows. It reflects 150 industry member organizations, plus 58 international associate members, plus five academic associate members, as well as the eight government members—for a total of 221. Government members include: Federal Aviation Administration, DOT Volpe National Transportation Systems Center, National Aeronautics and Space Administration, National Center for Atmospheric Research, United States Air Force, United States Army, Department of Commerce, and United States Navy.

The Control Number represents the total number of members at the above given date. This list and number is updated periodically and is current as of the date indicated.

RTCA ACTIVITIES

Question. What activities is the RTCA anticipated to conduct in fiscal year 2001?
Answer. FAA anticipates RTCA involvement in the following activities in fiscal year 2001 Special Committees (SC):

- SC-135—Environmental Testing
 - SC-147—Traffic Alert & Collision Avoidance System
 - SC-159—Global Positioning System
 - SC-165—Aeronautical Mobile Satellite Service
 - SC-172—VHF Air-Ground Communication
 - SC-181—Navigation Standards
 - SC-186—Automatic Dependent Surveillance-Broadcast
 - SC-188—High Frequency Data Link
 - SC-189—Air Traffic Services Safety and Interoperability Requirements
 - SC-190—Application Guidelines for RTCA/DO-178B (Software)
 - SC-192—National Airspace Review Planning and Analysis
 - SC-193—Terrain and Airport Databases
 - SC-194—Air Traffic Management Data Link Implementation
 - SC-195—Flight Information Services Communications
 - SC-196—Night Vision Goggles
- Steering/Select Committees:
 —Free Flight Steering Committee and Free Flight Select Committee
 —Certification Steering Committee and Certification Select Committee
 Policy Board Committees: Future Flight Data Recorders

RTCA ACTIVITIES SELECTION PROCESS

Question. How are RTCA activities selected? How are group members selected? What types of Chinese wall arrangements are created to make sure that the roles of manager, facilitator, and contractor do not become blurred?

Answer. The determination of activities is the decision of the FAA Administrator. The following process is used to select members for the various activities: Special Committee members are volunteers who have an interest in the subject being addressed by the committee. Members can come from across the full spectrum of the aviation community—government and industry, users and suppliers, labor and management, airports, service providers—and often include people from the international as well as the domestic segments of the global aviation community. The public and the aviation community are notified that a new Special Committee is being formed via an announcement in the Federal Register. It is important to note that because the committees are open and inclusive, anyone may participate at any time without an invitation. If, after the committee is organized, RTCA or the committee determines that the perspectives of an individual or organization not currently participating in the Special Committee are relevant to the committee's deliberations, RTCA will extend an invitation to participate in the committee's deliberations. All subsequent plenary meetings of the committee are announced in the Fed-

eral Register. (Membership in working groups under Special Committees is generally drawn from the Special Committee membership, although others with a relevant perspective are encouraged to participate in working group activities when appropriate and needed. The results of working group activities are provided to the Special Committee for consideration by the full committee when the committee meets in plenary session.)

The membership process and criteria for an RTCA Task Force and subordinate working groups parallels that of Special Committees.

Membership on the Government/Industry Free Flight Steering Committee is by appointment. FAA and the RTCA Policy Board identify potential Steering Committee members based on their organizational responsibilities, professional experience, interest in Free Flight issues being considered, and their group "problem solving" skills. If the desired individual is interested in voluntarily serving on the committee and their parent organization concurs with their appointment, they are appointed to Steering Committee membership. Steering Committee membership is dominated by operationally oriented organization representatives given the safety, capacity, and efficiency nature of the committee's mission. Some rotation occurs on an annual basis. The process is documented and is available for review at RTCA. The Free Flight Steering Committee only meets in plenary session. All meetings are announced in the Federal Register. All meetings are open to the public and the public is afforded an opportunity to express its views throughout the meetings.

Membership on the Free Flight Select Committee (the working arm of the Steering Committee) is by appointment. The process and criteria of identifying Select Committee members are similar to those used in identifying Steering Committee members. Select Committee tasking flows from the Steering Committee. Select Committee meetings are not open to the public. Select Committee working group membership is usually drawn from Select Committee membership; however, as in the case for Special Committee working groups, other people with relevant perspectives and professional experience can be and are invited to participate in working group deliberations. The process is documented and is available for review at RTCA.

Membership for the Certification Steering and Select Committees follows the process described for the Free Flight committees.

There are no arrangements to segregate the roles of participants in RTCA activities. The fundamental premises upon which the RTCA consensus-based process is based are as follows:

Acknowledge the inevitability of "conflict of interest" among the disparate aviation community groups/individuals; for example, government and industry, users and suppliers, labor and management, commercial and general aviation, airports, and service suppliers.

Fully consider the diverse interests of these groups/individuals and use the RTCA open, inclusive, consensus-based process to develop recommendations that remove the parochial views of any one group. The resulting recommended course of action serves the best interests of the aviation community and the public.

CONTROLLER PAY AGREEMENT

Question. What is the current estimate of the NATCA controller pay agreement cost? What percentage of the total dollar value of this agreement does the agency calculate will be offset through productivity gains and other quantifiable savings resulting from the agreement itself? What is the total aggregate savings resulting from the agreement to date—what is the cost of the agreement to date?

Answer. During the first part of fiscal year 1999, the FAA and NATCA worked to finalize the rules associated with the various productivity articles of the contract and the rules for the new pay system. A metrics team was established to identify and track measurable results of implementing the contract. Early indications from this effort are showing some positive trends, and the FAA will continue to refine and analyze this data to provide additional information to Congress on the results of this contract.

There are many indirect results of the contract with NATCA, including an improved and more productive working relationship between FAA management and NATCA in modernizing the aviation system. An example of this partnership is the manner in which Display System Replacement (DSR) has been fielded throughout the country, resulting in FAA completing many facilities well ahead of schedule. Another example is the STARS program; FAA has fielded the first segment at El Paso and Syracuse and is working on the advanced configurations of that program.

STAFFING STANDARD

Question. Please provide a table that lists for fiscal years 1995 through 2001 the staffing standard generated by the FAA systematically-derived requirement figures, the actual number of controllers, the differences, the average compensation per controller, and the aggregate cost differential (negative or positive) of the actual staffing level compared to the staffing standard multiplied by the average compensation in each given year.

Answer. The following table provides the information requested.

| Fiscal year | Staffing standard (SS) | Actual on board (AOB) | AOB-SS | Average compensation per controller | Aggregate cost differential (dollars in thousands) |
|-------------|------------------------|-----------------------|--------|-------------------------------------|--|
| 1995 | 14,232 | 14,614 | 382 | \$81,021 | \$30,949.9 |
| 1996 | 14,691 | 14,360 | - 331 | 83,728 | - 27,717.1 |
| 1997 | 14,261 | 14,588 | 327 | 86,240 | 28,200.6 |
| 1998 | 14,207 | 14,966 | 759 | 92,856 | 70,326.3 |
| 1999 | 14,282 | 14,902 | 620 | 104,747 | 64,943.3 |
| 2000 | 14,782 | ¹ 15,000 | 218 | 120,826 | 26,340.1 |
| 2001 | 15,210 | ¹ 15,000 | - 204 | 124,572 | - 25,412.7 |

¹ Estimated.

BACKFILL OVERTIME

Question. Please provide backfill overtime data from 1995 through 2001.

Answer. The backfill overtime usage for fiscal years 1995 through 1998 averaged \$3-4,000,000 per year.

In fiscal year 1999, the backfill overtime significantly increased to \$16,119,040 due to the DSR in eight air route traffic control centers.

It is projected that there will be \$17,715,868 spent in backfill overtime to support the transition of the remaining ten air route traffic control centers and the installation of the Center TRACON Automation System (CTAS) at two sites in fiscal year 2000.

The current projections for fiscal year 2001 in backfill overtime are \$24,000,000. This figure covers the costs for developmental and training activities associated with bringing new systems on-line and operational in facilities, such as the Standard Terminal Automation Replacement System (STARS) in terminal facilities, and the Automated Radar Terminal System Color Displays (ACD) that will be installed in fiscal year 2001 at terminal facilities that are not scheduled to receive STARS. The current schedule for CTAS includes installation at six sites, which requires instructor training, training of the controllers, transition in the en route and terminal facilities, and developmental activities for future site installations.

Additionally, there are several large TRACON's scheduled for building and occupancy in fiscal year 2001. These facilities include Atlanta, Northern California, and Potomac. These facilities will be consolidating personnel and cross-training them in the different areas to ensure that safety of the air traffic system is not compromised. All of the aforementioned programs will require training and transition time before the systems can become operational in the air traffic environment.

CONTROLLER WORKFORCE

Question. Please update the table from page 571 of last year's House hearing record on Controller Work Force (CWF) end of year employment for fiscal years 1996 through 2001.

Answer. The following table provides the information requested. The table shows the traffic management coordinators (TMC) and traffic management supervisors (TMS) as a separate entry. The TMC/TMS are part of the controller work force.

| | Fiscal year | | | | |
|--------------------------------------|-------------|-------|-------|---------------|---------------|
| | 1997 | 1998 | 1999 | 2000 estimate | 2001 estimate |
| Center: | | | | | |
| Controllers | 6,425 | 6,639 | 6,607 | 6,635 | 6,635 |
| Ops Supervisors (1st Line Sup) | 825 | 812 | 790 | 755 | 755 |

| | Fiscal year | | | | |
|--------------------------------------|-------------|--------|--------|------------------|------------------|
| | 1997 | 1998 | 1999 | 2000 estimate | 2001 estimate |
| TMC/TMS | 558 | 526 | 567 | 553 | 553 |
| Center Controller Work Force | 7,808 | 7,977 | 7,964 | 7,943 | 7,943 |
| Towers: | | | | | |
| Controllers | 8,163 | 8,327 | 8,295 | 8,330 | 8,330 |
| Ops Supervisors (1st Line Sup) | 1,261 | 1,276 | 1,177 | 1,129 | 1,129 |
| TMC/TMS | 156 | 176 | 203 | 197 | 197 |
| Tower Controller Work Force | 9,580 | 9,779 | 9,675 | 9,656 | 9,656 |
| Centers/Towers Combined: | | | | | |
| Controllers | 14,588 | 14,966 | 14,902 | 14,965 | 14,965 |
| Ops Supervisors (1st Line Sup) | 2,086 | 2,088 | 1,967 | 1,884 | 1,884 |
| TMC/TMS | 714 | 702 | 770 | 750 | 750 |
| Total Controller Work Force | 17,388 | 17,756 | 17,639 | 17,599 | 17,599 |

UNION TIME

Question. Please provide the estimated time granted by FAA managers for union activities for fiscal years 1995 through 2001.

Answer. Listed below are the estimated hours granted by FAA managers for union activities for fiscal years 1995 through 2001.

| <i>Fiscal year</i> | <i>Hours (estimate)</i> |
|--------------------|-------------------------|
| 1995 | 302,566 |
| 1996 | 302,566 |
| 1997 | 302,566 |
| 1998 | 394,351 |
| 1999 | 489,956 |
| 2000 | 457,339 |
| 2001 | 457,339 |

CONTRACT TOWERS

Question. How much funding is included in the fiscal year 2001 budget request to run contract towers. How much was included in the fiscal year 2000 budget request? How much is anticipated being spent on contract towers in fiscal year 2000?

Answer. The fiscal year 2001 includes \$55,600,000 for the contract tower program. The fiscal year 2000 budget request included \$55,600,000 for the contract tower program. We anticipate spending the full \$55,600,000 during fiscal year 2000 on contract towers.

OPERATIONAL ERRORS

Question. Please update the table on page 583 of last year's House hearing record relating to operational errors at contract towers and FAA facilities from fiscal year 1993 through fiscal 2000 (if partial year data is available). Do you have confidence in your operational error data?

Answer. The following tables provide the information requested.

OPERATIONAL ERRORS FAA— LEVEL I FACILITIES VS. CONTRACT TOWERS

| | Fiscal year | | | | | | |
|----------------------|-------------|------|------|------|------|------|------|
| | 1993 | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 |
| FAA Facilities | 4 | 5 | 2 | 4 | 2 | 6 | 12 |

OPERATIONAL ERRORS FAA— LEVEL I FACILITIES VS. CONTRACT TOWERS—Continued

| | Fiscal year | | | | | | |
|-----------------------|-------------|-------|------|------|------|------|------|
| | 1993 | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 |
| Contract Towers | 2 | | 2 | 3 | 10 | 6 | 7 |

¹The last 22 FAA Level 1 towers were converted to contract towers on October 1, 1999. There were 163 contract towers at the end of fiscal year 1999.

OPERATIONAL ERROR RATE—FAA LEVEL I FACILITIES VS. CONTRACT TOWERS—CENTER

[Errors per 100,000 Operations]

| | Fiscal year | | | | | | |
|-----------------------|-------------|-------|------|------|------|------|------|
| | 1993 | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 |
| FAA Facilities | 0.05 | 0.03 | 0.02 | 0.09 | 0.10 | 0.05 | 0.11 |
| Contract Towers | 0.12 | | 0.04 | 0.04 | 0.08 | 0.05 | 0.05 |

Note.—Fiscal year 2000 numbers are not available. At the beginning of fiscal year 2000, all FAA Level I towers were converted to contract towers. The data is validated for accuracy by the Air Traffic Investigations Office and entered into a database, which is retained by the FAA.

Question. Are some facilities more a problem with respect to operational errors than others? Which ones?

Answer. There is no defined trend or problem facilities in the Federal contract tower program. Operational errors continue to be a very rare occurrence. The FAA is working to further reduce this already low figure.

Question. Please update the table on pages 594–598 of last year's House hearing recording relating to en route operational errors.

Answer. The following table breaks down the total number of en route operational errors for the past five fiscal years.

| Facility | Location | Fiscal year | | | | |
|------------------------------|---|-------------|------|-------|-------|-------|
| | | 1995 | 1996 | 1997 | 1998 | 1999 |
| En route operational errors: | | | | | | |
| Albuquerque (ZAB) | 8000 Louisiana Blvd., NE Room 1014 Albuquerque, NM 87109. | 20 | 21 | 13 | 7 | 22 |
| Anchorage (ZAN) | 5400 Davis Highway Anchorage, AL 99506 | 3 | 2 | 3 | 4 | 9 |
| Atlanta (ZTL) | 299 Woolsey Road Hampton, GA 30228 | 51 | 36 | 38 | 41 | 52 |

CONTROLLER TRAINING

Question. Please provide estimated obligations under the current controller training contract for each of the fiscal years 1996–2001.

Answer. The following is a breakdown of funding to support the air traffic controller training program.

[In thousands of dollars]

| Activity | Fiscal year | | | | | |
|---|-------------|----------|----------|----------|-------------------|----------|
| | 1996 | 1997 | 1998 | 1999 | 2000 ¹ | 2001 |
| Air Traffic Instructional Services Contract | 9,572.2 | 11,920.0 | 13,893.5 | 15,494.7 | 16,700.0 | 16,700.0 |

¹ Includes the Administration's fiscal year 2000 Supplemental request.

CONTROLLER WORK FORCE

Question. Please provide a table consisting of the controller work force divided into total air traffic activity by year from fiscal year 1992–2001. Please comment on the trend in this controller productivity measure. Has the FAA developed any other metrics to measure controller productivity. Please provide a note estimating the number of controller staffing years that are incurred by virtue of backfill overtime.

Answer. The following table provides the information requested:

| Year | ATCS | Total operations | Operations per ATCS |
|------------|--------|------------------|---------------------|
| 1992 | 15,147 | 143,590,432 | 9,480 |
| 1993 | 14,970 | 143,226,923 | 9,567 |
| 1994 | 14,953 | 145,871,002 | 9,755 |
| 1995 | 14,614 | 145,171,595 | 9,934 |
| 1996 | 14,360 | 141,457,797 | 9,851 |
| 1997 | 14,588 | 142,759,683 | 9,786 |
| 1998 | 14,966 | 145,456,514 | 9,719 |
| 1999 | 14,902 | 150,821,483 | 10,121 |
| 2000 | 15,000 | 152,105,300 | 10,140 |
| 2001 | 15,000 | 155,524,300 | 10,368 |

The FAA does not believe that a good set of productivity metrics exists today. The FAA and NATCA are working together to develop an accurate set of performance indicators for the air traffic control system, including productivity indicators. The FAA expects the report to be finished and delivered by the end of May 2000.

Note.—The estimated numbers of controller staffing years that are incurred by virtue of backfill overtime are:

| Fiscal year | |
|-------------|-----|
| 1998 | 44 |
| 1999 | 126 |
| 2000 | 130 |

CONTROLLER PRODUCTIVITY

Question. What tools are anticipated to be available in the next fiscal year that will enhance controller productivity by virtue of increasing the number of operations handled by the average controller or by obviating the need for en route or other operations.

Answer. The following are tools that are anticipated to be available in the next fiscal year that will enhance controller productivity:

(1) Traffic Management Advisor (TMA), which provides the en route controller with more accurate time-based metering. TMA also allows for better, more effective coordination between the en route center and the approach control in determining airport acceptance rates.

(2) Passive Final Approach Spacing Tool (PFAST) provides a runway number and a sequence number to the terminal controller on the Automated Radar Terminal System (ARTS) data block. It will assist the controller in determining appropriate runway and sequence number to aircraft entering the terminal environment. PFAST alleviates some of the cognitive activity associated with manual determination of aircraft sequence.

(3) User Request Evaluation Tool, (URET) is the prototype for the Free Flight Phase 1 component, User Request Evaluation Tool Core Capability Limited Deployment (URET CCLD). URET provides alert notification of potential aircraft conflicts, enabling rapid analysis of and response to aircraft requests. It also supports the controller by providing electronic flight data management capabilities and supporting some reduction in verbal coordination activities. Prototyping activities will continue through fiscal year 2001, with delivery of the Free Flight component URET CCLD at the key site Kansas City Air Route Traffic Control Center in September 2001.

DEPARTURE AND ARRIVAL PAIRS

Question. What are the average number of controller operations per departure and arrival pair by year from fiscal year 1992 through fiscal year 2001.

Answer. The FAA does not maintain data on “departure and arrival pairs.” To develop a data base of that nature would be labor intensive. However, the Agency does maintain a statistic called total operations. It is made up of Instrument Flight Recorder aircraft handled in centers, terminal instrument operations, and airport tower operations. It does not include statistics from contract towers. Using this statistic and the addition of the number of center and terminal air traffic controllers (ATCS) database, the FAA has calculated the number of total operations per ATCS for the fiscal years 1992 through fiscal year 2001. The figures for fiscal year 2000 and fiscal year 2001 are estimates based on forecasts.

The following table provides the information requested.

| Year | ATCS | Total operations | Operations per ATCS |
|------------|--------|------------------|---------------------|
| 1992 | 15,147 | 143,590,432 | 9,480 |
| 1994 | 14,953 | 145,871,002 | 9,755 |
| 1995 | 14,614 | 145,171,595 | 9,934 |
| 1996 | 14,360 | 141,457,797 | 9,851 |
| 1997 | 14,588 | 142,759,683 | 9,786 |
| 1998 | 14,966 | 145,456,514 | 9,719 |
| 1999 | 14,902 | 150,821,483 | 10,121 |
| 2000 | 15,000 | 152,105,300 | 10,140 |
| 2001 | 15,000 | 155,524,300 | 10,368 |

AIRPORT MOVEMENT AREA SAFETY SYSTEM (AMASS)

Question. Please provide the anticipated commissioning dates for the AMASS system deployments.

Answer. The following table reflects AMASS delivery dates and first and last operational readiness demonstration (ORD) dates. Following completion of the In-service review decision scheduled for 01/01, ORDs between San Francisco and Andrews Air Force Base will be in an order prioritized by Air Traffic and are expected to occur at a rate of approximately three every eight weeks. Commissionings are expected to occur, depending on site-specific requirements, two to three months after a site's ORD.

| City | Delivery date | ORD date |
|-----------------|---------------|----------|
| Detroit | 8/29/97 | |
| St. Louis | 1/16/98 | |

| City | Delivery date | ORD date |
|----------------------------------|------------------|------------------|
| FAA Technical Center | 3/8/99 | |
| San Francisco | 6/15/99 | 6/01 |
| FAA Academy | 6/22/99 | |
| Chicago | 8/5/99 | |
| Boston | 8/16/99 | |
| Los Angeles #1 | 8/25/99 | |
| Los Angeles #2 | 9/2/99 | |
| Salt Lake City | 9/10/99 | |
| Cleveland | 9/16/99 | |
| Seattle | 10/8/99 | |
| Newark | 10/12/99 | |
| Miami | 11/2/99 | |
| Minneapolis | 11/5/99 | |
| New York—Kennedy | 12/10/99 | |
| Cincinnati | 1/10/00 | |
| Kansas City | 1/12/00 | |
| Portland | 1/19/00 | |
| Pittsburgh | 2/2/00 | |
| Memphis | 2/10/00 | |
| Baltimore | 3/6/00 | |
| Philadelphia | 3/6/00 | |
| New Orleans | 3/16/00 | |
| Louisville | 3/00 | |
| Las Vegas | 4/00 | |
| Denver #1 | 4/00 | |
| San Diego | 4/00 | |
| Dallas/Ft. Worth #1 | 5/00 | |
| Dallas/Ft. Worth #2 | 5/00 | |
| Anchorage | 5/00 | |
| Denver #2 | 5/00 | |
| Charlotte | 6/00 | |
| New York—La Guardia | 6/00 | |
| Dulles | 6/00 | |
| La Guardia NY | 6/00 | |
| Houston #1 | 6/00 | |
| Houston #2 | 7/00 | |
| Reagan Washington National | ¹ TBD | ¹ TBD |
| Andrews AFB MD | 1/01 | 9/02 |

¹ Due to multipath on runways, DCA did not commission its ASDE-3 9/99. To mitigate the multipath, the ASDE-3 antenna must be relocated. Funds have not yet been identified for this task. Commissioning date cannot be determined until funds have been allocated. This impacts the AMASS commissioning.

LEASED TELECOMMUNICATIONS

Question. Please provide the actual obligations for leased telecommunications for the past five fiscal years and the estimates for fiscal year 2000 and 2001.

Answer. The following represent the actual obligation for leased telecommunications for fiscal year 1995 to fiscal year 1999 and the estimates for fiscal years 2000 and 2001:

[In thousands of dollars]

| Fiscal year | |
|-------------|-------------|
| 1995 | 312,477,400 |
| 1996 | 314,776,900 |
| 1997 | 314,981,600 |
| 1998 | 307,835,300 |
| 1999 | 273,332,200 |
| 2000 | 277,716,000 |
| 2001 | 355,819,000 |

IMPLEMENTATION OF OVERFLIGHT FEES

Question. Please reprint your reply to last year's question on the implementation of overflight fees (page 717 of the House hearing record) and respond to that question for the current budget cycle. In light of that response, what gives the FAA any confidence that the new user fees anticipated in the President's budget request will be realized as projected in the President's request, particularly in light of the deferral of work on the cost accounting system?

Excerpt from page 717 of last year's House hearings:

"Mr. WOLF. What is your schedule for implementing the currently authorized overflight user fee, and what is your estimate of collections for fiscal year 2000?

[The information follows:]

Our schedule has been driven by the overall schedule for development of the Cost Accounting System. The necessary cost accounting data should be available within the next two months, and our goal is to have the overflight fees in effect by no later than October 1, 1999. We cannot give a precise estimate of collections at this point, pending availability of the cost accounting information upon which the fees will be based. We do know, however, that the fees and subsequent collections will be lower than those estimated under the previous rule."

Answer. With respect to the current budget cycle, we expect to publish a new overflight fee document in the Federal Register in the spring of 2000. The President's budget for fiscal year 2001 assumes collections of \$5,100,000 in fiscal year 2000 and \$22,100,000 in fiscal year 2001.

The deferral of certain work on the cost accounting system has no adverse effect on the FAA's ability to realize \$965,000,000 in the new user fee revenues assumed in the President's budget. Those revenues would come from new cost-based fees for air traffic control services. The FAA already has good cost information of over \$2,000,000,000 for en route and oceanic services, and would build upon this information to derive the new fees proposed in the President's budget.

OFFICE OF THE CHIEF COUNSEL

Question. Please provide detail as to how the increase requested for the Office of the Chief Counsel is to be used? What level of contract legal support is currently being utilized by the FAA?

Answer. The Office of the Chief Counsel will primarily use the increase to fund staff for support efforts in personnel and rulemaking matters. AIR 21 restored Merit System Protection Board (MSPB) and Office of Special Counsel (OSC) jurisdiction over personnel actions taken by FAA supervisors and managers. FAA employees are allowed to appeal adverse actions to MSPB. Actions appealable to the MSPB/OSC involve serious personnel actions.

The Safer Skies agenda goals and initiatives have identified safety interventions that will require additional advisory circulars, rules, guidance and policy letters. Each of these will require legal review. Backlogs in domestic Airworthiness Directives (AD's) and international AD's Mandatory Continued Airworthiness Instructions are continuing and can be expected to grow with the increased workload. Additional legal expertise in the regional counsel office will help keep backlogs to a minimum.

The FAA is not currently utilizing any contracted legal support; the existing legal staff consists of FAA employees.

NEW PROGRAMS REQUESTED IN FISCAL YEAR 2001

Question. Please provide a list, with corresponding fiscal year 2001 funding, of all new programs, projects, or activities in the fiscal year 2001 F&E budget request not requested in fiscal year 2000.

Answer. Listed below are the fiscal year 2001 programs not requested in fiscal year 2000.

| | |
|--|--------------|
| Free Flight Phase 2 | \$50,000,000 |
| Terminal Applied Engineering | 6,700,000 |
| Mode-S | 1,974,000 |
| Low Cost Airport Surface Detection Equipment | 8,400,000 |
| Weather Message Switching Center Replacement | 2,500,000 |
| ILS-Replace GRN-27 | 1,000,000 |
| Gulf of Mexico Program | 1,900,000 |
| Distance Learning | 2,200,000 |

NAS HANDOFF

Question. What level of NAS handoff funding was requested in Operations for fiscal year 2000 and what is currently anticipated to be funded out of the Operations account? How much NAS handoff funding is requested for fiscal year 2001 in Operations? In F&E?

Answer. The FAA's increase for NAS handoff in fiscal year 2000 was \$85,500,000. The table, below, shows the disposition of the appropriated funds.

Approximately 81 percent of the funds appropriated for NAS Handoff had to be reprogrammed to cover operational shortfalls within the affected lines of business. The NAS Handoff costs were either funded by the F&E appropriation for another year, or were funded at greatly reduced levels within the operations base funding for existing NAS systems.

FISCAL YEAR 2000 PRESIDENT'S REQUEST—NAS HANDOFF

| Budget activity | Fiscal year 2000 request | Congressional action | Appropriation | Reprogram | Net program |
|------------------------------------|--------------------------|----------------------|--------------------|--------------------|-------------------|
| Regulation and Certification | \$3,730,000 | | \$3,730,000 | -\$3,730,000 | |
| Civil Aviation Security | 1,800,000 | -\$713,000 | 1,087,000 | -1,087,000 | |
| Air Traffic Services | 79,970,000 | -15,050,000 | 64,920,000 | -51,958,000 | \$12,962,000 |
| Total FAA | 85,500,000 | -15,763,000 | -69,737,000 | -56,775,000 | 12,962,000 |

The fiscal year 2001 request for NAS handoff is \$135,426,600, all in the Operations appropriation. The distribution by line of business is: \$2,900,000 for Regulation and Certification; \$3,388,000 for Civil Aviation Security; and \$129,138,600 for Air Traffic Services.

PERCENTAGE OF F&E BUDGET REQUEST

Question. What percent of the F&E budget request for fiscal years 1999 through 2001 was for FAA salaries by year? What percentage for direct research, development, or procurement of items to sustain or modernize the NAS? What percentage is for overhead?

Answer. The percentages are listed below:

| | Fiscal year | | |
|-----------------------|-------------|------|------|
| | 1999 | 2000 | 2001 |
| Salaries | 12 | 14 | 13 |
| Direct research | 1 | 1 | 1 |
| Development | 1 | 2 | 3 |
| Procurement | 86 | 83 | 83 |

Overhead charges do not apply to the F&E appropriation.

APPROVED COST AND SCHEDULE BASELINES

Question. Please provide a listing of each baselined F&E program providing a notation as to when the baseline was established and whether such baseline is either the first or second baseline for the program. In addition, please display the cost baseline, the schedule baseline, and the current status of the program against such baseline.

Answer. The baselined listing follows:

[Dollars in millions]

| Program name baseline date | Total F&E cost baseline | Schedule baseline (last ORD) | Current Status |
|--|--------------------------|------------------------------|--|
| 14 programs initiated after October 1996: | | | |
| Host and Oceanic Computer System Replacement (HOCSR) May 1998 .. | \$424.1 | 9/99 (Phase I) | Phase I completed. |
| FSAS Operational and Supportability System (OASIS) December 1996 ... | Initial: 174.7 | Initial: 8/01 | Baseline under review. |
| | Re-baseline: 222.2 | Re-baseline: 9/02 | |
| | Re-baseline: 249.5 | Re-baseline: 5/05 | |
| Safety Performance and Analysis System (SPAS) August 1997 | 32.3 | 9/03 | No change. |
| Free Flight Phase One April 1999 | 628.8 | 12/02 | No change. |
| Controller Pilot Data Link Communications-Build 1/1A October 1998 | 159.9 | 12/05 | No change. |
| Next Generation Air/Ground Communication System May 1998 | 407.6 | 9/08 | The program is currently being restructured due to budget deferrals. |
| FAA Telecommunications Infrastructure July 1999 | 205.7 | 12/08 | No change. |
| Systems Engineering and Technical Assistance Contract (SETA II) June 1999. | | | Contract to be awarded in June 2000. |
| Facility Security Risk Management February 1999 | 148.3 | 9/05 | No change. |
| NAS Infrastructure Management System—Phase I March 1997 | Initial: 100.8 | 9/00 | The FAA re-baselined the program and has submitted a basis of determination to Congress. |
| | Re-baseline: 60.3 | | |
| ACQUIRE December 1996 | 5.6 | 9/98 | Completed 12/98. |
| Local Area Augmentation System January 19998 | Initial: 536.1 | Initial: 12/06 | Baseline under review. |
| | Re-baseline: 718.5 | Re-baseline: 10/11 | |
| Air Traffic Control Beacon Interrogator Replacement August 1997 | 282.9 | 9/04 | Baseline under review. |
| NAS Implementation Support Contract October 1996 | 1337.0 | 9/07 | No change. |
| 30 programs initiated prior to October 1996: | | | |
| Display System Replacement May 1996 | 1,055.3 | 5/00 | The program is reporting a \$48.0M under-run to its cost baseline. |
| Common ARTS (ARTS IIA, ARTS IIIE) March 1997 | 86.1 (ARTS IIIE) | 1/99 (ARTS IIIE) | The last ARTS IIIE ORD was completed in 6/99. The last ARTS IIE ORD is scheduled to be complete in 5/00. |
| | 109.8 (ARTS IIE) | 4/00 (ARTS IIE) | |

| | | | |
|--|-------------------------|-----------------------|---|
| Standard Terminal Automation Replacement System January 1996 | 1,076.1 (ceiling) | 10/05 (ceiling) | A new cost/schedule baseline was presented to the Joint Resources Council in 10/99. The current estimate for the cost baseline is \$1402.6M with a Last ORD of 9/08. The revised APB is under review and will be approved shortly. The primary reason for the increase is computer-human interface modifications to the system which require significant custom software development. |
| Oceanic—Build 1 July 1996 | 73.2 | 10/99 | The Last ORD slipped to 6/00 due to New York Center priorities for deployment of DSR and HOCSSR over MS—ODL. |
| Portable Performance Support System (PPSS) October 1998 | 45.7 | 9/04 | No change. |
| Integrated Flight Quality Assurance (IFQA) October 1998 | 18.7 | 9/01 | No change. |
| Voice Recorder Replacement Program January 1994 | 1,452.9 | 5/00 | The program is reporting an underrun of \$40.5M. The schedule reflects the Last ORD for VTABS. |
| Radio Control Equipment October 1998 | 260.4 | 12/01 | The Last ORD has slipped to 6/02 due to budget deferrals. |
| Back up Emergency Communications Replacement October 1998 | 54.1 | Initial: 4/04 | Baseline under review. |
| | | Re-baseline: 2/09 | |
| Voice Recorder Replacement Program October 1998 | 29.4 | 5/02 | The Last ORD has slipped to 6/04 due to budget deferrals. |
| Potomac TRACON July 1999 | 92.4 | 6/03 | No change. |
| No. Cal TRACON October 1999 | 88.1 | 7/02 | No change. |
| Atlanta TRACON October 1999 | 62.2 | 8/01 | No change. |
| CAEG Replacement October 1999 | 18.5 | 4/02 | No change. |
| Aeronautical Center-TSF/LSF April 1999 | 31.0 | 9/04 | No change. |
| Wilcox Cat II/III ILS Replacement October 1998 | 14.3 | 12/99 | Program Complete. |
| AN/GRN—27 ILS Replacement October 1998 | 87.6 | 12/99 | The Last ORD has slipped to 12/01 due to budget deferrals. |
| Wide Area Augmentation System January 1998 | Initial: 1,006.6 | Initial: 12/01 | Baseline under review. |
| | Re-baseline: 2,978.0 | Re-baseline: 12/06 | |
| Airport Surface Detection Equipment October 1998 | 249.1 | 11/99 | The last ORD slipped to 2/02. The schedule slip is associated with the last site, Charlotte, which is a refurbished system awaiting spare parts. |
| Airport Movement Area Safety System (AMASS) October 1998 | Initial: 74.1 | Initial: 8/00 | Baseline under review. |
| | Re-baseline: 151.8 | Re-baseline: 9/02 | |
| Mode S December 1999 | 467.1 | 10/04 | No change. |
| Terminal Radar Program—ASR—9 October 1998 | 856.7 | 8/98 | Completed 8/99. |
| Terminal Digital Radar—ASR—11 November 1997 | 743.3 | 9/05 | Baseline under review. |

[Dollars in millions]

| Program name baseline date | Total F&E cost baseline | Schedule baseline (last ORD) | Current Status |
|---|-------------------------|------------------------------|---|
| Long Range Radar Program—ARSR—4 October 1998 | 415.8 | 6/99 | Completed 3/00. |
| Aviation Surface Weather Observation Network (ASWON) October 1999. | 350.9 | 4/02 | No change. |
| Terminal Doppler Weather Radar October 1998 | 393.5 | 12/00 | No change. |
| WARP Stage 0/1/2/3 October 1998 | Initial: 125.6 | Initial: 7/00 | The FAA has re-baselined the program. The cost baseline increased \$17.2M due to increased telecommunications infrastructure costs, additional time required to complete deployment of WARP Stage 1/2, and the need to continue providing WARP Stage 0 service to the field until Stage 1/2 deployment. The Last ORD slipped to 2/01. |
| | Re-baseline: 143.6 | Re-baseline: 2/01 | |
| Upgrade LLWAS to Expanded Network October 1998 | 43.5 | 10/01 | The Last ORD has slipped to 3/02 due to the sub-contractor defaulting on the contract to produce and deliver radio transceivers for LLWAS sensors. The cost baseline increased \$3.0M for contractor termination costs. |
| Integrated Terminal Weather System (ITWS)-Initial Operating Capability June 1997. | 173.0 | 7/03 | No change. |
| ASR Weather Systems Processor October 1998 | 80.4 | 9/02 | The Last ORD slipped to 12/02 due to a 90-day extension in the contract start date as requested by Northrop-Grumman. |

772

SCHEDULE FOR BASELINING REMAINING PROGRAMS

Question. Are all major acquisition programs baselined? Which programs remain unbaselined, and what is the schedule for completion of baselining those programs?

Answer. All major acquisition programs are either baselined, in process or identified to be baselined. There are currently 44 acquisition programs baselined, accounting for approximately 70 percent of the acquisition dollars in the agency's fiscal year 2001 F&E budget. The list below identifies those either in process or identified to be baselined.

| Program name | Planned completion date |
|--|-------------------------|
| En Route Communications Gateway (Eunomia) | September 2000. |
| AFSS Voice Switch Replacement | May 2000. |
| Aeronautical Data Link—CPDLC Build II | TBD. ¹ |
| Power Systems | May 2000. |
| Information Security | TBD. ¹ |
| Runway Incursion (in two phases) | August 2000. |
| ASDE-X Non-Radar | TBD. ¹ |
| Oceanic—ATOP | TBD. ¹ |
| Airport Cable Loop | May 2000. |
| Aeronautical Center—CAMI | TBD. ¹ |
| NAS Training Modernization | September 2000. |
| Asset & Supply Chain Management | September 2000. |
| Long Range radar Improvements—Infrastructure Upgrades | TBD. ¹ |
| NEXRAD Upgrades | TBD. ¹ |
| TDWR Computer Replacement | TBD. ¹ |
| Aviation Safety Analysis System | TBD. ¹ |
| NAS Recovery Communications (RCOM) | September 2000. |
| Enhanced Terminal Voice Switch | September 2000. |
| A/G Communications | TBD. ¹ |
| Alaskan NAS Interfacility Communications System Satellite Network-Phase II | August 2000. |
| Sustain Distance Measuring Equipment | TBD. ¹ |
| NIMS—Phase II | May 2000. |
| Free Flight Phase II | TBD. ¹ |
| En Route Domain Infrastructure (ERDI) | TBD. ¹ |
| Advanced Airport Security Systems | TBD. ¹ |

¹The baselines on TBD (to be determined) status are those programs in the process of having an investment analysis performed. Baselines are not established until an investment analysis of the alternatives is completed.

FACILITIES AND EQUIPMENT END OF YEAR OBLIGATIONS

Question. Please update the bar chart on page 783 of last year's House hearing record concerning end of year F&E obligations.

Answer. The bar chart follows:

FREE FLIGHT PHASE 1

Question. Please update the Free Flight Phase 1 (FFP1) baseline schedule on page 804 of last year's House hearing record.
Answer. The schedule follows.

*FFP1 Baseline Schedule**

| | TMA(SC) | | EAST | | WEST/COLD | | SEA | | SOUTH | |
|--------------|---------|-------|-------|-------------|-----------|------|-------------------------------------|-------------------------------------|------------------|------------------|
| | IDU | PCA | IDU | PCA | IDU | PCA | IDU | PCA | IDU | PCA |
| Chicago | TBD** | TBD** | TBD** | TBD** | 2/02 | 8/02 | | | 12/99 (ORD) | 12/99 (ORD) |
| Ft. Worth | 4/00 | 4/00 | 4/00 | 4/00 (DFW) | | | | | 12/99 (DFW) | 12/99 (DFW) |
| Los Angeles | 11/00 | 11/01 | 2/01 | 8/01 (LAX) | | | | | | |
| Atlanta | 2/01 | 2/02 | 3/01 | 9/01 (ATL) | 2/02 | 8/02 | | | | |

* Implementation sites defined by RTCA, Addendum 1

** Begin development after completion of current airspace review and design

WIDE AREA AUGMENTATION SYSTEM (WAAS)

Question. Please provide the names of the FAA WAAS team members working closely with Raytheon on resolving programmatic issues. Who is the accountable FAA official for cost and schedule baseline targets?

Answer. Key team members from FAA's Global Positioning System (GPS) Product Team who are working closely with Raytheon on resolving programmatic issues include the following:

- Jack Loewenstein, Integrated Product Team Leader (IPTL) for Navigation Systems
- Harry Kane, Deputy IPTL
- Steve Hodges, GPS Product Team Lead
- Hal Bell, Deputy GPS Product Team Lead
- Dan Hanlon, WAAS Program Manager
- Leo Eldredge, WAAS Phase 1 Project Manager
- Bill Wanner, Test and Evaluation Team Lead
- Tom McHugh, Deputy Test and Evaluation Team Lead
- Bruce DeCleene, Aircraft Certification
- Hank Cabler, Flight Standards, WAAS Program Sponsor
- Doug Davis, Airway Facilities, Communications, Navigation, Surveillance and Infrastructure
- Susan Eicher, GPS Product Team Contracting Officer
- Linda Lewis, GPS Product Team General Counsel

In addition to the above, numerous other FAA personnel and various technical experts from MITRE, NASA Jet Propulsion Laboratory, Ohio University, and Stanford University also provide extensive support to the WAAS project.

The FAA Acquisition Executive is the FAA official who is accountable for cost and schedule baseline targets. The FAA Acquisition Executive is Steve Zaidman, Associate Administrator for Research and Acquisitions.

SATELLITE NAVIGATION

Question. Please reprint your response to the satellite navigation questions on pages 807 and 808 of last year's House hearing record. Please, with hindsight, com-

ment on the current difficulties the FAA and Raytheon faces in the WAAS procurement and the studies findings?

Reprint of House hearing record p. 807—Satellite Navigation, question 1:

“Mr. WOLF. The Johns Hopkins University recently completed its review of satellite navigation systems. While the Air Transport Association hailed the study’s results, some outside observers have attacked the report on technical grounds. What are your views of the adequacy of this study?”

[The information follows:]

Johns Hopkins University Applied Physics Laboratory did an excellent job given the time and resources that were available to them. The FAA is pleased with the study’s findings that sole-means and sole-service are technically achievable, and that the risks to attaining those goals are manageable. The report also identifies those areas where additional work is necessary, such as the definition of the intentional interference threat and a reassessment of the most cost-efficient satellite navigation architecture. These findings are not interpreted to mean that implementing of satellite navigation will be easy, but rather to indicate where risk mitigation efforts should be directed. The FAA is also considering the criticisms of the report in determining future satellite navigation policy.”

Answer. The Johns Hopkins University Applied Physics Laboratory study identified interference and ionospheric propagation and scintillation as areas of risk. The FAA has focused risk mitigation efforts in these same areas as identified in the report. The FAA has done a considerable amount of work in the mitigation of interference and also has a variety of initiatives that focus on ionospheric issues. As the report predicted, ionospheric issues have been challenging. The FAA is addressing these issues with academia and various international partners who face these same challenges.

Reprint of House hearing record p. 807—Satellite Navigation, question 2:

“Mr. WOLF. Does this provide sufficient evidence for the FAA to move ahead beyond phase one of WAAS?”

[The information follows:]

We are encouraged by the Johns Hopkins risk assessment and remain committed to delivering sole-means global navigation satellite systems. The determination that “sole-means” and “sole-service” capabilities are feasible is an incentive to finding an affordable end-state wherein risk is managed effectively. The required levels of performance will not be provided in Phase One. We are developing an action plan to address all of the issues and recommendations that have been raised by the study, and are preparing a Satellite Navigation Investment Analysis to determine the most cost-effective means of providing sole-means and/or sole-service capabilities.”

Answer. The Satellite Navigation Investment Analysis was completed in September 1999. The findings were provided to Congress in November 1999. As a result of the investment analysis, satellite navigation, despite its challenges, is still considered to be the most cost-effective means sole and sole source capabilities. A combined WAAS/LAAS approach, with a basic backup network of ground based NAVAIDS, was shown to be the most cost-effective.

Reprint of House hearing record p. 808—Satellite Navigation, question 3:

“Mr. WOLF. The Johns Hopkins study discusses a number of operational and technical risks in achieving the potential of GPS. Isn’t it one thing to say that something is “technically possible”, and quite another to say it is cost-effective?”

[The information follows:]

Yes. The Johns Hopkins study was conducted to answer the “technically possible” question. Another study, the FAA’s ongoing Satellite Navigation Investment Analysis, is intended to determine its cost-effectiveness, particularly in comparison to other navigation alternatives. That study is expected to be completed in June 1999.”

Answer. The Satellite Navigation Investment Analysis was completed in September 1999. The findings were provided to Congress in November 1999. One alternative retained all Very High Frequency Omnidirectional Radio Range/Distance Measuring Equipment/Instrument Landing System in lieu of augmented satellite navigation Wide Area Augmentation System/Local Area Augmentation System (WAAS and LAAS). The study reaffirmed satellite navigation as the most cost-beneficial navigation concept for the future with a benefit to cost ratio 2.4 for the WAAS/LAAS alternative.

Additionally, the FAA has been working closely with aviation user groups to ensure that navigation solutions developed and implemented by the FAA will be in line with the needs of the user community. Aviation user groups have validated their support of the FAA's commitment to satellite navigation. These groups have enthusiastically cited examples of both current and potential benefits enabled by GPS and its augmentations (WAAS/LAAS). These benefits include the provision of navigation capability to areas where it currently did not exist, increased safety through improved position-awareness, and increased cost-effectiveness of operations due to the unique flexibility enabled by satellite navigation.

Question. Please describe the FAA's anticipated strategy to address the integrity issue as it relates to WAAS. Were any of the academic experts working on this proposed solution involved in the John Hopkins study? If so, which ones?

Answer. The FAA's approach for addressing the WAAS integrity issue is two-fold. The FAA has developed a WAAS Integrity and Performance Panel (WIPP) comprised of leading experts in the satellite navigation field—including representatives from MITRE, NASA's Jet Propulsion Laboratory, Stanford University, Ohio University, Zeta, Raytheon Corporation, and the FAA. The objectives of this panel will include the identification of technical solutions and evaluation of future concepts for the WAAS in the areas of algorithm and architecture, with the emphasis of achieving integrity while balancing acceptable levels of accuracy and availability performance. Additionally, a WAAS Independent Review Board, consisting of a separate panel of technical and operational aviation experts, will be formed to review the overall approach and specific technical deliverables produced by the WIPP. The charter and membership for these two groups is currently being developed.

None of the technical experts involved in the current WIPP effort was directly involved in the Johns Hopkins University/Applied Physics Laboratory GPS Risk Assessment Study, except to provide information as requested by the university.

Question. Considering the certification difficulties involved with WAAS that need to be resolved, and the recognition that the LAAS uses similar GPS technology as its basis, please describe the FAA's anticipated strategy to address the integrity issue as it relates to LAAS. Will the same issue effect the LAAS certification process and how does the FAA plan on avoiding repeating the WAAS history in the LAAS program?

Answer. In 1995, LAAS was developed as a demonstration and validation program. Operation requirements and approval to establish LAAS standards were completed by February 1996. LAAS has used FAA's other transaction authority to focus industry on development and certification of ground and air segments, both beginning with development of CAT I LAAS and then CAT II/III LAAS. The FAA has obtained experience on the Special Category I (SCAT-I) systems, privately developed local area augmentation systems. Recognizing from the start that integrity is a key issue, the FAA created the LAAS Integrity Panel (LIP) to address each SCAT-I vendor's approach to integrity. This panel has continued to monitor the LAAS Government Industry Partnerships (GIP) that were established in April 1999 and has even spawned a similar panel with the WAAS procurement. The experience gained by the LIP will continue to be applied to the LAAS development through CAT III. That is, the FAA will apply its most knowledgeable experts to the LAAS CAT III integrity problem, just as it has for SCAT-I and LAAS CAT I.

The FAA is aware of the integrity challenge presented by LAAS and is aggressively addressing this issue. The LAAS team is considering integrity a key requirement at the start. Further, the LAAS team is continually applying the experience gained on SCAT-I and will eventually apply experience gained with LAAS CAT I. These factors minimize the LAAS integrity risk.

Question. What are the future spending needs of the WAAS and LAAS? Over what time frame will those funds be needed?

Answer. At this time, FAA's most accurate estimate is the December 1999 FAA Satellite Navigation Program Baselines. The future WAAS program needs shall be determined once the Agency has the technical solutions for the system integrity problem, which are expected in December 2000.

RUNWAY INCURSIONS

Question. Does the Automatic Dependent Surveillance-Broadcast (ADS-B) program have a role to play in addressing the runway incursion issue?

Answer. Yes. ADS-B will be able to contribute two critical components to the runway incursion issue. The first component would provide ADS-B target information to the controllers. This capability would be similar to radar based Airport Surface Detection Equipment (ASDE) display functionality in the tower cab, but would pro-

vide controllers with more accurate target information, such as aircraft data tag and precise GPS derived position.

The second component is ADS-B driven cockpit surface moving map displays. Safe Flight-21 is currently developing commercial cockpit displays, which provide pilots critical information such as their precise position on the airport surface relative to other aircraft occupying runways or about to land. This tool should be very effective in reducing the number of pilot and vehicle deviations, by providing pilots and ground vehicles the same "situational awareness" picture afforded only to tower controllers today. More importantly, since ADS-B works between equipped aircraft pairs, cockpit moving map displays would offer a level of safety at airports that currently don't have ASDE equipment.

TOWER REPLACEMENTS

Question. Please update the data on tower replacements found on pages 820–838 of last year's House hearing record.

Answer. The following table provides the information requested:

Tower Replacements—Funding and Construction Status

Fiscal year 1989:

Windsor Locks, CT:

| | |
|--------------|-------------|
| Fiscal year: | |
| 1997 | \$9,393,000 |
| 1999 | 1,596,000 |

Status: Commissioned September 19, 1999.

Fort Smith, AR:

| | |
|--------------|-----------|
| Fiscal year: | |
| 1997 | 1,295,000 |
| 1998 | 2,310,000 |
| 1999 | 35,000 |

Status: Commissioned September 17, 1999.

Fiscal year 1990:

St. Louis, MO (ATCT):

| | |
|-------------|-----------|
| Fiscal year | |
| 1997 | 1,130,000 |
| 1998 | 760,000 |
| 1999 | 1,900,000 |
| 2000 | 1,600,000 |

Status: Commissioned May 15, 1999.

La Guardia, NY:

| | |
|--------------|------------|
| Fiscal year: | |
| 2000 | 2,200,000 |
| 2001 | 25,440,000 |

Status: Site adaptation engineering underway.

Schedule: Construction award January 2001. Commissioning June 2003.

Remarks: Site selection and approval on this congested airport required an unusually long time. Fiscal year 1999 funding decreased by Congress from \$23,960,000 to 13,960,000. \$13,960,000 reprogrammed to accommodate Congressional adds and other construction.

Newark, NJ:

| | |
|--------------|------------|
| Fiscal year: | |
| 1998 | 24,348,000 |
| 2000 | 2,200,000 |
| 2001 | 2,407,500 |

Status: Construction award September 1999.

Schedule: Commissioning November 2002.

Remarks: Site selection and approval on this congested airport required an unusually long time.

Fiscal year 1991:

Syracuse, NY:

| | |
|--------------|-----------|
| Fiscal year: | |
| 1997 | 25,000 |
| 1998 | 2,400,000 |

Tower Replacements—Funding and Construction Status—Continued

| | |
|--|-----------|
| 1999 | 941,000 |
| Status: Commissioned December 12, 1999. | |
| Houston Hobby, TX: | |
| Fiscal year: | |
| 1997 | 25,000 |
| 1998 | 1,100,000 |
| 1999 | 1,015,000 |
| 2000 | 400,000 |
| 2001 | 818,550 |
| Status: Electronic installation underway. | |
| Schedule: Commissioning June 2000. | |
| Beaumont, TX: Fiscal year 1998 | 820,000 |
| Status: Site has been selected. Engineering that was on hold per Congressional direction, is underway. | |
| Schedule: Construction award November 2000. Commissioning March 2003. | |
| Fiscal year 1992: | |
| Portland, OR: | |
| Fiscal year: | |
| 1997 | 7,526,000 |
| 1998 | 2,130,000 |
| 1999 | 596,000 |
| 2000 | 50,000 |
| Status: Commissioned December 5, 1999. | |
| Stewart (Newburgh), NY: | |
| Fiscal year: | |
| 1992 | 3,000,000 |
| 1993 (Fiscal year 1993 funding under ATCT Establish) | 1,700,000 |
| 2001 | 500,000 |
| Status: Alternate site has been selected. | |
| Schedule: Construction award October 2001. Commissioning September 2004. | |
| Fiscal year 1993: | |
| Topeka, KS: | |
| Fiscal year: | |
| 1999 | 700,000 |
| 2001 | 4,361,840 |
| Status: Engineering is complete. | |
| Schedule: Construction award October 2000. Commissioning November 2003. | |
| St. Paul, MN: | |
| Fiscal year: | |
| 1997 | 115,000 |
| 1998 | 110,000 |
| 1999 | 298,000 |
| Status: Commissioned November 6, 1999. | |
| Salt Lake City, UT (ATCT): | |
| Fiscal year: | |
| 1997 | 2,289,000 |
| 1998 | 1,370,000 |
| 1999 | 727,000 |
| Status: Commissioned June 26, 1999. | |
| Little Rock, AR: | |
| Fiscal year: | |
| 1999 | 1,076,000 |
| 2000 | 740,000 |
| 2001 | 642,000 |
| Status: Electronic installation underway. | |
| Schedule: Commissioning September 2000. | |
| Islip, NY: | |
| Fiscal year: | |
| 1997 | 367,000 |

Tower Replacements—Funding and Construction Status—Continued

| | |
|--|------------|
| 1999 | 50,000 |
| Additional Cost to Complete | 5,714,500 |
| Status: Architect/engineers proposal for site adaptation design submitted and approved, and on hold. | |
| Schedule: Construction award October 2002. Commissioning September 2005. | |
| Dallas Addison, TX: | |
| Fiscal year: | |
| 1997 | 640,000 |
| 1999 | 700,000 |
| Schedule: Construction award October 2001. Commissioning September 2004. | |
| Fiscal year 1995: | |
| Merrill, AK: | |
| Fiscal year: | |
| 1997 | 5,202,000 |
| 1998 | 150,000 |
| 1999 | 130,000 |
| 2001 | 321,000 |
| Status: Commissioned November 2, 1999. | |
| Remarks: Fiscal year 2001 funds are for old tower demolition. | |
| Salina, KS: | |
| Fiscal year: | |
| 1997 | 184,000 |
| 2001 | 267,500 |
| Additional Cost to complete | 4,675,777 |
| Status: Engineering is underway. | |
| Schedule: Construction award November 2000. Commissioning July 2003. | |
| Newport News, VA: | |
| Fiscal year: | |
| 1997 | 74,000 |
| 1999 | 400,000 |
| Additional Cost to complete | 5,950,000 |
| Status: Site selection is complete. | |
| Schedule: Construction award October 2001. Commissioning September 2004. | |
| Roanoke, VA: | |
| Fiscal year: | |
| 1997 | 578,000 |
| 1999 | 100,000 |
| 2000 | 4,900,000 |
| 2001 | 2,140,000 |
| Status: Engineering is underway. | |
| Schedule: Construction award August 2000. Commissioning September 2002. | |
| Columbus, OH: | |
| Fiscal year: | |
| 1999 | 750,000 |
| 2000 | 17,600,000 |
| 2001 | 1,000,000 |
| Status: Engineering is underway. | |
| Schedule: Construction Award October 2000. Commissioning April 2004. | |
| Remarks: Fiscal year 1999 funding increased by Congress from \$50,000 to \$750,000. | |
| Manchester, NH: | |
| Fiscal year: | |
| 1997 | 937,500 |
| 1999 | 80,000 |
| Additional Cost to complete | 3,565,700 |

Tower Replacements—Funding and Construction Status—Continued

Status: Site has been selected. Engineering is underway.

Schedule: Construction award October 2001. Commissioning November 2004.

Everett, WA:

| | |
|-----------------------------------|-----------|
| Fiscal year 1999 | 1,050,000 |
| Additional Cost to complete | 5,541,655 |

Status: Engineering is underway.

Schedule: Construction will be in two phases. Phase I (foundation) Construction award March 2000. Phase II Construction award October 2002. Commissioning September 2005.

Remarks: Fiscal year 1999 funding increased by Congress from \$50,000 to \$1,050,000.

Ft. Lauderdale Executive FL:

| | |
|-----------------------------------|-----------|
| Fiscal year 1999 | 50,000 |
| Additional Cost to complete | 3,084,200 |

Status: Engineering is underway.

Schedule: Construction award October 2002. Commissioning September 2005.

Oakland, CA:

| | |
|--------------|------------|
| Fiscal year: | |
| 1999 | 50,000 |
| 2001 | 25,912,347 |

Status: Engineering is underway.

Schedule: Construction award January 2001. Commissioning August 2004.

Birmingham, AL:

| | |
|--------------|------------|
| Fiscal year: | |
| 1998 | 10,130,000 |
| 1999 | 550,000 |
| 2000 | 1,250,000 |
| 2001 | 1,359,540 |

Status: Under construction.

Schedule: Commissioning January 2001.

Salt Lake City, UT (TRACON):

| | |
|--------------|-----------|
| Fiscal year: | |
| 1998 | 1,320,000 |
| 1999 | 50,000 |

Status: Commissioned June 26, 1999.

St. Louis, MO (TRACON):

| | |
|-----------------------------------|------------|
| Fiscal year: | |
| 1998 | 11,630,000 |
| 1999 | 1,050,000 |
| 2000 | 3,800,000 |
| 2001 | 3,317,000 |
| Additional Cost to complete | TBD |

Status: Under construction.

Schedule: Commissioning February 2002.

Fiscal year 1996:

| | |
|---|-----------|
| Corpus Christi, TX: Fiscal year 2000 (Fiscal year 2000 funds added by Congress) | 1,500,000 |
|---|-----------|

Status: Under construction.

Schedule: Commissioning March 2003.

Remarks: Construction funded with fiscal year 2000 funds that could not be obligated on the Boston TRACON.

Seattle (TRACON), WA:

| | |
|-----------------------------------|------------|
| Fiscal year 1999 | 50,000 |
| Additional Cost to complete | 24,577,263 |

Tower Replacements—Funding and Construction Status—Continued

Status: Site selection is underway.

Schedule: Construction Award October 2001. Commissioning September 2004.

Champaign, IL:

Fiscal year:

1997 1,287,000

2001 749,000

Additional Cost to complete 2,683,072

Status: Site has been selected. Engineering is underway.

Schedule: Construction award October 2001. Commissioning September 2004.

Grand Canyon, AZ:

Fiscal year:

1999 8,170,000

2000 243,000

2001 267,500

Status: Engineering is complete.

Schedule: Construction award January 2001. Commissioning April 2003.

Vero Beach, FL: Additional Cost to complete 5,507,870

Status: Engineering underway.

Schedule: Construction award October 2001. Commissioning September 2004.

Bedford, MA:

Fiscal year:

1999 4,800,000

2001 535,000

Status: Construction contract awarded January 26, 2000.

Schedule: Commissioning January 2003.

Fiscal year 1997:

Abilene, TX:

Fiscal year:

1997 693,000

1998 1,010,000

Additional Cost to complete 12,990,000

Status: Site selection underway.

Schedule: Construction award October 2002. Commissioning September 2005.

East St. Louis, IL:

Fiscal year:

1997 25,000

1998 500,000

Additional Cost to complete 3,469,000

Status: Site selection underway.

Schedule: Construction award October 2002. Commissioning September 2005.

Seattle (ATCT), WA:

Fiscal year:

1997 645,000

1998 580,000

1999 19,770,000

2000 10,270,000

2001 25,000

Status: Construction Contract awarded January 11, 2000.

Schedule: Commissioning June 2003.

Richmond, VA:

Fiscal year:

1997 525,000

1998 1,350,000

2000 (Fiscal year 2000 funds added by Congress) 3,000,000

Additional Cost to complete 6,002,100

Tower Replacements—Funding and Construction Status—Continued

Status: Site selection under review. The airport sponsor has proposed construction of the tower under a leaseback agreement.
 Schedule: Construction award October 2001. Commissioning September 2004.

Savannah, GA:

| | |
|--------------|-----------|
| Fiscal year: | |
| 1997 | 288,000 |
| 1998 | 680,000 |
| 2001 | 7,741,015 |

Status: Engineering underway.

Schedule: Construction award January 2001. Commissioning March 2004.

Boston (TRACON), MA:

| | |
|--------------|------------|
| Fiscal year: | |
| 1997 | 1,110,000 |
| 1998 | 1,880,000 |
| 1999 | 1,870,000 |
| 2000 | 10,000,000 |
| 2001 | 24,944,308 |

Status: Site has been purchased. Design is complete.

Schedule: Construction award January 2001. Commissioning November 2003.

Remarks: Fiscal year 2000 funding reduced by Congress.

Fiscal year 1998:

N. Las Vegas, NV:

| | |
|--------------|-----------|
| Fiscal year: | |
| 1998 | 5,700,000 |
| 1999 | 1,200,000 |
| 2000 | 2,354,000 |
| 2001 | 214,000 |

Status: Engineering is underway.

Schedule: Construction award March 2000. Commissioning October 2001.

Remarks: Fiscal year 1999 funding increased by Congress from \$200,000 to \$1,200,00.

Medford, OR:

| | |
|-----------------------------------|-----------|
| Fiscal year 1998 | 600,000 |
| Additional Cost to complete | 8,565,708 |

Status: On hold.

Schedule: Construction award October 2002. Commissioning September 2005.

Swanton (Toledo), OH:

| | |
|-----------------------------------|-----------|
| Fiscal year: | |
| 1998 | 700,000 |
| 2000 | 700,000 |
| Additional Cost to complete | 8,386,873 |

Status: Site selection is complete. Construction will be accomplished by sponsor.

Schedule: Dependent on sponsor.

Fiscal year 1999

Asheville, NC:

| | |
|-----------------------------------|-----------|
| Fiscal year 1999 | 298,000 |
| Additional Cost to complete | 7,214,550 |

Status: On hold due to anticipated long lead-time for construction funds.

Schedule: Construction award October 2002. Commissioning April 2005.

Tulsa Riverside, OK:

| | |
|-----------------------------------|-----------|
| Fiscal year 1999 | 298,000 |
| Additional Cost to complete | 7,525,470 |

Tower Replacements—Funding and Construction Status—Continued

Status: On hold due to anticipated long lead-time for construction funds.

Schedule: Construction award October 2002. Commissioning June 2005.

Reno, NV:

Fiscal year 1999 297,000
 Additional Cost to complete 8,636,360

Status: On hold due to anticipated long lead time for construction funds.

Schedule: Construction award October 2002. Commissioning September 2005.

Billings, MT:

Fiscal year:
 1999 1,000,000
 2000 (Fiscal year 1999 and fiscal year 2000 funds added by Congress) 1,000,000
 Additional Cost to complete 11,000,000

Status: Site selection is complete.

Schedule: Construction award October 2003. Commissioning July 2006.

Fiscal year 2000:

Atlanta International, GA:

Fiscal year:
 2000 1,800,000
 2001 167,900

Status: Construction to be accomplished by and funded by airport sponsor. FAA funding is for equipment procurement.

Phoenix, AZ: Fiscal year 2000 (Fiscal year 2000 funds added by Congress) 4,000,000

Status: Site selection is underway.

Schedule: TBD

Fiscal year 2001 (Proposed):

Chantilly (Dulles), VA: Fiscal year 2001 75,000
 Broomfield, CO: Fiscal year 2001 75,000
 Phoenix (Deer Valley), AZ: Fiscal year 2001 75,000
 Gulfport, MS: Fiscal year 2001 75,000
 Kalamazoo, MI: Fiscal year 2001 75,000

STANDARD TERMINAL AUTOMATION REPLACEMENT SYSTEM (STARS)

Question. Please provide a breakdown of the F&E funding requested for STARS in the fiscal year 2001 request with appropriate funding for fiscal year 2000 broken down in the same manner.

Answer. The breakdown of STARS F&E funding for fiscal years 2000 and 2001 follows.

[In millions of dollars]

| Activity | Fiscal year | |
|--------------------------------|-------------|-------|
| | 2000 | 2001 |
| Product development/Test | 87.9 | 80.9 |
| Production | 7.9 | 21.6 |
| Implementation | 6.8 | 16.4 |
| NAIS/Maintenance | 6.5 | 14.8 |
| HQ Technical Assistance | 20.0 | 14.1 |
| ANS Facility Upgrade | 0.8 | 2.8 |
| OGC/GFE | 21.3 | 16.4 |
| ACDs/ARTS IIIE | 37.8 | 11.8 |
| IOT&E | | 0.5 |
| Total | 188.9 | 179.2 |

Question. Provide an updated waterfall schedule for delivery of STARS systems for fiscal years 2000, 2001, 2002, and 2003.

Answer. A STARS Site Deployment Working Group has recently been formed to provide an updated waterfall schedule for delivery of STARS systems through 2008. This updated waterfall will be available the end of fiscal year 2000.

INSTRUMENT LANDING SYSTEM (ILS)

Question. Please provide the updated ILS survey and analysis of existing and future needs. Please provide the current list of the locations for which the FAA has identified current or future ILS requirements.

Answer. In September 1998, the FAA conducted a cursory benefit cost analyses (BCA) of all potential precision approach locations in the NAS. The results of this study which was based on Airport Planning Standards Number One (APS-1) criteria, identified approximately 100 airport locations that yielded a positive BCA and were potential candidates for precision approach services. The resultant listing follows.

| No. | State | Airport | Region | RWY | Type |

NAS HANDOFF FOR SATELLITE-RELATED INFRASTRUCTURE

Question. What operation and maintenance costs are anticipated in fiscal year 2001 for NAS handoff requirements relating to operation and maintenance of the satellite-related infrastructure, pursuant to the eventual transition to a satellite-based navigational system?

Answer. The fiscal year 2001 NAS handoff requirement is \$10,000. This money will be used to fund one month (September 2001) of interim contractor depot logistics support.

FEDERAL FUNDED RESEARCH AND DEVELOPMENT CENTER COMPREHENSIVE REVIEW

Question. Please provide a copy of the November 30, 1999 comprehensive review of the Federally Funded Research and Development Center (FFRDC), Center for Advanced Aviation System Development (CAASD) that the FAA indicated would be complete in a response to the question for the record last year.

Answer. A copy of the Comprehensive Review of the FFRDC for Advanced Aviation System Development follows.

[CLERKS NOTE.—Because of its volume the Comprehensive Review will not be printed here but retained in the subcommittee files.]

WIDE AREA AUGMENTATION SYSTEM

Question. The FAA's SatNav Investment Analysis and Report completed late last year, said (page 86) " * * *. The airlines support WAAS and LAAS * * *. However, they are much less enthusiastic about WAAS than LAAS, because in aircraft equipped with FMS, WAAS will not provide substantial added economic or operational value to them beyond what unaided GPS can provide, or beyond what they can achieve with RNAV-capable FMS equipment * * *." If that's true wouldn't you agree it would seem to make sense that we not continue to spend money on this ever increasing and very expensive program?

Answer. WAAS is very beneficial for the entire aviation population. The WAAS system will allow GPS to be used as a navigation system for en route, non-precision approaches, and precision approaches in the United States. Indeed, all airlines support the development of WAAS because it will increase the capacity of major airports in the United States, by allowing smaller aircraft to land at more airports by expanding precision approach capability to smaller airports.

Question. That same analysis indicates that only with some very generous assumptions, the benefit/cost (B/C) ratio for this program appears to be barely better than 1.0. There must be other FAA programs that promise better benefits and more prudent use of available resources. What FAA programs have better B/C ratios than is currently contemplated for the WAAS program that are not being funded adequately or given the funding priority that the WAAS initiative is being given?

Answer. The latest acquisition program baseline for WAAS, signed in December 1999, shows a B/C ratio of approximately 2.4 calculated with Passenger Value of Time (PVT), per DOT policy, and a net present value of \$2,400,000,000. While these ratios are generally estimated as part of the investment analysis, they are not the final determining factor in all investment and funding decisions. There are some smaller programs, which may have slightly higher ratios, but will not provide the total overall return that WAAS is expected to. An important element of the WAAS B/C ratio to remember is the fact that the FAA calculated the ratio based on very conservative estimates. Indeed, the FAA identified a number of benefits that were not quantified because of data that could not be verified at a high-confidence level within the resources of the study. If those benefits could be quantified and incorporated into the study results, the WAAS benefit/cost ratio would significantly increase. In addition, WAAS provides the enabling technology for a number of more advanced systems which will provide the basis of Free Flight. An example is ADS-B, which has received a great deal of interest from the user community, and is expected to provide significant additional safety and efficiency benefits, which would not be available without the navigation accuracy that WAAS provides.

Question. We have heard reports that late last year (1999) WAAS tests at the Tech Center were sufficiently poor as to cast a shadow on the scheduled WAAS implementation date summer 2000. Provide the committee the information about those tests and is a further delay contemplated from FAA's previously announced WAAS implementation date?

Answer. There will be additional time required to achieve initial operational capability (IOC). IOC is defined as a limited precision landing capability called Lateral Navigation/Vertical Navigation (LNAV/VNAV). The WAAS program now plans to

deliver LNAV/VNAV that will support a height above touchdown (HAT) of 350 feet in IOC.

The FAA is less certain about the approach for WAAS to achieve a precision approach down to 200 feet HAT, which is regarded as final operational capability (FOC). This lack of certainty is due to problems encountered with the system integrity, or the ability of the WAAS system to detect system errors and inform users of errors that can't be corrected. To address these system integrity problems, the FAA has engaged the knowledge and the experience of the WAAS Integrity and Performance Panel (WIPP). The FAA will be able to better evaluate the cost and schedule for FOC after the WIPP completes its work around December 2000.

The GPS Product Team plans to rebaseline the WAAS and LAAS projects in 2001 after firm cost and schedule estimates are developed. The Agency cannot definitively project final cost and schedule baselines at this time.

SATELLITE NAVIGATION

Question. The FAA is planning a transition from a ground-based civil air navigation system using signals generated by the Department of Defense's GPS. FAA is acquiring a WAAS—a network of equipment on the ground and in space—to enhance GPS so that the system can meet civil aviation requirements. Satellite-based navigation, using GPS/WAAS is expected to improve the safety of flight operations and increase airport and airspace capacity to meet future air traffic demands. Since 1995, WAAS has experienced significant cost growth of over \$2,500,000,000 and schedule slippage of over three years. Recent announcements by the FAA that the program may experience more delays and added cost have raised questions about whether the WAAS program is heading in the same direction as the former Advance Automation System (AAS), which FAA canceled after it incurred significant cost growth and delays. What is FAA's current assessment of whether WAAS will meet its performance goals within current cost and schedule baselines?

Answer. Additional time is required to achieve initial operational capability. IOC is defined as a limited precision landing capability called LNAV/VNAV. The WAAS program now plans to deliver LNAV/VNAV that will support a height above touchdown (HAT) of 350 feet in IOC.

The FAA is less certain about the approach for WAAS to achieve a precision approach down to 200 feet HAT, which is regarded as final operational capability (FOC). This lack of certainty is due to problems encountered with the system integrity, or the ability of the WAAS system to detect system errors and inform users of errors that can't be corrected. To address these system integrity problems, the FAA has engaged the knowledge and the experience of the WAAS Integrity and Performance Panel (WIPP). The FAA will be able to better evaluate the cost and schedule for FOC after the WIPP completes its work around December 2000.

The GPS Product Team plans to rebaseline the WAAS and LAAS projects in 2001 after firm cost and schedule estimates are developed. The Agency cannot definitively project final cost and schedule baselines at this time.

Question. If the program will not meet its current goals, when will FAA announce new cost, schedule, and performance goals?

Answer. At the March 15, 2000, SATNAV Summit, the FAA provided an updated schedule projection for WAAS. It was stated that this schedule will be better defined in six to nine months after the WAAS Integrity and Performance Panel (WIPP) completes its work. The WIPP will address the necessary technical details to solve integrity issues to get to this initial capability and additionally will develop a high-level roadmap for WAAS to achieve the end-state capability. The participants of the SATNAV Summit, including key government and industry representatives, agreed to meet again at the completion of the WIPP activities, to present and discuss the results. Accordingly, the GPS Product Team plans to complete rebaselining the WAAS and LAAS projects in 2001 after a technical solution recommended by the WIPP is quantified in terms of cost and schedule.

Question. What steps are FAA and its contractor taking to ensure that WAAS does not become another AAS?

Answer. The FAA has learned from its experiences with AAS, and is striving to apply lessons learned, as appropriate. For example, whereas AAS strove to deliver a huge amount of capability at one time, WAAS is being developed to be implemented in a phased approach. There are some issues, however, that complicate this phased approach, and that is the requirement for integrity. In order for WAAS to be used for safety critical functions, the integrity requirement must be fully addressed with the initial delivery. The FAA is aggressively addressing integrity issues through the formation of the WIPP and the Independent Review Board (IRB). The WIPP is a team of technical experts, which will detail the work that needs to

be done by Raytheon to correct the problems with system integrity and identify the most realistic cost, schedule, and performance expectations. The IRB, which is a team of independent senior level experts, will oversee the work and progress of the WIPP and report directly to the FAA Administrator. Another example of applying lessons learned is the open communication with industry and users. The FAA is focusing on routinely communicating a very candid picture of the status and progress of the WAAS program.

WIDE AREA AUGMENTATION SYSTEM

Question. The WAAS prime contractor has informed the Subcommittee that extensive broadcasting of the WAAS signal will be required as part of its continuing development activity, both to demonstrate system performance as well as to validate assumptions that are part of the fault analysis. This is consistent with the conclusion reached by the Deleaney Commission in October 1997. Many WAAS avionics manufacturers also require a steady signal for their receiver certification activity, and some of these avionics manufacturers are also bringing to market non-certified receivers that can use the signal in its present configuration. Has the FAA considered making a public commitment that the WAAS signal will be provided in a limited level of service during the period leading up to FAA certification and declaration of initial operational capability? Would such a "test" period provide advantages to incrementally developing the various capabilities (runway incursion identification and en route activities) that the signal might ultimately be useful for, assuming the program can address the current integrity shortcomings, does not suffer any further setbacks, and can be cost beneficial at the margins with other programs?

Answer. Raytheon will indeed continuously broadcast WAAS signals, though it may be intermittent for short periods of time (minutes to a few hours in extreme cases) due to integration (that is, ground uplink station (GUS) switchover tests, correction and verification (C&V) failures from unproven private builds). Raytheon will be "hands off" the system during the five integration tests (21 day) and during the 60-day test. The details of these demonstrations are being finalized with Raytheon. Once they are finalized, they will be shared with the receiver manufacturers and those developing technologies that depend on WAAS. Continuous broadcast of the WAAS signals are therefore critical for the completion of WAAS receiver and WAAS ground system testing. The FAA plans to officially announce to the public that the WAAS signal is available for use in non-safety critical functions. This announcement will be made after Raytheon has completed the 21-day stability test (around June/July 2000). As such, the FAA plans to broadcast an increasingly operational-like signal during several periods from now through contract acceptance inspection (CAI), and then continuously at all times from CAI on.

Some examples of non-safety critical functions include ADS-B applications such as avoidance of runway incursions using runway situational awareness, and terrain avoidance warning systems.

WAAS INTERNATIONAL POSITION

Question. The following excerpts are from an article in the Thursday, March 30, 2000 Aviation Daily: "Delegates to an international symposium in Bonn rejected dependence on a single technology in favor of retaining a diversity of systems as advanced navigational technologies become operational. The March 22-23 conference, an initiative of the Germany Federal Ministry of Transport, was organized by the German Institute of Navigation and supported by the Northwest Europe Loran-C System (NELS) inter-governmental consortium. Discussions focused on determining the optimum mix of satellite and terrestrial systems to ensure safety of life and property while minimizing costs to the provider and users.

Data communications using the Loran-C navigation system for distribution of satellite error corrections and position integrity also received much attention. Building on the concept employed by the United States. Defense Department for communication with the Polaris submarine fleet, a team of Delft University has developed an advanced error-correcting version of the technology called Eurofix that is now being installed for operational use in Europe. The technology and status of Eurofix implementation was presented and supported with an on-air demonstration. Further innovations to the Eurofix concept to provide an alternative to the GPS WAAS were presented by the United States Coast Guard."

Given the continual difficulty the FAA has had with the WAAS procurement and the concerns about sole source navigational concepts, jamming, and other issues, is the FAA doing any work on evaluating or exploring other satellite navigational architectures similar to what the Aviation Daily article mentions (or other concepts)?

Answer. The FAA is currently in the process of evaluating Loran-C as a potential means of providing navigation to users of the National Airspace System (NAS). These evaluations include (a) use of a magnetic field (H-field) antenna to reduce or eliminate precipitation static that can severely affect the use of Loran during rain and snow conditions; (b) next generation digital Loran receiver technology; (c) feasibility of integrated GPS/Loran/Distance Measuring Equipment receivers; and (d) capability of Loran to provide a data path for WAAS correction information. An integrated Government/Academic/Industry team led by the FAA and including members from the Coast Guard, Coast Guard Academy, Ohio and Stanford University, Booz-Allen & Hamilton, and Illgen Simulations is conducting these evaluations, which will include actual flight demonstrations in fiscal year 2001. The FAA is also working with the University of Alabama to explore feasibility of using gyroscopic technology to provide a redundant aircraft navigation capability. The challenge of this effort is to provide a precision capability at costs acceptable to all users.

WIDE AREA AUGMENTATION SYSTEM

Question. The Committee is hearing increasing concerns that signal integrity may be a concern with the LAAS procurement and the difficulty of assuring signal integrity increase as the system is evolved to Category II and III approaches. What work has been done to address this issue up front so as not to repeat the WAAS experience?

Answer. The FAA has been aware of the challenge of certifying the LAAS integrity for a number of years. The challenge was first recognized during the LAAS Special Category I (SCAT-I) Type Acceptance certification process in the mid-1990's. During that time a special LAAS Integrity Panel (LIP) was formed to review the applicant vendor's integrity algorithms. The LIP certification process provided the LAAS technical team members with valuable exposure to the various integrity concepts being proposed as well as providing insight into the particular technical challenge integrity certification posed. As evidence of the success of the LIP process a number of LAAS SCAT-I systems have already achieved FAA approval under the SCAT-I certification guidance, FAA Order 8400. Although SCAT-I is less challenging than CAT III the experience of the LIP has assisted in the identification of the major elements of technical risk for development and certification of a CAT III LAAS.

Based on the experience gained with the SCAT-I integrity certification process, the LAAS project has retained the LIP concept as part of its LAAS Cat I Type Acceptance process.

A more recent integrity certification challenge being addressed involves the differential error correction standard deviation, known as 'Sigma', and ensuring our LAAS message error distribution standard deviation overbounds the actual error. Special technical 'tiger teams' have been formed within the FAA and RTCA to address this issue. The FAA's Integrity Tiger Team, known as the Sigma Overbounding group, has reached an interim consensus on the integrity solution approach to take for Cat I. RTCA Subcommittee-159 Working Group-4 is also actively involved in ensuring that the integrity problem is addressed and solved and is providing advice on the overbounding problem.

Unlike WAAS, the LAAS architecture is simplified by ensuring integrity within the local area of the installed LAAS system. This is in contrast to the integration of the wide area differential error correction components that WAAS must use to generate and broadcast wide area differential corrections. Differential corrections for a local area simplify the integrity challenge for LAAS significantly.

In summary, the task of achieving and validating Cat III integrity remains a significant challenge. The experience already gained from the LAAS SCAT-I LIP and the experience being obtained from the LAAS Cat I Type Acceptance LIP certification process have both served to help us foresee the LAAS integrity certification.

USER REQUEST EVALUATION TOOL (URET)

Question. What is the timeframe and locations for URET deployment? What are the challenges to greater deployment of the technology? What procedures need to be established and implemented in order to fully achieve the efficiency offered by this technology? What are the procedural issues that must be addressed before greater utilization of this technology?

Answer. The URET prototype is currently in daily use at Indianapolis and Memphis. As part of Free Flight Phase 1, URET Core Capability Limited Deployment (CCLD) will be deployed for initial daily use to Memphis, Indianapolis, Kansas City, Cleveland, Washington, Chicago, and Atlanta starting in November 2001 through February 2002. URET CCLD development and deployment will address the major

technical challenges for greater deployment to the remaining centers. Additionally, procedural issues are being addressed by both our national and local (FAA/NATCA/PASS) user teams representatives based on the daily use of the URET prototypes at Indianapolis and Memphis. National and local procedures supporting reduced flight strip postings and markings must be implemented to fully achieve efficiencies offered by this technology. Both national and local procedures are being modified and used at Memphis and Indianapolis. We anticipate procedural issues will continue to evolve and we will address these issues, resulting from increased utilization of the tool, as they arise.

STARS

Question. When will the FAA present revised STARS baselines to Congress?

Answer. Revised STARS baselines will be presented to Congress upon final OMB approval the Terminal Acquisition Program Baseline (APB). The Terminal APB is presently undergoing final FAA internal review. A STARS Site Deployment Working Group has recently been formed to provide an updated waterfall schedule for delivery of STARS systems through 2008. This updated waterfall will be available the end of fiscal year 2000.

Question. How much program delay and added cost will the new baselines reflect over existing baselines? Over the original STARS baseline?

Answer. The “existing” STARS baselines did not change in cost but reflect the new terminal automation strategy, known as Option 8R, which addresses near-term infrastructure and modernization issues. In October 1999, the FAA Joint Resources Council (JRC) provided interim approval for the STARS F&E rebaselining.

The new baseline as presented and approved by the JRC, reflects an increase in F&E costs of \$462,000,000. The following provides a comparison of the STARS original and new cost/schedule baselines:

[Dollars in millions]

| | Original (9/96) | Option 8R (10/99) |
|---------------------------------------|--------------------|----------------------|
| Cost | \$940.2 | \$1,402.6 |
| Schedule: | | |
| First FAA full service site ORD | 12/98 | 12/02 |
| Last FAA full service site ORD | 2/05 | 9/08 |

Question. What outstanding issues must FAA address to ensure that STARS is delivered within its new cost, schedule and performance goals?

Answer. There are two outstanding issues that must be addressed to ensure that the STARS program is delivered within its new cost, schedule and performance goals.

The foremost issue is the amount of software remaining to be developed and tested to resolve human factors concerns. The current estimate of total source lines of code (SLOC) to be developed is 415,000. The FAA has identified and initiated a risk mitigation strategy via the implementation of incremental software builds, early operational assessments, early user involvement initiatives and active user community working group participation to ensure on time software development and testing performance.

The other issue involves the definitization of the STARS contract modification that incorporates the revised program strategy known as Option 8R. The FAA completed negotiations on Option 8R on March 27, 2000, and will have a contract modification in place by the Spring of 2000. This contract modification includes the STARS human factor enhancements requested by the unions. Based on the completion of these activities, the FAA will have a new contract baseline in place against which to track and monitor contractor performance.

Question. The FAA has a substantial investment in the deployment of STARS. The system is being deployed and will be an integral part of the FAA inventory of the next 20 years. STARS is based on commercial-off-the-shelf/non-developmental item (COTS/NDI) systems that are in operation worldwide for both terminal and en route applications and include Radar Data Processing (RDP) and Flight Data Processing (FDP). Inherent in STARS are safety critical en route automation functions such as Minimum Safe Altitude Warning (MSAW), Mode C Intruder, and Conflict Alert, all of which are included in the 2001 budget request. The STARS program will also benefit from Pre-planned Product Improvements (P3I) like the Center/TRACON Automation System (CTAS) and ADS-B capability that not only provide

benefits to the terminal area, but also to the en route environment. Accordingly, has the FAA considered using STARS for other air traffic automation applications such as modernization of the en route system's emergency back-up system?

Answer. As standard practice, the FAA assesses the ability of COTS/NDI solutions, both in the existing FAA inventory and in the commercial market place, to meet future system requirements. Through market survey assessment, the En Route Integrated Product Team received inputs from all interested vendors regarding the capabilities inherent in existing systems that could satisfy future en route requirements. The assessment determined that there is no existing system that could meet all en route requirements, and that additional development would be needed.

Because of traffic volume and complexity, the United States en route system requirements differ significantly from those of the terminal environment and other en route civil aviation authorities. As currently developed, the deployed STARS (and the COTS/NDI systems upon which it is based) will not meet en route system requirements. For example, the en route automation system must include all flight data processing (FDP) capabilities not currently contained in the terminal automation system.

Future en route system evolution will consider the integration of COTS/NDI products as potential components for radar data processing and FDP replacement solutions.

AIRPORT SURVEILLANCE RADAR, MODEL 11 (ASR-11)

Question. Now that the Department of Defense (DOD) has made the decision to proceed into production of the joint DOD/FAA ASR-11 radar, does the FAA anticipate a timely production decision for the ASR-11 radar in order to remain in step with STARS deployment?

Answer. The FAA anticipates a timely production decision, and we will ensure that this program is in proper alignment with STARS system deployments.

OCEANIC AIRSPACE

Question. What is the FAA's current strategy for implementing new communications, navigation, and surveillance technologies in oceanic airspace?

Answer. The FAA has initiated the Advanced Technologies and Oceanic Procedures (ATOP) acquisition to obtain an advanced and integrated automation system for the three Air Route Traffic Control Centers (ARTCCs) engaged in the control of oceanic air traffic.

The automation solution is expected to be adaptable to all three sites and to consist of flight data processing integrated with surveillance data processing, Controller Pilot Data Link Communications, Air Traffic Services Interfacility Data Communications, tools for dynamic workload allocation, and both short-term and long-term conflict detection/prediction capabilities.

The ATOP acquisition strategy is one that will leverage the global marketplace through taking advantage of available technology by purchasing a non-developmental system. The strategy provides for an iterative evaluation process where the FAA uses increasingly refined filters to determine which one of the systems available provides the best match between existing capabilities and our FAA workforce. It is the FAA's intent to modify procedures, to the extent consistent with the highest level of safety, to fit existing systems rather than engage in a large developmental effort. Prior to obligating the government to any significant resources, the FAA will have negotiated a multilateral agreement between the FAA, its union workforce and the contractor, which establishes low risk solution with firm price, schedule and cost baselines.

The FAA has already completed the majority of the evaluation process for the first filter. As part of the first filter, potential vendors were allowed to bring their candidate systems to the FAA's Technical Center for demonstration testing. The ATOP schedule provides for the evaluations to be completed with a selection recommendation for two vendors to move on to the next filter by the end of May 2000. Planning for the second filter, which will include first level operational testing, is already ongoing.

Question. What is the FAA's view on the contracting out of air traffic control?

Answer. In the short term, the FAA has initiated an air traffic control system replacement program called the Advanced Technologies and Oceanic Procedures (ATOP) acquisition which will introduce new Communication, Navigation and Surveillance technologies into the oceanic environment, supporting our customer's growing needs. Our controllers are very much involved in this activity and are working with our technicians and engineers to choose the right system and develop the oper-

ational procedures to support its introduction. On the longer term, the President recently directed the FAA to come back to him in 45 days with a plan for achieving broader reform of the air traffic control system. The FAA will consider this proposal during its deliberations.

Question. How much is the FAA paying potential oceanic contractors to participate in the procurement?

Answer. Each contractor received approximately \$500,000 to participate in the show-me demonstrations for Advanced Technologies and Oceanic Procedures, for a total of \$1,500,000.

WIDE AREA AUGMENTATION SYSTEM

Question. On April 1, 1996, the FAA began operating under a new procurement system. The new system was to enable FAA to address the unique needs of the agency and provide for more timely and cost effective acquisition of equipment and materials. Despite the Congress granting FAA this reform nearly four years ago, many FAA modernization projects, such as WAAS and STARS, have encountered significant schedule delays and cost overruns. Also, other projects, such as Oceanic Automation and National Airspace System Infrastructure Management System, have been significantly restructured. At least two independent reviews of the FAA's acquisition management system found that the agency had not achieved its acquisition goals of executing more timely and cost-effective programs. What steps has FAA taken to develop accurate information for use in decision making, including accurate estimates of the cost of programs and the time to develop them?

Answer. The FAA has established the investment analysis process as a way for the stakeholder organizations to work collaboratively to identify potential alternative technical solutions or approaches to a given shortfall in mission capability. This often includes a market survey and identification of potential trade-offs between requirements and cost and schedule. This emphasis on better cost and schedule planning earlier in the process should result in more accurate estimates.

Question. Since Congress granted the agency acquisition reform in 1996, how has this helped the FAA to meet its goals for ATC Modernization?

Answer. The agency's acquisition reform first authorized in 1996 has helped simplify, integrate, and unify elements of life cycle acquisition management into a more effective system. This has helped the FAA to meet its goals for ATC.

Acquisition reform has shifted focus to life cycle management of program, created an improved structure and processes for defining FAA needs and investments, established corporate-level decision making for FAA needs and investments, and increased involvement of stakeholders in decision-making process.

Substantially streamlined procurement processes have produced a 50 percent reduction in the time to award contracts and has increased the percentage of contracts awarded competitively and based on best value, improved communications with FAA vendors, and has an impact on improving delivery of products and services.

Question. What steps has FAA taken to ensure that it provides oversight of all its modernization projects—those under development as well as those in operation?

Answer. The FAA has initiated several different reform efforts aimed at providing oversight of its modernization project.

Performance Plans. FAA took an important step in support of culture change and improved performance by formulating and promulgating annual outcome-based, mission-focused performance goals and indicators in Lines of Business (LOB) performance plans. These plans are shared goals between applicable LOB's.

FAA Acquisition Executive Advisory Board (FAB). FAB is an established group of executives, across all lines of business to ensure that the appropriate steps are taken in the front-end of the acquisition process of all programs. FAB also, provides links between the Research, F&E, and Operations budgets.

Quarterly Acquisition Reviews. The FAA schedules these Acquisition Reviews for the sole purpose to inform senior managers and key executives about the status and risks in acquisition projects that are under way. Information from these reviews is intended to provide a basis for building consensus and discussing challenges that could inhibit the success of critical acquisitions.

Integrated Product Development System (IPDS). IPDS is a team-based process that established cross-functional teams throughout FAA's lines of business to produce effective and efficient products/services that satisfy customer/user needs. Past examples of successful team-based programs are the En-Route Display System Replacement (DSR) and Host and Oceanic Computer System Replacement (HOCSR).

FAA-integrated Capability Maturity Model (FAA-iCMM). The Agency developed and began using the iCMM as a unified approach for evaluating its processes and improving them. This cross-functional process involving employees from different

LOBs and is anticipated to further provide a more effective and efficient collaboration between Agency organizations in order to achieve higher levels of maturity on the model's scale.

Requirements Process. The requirements process was reengineered to establish a single organizational entity in order to better manage system requirements and ensure improved collaboration with the teams.

Portfolio Management. The FAA plans to implement portfolio management to aggregate investment candidates into funding categories in order to facilitate managing the capital investment portfolio as a whole, increasing benefits, and managing risks.

Question. What is the status of FAA's effort to reform its culture, including fully implementing integrated product development teams to acquire and management systems?

Answer. The FAA's strategy for acquisition culture change is a dynamic process that provides a framework and focal point for integrating individual interventions of various organizational elements and strengthens the drive toward better performance. The FAA has instituted important structural and procedural changes designed to eliminate culture, acquisition, and organizational problems of the past:

Integrated Product Development System (IPDS). This process is helping to transform how the Agency does business, and facilitates breaking down stovepipe organizational barriers. Through IPDS, the Agency is focusing on corporate issues and problems affecting the FAA, such as human factors, and life cycle acquisition management. IPDS is gradually changing how employees and management interrelate by recognizing the value and utility of cross-functional teams for applicable tasks and how employees are empowered by managers.

Other ongoing initiatives designed to change and improve the Agency's culture include the requirements process and performance planning. The requirements process has been reengineered to better manage system requirements and ensure improved collaboration with the teams. FAA has taken an important step in support of culture change and improved performance by formulating and promulgating outcome-based, mission-focused performance goals and indicators in our performance plans.

Performance-driven behavior change within a large organization, such as the FAA, is a challenging task. Change management of this magnitude and difficulty can be successful over time and with the consistent and focused attention of its leaders. The Agency is making progress in all three areas identified in the 1999 Booz-Allen & Hamilton Report. The FAA is making progress through a variety of efforts to change the acquisition culture, overcome organizational barriers ("stovepipes"), and recognize and address gaps in AMS. The FAA is committed to having a workforce and business practices that are adaptable to changing aviation and technological environments and that provide the safest, most efficient and responsive aerospace system in the world.

INVESTMENT PORTFOLIO

Question. In its April 1999 report on FAA's investment management approach, GAO said that the Acquisition Management System was a good first step in establishing a structured, disciplined process for managing FAA's modernization investments, but concluded that the system had some very significant shortfalls that limited its effectiveness. GAO made five recommendations designed to correct problems it had identified with the system. GAO directed the FAA to establish and control a complete investment portfolio, including those projects already in operation. What has been done to implement this recommendation?

Answer. The FAA has developed the CIP with associated funding requirements for five years that tie to OMB outyear targets. This plan is the basis of the agency's investment portfolio for selecting and controlling investment decisions. The FAA is developing full life-cycle baselines for acquisition programs, which are included in the agency's CIP. The agency will incorporate in to its CIP all of the future F&E appropriation funded programs in its CIP.

Question. Exactly how many projects and systems are in the modernization investment portfolio?

Answer. Within the agency's CIP, there are 113 identified projects in the ATC services and facilities sustainment and new ATC services groupings that constitute the agency's modernization effort.

Question. Of those, how many have reliable cost baselines?

Answer. The FAA has baselined 29 major acquisition programs in the services and facilities sustainment groupings. There are an additional 17 major acquisition programs with baselines in process or identified to be baselined.

Question. When will the FAA have reliable operations cost baselines for every project in your investment portfolio?

Answer. To date the FAA has approved operations baselines for 15 CIP and ten legacy projects, accounting for over 55 percent of the operations cost identified in the System Architecture. The 15 CIP projects with operations cost baselines include seven baselined in fiscal year 1999 and eight in fiscal year 2000. By the end of fiscal year 2000, the FAA has targeted an additional ten CIP projects for baselining. This would bring the total operations baselines of CIP projects to 25. We are assessing how best to complete all baselines for the 113 identified F&E projects.

REPORTING ON ESTIMATED VERSUS ACTUAL PERFORMANCE

Question. GAO reported in April 1999 that information use to control projects was incomplete since FAA had not fully implemented an effective process for controlling the baselines for the costs, schedules, benefits, performance, and risks of its investments. At that time, FAA had approved baseline information for only half of the required universe of projects and the agency's processes for tracking actual performance against estimates frequently had provided incomplete information. The acquisition management system had been in place for three years when the GAO report was issued in April 1999. Why, then, was the FAA only able to establish and approve baselines for half of the projects during that three-year period?

Answer. The universe of projects targeted for baselining in GAO's report were F&E funded programs. Many of the projects were undergoing investment analysis and were, therefore, premature to baseline. The FAA currently has 44 projects baselined, and plans to have four more projects baselined by the Spring of 2000, which provides baselines for over 70 percent of F&E expenditures.

Question. Why is it taking so long for the FAA to develop and finalize the most basic baseline data on these key projects?

Answer. Of the F&E funded programs in the universe of projects identified in GAO's report, many are still undergoing investment analysis and will not have baselines until after the Joint Resources Council (JRC) approves the investment. Since programs are being managed to baselines, it is very important to develop accurate baselines. That can not be done until the investment analysis is complete and the number of systems to be purchased is determined along with a detailed estimate of system costs.

Question. GAO also found that the FAA frequently has incomplete reports on projects' estimated versus actual performance in the areas of cost, schedule, benefits, and performance. What has the FAA done to change this situation?

Answer. The FAA developed a centralized information system known as the Simplified Program Information Reporting Evaluation database. Programs are required to report variances to their cost, schedule, performance, and benefits baselines monthly. All program variances are tracked and included in a quarterly report to the JRC. Substantial acquisitions with variances greater than 10 percent are reported to the FAA Administrator for her determination to continue or terminate the program.

Question. Given the substantial cost overruns, lengthy delays, and significant performance shortfalls that have characterized FAA's modernization program, how important is it for the FAA to closely monitor and document its estimated versus actual performance?

Answer. A program's estimated versus actual performance is monitored at the highest level in the FAA. The FAA has developed an information system known as the Simplified Program Information Reporting Evaluation system, in which programs report monthly on variances to their program's baseline. Variances to baselines are monitored and documented in a quarterly report to the JRC. In addition, key officials are briefed monthly by the product teams on the status of cost, schedule, performance, benefits, and risk. Similarly, members of the JRC are briefed semi-annually on these same areas. The Associate Administrator for Research and Acquisitions (the Federal Acquisition Executive) obtains a monthly status of key milestones for critical projects via updates to the Program Status Matrix wall charts. Finally, the FAA Administrator is notified of substantial acquisitions with variances of greater than 10 percent for her determination to continue or terminate the program.

Question. What specific steps are being taken to implement the GAO recommendations to ensure project officials fully track and document estimated versus actual results on all baseline elements?

Answer. The development of the Simplified Program Information Reporting and Evaluation System, variance tracking and reporting to FAA management, and reporting to the FAA Administrator variances of greater than 10 percent are some ex-

amples of FAA's progress in implementing the GAO's recommendations to document estimated versus actual results on the baseline elements.

NATIONAL AIRSPACE SYSTEM MODERNIZATION

Question. When will the FAA have a complete and enforced systems architecture for the ATC modernization program?

Answer. The FAA understands the question to relate to the technical architecture for the en route air traffic automation modernization that we define the allocation of functions, before the en route automation software is replaced. The technical architecture timing is dependent upon funding for fiscal year 2001. The technical architecture will be completed within one year of program funding and before production commitments are made to modify or replace the current 1970's technology software.

Question. When will the FAA complete its efforts to institutionalize sound cost estimating processes?

Answer. FAA uses sound cost estimating processes appropriate to the level of detail needed for a given estimate. The Agency has established a standard work breakdown structure, and completed the development of a Cost Estimating Handbook, dated January 2, 1998, which provides guidance for all our estimates.

COST ACCOUNTING SYSTEM

Question. When will the FAA have a cost accounting system in place?

Answer. The FAA is implementing the cost accounting system in phases by organization from fiscal year 2000 through fiscal year 2002. To date, the FAA has implemented en route and oceanic services for the Air Traffic Services (ATS) line of business. The fiscal year 1998 and fiscal year 1999 costs of these services have been identified. ATS Flight Service Stations will be added in fiscal year 2000 and terminal/tower services in the beginning of fiscal year 2001. The implementation schedule for all organizations is:

| FAA organization | Date |
|--|-----------------|
| ATS Flight Service Stations | June 2000. |
| ATS Terminal and Tower | October 2000. |
| Research and Acquisitions | February 2001. |
| Aeronautical Center | April 2001. |
| Airports/Commercial Space Transportation | November 2001. |
| Certification and Regulation | February 2002. |
| Civil Aviation Security | June 2002. |
| Staff Offices | September 2002. |

FAA SOFTWARE PROCESSES

Question. When will the FAA be able to report that its software processes are at a mature level? What challenges are causing this effort so long to complete?

Answer. FAA is improving its processes using an integrated approach that improves systems engineering, software engineering, acquisition, and management processes simultaneously via the FAA's integrated Capability Maturity Model (FAA-iCMM). There are nine process areas that must be performed at a planned and tracked, and repeatable capability level to be considered maturity level 2. The nine process areas are: Needs, Requirements, Outsourcing, System Test and Evaluation, Transition, Project Management, Contract Management, Quality Assurance and Management, and Configuration Management. The Agency has recently completed a major appraisal of eleven engineering and acquisition programs spanning the FAA acquisition lifecycle, and also have appraised the maturity of several processes performed across the FAA Technical Center. The results of these appraisals indicate that the majority of the programs or organizations assessed have achieved capability level 2 for most of the nine maturity level 2 process areas that are relevant to the engineering and acquisition activities that each program/organization performs. Several of the eleven programs assessed have reached full maturity level 2. Those programs that have not yet completely reached maturity level 2 are currently preparing action plans, which when implemented, will allow them to reach full maturity level 2 by the end of fiscal year 2000.

Additionally, the FAA continues to build on the process improvement accomplishments to date. Overall, FAA is performing extremely well in improving its processes following an integrated approach. This integrated effort is being achieved at a pace

faster than the industry norm, where typically it takes 25 months to improve from level 1 to level 2 on the Capability Maturity Model (CMM) for software alone. In roughly that timeframe, FAA has been achieving mature process on the FAA-iCMM, which is equivalent to achieving comparable maturity on three CMMs simultaneously: the CMMs for Software, Software Acquisition, and Systems Engineering. Because of continuing changes in technology and in the identification of new or improved "best practices," process improvement can never be considered complete.

ACQUISITION REFORM

Question. How has acquisition reform helped the FAA meet its goals for ATC modernization? How has it impeded the FAA from meeting those goals?

Answer. The agency's acquisition reform authorized in 1996 has aided to simplify, integrate, and unify elements of life cycle acquisition management into a more effective system, which has helped the FAA to meet its goals for ATC modernization. Acquisition reform has shifted focus to life cycle management of programs, created an improved structure and processes for defining FAA needs and investments, established corporate-level decision-making for FAA needs and investments, and increased involvement of stakeholders in decisions. Substantially streamlined procurement processes have produced a 50 percent reduction in the time to award contracts, increased the percentage of contracts awarded competitively and based on best value, improved communications with FAA vendors. It also improves the delivery of products and services.

FACILITY SECURITY

Question. When will the FAA correct known weaknesses and complete security accreditations for its 187 facilities?

Answer. The FAA has established a six-year program to upgrade security and complete accreditation of approximately 1,000 staffed facilities, not 187 as referenced in the question. Upgrades and accreditations are planned for completion by 2005.

AIR TRAFFIC CONTROL SYSTEMS ASSESSMENTS

Question. When will FAA complete its efforts to assess, certify, and accredit all air traffic control systems, as required by agency policy?

Answer. The FAA plans are to complete the certification and authorization of its critical air traffic control systems by May 2003. This date is dependent upon required funding to support the risk assessments and mitigation of any high-risk items or vulnerabilities found during the assessment process.

AIR TRAFFIC CONTROL SECURITY REQUIREMENTS

Question. When will the FAA complete its efforts to ensure that specifications for all new ATC systems include security requirements based on detailed security assessments?

Answer. The FAA will complete all risk assessments for new ATC systems by May 2003, in accordance with Presidential Decision Directive 63. High-level NAS requirements have been developed. The FAA is currently developing "protection profiles" at the system level in compliance with National Institute of Standards and Technology standards. These protection profiles will define security requirements for new NAS systems.

BACKGROUND CHECKS

Question. In December 1999, GAO reported that the FAA had not consistently performed background checks or investigations on contractor employees, as required by its policy. In fact, GAO provided an example in which 36 mainland Chinese nationals were provided copies of some of FAA's most important air traffic control systems, but had not undergone background searches as required by FAA policy. GAO made several recommendations to address security weaknesses, and FAA agreed to implement these recommendations. What are the FAA's plans for enforcing its policy on background checks or investigations to ensure that such a lapse does not occur in the future? When will the FAA complete its efforts to address the GAO recommendation?

Answer. FAA has taken swift action to address the key issues identified in the December 1999 GAO report, and continues longer-term actions to ensure that it has the policies and procedures in place to ensure background checks or investigations are conducted, as necessary, on contractor employees.

FAA's Civil Aviation Security (ACS) provided contractor personnel security requirement briefings to acquisition personnel during the month of March 2000 to heighten their awareness of the requirements of FAA Personnel Security Order 1600.1D, and remind them of their responsibilities under the order.

The FAA Office of Acquisitions has developed, in coordination with ACS and Legal Counsel for Procurement Policy, new security provisions (clauses, guidance, prescriptions, and forms) for use in new, as well as existing contracts. The new prescriptions require contracting and operating offices to implement the requirements of 1600.1D in all contracts, unless a determination is made that no access by Contractor personnel to FAA facilities, sensitive information and/or resources is required.

These new provisions clarify the requirements for conducting risk/sensitivity level determinations for each applicable position under a contract and for mechanisms to allow initiating appropriate background checks/investigations prior to allowing a contractor employee to start or to continue work on a FAA system.

Since January 2000, the FAA continues reviewing all of its existing contracts, as well as all new contracts before issuance, to ensure appropriate risk/sensitivity level designations for applicable positions under those contracts are made. Where appropriate, FAA is incorporating the appropriate security provision(s), which call for contractor employees to provide necessary forms to allow the FAA to conduct, as necessary and appropriate, the background checks/investigations.

ACS is developing procedures, intended to be in place by September 2000, for conducting semi-annual audits of contracts for the sole purpose of monitoring compliance with FAA order 1600.1D.

All existing, as well as newly awarded, contracts should be modified by the first ACS review in September 2000.

In accordance with the order, ACS will ensure the required background checks or investigations are conducted and will maintain a contractor personnel database.

OVERSIGHT OF AVIATION REPAIR STATIONS

Question. Last summer, the FAA issued two NPRM's concerning oversight of aviation repair stations. One concerned the training and certification requirements for repair station personnel. This NPRM was subsequently withdrawn. What are the reasons for the withdrawal of the NPRM, and what is the FAA's plan for issuing a revised NPRM? The other NPRM had been several years in the making and addressed more comprehensively the oversight of repair stations. The comment period was extended and expired the end of last year. Can you estimate when a final rule will be published?

Answer. The Revision of Certification Requirements: Mechanics and Repairmen NPRM was published on July 9, 1998. More than 1500 commentaries responded to the NPRM. Most of the commentaries opposed the provision in the NPRM to establish the Aviation Maintenance Technician and Aviation Maintenance Technician (Transport) certificates. Several associations such as the Regional Airline Association, the Aircraft Owners and Pilots Association, the Aeronautical Repair Manufacturers, and the National Air Transportation Association opposed the NPRM and some associations asked the FAA to withdraw the NPRM. As a result, the notice to withdraw the Revision of Certification Requirements: Mechanics and Repairmen NPRM was published on August 5, 1999. The NPRM was withdrawn due to the large number of comments that were received in opposition. A review is being conducted to determine what actions are needed to bring Part 65 in line with the comments received and whether or not to reissue Part 66.

The Part 145 Review: Repair Stations NPRM was published on June 21, 1999, with a comment period deadline of October 19, 1999. The comment period deadline was extended to December 3, 1999. The FAA received 535 comments in regards to the NPRM. The FAA is currently analyzing these substantive comments and anticipates publishing the rule April 3, 2001, which is within 16 months of the comment period deadline and in accordance with the FAA Reauthorization Act of 1996 final rule publication requirements.

PROTECTION OF VOLUNTARILY SUBMITTED INFORMATION

Question. For many years flight safety experts have identified the proactive use of data from flight data recorders as an essential means of achieving the eighty percent reduction in aviation accident rates set by the White House Commission on Aviation Safety and Security. One of Administrator Garvey's first acts as FAA Administrator was to expedite rulemaking that would enable the use of this information. Yet it was only last fall that a NPRM protecting this information from release

under the FOIA was issued. Why did it take so long to issue this NPRM, and when do you anticipate a final-rule?

Answer. The FAA initiated the Protection of Voluntarily Submitted Information rulemaking on December 11, 1996, as a result of a requirement established in the FAA Reauthorization Act (Act) of 1996 and a recommendation from the White House Commission on Aviation Safety and Security. The Act allows the Administrator, through FAA regulations, to protect from disclosure voluntarily provided information related to safety and security issues. The White House Commission on Aviation Safety and Security noted that the most effective way to identify problems is for people who operate the system to self-disclose the information, but there is reluctance to provide information to the FAA unless it can be protected.

Throughout the NPRM process, the determining of the rule's scope and approach and performing economic analysis required coordination within FAA as well as the Office of the Secretary of Transportation and the Office of Management and Budget. Issues identified at each stage of the review process required resolution prior to the publication of the NPRM.

The Protection of Voluntarily Submitted Information NPRM was published on July 26, 1999, with a comment deadline of September 24, 1999. On September 21, 1999, the National Transportation Safety Board requested that the FAA extend the comment period by 30 days. Consequently on October 5, 1999, the FAA published a notice reopening the comment period for an additional 30 days resulting in the closing of the comment period on November 4, 1999. The FAA is developing the final rule, and anticipates publishing the rule by February 26, 2001, which is within 16 months of the close of comment period and in accordance with the FAA Reauthorization Act of 1996 final rule publication requirements.

AIRPORT MOVEMENT AREA SAFETY SYSTEM (AMASS)

Question. Given the difficulties with AMASS procurement, does it make sense to take a step back from the program and consider whether other emerging capabilities within other procurements that have not experienced comparable difficulties might have complementary or corresponding capabilities that could obviate the concerns that the AMASS program purportedly should address. Does the ADS-B program have a role to play in addressing the runway incursion problem?

Answer. The FAA has completed an in-depth review and restructuring of AMASS and concluded that the revised program goals will be met. The AMASS system is a key player in helping prevent accidents that could result from runway incursions. Yes. The ADS-B program does have a role to play in addressing the runway incursion problem.

The total program quantity of 40 systems are on contract utilizing prior year funding authority; 29 systems have been delivered and 23 systems have been accepted by the FAA. A total of 38 systems will be installed at the 34 highest priority airports, with two support systems in Oklahoma City. With active union participation and new program management in place, the program is now on schedule. Human factor issues critical to the commissioning process have been corrected. Operational Test (OT) critical issues have been resolved and have passed factory testing and field testing in Atlanta. The OT regression testing to validate the corrections is on schedule to be completed in June 2000. Initial operating capability (IOC) is on schedule for August 2000. The Independent Operational Test & Evaluation will follow starting in September in San Francisco and in October in Detroit. First AMASS commissionings are scheduled for early calendar year 2001, following completion of the required FAA in-service review process.

The ASDE-3/AMASS is the only currently available technology that includes safety logic that has been formally operationally tested with the participation of FAA Airways Facilities and Air Traffic personnel. Technologies such as multilateration and data fusion, which are being tested at Dallas/Fort Worth airport, under a research and development program, still required an extensive development effort to become operationally suitable in the FAA's National Airspace System. A new program named ASDE-X, now in the acquisition phase with a contract award scheduled for September 2000, will incorporate these new technologies. These new technologies will not include the safety logic that is the core of the AMASS system. The ASDE-X systems are planned to be deployed at airports other than the ASDE-3/AMASS sites. The current schedule for AMASS includes commissioning of all systems by the end of calendar year 2002, prior to the first possible commissioning of an ASDE-X system scheduled for calendar year 2003.

ADS-B will be able to contribute two critical solutions to the runway incursion issue. The first component would provide ADS-B target information to the controllers. This capability would be similar to radar based ASDE display functionality in

the tower cab, but would provide controllers with more accurate target information, such as aircraft data tag and precise GPS derived position.

The second component is ADS-B driven cockpit surface moving map displays. Safe Flight-21 is currently developing commercial cockpit displays, which provide pilots critical information such as their precise position on the airport surface relative to other aircraft occupying runways or about to land. This tool should be very effective in reducing the number of pilot and vehicle deviations, by providing pilots and ground vehicles the same "situational awareness" picture afforded only to tower controllers today. More importantly, since ADS-B works between equipped aircraft pairs, cockpit moving map displays would offer a level of safety at airports that currently don't have ASDE equipment.

AIRPORT IMPROVEMENT PROGRAM

Question. Please provide a listing of the top 50 airside airport projects that add capacity to the system. Please provide the estimated costs of such projects and the years in which those costs occur. In addition, please provide any relevant cost benefit information with those projects.

Answer. New runways generally provide the largest increases in airside capacity. Twenty-eight new runways have been identified at the 100 busiest airports in the National Plan of Integrated Airport Systems as a result of local planning efforts for a total estimated cost of nearly \$7,000,000,000 for all 28 runways. Construction of these new runways represents many more than 50 airside airport projects; however, for purposes of providing a meaningful level of information, projects are listed at the airport level, without breaking airport initiatives into lower level airside airport projects.

Of the 28 proposed new runways, four are under construction with runway operational dates of: 2000 for Phoenix; 2001 for Detroit; 2003 for Minneapolis; and 2006 for Seattle. Following is the list of airports with planned runways through 2010. Benefit-cost analyses and funding plans (approved Letters of Intent) for Detroit, Minneapolis, and Seattle have been completed. The remaining locations either are or will be examined as the AIP project approval process evolves.

TOP 100 AIRPORTS

Proposed New Runways (through 2010)

| LOCID | City, State | 98 Rank | Hub Category | Runway Identifier | Opening Date | Work Begun | Cost (Millions) | Status |
|--------------|--------------------------|---------|--------------|-------------------|--------------|------------|-----------------|-------------------------------|
| PHX | Phoenix, AZ | 9 | Large | 7/25 | Oct-00 | 1997 | \$185 | Under Construction |
| DTW | Detroit, MI | 10 | Large | 4/22 | 2001 | 1999 | \$116 | Under Construction |
| CLE | Cleveland, OH | 33 | Medium | 5W/23W | 2002 | | \$1,000 | Construction to begin 10/00 |
| MIA | Miami, FL | 8 | Large | 8/26 | Early 2003 | | \$206 | |
| MCO | Orlando, FL | 16 | Large | 17L/35R | Early 2003 | | \$132 | |
| CLT | Charlotte, NC | 21 | Large | 18W/26W | 2003 | | \$140 | |
| MSP | Minneapolis, MN | 15 | Large | 17/35 | Late 2003 | 1999 | \$490 | Under Construction |
| IAH | Houston, TX | 14 | Large | 8L/28R | 2003 | | \$130 | EIS Underway |
| DEN | Denver, CO | 6 | Large | 16R/24L | 2004 | | \$160 | |
| SRQ | Sarasota-Bradenton, FL | 91 | Small | 14L/32R | 2004 | | \$10 | |
| ATL | Atlanta, GA | 1 | Large | 9S/27S | 2005 | | \$450 | |
| CVG | Cincinnati, OH | 23 | Large | 18R/36L | 2005 | | \$233 | |
| IAD | Washington Dulles, VA | 28 | Large | 1W/19W | 2005 | | \$200 | |
| GSO | Greensboro, NC | 75 | Small | 5L/23R | 2005 | | \$96 | |
| BOS | Boston, MA | 17 | Large | 14/32 | 2005 | | \$50 | |
| DFW | Dallas-Ft. Worth, TX | 4 | Large | 18R/36L | 2005 | | \$367 | Need Environ. Revalidation |
| ORF | Norfolk, VA | 72 | Small | 5R/23L | 2005 | | \$100 | |
| TUS | Tucson, AZ | 65 | Medium | 11R/29L | 2005 | | \$30 | |
| STL | St. Louis, MO | 13 | Large | 12/30 | 2006 | | \$850 | |
| SEA | Seattle, WA | 18 | Large | 16W/34W | 2006 | 1999 | \$773 | Under Construction |
| PIT | Pittsburgh, PA | 24 | Large | 10/28 | 2006 | | \$150 | |
| BWI | Baltimore-Washington, MD | 27 | Large | 10R/28L | 2008 | | \$150 | |
| IAD | Washington Dulles, VA | 28 | Large | 12R/30L | 2008 | | \$200 | |
| IND | Indianapolis, IN | 44 | Medium | 5R/23L | 2008 | | \$80 | |
| MSY | New Orleans, LA | 40 | Medium | 18/36 | 2010 | | \$400 | Environmental Not underway |
| RSW | Ft. Myers, FL | 61 | Medium | 6R/24L | 2010 | | \$80 | |
| GSP | Greer-Greenville | 95 | Small | 3R/21L | 2010 | | \$65 | |
| TUL | Tulsa, OK | 67 | Medium | 18/36 | 2010 | | \$115 | |
| SFO | San Francisco, CA | 5 | Large | | | | | EIS underway (ROD 2001); 2007 |
| TOTAL | | | | | | | \$6,958 | |

Local planning efforts have identified 28 new runways at the top 100 airports through 2010. This does not constitute approval or a commitment on behalf of the FAA to participate in the funding of these runways.

REVENUE DIVERSION

Question. The GAO reported that (1) unauthorized land use at general aviation airports had results in safety hazards and led to revenue diversion or loss, which FAA has not always addressed; (2) airport revenues have been diverted at Bader Field, New Jersey and at Queen City Airport in Pennsylvania, since the early 1970's and (3) FAA's decision to allow Kansas City to sell the Richards-Gebaur Memorial Airport without an appraisal or ensuring the fair market value was improper. In its response, FAA stated that its field offices were aware of the cases cited by GAO. FAA said it prefers to address noncompliance through negotiations and settlement with the airport sponsor. FAA said it was carefully reviewing the proposed leases of the Richards-Gebaur Airport and would consider amending the Memorandum of Agreement or rejecting the structure of the sale. GAO recommended that FAA's compliance policy guidance be revised to require among other things, periodic on-site visits and to include specific criteria for initiating enforcement actions and set reasonable time frames for taking progressively stronger enforcement actions in cases where efforts to achieve voluntary corrective action are unsuccessful. If FAA field offices knew about these unauthorized land uses, safety hazards, and diversion of revenues, abuses that in several cases cited by GAO, went on for decades, why didn't the agency take actions to stop them?

Answer. In the past the FAA encouraged its field offices to resolve compliance issues on an informal basis. The consequence was that some negotiations took unacceptably long periods of time. Now, thanks in part to the February 16, 1999, issuance of the FAA Policy and Procedures Concerning the Use of Airport Revenue and the Rules of Practice for Federally Assisted Airport Proceedings (published October 16, 1996), the issues are defined more clearly, negotiations are more focused, and the FAA is quicker to use its administrative process to assure compliance. Additionally, each region remains responsible for monitoring and surveillance of airport sponsor compliance with Federal obligations on a routine basis. FAA HQ monitors the regions compliance monitoring and surveillance by requiring each region to submit a semiannual compliance monitoring and surveillance report to the Airport Compliance Division at FAA Headquarters. This report includes, but is not limited to, each region's land release activities, compliance evaluations and determinations, as-well-as corrective and enforcement action taken to effect airport sponsor compliance.

Question. Is there a time frame for how long the FAA will allow airport land to be usurped and revenues to be diverted before taking action?

Answer. Once the FAA becomes aware of an alleged violation of an airport sponsor's Federal obligations it acts immediately to investigate the alleged violation either formally or informally. Our first choice in addressing an apparent airport owner assurance violation is always to seek voluntary compliance through the informal compliance efforts of our regional offices, or to otherwise resolve the issues at the regional level. However, when voluntary compliance cannot be achieved, FAA Headquarters will initiate a formal FAA investigation in accordance with FAR Part 16. FAA policies and procedures do not provide a standard time frame in which corrective actions must be completed because all cases are different. In most cases, the actual time taken to complete enforcement action can be attributed to the time associated with the FAA informal and formal administrative processes, and the legal requirement to provide the opportunity for correction of the condition prior to enforcement action, as provided in FAR Part 16. The time frame for the compliance process may vary greatly depending on the complexity of the case and the airport specific circumstances. However, it has always been FAA's policy to resolve compliance matters as quickly as possible.

Question. Provide some instances and dates when the FAA has taken enforcement action in the past five years. More specifically, what enforcement action has the FAA taken to resolve long-standing instances of non-compliance and revenue diversion at the Queen City Airport in Pennsylvania and at Bader Field, New Jersey?

Answer. The FAA has taken the following enforcement action with regard to Queen City and Bader Field.

Queen City. The FAA worked extensively with the City of Allentown, Pennsylvania, to resolve the Office of Inspector General's finding of a \$2,400,000 revenue diversion at the Queen City Airport. Although the city disagrees with the amount of the finding, it entered into negotiations with the Lehigh Northampton Airport Authority (LNAA) to transfer the Airport to the LNAA as a means of repaying the diverted revenue. As the result of the negotiations, the City and the LNAA agreed in principle to the transfer, but the transfer has not occurred yet, due to two unresolved issues. First, the city wants to continue its use of the Vultree hangar as a municipal garage. Second, the city proposed a plan to close both the Queen City and

the Lehigh Northampton Airports and replace them with a new facility. Since negotiations have stalled, the FAA is currently taking action to re-coup the revenue diversion reported in the audit finding.

Bader Field. The FAA continues to work with Atlantic City to resolve the land-use and safety issues at the Bader Field Airport. With regard to the land-use issues, the FAA is waiting for the city to support its claim that it provides sufficient financial aid to the Airport to offset any rent on the land that the city uses for non-airport purposes. With regard to safety issues, on March 3, 2000, the FAA issued an emergency Order of Compliance to the city that required the city to operate the airport in a safe manner. On March 6th and 10th the city met with the Assistant U.S. Attorney to discuss the steps the city must take to comply with the Order. The outcome of those meetings was a three-party agreement in principle among the city, New Jersey Department of Transportation, and the United States Attorney to improve signage and markings on the airport. The FAA is awaiting the signed copy of the agreement. If the city refuses to sign the agreement, the United States Attorney has the option of obtaining a court injunction to enforce the order. In the meantime, the FAA is continuing to conduct safety inspections at the airport.

Question. Has the FAA taken any steps to obtain information, either through site visits by the FAA personnel or from interested parties, regarding general aviation airport compliance with land and revenue use requirements?

Answer. The FAA continues to believe that the extent of unauthorized land use was overstated in the GAO report. GAO's random sample of 506 airports produced issues at only nine airports, or fewer than 2 percent of the airports surveyed. The FAA was aware of all those issues, which had been previously identified under long-standing procedures, such as FAA's formal and informal complaint processes, through which airport users often bring matters of airport sponsor non-compliance to the attention of the FAA. Moreover, the FAA is working on and continues to address the issues identified by the GAO.

Information on compliance matters at general aviation airports can come to the FAA from a number of sources or interested parties. Airport users at the airport are usually the initial source of information regarding potential problems with a sponsor's ability to comply with its grant assurances. This information can be brought to the agency's attention directly by the airport users in an aviation support group such as the Aircraft Owners and Pilots' Association Airport Support Network. State aviation departments that routinely conduct inspections of general aviation airports will also communicate with FAA local and regional offices about safety and compliance problems.

Also, the FAA proposes to select annually a total of 18 general aviation airports (two per region) to conduct on-site compliance inspections. The selections will be made based on prior or current knowledge of compliance issues at the airports. Absent such issues, The FAA will concentrate on airports that are large in size (extensive acreage as reported on the FAA Form 5010, Airport Master Record), in relation to the level of aircraft operations at the airport. Airports with substantial acreage and no aeronautical purpose for such land would presumably have more opportunity and incentive for unauthorized land use. To achieve this goal, we will employ airport compliance specialists in the field, or in the alternative, safety certification inspectors knowledgeable of airport compliance requirements will conduct on-site compliance reviews.

MILITARY AIRPORT PROGRAM

Question. Please provide a list of airports currently in the Military Airport Program (MAP) Program.

Answer. The following is a list of the 12 airports currently in the MAP. Eleven of these former surplus military airfields were declared surplus under the recent Department of Defense Base Realignment and Closure program and have been converted to reuse as civil airports. Chippewa County International is a former surplus military airfield currently being used as a civil primary commercial service airport. The list of 12 airports includes:

| | |
|---|---|
| Austin-Bergstrom Austin, TX (BSM) (Bergstrom AFB) | Alexandria International Alexandria, LA (AEX) (England AFB) |
| Homestead Regional Miami, FL (HST) (Homestead AFB) | Rickenbacker International Columbus, OH (LCK) (Rickenbacker AFB) |
| Millington Municipal Memphis, TN (NQA) (Memphis NAS) | Sawyer Airport Gwinn, MI (SAW) (K.I. Sawyer AFB) |
| Williams Gateway Phoenix, AZ (IWA) (Williams AFB) | Myrtle Beach International Myrtle Beach, SC (MYR) (Myrtle Beach AFB) |

Southern California International
Victorville, CA (VCV) (George AFB)
Chippewa County International Sault
Ste Marie, MI (CIU) (Kincheloe AFB)

Pease International Tradeport
Portsmouth, NH (PSM) (Pease AFB)
Cecil Field Jacksonville, FL (VQQ)
(Jacksonville NAS)

AIRPORT IMPROVEMENT PROGRAM

Question. Please provide a table showing AIP projects for which obligations were incurred more than two years ago and no cash expenditures have been made, similar in format to table provided in the past to the appropriations committees.

Answer. The AIP projects table is listed below.

| Location | Airport | Project No. | Federal funds |
|---------------------------|--------------------------------|-------------|---------------|
| Hayward, CA | Hayward Executive | 09-97 | \$150,000 |
| Oceano, CA | Oceano County | 03-97 | 374,000 |
| Oceanside, CA | Municipal | 01-95 | 674,385 |
| Sacramento, CA | Metropolitan | 21-97 | 3,594,191 |
| San Carlos, CA | San Carlos | 07-97 | 108,000 |
| San Luis Obispo, CA | County | 15-97 | 704,007 |
| Tracy, CA | Municipal | 07-95 | 117,090 |
| Hilo, HI | International | 07-97 | 2,371,500 |
| Honolulu, HI | International | 39-97 | 933,000 |
| Honolulu, HI | International | 40-97 | 5,625,000 |
| Honolulu, HI | International | 41-97 | 3,455,075 |
| Kalaupapa, HI | Kalaupapa | 02-97 | 243,000 |
| Kaunakakai, HI | Molokai | 04-97 | 1,350,000 |
| Lihue, HI | Lihue | 19-97 | 3,422,963 |
| Detroit, MI | Detroit Willow Run | 17-97 | 345,267 |
| Keene, NH | Dillant-Hopkins | 13-97 | 962,280 |
| New Hampshire | State | 01-97 | 83,041 |
| Atlantic City, NJ | International | 23-97 | 250,000 |
| New Jersey State | Block Grant | 07-97 | 285,000 |
| Newark, NJ | International | 53-95 | 2,432,000 |
| Newark, NJ | International | 55-96 | 1,000,000 |
| Flushing, NY | LaGuardia | 50-94 | 1,216,000 |
| Newburg, NY | Stewart International | 22-95 | 5,097,277 |
| Newburg, NY | Stewart International | 23-96 | 1,174,081 |
| Newburg, NY | Stewart International | 24-97 | 1,492,183 |
| New York, NY | E. 34th Street | 02-96 | 488,099 |
| Syracuse, NY | International | 49-97 | 1,616,699 |
| Utica, NY | Oneida County | 16-96 | 383,697 |
| Las Vegas, NV | McCarran International | 36-97 | 3,055,838 |
| Reno, NV | Reno/Tahoe International | 26-97 | 400,000 |
| Reno, NV | Reno/Stead | 13-97 | 500,000 |
| Hazleton, PA | Municipal | 06-95 | 500,000 |
| Pennsylvania | State of Pennsylvania | SB-97 | 225,000 |
| Philadelphia, PA | International | 25-90 | 975,000 |
| Total Federal funds | | | 45,603,673 |

Question. Please provide a copy of each letter of intent issued over the past year. Please provide a table outlining the commitment of AIP funds for letters of intent projects.

Answer. The FAA did not issue any new letters of intent (LOI) in fiscal year 1999. However, a number of applications were reviewed during the year, resulting in the recommendation to approve four. Three LOIs were issued after submission to Congress on March 3 for a 30-day period. The fourth LOI, for Dallas-Fort Worth International is being held pending development of mutually acceptable language concerning a possible AIP grant compliance issue. Copies of the proposed LOIs with commitments of AIP funds follow.

LETTER OF INTENT

Dallas/Fort Worth International Airport Dallas/Fort Worth, Texas

Project Description: Design and construct Runway 17C extension (2,012 feet), Runway 18L extension (2,012 feet), Runway 18R extension (2,012 feet), Northwest Holding Apron and associated taxiway development.

PAYMENT SCHEDULE

| Fiscal year | Apportionment | Discretionary | Total |
|--------------------|-------------------|-------------------|-------------|
| 2000 | | \$6,292,000 | \$6,292,000 |
| 2001 | | 2,292,000 | 2,292,000 |
| 2002 | | 3,292,000 | 3,292,000 |
| 2003 | | 4,892,000 | 4,892,000 |
| 2004 | | 4,892,000 | 4,892,000 |
| 2005 | | 5,692,000 | 5,692,000 |
| 2006 | | 5,692,000 | 5,692,000 |
| 2007 | | 2,752,000 | 2,752,000 |
| 2008 | | 2,552,000 | 2,552,000 |
| 2009 | | 5,292,000 | 5,292,000 |
| 2010 | | 6,000,000 | 6,000,000 |
| Total | 49,640,000 | 49,640,000 | |

MIAMI INTERNATIONAL AIRPORT MIAMI, FLORIDA

Project description: Construct new northside runway complex, consisting of: New Runway 8-26 (8,600 ft by 150 ft), relocated parallel Taxiway "L" (8,600 ft by 75 ft) and taxiway connectors, parallel Taxiway "K" (8,600 ft by 75 ft) and taxiway connectors; including airfield lighting and signage, grading and drainage, runway grooving, pavement marking, obstruction removal, removal of utilities, removal of buildings, and removal of contaminated materials. Construction includes airside service road and NAVAIDS (2 localizers with DME, REILS and 2 PAPIs).

PAYMENT SCHEDULE

| Fiscal year | Apportionment (Entitlement & Cargo) | Discretionary | Total |
|--------------------|---|-------------------|--------------------|
| 2000 | \$7,000,000 | \$5,000,000 | \$12,000,000 |
| 2001 | 7,000,000 | 3,000,000 | 10,000,000 |
| 2002 | 7,000,000 | 2,840,000 | 9,840,000 |
| 2003 | 7,000,000 | 4,000,000 | 11,000,000 |
| 2004 | 7,000,000 | 5,000,000 | 12,000,000 |
| 2005 | | 8,000,000 | 8,000,000 |
| 2006 | | 7,550,000 | 7,550,000 |
| 2007 | | 8,000,000 | 8,000,000 |
| 2008 | | 4,000,000 | 4,000,000 |

AIRPORT IMPROVEMENT PROGRAM

Question. Please provide a bar chart showing actual and estimated PFC collections for fiscal years 1994 through 2001. Please shade the actual bars with estimated commitment of collections to landside v. airside projects.

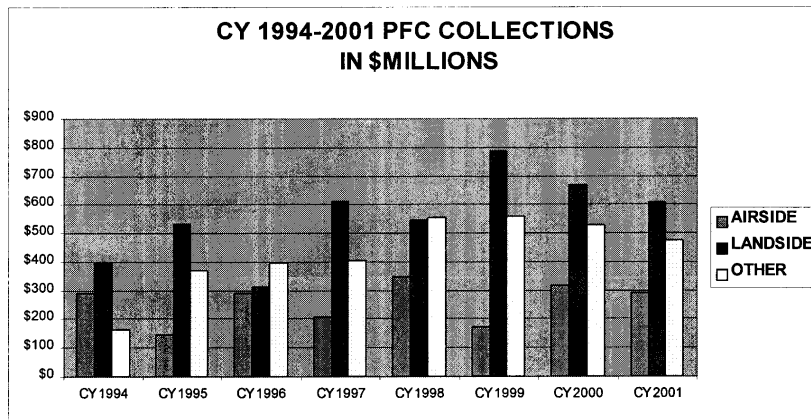

Answer. The following bar chart provides the requested information on actual and estimated PFC collections by calendar year. The FAA produces passenger facility charge (PFC) collection data based on calendar years (CY), not fiscal years, to avoid confusion among public agencies that use a variety of different fiscal year definitions.

The FAA has been conservative in its official estimates of future PFC collections. Estimated collections are based on latest published actual enplanement statistics and airports collecting PFCs as of the start of the year. CY 2000 and CY 2001 estimates in the bar chart do not assume new PFC applications or PFC levels above \$3 and are therefore conservative. However, assuming new applications, PFC actual collections may exceed \$1.55,000,000,000 in CY 2000 at the \$1,600,000,000 in CY 2001 at the \$3 level.

In addition, AIR-21 raises the maximum PFC level to \$4.50. The FAA is unable to ascertain at this time the number or airports that will seek or the number of projects that will qualify for the higher \$4.50 PFC. However, assuming that all eligible airports seek and implement the higher PFC, it could generate as much as \$200,000,000 in additional CY 2000 and \$700,000,000 in additional CY 2001 collections.

The next bar chart provides an estimated allocation of PFC collections by landside, airside, and other projects. "Landside" projects in this chart include ground access and terminal projects. "Airside" projects include runways, taxiways, aprons, and associated airfield projects. "Other" projects include debt payments (typically for a blend of project types), planning, noise, and miscellaneous items. Allocation to these categories was done by reviewing annual PFC authority approved by project type and applying the resulting ratios to collections in that year. This allocation approach provides the clearest indication of annual variations in project mixes submitted to the FAA for PFC approval. The project allocations for 2000 and 2001 are based on the average ratios of the prior six years.

QUESTIONS SUBMITTED TO THE FEDERAL HIGHWAY ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

DISCRETIONARY BRIDGE FUNDING

Question. Please provide a list of all bridges eligible for discretionary bridge funding for which the agency has (or expects within the next fiscal year) an application. Please indicate whether such bridge is eligible for discretionary funding, other discretionary programs.

Answer. The following lists contain bridge candidate projects (both seismic and non-seismic) that were considered for fiscal year 2000 funding under the Discretionary Bridge Program. The status of our actions on each project are noted in the tables. For fiscal year 2001, the request for candidates was issued on April 15, 2000. We do not expect to receive the fiscal year 2001 candidates before July 2000. Those bridge projects on the Interstate system costing over \$10 million and ready for construction within one year of the allocation are eligible for Interstate Maintenance discretionary funds which is indicated on the lists for the appropriate projects. Discretionary bridge applications do not contain the information necessary for us to make a determination of eligibility for public lands discretionary or the corridors/borders discretionary programs.

DISCRETIONARY BRIDGE PROGRAM FOR FISCAL YEAR 2000 FUNDING

[Seismic Retrofit Candidates]

| State | Project | Comments |
|------------------------------|------------------------------------|--|
| California | Golden Gate Bridge | Funded with fiscal year 2000 DBP funds. |
| Tennessee and Arkansas | Hernando Desoto Bridge | Funded with fiscal year 2000 DBP funds. Also eligible for IM discretionary. |
| Washington | Spokane Street Over-crossing | Meets rating factor criteria (RF=40.7), but did not meet eligibility criteria (a 4th quarter project) for funding in fiscal year 2000. |

Only two candidates submitted for fiscal year 2000 funds are well-qualified according to the eligibility criteria. The Golden Gate Bridge and the Hernando Desoto Bridge are continuing projects and have received seismic retrofit discretionary funds in previous years. The Hernando Desoto Bridge is in the New Madrid Fault region.

DISCRETIONARY BRIDGE PROGRAM FOR FISCAL YEAR 2000 FUNDING

[Non-Seismic Candidates]

| State | Project | Comments |
|---|--------------------------------|---|
| Continuing Projects (Partially funded in previous years): | | |
| Michigan | Dequindre Yard | Funded with fiscal year 2000 DBP funds. Also eligible for IM discretionary. |
| Missouri | Chouteau Bridge | Funded with fiscal year 2000 DBP funds. |
| Tennessee | Loudon City Memorial | Funded with fiscal year 2000 DBP funds. |
| Washington | Snohomish River Br | Funded with fiscal year 2000 DBP funds. |
| South Carolina | Grace Memorial Bridge | Did not meet eligibility criteria (4th quarter project) for funding in fiscal year 2000. |
| Olympic Cities Projects: | | |
| Utah | Kimballs Jct. Bridge | Not funded in fiscal year 2000—unfavorable rating factor and therefore low benefit to cost ratio. Also eligible for IM discretionary. |
| Utah | Silver Creek Jct. Bridge | Not funded in fiscal year 2000—unfavorable rating factor and therefore low benefit to cost ratio. Also eligible for IM discretionary. |
| Other Non-seismic Projects: | | |
| New Mexico | I-25/I-40 Interchange | Funded with fiscal year 2000 DBP funds. Also eligible for IM discretionary. |
| Illinois | Wacker Drive Viaduct | Funded with fiscal year 2000 DBP funds. |

DISCRETIONARY BRIDGE PROGRAM FOR FISCAL YEAR 2000 FUNDING—Continued

[Non-Seismic Candidates]

| State | Project | Comments |
|-------------------------|--|--|
| Kansas | Turner Diagonal Bridge | Earmarked in H.R. 2084 Conference Report and funded with fiscal year 2000 DBP funds. |
| West Virginia | Williamstown-Marietta Bridge | Earmarked in H.R. 2084 Conference Report and funded with fiscal year 2000 DBP funds. Also eligible for IM discretionary. |
| New York | North Grand Island Bridge | ¹ Eligible-not funded. |
| Minnesota | Ford Bridge | ¹ Eligible-not funded. |
| New York | Stutson Street Bridge | ¹ Eligible-not funded. |
| Michigan | Grand Rapids (R07) | ¹ Eligible-not funded. |
| New Hampshire & Vermont | Rt. 9 over Connecticut Riv | ¹ Eligible-not funded. |
| Rhode Island | Washington Br. Over Seekonk River | ¹ Eligible-not funded. Also eligible for IM discretionary. |
| Michigan | Grand Rapids (R06-1) | ¹ Eligible-not funded. |
| Michigan | Grand Rapids (R06-2) | ¹ Eligible-not funded. |
| Texas | Sabine River Bridge | ¹ Eligible-not funded. Also eligible for IM discretionary. |
| New York | Ridge Rd. over Railroads | ¹ Eligible-not funded. |
| Mississippi | Jourdan River Bridge | ¹ Eligible-not funded. Also eligible for IM discretionary. |
| Massachusetts | Hadley Bridge (Calvin Coolidge Mem. Br.) | ¹ Eligible-not funded. |
| West Virginia | Star City Bridge | ¹ Eligible-not funded. |
| Massachusetts | Fall River Bridge | ¹ Eligible-not funded. |
| New York | Marcy Ave. Ramp | ¹ Eligible-not funded. |
| New York | Manhattan Bridge | Eligible-not funded. |
| Mississippi | Pascagoula River Bridge | ¹ Eligible-not funded. |
| Missouri | Lexington-Missouri Riv. Br | ¹ Eligible-not funded. |
| Massachusetts | Fitchburg Bridge | ¹ Eligible-not funded. |
| Alaska | Kenai River Bridge | ¹ Eligible-not funded. |
| Texas | Trinity River Bridge | ¹ Eligible-not funded. |
| Alabama | Clement C. Clay | Did not meet eligibility criteria (4th quarter project) for funding in fiscal year 2000. |
| Florida | Royal Park Bridge | Did not meet eligibility criteria (4th quarter project) for funding in fiscal year 2000. |
| Kentucky | Burnside-Monticello Bridge | Did not meet eligibility criteria (4th quarter project) for funding in fiscal year 2000. |
| Maryland | Woodrow Wilson Bridge | Did not meet eligibility criteria (4th quarter project) for funding in fiscal year 2000. |

¹ These projects were eligible for funding, but because of the limited amount of discretionary bridge program funds available for non-seismic projects (\$75 million less obligation limitation), they were not selected for funding.

Seven other projects were submitted by States but are not shown because the bridges were not eligible for various reasons—bridges not deficient, rating factor greater than 100, or not a highway bridge.

Nine projects were earmarked in the Conference Report H.R. 2084. Two were funded as shown above, but seven others were not because they did not meet program eligibility criteria.

RABA TRANSFERS

Question. Please provide a revised version of the tables starting on page II-15 of the Federal Highway budget justification to reflect the levels for each line without the Administration's proposed transfers from RABA and within the original program without exempting any activity from the proportionate obligation limitation restriction necessitated by the TEA-21 legislation's levels.

Answer.

FEDERAL-AID HIGHWAYS ESTIMATED OBLIGATIONS

[In millions of dollars]

| Programs | Fiscal years— | | |
|---|---------------|----------------------------|-----------------------------|
| | 1999 actual | 2000 estimate | 2001 estimate (current law) |
| Subject to limitation: | | | |
| Surface transportation program | 6,227 | 6,216 | 6,726 |
| National highway system | 4,888 | 5,319 | 5,757 |
| Interstate maintenance | 3,357 | 4,419 | 4,785 |
| Bridge program | 2,565 | 3,785 | 4,102 |
| Congestion mitigation and air quality improvement | 1,145 | 1,509 | 1,635 |
| Minimum guarantee | 2,167 | 1,763 | 2,000 |
| Safety incentive grants for use of seat belts | 54 | 80 | 99 |
| Safety incentive to prevent operation of motor carrier by intoxicated persons | 43 | 70 | 79 |
| ITS standards, research and development | 75 | 98 | 97 |
| ITS deployment | 71 | 124 | 114 |
| Transportation research | 208 | 220 | 216 |
| Federal lands highways | 339 | 653 | 673 |
| National corridor planning and coordinated border infrastructure | 118 | 122 | 136 |
| Administration | 331 | 304 | 316 |
| Other programs | 2,162 | 432 | 582 |
| High priority projects | 581 | 1,560 | 1,631 |
| Woodrow Wilson memorial bridge | 1 | 139 | 194 |
| Transportation infrastructure finance and innovation | 48 | 101 | 107 |
| Appalachian development highway system | 319 | 394 | 388 |
| Emergency Relief | | | 9 |
| Motor Carrier Safety Administration | | | 16 |
| Total subject to obligation limitation | 24,700 | ¹ 27,308 | ² 29,662 |
| Emergency relief program | 129 | 111 | 100 |
| Minimum allocation/guarantee | 858 | 702 | 664 |
| Demonstration projects | 248 | 394 | 275 |
| Total exempt programs | 1,234 | 1,207 | 1,039 |
| Emergency relief supplemental | 97 | 15 | |
| Grand Total, Federal-aid highways (direct) | 26,031 | 28,530 | 30,701 |

¹Reflects estimated obligation which is less than the adjusted obligation limitation.²At this level of obligation limitation, an estimated \$29.677 billion will be obligated

MISSISSIPPI DELTA

Question. On page 763 of the budget appendix, on line 00.34, \$23 million is requested for the Delta initiative. On page 765 of the budget appendix, under the RABA write-up, a \$48 million Mississippi Delta initiative is noted. Please provide a comparison of these two initiatives and provide details as to the anticipated uses of the funds requested for these initiatives. Is any of the requested money slated for a particular project or community?

Answer. A total of \$48 million is requested within highway program funding for the Mississippi Delta initiative. Of this, \$25 million would be used for I-69 and the Great River Bridge.

INTELLIGENT TRANSPORTATION SYSTEM

Question. Please restructure the fiscal year 2001 request to comport only with last year's appropriations report and TEA-21 and submit all spending allocation tables.

Answer. With the exception of the Mainstreaming line item included in the fiscal year 2000 Conference Report; the fiscal year 2001 budget request contains the exact line items as included in the Conference Report. The costs of exhibits, printing and publications, which constitutes the Mainstreaming line item, have been included in the various program line items in the fiscal year 2001 budget request.

All spending allocation tables are included as part of the response to the next question.

Question. In addition, please submit for fiscal year 1999 and fiscal year 2000 comparable spending allocation tables to those for the fiscal year 2001 requests, as displayed on tab 4, pages 1–5 of the fiscal year 2001 Budget Justification. Please describe how program continuity is ensured.

Answer. Attached are spending allocation tables for fiscal years 1999 and 2000. We ensure program continuity by diligently comparing the projects and various budget request program areas to overall ITS program objectives and performance plans and then assuring that spending plan allocations are in line with programs and projects as included in our various budget requests. You will note that, historically, the ITS program has maintained a structure of funding which has remained relatively constant over the years, with changes only being made to accommodate additional legislative and/or program requirements. These processes assure program continuity.

HIGHWAY/RAIL GRADE CROSSINGS

Question. What is the status of each of the ITS projects intended to advance safety at highway/rail grade crossings? For each project, please list accomplishments to date, purposes and objectives, amount obligated, amount planned to be spent, amount unobligated, scope and nature of the project, status, and expected date of completion.

Answer. There are currently seven projects supported by USDOT that examine how ITS can improve safety and efficiency of travel at rail-highway grade crossings. These seven active projects are in addition to the Vehicle Proximity Alert System (VPAS) field testing that was completed in 1994. The Federal share of funding for these seven projects comes from a wide variety of sources: FHWA, FRA and FTA. Several are grass-roots initiatives that were included as part of corridor or statewide “high-priority” (earmarked) programs that local participants chose to pursue without federal assistance.

Minnesota Guidestar

Purposes and objectives.—The Minnesota Department of Transportation entered into a partnership with 3M Corporation and Dynamic Vehicle Safety Systems (DVSS) to develop an in-vehicle warning system, and test that system in a revenue service operational railroad crossing environment. In addition, the partners tested a passive train detection system developed by DVSS.

Amount obligated/Amount planned to be spent/Amount unobligated.—This project was funded as part of Minnesota Guidestar—Minnesota’s statewide ITS program.

Scope and nature of the project.—The system uses 3M’s wireless vehicle and road-side communication antennas that can be built into the crossbuck, “RXR” sign and front vehicle license plate. The track?side unit picks up a signal from the railroad’s train detection electronics and transmits that signal to 3M’s antenna-signs. The in-vehicle display, provided by DVSS, alerts drivers using both visual and audible signals. The passive system detects an internal radio frequency communication emitted by the Front Rear End Device (FRED), which is used by most freight railroads to coordinate braking between the front and rear of the train. The FRED passive train detectors are installed directly onto the vehicles, so that no special equipment is needed at the crossing infrastructure. SRF Consulting Group, Inc. served as an independent evaluator during the tests.

Status.—Testing took place on 30 school buses at five revenue service crossings, operated by Twin Cities & Western Railroad, in Glencoe, Minnesota—a rural community 30 miles west of the Minneapolis/St. Paul metropolitan area. Testing of the in-vehicle warning system took place from December 1997 to May 1998 and testing of the passive train detection system took place in June 1998.

Expected date of completion.—The project was completed in August 1998 and a final evaluation report is available.

Gary-Chicago-Milwaukee Corridor

Purposes and objectives.—The Illinois Department of Transportation is partnering with a team lead by Raytheon E-Systems to design and install an in-vehicle warning

system, test that system in a revenue service operational railroad crossing environment, and provide on-going maintenance of the system.

Amount obligated/Amount planned to be spent/Amount un-obligated.—This project is being funded as part of the Gary-Chicago-Milwaukee ITS Corridor program.

Scope and nature of the project.—The contract team includes Cobra Electronics, Calspan SRL and the Metro Transportation Group as subcontractors. The advisory in-vehicle warning systems were installed in 300 vehicles, including school buses, emergency service vehicles (police, fire, EMS), and commercial vehicles which regularly traverse the study area. The study area included five railroad grade crossings on the Metra-Milwaukee North Line which is in the northern Chicago suburbs. The in-vehicle receiver is capable of operating in three modes: audible only, visual only and combination audio/visual. The University of Illinois at Urbana-Champaign is serving as an independent evaluator during the test. The University of Illinois evaluation will emphasize the reaction and perception of the drivers to the warning information provided under different modal scenarios.

Status.—The track-side equipment was installed in Spring 1998, but due to technical problems, the in-vehicle equipment had to be replaced. This was completed in the Fall of 1999. Additional system refinement postponed the beginning of the demonstration until early March 2000. The system has begun a one-year testing period.

Expected date of completion.—The one year testing and evaluation period should be completed by April 2001 and an evaluation report will be finished by early Fall 2001.

Long Island Railroad

Purposes and objectives.—The New York State Department of Transportation is partnering with Alstom Signaling (formerly known as General Railway Signal Corp.) to develop an Inter-modal Control System (ICS) that uses ITS technologies to perform a number of functions to improve railroad crossing safety. NYSDOT and Alstom will test the ICS in an operational environment.

Amount obligated/Amount planned to be spent/Amount un-obligated.—Thus far the amount of federal funds that have been spent is \$4.8 million. The amount of federal monies remaining is \$2.82 million. The matching funds that have been spent are \$5 million with \$975 thousand remaining. The total cost of the current project is \$13.6 million and no other sources of funding have been identified to complete the project.

Scope and nature of the project: Several HRI-ITS technologies will be tested at the New Hyde Park transit station of the Long Island Rail Road:

- Uniform Time Warning System.*—Sensors that detect the speed as well as the presence of on-coming trains will activate bells, lights and gates, so that the time between activation and the arrival of the train is constant. This innovation is expected to reduce gate down-time by up to 50 percent.
- Near-Side Station Stop.*—Currently, when the train is stopped at the station, the train activates gates and warning lights at both crossings on both sides of the station platform, which creates a situation where impatient drivers might drive around the lowered gates. The combination automatic/manual override system will improve this situation by activating the gates and warning lights at crossings that are very close to the Hyde Park Station.
- Variable Message Sign.*—A variable message sign will provide motorists and pedestrians with current information about train operations, such as a second train approaching, etc.
- Priority Vehicle Preemption System.*—Vehicles that require expedited movement, such as ambulances or fire trucks, will have equipment installed on their vehicles that will allow the driver to request preemption at a desired crossing. An approaching train would be slowed or stopped to allow the priority vehicle to cross. If the train has already passed the safe breaking point, the priority vehicle will be given advance notice that it will need to wait at the crossing or use an alternate route.
- Stalled Vehicle Detection.*—If a vehicle becomes stopped or stalled on the crossing for any reason, the ICS will detect the situation and signal the train to stop before reaching the crossing.

The Volpe National Transportation Systems Center will serve as an independent evaluator during the test.

Status.—Simulations conducted have shown the reduction in delay to motor vehicles at the crossing. The testing is expected to begin in the summer 2000 and the demonstration of the full system capabilities is expected to begin in the Fall 2000.

Expected date of completion.—The project is expected to be completed and a final evaluation report made available by December 2000.

Baltimore Light Rail Transit "Second Train Coming"

Purposes and objectives.—The Maryland Mass Transit Administration tested a second train warning system, which consists of a variable message sign that warns drivers on crossing multiple tracks that a train is approaching. The system was tested in a revenue service crossing environment.

Amount obligated/Amount planned to be spent/Amount un-obligated.—This project was funded by a grant from the Transit Cooperative Research Project (TCRP) program of the Transportation Research Board. The grant is administered by the FTA's Office of Technology (TRI-20).

Scope and nature of the project.—The system was tested at the Timonium Road crossing in Timonium, MD, on the Maryland Mass Transit Administration's light rail transit line.

Status.—The system became operational in September 1998.

Expected date of completion.—The project was completed as of the Spring of 1999 and a final evaluation report is available.

Los Angeles Light Rail Transit "Second Train Coming"

Purposes and objectives.—The Los Angeles Metropolitan Transportation Authority is testing a second train warning system which consists of a variable message sign that warns drivers on which of multiple tracks a train is approaching. The system will be tested in an operational railroad crossing environment.

Amount obligated/Amount planned to be spent/Amount un-obligated.—This project is being funded by a grant from the Transit Cooperative Research Project (TCRP) program of the Transportation Research Board. The grant is administered by the FTA's Office of Technology (TRI-20).

Scope and nature of the project.—The system is being tested at the Vernon Avenue crossing in Long Beach, CA on the Los Angeles Metropolitan Transportation Authority's light rail transit line.

Status.—Installation of the equipment was completed and testing began in the Fall 1999.

Expected date of completion.—The project is expected to be completed and a final evaluation report is expected to be available by the Spring 2000.

San Antonio AWARD

Purposes and objectives.—The Texas Department of Transportation tested a train detection system for traffic management and traveler information called Advanced Warning for Railroad Delays (AWARD). The system was tested in an operational railroad crossing environment.

Amount obligated/Amount planned to be spent/Amount un-obligated.—The AWARD project was part of the San Antonio Metropolitan Model Deployment Initiative, a Federally-funded ITS program in four metropolitan areas to develop and then showcase integrated ITS systems.

Scope and nature of the project.—Acoustic sensors and radar speed guns were placed upstream of three crossings along the Union Pacific Railroad line parallel to I-410 in San Antonio. These sensors were expected to detect the presence, length and speed of approaching trains. The time and duration of crossing blockage was then calculated. The predicted delay was disseminated in three ways:

—Variable message signs upstream from the crossing to alert drivers to take alternate routes or freeway exits to avoid delay.

—The TransGuide traffic management center includes delay information updated each minute and distributed via the Internet to in-vehicle displays.

—Emergency service vehicles such as ambulances use the delay information to plan their routes in real-time.

MDI evaluation contractors SAIC, Virginia Polytechnic Institute and the Volpe National Transportation Systems Center evaluated the system's costs and its ability to reduce travel time and increase travelers' perceived convenience.

Status.—The system became operational in the Summer of 1998 and continued for one year through the Summer of 1999.

Expected date of completion.—The project has been completed and a final evaluation report is available.

Connecticut Four-Quadrant Gate System

Purposes and objectives.—The Connecticut Department of Transportation tested an in-locomotive warning system that warns the locomotive engineer if an obstacle, such as a stopped vehicle, is blocking the crossing in time to bring the train to a complete stop. The system was tested in a revenue service operational railroad crossing environment.

Amount obligated.—\$800,000 has been obligated from Section 1036 of ISTEA (FRA) with \$200K matching funds provided by the State.

Amount planned to be spent.—All funds have been spent, which are \$800,000.

Amount unobligated.—\$0

Scope and nature of the project.—A system of four-quadrant gates is used rather than the usual two in order to totally block the crossing. This four-quadrant gate system allows for the possibility that a vehicle might get stuck between the gates. Sensors detect if a vehicle or other obstacle is blocking the crossing and then signals the locomotive engineer in time to stop the train before the train reaches the crossing. A back-up system can also bring the train to a stop automatically, if necessary.

Status.—The demonstration began in July 1998 and continues in operation today. Furthermore, a second crossing in Stonington, Connecticut, has been equipped and will become operational in 2000. Six more crossings in Connecticut are scheduled to be equipped with this system. An evaluation report will be prepared by the Volpe Center later this year (2000).

Expected date of completion.—The project is complete and a final evaluation report is available.

ITS INVESTMENTS

Question. What has been achieved as a result of past ITS investments in that area? How much is budgeted for standards development and operational testing in that area in fiscal year 2001?

Answer. The investment in the Vehicle Proximity Alert System (VPAS) project, which tested several competing in-vehicle warning technologies, provided the opportunity to refine the passive train detection system developed by Dynamic Vehicle Safety Systems (DVSS). The DVSS system was later tested in an operational environment in the Minnesota Guidestar project.

The ITS Joint Program Office is sponsoring a cross-cutting study that will derive common lessons learned from the activities described above. One of the steps in data collection of the cross-cutting study was the hosting of an HRI Evaluation Workshop, which was held in Boston, Massachusetts May 6–7, 1999. Representatives from each of the seven projects described above presented their project implementation plan and evaluation results. This cross-cutting study will provide a basis for a strategic plan for future Federal HRI–ITS activities. In addition, the lessons learned will help guide communities throughout the nation in the implementation of highway-rail crossing technology.

In addition, the Federal Railroad Administration in partnership with the ITS Joint Program Office conducted an Highway-Rail Intersection Standards Development Workshop in July, 1999. From that workshop came the action to develop a strategic plan for standards development and a plan for deployment guidance in the absence of standards. The strategic planning efforts are planned to begin in the Spring of 2000. They will be led by the Federal Railroad Administration.

The fiscal year 2001 budget includes \$200,000 in funding for standards development and another \$150,000 for HRI evaluation. The intention in fiscal year 2001 is to finalize the HRI strategic plan and get early adopted standards established. With this initial foundation, guidance can be given to the communities for including the elements of the HRI architecture in the engineering studies that are conducted for determining the types of warning devices to be installed.

Question. For each of the last three years, please compare your actual expenditures with the amounts appropriated for each ITS category of funds specified in the conference report. Please indicate the amount of carryover funds for each year by category and explain any deviations from amounts specified in the various conference reports beyond the 10 percent flexibility that is allowed by the Committee.

Answer. Attached is a table which compares actual amounts allocated to the various ITS fund category (program) to amounts included in the Conference Reports accompanying the DOT Appropriations bills for fiscal years 1998, 1999, and 2000.

Fiscal year 1998 was an extremely unusual year in that the appropriation bill was passed several months prior to Public Law 105–178, TEA–21, an authorization bill which significantly changed funding sources and programs from those envisioned at the time of the passage of the appropriation bill. Therefore, although the table includes a comparison of fiscal year 1998 Conference Report amounts with actual allocations, no legitimate comparison can be made due to these legislative changes.

For fiscal years 1999 and 2000, an adjusted amounts column has been added, the purpose of these columns is to necessarily reduce the Conference Report amounts to comply with reductions in the ITS Research and Development funding as mandated annually by Section 1102(f) of TEA–21. These reductions equated to 11.7 percent in fiscal year 1999 and 12.9 percent in fiscal year 2000.

In fiscal year 1999, after adjusting Conference Report amounts by the Section 1102(f) reductions, all of the actual funding allocations are within the 10 percent flexibility provision allowed by the Committee with the exception of Operational Tests. Fiscal year 1999 ITS Operational Tests were necessarily reduced to provide \$6.648 million in funding to the National Advanced Driver Simulator (NADS) project in accordance with guidance included on page 1421 of the Conference Report which read "National advanced driving simulator. Within the funds provided for ITS research and development and other surface transportation research contract authority programs, sufficient funds are included for ongoing activities of the national advanced driving simulator."

In fiscal year 2000, after adjusting Conference Report amounts by the Section 1102(f) reductions, all of the actual funding allocations are within the 10 percent flexibility provision allowed by the Committee with the exception of Program Support. Most of the items included under Program Support are multi-year contracts and cooperative agreements with organizations such as ITS America, Mitretek, and the Jet Propulsion Laboratory which provide technical programmatic and administrative services without which the ITS program could not successfully operate. Very little flexibility in the funding amounts in these contracts is available; therefore, the full 12.9 percent overall funding reduction required by Section 1102(f) could not be fully applied to this activity. However, the current amount allocated for Program Support (\$8.765 million) is fully within the 10 percent flexibility provision when compared to the actual amount of \$9.0 million included in the Conference Report by the Committee.

ANALYSIS OF R&D FUNDING BY CATEGORY
[Dollars in thousands]

| Program category | Fiscal year 1998 | | | Fiscal year 1999 | | | | Fiscal year 2000 | | | |
|--------------------------------------|------------------|-------------------------------|------------------|------------------|---------------------------|-------------------------------|------------------|------------------|---------------------------|----------------------------------|-----------------------|
| | Amount in report | Actual allocated ¹ | Unoblig. 9-30-98 | Amount in report | Adj. amounts ² | Actual allocated ¹ | Unoblig. 9-30-99 | Amount in report | Adj. amounts ² | Estimated allocated ¹ | Est. unoblig. 9-30-00 |
| RESEARCH AND DEVELOPMENT | \$31,500 | \$39,651 | \$1,347 | \$38,000 | \$33,554 | \$35,976 | \$1,149 | \$47,450 | \$41,329 | \$40,901 | |
| OPERATIONAL TESTS | 83,900 | 8,841 | 2,089 | 17,000 | 15,011 | 7,080 | 4,744 | 6,650 | 5,792 | 6,090 | |
| EVALUATION/PROG. ASSESSMENT | 7,000 | 6,000 | 634 | 6,500 | 5,740 | 5,510 | | 7,000 | 6,097 | 6,000 | |
| ARCHITECTURE/STANDARDS | | 10,662 | 23 | 18,000 | 15,894 | 14,429 | 750 | 16,400 | 14,284 | 14,000 | |
| INTEGRATION/MAINSTREAMING | | 10,837 | 925 | 6,000 | 5,298 | 5,676 | 1,957 | 11,700 | 10,191 | 9,776 | |
| PROGRAM & SYSTEM SUPPORT | 7,760 | 8,654 | 674 | 9,500 | 8,389 | 8,566 | 3,971 | 9,000 | 7,839 | 8,765 | |
| NAT'L. ADV. DRIVER SIM. (NADS) | | | | | | 6,648 | | | | | |
| Total | 130,160 | 84,645 | 5,692 | 95,000 | 83,885 | 83,885 | 12,571 | 98,200 | 85,532 | 85,532 | |

¹ Allocated Amounts reflect reductions in TEA-21 amounts authorized for ITS R&D as required by Section 1102(f) of TEA-21; i.e 10.9 percent in fiscal year 1998, 11.7 percent in fiscal year 1999 and 12.9 percent in fiscal year 2000.

² Adjusted Amounts reflect proportionate reductions in Conference Report amounts as required by Section 1102(f) of TEA-21; i.e 11.7 percent in fiscal year 1999 and 12.9 percent in fiscal year 2000.

Question. Please prepare a detailed table showing any unobligated funds and funds that are obligated but not yet committed by year for any ITS projects specified in the fiscal year 1996-fiscal year 2000 conference reports. What is the status of each of those projects?

Answer.

DEPLOYMENT PROJECTS

Question. Please prepare a list of all of the fiscal year 1996-fiscal year 2000 operational tests or earmarked deployment projects and indicate their starting date, expected date of completion, expected submittal date of final evaluation, remaining unobligated balances, remaining obligated balances, and any anticipated challenges that might interfere with their completion.

Answer. With the exception of the remaining obligated balances, our response is provided in the tables below. In order to provide data regarding unspent balances, we would have to conduct a coordinated effort with our financial administrators both in the Headquarters, Resource Centers and Division Offices to search databases and cross-reference accounting codes.

Please note that the expected date of completion and expected submittal date of final evaluation are the same dates in our definition of project completion. Projects are not considered completed until the final, publicly available evaluation report is approved and submitted. The fiscal year 1999 earmarked deployment/integration projects are listed with estimated completion dates. Accurate identification of evaluation completion dates at this time is problematical since evaluation planning is, in many cases, still in progress. There are currently no unobligated balances of ITS funds associated with these projects except those listed at the end of the response in a separate table. The identification of anticipated challenges is based on project description information only.

| Project | Start date | Expected completion/ final report date | Remain. obligated balance |
|---|------------|---|---------------------------|
| OPERATIONAL TESTS | | | |
| METROPOLITAN ITS INFRASTRUCTURE: DIRECT—Phase II | 5/1/99 | 3/1/01 | \$1,000,000 |

| Commonwealth of Pennsylvania | 10,731,000 |
| Scranton, Pennsylvania | 791,000 |
| University of North Dakota—ATWIS | 549,000 |
| Volusia County, Florida | 791,000 |

JPO SUPPORT

Question. Please specify on a contract by contract basis how the fiscal year 1999, fiscal year 2000, and fiscal year 2001 program support monies were used or will be used. Please indicate the scope, nature, and amount of each contract.

Answer. There are two principal contractors that provide program support to the JPO; ITS America, and the Mitretek Corp. ITS America is the official advisory committee to the U.S. DOT on the ITS program, and organizes and staffs the national committees that address each major facet of the program. These committees are one of the formal forums to bring together technical expertise in specific areas to review the program, suggest research issues to be addressed, and provide a venue for policy discussions with the ITS community. In addition, there are specific tasks the U.S.DOT requests ITS America to perform that require access to their membership, or that they are uniquely qualified to provide. The U.S. DOT funding covers only these activities, and represents \$2.5 million of the approximately \$11 million 2000 annual budget of ITS America.

The Mitretek Corp. provides the principal technical support function for the JPO. Mitretek's support can be categorized into 7 general areas:

- Program planning and assessment
- The rural program
- System architecture and deployment
- Communications and frequency spectrum
- Safety technology research for NHTSA
- IVI program
- Incorporating ITS into the transportation planning process

Mitretek is the technical arm of the JPO. As such, they review and/or generate all of the technical guidance, analyses, and research activities in which the JPO is engaged. Most of the small JPO staff are each managing several areas of the program, and also provide the policy development options and rationale for senior management. The Mitretek staff is the support that allows the existence of a small JPO staff to accomplish these tasks. In 1999, the JPO developed and produced separate technical documents that encompassed technical guidance, results of research and deployment, outreach, and informational documents for use by cities and states across the country. Mitretek drafted many of these documents and is the only entity that maintains in depth technical expertise in all facets of the ITS Program.

There are several small activities that provide support to the JPO in the areas of the computer network, the internet Web page, special support for conferences and workshops, and consultants for special issues that arise during the conduct of the program.

The expenditures for program support fall into three categories; ITS America, Mitretek, and miscellaneous support activities.

[In millions of dollars]

| Activity | Fiscal years— | | |
|---------------------|---------------|------|------|
| | 1999 | 2000 | 2001 |
| ITS America | 2.5 | 2.6 | 2.6 |
| Mitretek | 5.25 | 5.5 | 5.5 |
| Misc. Support | 1.25 | 0.66 | 1.0 |

[In millions of dollars]

| Activity | Fiscal years— | | |
|-------------|---------------|-------|------|
| | 1999 | 2000 | 2001 |
| Total | 9.0 | 8.766 | 9.1 |

NATIONAL SYSTEMS ARCHITECTURE AND STANDARDS

Question. Please specify the amount and purposes of all fiscal year 1998, fiscal year 1999, and fiscal year 2000 contracts relating to the national systems architecture and standards work.

Answer. In fiscal year 1998, fiscal year 1999 and fiscal year 2000, \$2.498 million, \$4.306 million and \$4.830 million, respectively, have been placed on system architecture contracts in support of architecture program activities. This includes \$1.250 million in fiscal year 1998, \$2.103 million in fiscal year 1999 and \$2.355 million in fiscal year 2000 to Lockheed Martin and \$1.248 million in fiscal year 1998, \$2.203 million in fiscal year 1999 and \$2.475 million in fiscal year 2000 to Iteris, Inc. (formerly Odetics, ITS). These funds and contracts support:

Architecture Deployment Support.—Deployment technical assistance involves direct interface with state, local, and regional transportation planners and engineers. As the top priority, the Architecture Team is conducting workshops at many sites around the country to help structure their individual site architectures, to facilitate the identification of common interfaces, and to keep them apprized of ITS standards related to their individual projects. As part of this effort to broad groups of state and local transportation planners, the Architecture Team has and is providing technical support, reviewing draft transportation plans and architectures, and giving presentations to stakeholders and ITS deployers at numerous meetings and conferences throughout the country. In addition, development of an interactive software tool, “Turbo Architecture”, for ITS planners and designers has been completed and will be available in May 2000. This tool will assist them in using the National ITS Architecture as a reference to develop their unique ITS regional and project architectures.

Architecture Training.—The Architecture Team’s previously developed two and three-day architecture training courses have now been given on more than 100 occasions to nearly 2200 persons throughout the country through March 2000. These classes have both public and private sector participation and considerable interaction between the students and members of the architecture team. The courses include use of the CD-ROM version of the architecture as well as practical exercises. A three-day advanced architecture course has been developed as a follow-on and is being given to FHWA and FTA ITS specialists to further enhance their knowledge and understanding.

Architecture New User Service Changes.—The rural user community is in the process of developing a new user service to define ITS needs in the area of rural “operations and maintenance”. This is expected to become the thirty-second user service. Work should begin in late CY 2000 to expand the National ITS Architecture by integrating this stakeholder user service as had been previously done with both highway-rail intersection and archived data.

Maintenance of the National ITS Architecture.—The architecture team is maintaining and keeping the National ITS Architecture current based on ITS standards development efforts and deployment experiences. Design documents from ITS deployment efforts and draft standards from the five standards development organizations under DOT contract have and are currently being reviewed for modifications and additions to the architecture, with more than 100 such modifications in the most recent revision. In addition, a new section, market packages, was developed in response to stakeholder user requirements.

Distribution of the National ITS Architecture.—Two major means are being used to put the architecture in the hands of transportation planners and engineers. More than 9000 copies of the third version (3.0) of the National ITS Architecture, which includes the Archived Data User Service (ADUS), are being distributed on CD-ROM. Distribution of this version began in December 1999. In addition, the most current version of the architecture is and has been available on the FHWA ITS web site as well as the ITS America web site.

In fiscal year 1998, fiscal year 1999, and fiscal year 2000, \$7.673 million, \$9.51 million, and \$9 million, respectively, have been placed on contracts to advance standards work. The standards program is categorized into five areas:

1. Research and Development, which includes analyzing and defining standards requirements.

2. Standards Development, which provides funding for standards development organizations to write the standards and for technical support organizations to analyze and report on current standards and standards development efforts.

3. Testing and Interoperability, which involves investigating the performance of the standards, measuring the degree of interoperability in standardized systems, rigorously “proving” the standards in realistic transportation settings under realistic operating conditions, and providing information about their performance to public agencies.

4. Implementation, which provides transportation stakeholders involved in deploying ITS systems with outreach, resource materials and information, such as user guides and other documentation about the standards, and training and technical assistance.

5. Conformity, which includes policy development and rulemaking support. For the standards program, in fiscal years 1998, 1999, and 2000, the following amounts (in thousands) were budgeted to advance ITS standards in the five areas:

(In thousands of dollars)

| | Fiscal years— | | |
|------------------------------------|---------------|-------|-------|
| | 1998 | 1999 | 2000 |
| Research and Development | 400 | 600 | |
| Standards Development | 5,413 | 4,150 | 4,400 |
| Testing and Interoperability | 1,860 | 2,300 | 2,500 |
| Implementation | | 2,460 | 1,900 |
| Conformity | | | 200 |
| Totals | 7,673 | 9,510 | 9,000 |

During the three-year period, contracts for the standards development effort were primarily to standards development organizations to write standards. Five standards development organizations are supported through cooperative agreements. These are the American Association of State Highway and Transportation Officials (AASHTO), the American Society for Testing and Materials (ASTM), the Institute of Electrical and Electronics Engineers (IEEE), the Institute of Transportation Engineers (ITE), and the Society of Automotive Engineers (SAE). Other contracts for standards development support were awarded to the Volpe Transportation Systems Center, to provide planning and analysis assistance, and The Johns Hopkins University Applied Physics Laboratory, to develop and evaluate dedicated short range communications and electronic data interchange standards. Mitretek Systems and the Jet Propulsion Laboratory (JPL) provided technical and program management support.

In the area of testing and interoperability, Battelle Memorial Laboratory ran the formal standards testing program, Oak Ridge National Laboratory tested location referencing approaches and developed metrics and tests for interoperability, and The Johns Hopkins Applied Physics Laboratory tested commercial vehicle electronic data interchange standards and dedicated short range communications (DSRC) standards.

In the area of implementation, lessons learned reports were provided by Battelle and resource materials and training were provided by JPL, ITE, Volpe, the U.S. DOT Peer-to-Peer Program, the U.S. DOT Professional Capacity Building Program, and Equals3.

ITS SUPPLEMENTAL FUNDING

Question. During fiscal year 1999 or fiscal year 2000, which ITS projects required supplemental federal funding above the amounts specified in their original cooperative agreements? Why were these additional funds added?

Answer. In fiscal year 1999, \$250,000 of additional funding was added to the Automated Collision Notification Operational Field Test to allow for additional data collection. While no other projects requested funding increases, several received ad-

ditional earmarked funding in the fiscal year 1999 and fiscal year 2000 appropriations.

INTERMODAL FREIGHT TECHNOLOGY

Question. Please provide a description of the two projects selected for intermodal freight technology operational testing. What do you expect to gain from these tests? How much money will be spent on each project? What amount of cost sharing was received for each project?

Answer. The two tests are with the ATA Foundation in conjunction with Illinois State DOT, and with Washington State DOT.

The ATA Foundation project with Illinois State DOT builds on a phase I activity called the "O'Hare Air Cargo Security Access System" conducted by FAA, O'Hare Airport and the ATA Foundation. The phase I project's objective was to develop a biometric smart card access system that would both expedite the transfer of truck-air cargo and enhance the process' security. The project was developed, installed, and tested in Chicago using 87 trucking companies, 12 airlines and 500 drivers.

The Phase II project is called "An Integrated Cargo Information and Security System for Intermodal Distribution Channels", which the focus of the partnership with USDOT. In Phase II, a secured multimodal electronic cargo manifest will be developed allowing for the automated transfer of comprehensive cargo data across transportation modes and political jurisdictions. The primary objective of Phase II is to enhance operational efficiency for freight shippers and operators, while ensuring cargo safety and security for the public good. Similar to Phase I, Phase II will involve biometric smart card technologies to ensure system integrity and security. The system will also utilize an internet-based electronic manifest. Lastly, the project will be installed and beta-tested in Chicago's O'Hare Airport using approximately 10 manufacturers, 10-15 trucking companies, and 5-10 air cargo carriers and receivers that will be recruited by SecurCom and the ATA Foundation. After the beta-test is successfully completed, a second airport and supply chain will be added at Newark, New Jersey.

The total project budget is \$1,098,000 with \$468,000 in federal funds, a \$630,000 match from ILDOT and ATA Foundation.

The second project is focused on the Pacific Northwest is in partnership with the Washington State DOT. The purpose of the project is to link public highway ITS technology with private port-side Electronic Data Interchange (EDI) systems. This will decrease operating costs and reduce congestion by permitting freight organizations to identify and bypass transportation bottlenecks.

The project will involve the Puget Sound Regional Council, the Ports of Tacoma and Seattle, several maritime shipping lines, U.S. Customs, a private company that manufactures electronic tags and the Washington Trucking Association. Three test systems will be developed and evaluated as part of this project:

- The use of disposable electronic container doors seal (E-Seals) as a tool to track shipping containers both in the port and along roadways.
- Several traveler information systems designed to reduce congestion on roads leading to a port's gate. Systems being examined include Internet cameras showing roads leading to port gates and a trucker-oriented web site for container pickup notification.
- Linking the many ITS in the region to collect freight data to support local and regional freight planning.
- The total project budget is \$700,000, with \$350,000 in federal funds, a \$350,000 match from Washing State DOT.

NATIONAL ITS ARCHITECTURE

Question. How are investments in earmarked ITS deployment projects impacting the National ITS Architecture? What progress has been made toward implementing the TEA-21 provision regarding conformance with the National ITS Architecture and Standards? What issues remain?

Answer. USDOT is using investments in earmarked ITS deployment projects to advance the National ITS Architecture by requiring that these projects use the National ITS Architecture and, in most cases, make provisions for development of a regional architecture.

Requirements for ITS earmarked projects are based on the proposed policy on conformance with the National ITS Architecture and standards as contained in the Notice of Proposed Rulemaking (NPRM). The project proposal for the earmarked ITS project shall explicitly state how the National ITS Architecture will be incorporated into the project. The proposed integration project must be part of an existing regional ITS architecture, or, if a regional ITS architecture does not exist, the develop-

ment of a regional ITS architecture must be either ongoing or proposed to be developed in conjunction with the proposed integration. Further, if the proposed project develops a regional architecture it must use the National ITS Architecture in the development; must make provision to include participation from all agencies with which information-sharing is planned; and the regional architecture must include a concept of operations and conceptual design.

Considerable progress has been made toward implementing the TEA-21 provision regarding conformance with the National ITS Architecture and Standards. Two NPRMs have been developed that when taken together will implement the TEA-21 provision regarding ITS architecture and standards conformance. The NPRMs are currently in the signature process. The proposed policy contained in the NPRMs was developed through significant internal discussions and through extensive feedback from stakeholder groups.

The proposed policy spans the transportation planning process and project development; therefore, part of the proposed policy is contained in the NPRM on metropolitan and statewide transportation planning. The remainder of the policy is contained in an NPRM titled "Intelligent Transportation Systems Architecture and Standards." The NPRMs are expected to be published in May 2000. A 90-day comment period follows publication after which USDOT must assess and respond to each comment. During the 90-day comment period, seven outreach sessions will be held throughout the country. The purpose of the sessions is to clarify the proposed rule and to encourage comment. If the comments are not significant, a final policy can be developed based on the NPRM and responses to the docket. A final policy could be published in late 2000 but, more likely, in early 2001. Extensive comments would require additional time.

The primary issues lie after publication of the final rule. Assuming the final rule is similar to the currently proposed rule, the final rule will have impact on numerous transportation agencies. USDOT is currently developing a strategy to support policy implementation with 1) federal field staff and 2) stakeholders.

For federal field staff, technical expertise must be developed sufficiently to enable clear understanding, and consistent implementation and oversight of the policy. Additionally, we anticipate that federal field staff are key to supporting policy implementation with stakeholders. We find that developing sufficient technical depth requires repeated exposure to and application of the policy's principals. We anticipate training, application workshops and repetitious video and teleconferences for federal field staff.

For stakeholders, technical expertise must be developed sufficiently to implement the policy. Stakeholders include Metropolitan Planning Organizations (MPO), state departments of transportation, city and county transportation departments and others. Some stakeholders, such as state, city and county transportation professionals and, possibly, technical staff within an MPO, require technical expertise at a depth that enables development and maintenance of a regional architecture. Training will be necessary in the principals of the policy, the technical applications of the National ITS Architecture, and the systems engineering process. For non-technical planning staff and decision-makers an understanding of the application of the policy is necessary at a higher level. These stakeholders need to understand the basic principles and benefits of integration and interoperability in order to apply it locally. Different training will likely be required for planning staff along with an outreach effort to increase awareness of the policy requirements.

INTEGRATION GOAL OF TITLE V

Question. How are you using investments in earmarked ITS deployment projects to advance the integration goal of Title V of TEA-21?

Answer. The stated goal of the ITS Integration Program is to accelerate the integration and interoperability of ITS across system, jurisdictional and modal boundaries. To that end, all ITS earmarked projects in metropolitan areas are required to focus on integration.

Each earmarked project is required to submit a project proposal. Included in the project proposal is an explicit identification of the ITS components that are proposed for integration. Additionally, the proposal must describe the systems that will be integrated and the technologies that will be deployed to integrate them. USDOT guidance for these projects states that funding shall be used for activities necessary to integrate ITS infrastructure components that are either deployed (existing systems) or will be deployed with other sources of funds. For projects in rural areas, the funds may be used for integration purposes as well as for limited deployment of ITS. The guidance material goes on to specify eligible activities all of which are focused on integration. Development of a regional ITS architecture is also an eligible ex-

penditure since it provides the “blueprint” for integrated deployment. The project proposal must also discuss how the project addresses the other requirements of TEA21 including match, architecture and standards conformance, and evaluation.

All ITS earmarked projects are subject to a review by FHWA field staff and an independent validation by a multi-agency team composed of headquarters FHWA and FTA staff and FHWA Resource Center staff. That review makes use of a checklist of key issues that must be satisfactorily addressed to award funding. Two items on the checklist are specific to integration. One item requires validation that the proposed project is consistent with the goals and purposes of the ITS Program as describe in Title V of TEA21. The other item requires validation that the project proposal identifies the ITS infrastructure components that will be integrated.

We have prepared an interim report on the TEA-21 ITS Deployment Program outlining how this program is supporting integration. This report will be submitted to the Committees under separate cover.

EARMARKED ITS DEPLOYMENT PROJECTS

Question. How are you using investments in earmarked ITS deployment projects to advance ITS standards work?

Answer. ITS projects funded through Title V of TEA21 are primary targets for the standards testing program. The guidance materials for these projects requires that the project proposal identify the applicable ITS standards and interoperability tests that are being considered or are expected to be specified in the project. Further, the project proposal shall explicitly state that the proposed integration project will cooperate with the test site analysis and be prepared to serve as an ITS standards testing site if selected. Each project will be analyzed as a potential test site for the US DOT ITS Standards Testing Program. Each project will be evaluated based on a set of established criteria to find ITS field sites that can be used in the ITS testing program.

ITS STANDARDS DEVELOPMENT

Question. With the first wave of ITS standards development nearing completion, what steps are being taken to incorporate these standards into deployment at both the state and local levels?

Answer. Earmarked ITS deployment projects, as well as all other ITS deployment projects, are being treated as opportunities to advance ITS standards deployment, at the state and local levels, through testing, outreach, education, technical support, and conformity support activities.

With the standards development activity now producing a number of approved standards, the emphasis on the standards program is shifting from development towards implementation support. Testing, training, and technical support are being given a greater emphasis and being supported by a greater portion of the standards budget.

Standards testing at actual deployment sites provides information to potential users on the reliability, functionality and performance of systems based upon the standards. Building confidence in the standards through standards testing and the wide distribution of the test results will encourage early voluntary adoption of ITS standards at the state and local levels.

Classroom training on the application of standards will be used to assist users in incorporating the standards into ITS deployments. This training will be developed in a modular fashion to allow easy incorporation into existing traffic management and operations training courses and to allow modules to be combined to meet the needs of a particular jurisdiction.

Technical support will be provided through the development of a wide variety of materials such as fact sheets, user guides, sample procurement specifications, lessons learned and case studies. In addition, as sites are beginning to use standards and run into technical issues, the standards program is prepared to offer technical assistance through the Peer-to-Peer program. Individuals familiar with the standards and their use will be made available to deployers of ITS systems for short-term support and troubleshooting.

Question. When will each of the adopted standards be required to be incorporated into any project receiving federal aid funds?

Answer. Two policy setting processes must be complete for ITS standards to be required in a federal ITS project.

First, the rulemaking must be complete that will require use of ITS standards. A Notice of Proposed Rulemaking (NRPM) has been developed and is currently in the signature process which implements section 5206(e) of TEA21 on conformance with ITS architecture and standards. A section of that NPRM addresses the use of

standards. The proposed policy states that any federally funded ITS project shall use USDOT adopted standards. The NPRM is expected to be issued in May 2000. USDOT must address any comments on the NPRM, and develop and publish a final policy. This process will likely be completed in late 2000 or early 2001. Assuming the final policy is the same as the proposed policy contained in the NPRM, the use of USDOT adopted standards will then be required on all federally funded ITS projects.

Second, specific ITS standards must be officially adopted by the USDOT. Once a standard is developed, tested, and deemed ready to use it must go through its own rulemaking process. Standards are proceeding in this manner today. DSRC for commercial vehicle operations (CVO) credentials and safety reports is the first standard for which rulemaking has been initiated. The DSRC NPRM closed on February 25, 2000. Comments are new under review. Once the rulemaking process is completed, the standard is considered to be a USDOT adopted standard.

Question. When will each of the adopted standards be required to be incorporated into any project receiving Title V TEA-21 funds?

Answer. They will be required as soon as they are adopted. See the answer to the previous question for details on the adoption process.

In the meantime, ITS projects funded through Title V of TEA21 are primary targets for the standards testing program. The guidance materials for these projects requires that the project proposal identify the applicable ITS standards and interoperability tests that are being considered or are expected to be specified in the project. Further, the project proposal shall explicitly state that the proposed integration project will cooperate with the test site analysis and be prepared to serve as an ITS standards testing site if selected. Each project will be analyzed as a potential test site for the USDOT ITS Standards Testing Program. Each project will be evaluated based on a set of established criteria to find ITS field sites that can be used in the ITS testing program.

DEPLOYING ITS INFRASTRUCTURE

Question. In 1996, DOT set a goal of deploying the basic ITS infrastructure in the major metropolitan areas within 10 years. What progress has been made in achieving that goal?

Answer. In January 1996, Secretary Peña set a goal of integrated ITS deployment in 75 of the largest metropolitan areas by 2006. The ITS infrastructure being tracked consists of nine components: Freeway Management; Incident Management; Transit Management; Emergency Management; Transit Management; Electronic Toll Collection; Electronic Fare Payment; Highway Rail Intersections; and, Regional Multimodal Traveler Information. The definition of a complete deployment will vary for each of the 75 metropolitan areas being tracked, in response to variations in local conditions. Factors such as levels of congestion, population growth rates, available budgets, and road and ramp geometry can create quite different sets of requirements for ITS infrastructure in each metropolitan area. Any methodology for measuring progress toward the Secretary's goal must take into account the lack of a single 'one size fits all' solution.

Because of the variation in deployment requirements, it is not currently possible to devise a set of individual deployment goals for each metropolitan area. However, experience in tracking deployment and integration has shown that minimum threshold levels for deployment and integration can be established. These thresholds can provide a common frame of reference for rating deployment and integration progress in the largest metropolitan areas. Using an assessment of the level of metropolitan ITS infrastructure deployment and integration of the individual infrastructure components, metropolitan areas can be assigned ratings of either high, medium, or low for their levels of integrated deployment.

This methodology is based on thresholds that indicate a significant state of deployment—for example, the deployment of surveillance on 20 percent of freeway miles—without necessarily indicating that deployment is complete. Five deployment component areas are used: Freeway Management/Incident Management; Arterial Management; Transit Management; Emergency Management; and, Regional Multimodal Traveler Information. A high rating is achieved when all five thresholds have been attained, low when none are met, and medium where some have been met. Integration is based on the existence of links between Freeway Management, Transit Management, and Arterial Management. When all three have at least some links, the metro area is high for integration. A single rating is assigned that combines the deployment and integration score.

As portrayed in the following figure, 27 regions are characterized low, 26 as medium, and 22 as high in deployment in fiscal year 1999. This can be contrasted with

the 1997 deployment baseline in which 39 areas were characterized as low, 25 as medium, and 11 as high. The information suggests that considerable progress has been made in the deployment of integrated ITS over the past two years. A total of 10 areas increased to a high level of deployment and two areas moved from low to medium level of integrated deployment.

* Data as of November 29, 1999 (81% return rate)

The significance of crossing a threshold for either deployment or integration is that a metro area has made a sustained effort to deploy a significant level of at least some of the technology associated with the components or to begin to integrate. It does not mean that deployment or integration are complete. A better way to consider the high, medium, and low ratings is that they are indications of momentum. A high rating indicates broad interest in deploying a regionally integrated ITS infrastructure with at least a significant beginning in deploying and integrating all major components.

The measurement of progress for 1999 can be set in a context of yearly goals leading to successful achievement of the Secretary's 2006 goal. The following figure portrays the level of integrated deployment measured in 1997 and 1999 along with projected levels of deployment for each year through 2005. No data were collected in 1998; therefore, only the projected levels of integrated deployment are shown for 1998. This figure shows that as of 1999, nationwide integrated deployment is advancing at a rate compatible with the achievement of the Secretary's year 2005 goal.

Integrated Deployment Goals and Actual Levels for 75 Metropolitan Areas

FEDERAL AID FUNDS FOR ITS DEPLOYMENT

Question. What evidence exists that the Title V projects are accelerating the use of federal aid funds for ITS deployment?

Answer. Little quantitative data exists to measure how much Title V projects are accelerating the use of federal aid funds for ITS deployment; however, it is clear from review of these projects that federal aid funds are being expended for ITS and that deployment is accelerating.

The Title V ITS project funds require a 50 percent match. Of that 50 percent match, 20 percent must be cash or in-kind contributions wholly related to the project. The other 30 percent match may come from other federal sources. Typically, the 30 percent match is met by other related ITS projects that are funded with federal aid dollars, such as NHS or CMAQ funds. It is common for other federally funded ITS projects to be significantly larger projects than the Title V ITS project.

Additionally, Title V ITS funds are only eligible for projects that directly support integration and interoperability. In order for an integration project to be viable, infrastructure components must be in place. Therefore, in areas that have little existing ITS infrastructure in place, the Title V project provides the impetus for the installation of infrastructure through other funds, typically other federal aid funds. Local governments are anxious to take advantage of the Title V funds and, in many cases, that provides enough incentive for other ITS projects to successfully compete for federal aid funds.

Finally, approximately 50 percent of the fiscal year 1999 and fiscal year 2000 Title V projects are in a top 78 metropolitan area. Data from the deployment tracking surveys for these locations indicates an increase in ITS deployment from 1997 to 1999. Of the top 78 metropolitan areas surveyed in 1997, eleven were classified as "high" deployment areas, 25 were classified as "medium" and 39 were "low". In 1999, the data shows a noticeable change with 22 areas classified as "high", 26 as "medium" and 27 as "low". We believe that the Title V ITS projects with their focus on integration has contributed to this increase in ITS deployment.

STANDARDS PROGRAM

Question. How much of the fiscal year 2000 and fiscal year 2001 funds are likely to be spent on each of the following activities: standards development, standards testing, outreach and education, and standards refinement?

Answer. Under the standards program, in fiscal year 2000 and fiscal year 2001, the following amounts (in thousands) are likely to be spent for the listed activities:

[In thousands of dollars]

| | Fiscal years— | |
|------------------------------|---------------|-------|
| | 2000 | 2001 |
| Standards Development | 3,950 | 3,200 |
| Standards Testing | 1,700 | 1,700 |
| Outreach and Education | 1,900 | 2,300 |
| Standards Refinement | 450 | 350 |

The standards development activity provides funding for standards development organizations to write the standards and for technical support organizations to analyze and report on standards development, testing and deployment efforts. Standards testing includes formally investigating the correctness, completeness and operation of the standards, measuring the degree of interoperability in standardized systems, rigorously “proving” the standards in actual transportation settings under realistic operating conditions, and providing information about standards performance to stakeholders. While development and testing support has assisted in the technical elements of standardization, an even more significant element of the program relates to actual usage of the formalized standards. Outreach and education are priority activities that provide transportation stakeholders with educational resource materials and technical assistance in support of the deployment of ITS systems. This information combined with an understanding of the application of the standards is essential for successful implementation of ITS Standards. The specific products to be developed and delivered under the outreach and education effort include: user implementation guides, application fact sheets, lessons learned and case studies, sample procurement specifications, application training courses, and technical assistance with implementation. Standards refinement activities address needed modifications and extensions to the standards based upon information obtained from formal standards testing and from the experiences of vendors and users of the standards. Since the formal testing program is in its early stages, the amounts for standards refinement are estimated. These estimates are projected to be approximately 10 percent of the development costs and are currently funded out of the standards development budget.

STRATEGIC VISION FOR ITS RURAL PROGRAM

Question. Please outline the progress that has been made in implementing a strategic vision for the ITS rural program and describe how the fiscal year 2001 request addresses priority challenges.

Answer. We have made significant progress in defining the Rural ITS Program and laying out an aggressive agenda of research, field testing and deployment incentives to develop and deploy ITS systems and services that address the needs of rural travelers and operators. In order to focus the rural ITS research and development program and assure continuity, the program has been organized around a set of development tracks which allows for long-range output-oriented program development. These tracks include Regional Infrastructure, Emergency Services, Rural Transit, Rural Crash Prevention, Rural Traffic Management, Tourism/Traveler Information, and Operations and Maintenance. For each of these development tracks we have developed long-range goals and interim milestones that are being used to direct the program.

Efforts are planned in fiscal year 2001 to further several of the rural development tracks that we consider priority areas. We will be pursuing the deployment of enhanced wireless 911 and automatic collision notification; the development of advanced signal control systems for small communities; the development of practical variable speed limit systems; the deployment of regional/multi-state traveler information; the availability of detailed road specific road surface and weather information for winter maintenance and traveler information; improved rural transportation services (in cooperation with the Departments of Health and Human Services and Labor).

A number of important milestones will be achieved in fiscal year 2001. Under the research program, a weather decision support systems for surface transportation users will be developed; signal control systems and traffic control strategies for small communities will be developed; strategies for the deployment of enhanced wireless 911 and automated collision notification systems will be developed; several examples of integrated subsidized transportation services using ITS technologies will be completed. Under the operational test program, we will initiate a test of a rural variable speed limit system; a field test of one or more rural safety warning systems; a multi-state traveler information service; a test of accurate road surface condition information; an enhanced wireless 911 test and an integrated subsidized transportation service field test.

ITS RURAL PROGRAM

Question. What is the rationale for the requested fiscal year 2001 distribution of funds between research and operational tests in the ITS rural program?

Answer. We have developed a program in rural ITS that we believe is appropriately balanced between research and operational tests. In fiscal year 2001 we have proposed a research budget of \$2.75 million to define and develop various rural ITS systems and services as defined in our long range program as well as \$7.55 million in operational tests to complement the research program. As we have stated previously, there are a number of reasons why the emphasis has been placed on operational tests in the Rural ITS Program. Field operational tests allow us to engage other stakeholders in the program which is especially important in rural ITS where many of the stakeholders are not currently engaged in ITS nor see how ITS relates to their transportation problems. Field operational tests also ensure that the systems and services developed and tested are practical and deployable. Field operational tests allow us the opportunity to address some of the non-technical challenges associated with the deployment of rural ITS. We are also following advice received from the Appropriations Committee several years ago, when it urged FHWA to spend more on rural ITS operational tests and less on studies related to this program. Having said that there is still a need to carry on a robust program of research and development to address those issues that cannot adequately or efficiently be addressed in a field test. Field tests are not an appropriate tool for such important activities as assessing the extent of a problem, exploring alternate solutions, initial system development or guidance development. We believe this budget reflects that balanced approach.

ITS TRAINING

Question. How much was spent on professional capacity building related to ITS during each of the last three fiscal years and how much is proposed for funding in fiscal year 2001?

Answer. The following amounts were spent on training during the past three fiscal years:

- 1998—\$6.063 M (includes \$1.298M for CVO)
- 1999—\$3,529 M (includes \$998 for CVO)
- 2000—\$3.350 M (includes \$900 for CVO)

ITS HELPING STATES AND LOCAL GOVERNMENT

Question. Please describe how the Department's fiscal year 2001 budget request for ITS research and deployment could help states and local government entities improve their operations and management of the surface transportation system. Please exclude from the discussion the use of the additional contract funds requested beyond the amount now authorized.

Answer. ITS research and deployment funds are being used to produce a wide variety of products designed to help states and local government entities improve their operations and maintenance practices.

Snow, ice, fog, rain and other inclement weather reduce the capacity and safety of road systems. The FHWA will develop and begin testing a winter maintenance weather decision support system for managers and traveler information for travelers. This effort will build upon previous efforts that have focused on roadway winter maintenance, shifting the focus to a variety of road users (e.g., private travelers, commercial vehicle operators, school bus operators, transit operator, and emergency responders). Prototype testing will be conducted to determine optimal information presentation and the filtering and fusing of the various information sources that must take place to achieve this presentation.

In support of releasing the ITS Deployment Analysis System (IDAS), the FHWA will develop case studies on its use in the transportation planning process. IDAS

is as a cost benefit software tool that helps communities determine the costs and benefits of implementing specific ITS improvements. These case studies will supplement the training course on how to use IDAS most effectively. Delivery of the training course will begin in fiscal year 2001, and the Operations CBU will work through our field staff and resource centers to ensure its wide distribution.

Adaptive Signal Control Systems (ACS) allow traffic signal control systems to respond to current traffic conditions in real time. Field tests on three alternative ACS algorithms will be completed in fiscal year 2001. The algorithms that have been developed for various conditions will be commercially available shortly thereafter. The Operations CBU will work through our field staff and resource centers to raise awareness of the application of ACS, what works under what conditions, and provide technical assistance to agencies that wish to implement ACS.

Turbo Architecture is a software tool that was developed in response to our partners' needs in developing regional ITS architectures. It walks the users through the National ITS Architecture through a question and answer process, thereby helping them develop regional and local ITS architectures consistent with the National ITS Architecture. In support of its release at the 2000 ITS America Annual Meeting, training courses will be completed and delivered in fiscal year 2001. Also, the Operations CBU is working with the FHWA field staff and resource centers to ensure that proper technical assistance is available to Turbo Architecture users.

CORSIM (CORridor SIMulation), which is one of the most comprehensive traffic simulation models in the world, allows users to simulate traffic and traffic control conditions on street, corridor, and freeway networks, and measure operational performance. Version 5.0 of CORSIM is integral to a new user friendly version of the traffic simulation suite TISIS, which will provide for an easier method for user to enter data and view the results of the simulation. TISIS 5.0, released late in fiscal year 2000, enables state and local agencies to simulate freeways and large street networks, including ramp metering interactions, for alternatives analyses and planning. In fiscal year 2001, the FHWA will continue to support CORSIM users through the McTrans center, as well as offer training courses on using the simulation.

The ITS Professional Capacity Building (PCB) program has trained almost 9,000 people in various travel management topics geared toward the operation and management of the transportation system. We have also trained over 3,000 people in CVO courses, and over 12,000 people have seen the CVO technology truck. Several states have started to tailor courses to meet their specific needs, including California, Virginia, Florida, and Utah. The focus of the ITS PCB program, especially in fiscal year 2001, is on distance learning, or providing the key technical training courses to the people who need them, when and where they can obtain the training. Working with university partners, three web-based training courses will be delivered in fiscal year 2001, which will reach many additional people to assist them in operating and managing their transportation systems.

In addition to activities solely funded with ITS program funds, we will also pursue other activities with a mix of ITS and Operations program funding. In the area of improved work zone operations, FHWA will be developing decision-making tools which will allow practitioners to evaluate alternate strategies to mitigate the mobility and safety impacts resulting from work zones. We will also continue to develop and deliver technical guidance and training in a number of ITS and operations areas, such as traveler information, traffic management, incident management, arterial management, HOV facilities, and travel demand management.

REALIGNMENT OF JPO

Question. Please discuss how and whether the realignment of the JPO with the operations core business unit in FHWA has delivered more effective guidance and technical assistance regarding ITS to state and local government entities.

Answer. In general, the FHWA realignment has had little impact on the operation of the ITS Joint Program Office (ITS JPO). The ITS JPO continues to provide the planning, strategic direction, coordination and oversight for the ITS program in an independent, multi-modal manner. The Director of the ITS JPO continues to report to both the FHWA Administrator and the Deputy Secretary of DOT. The significant change as a result of realignment has been the ITS JPO Director serving in a dual capacity as the FHWA Operations Core Business Unit, Program Manager. This change has improved FHWA's ability to deliver guidance and technical assistance regarding ITS to state and local governments by:

- Streamlining the decision-making process and bringing about an increased continuity between the ITS JPO and the FHWA units charged with ITS Deployment;

- Integrating ITS into the FHWA leadership through the inclusion of the Operations CBU, Program Manager as part of the FHWA Management Council. In this capacity the Operations, Program Manager works directly with the FHWA Headquarters and Field leadership on the implementation of ITS programs and policies; and
- Facilitating the creation of an ITS Deployment team within the Operations CBU. This team works directly with the ITS staff in the FHWA field offices to support deployment at the State and local level.

REPORTS PERTAINING TO ITS

Question. Please list each of the reports or strategic plans that pertain to ITS as specified in TEA-21 and discuss your progress on each one to date. How much of the fiscal year 2000 budget is allocated to complete those reports or plans and how much is requested in the fiscal year 2001 budget to further these efforts.

Answer. There are two reports or strategic plans that pertain to ITS that are specified in TEA-21. The first is in Section 5206(b), and is the Report on Critical Standards. The TEA-21 required the Department to submit a report to Congress, not later than June 1, 1999, identifying which standards are critical to ensuring national interoperability or critical to the development of other standards and specifying the status of the development of each standard identified. The ITS critical standards report was completed and submitted to Congress in July 1999. The critical standards report is available on the ITS website at www.its.dot.gov. Since the report is complete, no funding will be required in fiscal year 2000 for this activity. The second item is the National ITS Program Plan as required in Section 5205(a)(1) and (a)(2). In order to fulfill this directive in the most timely and useful manner, the DOT has broken down the requirement into three distinct parts: a Five-year Plan; a Ten-year Plan; and a National Deployment Strategy.

The Five-year Plan concentrates on codifying the ITS program's deployment road maps that were developed by DOT in 1998. It addresses how DOT carries out the ITS program under TEA-21 and will broadly guide all program, policy and budget decisions over the next five years. The Draft Five-year Plan has been completed and will be transmitted to Congress after the Office of the Secretary completes its final review. It will be submitted as part of the Surface Transportation Research and Development Strategic Plan.

The Ten-year Plan will focus on identifying a longer-term, next generation ITS research agenda. It will be developed by DOT in partnership with the larger ITS community through ITS America. The Ten-year Plan effort began in February 2000 and will be completed by early 2001.

The National Deployment Strategy is the third part. Unlike the Five- and Ten-year Plans, which focus primarily on DOT activities, the National Deployment Strategy will define the larger array of actions that must be undertaken. ITS America is leading this effort which involves State and local governments, as well as industry, to define the broader strategic actions necessary—beyond DOT spending—to bring about widespread ITS deployment in the United States. The National Deployment Strategy was completed in February 2000 and is being printed. It will be transmitted to the Congress shortly.

It is anticipated that \$250,000 will be required in fiscal year 2000 to develop the Ten-Year plan. No fiscal year 2001 funds have been requested for this effort.

ITS INTEGRATION PROGRAMS

Question. As part of the ITS program, FHWA spends millions of dollars on outreach, public information, mainstreaming, and training. Please provide a table indicating the amount of funding spent on each of those activities for each of the last three years and how much is planned for fiscal year 2001.

Answer. The following table depicts what the ITS program actually spent on Integration (Mainstreaming) programs in fiscal years 1998 and 1999 and the amounts anticipated to be spent on this activity in fiscal years 2000 and 2001:

(Dollars in thousands)

| | Fiscal years— | | | |
|----------------------------|---------------|---------|---------|---------|
| | 1998 | 1999 | 2000 | 2001 |
| Technical Assistance | \$3,835 | \$2,950 | \$4,766 | \$5,800 |
| Planning/Policy | 20 | 450 | 500 | 1,000 |
| Training | 6,063 | 1,559 | 3,350 | 3,700 |

[Dollars in thousands]

| | Fiscal years— | | | |
|---------------------|---------------|--------------|--------------|---------------|
| | 1998 | 1999 | 2000 | 2001 |
| Outreach/Comm | 919 | 717 | 660 | 580 |
| Mainstreaming | | | 500 | |
| Total | 10,837 | 5,676 | 9,776 | 11,080 |

¹ Excludes \$1.970M for CVO and Architecture training included under those program categories.

Note: Fiscal year 2000 amount for Mainstreaming (printing and exhibits) shown under Integration whereas in other fiscal years these costs were included in program budgets.

INTERMODAL FREIGHT ACTIVITIES

Question. Please discuss the scope, nature, benefits and costs of the Department's ITS intermodal freight activities. How much was invested in that area during each of the last two fiscal years and how much is requested for fiscal year 2001?

Answer. The ITS intermodal program complements One DOT efforts to coordinate planning and infrastructure development across transport modes. It ensures that technologies applied are interoperable, efficient, and well coordinated. Intermodal is increasingly the means by which trade moves. Trade is also typically multijurisdictional; that is, several States, localities, and other countries may be involved in intermodal freight movement. Given the increasingly reliance on intermodality and the issues of multijurisdictional coordination, a strong Federal presence is required to ensure a strategic and coordinated perspective by all parties. Between 1981 and 1997, the share of U.S. GDP devoted to freight logistics declined from 18.1 percent to 10.4 percent, but has recently increased to 10.8 percent. Developing a strong national ITS intermodal program to improve freight flow efficiency will allow U.S. firms to (1) reduce freight logistics costs; (2) adapt innovative manufacturing/distribution strategies to compete more effectively in a global market; and (3) support advanced corporate basic and applied research programs. The partnership between industry and government will benefit both parties, strengthening the U.S. economic base, protecting U.S. jobs and providing opportunities for advanced technology job creation. This partnership is not possible without strong Federal involvement.

Funding prior to fiscal year 1999 was focused on determining a need for an ITS Freight Architecture, to support an Intermodal Freight Technology Working Group within ITS America, and to develop a research design for an intermodal freight operational test. Funding was also used to help support an intermodal task force within US DOT.

During fiscal year 1999, \$500,000 was used to fund ITS intermodal freight pilot projects solicited by a March 1999 Request for Applications (RFA). An additional \$100,000 was used to support the ITS America Intermodal Freight Working Group (IFTWG) initiation of the mapping of the intermodal freight process from origin to destination. The IFTWG, a one-of-a-kind public/private initiative, was identified at the first ITS America Intermodal Freight Identification Technology Conference in Reston, Virginia as the means by which a successful intermodal freight program could be developed and implemented. The creation of the IFTWG, and the process mapping project, are key inputs to identifying potential improvements in intermodal freight efficiency including applications of ITS technology.

During fiscal year 2000, \$1,000,000 is being used to conduct six major tasks. The first of these is to complete the mapping of the intermodal freight process under the IFTWG. The border operational tests on safety systems, being conducted in conjunction with U.S. Customs, is scheduled for completion. A border crossing modeling tool will be developed to establish a baseline and to measure the benefits of ITS improvements. Oversight and evaluation of the freight operational tests in the Pacific Northwest and in Chicago and Newark will continue. These operational tests include multimodal technology applications to link appropriate information systems that will expedite the movement of trucks through major metropolitan areas as they deliver and pick up containers at port and air freight facilities. A National Freight Technology Conference will be held in Rosslyn to continue the partnership with the Department of Defense and industry on technology harmonization.

In fiscal year 2001, \$3 million is requested to build on lessons learned and conduct additional operational tests in major metropolitan areas to enhance the efficiency and safety of commercial vehicle traffic. Additionally the focus of attention will be on the development of a user service to begin the development of a freight architecture as a component of the ITS National Architecture. The freight architec-

ture will support State and MPO responsibilities in facilitating interstate commerce and ensuring public safety.

Included in that activity will be a border architecture to link the activities of transportation, customs and immigration. The two operational tests in the Pacific Northwest and Chicago and Newark are expected to be concluded in fiscal year 2001 and there will be continuing oversight on the commercial vehicle container drayage project.

COMMERCIAL VEHICLE OPERATIONS

Question. What progress have you made in meeting the TEA-21 goal to “deploy CVISN in a majority of states by 2003?” How many and which states will be using a Level 1 CVISN by 2003?

Answer. Forty-two states are in one of the three steps for CVISN Level 1 deployment—planning, design, or deployment. Currently, twelve states are in step 1, planning; twenty states are in step 2, design; and ten states (the original two prototype and eight pilot states) are in step 3, deployment.

Based on a recent survey of all states, eight states have indicated that they expect to complete Level 1 deployment by September 30, 2002. They consist of the two CVISN prototype and six pilot states which have been fully funded to complete Level 1 deployment. We expect Kentucky, Maryland, Washington, and Virginia to be deploying CVISN Level 1 capabilities by the end of fiscal year 2000, and California and Minnesota to be completed by the end of fiscal year 2001. We also expect Colorado and Connecticut to complete Level 1 deployment by the end of fiscal year 2002.

Thirty additional states also responded that they expect to deploy CVISN Level 1 capabilities by September 30, 2003, contingent upon receiving fiscal year 2001 federal ITS deployment funds and/or state resources to support CVISN deployment. The ability to direct federal ITS deployment funds to states which are ready to begin CVISN deployment will help the Department achieve the Congressional goal of completing CVISN deployment in a majority of states by September 30, 2003. The lack of federal ITS deployment funds puts the FMCSA’s, the FHWA’s and the states’ ability to meet this Congressional goal in jeopardy.

Question. Please discuss your plans to specify a DSRC standard for commercial vehicles that would need to be used in projects using federal aid funds. When do you anticipate a final standard? Will your involvement in this standards process provide a neutral basis towards both passive and active approaches?

Answer. Dedicated Short Range Communications (DSRC) is the technology that is used to perform the electronic screening and clearance of commercial vehicles. Electronic screening allows trucks and buses that are equipped with DSRC transponders to bypass weight/inspection stations if they are safe and legal. Electronic clearance is a component of CVISN, which is defined as the collection of information systems and communication networks that support CVO.

The competitive battle over the selection of a technology for use in Dedicated Short Range Communications applications has been going on since the mid-eighties as part of the normal economic and competitive market place. There are two basic transponder technologies employed for DSRC: the “passive” approach provided by two suppliers, and the “active” approach provided by two other suppliers.

In the early nineties, when DSRC technology was applied to the CVO application, two consortiums of states selected the active approach to implement their CVO functions. These consortiums consisted of six states on the west coast, the HELP Crescent project, and the Advantage I-75 project consisting of six midwest states along the I-75 corridor. (These consortia are now known by their commercial names; PREPASS and NORPASS respectively.)

In parallel with these CVO activities, the industry was trying to agree on a common standard through the American Society of Testing and Materials (ASTM) standards setting organization.

The US DOT has been actively involved in this standards process since 1996, and has convened numerous meetings with the various elements of the industry and the users of DSRC technology to encourage the industry to arrive at a consensus. Although the DOT has financially supported ITS standards to accelerate the process, the industry, manufacturers and users are the ones that must agree on a standard. The DOT has not taken sides in the discussion. The DOT’s interest is that a standard be adopted.

However, because of their individual commercial interests and their large installed base, principally in electronic toll collection, the industry has been unwilling to agree on a single standard for DSRC. Therefore, at the conclusion of the stand-

ards process, the industry agreed to disagree and adopted a standards that includes both the active and passive technologies.

As a result of the standards stalemate, the DOT entered a regulatory process to require the use of a single technology for CVO applications to ensure national interoperability.

The only option available to the DOT is to choose a technology that was already being used by all the states using DSRC for CVO applications. Thus, the proposed solution is to build upon the equipment already installed, or being installed by 23 states. The proposed rule would require the use of the active technology that is now deployed, with the addition of features from the ASTM standard and the IEEE standard that deals with the application of the devices. This new device would be backward compatible with the existing equipment installed or planned by the states. Therefore, states would not have to modify their existing installations. It is proposed that this provisional standard be employed after January 1, 2001. This provisional standard would not effect electronic toll collection. This proposed regulation was published on December 30, 1999, as FHWA Docket No. 99-5844. The comment period on this proposed regulation closed on February 28, 2000. The US DOT is in the process of evaluating the comments received and expects to publish the final regulation by the middle of 2000.

DSRC PLANS

Question. Which technology will be disadvantaged if the Department proceeds with its current DSRC plans?

Answer. There currently exists a de facto standard for CVO applications. All of the 23 states deploying CVO technology have chosen the active approach. The DOT's proposed regulation would require that all future deployments continue to use the active approach. Thus, the current DSRC plans have the effect of disadvantaging the passive technology.

DSRC STANDARDS

Question. Please discuss why the Department maintains that it must get involved in the DSRC standard, paying particular attention to regional considerations and cross country operations.

Answer. Section 5206(c)(1) of TEA-21 states that:

If the Secretary finds that the development or balloting of an intelligent transportation system standard jeopardizes the timely achievement of the objectives (interoperability), the Secretary may establish a provisional standard after consultation with affected parties, and using, to the extent practicable, the work product of appropriate standards development organizations.

After several years of trying US DOT has concluded that the industry balloting process cannot nor will not achieve a standard for commercial vehicle operations and that the lack of a DSRC standard will result in non-interoperability among states and regions which are routinely traversed by commercial vehicles in interstate commerce.

Section 5206(c)(2) goes on to state that:

If a standard identified as critical in the report under subsection (b) is not adopted and published by the appropriate standards development organization by January 1, 2001, the Secretary shall establish a provisional standard after consultation with affected parties, and using, to the extent practicable, the work product of appropriate standards development organizations.

The CVO application of DSRC is the only current use that is considered as necessary for national interoperability, as defined in the "Critical Standards Report" submitted to Congress on April.

The objective of the CVO program is to allow vehicles that have good safety records to travel across the country without stopping for interstate or intrastate inspections. This goal can only be achieved if there is uniformity among the states in how the identification of vehicles is accomplished. Since, the industry has not been able to agree on a single standard for DSRC TEA-21 mandates that the DOT establish a provisional standard. The proposed provisional standard for DSRC would not apply to toll authorities, and thus, would not have any impact on regional toll operations.

TRIPLE LAYER TAG

Question. How likely is it that any manufacturer will manufacture the triple layer tag that is likely to be specified by the Department?

Answer. Both manufacturers of active DSRC devices have verbally indicated that they will manufacture the standard being proposed by the DOT.

NEXT GENERATION TAG

Question. Would it be worth waiting until the next generation tag is developed before imposing a DSRC standard? What are the advantages and disadvantages of waiting?

Answer. No. It is not worth waiting for the next generation DSRC device for three principal reasons.

1. Even though the industry has begun talking about a standards for the next generation DSRC device at the higher frequency of 5.9 Giga Hertz, there is no assurance that we will actually have a single standard. We would likely end up with the same dilemma that exists today; a stalemate between the two technologies.

2. We have no clear indication when the next generation devices will actually be developed, much less available for deployment. Thus, the states that are planning to deploy DSRC for CVO would not know whether to deploy or wait for the elusive next generation. It would substantially delay the deployment of CVISN.

3. Right now, all states use the active transponder and have (or can achieve) technical interoperability. Waiting exposes the interstate commerce world to splitting the market between active and passive mode—with one set or the other being forced to give up their installed technology. By intervening now (as Congress directed in TEA-21) we avoid that problem.

MAILBOX SYSTEM

Question. Previous reports have encouraged the DOT to advance the “mailbox” system to catch drivers who violate out-of-service orders issued by MCSAP inspectors. What is the status of this system and what challenges, costs, and benefits are associated with its deployment? What progress have you made in implementing the directions regarding this technology that were specified in last year’s conference report?

Answer. The status is that currently over 3000 locations are receiving the necessary software to connect to the SAFER data mailbox. There are two problems delaying wide-spread implementation and use of the SAFER data mailbox. One is funding for wireless communication from the inspection location to the SAFER data mailbox. States are indicating that the lack of funding for communications is the major obstacle to implementation. Overall cost to get every state connected to the SDM is estimated between \$7–8 million. We have developed a strategy to make it more cost-effective for the states to get previous inspection information under the Past Inspection Query (PIQ) routine. The states simply go through the PIQ instead of logging on and off of each system separately. We are in the process of implementing that strategy. The second is for institutional support from many of the states due to concern of data ownership. Some states are concerned about having their field officers upload inspections to the SAFER data mailbox before their supervisors have a chance to check the inspections for quality assurance. Through meetings with the states at a number of national forums, these institutional issues can be overcome. Those meetings are underway.

In terms of benefits, the SDM has been very successful in many states, especially seven Eastern states. The SDM has allowed states to detect uncorrected out-of-service violations, identify falsified log books used to exceed safe hours of operation, and prevent duplicate inspections where there is no evidence of problems. A study published in 1998 showed that safety inspectors removed an additional 4,000 unsafe drivers and vehicles attributable to advanced information systems. Connecticut, especially, has said that the overnight roadside information has proven helpful in focusing their attention on the high risk carriers. The SDM will be even more effective once the Unified Carrier Register (UCR) is operational. The UCR will provide intrastate carrier and commercial vehicle safety and credentials data that roadside inspectors can use to more effectively target high-risk operators.

As a result of directions specified in last years conference report the strategy was developed that will allow states to query multiple data bases through one gateway. Also FMCSA is providing a grant to North Dakota to upgrade, distribute and maintain the PIQ software that will support that multiple query capability, with North Dakota as the lead state along the northern border.

Question. What are your plans, if any, to encourage the development of a truly nationwide mailbox system?

Answer. The SDM technology is fully functional and can be deployed nationwide. Any geographic areas where it is not functioning is due to local State institutional and communication infrastructure issues. Full deployment of a “truly nationwide system” requires considerable State infrastructure and commitment to use state-of-the-art wireless technology and communication protocols. The good news is that wireless technology is rapidly evolving and will become steadily easier to implement and widely available for use in State law enforcement. This will provide State safety and enforcement officials at the roadside access to near real-time inspection information on commercial vehicles and their drivers that have been previously cited for out-of-service violations. Additional funding and State encouragement would accelerate State adoption of the SDM. We plan to meet with the states and encourage their commitment to participate in the SAFER data mailbox (SDM) program. We also plan to encourage states to consider using their 2001 MCSAP funds to cover wireless communication costs. With our development of a system with a multiple query capability, states will be able to access through one gateway previous inspections, make registration decisions based upon safety history, check the overall carrier safety status, get insurance and licensing information, and make driver licensing queries. This will simplify the process and make the inspector more effective in carrying out enforcement responsibilities. This should help the states to justify the investment for remote communication capabilities.

Question. How much is in your fiscal year 2000 spending plan to address this technological option?

Answer. In fiscal year 2000, we are spending \$500,000 to enhance and maintain the PIQ software.

Question. How much is in your fiscal year 2001 budget request to address this technological option?

Answer. The Department plans on using \$100,000 out of its fiscal year 2001 ITS Budget SAFER request of \$2,500,000 to provide enhanced land-line and mobile communications support to new SAFER data mailbox users. The Department’s FMCSA fiscal year 2001 Budget request also includes funds to support the Field Systems Group’s efforts in enhancing PIQ capabilities for streamlined access to multiple safety systems through the SDM.

Question. What evidence do you have that the mailbox project has been successful?

Answer. Identification of out-of-service violators has increased during the operation of the SAFER Data Mailbox (SDM). However, this increase is influenced by a number of factors and is not necessarily attributable to the SDM. Anecdotal information from individual users indicates that inspection queries to the SDM does help to identify violators, including offenders with out-of-service (OOS) violations and falsified log books that have been inspected earlier on the same trip. In addition, the anecdotal evidence that Connecticut and 6 other Northeastern states have had getting overnight roadside information through the SDM has proven helpful in focusing their attention on the high risk carriers.

INSPECTIONS WITH VIOLATION OF AN OUT OF SERVICE ORDER

| | Total in- spections | Percent |
|------------|------------------------|---------|
| 1997 | 923 | .04 |
| 1998 | 1,105 | .05 |
| 1999 | 1,654 | .07 |

Source: Motor Carrier Management Information System (MCMIS).
Note: Data does not include intrastate inspections.

CVISN PROJECTS

Question. How many states have completed their CVISN project plan and “top-level” engineering design? How much of the fiscal year 2000 budget will be used to help the states achieve that technological objective? How many states will be assisted during fiscal year 2001? What are the expected costs of those efforts?

Answer. The two CVISN prototype states and eight pilot states completed their CVISN project plans and top-level designs in June 1997 at a series of three workshops. The workshops are a week in length and spaced over a 9 month period of time. The first deals with scoping, to help the states to define the technical scope

of CVISN and develop a partial CVISN system design. The second deals with planning, to begin the formal planning for the CVISN program. The third deals with design, to complete the detailed design of the system using the first two workshops as key building blocks.

We initiated a second round of technical workshops in July 1999 and expect an additional 20 states to complete their CVISN project plans and top-level designs by the end of fiscal year 2000. The cost for those workshops conducted in fiscal year 2000 is estimated to be \$467,000.

We are planning to use \$400,000 of fiscal year 2001 funds to sponsor a fourth round of CVISN deployment workshops for up to seven states that will begin during the third quarter of fiscal year 2001. In addition, the I-95 Corridor Coalition has agreed to sponsor a round of deployment workshops during fiscal year 2001 for up to six of its member states. As a result, we expect that up to 13 additional states will complete their CVISN project plans and top-level designs during fiscal year 2001.

CVO BORDER PROJECTS

Question. Please discuss the purpose, status, challenges, and results of the federal investment in each of the CVO border projects. What are the fiscal year 2001 funding needs for each of those projects?

Answer.

Purpose.—The purpose of the CVO border projects was to demonstrate the feasibility of using ITS technology and Dedicated Short-Range Communication (DSRC) technology to facilitate trade and transportation at our international borders. This was demonstrated by installing ITS technology and DSRC at seven border crossing sites, in cooperation with the Treasury Department. Based on the field operational tests (FOTs) conducted at these seven sites, as well as the evaluations conducted of the tests, we believe we have accomplished our intended purpose and believe it is feasible to utilize ITS technology and DSRC at border crossings to facilitate trade and transportation.

Status.—To date, DSRC and ITS technology has been installed at border crossings sites in Otay Mesa, CA., Nogales, AZ., El Paso, TX., Laredo, TX. (two sites), Detroit, MI., and Buffalo, NY. The Department is currently working with the Customs Service to specifically define an architecture and the general design for instrumenting a border crossing. An agreement was signed in September 1999 with US Customs to conduct a test of the International Border Clearance Safety System (IBCSS). The IBCSS communicates between the SAFER system and the National Customs Automation Prototype (NCAP). The tests have been held up due to Customs funding issues. It now appears that the tests will move ahead during fiscal year 2000. There are no funding expectations for fiscal year 2001 to complete the tests.

Program Challenges.—There are numerous program challenges to achieving a seamless border environment that ensures safe and legal commercial motor vehicles. These include:

- institutional challenges and impediments that have occurred with getting cross-cutting, supportive budgets between USDOT and Treasury;
- coordination by Federal agencies for planning, funding and deploying related border crossing initiatives;
- Integration of disparate stakeholder processes (Federal, State, and private);
- Reliability of DSRC during the FOTs; and
- North American Trade Automation Prototype to DSRC interface stability.

Results of Federal Investment & Funding Needs.—All the start-up and installation costs for existing FOTs were funded in previous years. The current focus of the IBCSS is on finalizing the testing safety screening capabilities at two border sites of Laredo, Texas and the Detroit Ambassador Bridge.

Funds obligated in fiscal year 1998 were \$1.125 million, and in fiscal year 1999 were \$1.1 million to complete the safety system tests. No ITS funds were required in fiscal year 2000 or will be required in fiscal year 2001 for operational tests but emphasis will be placed on the TEA-21 Section 1118/1119 grant funds to the states for international border crossings and trade corridors, and completion of the IBCSS-SAFER tests at the border with Customs. This will feed into completion of a border architecture for future technology application. There will also be emphasis on the development of a simulation tool, in cooperation with other agencies, to measure the effects of proposed improvements. This will start in fiscal year 2000 and continue to the extent necessary in fiscal year 2001.

The results of the federal investment can be summarized in an evaluation of the IBEX project at Otay Mesa, California by Booz-Allen and Hamilton. This evaluation focused on four major areas of interest: documentation of the level of system and

component technical performance; assessment of the user acceptance of the technologies and services provided; estimation of the potential impacts to the trade community; and documentation of the institutional and technical lessons learned.

System Technical Performance

While accurate statistical data regarding the technical performance of the IBEX system are not available, a number of conclusions regarding functionality can be made. As anticipated, the layout of an international border compound, and the operations within it, present a challenge in implementing current DSRC systems in a border environment. The large number of trucks operating in close proximity, often looping the inside of the compound going to and from secondary inspection facilities, place a premium on appropriate reader and antennae placement and tuning. In the import compound, the placement of the advance reader, and the tuning of one of the exit readers, resulted in both missed and extraneous transponder reads. The link between the DSRC system and the NATAP system, referred to as the TRAFIC hub, demonstrated that it was capable of providing communications between transponder-equipped vehicles and the Treasury prototype. However, review of system logs from both systems indicated a success rate of around 60 percent. Thus, while the technical feasibility of the concept was validated, success rates in excess of 90 percent would likely be required for the system to be of value to users.

User Acceptance

Overall, carrier participants indicated that they liked the simplicity of the transponders. They also indicated that they saw a great deal of potential for enhancement of their operations using the technologies provided at the border and on their trucks. A common interviewee comment was that the provided technologies were capable and adequate to perform the intended purpose, but the processes surrounding the technology required further refinement. Participants generally agreed that the cost of technology is continually declining, and they do not believe that transponders and data entry devices will constitute a significant investment. Considering the perceived potential return in time savings and enhanced productivity, some initial investment was considered acceptable provided the process was not required to be duplicated on paper. The perception that the reengineering of the existing paper-based processing is of primary importance was echoed in the responses from participating customs brokers. The primary shipper concern was the degree to which the NATAP program and other automated data exchange programs could be integrated with their existing processes and systems. It should be noted that the commercial participants in this test take part in the maquiladora business model, and as such, represent highly integrated, cross-functional organizations consisting of companies operating under long-term relationships. Therefore, the feelings expressed by these respondents may not necessarily reflect those of other operating models.

Potential Impacts

Test participants were asked to indicate what reduction in border crossing times that they perceived was achieved in using the services and technologies provided by the IBEX program in conjunction with NATAP. All respondents indicated that currently any time savings that may have occurred is tempered by the pre-processing time investment, and the preparation of all of the normal paper documentation that is still required in this phase of the NATAP test. Only when the NATAP test is moved to the next phase where paper documentation is not required do the respondents believe that they will be able to quantify any reduction in time required to move goods across the border. In general, participants interviewed believe that as congestion at the border increases that participation in automated pre-clearance programs will make the difference in the efficiency and competitiveness of their operations. One participant stated that benefits from the current process indicated that participation in the automated border crossing programs early will allow him to make business decisions based on the future character of the border rather than the current situation, once again, maintaining competitiveness in the market.

Lessons Learned

The institutional environment within which international goods movement must take place is highly complex. This complexity has had two major impacts. The first is the travel delay stemming from the difficulty associated with processing goods, vehicles and drivers through the port in a timely manner. The second is the genesis of thriving commercial enterprises that prosper by capitalizing on the secondary effects of inefficient processing and increasing demand. As such, the implementation of systems such as IBEX and NATAP represent positive change from a border operations perspective, and potentially negative change from the perspective of the aforementioned commercial interests. Understandably, there is considerable skep-

ticism regarding the near term success of such systems, especially as long as participation remains voluntary. This skepticism is, however, tempered by those companies who see themselves as forward-thinking, and are confident they can offer participation as a competitive advantage for clients.

CVO FUNDS

Question. How were CVO funds used at the border during fiscal year 2000?

Answer. ITS funds from fiscal year 1999 are being used to complete the border operational tests on safety systems, being conducted in conjunction with U.S. Customs. No additional funds are anticipated in fiscal year 2000. The two tests are scheduled for completion in fiscal year 2000 but are dependent upon US Customs for information systems support. The support is contingent upon US Customs getting funding from Congress to conduct a prototype test of their new import system. Also in fiscal year 2000, a border crossing modeling tool will be developed to establish a baseline and to measure the benefits of ITS improvements. The tool is expected to be used to predict benefits and to assess the benefits once improvements have been made. The model tool will be built to use actual data from each border crossing being evaluated.

ITS DEPLOYMENT FUNDS

Question. Please prepare a table showing the allocation of ITS deployment funds to the fiscal year 1999 and fiscal year 2000 recipients of Title V funds, being certain to show the amount used for integration activities and the amount used for CVISN projects.

Answer. Attached are tables which list recipients of Title V ITS Deployment funds in fiscal year 1999 and projected recipients in fiscal year 2000. The tables also show, as requested, amounts allocated for CVISN and Integration activities.

ANALYSIS OF FISCAL YEAR 1999 ITS DEPLOYMENT INCENTIVE FUNDING

CVO OUTREACH

Question. Please specify the amounts that were spent or will be spent on outreach related to CVO during fiscal year 1999, fiscal year 2000, and fiscal year 2001. What were the purposes of each activity and what was achieved? Please break down in detail your current or expected use of those monies on a project-by-project basis for fiscal year 1999.

Answer. In fiscal year 1999, the FMCSA spent nearly \$110,000 of ITS funds on outreach related to CVO. These funds were used to maintain the portable ITS/CVO kiosk and to ship it to and from 22 different requesters' sites (\$45,000); to produce 250 compact disk versions of the portable ITS/CVO kiosk (\$30,000); to replace a damaged ITS/CVO kiosk (\$26,000); and to maintain the ITS/CVO website for document uploads and conversions (\$8,000). No fiscal year 2000 or fiscal year 2001 ITS funds will be spent on the ITS/CVO kiosk.

In fiscal year's 2000 and 2001, the CVO program will coordinate outreach activities with the ITS Joint Program Office as part of the overall ITS program. Funds will be used, as part of the overall program, to provide CVO stakeholders printed publications, training materials, exhibit materials and presentations, as well as the linkage of the ITS CVO website to the ITS JPO website.

CVO MONIES ALLOCATED

Question. Please break out in extensive detail how all of the CVO monies are expected to be allocated during fiscal year 2000. Please specify funds for all research, development, training, business plans, earmarks, operational tests, and IVI projects.

Answer. The information on how all of the CVO funds for research, development, training, and operational tests are expected to be allocated during fiscal year 2000 is provided in the table below. We do not anticipate using any fiscal year 2000 CVO funds for business plans or IVI projects.

Research and Development:

| | |
|--|-------------|
| Safety Data Systems | \$2,650,000 |
| CVISN Support for Level 1 Deployment | 1,200,000 |
| Roadside Identification Technology | 350,000 |
| Architecture Consistency | 1,245,000 |
| Training | 900,000 |
| CVISN Pilots | 2,000,000 |

In fiscal year 2000, the states identified in the table below, were selected by Congress to receive federal ITS earmarks. The table shows the fiscal year 2000 earmark, the total adjusted amount of federal ITS funds available to the state, and the amount of funds the state has agreed to use for supporting CVISN deployment.

| State | Fiscal year 2000 earmark | Adjusted total available | Amount for CVISN |
|-------------------------------|--------------------------|--------------------------|------------------|
| Alabama | \$1,300,000 | \$1,022,347 | \$40,000 |
| Alaska | 3,000,000 | 2,359,263 | (¹) |
| Arizona | 1,000,000 | 786,421 | 786,481 |
| Colorado | 1,500,000 | 1,179,632 | 1,179,632 |
| Delaware | 2,000,000 | 1,572,842 | |
| Idaho | 2,000,000 | 1,572,842 | 393,211 |
| Illinois | 1,500,000 | 1,179,632 | |
| Maryland | 2,000,000 | 1,572,842 | 900,000 |
| Minnesota | 7,000,000 | 5,504,947 | (²) |
| Montana | 1,000,000 | 786,421 | 786,421 |
| Nebraska | 500,000 | 393,211 | (³) |
| New Mexico-Santa Teresa | 1,000,000 | 786,421 | 786,421 |
| New York/New Jersey | 2,000,000 | 1,572,842 | |
| Oregon | 1,000,000 | 786,421 | |
| Texas | 4,000,000 | 3,145,684 | (¹) |
| Vermont | 1,000,000 | 786,421 | |
| Virginia | 4,000,000 | 3,145,684 | 2,425,000 |

¹To be determined.

²Minnesota used its fiscal year 1999 earmark to fully fund CVISN deployment. The state will not use any of its fiscal year 2000 earmark for CVISN deployment.

³Nebraska is using its own state funds to support activities related to CVISN deployment in fiscal year 2000.

ITS SPENDING PLANS

Question. Please prepare comparable fiscal year 2000 and requested fiscal year 2001 spending plans to demonstrate how and whether program continuity and completion of projects will be achieved.

Answer.

FISCAL YEAR 1999 SPENDING PLAN FUNDING SOURCES AND BALANCES

[In thousands of dollars]

| Activity/project | Fiscal year 1999 | Prior year | | Total available | Obligated | Unobligated |
|--|------------------|-------------|------------|-----------------|-----------|-------------|
| | | Unobligated | Recoveries | | | |
| RESEARCH AND DEVELOPMENT | 35,976 | 1,347 | 30 | 37,353 | 36,314 | 1,039 |

SMART CARDS FOR COMMERCIAL DRIVERS LICENSES

Question. In the fiscal year 2000 conference report, the Committee requested that FHWA provide up to \$1,000,000 for the testing and development of a smart commercial drivers license utilizing smart card and biometric elements to enhance safety and efficiency. What has FHWA done to implement that objective? How much will be allocated during fiscal year 2000 on those activities?

Answer. The FHWA began to implement this objective in 1996 with a study of the feasibility of smart cards for commercial drivers licenses. The study's final report concluded that: "Analysis shows that enhancing the CDL is most feasible through the use of a smart card for all drivers, not only commercial drivers. However, smart card tracking of hours of service was not found to be institutionally feasible. Although beneficial to law enforcement, smart card tracking of hours of service could be effectively opposed by drivers and carriers at several stages of system implementation." The American Association of Motor Vehicle Administrators is working to standardize smart card technology. One Canadian province is scheduled to issue smart cards beginning in calendar year 2001.

Currently, the FMCSA is evaluating the best biometric elements to uniquely identify a commercial driver. The FMCSA has a Cooperative Agreement with the California Department of Motor Vehicles to determine the optimum combination of fingerprint and facial images to best detect license fraud and the optimum communication protocol to exchange fingerprint images between states electronically. California is one of 3 states which will collect a total of 32,000 sample digital facial images and sets of fingerprints from volunteers. A random sample of records will be duplicated and sent to vendors to see if they can identify the duplicate records. The project started in fiscal year 1999 with \$100,000 in research funds. Funding for fiscal year 2000 is \$100,000 in Motor Carrier Safety Assistance Program funds and \$100,000 Intelligent Transportation Systems/Commercial Vehicle Operations funds. The project is scheduled for completion in October 2001. No further funding for fiscal year 2001 is planned.

In addition the Office of Freight Management within FHWA is conducting an ITS freight operational test with the ATA Foundation and the Illinois DOT on a secure freight movement system in conjunction with an end-to-end electronic manifest system from manufacturer to customer. The overall cost of the system is \$1.1 million, with \$468 thousand federal funds and the rest from the state and private partnerships. The system will test biometric identifiers of all the handlers of the freight, including commercial motor carrier drivers. A smart card will be used with the fingerprint captured digitally for each individual responsible for the freight as it moves from origin to destination. The evaluation of this test, expected in 2001, will provide additional information on the success of using a "smart card and biometric elements to enhance safety and efficiency".

DEPLOYMENT OF CVISN LEVEL I

Question. FHWA states in the budget justification that in fiscal year 2001 you will complete the deployment of CVISN Level I in the 10 pilot states. What is the empirical basis of this projection? What could be done to help the Department achieve this milestone?

Answer. The budget justification states that CVISN is being developed and deployed using a building block approach, designed to achieve a 10-state CVISN network in fiscal year 2001. The empirical basis of this projection was: (1) these states completed their CVISN project plans and top-level designs in June 1997; (2) that it would take approximately 2 years to complete CVISN Level 1 deployment; and (3) that the funds necessary for these ten states to complete CVISN Level 1 deployment by fiscal year 2001 would be available. In fact, TEA-21 authorized a total of \$184 million of federal ITS funds from FYs 1998-2003 to deploy CVISN in a majority of states by September 30, 2003. However, most of the federal ITS deployment funds originally intended to support CVISN deployment are being designated by Congress through the appropriations process to fund other ITS projects.

Both the ITS Joint Program Office and FMCSA have tried to supplement the deployment of CVISN by using R&D and MCSAP funds have used a limited amount of federal funds from the ITS and FMCSA programs to support CVISN deployment in the prototype and pilot states. In some instances, these states also received Congressional earmarks and used all or a portion of those funds to support their CVISN deployment activities. As a result, we expect Kentucky, Maryland, and Virginia to be deploying CVISN Level 1 capabilities by the end of fiscal year 2000, and California, Minnesota, and Washington to be completed by the end of fiscal year 2001. We also expect Colorado and Connecticut to be completed by the end of fiscal year 2002.

The FMCSA's and the FHWA's highest priority for the use of federal ITS deployment funds has been and will continue to be completing CVISN Level 1 deployment in the pilot states. The ability to direct federal ITS deployment funds to complete CVISN deployment in the remaining pilot states of Michigan and Oregon will provide the essential foundation for subsequent CVISN deployment of Level 1 capabilities across the nation. The ability to direct federal ITS deployment funds to states which are ready to begin CVISN deployment will help the Department achieve the Congressional goal of completing CVISN deployment in a majority of states by September 30, 2003. The lack of full federal ITS deployment funds for CVISN puts the FMCSA's, the FHWA's and the states' ability to meet the Congressional goal in jeopardy. It is not a matter of spending more money but one of either giving the Joint Program Office the discretion to focus the deployment funds on the states that are already in the process of deploying, or have Congress do that.

INTELLIGENT VEHICLE INITIATIVE (IVI)

Question. Please explain or justify the allocation between the amount of funds requested for research versus the amount requested for operational testing.

Answer. In the fiscal year 2001 budget request for IVI we have requested \$30 million. \$14.4 million for research, \$11.6 million for field testing of longer term systems, and \$4.6 million for the Generation Zero Operational Tests.

- The Research budget funds problem size and causality, functional analysis, performance specifications, human factors and estimation of benefits. This can be characterized by laboratory and test track work on systems which lack technical maturity.
- The field testing budget funds the test and evaluation of systems that we have a significant understanding of their technical performance, user acceptance and benefits. These systems are sufficiently mature to be evaluated in an operational environment but are not expected to be commercially available within the next five years because of cost, performance and institutional issues.
- The Generation Zero Operational Tests will evaluate systems which are expected to enter production preparation by 2003. The purpose of these tests is to measure their effectiveness on real roads with real drivers. This will allow us to measure the effectiveness as well as address any other obstacles to the deployment of safety impacting systems.

In order to achieve the near-term program goals without ignoring the increased benefits of more advanced systems, the program is focused on developing multiple generations of vehicles which have increasing capabilities. The generation vehicles will be developed in partnership with industry and stakeholders for the purpose of evaluating the benefits, technical capabilities and user acceptance of these systems. This arrangement allows the government research investment to influence the in-

dustries which must produce these systems as well as the individuals and organizations that will use them.

Fiscal year 2001 will be the fourth year of the IVI program. Fiscal year 1998 was spent on defining and organizing the program. In that limited budget year, we focused on developing the early services which were primarily developed under the predecessor programs to the IVI. In fiscal year 1999, we initiated a program to test and evaluate Generation 0 products (near market systems). The objective of this activity is to measure the effectiveness of these technologies. While this is in progress we will initiate field tests of some next generation services (Generation 1) and conduct longer term research of future generations (Generation 2 and beyond). All of this is conducted in a framework which was defined by an industry-stakeholder-government working group.

FUNDING UNDER IVI PROGRAM

Question. Please submit detailed spending plans of the activities funded under the IVI program for fiscal year 1999 and fiscal year 2000. Delineate expenditures related to the passenger platform.

Answer.

COMMERCIAL VEHICLE-RELATED TECHNOLOGIES

Question. How much of the IVI program during fiscal year 1998, fiscal year 1999 and fiscal year 2000 was devoted to commercial vehicle-related technologies? How were those funds used?

Answer. During fiscal year 1998, \$1,824,000 was spent on commercial vehicle elements of the IVI program. The Commercial Vehicle element of the IVI program conducts research, analysis, information sharing, field tests and evaluations aimed at developing selected deployable commercial vehicle IVI technologies. The IVI Commercial Vehicle technologies apply to trucks and non-transit buses and are intended to improve safety and operational efficiency. Specifically, we invested \$649,000 in the vehicle stability and \$790,000 in the driver condition warning IVI Commercial Vehicle problems areas. In addition, we invested \$385,000 in electronic braking systems (EBS) performance testing. EBS is an enabling technology for many of the IVI Commercial Vehicle Services.

During fiscal year 1999, \$5,250,000 was spent on commercial vehicle elements of the IVI program. The Commercial Vehicle element of the IVI program conducts research, analysis, information sharing, field tests and evaluations aimed at developing selected deployable commercial vehicle IVI technologies. The IVI Commercial

Vehicle technologies apply to trucks and non-transit buses and are intended to improve safety and operational efficiency. Specifically, we invested \$1,100,000 in the vehicle stability and \$1,500,000 in the driver condition warning IVI Commercial Vehicle problems areas. In addition, we invested \$150,000 in EBS performance testing. Three Generation 0 Operational Tests were awarded for Commercial Vehicle Projects and \$4,500,000 was obligated to these projects in fiscal year 1999. The objective of these tests is to measure the effectiveness of systems which will be deployed by 2003. Freightliner will test a rollover stability advisor system. Mack Trucks will test an infrastructure assisted hazard warning system. Volvo will test a rear-end collision warning system and an advanced brake system.

In fiscal year 2000, \$5,750,000 was spent on commercial vehicle projects. We invested \$4,500,000 to continue the Generation 0 Operational Tests and Evaluation projects. We invested \$250,000 to initiate development of objective test procedures for advanced braking systems. Fiscal year 2000 will be our final year of preparation for a Drowsy Driver Field Test. We invested \$1 million to complete a driver vehicle interface and perform a final validation of the PERCLOS system.

Question. How much of the IVI program during fiscal year 2001 will be devoted to technologies to improve commercial vehicle safety? How will those funds be used?

Answer. In fiscal year 2001, \$8.2 million of the IVI program funding will be devoted to technologies to improve commercial vehicle safety. The commercial vehicle platform will be the early deployer of these technologies but as system performance improves, costs decrease and benefits are demonstrated, these safety systems will become available on the light vehicle platform. Our evaluation of these projects will include the "transferability" to light vehicles. The fiscal year 2001 funds will be used as follows:

Generation 0 Operational Tests and Evaluation.—\$3,500,000. This will be the final year of funding for the four Generation 0 operational tests which were awarded during fiscal year 1999. Data collection will be conducted in fiscal year 2001 and into fiscal year 2002. All work should be completed in fiscal year 2002 using previous funding. This project is focused on driver-assistance products that will be commercially available within the next five years. We do not expect that these systems will meet the full performance required to address the individual problem areas, as described in our preliminary performance specifications. It is important to determine if these systems will have an impact on safety and performance, whether it is positive or negative. Of equal importance to safety is the impact of multiple systems on the driver's performance. The subject of the operational tests follows:

A collision warning system (advanced Eaton-Vorad) including closing distance warning, blind spot object warning, and adaptive cruise control will be evaluated on 50 heavy vehicles and an additional 50 vehicles will be used as a control group. The 100 test vehicles will operate in commercial service on public roads through the U.S.

Infrastructure-assisted road hazard warning will be evaluated on 143 commercial vehicle tractors. The test vehicles will operate in commercial service on public roads throughout the Commonwealth of Virginia.

A truck "Rollover Stability Advisor" (RSA) to warn truck drivers of potential instability will be evaluated. Six tractors coupled to tanker semi-trailers will operate in commercial service in the Midwest. Three of the tractors will be equipped with the countermeasure and three will serve as the unequipped control group. The test fleet will be dispatched and managed from LaPorte, IN, about 45 miles southeast of Chicago.

Generation 1—Vehicle Stability Operational Test—\$1,000,000.—This field test will build on technologies developed under the IVI commercial vehicle platform in fiscal year 1999 and fiscal year 2000 to test on commercial vehicle operators in real world, revenue producing operations the effectiveness of electronic braking systems (EBS). This will also test the enhanced safety benefits of using EBS as these systems have the potential to: reduce brake response and release times; decrease stopping distance; improve anti-lock braking performance; provide the capability for stability corrections by selective braking; optimize braking strategies for brake pressure distribution, optimize brake lining wear; enhance braking compatibility between tractors and trailers; and foster development of collision avoidance systems for commercial vehicles. It is expected that commercial vehicle manufacturers and commercial vehicle fleets will cooperatively work with the Department in field testing these devices. In addition, this work may be done in separate tests in order to assess EBS performance on double and triple trailer combination trucks. These systems potentially offer many advantages, compared to pneumatically-controlled systems, in terms of safety, efficiency, productivity and reliability, including: reduced brake response and release times, decreased stopping distance, and an optimized strategy for brake pressure distribution and adhesion utilization.

Generation 1—Drowsy Driver Operational Test—\$2,000,000.—This operational test will be the second year of a three year operational test of drowsy driver technology developed under the IVI commercial vehicle platform in previous years. This technology detects and warns of drowsiness of drivers of commercial vehicles in real world, revenue producing operations. This Operational Test will evaluate the use of such a system in preventing crashes involving fatigued commercial vehicle drivers. It is expected that commercial vehicle manufacturers and commercial vehicle fleets will be working cooperatively work with the Department in field testing of these devices.

Generation 1—Vehicle Stability Field Test—\$1,000,000.—This field test will build on technologies developed under the IVI commercial vehicle platform in fiscal year 1999 and fiscal year 2000 to test on commercial vehicle operators in real world, revenue producing operations the effectiveness of electronic braking systems (EBS). This will also test the enhanced safety benefits of using EBS as these systems have the potential to: reduce brake response and release times; decrease stopping distance; improve anti-lock braking performance; provide the capability for stability corrections by selective braking; optimize braking strategies for brake pressure distribution, optimize brake lining wear; enhance braking compatibility between tractors and trailers; and foster development of collision avoidance systems for commercial vehicles. It is expected that commercial vehicle manufacturers and commercial vehicle fleets will cooperatively work with the Department in field testing of these devices. In addition, this work may be done in separate tests in order to assess EBS performance on double and triple trailer combination trucks. These systems potentially offer many advantages, compared to pneumatically-controlled systems, in terms of safety, efficiency, productivity and reliability, including: reduced brake response and release times, decreased stopping distance, and an optimized strategy for brake pressure distribution and adhesion utilization.

Generation 2—Vehicle Stability Problem Area Research—\$700,000.—This project will support advanced activities in this problem area that build on the capabilities addressed in the ongoing field test. This is a core activity of the Commercial Vehicle Intelligent Vehicle program and will explore the most promising method of integrating the stability enhancement and vehicle diagnostic research to develop the fully integrated IVI Commercial Vehicle. The performance specifications developed for other platforms will be expanded to incorporate adverse weather, complex road geometry and night time driving conditions. It is expected that the role of infrastructure cooperative and vehicle to vehicle cooperative systems will be increased. Supporting research areas include in-vehicle naturalistic vehicle following studies, benefits methodology developments including NADS and traffic simulation methods. This activity will also include the development of tools that will be used to quantify the performance of concepts and specific systems to be integrated in any IVI Commercial Vehicle Operational Test of the developed technology.

IVI CHALLENGES

Question. Is the Department having any problems or facing any challenges in moving the IVI forward expeditiously? If so, please describe the scope and nature of those challenges and discuss how and whether the fiscal year 2001 budget will address those concerns.

Answer. The IVI seeks to expedite the commercial availability of advance vehicle control and safety systems that will reduce driver workload and improve decision making in complex traffic or hazardous situations. By its nature this is a difficult and complex problem to solve. From its inception, this program has been designed to address these challenges.

Developing solutions to the eight problem areas is a highly complex undertaking. It involves determining causality, developing performance specifications for potential countermeasures, measuring the technical performance and user acceptance of applicable systems, estimating and validating benefits. In order to provide near term benefits, the IVI will not wait to develop the optimal solution, but will evaluate and encourage the deployment of effective systems that may only partially address the problem areas. In order to implement this incremental approach, the IVI will focus on developing generations of vehicles with increasing capabilities which address the eight problem areas. During the period covered by TEA-21, U.S. DOT intends to support work on generations zero, one, and two. Each succeeding generation is expected to address systems with more advanced capabilities, higher levels of integration and increased infrastructure cooperation.

Fiscal year 2001 will be the final year of funding for the Generation 0 Operational Tests. These tests will demonstrate the effectiveness and benefits of systems which will be deployed by fiscal year 2003. We will continue our preparation for Genera-

tion 1 Field Tests. This will include development of objective test procedures, evaluation methodologies and driver vehicle interface requirements. Generation 2 research will focus on extending the benefits of IVI systems through cooperation with infrastructure and inter-vehicle communications. A central theme which runs through all of our research and operational testing is a concern for the effect IVI systems will have on driver distraction and behavior. To address these issues we are collecting naturalistic driving data, developing workload metrics, developing driver-vehicle interface guidelines and field testing IVI systems.

COLLISION AVOIDANCE SYSTEM

Question. In fiscal year 2001 does the Department intend to issue another solicitation inviting participation in operational tests to advance technologies tested in the passenger vehicle platform? What would be the scope and nature of that solicitation?

Answer. In fiscal year 2001, we intend to solicit participation in a field test of a Generation 1 road departure collision avoidance system for light vehicles (passenger vehicles). We intended to issue this solicitation in fiscal year 2000, but it was delayed in order to complete evaluation methodologies and objective test procedures. This will be a competitive solicitation open to teams led by an automotive manufacturer or tier one supplier who will provide significant cost share. This project will equip and test a fleet of vehicles with a first-generation road departure collision avoidance system. This system may be vehicle based or have infrastructure cooperative elements. The evaluation will include a study of driver workload, driver acceptance, and behavioral adaptation. This will be a 3-year effort.

NAS PEER REVIEW PANEL

Question. What are the principal findings from the National Academy of Sciences peer review panel on the IVI?

Answer. The panel published its first letter report in June 1999. A second report is expected in June of this year. A summary of the committee's key findings and the DOT response from the June 1999 report follows:

1. "The main point of confusion was the scope of program activities, specifically whether highway as well as vehicle improvements are part of the IVI program mission. In their presentations to the committee, IVI program staff made clear the safety goal and vehicle-related, near-term focus of the program, but the committee believes the documentation would be more compelling if program goals were described more simply and clearly in future revisions of these materials."

The scope of the IVI covers vehicle-based systems. This includes autonomous countermeasures which are completely contained on the vehicle, and cooperative systems which have an on-board component that communicate with an infrastructure-based component. The 1997 Business Plan has been revised in part, to clarify the program goals.

2. "The committee is unanimous in its support of safety as the primary program goal. Moreover, it agrees that DOT has an appropriate and important role to play in facilitating the development of IV technologies, and evaluating their impact on safety as they appear on more and more vehicles."

We agreed with this statement and reiterated that the program goal as documented in the business plan is to increase safety on U.S. roads.

3. "The committee believes the safety goal of the IVI program would be better served if DOT were to acknowledge the limits of its role in accelerating the deployment of in-vehicle technologies, and place greater emphasis on accelerating enabling research, facilitating standards setting, and understanding the crash reduction potential and other safety effects of candidate IV technologies both in development and commercially available."

We believe we have acknowledged our limitations. The program mission states that we are "facilitating" the acceleration of deployment. We have engaged the true deployers of these systems and engaged them in cooperative research and testing. The activities that were recommended ("accelerating enabling research, facilitating standards setting, and understanding the crash reduction potential and other safety effects of candidate IV technologies both in development and commercially available") are already the core activities of the IVI program.

4. "Consideration should be given to allocating part of the program budget to human factors research on IV technologies that have already reached the marketplace."

The IVI program addresses technologies that have already been deployed in two ways. First, we have defined a problem area titled "Safety Impacting Services." This category addresses the system performance as well as human factors related impact

with regard to safety of in-vehicle ITS systems, such as in-vehicle computers, that are entering or already in the marketplace. Secondly, within each of the other problem areas, we evaluate the performance of these systems which are already on the market, on a case by case basis. For example we are conducting an operational test of the Eaton-VORAD Collision Warning System, and are conducting test track studies of in-vehicle computing systems. We published a compendium of our ongoing and planned human factors activities to document this.

5. "The program would also benefit from a more detailed discussion of how proposed human factors research will be integrated into each stage of technology development and assessment."

We provided a detailed presentation on this subject during the November 1999 committee meeting. A briefing paper on our human factors strategy and a copy of the compendium of our ongoing and planned human factors activities was included in the committee's pre-meeting reading materials and is available on our web site (<http://www.its.dot.gov>).

6. "At the broadest level, the committee believes the federal government's role in the IVI program should be to facilitate (rather than accelerate) the development and to monitor and evaluate the deployment of new motor vehicle technologies with the potential to make the driving task safer."

We agree with this statement and believe the activities described in the program documentation are intended to achieve facilitation.

7. "In the committee's judgment, the appropriate role for government in the IVI program should be more sharply defined than it is at present, so that the value added by government participation will be evident."

The IVI can only be effective at reducing motor vehicle crashes if the widespread deployment of vehicle-based and infrastructure cooperative safety enhancing products and systems is achieved. In order to achieve this vision, U.S. DOT has a two-part role. The first, is to ensure that safety is not comprised by the introduction of in-vehicle systems. A particular interest for the IVI is the safety impact of combining multiple systems, such as route guidance and navigation, adaptive cruise control, cellular telephones, and in-vehicle computers. We will investigate the impact that these systems may have on driver behavior by measuring any changes in the level of driver workload and distraction.

The second part of the Federal role in IVI, addresses our responsibility for reducing deaths, injuries and economic losses resulting from motor vehicle crashes. This role, which is a cornerstone of U.S. DOT's mission, will be carried out by facilitating the development, deployment and evaluation of driver-assistance safety products & systems. An analysis conducted by NHTSA showed that the widespread deployment of advanced driver assistance systems which address just three of the 8 IVI problem areas can reduce motor vehicle crashes by 17 percent annually. Based on this analysis, the IVI program was formed to more definitively evaluate the effectiveness of these technologies and depending on the results encourage their availability in the marketplace.

There are several factors which influence the definition of an effective role for U.S. DOT in this endeavor.

- IVI systems will be primarily developed by the private sector. U.S. DOT will work cooperatively with industry to define performance specifications for safety systems.

- IVI services will be deployed by the motor vehicle industry, fleet operators and local transportation agencies. U.S. DOT will support these stakeholders by providing information on the necessary technical performance, user acceptance and benefits of systems which address the IVI problem areas.

With these factors in mind, we have defined a role for U.S. DOT (as documented in the revised business plan) that will define the performance requirements for crash avoidance systems, evaluate their effectiveness and depending on results encourage their market availability. Some products which address the IVI problem areas with varying levels of effectiveness have and will continue to be made available even without a federally funded IVI program. But with the IVI program, we may expect better systems available sooner.

8. "In general, the government role in the IVI program should encompass activities (Enabling research, Research on technology integration, Research on unintended safety consequences of commercially available IV technologies), that industry or others are unlikely or unwilling to perform."

The IVI program does encompass these activities. This is documented in the program business plan.

9. "Government should help provide at least three types of data (Data and methodologies for benefit estimation, Baseline data on driver behavior, Data on crashes)."

The IVI program will help provide this data. This is documented in the program business plan.

10. "A key government role is to facilitate the necessary infrastructure investments for specific IV technologies that require cooperation between the vehicle and the highway (e.g., intersection collision avoidance systems)."

The scope of the IVI covers vehicle-based systems. This includes autonomous countermeasures which are completely contained on the vehicle, and cooperative systems which have an on-board component that communicate with an infrastructure-based component. We will assess the need for infrastructure cooperation within each of the problem areas. We have initiated a system study for the intersection and road departure collision problem areas. The results of these systems studies will define the path of future research. We have formed a consortium of State DOTs to address infrastructure issues. Additionally, we have several cross-cutting activities that address sensor friendly infrastructure and communication needs.

11. "The committee urges that this information be brought together in one place and clarified so that the federal role, and the resources that support it, is clearly identified for each program activity."

This has been done in the revised business plan.

12. "Given the reduced budget, narrower mission, and near-term objectives of the IVI program, the committee believes it is critical for the program to be well focused and for the roles of government and industry to be clearly defined."

This has been documented in the revised business plan. A briefing paper on this topic was provided to the committee and is available on our web site (<http://www.its.dot.gov>).

13. "DOT should set targets with respect to the crash reduction potential of particular technologies, and establish milestones for monitoring progress toward the deployment of those technologies and the realization of safety benefits."

A presentation on our strategy for benefits estimation was provided during the November meeting. We have initiated an activity to develop benefits estimates for the problem areas. This activity is difficult because of the nature of crash avoidance (long deployment cycles, difficult to measure) and the limited role of government (not a vehicle developer or deployer) but our work will lead to surrogate measures and protocols which will allow us to quantify benefits.

14. "The committee applauds DOT efforts to keep the IVI program focused. However, certain IV technologies also have important potential application for improved crashworthiness and injury mitigation once crashes have occurred. Some committee members urged that more provision be made in the program for these applications."

DOT recognizes and supports crash-worthiness efforts, however given the reductions in funding for IVI activities; it is a conscious decision by DOT to focus on crash avoidance.

15. "An important role for government is to facilitate the involvement of these new participants in appropriate partnership arrangements and other relevant program activities."

The mutual governance structure is intended to accomplish this. The non-traditional players will be brought in either to support the car, truck or infrastructure consortiums or the Federal Advisory Committee. A briefing paper was provided to the committee and is available on our web site (<http://www.its.dot.gov>).

16. "The committee urges that more of such material on problem identification and expected safety benefits be included in future revisions of IVI program documents."

The committee was provided with a briefing paper on this topic which is available on our web site (<http://www.its.dot.gov>).

NAS FINDINGS

Question. What actions has DOT taken to address these findings?

Answer. The panel published its first letter report in June 1999. A second report is expected in June of this year. A summary of the committee's key findings and the DOT response from the June 1999 report follows:

1. "The main point of confusion was the scope of program activities, specifically whether highway as well as vehicle improvements are part of the IVI program mission. In their presentations to the committee, IVI program staff made clear the safety goal and vehicle-related, near-term focus of the program, but the committee believes the documentation would be more compelling if program goals were described more simply and clearly in future revisions of these materials."

The scope of the IVI covers vehicle-based systems. This includes autonomous countermeasures which are completely contained on the vehicle, and cooperative systems which have an on-board component that communicate with an infrastruc-

ture-based component. The 1997 Business Plan has been revised in part, to clarify the program goals.

2. "The committee is unanimous in its support of safety as the primary program goal. Moreover, it agrees that DOT has an appropriate and important role to play in facilitating the development of IV technologies, and evaluating their impact on safety as they appear on more and more vehicles."

We agreed with this statement and reiterated that the program goal as documented in the business plan is to increase safety on U.S. roads.

3. "The committee believes the safety goal of the IVI program would be better served if DOT were to acknowledge the limits of its role in accelerating the deployment of in-vehicle technologies, and place greater emphasis on accelerating enabling research, facilitating standards setting, and understanding the crash reduction potential and other safety effects of candidate IV technologies both in development and commercially available."

We believe we have acknowledged our limitations. The program mission states that we are "facilitating" the acceleration of deployment. We have engaged the true deployers of these systems and engaged them in cooperative research and testing. The activities that were recommended ("accelerating enabling research, facilitating standards setting, and understanding the crash reduction potential and other safety effects of candidate IV technologies both in development and commercially available") are already the core activities of the IVI program.

4. "Consideration should be given to allocating part of the program budget to human factors research on IV technologies that have already reached the marketplace."

The IVI program addresses technologies that have already been deployed in two ways. First, we have defined a problem area titled "Safety Impacting Services." This category addresses the system performance as well as human factors related impact with regard to safety of in-vehicle ITS systems, such as in-vehicle computers, that are entering or already in the marketplace. Secondly, within each of the other problem areas, we evaluate the performance of these systems which are already on the market, on a case by case basis. For example we are conducting an operational test of the Eaton-VORAD Collision Warning System, and are conducting test track studies of in-vehicle computing systems. We published a compendium of our ongoing and planned human factors activities to document this.

5. "The program would also benefit from a more detailed discussion of how proposed human factors research will be integrated into each stage of technology development and assessment."

We provided a detailed presentation on this subject during the November 1999 committee meeting. A briefing paper on our human factors strategy and a copy of the compendium of our ongoing and planned human factors activities was included in the committee's pre-meeting reading materials and is available on our web site (<http://www.its.dot.gov>).

6. "At the broadest level, the committee believes the federal government's role in the IVI program should be to facilitate (rather than accelerate) the development and to monitor and evaluate the deployment of new motor vehicle technologies with the potential to make the driving task safer."

We agree with this statement and believe the activities described in the program documentation are intended to achieve facilitation.

7. "In the committee's judgment, the appropriate role for government in the IVI program should be more sharply defined than it is at present, so that the value added by government participation will be evident."

The IVI can only be effective at reducing motor vehicle crashes if the widespread deployment of vehicle-based and infrastructure cooperative safety enhancing products and systems is achieved. In order to achieve this vision, U.S. DOT has a two-part role. The first, is to ensure that safety is not comprised by the introduction of in-vehicle systems. A particular interest for the IVI is the safety impact of combining multiple systems, such as route guidance and navigation, adaptive cruise control, cellular telephones, and in-vehicle computers. We will investigate the impact that these systems may have on driver behavior by measuring any changes in the level of driver workload and distraction.

The second part of the Federal role in IVI, addresses our responsibility for reducing deaths, injuries and economic losses resulting from motor vehicle crashes. This role, which is a cornerstone of U.S. DOT's mission, will be carried out by facilitating the development, deployment and evaluation of driver-assistance safety products & systems. An analysis conducted by NHTSA showed that the widespread deployment of advanced driver assistance systems which address just three of the 8 IVI problem areas can reduce motor vehicle crashes by 17 percent annually. Based on this analysis, the IVI program was formed to more definitively evaluate the effectiveness of

these technologies and depending on the results encourage their availability in the marketplace.

There are several factors which influence the definition of an effective role for U.S. DOT in this endeavor.

—IVI systems will be primarily developed by the private sector. U.S. DOT will work cooperatively with industry to define performance specifications for safety systems.

—IVI services will be deployed by the motor vehicle industry, fleet operators and local transportation agencies. U.S. DOT will support these stakeholders by providing information on the necessary technical performance, user acceptance and benefits of systems which address the IVI problem areas.

With these factors in mind, we have defined a role for U.S. DOT (as documented in the revised business plan) that will define the performance requirements for crash avoidance systems, evaluate their effectiveness and depending on results encourage their market availability. Some products which address the IVI problem areas with varying levels of effectiveness have and will continue to be made available even without a federally funded IVI program. But with the IVI program, we may expect better systems available sooner.

8. “In general, the government role in the IVI program should encompass activities (Enabling research, Research on technology integration, Research on unintended safety consequences of commercially available IV technologies), that industry or others are unlikely or unwilling to perform.”

The IVI program does encompass these activities. This is documented in the program business plan.

9. “Government should help provide at least three types of data (Data and methodologies for benefit estimation, Baseline data on driver behavior, Data on crashes).”

The IVI program will help provide this data. This is documented in the program business plan.

10. “A key government role is to facilitate the necessary infrastructure investments for specific IV technologies that require cooperation between the vehicle and the highway (e.g., intersection collision avoidance systems).”

The scope of the IVI covers vehicle-based systems. This includes autonomous countermeasures which are completely contained on the vehicle, and cooperative systems which have an on-board component that communicate with an infrastructure-based component. We will assess the need for infrastructure cooperation within each of the problem areas. We have initiated a system study for the intersection and road departure collision problem areas. The results of these systems studies will define the path of future research. We have formed a consortium of State DOTs to address infrastructure issues. Additionally, we have several cross-cutting activities that address sensor friendly infrastructure and communication needs.

11. “The committee urges that this information be brought together in one place and clarified so that the federal role, and the resources that support it, is clearly identified for each program activity.”

This has been done in the revised business plan.

12. “Given the reduced budget, narrower mission, and near-term objectives of the IVI program, the committee believes it is critical for the program to be well focused and for the roles of government and industry to be clearly defined.”

This has been documented in the revised business plan. A briefing paper on this topic was provided to the committee and is available on our web site (<http://www.its.dot.gov>).

13. “DOT should set targets with respect to the crash reduction potential of particular technologies, and establish milestones for monitoring progress toward the deployment of those technologies and the realization of safety benefits.”

A presentation on our strategy for benefits estimation was provided during the November meeting. We have initiated an activity to develop benefits estimates for the problem areas. This activity is difficult because of the nature of crash avoidance (long deployment cycles, difficult to measure) and the limited role of government (not a vehicle developer or deployer) but our work will lead to surrogate measures and protocols which will allow us to quantify benefits.

14. “The committee applauds DOT efforts to keep the IVI program focused. However, certain IV technologies also have important potential application for improved crashworthiness and injury mitigation once crashes have occurred. Some committee members urged that more provision be made in the program for these applications.”

DOT recognizes and supports crash-worthiness efforts, however given the reductions in funding for IVI activities; it is a conscious decision by DOT to focus on crash avoidance.

15. "An important role for government is to facilitate the involvement of these new participants in appropriate partnership arrangements and other relevant program activities"

The mutual governance structure is intended to accomplish this. The non-traditional players will be brought in either to support the car, truck or infrastructure consortiums or the Federal Advisory Committee. A briefing paper was provided to the committee and is available on our web site (<http://www.its.dot.gov>).

16. "The committee urges that more of such material on problem identification and expected safety benefits be included in future revisions of IVI program documents."

The committee was provided with a briefing paper on this topic which is available on our web site (<http://www.its.dot.gov>).

RESEARCH, DEVELOPMENT, AND TECHNOLOGY TRANSFER (RD&T)

Question. In the fiscal year 2000 report, for surface transportation RD&T the conferees encouraged FHWA to provide funding for a list of specified projects. For each project listed, please detail how FHWA responded to the request for support, being certain to identify the amount of funding that will be provided for each project.

Answer.

SUPPLEMENTAL TECHNOLOGY DEPLOYMENT

Question. Please delineate in detail how the \$7.7 million proposed for supplemental technology deployment will be used. Please break out the proposed use of those funds.

Answer. FHWA proposes to distribute the \$7.7 million Supplemental Technology Deployment funds for marketing and technology delivery programs proportionately among our strategic goals, based upon the percentages in our original fiscal year 2001 budget request. Funds will be provided to support activities in the Resource Centers, Division Offices and Headquarters that promote innovation. Among the technology deployment tools that will be supported are demonstration projects, test and evaluation programs and the development of training materials to introduce and implement new technology.

PRELIMINARY DISTRIBUTION

| Goal | Fiscal year 2001 request | Percent of re- quest | Portion of \$7.7m |
|-------------------------|-----------------------------|-------------------------|-------------------|
| Mobility | \$62,015 | 49 | \$3,773,000 |
| Safety | 18,950 | 15 | 1,155,000 |
| Productivity | 14,525 | 12 | 924,000 |
| Environment | 19,825 | 16 | 1,232,000 |
| National Security | 665 | 1 | 77,000 |
| Tech.Del./Market | 9,200 | 7 | 539,000 |
| Total | 125,180 | 100 | 7,700,000 |

PERFORMANCE MEASURES

Question. Please describe in extensive detail the scope, nature, and objectives of your request for \$1.85 million for performance measures.

Answer. There are three key objectives in our request of \$1.85 million for performance measures:

(1) Although some performance indicators were included in the FHWA strategic plan, and others have been developed and reported to FHWA management, considerable work remains. For example, there are a number of unquantified GPRA measures like travel time, freight productivity, life-cycle cost/return on investment, etc.

(2) A conceptual framework has yet to be put in place for measuring the effectiveness of FHWA R&T expenditures. This activity is integral to assessing how R&T programs contribute to successful achievement of the agency's strategic goals. If we receive the level of funding requested in fiscal year 2001, the strategic assessment framework for evaluating R&T contributions should be in place by fiscal year 2002 with goal owners developing and applying performance measures to assess the contribution of R&T activities to their strategic goals.

(3) In the highway field, Federal activities are generally only a part of achieving results. Much of the responsibility for implementation falls to the state and local

goals and private sector. As we implement GPRA responsibilities, we will continue to engage our partners, customers, and stakeholders in improving, refining and setting performance goals, targets and measures. The funds will be used to complete implementation, coordinate data collection and conduct an overall assessment of the approach.

Question. What is the empirical basis for this request? How much is FHWA spending on similar activities, including the improvement of its performance measures in fiscal year 2000?

Answer. In fiscal year 2000, FHWA is using a combination of our general operating expenses, R&T funds, in-house staff, partners, and consultants to assist us in developing performance measures, facilitating meetings, and conducting GPRA-related studies.

Question. Why does FHWA maintain that it is important that this proposal be funded now?

Answer. It is important that we fund this proposal now because FHWA wants to develop and mobilize a long-term strategy for improving the agency's ability to meet the GPRA responsibilities and to carry out our overall mission. The funds will be used to develop a number of the unquantified GPRA measures like travel time, freight productivity, life-cycle cost/return on investment, etc.

The difficulty of linking R&T to specific outcomes does not preclude the application of performance measures to FHWA R&T programs or the incorporation of R&T into the broader framework of the Strategic Plan. Likewise, it does not prevent meaningful consideration of the real or potential contribution of specific research to future accomplishments. The definition and attainment of performance measures for future years will benefit from well-designed and implemented research activities that increase the understanding of issues and challenges, provide the foundation for solutions, demonstrate benefits, and generally support the implementation of successful innovations.

If we receive the level of funding requested in fiscal year 2001, the strategic assessment framework for evaluating R&T contributions should be in place by fiscal year 2002 with goal owners developing and applying performance measures to assess the contribution of R&T activities to their strategic goals. In which case, the fiscal year 2002 funds would be used to complete implementation, coordinate data collection, and conduct an overall assessment of the approach. If the level of funding is reduced, fiscal year 2002 funds would be used to put performance measures in place.

Question. Could some of these activities be conducted as part of the surface transportation R&D analyzes performed by RSPA?

Answer. The U.S. DOT Research and Technology Coordinating Council for DOT-level R&T strategic planning activities (as directed by TEA-21 Sec. 5108) requires support from all modal administrations for this work. RSPA relies on input from FHWA and other modal administrations which is provided through the Council. As the lead DOT agency for this activity, RSPA advises us of system-level, policy research areas which would contribute to Departmental R&T objectives. RSPA's analysis of the surface transportation R&D does not get down to the individual program level. It is primarily responsible for supporting the overall departmental level of analysis and for balancing departmental priorities and policy.

TRANSPORTATION RESEARCH BOARD

Question. Could you now conduct some of these activities using the Transportation Research Board at much less expense?

Answer. The Research and Technology Coordination Council of the U.S. Department of Transportation (DOT) and the National Research Council (NRC), acting through the Transportation Research Board (TRB), convened the Committee for Review of the National Transportation Science and Technology to review and comment on DOT's Strategic Plan, Performance Plan, and Program Performance Report (required under GPRA) with regard to surface transportation research and technology development. The committee formulated two key recommendations: (1) R&T priorities and activities should be tied more explicitly to the Department's strategic and performance goals and their relationship to these goals should be articulated more clearly; and (2) the R&D Plan should include the funding budgeted for specific R&T activities and performance goals, since budgets are a tangible reflection of the real priorities of an agency. The committee also recommended that the Department adopt explicit criteria and methodologies for prioritizing R&T activities, and specific performance measures for analyzing results. We believe that the Transportation Research Board has already given us their recommendations and now it is up to FHWA to develop strategies for implementing those recommendations in a system-

atic way. To be most effective, performance measurement should be the responsibility of the agency responsible for goal delivery.

GPRA RESPONSIBILITIES

Question. How are you now performing your GPRA responsibilities and your strategic planning pertaining to the R&D program without these funds?

Answer. We are now carrying out our GPRA responsibilities and strategic planning pertaining to the R&D program with a combination of general operating expenses, R&T funds, in house staff, partners, and consultants. However, in order for goal owners to develop and apply performance measures to assess the contribution of R&T activities to their strategic goals, we should have in place a well-designed strategic assessment framework for evaluating R&T contributions.

TECHNOLOGY DEPLOYMENT

Question. In the fiscal year 2000 conference report, the conferees directed that FHWA respond by December 1, 1999, to each of the recommendations presented in the Transportation Research Board report on technology deployment. Was this response submitted to both the House and Senate Committees on Appropriations? If not, please explain why.

Answer. Yes, on March 9, 2000.

TECHNOLOGY TRANSFER AND EVALUATIONS

Question. In light of the TRB report, how will FHWA improve its mechanisms of technology transfer and evaluations. What changes will be made in response to this report?

Answer. FHWA held a senior leadership retreat in January to examine how the new organizational structure is working. The first recommendation, that an FHWA headquarters office be assigned responsibility for agency wide technology transfer management, was a key item on the agenda. Our leadership agreed that while the new organization was intended to create a closer connection with potential users of technology, it also spread technology transfer expertise across many offices, making a corporate view on technology transfer difficult to achieve.

The FHWA senior leadership agreed to give responsibility for agency wide coordination of technology transfer management to the Office of Research and Technology Services, within the Research, Development, and Technology Service Business Unit. That office will coordinate technology transfer activities across the CBU's, as well as coordinating the preparation of a management plan and strategy for the agency's technology transfer activities, recommended by the RTCC. The office will also serve as a repository for technology transfer management expertise, identifying and sharing information regarding what works in the long run, in terms of technology transfer methods, for research products and FHWA customers.

In order to ensure close coordination between the various offices, I have asked each CBU and RC to designate a lead position specifically responsible for technology transfer. We have also agreed to establish a staff level technology transfer coordinating committee which will consist of representatives of each of the CBU's and RC's. Chaired by the Office of Research and Technology Services, this committee will develop an agency-wide technology transfer strategy and identifying appropriate venues and mechanisms for technology transfer. The committee will meet monthly to share expertise and coordinate technology transfer activities.

Finally, with regard to the third recommendation, we agree with the RTCC that FHWA needs to develop strong partnerships with those who use and implement highway technologies, as well as the decision-makers who are responsible for funding related to innovation. A National R&T Partnership Initiative, is currently underway, facilitated and coordinated by TRB, to establish stronger working relationships with key partner and customer groups. The objectives of the National Partnership Initiative are to broaden the range of contacts between the FHWA and the user community, to help develop a national consensus on the need for highway R&T, to determine priorities for highway R&T, to establish a national R&T agenda, and to identify the appropriate roles of the Federal Government, state and local governments, universities and the private sector in implementing an R&T program. Five Working Groups have been established under the National Partnership Initiative covering the areas of safety, infrastructure renewal, policy analysis and system monitoring, operations and mobility, and planning and environment. Representatives of FHWA are active participants in these working groups, and we will be tracking the overall FHWA effort, to ensure that there is sufficient communication between the working groups and a cross-cutting look at the issues identified.

Question. How is this reflected in the fiscal year 2001 budget request?

Answer. Although we did not specifically identify this function as a line item the responsibility for this management function will be with RD&T. Funding for this will be redirected from the Agency wide activities supporting the R&T program.

SURFACE TRANSPORTATION ACCOUNT

Question. For the surface transportation account, please compare your actual expenditures for each RD&T budget category, including technology assessment and deployment, against the amounts appropriated for fiscal year 1998 and fiscal year 1999. Please explain any deviation of more than 10 percent and be certain to exclude any carryover funds.

Answer.

[Dollars in thousands]

¹The column reflect the actual allocation of funds based on 89.3 percent of total contract authority contain in TEA21.

²The column reflect the actual allocation of funds based on 88.3 percent of total contract authority contain in TEA21.

³The column reflect the actual allocation of funds based on 87.1 percent of total contract authority contain in TEA21.

⁴These columns reflect the amounts authorized in TEA21.

CARRYOVER FUNDS

Question. Please indicate the amount of carryover funds for each of the last three years by subaccount or research category.

Answer. The carryover funds for each of the last three fiscal years are shown below by subaccount or research categories.

[In thousands of dollars]

| Program | Fiscal years— | | |
|--|---------------|-------|-------|
| | 1999 | 1998 | 1997 |
| Surface Transportation Research: | | | |
| Safety | 594 | 100 | 1,235 |
| Pavements | 1,873 | 1,408 | |
| Structures | 2,212 | 1,634 | 88 |
| Environment | 251 | 370 | 95 |
| Real Estate Services | 3 | | |
| Policy | 60 | | 30 |
| Planning | 172 | | |
| Motor Carriers | 454 | 858 | 2,327 |
| Basic Research | 441 | 72 | 72 |
| Technology Assessment and Deployment | 937 | 65 | 300 |
| Long-Term Pavement Performance | 16 | 11 | |
| R&T Technical Support | 1,419 | 345 | |
| Local Technical Assistance Program | 242 | 407 | |
| National Highway Institute | 718 | 130 | 669 |
| Eisenhower Fellowship | 335 | 116 | 1 |
| Advanced Research | 34 | | |
| Highway Operations | 41 | | |

| ITS Research and Development | 38,129 | 3,773 | 351 |

TRANSPORTATION RESEARCH BOARD ASSISTANCE

Question. For each of the last three years, how much did FHWA allocate to TRB for coordination and technical assistance to the RD&T program? Exactly what did TRB provide FHWA?

Answer. Over the last 3 years, FHWA has allocated to Transportation Research Board (TRB) for coordination and technical assistance to the RD&T program \$2,665,740 in fiscal year 1998, \$2,738,650 in fiscal year 1999, and \$2,032,000 in fiscal year 2000.

TRB possesses a unique capability for the coordination and dissemination of research and technology (R&T) results as well as the promotion, review, and critique of the national program and has been of significant assistance to FHWA. TRB provides a source of national and international expertise to focus on critical national agenda items upon which the FHWA could draw in formulating and delivering its Research and Technology Program, and it provides a mechanism for considering the views of research bodies, highway users, suppliers, and contractors, along with economic, social, energy, and environmental concerns, as these issues related to highway transportation research and technology policy and programs. TRB also addresses issues related to the implementation of research results and the application of technology in the highway transportation field.

TRB brings its unique capabilities to performing a series of activities in support of the FHWA's R&T Program.

Conduct an Annual Meeting.—TRB conducts an annual national meeting in the Washington, D.C., area as a forum for the presentation of highway research results. In conjunction with the annual meeting, it provides FHWA with display areas and meeting facilities, arranges for providing miscellaneous items such as electrical hookups, easels, spot lighting, etc., and solicits, reviews, and selects appropriate papers to be presented at the meeting. The annual meeting is held within the context

of an overall transportation research meeting involving various modes of transportation. As part of and in conjunction with the annual meeting, TRB provides facilities and support for the various technical committees established by the TRB. TRB also provides for registration of all FHWA employees requesting registration (approximately 600) at the annual meeting at a lump sum amount.

Technical Committees.—TRB maintains standing committees of authorities in subject areas of interest to the FHWA. These committees are responsible for promoting the exchange of technical research information, for advancing the state of the art in the areas of their expertise, and for identifying research needs. It also establishes appropriate new committees as the need is demonstrated to respond to changing issues facing the transportation industry and conducts committee-sponsored conferences and workshops as determined appropriate by the technical committees.

Maintenance of National Overview of Highway Research.—TRB maintains a national overview of highway research. It visits approximately 17 State highway agencies per year and 50 State highway agencies over a 3-year period to assess the interest, competency, and relevancy of the research conducted by each State highway agency as well as encouraging a coordinated national transportation emphasis. In conjunction with these visits, TRB visits selected key universities and public/private researchers responsible for highway-related research.

Maintenance and Dissemination of Research Results.—TRB processes publications into the Transportation Research Information Service (TRIS) (estimated at approximately 30,000 publications per year). In addition, it provides TRIS searches for FHWA and it provides FHWA a statistical summary of requests of TRIS which originate from State DOTs on a semi-annual basis. TRB has also partnered with the Bureau of Transportation Statistics, U.S. Department of Transportation, to develop and make available web access to TRIS as a means of increasing accessibility to TRIS for users.

Publication and Distribution of Reports.—TRB develops, publishes, and distributes a variety of reports and periodicals to assist in the transfer of technical information. Publications include, among other areas, general non-technical reports related to very specific topics. Reports have also been developed to summarize and highlight some of the key papers presented at the annual meeting. TRB also prepares and annually updates a mailing list for distribution of all publications. The annual update shall be coordinated through the AOTR.

Research and Technology Review, Coordination, and Communications Program.—TRB conducts and documents a program to maintain a national, federally-funded research and development coordination and communications program. The program examines national highway research needs and focuses on global transportation issues that

- Provides FHWA technical information about other ongoing research needs and activities relative to FHWA's Research and Technology Program.
- Ensures that the States, the private sector, all other highway research bodies, highway users, associated interest groups, and other highway research interests have input to the national agenda of research needs and programs.
- Supports the National R&T Partnership Initiative and facilitate the operations of the working groups established as part of the initiative.
- Ensures that economic, social, cultural, manufacturing, environmental, and technical voices are heard for planning and developing highway research programs.
- Ensures that products evolving from the highway research process are directed towards market development and application, both in national and international arenas.
- Reduces redundancy and fragmentation, fosters innovation and focuses resources in all major highway research programs.
- Positions the United States' highway research programs for preeminent world leadership in technical expertise and knowledge.
- Encourages improved government, public-private, and international harmonization in other highway-related fields and in multi-modal transportation research.
- Enhances interest, awareness, and opportunities for highway research careers with all participating agencies.
- Increases opportunities for participation in FHWA programs by public agencies and private sector constituents.

To accomplish these objectives, the TRB will use the services of a Research and Technology Coordinating Committee (RTCC) established under its auspices. The RTCC is composed of 15 to 20 members, selected from among researchers, administrators, users, and practitioners from the public, private, and academic sectors. Specifically it will provide technical information in the following areas:

- Identify gaps in research which FHWA can use in formulating and delivering its Research and Technology Program.
- Monitor and support the National R&T Partnership Initiative, especially by contributing to the activities of the working groups formed to advance this initiative, synthesizing the output of the working groups and distributing appropriately, and providing a mechanism for the groups to issue formal consensus-based advice.
- Use national and international technical expertise to focus on critical national highway research agenda items.
- Identify areas of duplication of effort.
- Provide a mechanism for gathering research needs from research bodies, highway users, suppliers, and contractors, along with identifying economic, social energy and environmental concerns as they relate to highway research needs.
- Consider ways and means to increase State, local, and private sector participation in highway research and innovation.
- Address issues related to the implementation of research results and the application of technology in the highway field.

Through the agreement, TRB provides adequate staffing, travel, and facilities support to meet its responsibilities including committee support functions.

A second group, the Surface Transportation Environmental Cooperative Research Program Advisory Board (STECREP), was established by TRB on behalf of FHWA. STECREP was established as a result of congressional direction in TEA-21 to create an advisory board to recommend environmental and energy conservation research, technology development, and technology transfer activities related to surface transportation. The board includes 17 members representing perspectives from various levels of government administration, environmental groups, private industry, and university research centers. STECREP is responsible for:

- Recommending a national agenda of environmental and planning research priorities and technology transfer strategies to be conducted by the Transportation community.
- Supporting outreach and collaborations on research by:
 - Identifying and recommending opportunities for partnerships and collaboration on outreach, research and development, and technology transfer and dissemination, both among USDOT offices and with other federal agencies, research organizations, and partners.
 - Identifying and recommending potential opportunities for pool-funded research and opportunities to leverage research findings.
 - Supporting the coordination of environmental and planning research conducted through programs such as NCHRP, TCRP, and university research centers with that conducted through USDOT offices.
 - Supporting the increased visibility of research programs on transportation and environment.
 - Supporting research evaluation by directly participating in the design of research program evaluation, products, and technology dissemination activities, including the assessment of customer satisfaction.

STECREP also serves as one of the working groups in the National R&T Partnership Initiative for topics in areas relevant to its environment and planning charter.

Conduct an Innovations Deserving Exploratory Analysis (IDEA) Program.—TRB conducts an annual Innovations Deserving Exploratory Analysis (IDEA) Program, stressing innovation, product oriented proposals, with the potential to produce significant technological improvements in the highway community. The program is administered as part of the NCHRP.

Individuals and members of institutions, universities, small and large businesses, consulting firms and research laboratories in the United States and abroad and anyone working in the broad science and engineering areas that are associated with, or have relevance to, highway technology are eligible for the program.

All proposals are evaluated on a competitive basis. The proposals meeting the technical eligibility criteria are evaluated by an Expert Task Group consisting of technical experts from the various science and engineering disciplines. The awards under this program are fixed price contracts in the range of \$10,000 to \$100,000 and with contract durations ranging from a few weeks to a year.

As of fiscal year 1999, FHWA no longer contributes funds to the IDEA Program. Even during FHWA's funding participation, the TRB obtained additional funding from other sources, primarily the AASHTO member States. Participating researchers in the projects are expected to provide matching funds to those provided through the program.

Special Studies, Reviews, and Conferences.—In addition to the core services TRB provides to the FHWA for the funds noted, TRB also conducts special studies, pro-

gram reviews, and conferences when requested by FHWA. Each request is funded individually outside of the funding for the core services.

Question. How much will be allocated for this assistance in fiscal year 2001?

Answer. In fiscal year 2001, \$2,800,000 will be allocated for TRB for coordination and technical assistance to the RD&T program.

ADVANCED RESEARCH PROGRAM

Question. Please discuss the scope and nature of your fiscal year 2000 advanced research program and indicate the amount and purpose of each relevant contract funded under that sub-account.

Answer: \$100,000—This safety portion of the fiscal year 2000 Advanced Research funding sponsored a feasibility study aimed at increasing the magnitude of improvements in impact performance of roadside safety structures. The work is looking at the present safety design process in reverse. Specifically, starting with a pre-selected amount of safety improvement, the study will determine if present-day computer power can be used to guide a designer to a structural configuration that provides the selected level of improvement. Most of the literature on this method (Inverse Analysis) focuses on linear systems. There is a small research community trying to apply this method to non-linear events. Vehicle/safety structure impacts are very non-linear and this effort will establish feasibility for the use of Inverse Analysis on this subject area. If successful, follow-on funding will develop a production tool for use by practicing safety designers. The goal is to more rapidly increase the level of potential crash safeness residing within the roadside structures along the Nation's highways.

\$100,000—This safety portion of the fiscal year 2000 Advanced Research funding sponsored development of an Automated Sign Recognition System (ASRS) using previously developed Equation Shell Software (EQS) which was delivered to the State of Connecticut in fiscal year 2000. This effort produced ASRS software capable of recognizing a finite set of individual traffic stop signs from the State's photolog database of highway video images. The ASRS software will replace manual detection of stop signs in the State's photolog database resulting in an inventory maintenance cost saving. The ASRS software was interfaced with the State's database and selected training sets for pattern recognition have been provided. The ASRS software is presently being developed with the State's most recent photolog data. \$100,000—This safety portion of the fiscal year 2000 Advanced Research funding is sponsoring development of a Software Reliability Handbook. Public safety depends on the correctness of the output of highway related software in areas such as bridge and highway design, bridge monitoring, collision avoidance and traffic management. Errors can result either from bugs in the software, using the software incorrectly, or using it outside its intended application area. This handbook will provide techniques to lower the frequency of errors produced by software in highway engineering.

Software called SpecChek was developed to test the correctness of software and is being applied to the Interactive Highway Safety Design Module (ISHDM) software. Tests of the ISHDM software are underway.

For the Infrastructure part of Advanced Research, the scope has been considerably reduced since the passage of TEA 21 and the resulting budget cuts. The program had to be severely reduced in fiscal year 1999 and now is focused on maintaining essential research capabilities at Turner Fairbank Highway Research Center and associated activities at the Center for Neutron Research at the National Institute of Standard and Technology (NIST). This supports staff research in the areas of materials science of concrete and nondestructive materials characterization.

Specific staff research projects include: (1) application of nonlinear 3-dimensional finite element computer models and chaos theory analysis to structural health monitoring of bridges and (2) advanced materials characterization of fly ashes for improvement of concrete properties. These two projects are conducted by postdoctoral research associates through an interagency program administered by the National Research Council of the National Academy of Sciences under a contract with FHWA. Another area of staff research concerns the application of nuclear nondestructive methods to highway materials. This is being done through an in-house contractor, Wiss Janney and Elstner as part of the NDE Validation Center at TFHRC. A fourth staff project concerns the development of a detailed chemical kinetics model for the curing of Portland cement concrete. This involves the use of neutron scattering methods at the NIST Center for Neutron Research as well as the heavy ion beam accelerator at the University of the Ruhr in Bochum, Germany. Finally, a major in-house research program concerns the problem of concrete deterioration associated with delayed ettringite formation. This consists of experimental studies and chem-

ical model development performed in collaboration with the University of Maryland and Howard University. It should be noted that these collaborations are not funded by FHWA, but by NSF and DOE respectively.

In addition to contractor support for staff research, there are a few research grants to universities to continue projects started in prior years. Two of these involve advanced materials characterization methods for the delayed ettringite problem. One is with the University of California at Berkeley, cofunded with NSF, and uses neutron diffraction and synchrotron radiation to determine micro structure changes. The other, at the University of Hawaii, uses the scanning acoustic microscope and Raman spectroscopy to characterize ettringite mineralogy. The final grant to New Mexico State University, cofunded with the New Mexico DOT, concerns the installation of Bragg grating fiber optic sensors to monitor strain during construction and operation of the Rio Puerco Bridge near Albuquerque, culminating several years of research on this topic.

The allocation of fiscal year 2000 funds is summarized in Table 76.1 below. Please note that this does not include funds from collaborating organizations which have averaged roughly \$1 million per year over the last 3 fiscal years.

TABLE 76.1.—Allocation of Fiscal Year 2000 Infrastructure Advanced Research Budget

[In thousands of dollars]

| Title (Contractor) | Fiscal year 2000 |
|--|------------------|
| Nuclear NDT Laboratory (Wiss Janney Elstner) | 99 |
| Application of Neutron Methods (NIST) | 140 |
| Postdoctoral Associates (National Academy of Sciences) | 70 |
| Concrete Deterioration Mechanisms (UC Berkeley/NSF) | 50 |
| Advanced Microscopy Methods for Concrete (U Hawaii) | 45 |
| Fiber Optics in Bridges (New Mexico State U.) | 35 |
| Small Purchases for Services, etc. | 45 |
| Total | 484 |

TABLE 76.2.—EXTERNAL FUNDING FOR ADVANCED RESEARCH PROJECTS (FISCAL YEARS 1998–2000)

| Project | Partner | Total funds | Partner share (percent) |
|---|-------------------------------------|--------------|-------------------------|
| Ettringite expansion test | University of Maryland | \$150 | 100 |
| Concrete deterioration | UC Berkeley/NSF | 200 | 50 |
| Neutron diffraction of ettringite | Missouri U. ² /NSF | 150 | 100 |
| Calcium leaching in concrete Northwestern | U./NSF | 150 | 100 |
| Cement hydration kinetics ¹ | W.R. Grace | 100 | 100 |
| Neutron chloride measurement ¹ | W.R. Grace | 150 | 100 |
| Ledyard Bridge Fiber Optic System | Dartmouth College | 10 | 30 |
| Kealakaha Bridge Fiber Optic System | Hawaii DOT | 200 | 100 |
| Rio Puerco Bridge Fiber Optic System | New Mexico DOT | 60 | 70 |
| Woodrow Wilson Bridge Fiber Optic System ¹ | Drexel University | 75 | 100 |
| Fiber Optic Weigh in Motion | State Pooled Fund | 118 | 100 |
| Electrochemical ASR Tests | State Pooled Fund | 230 | 100 |
| Aerial Robotics Bridge Inspection | State Pooled Fund | 400 | 75 |
| Microwave Fatigue Crack Detector | SBIR | 600 | 100 |
| Digital Acoustic Emissions System | State Pooled Fund | 600 | 100 |
| Total | | 3,193 | |

¹Proposed.

²PI transferring to another university.

ADVANCED RESEARCH CONTRACTS

Question. Please discuss the scope and nature of your fiscal year 2001 advanced research program and indicate the amount and purpose of each relevant contract likely to be funded under that sub-account.

Answer. \$100,000—This safety portion of Advanced Research funds will be applied to developing a final roadside safety design tool for practicing safety designers assuming feasibility is demonstrated in fiscal year 2000. (See fiscal year 2000, Inverse Analysis description.)

\$100,000—This safety portion of Advanced Research funds will be applied to an on-going effort by the Advanced Research staff in the area of Data Mining and Multi-Dimensional Data Visualization. Past funding on this subject has been small and limited in scope. The objective is to make these general purpose powerful analysis methods more readily available to the researchers at the laboratory in the form of a free service. The goal is to accelerate the quantity and quality of insight that is extracted from a variety of data available at the laboratory. It is anticipated that the increase and improvement in “problem domain insight” will lead directly to increases in innovative solutions.

\$50,000—This safety portion of Advanced Research funds will be applied to continue an on-going effort that utilizes a neural network as a basis for a drowsy driver warning system. Preliminary work on this topic has demonstrated feasibility, and, if no other source of funds are available, Advanced Research funds will be used to continue exploratory work on this topic. Although initial potential applications were envisioned for the large truck portion of the Nations vehicle fleet, the concepts explored in the feasibility phase indicate that it can also be considered for the total vehicle fleet.

\$100,000—This safety portion of Advanced Research funds will be applied to extending the ASRS to recognize other types of signs and roadside safety hardware. The condition of roadside hardware will be addressed and application of the ASRS software to other State’s databases. The EQS software will be applied to other highway applications such as traffic sensor and pavement applications.

\$100,000—This safety portion of Advanced Research funds will be applied to improving techniques and software for testing highway software to improve reliability. The Software Reliability Handbook will be applied to highway software to test the techniques in the handbook.

With no increase in funds over fiscal year 2000, the Infrastructure part of Advanced Research would continue to be a maintenance level activity with scope and nature the same as described in the answer to the question above.

Increased funding in fiscal year 2001 would permit the accelerated progress in existing research activities. It would also allow the restarting of dormant research projects in the mechanisms of concrete deterioration. These include: (1) application of ice mechanics to freeze-thaw damage processes; (2) innovative methods for monitoring corrosion of reinforcing steel; (3) advanced analytical methods for determining alkali reactivity of aggregates; and (4) colloidal chemistry of delayed ettringite formation. Additional funds would permit new starts in: (1) application of nanotechnology to highway structures as part of the National Nanotechnology Initiative; (2) aging of steel in bridges; (3) optimization and standardization of fiber optic bridge monitoring systems; and (4) nonlinear dynamic 3-dimensional computer modeling of pavements.

EARMARKED PROJECTS

Question. For each of the earmarked projects or university activities specified in TEA-21 for fiscal year 2001 that pertain to RD&T, please specify the scope and nature of the RD&T to be conducted, and describe how those projects or activities will be integrated into a national research agenda.

Answer.

TEA-21 EARMARKED PROJECTS OR UNIVERSITY ACTIVITIES—SCOPE & NATURE OF R&T

Programs funded from Technology Deployment Initiatives and Partnerships Program [503]: Sec. 5001 (a)(2)

Organization.—University of Alabama at Tuscaloosa

Program Title.—Center for Advanced Vehicle Technologies

Funding.—Fiscal year 1998 (\$0), fiscal year 1999 (\$353,200), and fiscal year 2000 (\$348,400)

Current Status.—The Center began operation in late 1998. The objective is to form a well-equipped interdisciplinary capability at the University to address a range of issues related to advanced vehicle development and operation.

Results.—During the first year of operation, progress was made to develop the administrative structure for the Center. Highlights include hiring of an administrative secretary and a key researcher to work in the Center. Equipment was purchased to improve the measurement of key engine properties including emissions. Five grants were awarded on various vehicle issues and a lecture series was introduced

which brings experts from other parts of the country to share insights. Finally, Dr. Bell made several presentations throughout the country to introduce the Center to others and to begin build partnerships.

Organization.—Oklahoma State University

Program Title.—Smart Bridge Research Project

Funding.—Fiscal year 1998 (\$0), fiscal year 1999 (\$883,000), and fiscal year 2000 (\$871,000)

Current Status.—The researchers have submitted quarterly progress reports, indicating all proposed tasks are well underway.

Results.—A medium-scale deck section has been constructed. They are currently working to develop and validate advance modeling software. The research team is refining their deck heating system design. Continuous investigations are underway into systems to measure and analyze weather data, including sensor testing and development of integrated control strategies. Work has also begun on corrosion assessment, life-cycle economic analysis, and an operational web site for technology transfer.

Organization.—University of Oklahoma

Program Title.—Intelligent Stiffener for Bridge Stress Reduction

Funding.—Fiscal year 1998 (\$0), fiscal year 1999 (\$883,000), and fiscal year 2000 (\$871,000)

Current Status.—Due to the recent death of the principal researcher, a proposal for this research grant has not been completed. A new researcher has been designated for the project, and a proposal is expected in the near future.

Results.—No results are available at this time.

Organization.—University of Alabama at Birmingham

Program Title.—Study of Advanced Trauma Care

Funding.—Fiscal year 1998 (\$0), fiscal year 1999 (\$662,250), and fiscal year 2000 (\$653,250)

Current Status.—The Alabama Trauma Registry (ATR) has been established. Hospitals in the State that see a sizeable number of trauma patients each year were identified and contacted to obtain their support in collecting data using the American College of Surgeons (ACS) trauma registry database (TRACS). A protocol and time line has been developed to transfer the data to the ATR.

Results.—The transfer of data from the participating hospitals to the ATR is presently in the pilot phase. However, it is expected that all major trauma hospitals in the State will be providing trauma data to the ATR by July 2000. Data from this project and others will be used to make recommendations and establish protocol for the routine collection of data to provide better patient care.

Organization.—Calspan—University of Buffalo Research Center

Program Title.—Transportation Injury Research

Funding.—Fiscal year 1998 (\$1,782,000), fiscal year 1999 (\$1,766,000), and fiscal year 2000 (\$1,742,000)

Current Status.—Grantees are in their second year of effort of interdisciplinary research on ways to reduce the occurrence, severity, and consequences of crash related injuries that now amount to nearly five million people each year in the U.S., including 42,000 deaths. CentTIR projects are underway to provide real-world demonstrations and evaluations of advanced technologies, systems and programs. These projects are advancing crash detection and notification technologies with crash injury assessment. They are also improving the process of providing emergency triage, transport, and treatment of crash injured people.

Results.—CentTIR research has advanced technical and governmental understanding of technological opportunities for, and institutional hurdles to, improving the safety of U.S. motorists. CentTIR research has helped define the safety potential for automatic crash notification technologies and the need for providing enhanced wireless 9-1-1 service nationwide. CentTIR research is being used at the Federal, State and local levels. At the Federal level, CentTIR communications on the safety potential of using wireless technologies to improve crash safety has been used in the NHTSA, FHWA, and JPO. In addition, CentTIR research has been a part of the deliberations of the NTSB, the FCC, and the Congress. On October 26, 1999, the President signed into law the Wireless Communications and Public Safety Act of 1999 that found “emerging technologies can be a critical component...to reduce emergency response times and provide appropriate care.” Stated its purpose as “to encourage and facilitate the prompt deployment throughout the United States of a seamless, ubiquitous, and reliable end-to-end infrastructure . . . to meet the Nation’s public safety and other communications needs.” We expect that there will be continued use of the findings of CentTIR research to advance the public safety by DOT and other agencies at all levels of government.

Organization.—Louisiana State University and The George Washington University

Program Title.—Head and Spinal Cord Research

Funding.—Fiscal year 1998 (\$0), fiscal year 1999 (\$441,500), and fiscal year 2000 (\$435,500)

Current Status.—Louisiana State University has commenced work in the following areas: (a) development and implementation of a motor vehicle crash victim data registry, (b) investigation of mechanisms of neurotrauma, and (c) exploration and evaluation of novel neuroprotective drugs.

The George Washington University has commenced work in collision avoidance research and crash analysis research. Under collision avoidance, the following tasks are underway: (a) literature review of collision avoidance methods and developments, (b) development of a driving simulator laboratory, and (c) review and comparison of specific adaptive or intelligent cruise control systems. In the category of crash analysis research, the following tasks are underway: (a) finite element modeling of vehicles, (b) development of a folded/vented airbag model, (c) mathematical simulation of crash test dummy certification procedures and comparison to equivalent laboratory data, and (d) airbag modeling code evaluation and validation.

Results.—Louisiana State University: (a) The motor vehicle crash data base now contains data on 400 victims with more than 2000 documented injuries. A Microsoft Access database is maintained on an Internet server, providing 24 hour update capability and access. (b) An improved percussion apparatus has been developed to support experimental head trauma experiments utilizing a rat model. (c) Preliminary studies have been conducted to identify up-regulation of the COX-2 gene in the brain preceding irreversible injury. (d) Experimental strategies for screening and evaluation of neuroprotective drugs have been devised.

George Washington University.—(a) Preliminary collision avoidance literature review is completed. (b) All components required to assemble the driver simulator are now available for assembly. (c) Portions of vehicle model development have been completed. (d) Air bag code evaluation has begun.

Organization.—Georgia Technical Research Institute

Program Title.—Motor Vehicle Safety Warning System

Funding.—Fiscal year 1998 (\$623,700), fiscal year 1999 (\$618,100), and fiscal year 2000 (\$609,700)

Current Status.—The Georgia Technical Research Institute is conducting an evaluation of radio and microwave technology for a motor vehicle safety warning system. The three elements that comprise the safety warning system are a mobile transmitter, a fixed site transmitter for roadside deployment, and an in-vehicle receiver and display unit. The study is currently evaluating the viability of sending variable text messages to vehicles and assessing potential application including rail crossing safety systems.

Results.—Georgia Tech. has confirmed that the fixed site transmitter can be remotely programmed in real time via a modem. This will allow an operator of an advanced traffic management system to change the information as needed to provide timely safety warnings to drivers through the remote fixed site transmitter. Potential applications that take advantage of this function will now be evaluated.

Organization.—Booz-Allen & Hamilton

Program Title.—Motor Carrier Advanced Sensor Control System

Funding.—Fiscal year 1998 (\$623,700), fiscal year 1999 (\$618,100), and fiscal year 2000 (\$609,700)

Current Status.—The initial task of the study is underway. It includes a literature review and related analyses of accident databases. A meeting with interested original equipment manufacturers (OEMs) and Commercial Motor Vehicle operators will be held in late February. The detailed project scope is under development. The Truck Manufacturers Association is working with the Federal Motor Carrier Safety Administration and the contractor to implement this program.

Results.—No information available at this time.

Organization.—Signal Corporation

Program Title.—Intelligent Transportation Infrastructure System

Funding.—Fiscal year 1998 (\$1,514,700), fiscal year 1999 (\$1,501,100), and fiscal year 2000 (\$1,480,700)

Current Status.—Project design is well underway in Pittsburgh and will begin later this year in Philadelphia. System implementation is expected around July 2000 in Pittsburgh and November in Philadelphia.

Results.—No results are available at this time

Organization.—State of Pennsylvania

Program Title.—Advanced Traffic Monitoring and Emergency Response

Funding.—Fiscal year 1998 (\$1,485,297), fiscal year 1999 (\$1,471,961), and fiscal year 1900 (\$1,451,957)

Current Status.—Little, if any work has been initiated on this project. A feasibility and needs' study is underway with completion expected in July 2000.

Results.—No results are available at this time.

Organization.—New Jersey Institute of Technology

Program Title.—Development of a Transportation Economic and Land Use System

Funding.—Fiscal year 1998 (\$891,000), fiscal year 1999 (\$883,000), and fiscal year 1900 (\$871,000)

Current Status.—The TELUS project began in August of 1998. The objective is to support State governments and Metropolitan Planning Agencies by developing an automated data base to report on the status of projects. The TELUS suite of programs will also include modules to analyze economic and land use impacts of projects.

Results.—A Beta test group, composed of 15 MPOs, has been formed and is currently testing an early release of TELUS. The Beta test group has reported very good results and is anxious to receive the final version.

Organization.—Twenty State Departments of Transportation (discretionary)

Program Title.—Innovative Bridge Research and Construction Program—Construction Component

Funding.—Fiscal year 1998 (\$8,910,000), fiscal year 1999 (\$13,245,000), and fiscal year 1900 (\$14,807,000)

Current Status.—Allocations of funds have been made to all 20 States participating in the program for fiscal year 1998 & fiscal year 1999. There are 60 different projects being conducted on varying schedules according to the individual States' construction programs. Some projects have already awarded for construction. One example is the replacement of deteriorated a concrete deck on the Salem Avenue Bridge over the Great Miami River Bridge in Dayton, Ohio. Most other projects are underway or will be awarded for construction in the Spring of 2000.

Results.—Results will vary according to the scope and complexity of the individual projects. At the Great Miami River Bridge in Dayton, Ohio, the deck replacement was completed successfully after solving several installation problems.

Organization.—Various outside organizations (discretionary)

Program Title.—Innovative Bridge Research & Construction Program—Research & Technology Component

Funding.—Fiscal year 1998 (\$891,000), fiscal year 1999 (\$13,245,000), and fiscal year 1900 (\$14,807,000)

Current Status.—The Ohio DOT has completed the replacement of a deteriorated concrete deck on the Salem Avenue bridge over the Great Miami River. The new deck was constructed using modular sections of fiber-reinforced polymer (FRP) composite materials. The complete sequence of section fabrication and installation was videotaped in order to provide other potential users with the benefits of Ohio DOT's experience. The Precast Concrete Institute has scheduled the International Symposium on High Performance Concrete for Bridges for September 25–27, 2000, in Orlando, Florida.

The University of Nebraska—Lincoln is preparing to conduct the National Conference on High Performance Steel for Bridges in Baltimore, Maryland, November 29–December 1, 2000.

Results.—The results of the re-decking of the Salem Avenue bridge over the Great Miami River have been documented. This project was the first major project where a bridge was rehabilitated using a lightweight modular FRP deck which was prefabricated offsite and installed on the existing girders after the concrete deck was removed. The lessons learned and captured on video during this pioneer project will be disseminated to all bridge owning agencies in order to help with the further application of FRP as a bridge material.

Organization.—General Atomics Corporations

Program Title.—Advanced Technology Pilot Program (low speed magnetic levitation—Maglev)

Funding.—Fiscal year 1998 (\$4,455,000), fiscal year 1999 (\$4,415,000), and fiscal year 1900 (\$4,355,000)

Current Status.—The FHWA is partnering with the FTA to carry out this project. To date, one project group has been selected. General Atomics Corporation (GA) will lead a team to develop Maglev technology for the purpose of providing a solution to urban and regional transportation problems. The GA team will develop low speed magnetic levitation technology in the following main task areas: (1) system studies, (2) base technology development (including technical risk identification and resolution), (3) route specific requirements, and (4) projection of overall system performance and a preliminary design for a full scale demonstration system concept. The

team comprises: GA, Macklin Engineering, Hall Industries, Booz Allen & Hamilton, Western Pennsylvania Maglev Development Corporation, Union Switch & Signal, Port Authority of Allegheny County, Sargent Electric Company, Mr. Richard Portis (DBE), P.J. Dick, Argonne National Laboratory, Carnegie Mellon University, Massachusetts Institute of Technology, and the Pennsylvania Department of Transportation.

Results.—The project was recently started and there are no measurable results at this time.

Organization.—Dowling College and Auburn University

Program Title.—Advanced Simulation Technologies

Funding.—Fiscal year 1998 (\$0), fiscal year 1999 (\$1,766,000), and fiscal year 1900 (\$1,742,000)

Current Status.—The contracts for this have been recently awarded in early fiscal year 2000; little, if any work has been initiated on this project.

Results.—No results are available at this time.

Discretionary programs

In support of the Technology Deployment Initiatives and Partnership Program, numerous activities under several core areas, to include: Infrastructure, Safety, Planning and Environment, Federal Lands, and Operations have been initiated.

Highlight of Several Activities:

- In a joint effort with Kansas DOT, developed a Concrete Pavement Smoothness Implementation package, which included a video on smoothness construction and benefits.
- Prepared documentation on the role of the Highway Economic Requirement System Model in the statewide planning process.
- Updated the Pavement Management Systems Software catalog, and expanded it to include pavement condition data collection equipment.
- Instructed and deployed information to State DOT's on Heat Straightening Repairs of Steel Bridges.
- Designed a booklet "Building on the Past, Traveling to the Future," which is aimed at promoting the use of transportation enhancement funds for historic preservation projects and providing technical information.
- Produced a guidebook for the planning practitioner.
- Developed a methodology for establishing an initial baseline for assessing the NEPA process.
- Supported International Scanning efforts in which several significant technologies were observed and documented to include: Bridge Scour Countermeasures, Steel Bridge Fabrication and Erection Technology, Methods and Procedures to Reduce Motorist Delay in Construction Zones, Recycled/Secondary Materials, Sustainable Transportation Development, and Durability of Concrete Segmental Bridges.
- Formulated the Manual on Uniform Traffic Control Devices, and reviewed the docket report.
- Converted the Federal Program manual to CD-ROM, and distributed to industry.
- Continued implementation of High Performance Concrete and Superpave into the Federal Lands program.
- Further development of the Rural ITS program.
- Coordinated development for Innovative Contracting activities.
- Developed a flow chart and mobility/safety recommendations and best practices report.
- Supported initiatives under the International Operations and Transportation Research Board and Performance Measures program.
- Supported the technology deployment initiatives of the Superpave and concrete pavement programs to State and local governments.

Funding.—Fiscal year 1998 (\$10,008,603), fiscal year 1999 (\$514,789), and fiscal year 1900 (\$2,249,793)

Programs Funded from Surface Transportation Research Program [§ 502]: Sec. 5001(a)(1)

Seismic Research Program

\$5.2 million has been awarded to date. The research is focusing on development of a Seismic Risk Analysis method which will be applicable to a major metropolitan area. To date, preliminary testing of the method has been tested using the Memphis, Tennessee area. A second focus area is the development of a seismic retrofitting manual for long span bridges. Finally, seismic specifications for standard

brides has been updated and will be submitted to AASHTO for their consideration in fiscal year 2000.

Asphalt Research

Section 5116(c) calls for \$250,000 grants in each of fiscal year 1999 and 2000 to Auburn University for asphalt research. The National Center for Asphalt Technology (NCAT) at Auburn is currently constructing a pavement test track for evaluating the performance of 26 asphalt test sections during 2 years of heavy loading. The TEA-21 grants are being used for the construction of two polymer-modified asphalt sections (in the spring of 2000), to evaluate the rutting performance of a common commercial modifier and of chemically modified crumb rubber. The test track program is being funded by Alabama, 7 other States, the TEA-21 grants, and private sector partners. The complete 26-section experiment will yield comparative performance data on a number of asphalts and aggregates and further validate and improve the Superpave binder selection and mixture design systems.

Fundamental Properties of Asphalts and Modified Asphalts

Under Section 5117(b)(5), the Western Research Institute is continuing its study of fundamental properties of asphalts and modified asphalts. Several techniques and concepts were developed which have the potential to improve the Superpave binder specifications. A modulated differential scanning calorimetry (MDSC) method was developed as a reliable and rapid means of predicting low temperature asphalt properties. Researchers found the physical properties of thin (< 50 m) asphalt films—characteristic of asphalt mixtures and pavements—could not be predicted from the bulk physical properties of asphalts which are measured in the current Superpave binder specifications. The WRI team also found water, in the form of saturated humidity, has a major effect on the rheology of aged asphalts, and, further, found aging in a humid environment was not predictable from the results of currently used dry aging procedures. To validate these and other developments from the TEA-21 research, the WRI researchers worked with the Wyoming DOT to construct a well-controlled test pavement section in Albin, Wyoming; construction of test sections is planned at three other sites during the 2000 construction season.

Recycled Materials Resource Center

In 1999, the Recycled Materials Resource Center (RMRC) at the University of New Hampshire fully established its staff and advisory board. The RMRC initiated nine research projects covering a range of topics, including a study of the weathering and leaching behavior of by-product materials, development of specifications for recycled materials in transportation applications, and monitoring of construction projects using recycled materials. Most of these projects involve State DOTs and industry. Outreach activities included establishment of the center website and client database. In 1999, there were 7,000 visitors to the website and over 400 clients have registered with the center. The RMRC has also publicized and shared its work through participation in and sponsorship of regional and national/international conferences, and participated in a FHWA scanning tour to review European recycling practices and innovations, for which center personnel are preparing the final report.

Seismic Research

An initial \$883,000 has been awarded to the University of California at San Diego (UCSD) for the development of a major national seismic shaking table which will be used to evaluate seismic design and response of retrofitted highway bridges. The study is jointly funded by the California Department of Transportation. The first series of testing will evaluate seismic isolation systems that will be retrofitted into major bridges in California.

Corrosion Control and Prevention

\$883,000 has been awarded to CC Technologies and NACE for a two-year study to investigate the cost of corrosion and develop preventive strategies. To date, three reports have been published in the Materials Performance NACE International Journal. The study will update the cost of corrosion to the nation, estimated in 1975 to be 4.2 percent of GNP or \$70 billion for 36 specific industry sectors.

Long-term Pavement Performance (LTPP)

Significant accomplishments for the LTPP program last year include the release of the DataPave 2.0 software. DataPave is a CD-ROM version of the LTPP database that provides the LTPP data in an easy to understand and useable format. DataPave 2.0 is a two CD-ROM set that includes triple the amount of data in DataPave 1.0. FHWA and the American Society of Civil Engineers sponsored a contest in the analysis of the LTPP data. The contest winner in 1999 presented a new

method of analyzing and understanding the profile of concrete pavements that has the potential to greatly improve the performance of future concrete pavements. Another product that was improved and released is LTPPBind 2.1. The improved LTPPBind has more information and significant improvements in functionality. This software enables highway agencies and industry in the selection of the most cost effective Superpave binders. Lastly, LTPP is cooperating with the National Cooperative Highway Research Program efforts in the development of the 2002 Pavement Design Guide. LTPP plays a critical role in the development of the new guide as the source of pavement data for the validation and calibration of the new Guide and in several instances as a source of information and procedures in the use of the new Guide.

Concrete Pavement

One of the significant products of the Concrete Pavement Program in the last year was the delivery of the HIPERPAV software and documentation. This user-friendly program allows engineers to predict and prevent early-age distress which may occur during the construction process. The result will be longer-lasting, better performing pavements. Also, procedures and equipment were developed for measuring the work ability of concrete prior to construction. This test will help avoid problems with placing and consolidating the concrete on the job.

EARMARKED PROJECTS OR UNIVERSITY ACTIVITIES

Question. For each of the earmarked projects or university activities specified in TEA-21 that pertain to RD&T, please specify the expected fiscal year 1999 and fiscal year 2000 budget amount and funding source.

Answer.

DESIGNATED PROGRAMS AND RECIPIENTS OF R&T FUNDS IN TEA 21 WITH TECHNICAL CORRECTIONS

| Program Name | 1998 ¹ | 1999 ² | 2000 ^{3,4} | 2001 | 2002 | 2003 | Total | Designated Recipient (if applicable) | TEA 21 Section |

| Total | 3.6 | 20.3 | 27.6 | 30.2 | 29.0 | 27.5 | 138.1 | | |

¹ Obligation limitation applied for fiscal year 1998 was 89.1 percent.

² Obligation limitation applied for fiscal year 1999 was 88.3 percent.

³ Obligation limitation applied for fiscal year 2000 was 87.1 percent.

⁴ All amounts to be fully obligated by the end of fiscal year 2000.

Note: Section 1213, Studies and Reports, contains requirements for which funds may be sought from Section 5001 (a)(1). Two of these requirements also are given authority to appropriate additional funds. Section 2007 requires two safety studies for which funds may be sought from Section 5001(a)(1).

IG AUDIT OF TURNER-FAIRBANK HIGHWAY RESEARCH CENTER

Question. In the fiscal year 2000 conference report, the conferees directed that FHWA identify and submit specific corrections it plans to take in response to the Inspector General's audit of the Turner-Fairbank Highway Research Center contracting activities. That document was to be submitted to the House and Senate Committees on Appropriations by December 1, 1999. When will this requirement be implemented? What specific corrections are anticipated?

Answer. In response to the fiscal year 2000 conference report, the Action Plan developed in response to OIG Report No. MA-1999-095 was submitted to the House and Senate Committees on Appropriations on November 30, 1999, under cover of letter from the FHWA Administrator. The Action Plan, which was developed jointly by the FHWA Office of Acquisition Management and the FHWA Office of Research, Development and Technology, proposed a schedule of twenty-six specific corrective actions to take place over the course of the period from June 1, 1999, through September 30, 2000. Of these twenty-six actions, twenty-one have been completed to date. Actions completed include the revision and conduct of ethics training for hundreds of TFHRC and other FHWA personnel, training for Contracting Officer Technical Representatives (COTRs) in a number of areas, the issuance of agency guidelines on the use of interagency agreements, a restructuring of COTR delegation process, and a new reporting format for tracking progress under contracts. Key actions remaining for completion include: a comprehensive COTR guideline/manual on the FHWA StaffNet (the draft of this manual is completed and electronic publication is anticipated by the end of fiscal year 2000); an internal compliance review of the Office of Acquisition Management (scheduled for completion by September 30, 2000); and the development of agency policy on monitoring and control of Government property under contracts.

TECHNOLOGY ASSESSMENT AND DEPLOYMENT FUNDS

Question. Please prepare a table showing the Technology Assessment and Deployment funds derived from the surface transportation R&D account for fiscal year 2000 and proposed for fiscal year 2001. To the extent possible, please specify total amounts as well as amounts associated with each of the traditional categories of surface transportation R&D.

Answer. Fiscal year 2000 was the last year that Technology Assessment and Deployment (TAD) was included as a separate line item in FHWA's R&T budget request. With the closing of the Office of Technology Applications, R&T initiatives under the TAD line item have been shifted to the appropriate corporate business units (CBUs) and other parts of the agency in accordance with FHWA's strategic goals. This approach recognizes that development and delivery of technology is integral to advancing FHWA goals and objectives, and meeting the needs of our customers. The table below outline current program plans for funding "TAD-type" activities.

SAFETY RESEARCH

Question. Why are you proposing to reduce safety research funded out of the surface transportation R&D account?

Answer. Actually, we are not. The fiscal year 2000 Appropriations Conference Report indicated a total of \$14.2 million for the safety line item. After the required obligation limitation reduction (12.9 percent for fiscal year 2000), \$12.4 million was available for the traditional category of safety R&D. The fiscal year 2001 request is for \$13.9 million for the traditional safety R&D category. The Administration's proposal includes a provision that the obligation limitation requirement be removed from the R&T funding categories. With approval of this provision the amount requested for fiscal year 2001 is an increase over the amount provided in fiscal year 2000. In addition, the Administration is proposing to increase TEA-21 authorization amounts for research and technology categories by a total of \$50 million, and safety would receive an additional \$5 million as part of this action. Approval of this request would improve our ability to advance critical safety R&T initiatives.

With about 40,000 highway fatalities per year, safety is certainly a high national priority. The fiscal year 2001 funds will be used for research and development for run-off-road (33 percent), pedestrian and bicycle (15 percent), human centered (12 percent), safety management (14 percent), speed management (20 percent), and work zones (6 percent).

EDUCATIONAL AND OUTREACH EFFORTS

Question. Please update your answer from last year regarding educational and outreach efforts to combat the problem of drivers running off the road. Please estimate fiscal year 2000 and fiscal year 2001 funds allocated or planned for this purpose and provide the funding source of these monies. What other relevant activities have been implemented?

Answer. The FHWA will have new starts and continue efforts started in fiscal year 2001 and prior to combat the problem of drivers running off the road. New starts include the development of training courses, demonstrations, and showcasing start-of-the-art technologies for practitioners. These include training courses/workshops for the highway practitioner in designing safer roadways e.g. Interactive Highway Safety Design Model, and Accommodating Older Drivers in Highway Design and Traffic Operations; the development and dissemination of technical guides and handbooks, e.g. Older Driver Highway Design Handbook, Highway Safety Design and Operations Guide; the showcasing and deployment of four Mobile Sign Retroreflector vans; and accelerating the deployment of roadside safety hardware to States and local communities.

Outreach efforts include a campaign on Run-Off-Road for safety practitioners and the highway public. This started in fiscal year 2000 and will be intensified in fiscal year 2001. The focus will be on three areas: keep the vehicle in lane, alert drivers when leaving their lane, and minimize the impact of the vehicle in the event of running off the road. Materials will be developed and disseminated focusing on these issues, e.g. rumble strips, share-the-road, specific user groups, techniques to improve roadside safety, skid resistant pavement, improved geometric designs, traffic control devices, better and improved methods for measuring the retroreflectivity of signs and markings.

Funding source.—Surface Transportation Research (STR)

Funds.—Fiscal year 2000—\$375,000; fiscal year 2001—\$750,000.

RUN-OFF-THE-ROAD ACTIVITIES

Question. On a project-by-project basis, please break down your request for \$4.570 million regarding run-off-the-road activities.

Answer.

| <i>Project</i> | <i>Request</i> |
|---|----------------|
| Policy Review Module for Multilane Rural Highways | \$100,000 |
| Interactive Highway Safety Design Model Training Course | 200,000 |
| Rural Multilane Crash Prediction Model | 300,000 |
| Safety Effectiveness of Roadway Improvements | 200,000 |
| Safety Effectiveness of Interchange Improvements | 300,000 |
| Beta Testing of IHSDM | 150,000 |
| IHSDM Driver Performance Module | 330,000 |
| Vehicle Performance for Operational Situations | 100,000 |
| Safety Evaluation Measures from TWOPAS | 200,000 |
| IHSDM Software Development | 200,000 |
| Geometric Design Laboratory | 500,000 |
| Safety Evaluation of Ultraviolet Headlamps | 210,000 |
| Night Visibility Enhancement | 210,000 |
| Night Driving and Highway Lighting Requirements for the Older Driver | |
| Development of Fog and Ice Detection Systems (SBIR funded) | |
| Service Support for Photometric and Visibility Facility | 70,000 |
| Dynamic Testing of Posts in Soil | 100,000 |
| Safety Hardware Performance on Non-level Terrain | 150,000 |
| Vehicle Tripping and Rollover Mechanisms | 300,000 |
| Side-impact Relevance Study | 200,000 |
| Simulation Centers of Excellence | 200,000 |
| Cooperative Research, Maintenance & Operation of the FHWA/NHTSA NCAC | 360,000 |
| Cooperative Agreement with AAMA to Use Finite Element Analysis Instead of Crash Tests | 100,000 |
| Development of DYNA3D Analysis Tools for Roadside Hardware Applications | |
| Federal Outdoor Impact Laboratory | 300,000 |
| Roadside Safety Audits | 150,000 |
| Roadway Design Guide | 100,000 |
| Retroreflectivity | 200,000 |

| <i>Project</i> | <i>Request</i> |
|-----------------------|----------------|
| IHSDM Marketing | 150,000 |
| TOTAL | 5,170,000 |

PEDESTRIAN AND BICYCLE SAFETY

Question. On a project-by-project basis, please break down your request for \$2.150 million regarding pedestrian and bicycle safety.

Answer.

| <i>Project</i> | <i>Request</i> |
|--|----------------|
| Automatic Pedestrian & Bicycle Counting Devices | \$300,000 |
| Accommodation of Non-Motorists in Restricted ROW | 315,000 |
| Intersection Hazard Index for Pedestrians (formerly titled: Effects of Intersection Design on Pedestrian & Bicyclist Safety) | 275,000 |
| Evaluation of Safety, Design, and Operation of Shared Use Paths (formerly titled: Design and Operations of Shared Use Paths) | 230,000 |
| Pedestrian Facilities Design Training Course (Funded by NHI) | 150,000 |
| Pedestrian/Bicyclist Reference Set, Version 2 | 450,000 |
| In-Service Trials/Technologies & Partnerships for Pedestrian/Highway Safety | 100,000 |
| Facilitator Training for "Pedestrian Safety Roadshow" | 330,000 |
| Pedestrian/Bicyclist Reference | |
| Pedestrian/Bicyclist Awareness | |
| TOTAL | 2,150,000 |

EFFECTIVENESS OF SAFETY RD&T PROGRAM

Question. How do you evaluate the effectiveness of your safety RD&T program? What measures of success are used? Please describe those results.

Answer. For products that are part of the Safety RD&T program, action plans that have input from the user community are developed. Part of the action plan includes what products have been developed and who the users are. Measures of success are: when the product is transferred from RD&T to CBUs and Field offices; delivery and deployment of new RD&T products included in CBU, Resource Center and Division Office Unit Plans; use of product by state DOT; and adoption of new product by state DOT.

Also, the effectiveness of the RD&T program is evaluated on many levels from determination of need to deployment and implementation at the state and local level. In the determination of need, workshops are held involving state and local personnel, FHWA field staff, and other partners (e.g. AASHTO, TRB, ITE, NSC, etc) to assess the safety need, research and/or focus area. During the program schedule additional workshops are held to provide guidance and ensure that the output of the activity meets the need and expectations of the user. The initial output of the activity can be an applied research product (e.g. Older Driver Highway Design Handbook), a process that improves highway design and safety (e.g. Interactive Highway Safety Design Model, Equipment for measuring signs and pavement marking retroreflectivity, Road Safety Audits, etc), the development of training workshops (e.g. Facilitator training for the Pedestrian Safety Roadshow), the deployment of technologies for test and evaluation (e.g. In-Service Trials/Technologies & Partnerships for Pedestrian Safety), the development of Safety Campaigns (e.g. Red-light-Running, Work Zone Safety, etc.) and the development of guidelines, safety brochures, PSA's or other safety related information packages (e.g. Safely Moving across America CD).

Each of these incorporate unique and different methods of evaluation, an example would be:

Older Driver Highway Design Handbook

First level of evaluation was based purely on demand for product—more than 7,000 copies were requested and disseminated.

Second level of evaluation was based on user/safety practitioner feedback to initial product—the safety practitioners, once exposed to the issues on accommodating the older driver in highway design and traffic operations, demand that a workshop be developed based on the above handbook, also numerous requests were made to FHWA for presentations at international (e.g. TRB, ATSSA, etc), national and state meetings.

Third level of evaluation was based on demand for indirect products—within a 30 month period FHWA conducted over 30 one-day older driver workshops, providing

classroom instruction and discussion to over 1,000 engineers and other safety practitioners from the state and local agencies.

Fourth level of evaluation is based on actual field deployment made by states and local communities—in this particular activity we are now evaluating this task.

Fifth level of evaluation is the measure of success—is to assess the fourth level of evaluation by collecting data before and after crashes and conflicts to determine success.

Sixth level of evaluation is inclusion into guidelines and policy issued by FHWA (e.g. AASHTO Green Book, MUTCD, etc.). This is measured by adoption of the state and inclusion in their policy and guidelines.

Finally, the last measure of the program—is in looking at the overall crash picture, with focus on the segments to gauge the relevant reduction in fatalities and injuries.

TECHNOLOGY DEPLOYMENT ACTIVITIES

Question. How much will be spent on technology deployment activities related to safety? How will this help the states?

Answer. \$3,000,000 for fiscal year 2000. The “technology deployment” activities will help States by:

- Creating an awareness among top management and administrators of the benefits, impacts, and resources associated with safety process, countermeasures, and technologies.
- Providing information and demonstrations of proven state-of-the-art safety technologies to practitioners.
- Promoting concepts of new technologies, both hardware and software.
- Effectively showcasing safety processes, countermeasures and other related technologies. The technology deployment activities will assist in improving the road safety of the nation by accelerating the deployment/implementation of safety processes, countermeasures and other related technologies at the state and local level.

ROAD CONSTRUCTION WORK ZONES

Question. Please update your answer from last year regarding training programs to educate new drivers on the dangers of road construction work zones.

Answer. Currently PR # 42–01–0073 is being processed through Acquisition Management. The PR was designed to develop a national program effort to heighten the awareness of new drivers to the dangers involved with traveling through work zones. The program is scheduled to be awarded in September 2000 and consists of the following bullets:

- (1) *Literature Search/Catalog.*—The first task is to collect as much information as possible on the available literature, videos, programs and other related materials and collect that into a training best practices guide, which will be sent to the Work Zone clearinghouse and appropriate State and local agencies.
- (2) *Training Video.*—The video will concentrate on the dangers that work zone patterns present to new, inattentive, aggressive or speeding drivers.
- (3) *Other Materials.*—A teachers/classroom manual, CD-ROM, posters and stickers are just a few of the additional products expected to be developed and distributed.
- (4) *Outreach and Marketing.*—All products above are to be completed by the end of March 2001. Outreach (distribution of video, CD-ROM, manual, etc.) and marketing are to be completed before June 30, 2001.
- (5) After one year the program is to be evaluated. A written report and oral presentation will be provided by September 30, 2002.

HUMAN-CENTERED RESEARCH

Question. Please break out and describe in detail your proposal to spend \$1.730 million on human-centered research, paying particular attention to research aimed at helping the elderly.

Answer. The following table shows a breakout of our proposed spending on human-centered safety-related research:

| Project | Request | Elderly-Related |
|---|-----------|-----------------|
| Driver Perception of Curves and Run-Off-Road Accidents (Resident Study) | \$350,000 | X |
| Prototype Driver Models for Highway Design | 300,000 | X |

| Project | Request | Elderly-Related |
|--|------------------|-----------------|
| Older Driver Handbook | | X |
| Driver Selection of Speed (Resident Study) | 250,000 | X |
| Driver Identification of Highway Hazards | | X |
| Support Services for HYSIM Simulator Laboratory (Resident Study) | 330,000 | X |
| Identification and Evaluation of Driver Errors | | X |
| Effects of Roadway Design on Traffic Speeds and Crashes | 200,000 | X |
| Traffic Control in Construction and Maintenance Zones | | X |
| Pedestrian, Bicycle and Roadway Integration (Resident) | 300,000 | X |
| Total | 1,730,000 | |

All of the above projects are directed at making highways safer by incorporating the human element into the design of the infrastructure. Understanding the capabilities and limitations of drivers, pedestrians, bicyclists, etc. can have an important impact on roadway safety. All of the above projects involve the use of human research participants in investigations of human/roadway interactions, and each project includes the study of elderly participants to assess their special needs. The products of this research are used by state and local agencies, highway and traffic engineers and ultimately by the roadway-using public.

For example, the "Pedestrian-Bicycle-Roadway Integration" study investigates older and younger pedestrian recognition and comprehension of pedestrian crossing signals. Results of this study will lead to recommendations on crossing signals that are readily understood by older and younger road users. In the "Perception of Curves" project, driver age is a key component so that safety benefits can be extended to older and younger drivers. The "Speed Selection" project evaluates acceptable and unacceptable operating speeds and traffic volumes from the pedestrian's perspective, and will study pedestrians of all ages. The "Traffic Speeds and Crashes" project uses an Operating-Speed Estimation Method that will consider the most important design, operational, and environmental factors influencing drivers' perceptions of safe operating speeds. Driver characteristics, including age, will be studied in the development and calibration of the method. The "Older Driver Handbook" is an extremely popular product of our research effort. This Handbook gives guidance to highway and traffic engineers on improving roads and highways to accommodate the unique needs of the older driving population. Guidance is offered for improving the design of intersections, interchanges, roadway curvature, passing zones and construction and work zones, all from the perspective of the elderly roadway user.

SAFETY CAMPAIGNS

Question. What new safety campaigns are planned for fiscal year 2000 and fiscal year 2001? Please indicate funding amounts for each project.

Answer.

Pedestrian Engineering Outreach/Awareness (2000 start)

Goal.—To reduce the number pedestrian fatalities 5,220 (1998) that occur on our roadway each year. This program is intended for safety practitioners, the highway public, and other groups. Materials will be developed and disseminated (hard copy and electronic) focusing on pedestrian safety issues (e.g. Safety countermeasures—enhancing pedestrian nighttime visibility, geometric design issues, specific user groups, technologies—infra-red detection, and other processes).

Status.—Campaign started in fiscal year 2000.

Funds.—Fiscal year 2000—\$200,000; fiscal year 2001—\$330,000.

Run-off-Road Campaign

Goal.—To reduce the number of run-off-road crashes that account for almost 1/3 of all highway fatalities. This program will focus on three areas; keep the vehicle in lane, alert drivers when leaving their lane and minimize the impact of the vehicle in the event of running off the road. Materials will be developed and disseminated focusing on these issues, e.g. rumble strips, share-the-road, specific user groups, techniques to improve roadside safety, skid resistant pavement, improved geometric designs, traffic control devices, better and improved methods for measuring the retro-reflectivity of signs and markings.

Status.—Campaign started in fiscal year 2000.

Funds.—Fiscal year 2000—\$200,000; fiscal year 2001—\$300,000.

Speed Management Campaign

Goal.—To reduce speed related highway crashes (more than one-third of all fatal crashes). This program will focus on restoring the credibility of speed limits in the United States. This will include promoting Variable Speed Limits and Reasonable and Safe Posted Speed limits.

Status.—Campaign started in fiscal year 2000.

Funds.—Fiscal year 2000—\$315,000; fiscal year 2001—\$250,000.

Intersection Safety Campaign (fiscal year 2001 start)

Goal.—To reduce intersection related crashes (more than 22 percent of all fatal crashes). This program will focus on intersections (controlled and uncontrolled) and intersection related crashes. Focus will include traffic control devices, sight distances, geometric, etc.

Status.—2001 start.

Funds.—Fiscal year 2001—\$200,000.

HIGH OCCUPANCY VEHICLE FACILITIES

Question. High occupancy vehicle facilities have drawn much attention around the country. How is FHWA helping state and local governments operate and maintain these facilities and how much of the fiscal year 2000 and fiscal year 2001 budgets will be allocated for this activity.

Answer. In May 1999, FHWA issued program guidance to reiterate and clarify its support of high occupancy vehicle (HOV) facilities as part of a regional or corridor approach to manage congested conditions. The guidance emphasized the need to evaluate the performance of HOV facilities over time, as one of the many strategies in the region to manage congestion.

In response to questions that were received from State and local agencies, the guidance also indicated when a Federal review of changes to the operations of HOV facilities is needed, and what should be included as part of that review.

Initiatives and associated funding for fiscal year 2000 and fiscal year 2001 include:

| | Fiscal years— | |
|--|----------------------|----------------------|
| | 2000 | 2001 |
| Develop HOV System training course for state and local agencies | (¹) | (²) |
| Develop case-study on New Jersey I-80 & I-287HOV lane conversions | \$25,000 | |
| Co-sponsor HOV System Conference | 15,000 | |
| Value pricing Ban alternative operating strategy available to optimize performance of HOV facilities | ³ 440,000 | ³ 675,000 |
| Technical guidance for state and local agencies on combining pricing and HOV strategies | (¹) | |
| Guidance on use of HOV lanes by inherently low emission vehicles | (⁴) | |

¹ Funded from prior year carry over funds.

² NHI course offering.

³ Funded under the Value Pricing program.

⁴ Internal staff effort.

MULTI-AGENCY INCIDENT MANAGEMENT

Question. How much is FHWA planning to allocate in fiscal year 2000 to support the development and maintenance of regional multi-agency incident management programs? Please describe those efforts and specify how the effectiveness of your efforts is evaluated. What new initiatives will be added in fiscal year 2001 and at what proposed costs?

Answer. The revision of the Incident Management Handbook will be delivered in Spring 2000. This handbook is a revision of the 1991 Freeway Incident Management Handbook and updates that handbook as well as adding a section on systematic program development for a regional multi-agency program. An “Implementation Guide for Regional Traffic Incident Management Programs” is being developed and will be completed mid-year 2000. This implementation guide discusses the steps needed to develop and sustain a regional multi-agency program from a strategic planning viewpoint. This document is intended to provide assistance in developing a multi-agency approach to strategic planning for incident management so that state and local agency goals are coordinated and budget development for resources needed from both state and local agencies is planned and coordinated. This strategic ap-

proach to incident management programs is missing in most regional programs. These efforts were funded under previous years' budgets.

FHWA will continue to provide technical support to the National Highway Institute's Incident Management Workshop in fiscal year 2000. The Workshop has been presented 42 times in 20 states from November 1998 through February 2000. The workshops are presented to mid-management level persons in various response agencies consisting primarily of police, fire, emergency medical, emergency management, transportation, emergency communications and planning as well as private sector partners in towing and recovery, hazardous materials and traffic information media. The workshops have been followed up by high level executive sessions involving state transportation and public safety directors in four states with two others scheduled in 2000. The Workshops include evaluation forms for participants to complete that are used to evaluate effectiveness of presentation and indicate which materials need updating. In fiscal year 2000, FHWA is providing \$50,000 to allow the Workshop presenters to capture the incident management experiences of the participants to provide information toward the state-of-the-practice benchmarking activities.

A training course on Incident Management is being developed for FHWA field personnel. The purpose of this training course is to acquaint Resource Center and Division office personnel with both technical and institutional issues related to incident management and emergency services response. This training will better enable field personnel to assist State and local agencies in the development, refinement, and maintenance of regional multi-agency incident management programs. This effort is split-funded between fiscal year 2000 (\$45,000) and fiscal year 2001 (\$50,000), and will be delivered in fiscal year 2002.

The development of the IEEE P1512 Base Standard "Common Incident Management Message Sets for Use By Emergency Management Centers" has been completed. This standard will help provide a common communications framework for all regional incident management agencies. The standard was successfully balloted in November 1999. Comments received in the ballot process are now being resolved. It is anticipated that this standard will receive final approval by IEEE in early spring of 2000. These initial efforts were funded under previous years' budgets.

A new effort is underway within the US DOT to develop a strategy and program to facilitate the integration of transportation and public safety systems at both the technical and institutional levels. This effort is envisioned to also involve the Department of Justice, the Federal Emergency Management Agency and the Federal Communications Commission as well as police, fire, emergency medical and transportation professional associations. The goal of this effort is to improve the efficiency and effectiveness of public safety and transportation systems through improved communications and data transfer. While public safety communication systems have existed for many years, they are undergoing rapid technological advancement. At the same time new ITS systems and standards are being developed. The benefits of integrating the systems are numerous. The challenges are more institutional than technical. The development of ITS standards which affect existing public safety communications systems have made this effort essential.

Work will begin on a number of outreach and awareness initiatives in a multi-year program to provide information (technical issue documents, successful practices documents, etc.) which will facilitate good incident management practices. Initial efforts started in fiscal year 2001 at an estimated cost of \$200,000, will address Incident Command (ICS) Procedures and Practices for Transportation Agencies and Liability Issues in Incident Clearance. ICS is an on-scene command and control protocol used by public safety agencies and not widely understood by transportation agency responders. Liability issues raised at incident scenes may result in lengthy delays in reopening roadways to travel. The liability issues are changing now and agencies may find themselves at greater risk for not taking aggressive clearance actions.

VALUE PRICING PILOT PROGRAM

Question. What are the status, accomplishments, and remaining challenges associated with the Value Pricing Pilot Program? What impacts on operations to transportation systems have resulted from this program?

Answer. STATUS.—As of February 29, 2000, approximately \$2 million of the TEA-21 Pilot Program funds had been obligated to support local and Statewide value pricing planning and pre-implementation activities. Because authorizations to support the TEA-21 Pilot Program did not become available until fiscal year 1999 and authorizations had not been available to support the ISTEA Pilot Program in fiscal year 1996 and fiscal year 1997, new program initiatives were delayed until

applicants had time to move from initial project concepts to development of detailed project proposals that could support Pilot Program cooperative agreements.

Value pricing is likely to have far-reaching impacts on multiple parties and activities and localities have been extremely careful and deliberate in developing their proposals in order to include comprehensive assessments and outreach activities before a commitment to implement a project would be made. For this reason, even though FHWA has received many inquiries about the Pilot Program, and several areas are interested in applying to the program, only 4 cooperative agreements have been signed since funding became available to the program in fiscal year 1999. Two of those agreements are supporting projects in the State of California, a third agreement is supporting a pre-implementation study in the State of Maryland, and the fourth agreement is with the State of Minnesota. We anticipate that additional project agreements will be signed during the remainder of fiscal year 2000, with the States of Texas, California, Florida, New Jersey, New York and Connecticut being likely candidates for program participation. It is our expectation that a total of about \$8 million to \$10 million of program funds will be obligated through the end of fiscal year 2000, depending on the success of moving ahead with implementation at the local level.

The initial cooperative agreement was signed in February 1999, to continue the State of California effort to monitor the effects of the private sector road pricing project on State Route 91 (SR91) in Orange County. In September 1999, agreements were signed to support pre-implementation studies in the States of California, Maryland, and Minnesota. In addition, some of the projects funded with ISTEA funds are continuing with use of previous year funding, or are continuing as operating projects without Federal support. These operating projects are of particular importance because they are beginning to provide information about the impacts of value pricing on transportation systems.

ACCOMPLISHMENTS.—The FHWA and its state and local project partners have now had 9 years of experience with the Value Pricing Pilot Program and its predecessor, the Congestion Pricing Pilot Program. Over this time, the U. S. has become a world leader in investigating the potential of this innovative approach to ease traffic congestion. Fourteen project agreements have been funded over these years, and over \$32 million in Federal funds have been provided to support these projects. Cities in all parts of the United States are showing interest in value pricing, and the experience being gained through the Pilot projects, as well as a private sector value pricing project in Orange County, California, is providing valuable information to transportation leaders in the U.S. and around the world.

Beyond the support being providing to state and local project initiatives, one of the key functions of the Federal program has been to establish a forum for discussion and exchange of information about value pricing. Regional workshops sponsored by FHWA and its project partners have fostered a high level of interest in value pricing in all parts of the United States. The most recent workshop, held in New York City, was highlighted by an announcement by the Executive Director of the New Jersey Turnpike Authority that value pricing would be established on the New Jersey Turnpike in the near future. This is just one example where value pricing is moving beyond the pilot program stage and is more widely being viewed as a way of managing demand on congested facilities and increasing the efficiency of the transportation system.

The ultimate test of the Pilot Program's accomplishments is, of course, the extent to which the projects supported with program funds move into the operational phase. In this regard we have had some exciting accomplishments. Operational projects are being supported in San Diego, California; Houston, Texas; and Lee County, Florida. In addition, program funds are being used to support a monitoring and evaluation study of priced express lanes on State Route 91 in Orange County, California. These projects are now providing some early results, which are summarized in the following section.

IMPACTS.—Perhaps the two most important findings resulting from the operation of the early pilot projects are that drivers do alter their behavior in response to variable pricing, and that highway users are receptive to value pricing if it can be shown to provide them with improved transportation services. In San Diego, where tolls on the I-15 Express Lanes vary dynamically with the level of congestion, value pricing has led to improved use of available HOV lane capacity, and has generated revenues to support express bus service in the corridor. The vast majority of highway users in the corridor view this project as a success, and the San Diego Association of Governments is studying the feasibility of expanding the express lanes operation to cover more miles of the I-15 facility.

In Lee County, Florida, the value pricing strategy has caused drivers to shift trips out of the peak-congestion period into the shoulders of the peak, leading to more

efficient use of available bridge capacity and improved service for bridge users. This project has been well received by bridge patrons, and the County is currently examining other value pricing options to improve local transportation service. Value pricing is also being offered in Houston, Texas, on the Katy Freeway's (I-10) HOV lane. This project has led to improved use of existing HOV lane capacity, allowing more people to be moved through the corridor. The project, after an initial infusion of start-up funds from the Pilot Program, has become financially self-sufficient, and users of the lanes report satisfaction with the service being provided.

The value pricing project with the longest history in the U.S. is the Express Lanes project on SR91 in Orange County, California. This is a privately owned and operated project, but the Pilot Program is supporting the State of California's monitoring and evaluation of the traffic and travel behavior impacts of the project. This project consists of variably-priced express lanes that were constructed in the median of SR91. The project has shown that value pricing can be used to maintain free-flow traffic conditions, and that motorists value having the option of paying to receive improved transportation service in this highly-congested corridor.

In sum, the early results from pricing projects in the U.S. are showing that travelers are willing to pay for improvements in transportation service, and that pricing can lead to more efficient use of existing highway capacity. People do respond to price signals when making transportation decisions, just as they do in other parts of their economic lives, and those responses can serve as important investment guides for transportation planners and policy makers.

REMAINING CHALLENGES.—The major challenges surrounding value pricing and the Value Pricing Pilot Program continue to be the challenges of project design and public acceptance. The pilot tests that have been initiated to date are path-breaking projects that show great promise for the future of value pricing in transportation. Yet, these projects have been limited in both geographic scope and variety of pricing innovations. Operational projects have been launched in California, Texas and Florida. Even though interest exists in other parts of the country, resistance to exploring new ways of charging for road use has not yet been overcome. Peak-period value pricing charges have been tested on a newly-constructed express lane facility and on existing HOV lanes with excess capacity, and off-peak toll discounts have been tested in Florida. Efforts to move beyond these initial concepts have yet to be undertaken.

The challenge of the Pilot Program is to continue to test the successful concepts in new areas, and to move beyond the initial pricing concepts to new applications of value pricing, including variable pricing on existing toll facilities, pricing of newly constructed highway facilities, parking pricing, and other innovative concepts. Continued information sharing and public outreach through the Pilot Program approach has an important role to play in expanding the number and variety of pilot tests. These tests show how greater use of pricing principles in highway transportation can help bring more rationality to transportation investment decisions, and can lead to significant reductions in the billions of dollars of economic waste associated with traffic congestion.

WEATHER IMPACTS ON HIGHWAY OPERATIONS

Question. How much are you spending in fiscal year 2000 and in fiscal year 2001 to help state and local highway agencies mitigate the impact of changes in weather on highway operations? How will this information be used by road users and operators? Please specify projects and their associated funding levels.

Answer. Proposed spending on research efforts in ITS and Operations research funds, including field tests, to mitigate the impact of changes in weather on highway operations is as follows:

| | ITS | Operations | Total |
|--------------|-------------|------------|-------------|
| Fiscal year: | | | |
| 2000 | \$2,100,000 | \$100,000 | \$2,200,000 |
| 2001 | 1,900,000 | 100,000 | 2,000,000 |

The heart of the weather and winter mobility program aims to improve surface transportation outcomes under adverse weather through the development of better (accurate, reliable, appropriate, and readily available) road weather information. This vision recognizes that the wealth of weather information available today is not tailored for road users and operators, and hence leads to system inefficiencies. Therefore, efforts under this program aim to develop improved decision aids for the host of road users and operators. Work to date consists of documenting the specific

information needs of all users and operators, and translating these needs into system requirements. Such an effort serves two purposes: (1) it provides us with the material needed to work with the federal weather community (e.g., the National Weather Service) to see that their weather products and services satisfy these requirements, and (2) it provides us with the foundation for further research and field testing. The bulk of this research and field testing is on these decision support systems that fuse and filter the seemingly unending weather information and present it to road users and operators in a manner that is easily interpretable. This will ultimately lead to improved decision making because the users and operators will be presented with road weather information that fits their specific requirements, rather than having to make decisions based on generic weather information.

To that end, the following research projects and field tests are proposed for fiscal years 2000 and 2001:

| | |
|--|------------------|
| Fiscal year 2000: | |
| Refinement of Surface Transportation Weather Requirements | \$300,000 |
| Develop Decision Support System for Winter Maintenance | 600,000 |
| Environmental Sensor Station Siting and Road Condition Forecasting Evaluation | 750,000 |
| Assimilation of Road Condition Observations | 450,000 |
| Outreach and Training (e.g., support AASHTO Snow & Ice Cooperative Program, PIARC, regional maintenance conferences, etc.) | 120,000 |
| Total | <u>2,220,000</u> |
| Fiscal year 2001: | |
| Refinement of Surface Transportation Weather Requirements (continuation of fiscal year 2000 project) | 250,000 |
| Field Test of the Winter Maintenance Decision Support System | 750,000 |
| Develop Decision Support System for Travelers | 800,000 |
| Evaluation of Automated Anti-icing Spraying Systems | 100,000 |
| Outreach and Training | 100,000 |
| Total | <u>2,000,000</u> |

Of the above totals, \$2,100,000 in fiscal year 2000 and \$1,900,000 in fiscal year 2001 are derived from the ITS program budget.

TECHNOLOGY TRANSFER CHALLENGES

Question. What are the basic R&D and technology transfer challenges facing the operations CBU?

Answer. We are currently in the process of identifying those issues in order to form a 5-year operations research and technology agenda. The first national discussion of those issues was held April 3rd thru 5th at the Institute of Transportation Engineers Conference in Irvine California. The results will be incorporated in the report from Transportation Research Board's National Transportation Research Partnership.

Initial hypotheses and anecdotal evidence suggest that some of the primary challenges in improving operations of the surface transportation system are:

1. Institutional and cultural: Existing institutions are extraordinarily fragmented and often have no institutionalized processes or lines of communication for sharing information or responses in systems operations. Most of the institutions are organized to carry out capital projects. The existing planning process is oriented toward capital planning. It generally does not include the operations stakeholders nor are there processes in place for discussing and systematically dealing with planning for operational improvements.

2. Tools: There are few planning tools that will help assess the value of operations improvements. Most models have a 5, 10, or 20 year horizon and are geared to a one time capital decision. Operations tools need horizons of minutes.

3. Skill and priority: In part because federal policy has been skewed toward capital investment, operations have been forced to compete in the local budget arena. Evidence suggests it is becoming "deprofessionalized" rather than increasingly professionalized. Funds and skill are apparently not available for even maintaining and updating timing of traffic signals. Awareness of the consequences of this neglect in terms of congestion and safety will be a major hurdle to overcome.

4. Adequate ITS infrastructure: Although we are making progress, installation of sufficient ITS infrastructure for surveillance and management purposes continues to be a challenge. Even in areas with substantial existing and planned infrastruc-

ture, integration of infrastructure and information across jurisdictional, modal, and functional boundaries remains an issue.

WORK ZONE DELAYS

Question. Work zone delays are a continuing issue with the traveling public. How much are you spending in fiscal year 2000 and in fiscal year 2001 to help state and local highway agencies address this area? Please describe the scope and nature of your activities and their associated funding levels on a project-by-project basis.

Answer. The Operations CBU's efforts cut across other offices within FHWA. In addition to the \$660,000 which is dedicated from Operations, an additional sum of \$500,000 is being provided by the Safety CBU as part of FHWA's overall Work Zone initiative. The additional funds are incorporated into the cost figures below.

The work zone budget for fiscal year 2000 and fiscal year 2001 is as follows. Details of these efforts follow.

| | Fiscal years— | |
|---|------------------|------------------|
| | 2000 | 2001 |
| Best Practices Guide Book | 150,000 | 75,000 |
| Work Zone Awareness Week | 50,000 | 50,000 |
| Technology Scan | 35,000 | 250,000 |
| Delay Measure, Decision Tool & Guidance to reduce delay | 865,000 | 825,000 |
| Training | 60,000 | 250,000 |
| Total Work Zone Operations | 1,160,000 | 1,450,000 |

Best Practices Guide Book

Development of a Work Zone Best Practices Guidebook is being carried out in partnership with the American Association of State Highway Officials (AASHTO). The guidebook presents a collection of highway community best practices, which focus on minimizing driver and worker exposure in construction and maintenance work zones. With this guidebook a process is established to update and maintain an initial set of best practices, allowing the continued sharing of highway agency success stories with practitioners across the Nation. Regional seminars, which present the information in the guidebook and encourage additional sharing of best practices are now being planned. To supplement this guidebook, a checklist is under development that will facilitate identification and correlation of practices, appropriate for each stage of the project planning, design, and implementation processes.

Work Zone Awareness Week

FHWA is partnering with AASHTO and the American Traffic Safety Services Association to sponsor National Work Zone Safety Awareness Week. The event is intended to heighten motorist and worker awareness of the dangers encountered when driving through highway construction and maintenance work zones. Through a network of government and industry partners, media events and community outreach will focus on education and awareness.

Delay Measure, Decision Tool, and Guidance to Reduce Delay

There is a need to develop user-friendly computer software tools which accurately analyze and reliably predict work zone impacts. FHWA has initiated development of decision making tools which will allow practitioners involved in the project preplanning, planning, development, and construction phases to weigh alternate strategies to mitigate the mobility and safety impacts resulting from work zones. Development of the first spreadsheet tool, which we are calling "Quickzone," is underway with field beta testing to be accomplished this summer, and full release planned for April 2001. In parallel with development of the decision making tool, FHWA will investigate work zone delay measurement practices and techniques, and work to quantify current national impacts, and develop guidelines for quantifying delays.

Technology Scan

In fiscal year 2000, FHWA will initiate a "Technology Scan" to showcase state-of-the-art technologies. With this activity, new and emerging work zone technologies, focused on improving mobility and safety, will be identified, demonstrated and shared with the highway community through field testing, evaluation and several multi-State workshops. Improving mobility and safety on the Federal-aid high-

way system, in light of construction and maintenance operations, is the goal of this activity, and technologies scanned will range from traveler information techniques, traffic management practices, means of contracting, and improved materials/methods of construction.

Training

In fiscal year 2001, FHWA will develop a Work Zone Traffic Management Training program. This training will facilitate an organizational understanding of work zone traffic management principles, shifting attention from the traditional site specific traffic control. The training will focus on integrating work zone traffic management principles into the early phase of project planning.

MULTI-MODAL FREIGHT ANALYSIS

Question. What is the purpose of the research effort on Multi-Modal Freight Analysis Framework?

Answer. A new era in freight transportation is emerging. It is driven by competitive global trade, new business and logistical practices, and increasing reliance upon information technology. The purpose of the multi-modal freight analysis is to:

- Marshal and/or develop freight analytical models, data sources, communication channels, and professional expertise (taken as a whole, these will provide freight intelligence support for the FHWA, the Department, State and local jurisdictions, and other public and private sector partners and investors who are seeking to improve freight service);
- Define the essential functions of the U.S. and North American freight corridors, connectors, and intermodal terminals; the varied challenges to these freight system components' continued performance, as defined by their current condition, extent, probable evolution, and investment needs;
- Enhance the ability of the FHWA and state and local governments to evaluate alternative infrastructure investment strategies vis-a-vis alternative private sector investment strategies. For example, major highway capacity investment for the purposes of intermodal goods movement improvement needs to match port capacity investment which in turn needs to match shipper and carrier business strategies.

Question. What end-products do you anticipate from this investment? How much will be allocated?

Answer. End products will include national databases on freight flows and models capable of analyzing alternative infrastructure investments relative to alternative futures and business practices. Spending will be extensive: \$900,000 was set-aside in fiscal year 2000; \$750,000 is requested in fiscal year 2001.

Question. How will this research help state and local governments? What do you anticipate as achievements from your research on freight performance measurement? How does the initiative support, or mesh with, other freight initiatives being conducted by the Operations CBU? How much are you planning to spend in fiscal year 2000 and fiscal year 2001 on this research?

Answer. State and local governments will be better able to evaluate and justify intermodal infrastructure investments. Performance measurement is required as part of the FHWA and DOT strategic plans, consistent with the GPRA. Measurement offers us the opportunity to more quantitatively assess system performance and efficiency relative to a critical user B shippers, carriers and ultimately the American public. Literally millions have been spent on measures and models for estimating system performance and investment benefits relative to the commuter. Very little has been spent to measure similar performance for goods movement. The advent of e-commerce makes such measures increasingly critical.

Our efforts include a search for one or two validated national measures to diagnose problem areas in freight transportation, and to help us evaluate significant system investments. This research also seeks to define specific measurements to use in assessing freight corridor and border crossing movements. Research to date has pinpointed some potential measurements that we may be able to use to diagnose problem areas and generate solutions. Our next step is to present these measurements to our partners and together seek consensus on an adequate measure or set of measures. This initiative involves more than simply establishing designated measurements' relevance to highway freight transportation. It also seeks to address more pragmatic concerns, such as the potential availability of reliable data and databases to support measurement, and the accessibility of privately held industry data for public use.

Ultimately, the application of performance measurements will support agency strategic planning and become an important component of our multi-year initiative to produce a freight analysis "framework," a major effort to evaluate the current

condition of U.S. and North American freight transportation, generate future scenarios of need and opportunity, evaluate potentially advantageous public policies, and knowledgeably design strategic public sector investments to improve freight performance and mobility. \$250,000 was provided in fiscal year 2000 and a similar amount is proposed for fiscal year 2001 for this research.

NATIONAL ECONOMIC COMPETITIVENESS

Question. Why is FHWA's Freight Management Office conducting research and conducting projects that deal with our national economic competitiveness and economic growth? How much money is being allocated for research and projects in fiscal year 2000, and proposed for fiscal year 2001? How will this help state and local governments? Please break out specific projects and associated funding levels.

Answer. A primary justification of federal involvement in and investment in transportation is to aid interstate and international commerce. Several studies have recently shown (notably one completed by Booz Hamilton, another by GAO, and the FHWA draft NHS Connector Study) that freight related infrastructure investments tend to fare poorly in the local planning process unless they can be justified based on benefits to passenger travel. One reason is the lack of analysis tools to demonstrate quantitatively the benefits of a freight related investment and how those benefits are likely to be distributed.

During 2001 and 2002, we are seeking to develop a national perspective on needed investments in, and improvements to, our national competitiveness and economic growth. Subsequently, in 2003 and beyond, we are proposing to expand our focus to include more local needs by developing investment "tools" for our state and Metropolitan Planning Organization (MPO) partners that can be used to assess the costs and benefits of freight projects.

These tools will help local officials to understand both the importance and the effects of freight investment on their region's economic productivity. Equally important they will assist in evaluating the distribution of benefits relative to the distribution of costs (both monetary and environmental).

The FHWA has allocated \$500,000 for investment work in fiscal year 2000. We have proposed \$750,000 in fiscal year 2001.

TRAFFIC CONTROL DEVICES

Question. What new tools, research, and skills are you working on to help state DOTs operate and maintain their highway systems more effectively?

Answer. The Operations Core Business Unit will be releasing the updated edition of the Manual on Uniform Traffic Control Devices in mid fiscal year. This Manual contains the standards for signs, traffic signals, and pavement markings, and incorporates the latest technologies and research, especially of the needs of older drivers, relating to the use of these traffic control devices to improve the flow and safety of all roads opened to public travel. Once the Manual is released, the text and figures will be available on our web site, <http://mutcd.fhwa.dot.gov>, and available on CD-ROMs. We will be working with the professional and contractor organizations to provide training for their staffs.

Snow, ice, fog, rain and other inclement weather reduce the capacity and safety of road systems. The surface transportation weather forecasting requirements will be developed and ready to serve as a basis for FHWA to engage the weather forecasting community in preparing weather forecasts for the surface transportation operations managers and the traveling public, just as they do for the aviation users. Using weather forecasts focused on the surface transportation system, as opposed to the use of general, area wide forecasts, operations managers will be better prepared to respond to snow removal, roads restricted by high water or trees, and roads with reduced visibility. Additionally, the FHWA will be completing the development and beginning the testing of a winter maintenance weather decision support system for managers and traveler information for travelers.

In the area of improved work zone operations, FHWA will be developing decision-making tools which will allow practitioners to evaluate alternate strategies to mitigate the mobility and safety impacts resulting from work zones. Other products that will be developed include work zone traffic management training, and guidelines on reducing construction times, on higher quality pavement, innovative contracting and innovative construction practices.

The Operations CBU will provide guidance to agencies on how to consider transportation systems operations during transportation planning processes. Also, guidance will be provided to operating agencies on how to better plan for improved system operations and maintenance from a performance-based perspective.

We will also continue to develop and deliver technical guidance and training in a number of operational areas, such as traveler information, traffic management, incident management, arterial management, HOV facilities, and travel demand management.

The ITS Deployment Analysis System (IDAS) will be released through McTrans this spring. IDAS is a cost benefit software tool that helps communities determine the costs and benefits of implementing specific ITS improvements. In addition to its upcoming release, a training course is under development that will show our state and local partners how to use IDAS most effectively. The training course will be ready in early next fiscal year and the Operations CBU will work through our field staff and resource centers to ensure its wide distribution.

Research on Adaptive signal Control Systems (ACS) is continuing. ACS will allow traffic signal control systems to respond to current traffic conditions in real time. Currently, three alternative algorithms have been developed for various conditions, and are being field tested. The field tests will be completed next year, and, ultimately, the algorithms will be made commercially available shortly thereafter.

The Operations CBU is continuing to advance the widespread deployment of Incident Management programs around the country. We are continuing to work with NHI to deliver approximately two incident management workshops per month. These multi-agency workshops cater to DOTs, police, fire, emergency medical personnel, and emergency communications operators. Also, a new Incident Management Handbook will be released this spring, updating the 1991 manual which documents best practices and procedures and key issues in incident management. An Incident Management Implementation Guide will also be released this spring which is geared toward helping communities develop an institutional framework for sustained incident management programs in the long term.

Turbo Architecture is also being released this spring. Turbo Architecture is a tool which was developed in response to our partners' needs in developing regional ITS architectures. It walks the users through the National ITS Architecture by a question and answer process, and helps to develop regional and local ITS architectures which will be consistent with the National ITS Architecture. It will be rolled out this spring at the ITS America Annual Meeting and then made available for distribution through McTrans. Training courses are also underway which will be provided through NHI when completed early next fiscal year.

TSIS version 5.0, which is one of the most comprehensive traffic simulation models in the world, is currently under development. This new user-friendly version will provide for an easy user data inputting interface. Once complete, TSIS 5.0 will enable our state and local partners to simulate freeways and large street networks for alternatives analyses and planning. When complete, it will be made available to our partners through McTrans.

In the area of ITS training, we have trained almost 9,000 people in various travel management topics geared toward the operation and management of the transportation system. We have also trained over 3,000 people in CVO courses, and over 12,000 people have seen the CVO technology truck. The ITS training program has been so successful that we are now seeing several states tailoring our courses to meet specific their needs, including California, Virginia, Florida, and Utah. FHWA Divisions and Resource Centers continue to reach many people in the profession. Associations such as ITE and ITS America are now developing and delivering courses under their own banners. ITE standards courses have reached over 2,000 people. The thrust of the ITS training program development now focuses on distance learning. In other words, providing the key technical training courses to the people who need them, when and where they can obtain the training. We are currently piloting three web-based training courses through which we plan to reach many people in the profession.

OPERATIONS CORE BUSINESS UNIT

Question. Please discuss the scope and nature of your fiscal year 2000 highway operations program and indicate the amount and purpose of each relevant contract funded under that sub-account.

Answer. The objective of the Operations Core Business Unit is to optimize the performance of the transportation system through unifying all aspects of the surface transportation system. Within the 5 offices of the CBU, there are 73 FTP, including the JPO, dedicated to this task. The Transportation Operations Office handles safety and mobility in construction/maintenance operations, Weather initiatives, MUTCD, and Emergency Preparedness. The Office of Travel Management is responsible for ITS Deployment, HOV Systems, Operations Planning Guidelines, Congestion Management, Value Pricing, and Highway Capacity Analysis. The Office of

Freight Management and Operations handles Size and Weight Enforcement, border crossings, National Freight Partnership, Multi-state freight corridor development, National Highway System connectors, and the Intermodal investment framework. The Office of Technology Services is responsible for strategic planning, communications and outreach, legislative coordination, research development and technology coordination, policy coordination, and training support/university programs. The ITS Joint Program Office is responsible for DOT-wide ITS coordination, the Intelligent Vehicle Initiative, Standards, Architecture, and Evaluation and coordinates with many of the initiatives throughout the other offices of the CBU.

The JPO maintains its role as a separate unit that serves all of the Department for ITS development and benefits from the organizational support as an office within FHWA. The Director of the JPO is also the Director of the Operations CBU. In its Department-wide functions, the JPO continues its extensive coordination and close working relationships with program managers and senior officials in FHWA, FRA, NHTSA, and FTA on the research, development and deployment of ITS technologies. As an office within FHWA, the JPO benefits from the program and administrative support of the agency and also relies on the FHWA field organization to support its initiatives. With the creation of the Operations CBU, FHWA better positioned itself to carry out the strategic direction set by the JPO and to take a leadership role in using the ITS infrastructure that is being put in place across the nation.

In fiscal year 2000, the Operations Core Business Unit is pursuing four strategies to advance more efficient operations as outlined in the Mobility goal of the strategic plan:

1. Complete key ongoing initiative and invest in a limited number of high impact "low hanging fruit" including: a. Completing the Manual of Uniform Traffic Control Devices; b. Launching a major Work Zone research and tech transfer initiative; c. Continuing the FHWA weather response initiative.
2. Invest in supporting the deployment of the ITS infrastructure including: a. Architecture consistency guidance and training; b. Completing two-thirds of the proposed ITS standards and launching testing and training; c. Implementing service plans in 55 of 78 largest metro areas; d. Completing the ITS Deployment Analysis System, a tool for planning ITS deployment; e. Developing and testing low cost adaptive control for small communities.
3. Invest in laying an information, measurement and institutional foundation for operations, including: a. Benchmarking; b. Developing options for national and local performance measures; c. Conducting national conferences and regional workshops to begin developing planning guidelines, developing a research agenda, and establishing local operations institutions.

The Operations Core Business Unit will pursue four strategies to improve the efficiency and productivity of freight movement. 1. Conduct analyses necessary to develop a cohesive set of long term freight improvement strategies; 2. Invest in corridor and border improvements thru the sec. 5118 and 5119 Borders and Corridor Program; 3. Continue to nurture multi-state freight/trade institutional partnerships to leverage public and private investments in freight related infrastructure and intermodal operations improvements; 4. Develop and test key elements of ITS technology.

The following chart shows the funding for the major programs for the offices in the Operations CBU in fiscal year 2000:

| <i>Projects by Office</i> | <i>Fiscal year 2000</i> |
|--|-------------------------|
| Freight Management: | |
| Decision-making Framework | \$1,600,000 |
| Institutional Partnerships | 150,000 |
| Performance Measures | 250,000 |
| Transportation Operations: | |
| Work Zone Operations (includes \$500,000 from Safety CBU) | ¹ 1,160,000 |
| Manual on Uniform Traffic Control Devices | 375,000 |
| Improved Weather Response | 100,000 |
| Emergency Preparedness | 135,000 |
| Travel Management: | |
| Freeway & Incident Management & Operations | 195,000 |
| Arterial Operations and Traffic Control | 230,000 |
| Travel Demand Management | 50,000 |
| Performance Analysis & Tools | 325,000 |
| Operations Technology Services: | |
| Measures of Success | 500,000 |
| Operations Outreach/Awareness and Institution Building | 861,000 |
| AASHTO/FHWA International Scan | 40,000 |

| <i>Projects by Office</i> | <i>Fiscal year 2000</i> |
|--|-------------------------|
| Congressionally Mandated Studies | 3,932,000 |
| <hr/> | |
| TOTAL | 9,903,000 |

¹ Includes \$500,000 from the Safety CBU for Work Zone initiatives.

FISCAL YEAR 2001 BUDGET REQUEST

Question. Document how the fiscal year 2001 request ensures program continuity with the fiscal year 2000 spending plan.

Answer. The 2001 budget request proposes to continue the strategies outlined in the answer to the previous question. For example:

- The budget request will support nationwide dissemination of the final MUTCD rule that will be completed by fiscal year 2001.
- It will provide extensive training and outreach to state and local agencies on proven ways to improve the safety of work zones and to efficiently manage work zones. This will include development and training on analytical tools to reduce construction times and the costs of work zone delays.
- FHWA will continue programs to benchmark and share best practices in travel management systems to help state and local governments to use their current traffic systems most effectively and to deploy ITS technologies and advanced techniques to improve the performance of their system.
- We will continue development of the Freight Analytical Framework launched in 2000.
- We will develop freight cost benefit analysis tools based on data collected in the year 2000.
- We will gain consensus on and test performance measures developed in 2000.
- We will continue regional workshops started in 2000 and add the self-assessment “operations audit” tool to the discussion.

PAVEMENT RESEARCH

Question. Why are you proposing to decrease the amount for pavement research funded out of the surface transportation R&D account?

Answer. The surface transportation research provisions of TEA–21 provide a fixed amount of authorized funds each year, which do not rise in conjunction with the growing demands from emerging or expanding areas such as transportation operations, freight, the environment and policy issues. This has forced FHWA to make difficult decisions on relative program priorities and some areas do show funding reductions, as reflected in the request for surface transportation research funds for pavement research being reduced in fiscal year 2001 over the fiscal year 2000 level. We certainly recognize the value of continuing to advance innovation through pavement-related R&T efforts and we have been reluctant to cut financial resources provided by current TEA–21 authorizations, but we feel this has been unavoidable given the current R&T funding environment. As outlined in response to the next question, we have proposed that additional funds be authorized beyond current TEA–21 levels to address this critical need.

Question. Your table comparing pavement research for fiscal year 2001 to that for fiscal year 2000 funded from the surface transportation research account shows a substantial reduction in funds for this research category. Please explain the strategic thinking behind this request.

Answer. Strategically, we do believe that there is a critical need to continue essential pavement-related R&T activities within the highway community, as this is a very high-priority area among our partners and customers. To achieve continuing advancement while FHWA funding is reduced (as noted in the answer to the previous question), we have worked very closely with key partners on collaborative approaches; and our State DOT partners, in particular, have been very responsive to this effort. The pavements area is a good example of where such partnerships have been successful, as funds from State DOTs have supported critical pavements-related work. However, our state partners have made their belief clear that additional Federal resources are needed for these efforts, and FHWA has taken the initiative to request that additional R&T funds be authorized beyond current TEA–21 levels. This FHWA request for a total of \$50 million in additional funds (\$40 million in surface transportation research, \$6 million in technology deployment, and \$4 million for training and education) includes a significant portion for pavement R&T to address the current shortfall in R&T.

RESEARCH AREAS

Question. What has been done in response to the fiscal year 1999 conference committee's encouragement to support research into geosynthetic materials, the use of polymer additives for pavements, lithium-based technologies, and composite bridge systems with funds provided for pavements? How much will be allocated for these research areas in fiscal year 1999 and in fiscal year 2000?

Answer.

Geosynthetic Materials

The FHWA technical representatives met with Montana DOT and the Montana State University. A Work Order contract was established in fiscal year 1999, to conduct the above effort. Since directed activities exceeded funds provided under the legislation, only \$600,000 was available for this effort in 1999. The Montana DOT, the FHWA, and the University representatives have formed a technical advisory group for this project. On January 25, 2000, the Montana State University produced its 1st interim report on this effort. This report contains the results of their work to model pavement performance and applicability for pavement design.

Polymer Additives for Pavements

In fiscal year 1999, the FHWA was encouraged by the conferees to investigate polymers produced by Martin Color-fi Incorporated of Edgefield, South Carolina. In December of 1998, FHWA hosted a meeting with Martin Color-fi, a producer of polyester fibers, to discuss the FHWA polymer research program and to learn about the polymers produced by this company.

The fiscal year 1999 appropriation provided funding of \$1,500,000 for this effort. However, the pavements' program stipulated by the original legislation and fiscal year 1999 appropriations totaled more than the allotted budget. Subsequently, activities called for under the fiscal year 1999 appropriations were only funded at 60 percent. Therefore the actual funding provided for this effort was \$900,000. In fiscal year 1999, this funding was used by FHWA to support the development of the chemically-modified product and to provide detailed laboratory analysis. Planned expenditures in this area for fiscal year 2000 are \$625,000.

Lithium-based technologies

Regarding research on lithium-based technologies (to mitigate alkali-silica reaction in concrete), there were no funds specifically designated for lithium work in fiscal year 1999. In fiscal year 2000, \$500,000 was allocated specifically for lithium work. In November 1999 and January 2000, FHWA met with lithium industry representatives to discuss research and implementation needs, and several potential projects were identified. An expert panel has been formed to assist FHWA in planning and selecting projects, and the panel will be meeting in early May to define the projects to be funded with fiscal year 2000 monies.

Composite Bridge Systems

On September 2, 1999, a cooperative agreement was signed with West Virginia University. Funding for fiscal year 1999 was \$600,000 in federal funds, with \$150,400 in matching funds from the university. The project is investigating the applicability of composite materials for dowel bars and reinforcement normally made of steel for use in concrete pavements.

SECOND GENERATION COMPOSITE BRIDGE DECK SYSTEMS

Question. What was accomplished in response to the fiscal year 1999 conference committee's encouragement to develop second generation composite bridge deck systems and technologies that may lead to better constructed and longer lasting pavements? How much will be allocated for these research areas in fiscal year 1999 and in fiscal year 2000?

Answer. On September 2, 1999, a cooperative agreement was signed with West Virginia University. Funding for fiscal year 1999 was \$600,000 in federal funds, with \$150,400 in matching funds from the university. The project is investigating the applicability of composite materials for dowel bars and reinforcement normally made of steel for use in concrete pavements. In fiscal year 2000, it is anticipated that no additional funds will be allocated for this effort.

LONG-TERM PAVEMENT PERFORMANCE (LTPP)

Question. Please bring us up to date on the progress, accomplishments, challenges, and outlook for the LTPP, as well as the integration of this effort with the pavement R&D program proposed for this fiscal year.

Answer. The progress, accomplishments and challenges for the LTPP are described in the LTPP: 1999 YEAR IN REVIEW, FHWA-RD-00-020. Highlights of the progress and accomplishments include the release of the DataPave 2.0 software. DataPave is a CD-ROM version of the LTPP database that provides the LTPP data in an easy to understand and use format. DataPave 2.0 is a two CD-ROM set that includes triple the amount of data in DataPave 1.0. FHWA and the American Society of Civil Engineers sponsored a contest in the analysis of the LTPP data. The contest winner in 1999 presented a new method of analyzing and understanding the profile of concrete pavements that has the potential to greatly improve the performance of future concrete pavements. Another product that was improved and released is the LTPPBind 2.1. The improved LTPPBind has more information and significant improvements in functionality. This software enables highway agencies and industry in the selection of the most cost effective Superpave binders. Lastly, the LTPP is cooperating with the National Cooperative Highway Research Program efforts in the development of the 2002 Pavement Design Guide. The LTPP plays a critical role in the development of the new guide as the source of pavement data for the validation and calibration of the new Guide and in several instances as a source of information and procedures in the use of the new Guide.

The principal challenge facing the LTPP is adequate funding. Although TEA-21 provides \$10 million per year for the LTPP, this is insufficient to operate the program. This shortfall in funding has been addressed by the State highway agencies. Through the National Cooperative Highway Research Program the states have provided \$4.7 million in 1999 and \$5.025 million in 2000 for the LTPP. These funds are used for data collection, analysis and product development.

The outlook for the LTPP is very positive. The program is producing the quality data, analysis results and products that the State highway agencies want. KEY FINDINGS from the LTPP Analysis, 1990-1999, FHWA-RD-00-085 provides an overview of the significant findings and results from the analysis of the LTPP data.

The LTPP data, analysis findings and products are being integrated into FHWA's pavement technology program. An example is the National Highway Institute course entitled Concrete Pavement Design Details and Construction Practices which includes a concrete pavement design procedure validated and calibrated with the LTPP data and analysis. The course will be updated to include a number of the LTPP findings on better performing pavements.

WOOD DEPOSITS AND LITHIUM TECHNOLOGY

Question. In House report 106-180, Congress encouraged FHWA to support research into wood deposits and lithium technology to mitigate the damage from alkali silica reactions. How much money was allocated for this project in fiscal year 2000, and how much is requested for fiscal year 2001? What progress has been made since last year?

Answer.

Wood deposits (s/b composites)

The Federal Highway Administration has entered into a cost sharing contract with the University of Maine to develop advanced wood composites for bridge construction. The government has obligated a total of \$900,000 (\$600,000 in fiscal year 1999 and \$300,000 in fiscal year 2000) to this contract. The objective of the contract is to obtain the services of the University of Maine's Advanced Engineered Wood Composites Center, its researchers, and engineers to conduct research on fiber-reinforced glulam technology for the next generation of vehicular wood bridges. The exact nature and extent of the Contractor's work will be based on task orders issued by the FHWA.

Lithium technology

\$500,000 was allocated in fiscal year 2000 specifically for lithium work. Additional funding has not been requested for fiscal year 2001. In November 1999 and January 2000, FHWA met with lithium industry representatives to discuss research and implementation needs, and several potential projects were identified including field trials, information booklets and guidelines, and research. An expert panel has been formed to assist FHWA in planning and selecting projects, and the panel will be meeting in early May to define the projects to be funded with fiscal year 2000 monies. In the months following this meeting, projects will be advertised and selected.

GEOSYNTHETIC MATERIAL RESEARCH

Question. In the fiscal year 2000 conference report, the conferees encouraged the FHWA to provide up to \$400,000 for geosynthetic material research, and up to \$1,500,000 to study the potential benefits to federally funded highway projects and

asphalt surfaces of early application of emulsified sealer/binder and research related to development of low cost pavement with flexibility to tolerate heaves in extreme climates. What has FHWA done to implement this request? How much will be allocated during fiscal year 2000 on those activities?

Answer.

Geosynthetic Materials

For fiscal year 2000, the Senate Committee on Appropriations has directed that an additional \$400,000 be allocated to this effort. Since Congressional directed activities for fiscal year 2000 exceed funds provided under the legislation, only \$200,000 is available for this effort in fiscal year 2000. On May 1, 1999, the representatives from the Montana DOT, the FHWA Montana Division, and the Montana State University will meet as part of a conference on geosynthetic materials. Work plans for utilizing these new funds will be finalized. The Montana State University has submitted a draft proposal for these additional funds and efforts are underway to modify the existing agreement to accommodate this additional research.

Asphalt surfaces

In the area of asphalt surfaces, early application of emulsified sealer/binder and research related to development of low-cost pavements with flexibility to tolerate heaves in extreme climates, the following is planned for fiscal year 2000. In fiscal year 2000, FHWA will provide up to \$375,000 to study the potential benefits to federally funded highway projects and asphalt surfaces of early application of emulsified sealer/binder. It is intended to conduct the workshop(s) through FHWA's cooperative agreement with the Asphalt Institute to identify a course of action based on user needs in this area. Based on the proceedings, develop a work plan for test sections, identify sites for test sections, develop a work plan for monitoring the test sections, award contracts of the placement and monitoring of the test sections and conduct a "Lessons Learned" workshop at the close of the project(s) to implement the results.

FHWA will provide up to \$375,000 to research related to development of low-cost pavements with flexibility to tolerate heaves in extreme climates. To this end, the following will be conducted, establish points of contact at the FHWA Alaskan Division Office and Alaskan Department of Transportation, initiate a meeting between FHWA, Alaskan DOT, Industry, and Academia to discuss possible research activities, develop a statement of work and initiate a contract and requests for proposal and award and conduct the research.

POLYMER ADDITIVES

Question. In the fiscal year 2000 conference report, the conferees encouraged FHWA to provide up to \$1,250,000 for research costs associated with constructing a segment of highway utilizing a binder composed of polymer additives and to work with the South Carolina State University and Clemson University to further research in this area. What has FHWA done to implement those studies? How much will be allocated during fiscal year 2000 on those activities?

Answer. In December of 1999, at the request of FHWA, the South Carolina Department of Transportation (SC DOT) hosted a meeting which included representatives from South Carolina State University (SC State), Clemson University, SC Asphalt Pavement Association, Martin Color-fi (SC polymer producer), and industry. SC DOT will be constructing a segment of highway utilizing binders composed of polymer additives in the Spring of 2000. SC State and Clemson are currently developing a work plan to provide the project with on site testing and continued monitoring.

The fiscal year 2000 appropriation provided funding up to \$1,250,000 for this effort. However, the pavements' program stipulated by the original legislation and fiscal year 2000 appropriations totaled more than the allotted budget. Subsequently, activities called for under the fiscal year 2000 appropriations are only funded at 50 percent. Therefore the actual funding provided for this effort is \$625,000.

In fiscal year 2000, FHWA has provided technical and laboratory efforts in support of this project at an approximate cost of \$200,000. Additional efforts by FHWA this fiscal year will cost approximately \$200,000. It is FHWA's intent to establish a cooperative agreement with Clemson and SC State in support of the work plan being developed. It is estimated that this effort will cost between \$175,000 to \$225,000 in fiscal year 2000.

STRUCTURES RESEARCH

Question. For just the surface transportation R&D funds, please break down in extensive detail the funds requested for structures R, D and T and compare to fiscal year 1999 and fiscal year 2000 expenditures.

Answer. The information follows:

| | Fiscal years— | | |
|----------------------------------|---------------|-------------|-------------|
| | 2001 | 2000 | 1999 |
| Bridge Inspection | \$2,200,000 | \$2,101,000 | \$2,606,000 |
| Bridge Management | 400,000 | 401,000 | 665,000 |
| Nondestructive Evaluation | 1,800,000 | 1,700,000 | 1,941,000 |
| High Performance Materials | 5,000,000 | 5,380,000 | 4,820,000 |
| Concrete | 500,000 | 500,000 | 700,000 |
| Steel | 700,000 | | 1,920,000 |
| Fiber Reinforced Polymers | 3,800,000 | 4,880,000 | 2,200,000 |
| Engineering Applications | 7,060,000 | 6,204,000 | 8,166,000 |
| Design Technology | 2,060,000 | 1,630,000 | 3,050,000 |
| Natural Hazard Reduction | 3,000,000 | 2,613,000 | 3,474,000 |
| Geotechnical/Foundations | 1,000,000 | 870,000 | 900,000 |
| Corrosion Protection | 1,000,000 | 1,091,000 | 742,000 |

RESEARCH AREA FUNDING

Question. Please break out in extensive detail the projects or research areas and associated amounts requested under bridge inspection, high performance materials, and engineering applications.

Answer. The funding, research areas, and projects requested for fiscal year 2001 are as follows:

| | <i>Fiscal year 2001</i> |
|--|-------------------------|
| Research Area: | |
| Bridge Inspection | \$2,200,000 |
| Bridge Management Projects | 400,000 |
| Nondestructive Evaluation Projects | 1,800,000 |
| High Performance Materials | 5,000,000 |
| Concrete Projects | 500,000 |
| Steel Projects | 700,000 |
| Fiber Reinforced Polymer Projects | 3,800,000 |
| Engineering Applications | 7,060,000 |
| Design Technology Projects | 2,060,000 |
| Natural Hazard Reduction Projects | 3,000,000 |
| Geotechnical/Foundation Projects | 1,000,000 |
| Corrosion Protection Projects | 1,000,000 |

Question. Compare the fiscal year 2001 request with the fiscal year 2000 spending plan and demonstrate program continuity in each of these areas.

Answer. Requested fiscal year 2001 research areas and projects within each research area are the same as for fiscal year 2000, as indicated in the table below. In addition to comparing research area and project titles between fiscal year 2001 and fiscal year 2000, program continuity is demonstrated by the fact that the fiscal year 2001 budget request and actual fiscal year 2000 expenditures are based solely on the Federal Highway Administration's (FHWA) Structures Strategic Plan for Research, Development and Technology (RD&T). Currently the FHWA Structures Strategic RD&T Plan is being coordinated with the joint Transportation Research Board/American Association of State Highway and Transportation Officials (TRB/AASHTO) Strategic Plan for Bridge Engineering Research. These plans will be merged into the broader National R&T Partnership Initiative, which is being facilitated by the TRB.

| | Fiscal years— | |
|-------------------------|---------------|-------------|
| | 2001 | 2000 |
| Bridge Inspection | \$2,200,000 | \$2,101,000 |
| Bridge Management | 400,000 | 401,000 |

| | Fiscal years— | |
|----------------------------------|---------------|-----------|
| | 2001 | 2000 |
| Nondestructive Evaluation | 1,800,000 | 1,700,000 |
| High Performance Materials | 5,000,000 | 5,380,000 |
| Concrete | 500,000 | 500,000 |
| Steel | 700,000 | |
| Fiber Reinforced Polymers | 3,800,000 | 4,880,000 |
| Engineering Applications | 7,060,000 | 6,204,000 |
| Design Technology | 2,060,000 | 1,630,000 |
| Natural Hazards Reduction | 3,000,000 | 2,613,000 |
| Geotechnical/Foundations | 1,000,000 | 870,000 |
| Corrosion Protection | 1,000,000 | 1,091,000 |

RESEARCH OPPORTUNITIES

Question. What has been done in response to the fiscal year 1999 conference committee's encouragement to make use of unique research opportunities while major interstate reconstruction is underway? How much will be allocated for this activity in fiscal year 2000 and 2001.

Answer. In cooperation with the Utah Transportation Center, the Utah Department of Transportation, Utah State University, the University of Utah, and Brigham Young University, the Federal Highway Administration provided \$883,000 in fiscal year 1999 to fund 10 studies related to: Fiber reinforced polymers; Earthquake resistant design and retrofit; Curved bridge design; Foundation design; Non-destructive evaluation technology; and Corrosion protection.

The Federal Highway Administration in cooperation with the same group identified above is providing \$750,000 in fiscal year 2000 funding to fund a half dozen studies in similar areas. The Federal Highway Administration is not planning on fiscal year 2001 funding to the group because the inventory of original structures on the I-15 project will have been removed and replaced with new construction.

ADVANCED COMPOSITE MATERIALS

Question. What has been done in response to the fiscal year 1999 conference committee's encouragement to explore new technologies in advanced composite materials and to support research into high performance materials, bridge systems, coatings, and non-destructive evaluations? How much will be allocated for those activities in fiscal year 2000 and 2001?

Answer. At the encouragement of the conference committee, fiscal year 1999 funds were used to advance technology in: Fiber reinforced polymer (FRP) bonded repair methods at the University of Missouri; Use of carbon ribbon rods to rehabilitate steel bridges at San Diego State University; Advanced wood composites at the University of Maine; Acceptance test specifications for FRP used in highway bridge applications at West Virginia University; FRP bridge deck development at the Georgia Institute of Technology; Accelerated test methods for FRP evaluation at the University of Wisconsin at Madison; High performance bridge systems at Lehigh University; nondestructive evaluations with Wiss Janey Elstner Associates; and Cost of bridge corrosion with the National Association of Corrosion Engineers. Fiscal year 2000 expenditures in the areas identified above total \$8.1 million. Planned fiscal year 2001 expenditure in the areas will total \$7.8 million.

MINIMUM PAVEMENT MARKING LUMINANCE

Question. Is it correct that there are no consensus standards for minimum pavement marking luminance? If so, what is FHWA doing about this issue?

Answer. To date there are no standards on minimum retroreflectivity values. Guidelines are being developed by the FHWA with input from state and local highway agencies and the general public through the Federal Register rulemaking process. When the FHWA completes the rulemaking process the guidelines (minimum retroreflectivity values) will be included in the Manual on Uniform Traffic Control Devices (MUTCD). The MUTCD is applicable to all roads, streets and highways in the United States.

HIGHWAY CONSTRUCTION TIMES

Question. How does your fiscal year 2001 request respond to the recommendations and conclusions of the TRB report entitled "Dramatically Reducing Highway Construction Project Times: Suggestions for Research?" What has FHWA done to implement the recommendations of this TRB report? What work is being conducted in fiscal year 2000? What could be done in fiscal year 2001 with contract funds authorized in TEA-21?

Answer. To implement the recommendations of this report, the following activities have been initiated:

In fiscal year 2000, FHWA developed a Work Zone Best Practices Guidebook in partnership with the American Association of State Highway Officials (AASHTO). The guidebook presents a collection of highway community best practices, as submitted from across the Nation, which focus on minimizing driver and worker exposure in construction and maintenance work zones. With this guidebook a process is established to update and maintain an initial set of best practices, allowing the continued sharing of highway agency success stories with practitioners across the Nation. Regional seminars, which present the information in the guidebook and encourage additional sharing of best practices are now being planned. To supplement this guidebook, a checklist is under development that will facilitate identification and correlation of practices, appropriate for each stage of the project planning, design, and implementation processes. This activity speaks directly to the recommendations in the TRB report. In fiscal year 2001, advancement and exposure of this activity will directly influence highway operations and improved mobility and safety through work zones. Budget: fiscal year 2000—\$150,000; fiscal year 2001—\$75,000

In fiscal year 2000, FHWA initiated development of user-friendly computer software tools which accurately analyze and reliably predict work zone impacts. The decision making tools which are now under development will allow practitioners involved in the project preplanning, planning, development, and construction phases to weigh alternate strategies to mitigate the mobility and safety impacts resulting from work zones. Development of the first spreadsheet tool, which we are calling "Quickzone," is underway with field beta testing to be accomplished this summer, and full release planned for April 2001. In parallel with development of the decision making tool, FHWA will investigate work zone delay measurement practices and techniques, and attempt to quantify current national impacts, and develop guidelines for quantifying delays. In addition, FHWA will initiate a research project aimed at defining and describing highway construction processes, and identifying potential changes which could lead to significant reductions in highway construction project durations. Improvements to existing methods and procedures will be identified, providing a basis for future research into innovative technologies, materials, and methods to achieve revolutionary changes in the highway construction industry. In fiscal year 2001, the development of traffic impact analysis, support decision-making, tools will be accelerated and broadened. Budget: fiscal year 2000—\$865,000; fiscal year 2001—\$825,000

TRANSIMS CONTRACT AND PLANNING RESEARCH

Question. Please break out in extensive detail how the TRANSIMS contract funds and the planning research funds were or will be used during fiscal year 2000 and fiscal year 2001.

Answer. The following activities have been funded or will be funded with fiscal year 2000 and fiscal year 2001 contract funds. No funds other than contract funds have been allocated to TRANSIMS in fiscal year 2000 and fiscal year 2001.

- Completion of the TRANSIMS technical specifications, completion of computer code and field testing of TRANSIMS in Portland. TRANSIMS technical specifications have been completed and computer code developed.
- Development of a commercial, user-friendly version of TRANSIMS. A Request for Proposals (RFP) has been issued for the development of a commercial version of TRANSIMS. Proposals have been received and we are now in the contract negotiation process. An award is expected in May of 2000 and funding for the commercial version will commence after the award.
- Support Metropolitan Planning Organizations which are first to implement TRANSIMS. Financial and technical support will be provided to the first Metropolitan Planning Organizations (MPO) to implement TRANSIMS. MPOs will be selected so as to include a diversity of sizes, demographic characteristics and issues to be addressed. The objective of this support is to demonstrate TRANSIMS' applicability in a wide variety of areas and situations.

—TRANSIMS Outreach. This includes development of training materials, publications and disseminating technical information on TRANSIMS capabilities. Three types of training materials will be developed; an introductory overview on TRANSIMS for managers and MPO officials, an introduction to TRANSIMS technical methodology for MPO technical staff, and a University level course on TRANSIMS theory. The University course is essential to providing training to students who will eventually become MPO staff. Publications will include descriptions of TRANSIMS suitable for distribution to a wide variety of audiences including MPO staff, elected officials, technical experts and Universities. Information dissemination will include conferences, presentations, technical support and use of a Website.

BREAKDOWN OF EXPENDITURES

[Dollars in thousands]

| | Fiscal years— | |
|---------------------------------------|---------------|---------|
| | 2000 | 2001 |
| Completion and Testing | \$2,400 | \$1,300 |
| Commercialization | 3,000 | 2,000 |
| Support to Metropolitan | | 500 |
| Planning Organizations Outreach | 275 | 633 |

Note: The amount stated for commercialization is an estimate. The specific amount will be determined during the contract negotiation process.

Question. How much money was allocated to TRANSIMS during fiscal year 1998, fiscal year 1999, and fiscal year 2000 and how much is planned for fiscal year 2001? Furthermore, indicate by year the amounts of cost sharing received from other federal agencies for this project. Please break out in detail the specific activities funded with those monies.

Answer.

TRANSIMS FUNDING—FISCAL YEAR 1998 TO FISCAL YEAR 2001

[Dollars in thousands]

| | Fiscal years— | | | |
|--|---------------|--------------|--------------|--------------|
| | 1998 | 1999 | 2000 | 2001 |
| Completion of Technical Specifications | \$6,411 | \$2,700 | \$2,400 | \$1,300 |
| Commercialization | | | 3,000 | 2,000 |
| Support for MPOs | | | | 500 |
| Outreach | | 300 | 275 | 633 |
| Total | 6,411 | 3,000 | 5,675 | 4,433 |

These activities are described in the previous question.

The table below describes TRANSIMS funding from sources other than FHWA for fiscal years 1995 through the present:

| | Fiscal years— | | | |
|-----------|---------------|-------|-------|-------|
| | 1995 | 1996 | 1997 | 1998 |
| FTA | \$500 | \$500 | | |
| EPA | 250 | 525 | \$275 | \$128 |

FTA funds in the past have supported general TRANSIMS development and ensured that transit issues are adequately addressed.

EPA funds have provided support for the development of the emissions module and supported the coordination of TRANSIMS with other emissions research. For the emissions module, these funds have provided data from the University of California on the relationship of the vehicle operating mode (speed, acceleration, tem-

perature) and modal emissions, and data from the University of West Virginia on medium and heavy duty truck operating characteristics. Along with data gathering, the funds have been directed to examining the interface between the traffic micro-simulation module and the emissions module and technical support on the emissions module. EPA has supported the development of TRANSIMS capability to simulate the emissions reduction from the use of modes other than the single occupant vehicle, including transit, ride sharing, bicycle and pedestrian modes. EPA has funded the coordination of TRANSIMS with other EPA research efforts and have the LANL staff participation in EPA conferences on emissions research.

SUSTAINABILITY RESEARCH

Question. Were any funds provided from any surface transportation subaccount for research into sustainability.

Answer. No.

REAL ESTATE SERVICES

Question. The real estate services section of the FHWA justification states: "Video tapes and CDROMs will be produced on the critical topics of business relocation, and residential dwelling comparability." How is this a research and development activity? Why isn't this request funded under LGOE?

Answer. This is largely a research and development activity because the substance for these products must be thoroughly researched and developed into usable best practices. Costs are almost entirely for the research itself and in small part for the tapes and CDs to provide the results to state and local officials.

INPUT FOR PLANNING RESEARCH PROGRAM

Question. Please discuss the scope and nature of input from MPOs and various states and local governments that FHWA receives in shaping the planning research program.

Answer. FHWA gets customer input, including input from MPOs, states and local governments, on planning research needs through a series of formal and informal methods. Informal input at the program and project level is received through staff's active participation in conferences, committees, workshops and other professional activities. In addition, FHWA sponsors a regular conference through TRB "Transportation Planning Needs and Requirements of Small and Medium Sized Communities."

Formal input is received through four mechanisms. First, FHWA holds an open forum on planning research immediately preceding the annual Transportation Research Board meeting to review the current program and discuss future needs. Secondly, FHWA works annually with the National Cooperative Highway Research Program to refine and implement the recommendations from the TRB conference on, "Refocusing Planning for the 21st Century: Transportation Technical Planning Research". In addition, FHWA sponsors scanning activities in several of the Priority Areas that provide significant input to the research program. Finally, FHWA is also receiving additional input on planning research from the STECRP.

EFFECTIVENESS OF PLANNING RESEARCH PROGRAM

Question. How do you evaluate the effectiveness of your planning research program? What does your most recent assessment tell you?

Answer. Feedback from intended users, typically through case studies, provides the primary means of evaluation for projects and priority areas. Scanning activities in priority areas is another evaluation mechanism that is increasingly used within the Planning Research Program.

An implicit measure of effectiveness of the overall program is partnership opportunities, both within DOT and externally. FHWA recognizes the value in partnerships and has worked to build consensus on the planning research agenda by sponsoring conferences and workshops to define critical areas and refine research issues. One example is in the area of incorporation of safety issues into the planning process. Safety has been defined by MPO's, states, local government as an area needing research. In addition, safety is the highest priority for FHWA. We have allocated funds to define the issues and develop an action plan in cooperation with TRB, NHTSA, FMCSA and others in fiscal year 2000. The Travel Model Improvement Program is another example of how FHWA is using partnerships to advance the Planning Research Agenda.

Feedback FHWA has received to date indicates a continuing need for training and technology transfer activities particularly addressing new planning issues and edu-

cating new planning staff. Areas of customer concern include equity analysis, planning for and implementing ITS.

PLANNING RESEARCH PROGRAM

Question. Please break out on a project-by-project basis how the \$3.924 million proposed for planning research would be used.

Answer. For fiscal year 2001, the Planning Research Program used the following priority areas:

Fiscal Year 2001 Priority Areas

| | |
|--|-----------|
| Intermodal Transportation Planning | \$500,000 |
| System Management & Operations | 500,000 |
| Transportation & Land Use | 840,000 |
| Planning Processes & Decision-Making | 840,000 |
| Forecasting Transport Demand & System Change | 840,000 |
| Safety Integration | 400,000 |
| Total | 3,920,000 |

FISCAL YEAR 2000 SPENDING PLAN

Question. Compare those expenditures to your fiscal year 2000 spending plan and discuss how program continuity is maintained.

Answer. For fiscal year 2000, the planning research program used the same priority areas as in fiscal year 2001 with the addition of a new category of Safety Integration in fiscal year 2001. The funds for Safety Integration will focus on the implementation of the recommendation of the action plan developed as part of the TRB workshop on, "Integration of Safety into the Planning Process".

Program continuity in fiscal year 2000 continues to be an issue due to earmarked projects and studies. For fiscal year 2000, priority areas to date are funded based on customer and stakeholder needs as well as amounts available after considering earmarks.

ENVIRONMENTAL RESEARCH

Question. Please break out on a project-by-project basis the expected use of the \$6.196 million requested for environmental research and compare those allocations to the fiscal year 2000 spending plan to demonstrate program continuity.

Answer. Major issues in Air Quality and Climate include particulate matter (PM2.5) emissions rates from transportation sources; development of model to assess NO_x impacts of heavy-duty engines; and development and evaluation of transportation control measures. It is expected that they will be continued in fiscal year 2001. Approximately \$1.0 million have been allocated or planned for these studies for fiscal year 2000. For fiscal year 2001, \$1.702 million have been requested for research in Air Quality and Climate.

Under Wetlands, Water Quality and Ecosystems, fiscal year 2000 funds have been allocated to support research in changes in constituent loads of highway runoff created by changes in fuel composition and vehicle components; emissions impacts on water quality from atmospheric deposition; watershed and ecosystem-based management schemes; and vegetation management. For fiscal year 2001, \$567,000 has been requested for Wetlands, Water Quality and Ecosystems.

Noise research focuses on reducing and managing the impacts of traffic noise on communities. Continued research is needed to validate and disseminate the latest Traffic Noise Model (TNM), and to incorporate technological advances in highway traffic noise analysis and abatement techniques. For fiscal year 2000, \$290,000 have been allocated for Noise research. For fiscal year 2001, \$474,000 has been requested for Noise research.

Global Climate Change research includes development and evaluation of strategies to reduce greenhouse gases, and the development of improved analytic techniques for tracking and quantifying them. Research in fiscal year 2001 will continue in these areas in addition to assessments of transportation sources of greenhouse gas emissions. For fiscal year 2001, \$475,000 has been requested for Global Climate Change research.

Research in the Communities, Neighborhoods, and People area will develop tools, techniques and methodologies to identify and collect accurate data; and to analyze and reduce the direct, indirect and cumulative impacts of highways on communities, including social, economic, and quality of life effects. Research includes: performance indicators, context sensitive design, transportation enhancements. In fiscal year

2000, approximately \$335,000 is budgeted for this research. For fiscal year 2001, approximately \$560,000 has been requested.

The Environmental Justice focus area develops tools and techniques and disseminates information to assess, prevent, and address these potential discriminatory effects. In fiscal year 2000, approximately \$600,000 is budgeted for this research. For fiscal year 2001, approximately \$600,000 has been requested.

The objective of the Pedestrian/Bicyclist research effort is to provide planning methodologies for localities to use to decide whether investments in non-motorized projects will meet their community's needs. In fiscal year 2000, \$80,000 in surface transportation research funds were budgeted for this effort. For fiscal year 2001, approximately \$210,000 has been requested.

Research in Cultural and Historic resources develops data management techniques and predictive tools to assess the direct, indirect, and cumulative impacts of highway development, reconstruction, and maintenance on historic and cultural resources. In fiscal year 2000, \$75,000 in surface transportation research funds were budgeted for this effort. For fiscal year 2001, approximately \$167,000 has been requested.

The livability research initiative will conduct research, develop performance measures for livability, develop tools and methods and provide educational materials to inform the public of livability issues. It will also serve as a forum for research coordination among federal agencies. The livability research will build on the results and enhance FHWA's programs that support livable strategies including traffic calming, CMAQ, Transportation Enhancements, flexible design, and others. In fiscal year 2000, \$80,000 in surface transportation research funds were budgeted for this effort. For fiscal year 2001, approximately \$167,000 has been requested.

A number of research efforts related to environmental streamlining are being funded in fiscal year 2000 including: \$250,000 to address the alternative dispute resolution provision in Section 1309 of TEA-21; \$100,000 to develop a new Technical Advisory to provide guidance for the proposed joint FHWA-FTA regulations on NEPA and Transportation Decision-making; \$100,000 for conducting informational interviews with Federal agencies, and non-federal entities, to explore the perspectives and attitudes of those directly involved in the project delivery and environmental review of transportation projects as they relate to environmental streamlining; \$300,000 for the development of an environmental streamlining information clearinghouse web site and related electronic communication to support successful implementation of streamlining. For fiscal year 2001, approximately \$1.27 million in STR funds has been requested to support environmental streamlining activities.

GUIDANCE UNDER SECTION 5107 OF TEA-21

Question. What advice and guidance has FHWA received from the advisory board that was set up pursuant to section 5107 of TEA-21? In your answer please specify for fiscal year 2000 and 2001 how much has been and will be spent on the advisory committee and associated outreach activities.

Answer. Pursuant to section 5107 of TEA-21, FHWA entered into a cooperative agreement with the National Academy of Science, Transportation Research Board (TRB) to establish the Surface Transportation-Environmental Cooperative Research Program (STECRP) Advisory Board.

The Advisory Board, a 17-member panel of experts from academia, the States, metropolitan planning organizations, industry and environmental organizations has been tasked to review, comment and recommend strategies for collaboration in research and technology transfer activities within the USDOT, and with other federal agencies and non-federal organizations. Periodic reports to the USDOT and to the Congress on their progress in developing a national agenda of surface transportation-environmental and planning research priorities, and the strategic direction of research conducted by the transportation community will be submitted by the Advisory Board in Fall 2000 and 2001.

The Advisory Board, in its initial phase of formulation, met in January and April of this year. As such, the Advisory Board has focused on conducting extensive outreach to gather information from the USDOT and its partners and stakeholders for meeting their goals, and is not yet prepared to provide advice and guidance to the FHWA on surface transportation research issues at this time.

The Advisory Board has required \$300,000 for their activities through fiscal year 2000. The FHWA estimates needs of between \$150,000 to \$200,000 for the remaining activities envisioned by the Advisory Board for fiscal year 2001.

PARTICULATE MATTER RESEARCH

Question. Now that particulate matter research is underway by EPA, FHWA, and other organizations, how much time and effort is anticipated to obtain an understanding of PM-2.5 impacts on transportation regulation, and to develop effective analytical tools and mitigation strategies? How much is requested for this research in fiscal year 2001? How much is being allocated in fiscal year 2000?

Answer. FHWA anticipates that at least 3-4 years will be required to gain an adequate understanding of the PM-2.5 issues. PM is a complex pollutant that is both generated directly from engines and kicked up by road dust, but also is formed in the atmosphere from smaller particles.

The draft work plan for PM views the overall effort in stages. First, sources and the generation of PM pollution must be identified with particular emphasis on transportation sources. This is critical since the relationships between travel activity, emissions and concentrations must be understood in detail before they can be adequately modeled for conformity, NEPA and other purposes. This could take at least 1-2 years, and possibly more. Second, the long and painstaking process of model development must be accomplished, taking perhaps another 1-2 years. Finally, initial research into cost-effective mitigation strategies should occur which will likely be an ongoing process.

NRC ADVISORY COMMITTEE

Question. Did the NRC advisory committee review the scope and nature of this research?

Answer. The Advisory board established under TEA-21 met in January 2000 for the first time, and again in April 2000. At the first meeting, Board members were given some information relating to FHWA's PM research effort but have not yet had an opportunity to provide input into it. FHWA will soon be providing the Board with a draft of a Strategic Workplan for Particulate Matter Research. This Workplan, which is still underdevelopment, draws on the results of an extensive literature review and a one-day symposium with transportation and air quality experts from around the Country in January 2000.

TOOLS/MODELS TO EVALUATE BENEFITS/BURDENS

Question. What research are you pursuing to advance analytical tools or models to evaluate the distribution of benefits and burdens in transportation decision-making and investments and environmental justice-related cases? How much is requested for this research in fiscal year 2001? How much is being allocated in fiscal year 2000? Did the NRC advisory committee review the scope and nature of this research?

Answer. In fiscal year 2000, the FHWA allocated \$600,000 towards the evaluation of environmental justice and Title VI; however, the fiscal year 2000 research allocations focused primarily on the technical transfer of existing tools and methods to identify benefits and burdens. The fiscal year 2000 the research effort will develop a brochure to provide basic background information, a set of case studies and effective practices on state of the practice for applying environmental justice in the planning, project development, and right-of-way decision making processes, and a website where a wide array of resources, including the current fiscal year 2000 research will be available. The final product of the fiscal year 2000 research will be a workshop that will include case studies and effective practices of using benefits and burdens analysis in transportation decision-making.

To evaluate the distribution of benefits and burdens FHWA is also pursuing the application of existing tools such as Community Impact Assessment for evaluating the distribution of transportation benefit and burdens. FHWA is also developing a One-Day Workshop which will be composed of different modules including data sources and methods, community impact techniques, and effective public involvement.

In fiscal year 2001, the FHWA requested \$600,000 for research in the environmental justice and Title VI focus area. Anticipated products would include improving existing analytic tools and models as well as investigating new methodologies for assessing transportation impacts on low-income and minority populations. The NRC advisory committee did not review the scope and nature of our research.

UNDERSERVED COMMUNITIES

Question. What would improve the effectiveness of state and local transportation agencies in involving and engaging traditionally underserved communities? What would be the associated monetary costs?

Answer. State and local transportation agencies should develop public involvement strategies that specifically target traditionally underserved communities. These strategies should be developed using members of the community to provide input and suggestions for to help gauge the effectiveness. State and local transportation agencies are encouraged to improve research and data collection methods relating to transportation needs of the traditionally underserved. Utilizing, as appropriate, Historically Black Colleges and Universities (HBCU), Minority Institutions (MI), Hispanic Serving Colleges and Universities (HSCU), and Indian Centers to network and form community links is yet another method to involve and engage under-served communities.

If a state or local transportation agency is unsure about how to improve the effectiveness of engaging traditionally underserved communities, there are several resources that are available from FHWA. "Public Involvement Techniques for Transportation Decision-making" offers several specific techniques to engage the traditionally under-served. FHWA also provides methods and tools to enable State and local transportation agencies to more effectively involve and engage traditionally underserved communities through Title VI training for State and local transportation agencies and through public involvement training. FHWA also provides public involvement methods and tools which are a fundamental component of all program operations, planning activities, and transportation decision-making. Through research and technical transfer, FHWA can provide state of the art techniques for meaningful public involvement using non-traditional techniques.

The community impact assessment is a method to effectively involve and engage traditionally under-served communities. The community impact assessment is a process to evaluate the effects of transportation action on a community and its quality of life. State and local transportation agencies can also participate in transportation enhancements (TE) activities to help foster the quality of life in communities. TE benefits the communities by preserving the natural and human environment and strengthening the public role in local and state transportation planning.

It is difficult to develop monetary costs because the need to improve the effectiveness will vary from location to location.

POLICY RESEARCH

Question. Please update your answer from last year regarding the major components in the road map for policy research developed by FHWA by indicating progress made in each area since last year. How does the fiscal year 2001 budget request help implement that road map?

Answer. Consistent with the restructuring of the FHWA, our research is now targeted toward achieving the goals of our strategic plan. The major components in the policy research agenda retain travel monitoring, highway investment/performance analysis, personal travel surveys, innovative financing and pricing strategies, highway cost allocation/truck size and weight studies, and improving economic productivity. Each of these areas is being advanced this year and the fiscal year 2001 budget is aimed at making further progress in our capabilities in these areas. Examples include:

Work is moving forward on the periodic National Personal Travel Survey (NPTS). During fiscal year 2000, the planning phase continues and the NPTS/ATS pretest is being fielded during February-May 2000. Development of the full survey is focusing on the need to provide travel data that will support both traditional travel demand forecasting and TRANSIMS. Further, the inclusion of an enriched long-trip data set will significantly enhance the ability to support statewide planning. Conducting the full survey is the primary activity planned for fiscal year 2001. The full 14-month coordinated NPTS/ATS will begin during October 2000 and will be completed in December 2001.

Enhanced capabilities are being incorporated into the highway investment/performance models used to predict capital investment requirements. These enhancements include an improved pavement deterioration model, improved emissions model to be consistent with the latest EPA product, increased accuracy in the benefit/cost analysis procedures, and development of a bridge investment/performance model that incorporates economic as well as engineering criteria. We are working toward use of the HERS model by States.

Research is underway to update data on travel characteristics by different vehicle configurations and to improve analytical tools used to assess pavement and bridge costs associated with operations of different vehicle classes based on recent research by others. Work is underway to complete tools for State highway cost allocation studies and technical assistance to a number of States in the use of those tools. New data on truck commodity flows have become available that will significantly improve

our ability to estimate changes in truck configuration and usage that may be expected. Improved analytical tools will provide FHWA and the States a much more complete picture of current truck utilization patterns and how those patterns would change under different policy options.

Research for the Value Pricing Pilot Program will provide improved technical support which in turn will aid outreach to increase interest and participation in the program. Research is underway to find better ways of developing pricing strategies, carrying out feasibility studies, and evaluation of pilot projects. Assessment includes the ability of the Pilot Program to achieve program goals relating to congestion relief, transit ridership, and air quality, as well as the financial effects on low-income drivers.

Work is under way to add to the picture of economic benefits of highway investment to the consumer sector and the business and industry sectors of the economy. A consolidation and integration of these aspects of highway transportation will lead to a better understanding of the extent to which highways contribute to the national economy.

Preparation of a new Travel Monitoring Guide is underway to aid the States in tracking travel trends. The guide is now undergoing a review process and is expected to be published in 2001.

CHALLENGES IN POLICY RESEARCH

Question. What is the most pressing challenge in research that needs additional attention during fiscal year 2001?

Answer. The most pressing challenge in research is to provide timely answers to decision makers and to anticipate their needs for resolution to research questions. Information on economics, demographics, highway travel and spending trends is combined to provide an understanding of the interrelationships between highway programs, systems, and services. This understanding forms the basis of the ability to assess the highway systems as a component of the overall transportation system. This knowledge is further used to identify issues, evaluate the effectiveness of current programs and policies, and to evaluate alternative programs and policies. Research contributes to these abilities through:

- systematic activities to anticipate future analytical needs.
- management of data systems, i.e., design, collection, assessment, presentation, and distribution of data and information.
- development of sophisticated tools for distilling underlying trends and relationships.
- design and testing of techniques to quantify relationships as a means to balance competing or complimentary goals.
- incorporation of analytical capabilities into programs to measure impacts and inform future program decisions.

STUDIES ON TRUCK SIZE AND WEIGHT

Question. How much of the policy research budget request will be allocated towards studies regarding truck size and weight?

Answer. Approximately \$450,000 from the policy research budget will be allocated for studies relating to truck size and weight issues. While essential for truck size and weight policy analysis, the data and analytical tools developed in this research will also be used for other freight-related studies conducted in cooperation with the Office of Freight Management and Operations. It is anticipated that data and analytical tools developed for Federal program and policy analysis will also be made available to the states for their own analyses. Data and analytical tools also are applicable to studies that estimate relationships between highway investment and overall business logistics costs.

STUDIES ON HIGHWAY COST ALLOCATION

Question. How much of the policy research budget request will be allocated towards studies regarding highway cost allocations?

Answer. Approximately \$475,000 from the policy research budget will be allocated for studies related to highway cost allocation. This research will feed directly into an update of the Federal highway cost allocation study that will be completed before surface transportation reauthorization. As with the truck size and weight research, data and tools that are essential for analyzing the extent to which user fees paid by various types of vehicles correspond to the pavement, bridge, and other infrastructure costs those vehicles create are also used for other program and policy studies. For instance, data and analytical tools developed to estimate user fees paid by different vehicle classes are also used to estimate future revenues to the High-

way Trust Fund impacts of various potential strategies to meet energy and environmental objectives, and potential alternatives to the fuel tax that are beginning to be discussed in the transportation community. Work to estimate costs of highway-related air pollution, motor-vehicle crashes, and other costs of motor vehicle use is conducted in coordination with other offices within and outside FHWA.

NATIONAL PERSONAL TRANSPORTATION SURVEY

Question. If none of the funds requested for the NPTS are approved under LGOE, how will work on this project proceed?

Answer. Unless funding can be obtained from other governmental sources, it will not proceed. This includes the completion of the actual survey and may impact the "add-on" samples requested by various States, local governments and Metropolitan Planning Organizations (MPOs). At this time, approximately 20 states and MPOs have indicated that they are considering the purchase of "add-on" samples for their jurisdictions. This increased interest in "add-on" samples reflects an increased awareness of the utility of the data set as a tool for Statewide and metropolitan planning.

Question. What is to be the minimum amount needed to conduct National Personal Transportation Survey activities during fiscal year 2001?

Answer. The \$4,750,000 requested for fiscal year 2001 is for conducting the data collection (not planning) for the coordinated 2000 NPTS/ATS. This is the minimum amount needed to continue work in fiscal year 2001, largely because we are making up for the lack of funds allocated to NPTS in fiscal year 2000. To assure that a complete picture of household travel is developed, the collection of daily travel through the NPTS is being closely coordinated with the contemporaneous data gathering of long trip data as part of the 2000 American Travel Survey (ATS) conducted by the Bureau of Transportation Statistics.

Question. How much is to be spent on this work in fiscal year 2000?

Answer. There were no funds specifically identified for NPTS in the fiscal year 2000 Appropriations Act. However, the Bureau of Transportation Statistics (BTS), our partner in the coordinated NPTS/ATS effort, provided a very significant share of the fiscal year 2000 funding for the pretest activity. In addition, FHWA was able to carve out some funding for NPTS from our general research funds.

Question. Is it likely that BTS or FTA will contribute funds towards this project?

Answer. The NPTS has historically been sponsored by several DOT agencies. In fiscal year 1999 and fiscal year 2000, BTS provided approximately \$1.5 million and NHTSA has provided \$200,000. FTA did not provide any funding in fiscal year 2000, but currently has a request for NPTS funding before the Committee at a minimum of \$500,000 for fiscal year 2001.

INTERNATIONAL ACTIVITIES AND RESEARCH

Question. Please specify the number of planned and completed international scanning trips taken during each of the last three years. Please specify the total cost of those trips for each year and the benefits derived from each trip. How do you assess the benefits of each trip?

Answer. The FHWA completed four reviews in fiscal year 1998 at a cost of approximately \$450,000. The FHWA's cost for five fiscal year 1999 reviews was \$520,000. Fiscal year 2000 was the formal start of the Joint AASHTO/FHWA International Scanning Program. This program is jointly managed and funded by AASHTO and the FHWA, and will thus reduce the overall cost of this program for FHWA. AASHTO participation ensures that scans serve the priority needs of the State DOT's for improved technology and practices. There are 6 reviews planned for fiscal year 2000. The FHWA's share will be an estimated cost of \$370,000.

Scanning benefits are assessed by scan team members and their U.S. colleagues. Benefits appear in many forms and typically are realized incrementally over the years after a scan takes place. Listed below are some major results and emerging benefits of scans taken in fiscal year 1998 and 1999. Similar information for fiscal year 2000 scans is not yet available.

Fiscal Year 1998 Scans:

Innovative and Emerging Traffic Controls for Congestion and Safety

The following devices and practices have been recommended for further study with a view to possible adoption in the U.S.: (1) variable speed limits with photo enforcement for freeway management; (2) all-white pavement marking systems; (3) freeway queue detection and back-of-queue warning to prevent rear-end collisions; (4) freeway lane control signals to indicate downstream lane status; (5) special markings to ease merging and diverging conflicts at multi-lane freeway ramps; (6)

detection and control logic to reduce rear-end collisions at high-speed signalized intersections; (7) area display of real-time parking availability and travel information to reduce travel and improve customer service; (8) pictograms and symbols for dynamic message signs; (9) use of symbols to indicate travel on freeway diversion routes; (10) a strategic goal to eliminate fatalities on highways; and (11) a stronger emphasis on the safety impacts of operational improvements.

Projects/studies being undertaken as a result of the scan include: (1) National Cooperative Highway Research Project (NCHRP) Project 4-28, Feasibility Study for an All-White Pavement Marking System and (2) NCHRP Project 3-59 Variable Speed Limit Implementation.

Motor Carrier Safety Technologies

Based on key findings, scan team recommendations include: (1) create a greater safety focus for third-party organizations; (2) collect crash data to establish crash causes; (3) consider standards in the development of passive safety systems (cab crash worthiness) and active safety systems (electronic interface); (4) use truck-only lanes; (5) develop a comprehensive, standardized driver education curriculum; (6) establish performance-based driver assessment; (7) encourage public and private organizations for advancing driver and motor carrier coordination; (8) develop a more systematic and scientific approach to manage commercial vehicle driver performance; and (9) promote an expanded focus on in-company inspections.

Geotechnology—Canada and Europe

Results of the scan have been directly integrated into: (1) NCHRP Synthesis 276 Geotechnical-Related Development and Implementation of Load and Resistance Factor Design (LRFD) Methods; (2) two NCHRP research studies related to updating and modifying the current AASHTO LRFD code for retaining walls and structural foundations; and (3) the National Highway Institute Course on Load and Resistance Factor Design for Highway Bridge Substructures—a course that has been presented at over 30 locations since July 1998.

As a result of the scan, the FHWA now represents the United States on an international committee to implement LRFD methods in geotechnical practice worldwide.

Winter Road Maintenance Practices II

Several states are experimenting with advanced European snow plows that efficiently clear snow and ice while doing less damage to road surfaces. The U.S. is embarking on wider use of road weather information systems, similar to those used in Europe, that are highly integrated into traffic management centers and intelligent transportation systems.

The scan verified that the U.S. has made good progress in recent years in acquiring and applying international advanced snow and ice control technologies.

Fiscal Year 1999 Scans

Bridge Scour Countermeasures.—A major scan team finding is that European practice uses riprap as a permanent solution for scour while in the U.S., riprap is generally considered a temporary measure. As a result of the scan, the design and installation techniques for riprap and scour prediction manuals are being re-evaluated.

Also, a National Highway Institute stream stability and scour course was developed in conjunction with the Wallingford Laboratory in the UK and with participation from Switzerland, Germany, and the Netherlands.

Steel Bridge Fabrication and Erection Technology.—Findings from the scan are being considered by the steel bridge fabrication community. Improvements in six areas are being considered for future implementation: integrated computer-aided design (CAD) and computer-aided manufacturing (CAM) software; automated recording; high performance steels and coatings; cutting and joining; certification and contracting; and design innovation.

A U.S. steel producer has begun testing weathering steel materials in cooperation with a Japanese fabricator.

Methods and Procedures to Reduce Motorist Delay in Construction Zones.—The scan identified several methods for potential applicability in the U.S. The scan team recommendations include the following: (1) shorten the contract time by using lane-rental concepts more frequently; (2) improve communications with motorists by using advanced and real-time information ITS technologies; (3) adopt a coordinated policy, planning, and programming approach to work zone planning and operations; (4) reduce lane widths; (5) design for future maintenance; (6) evaluate the use of yellow markings in work zones; (7) use highly visible traffic control devices and equipment to warn motorists of, and guide them through, work zones; and (8) implement quality control/quality assurance programs for traffic and worker safety.

Recycled/Secondary Materials.—Much was learned about the use in Europe of recycled materials in highway projects and how materials reuse contributes to the sustainability of transportation systems. As follow-up to the scan, a national workshop on “Applying Sustainability Principles to Materials Use in the Highway Environment” will be held this year. The workshop will highlight recycling practices reviewed on the scan, bring together key leaders from public agencies involved in devising recycling solutions, and demonstrate recycling projects.

European Practices for Sustainable Development.—The scan identified several broad measures to consider for possible implementation in the U.S. These include: (1) an emphasis on policy consistency and cooperative problem solving as a way to resolve transportation-environmental conflicts and speed attainment of environmental goals; (2) matching operating responsibility for transit and highway systems with control over funding for those systems; (3) strategic planning for both the long term and mid-term; and (4) use of performance standards along with monitoring and reporting on progress. More specific measures for potential applicability to the United States include: car sharing and other eco-driving projects, and joint development to help pay for expensive but socially and environmentally attractive project designs.

Durability of Concrete Segmental Bridges.—The scan found that segmental and cable-stayed bridge technology and developments in Europe and the U.S. are converging. One major difference, however, is that Europe relies heavily on waterproofing membranes and overlays to protect bridge decks from corrosion caused by de-icing salts. Improved grouting procedures to avoid corrosion were also found in Europe. The scan has set the stage for further exchanges of knowledge between the U.S. and Europe in these areas.

Fiscal Year 2000 Scans

Right-of-Way and Utilities Best Practices.—This scan has just been complete; benefit assessment is not yet available.

New Road Lighting Technologies and Practices.—This scan has just been completed; benefit assessment is not yet available.

TECHNICAL ASSISTANCE TO VARIOUS AFRICAN STATES

Question. Please assess the costs and benefits of the FHWA investment in providing technical assistance to various African states, and the Pan American Institute of Highways. Please estimate fiscal year 1999, fiscal year 2000, and requested fiscal year 2001 funds allocated or planned for that activity and provide the funding source of those monies.

Answer. Funding for the FHWA’s sub-Saharan African countries:

| Fiscal year | Amount | Source |
|-------------|----------------------|---------------------------------------|
| 1999 | \$65,000 | International Outreach Program Funds. |
| 2000 | ¹ 200,000 | International Outreach Program Funds. |
| 2001 | ¹ 275,000 | International Outreach Program Funds. |

¹ Planned.

The target countries in Africa receive information concerning U.S. transportation technology and practices which enables them to more effectively construct and manage their transportation systems, thus supporting the U.S. foreign policy of encouraging economic development and democratization of developing countries and countries in transition.

Our focus on establishing technology transfer centers in target countries aims at fostering a long-term commitment to technology transfer through institutionalization of the process. Institutionalization supports on-going improvement processes in the road sector. We also aim to encourage synergies among the centers by linking centers in the different world regions into a global network. The technology transfers we support indirectly promote the exports of U.S. highway related firms since the countries involved in technical exchange and assistance activities tend to develop a preference for U.S. standards and equipment.

Funding for the FHWA’s Pan American Institute of Highways:

| Fiscal year | Amount | Source |
|-------------|-----------|--|
| 1999 | \$220,000 | GOE funds for PIH contract staff. Program funding from International Programs. |

| Fiscal year | Amount | Source |
|-------------|----------------------|--|
| 2000 | ¹ 220,000 | GOE funds for PIH contract staff. Program funding from International Programs. |
| 2001 | 220,000 | GOE funds for PIH contract staff. Program funding from International Programs. |

¹ Planned.

The FHWA's investment in the PIH directly supports the U.S. foreign policy of encouraging economic development and democratization in Latin America. By participating in the PIH Network, Latin American countries and their technology transfer centers receive information about U.S. transportation technology and practices which enable them to more effectively construct, manage, and maintain their transportation systems. The PIH Technology Transfer Centers are a cost-effective mechanism for providing technical assistance to a country through its own local organizations. The FHWA also leverages the annual dues paid by the centers by providing consolidated services through the PIH Headquarters to the overall network.

The FHWA's investment benefits the U.S. private sector by providing a ready conduit for introducing U.S. highway-related products and services to markets in the Americas. The PIH Centers are able to provide information on possible solutions to selected transportation problems as well as suitable U.S. products and services. In 1997, a Latin American PIH Center workshop on winter de-icing technologies resulted in the sale of U.S. de-icing technology. The PIH also allows FHWA to stay abreast of investment opportunities made possible by the numerous privatization and concession programs being successfully implemented in the Americas. Other benefits include:

- Increased exposure to U.S. highway related products and services through increased participation in U.S. Trade Shows and exhibitions.
- Increased exposure to U.S. state-of-the-art and-practice engineering techniques through training and distribution of technical material.
- Increased exposure of U.S. companies to Latin American markets through participation in PIH seminars and conferences.
- Increased partnership with the World Bank, Inter-American Development Bank, and other developmental organizations.
- Increased exposure to U.S. technical materials, such as SUPERPAVE, Long Term Pavement Performance Studies.
- Training provided through over 40 highway maintenance seminars during the past 8 years in 17 countries for more than 7,000 participants.
- Preparation for, and limited assistance with, natural disasters.

TECHNICAL ASSISTANCE TO THE PAN AMERICAN INSTITUTE OF HIGHWAYS

Question. Please assess the costs and benefits of the FHWA investment in providing technical assistance to the Pan American Institute of Highway. Please estimate fiscal year 1999, fiscal year 2000, and requested fiscal year 2001 funds allocated or planned for that activity and provide the funding source of those monies.

Answer. Funding for the FHWA's sub-Saharan African countries:

| Fiscal year | Amount | Source |
|-------------|----------------------|---------------------------------------|
| 1999 | \$65,000 | International Outreach Program Funds. |
| 2000 | ¹ 200,000 | International Outreach Program Funds. |
| 2001 | ¹ 275,000 | International Outreach Program Funds. |

¹ Planned.

The target countries in Africa receive information concerning U.S. transportation technology and practices which enables them to more effectively construct and manage their transportation systems, thus supporting the U.S. foreign policy of encouraging economic development and democratization of developing countries and countries in transition.

Our focus on establishing technology transfer centers in target countries aims at fostering a long-term commitment to technology transfer through institutionalization of the process. Institutionalization supports on-going improvement processes in the road sector. We also aim to encourage synergies among the centers by linking centers in the different world regions into a global network. The technology transfers we support indirectly promote the exports of U.S. highway related firms since the

countries involved in technical exchange and assistance activities tend to develop a preference for U.S. standards and equipment.

Funding for the FHWA's Pan American Institute of Highways:

| Fiscal year | Amount | Source |
|-------------|----------------------|--|
| 1999 | \$220,000 | GOE funds for PIH contract staff. Program funding from International Programs. |
| 2000 | ¹ 220,000 | GOE funds for PIH contract staff. Program funding from International Programs. |
| 2001 | ¹ 220,000 | GOE funds for PIH contract staff. Program funding from International Programs. |

¹Planned.

The FHWA's investment in the PIH directly supports the U.S. foreign policy of encouraging economic development and democratization in Latin America. By participating in the PIH Network, Latin American countries and their technology transfer centers receive information about U.S. transportation technology and practices which enable them to more effectively construct, manage, and maintain their transportation systems. The PIH Technology Transfer Centers are a cost-effective mechanism for providing technical assistance to a country through its own local organizations. The FHWA also leverages the annual dues paid by the centers by providing consolidated services through the PIH Headquarters to the overall network.

The FHWA's investment benefits the U.S. private sector by providing a ready conduit for introducing U.S. highway-related products and services to markets in the Americas. The PIH Centers are able to provide information on possible solutions to selected transportation problems as well as suitable U.S. products and services. In 1997, a Latin American PIH Center workshop on winter de-icing technologies resulted in the sale of U.S. de-icing technology. The PIH also allows FHWA to stay abreast of investment opportunities made possible by the numerous privatization and concession programs being successfully implemented in the Americas. Other benefits include:

- Increased exposure to U.S. highway related products and services through increased participation in US Trade Shows and exhibitions.
- Increased exposure to U.S. state-of-the-art and-practice engineering techniques through training and distribution of technical material.
- Increased exposure of U.S. companies to Latin American markets through participation in PIH seminars and conferences.
- Increased partnership with the World Bank, Inter-American Development Bank, and other developmental organizations.
- Increased exposure to U.S. technical materials, such as SUPERPAVE, Long Term Pavement Performance Studies.
- Training provided through over 40 highway maintenance seminars during the past 8 years in 17 countries for more than 7,000 participants.
- Preparation for, and limited assistance with, natural disasters.

INTERNATIONAL ACTIVITIES

Question. Please discuss how FHWA is leveraging its funds for international activities with those of other countries. Are you promoting networks of technology transfer centers?

Answer. The FHWA is actively working to leverage its investment by cost-sharing with other U.S. Government agencies and international organizations. At the FHWA's urging, the World Road Association (PIARC) reviewed the concept of technology transfer centers and recognized their value in exchanging and transferring technology. Through its C-3 Technological Exchanges and Development Committee, PIARC is now annually providing four to five developing countries with \$10,000 each to establish technology transfer centers. The FHWA is working to obtain funding through USAID for two highway technology transfer projects in the Southern Africa Development Community (SADC) region of Africa. Additionally, the FHWA provided extensive training in the U.S. for 56 officials from the Turkish Directorate of Highways which was funded by a World Bank loan. This project has been expanded to include assistance in the development of a highway information system in Turkey which will also be funded through the World Bank. The FHWA will continue to develop relationships and partnerships with these agencies and organizations as well as work to find the most efficient and cost-effective method for providing technical assistance to developing countries. The FHWA will also continue to

leverage in-kind contributions of staff time and technical information provided by AASHTO, State DOTs, and LTAP Centers in conducting technical assistance activities.

The FHWA is supporting regional networks of technology transfer centers and encouraging regional networks to link globally. A global technology transfer network will be an efficient mechanism for sharing information on new technologies, innovations, and best practices among transportation professionals throughout the world. Although the focus is generally developing countries, the network needs to include developing and developed countries in order to be effective. The primary challenge in establishing such a network is how to share information effectively and ensure that it reaches those who need it most in a format that is likely to be used. The global technology transfer network will serve as a conduit to promote U.S. expertise and technology internationally. In addition, the network will serve as a means to easily learn of new technology and best practices from the FHWA's counterparts abroad.

MARKETING BY U.S. COMPANIES OF HIGHWAY RELATED TECHNOLOGIES

Question. Please provide estimates for fiscal year 1999, fiscal year 2000 and fiscal year 2001 of the amounts of funds used or planned to be used to promote marketing by U.S. companies of highway-related technologies abroad.

Answer. The FHWA's activities in this area focus on helping U.S. firms become export-ready in collaboration with the Department of Commerce. The FHWA spent no funds in fiscal year 1999. The FHWA plans to spend \$10,000 in fiscal year 2000 and \$10,000 in fiscal year 2001.

INTERNATIONAL TECHNICAL ASSISTANCE PROGRAMS

Question. What benefits do FHWA's international technical assistance programs provide for the U.S. highway community? Is any cost sharing received? If so, please specify the nature and amount. If not, what might be done to further leverage the federal investment?

Answer. The FHWA's technical assistance programs are developed in response to the international mission the Congress set out in Title 23, U.S.C., section 506. The International Outreach Program charges FHWA with developing programs that: (1) inform the U.S. of technological innovations in foreign countries; (2) promote U.S. highway transportation expertise, goods, and services abroad; and (3) increase transfers of U.S. highway transportation technology to foreign countries.

Additionally, FHWA's technical assistance programs directly support U.S. foreign policy by encouraging economic development and democratization in developing countries. The countries that FHWA cooperates with receive information about U.S. transportation technology and practices which enable them to more effectively construct, manage, and maintain their transportation systems.

This investment in technical assistance indirectly promotes the exports of U.S. highway-related firms since the countries involved in technical exchange and assistance activities tend to acquire a preference for U.S. products and equipment. As these countries develop, they are able to purchase more U.S. goods and services. Examples of benefits include winter maintenance equipment sales to Chile, construction equipment to Russia, and consulting services in South Africa.

In addition, with the focus of our program being technology transfer and exchange, the U.S. highway community also learns from less developed countries. While some countries may be less developed economically, they can be innovative technically and institutionally.

The FHWA is working to secure cost-sharing partners or outside sources for its technical assistance project. For the FHWA's Russian Technical Assistance Project, the FHWA provided approximately \$5 million of in-kind assistance for a \$300 million World Bank-funded institutional building project from 1993 through 1998. For the FHWA's Baltic Technical Assistance Program, the FHWA has provided approximately \$122,000 in technical assistance and its partner, the Finnish National Road Administration has provided an similar amount of in-kind support. The FHWA obtained approximately \$527,000 in funding from the World Bank to implement its Turkish Technical Training Program. The FHWA is working to obtain funding through USAID for two highway technology transfer projects in the Southern Africa Development Community (SADC) region of Africa. The FHWA also leverages in-kind contributions of staff time and technical information provided by AASHTO, State DOTs, the private sector and Local Technical Assistance Program (LTAP) Centers in conducting technical assistance activities. The FHWA will continue to develop relationships and partnerships with these agencies and organizations as well as work

to find the most cost-effective methods for providing technical assistance to developing countries.

INTRA-REGIONAL TRANSPORT

Question. What efforts are underway in sub-Saharan Africa to improve intra-regional transport? How much was and will be allocated for this effort? Why is this an appropriate activity for FHWA to fund? What are the benefits and costs of FHWA's technical exchange program with other developed countries?

Answer. The funding for the FHWA's sub-Saharan activities is summarized below:

| | Fiscal years— | | | |
|--------------------------|---------------|----------|------------------------|------------------------|
| | 1998 | 1999 | 2000 | 2001 |
| Sub-Saharan Africa | \$250,300 | \$65,000 | ¹ \$200,000 | ¹ \$275,000 |

¹Planned.

Under Section 506 of Title 23 U.S.C., the Congress charged the FHWA with increasing the transfer of U.S. highway transportation technology to foreign countries through training, demonstrations, research, and other methods of technology transfer and exchange. The FHWA's initiative in sub-Saharan Africa is designed to help improve sub-Saharan Africa's access to road technology, including institutional and program-building techniques. These will, in turn, facilitate sustainable development, foreign direct investment and the flow of international trade with and within sub-Saharan Africa. The FHWA's initiatives directly support the Congress's charge in Section 506 as well as the Administration's overall foreign policy objectives for Africa.

FHWA is assisting in the establishment of a network of technology transfer centers in sub-Saharan Africa with links to U.S. technology centers and other technology transfer centers elsewhere in the world. The geographic focus of this program is the Southern Africa Development Community region which includes: Angola, Botswana, The Republic of the Congo, Lesotho, Malawi, Mauritius, Mozambique, Namibia, South Africa, Swaziland, Tanzania, Zambia, and Zimbabwe. To date, FHWA has cooperated most closely with South Africa, Tanzania and Zimbabwe. As this program is implemented, we are urging the SADC region countries to examine the role of AASHTO in the U.S. and whether a similar organization, comprised of national road agencies, would facilitate the improvement of intra—regional transport. FHWA, AASHTO, USAID and SATCC have had discussions regarding cooperation in this area. FHWA with AASHTO and USAID have further recommended that the countries of this region cooperate in the following activities:

- Development of a regional (SADC) networking model to bring about more consistent transport policies, programs, and standards across the member countries.
- Furthering institutional restructuring, including the possibility for a dedicated road funds.
- Advancing safety advocacy and results to reduce the injuries and fatalities in transportation.
- Advancing additional technology transfer points in the SADC region.
- Furthering development of strategic roadway management approaches—systems, data, training, etc.

The overall cost of the FHWA's exchange program with developed countries, including the scanning program, is approximately \$650,000. The Joint AASHTO/FHWA International Scanning Program is managed cooperatively with, and co-funded by AASHTO.

The FHWA's technical exchange programs are the bridge between the U.S. and the other major producers of highway-transportation-related innovations, mainly in Western Europe and selected countries on the other side of the Pacific. Developed countries face similar transportation opportunities and constraints. Our partners across the Atlantic and Pacific are prolific sources of policy and technical innovation in transportation and have a wealth of experience to share. International exchanges have often served as catalysts for reviewing and changing U.S. practices.

Our exchanges have resulted in improvements in the way we do business in U.S. highway agencies, our approach to problems, and the solutions we adopt:

- Some U.S. transportation agencies have been spurred to act more like firms, inspired in part by the examples of Australia, New Zealand, Sweden and the U.K., with a focus on accountability and efficiency.

- The use of design-build, performance-specifications, and performance warranties in contracts are drawing on and tempered by experience gained abroad.
- Stronger concrete pavements designs, more durable asphalt pavements, and accelerated pavement testing equipment are in use here because of our international technical assessments.
- Over 25 research and demonstration projects concerning bridge composite material have been influenced by foreign observations.
- Steel bridge fabrication techniques based on computer-aided design and manufacturing are advancing because of practices learned abroad.
- High performance concrete use is spreading, inspired by successes from Canada and other countries.
- New techniques for predicting bridge scour and for controlling it are under study, stimulated by the European approach.
- Improved U.S. techniques and equipment for winter maintenance—including anti-icing measures, road-weather information systems and a large AASHTO Snow and Ice Cooperative Pooled Fund Program that is transforming U.S. practice—owe their origin to exchanges with Nordic and other countries.
- A cost-saving slope-stabilization technique is common practice in the U.S. thanks to cooperation with France and nearby countries. This technique is estimated to have saved \$40 million to date.
- Safety audits are in frequent U.S. use based on successful experience observed in Australia and New Zealand.
- Overseas experience has encouraged use of speed management techniques such as variable speed limits, aggressive driving surveillance equipment, red light running cameras, and roundabouts and other traffic calming measures in residential neighborhoods.
- Foreign practices have illustrated the benefits of all white pavement markings and many innovative traffic control devices to save costs and lives. These are under evaluation for possible adoption in the U.S.
- Longitudinal tunnel ventilation introduced from abroad has saved an estimated \$40 million to date.
- Guidelines for implementing ITS, improved methods for measuring pavement condition, and less road-damaging heavy vehicle suspension designs have resulted from our international cooperation.

ADVANCED VEHICLE TECHNOLOGY PROGRAM

Question. What is the status, strategic vision, and timetable for this program? *Answer.* The AVP is entering its second year and represents a successful transition and shift in emphasis of the Electric and Hybrid Electric Vehicle (EV/HEV) program managed by the Defense Advanced Research Projects Agency (DARPA) from fiscal year 1993 through fiscal year 1998. Building on the momentum achieved from investment by DARPA and private-public partners (a total of over \$250 million from 1993–1998) for advancing medium and heavy electric and hybrid-electric vehicle and infrastructure technologies.

Since assuming management in fiscal year 1999, DOT has announced program directions for fiscal year 1999, fiscal year 2000 and fiscal year 2001–2003. In response to the fiscal year 1999 solicitation, DOT awarded 26 projects to consortia in fiscal year 1999 for a total federal contribution of \$12 million—\$5 million from DOT and \$7 million from DARPA. These important projects are underway and well ahead of schedule in great part due to the AVP's fast-tracked public and private partnership and the use of "other transactions" agreements. Project selection for fiscal year 2000 and fiscal year 2001 is nearing completion. DOT will award funding for fiscal year 2001 projects upon allocation of the fiscal year 2001 appropriations. Neither the Department of Defense nor the Department of Energy contributed any funds to this partnership in fiscal year 2000. The President's budget for the Department for fiscal year 2001 is \$20 million and is based on a consensus of Departmental leadership of the program's importance to addressing the nation's energy efficiency, environmental and national security concerns.

The Department's strategic vision for the AVP is to have U.S. commercially available and affordable, fuel-efficient, low-emission, medium- and heavy-duty vehicles. The AVP seeks annually a balanced portfolio of projects across various technologies and degrees of risk and potential benefit. This approach provides significant opportunity to capitalize on emerging developments that may not lend themselves to a "top-down" planning approach with narrow objectives and schedules. Instead, the technologies being pursued under the AVP support a broad set of objectives: (1) reductions in vehicle emissions beyond the 2004 standards; (2) a 50 percent improvement in vehicle fuel efficiency; (3) a globally competitive U.S. advanced vehicle in-

dustry; and (4) increased public acceptance of advanced transportation technology. The Department is starting to show early returns on its investment in the AVP. Projects funded in fiscal year 1999 are beginning to deliver products and demonstrate technologies, such as battery cyclers and hybrid electric drive trains, that show promise in meeting the program objectives.

Question. Please list the amount, nature, and participants in each of the contracts awarded to date that use funds from the DOT appropriations.

Answer. The amount, nature and participants in each of the projects awarded to date under the AVP are contained in the attachment, "Fiscal Year 1999 Project Summaries."

Question. How will fiscal year 2000 monies be used? On which technologies?

Answer. The fiscal year 2000 program direction to the seven regional consortia was announced late last Fall. In response to this solicitation, DOT received 26 proposals from eligible consortia. To ensure continuity from fiscal year 1999 projects and to accelerate project awards, the Department did not request concept papers and, instead, asked the consortia to submit full proposals on high-priority projects from fiscal year 1999. These projects either did not receive funding in fiscal year 1999 or, given additional funding in fiscal year 2000, would accelerate technology deployment. The proposals have been evaluated by a team comprised of reviewers from DOT operating administrations, DARPA, and DOE with support from technical experts for award selection. The team has made an initial selection of projects for fiscal year 2000 funding, and negotiations are proceeding with the consortia for project award in May. We will forward a summary of those projects once awarded.

Question. What is the empirical basis for the amount requested? How will those funds be allocated?

Answer. The Electric Vehicle and Hybrid Electric Vehicle Program under the Defense Advanced Research Projects Agency (DARPA) was funded at an annual level of \$15 million for the past several years. Recognizing the need to continue the momentum of this partnership, the Transportation Equity Act for the 21st Century authorized the AVP at an annual level of \$50 million.

Additionally, the transportation sector accounts for about 65 percent of the national petroleum consumption. The U.S. transportation sector itself is 97 percent dependent on petroleum. This means that the transportation sector accounts for nearly one-third of the CO₂ emissions in the U.S., with motor vehicles accounting for about 25 percent alone. Pollutants from motor vehicles are major contributors to problems with urban air quality. Technologies developed through this program could significantly increase the energy efficiency of vehicles while reducing their emissions. The program, if successful, could significantly reduce greenhouse gas emissions by improving fuel efficiency of medium- and heavy-duty vehicles and by using alternative fuel and hybrid technologies. Several of the projects are now graduating from a concept testing phase to a product implementation stage, requiring two to three times larger project investment. The \$20 million requested for fiscal year 2001 will enable DOT and the consortia to sustain products emerging from the program to meet the program objectives.

The fiscal year 2001 funds will be allocated using the current competitive process developed under the DARPA Program. The exact allocation in fiscal year 2001 is pending completion of the selection process.

ADVANCED VEHICLE CONSORTIA PROGRAM

Question. In the fiscal year 2000 conference report, the conferees directed that FHWA include with the fiscal year 2001 budget request a report that delineates a detailed strategic spending plan for the advanced vehicle consortia program. Please explain why the report is not in the budget justification.

Answer. The Department recently completed a document, Medium- and Heavy-duty Vehicle R&D: Strategic Plan. The Plan not only responds to a Congressional mandate, but also provides a framework for the multitude of research activities focused on advanced medium- and heavy-duty vehicle technologies that are supported by DOT. The Secretary of Transportation submitted the Plan to both the House and Senate Committees on Appropriations.

Question. When will this requirement be implemented?

Answer. The Department recently completed a document, Medium- and Heavy-duty Vehicle R&D: Strategic Plan. The Plan not only responds to a Congressional mandate, but also provides a framework for the multitude of research activities focused on advanced medium- and heavy-duty vehicle technologies that are supported by DOT. The Secretary of Transportation submitted the Plan to both the House and Senate Committees on Appropriations.

Question. Please summarize your initial thinking regarding a strategic spending plan.

Answer. The DOT Medium- and Heavy-duty Vehicle R&D: Strategic Plan builds on strategic planning efforts of the Department and the National Science and Technology Council Committee on Technology's Transportation R&D Subcommittee, as documented in the DOT Strategic Plan and National Transportation Science and Technology Strategy, respectively. The Plan addresses DOT research and development activities, including the Advanced Vehicle Technologies Program (AVP), that support improvements in environmental characteristics and energy efficiency of medium- and heavy-duty vehicles. The Plan not only responds to the Congressional mandate but documents the early stages of what will be an ongoing strategic planning process specific to medium- and heavy-duty vehicle R&D. In addition, it will be used as an input for a broader Federal R&D Plan under the aegis of the National Science and Technology Council Committee on Technology.

FIFTY PERCENT NON-FEDERAL MATCH

Question. In the fiscal year 2000 conference report, the conferees directed that "all development, demonstration, and deployment projects to be funded within the advanced vehicle consortia program require at least a fifty percent non-federal match and that none of the funds provided for this program shall be used to advance magnetic levitation technology." How is this requirement being implemented?

Answer. As with the DARPA Electric Vehicle and Hybrid Electric Vehicle Program, the AVP has maintained the requirement for the consortia to at least match the Federal funding levels. The ratio of private to public investment will be at least 1:1.

The Department of Transportation has mechanisms in place to ensure that the funds provided for the AVP will not be used to advance magnetic levitation technology. An executive team, made up of DOT and other agency representatives, define and approve the technology focus areas of the program that offer the most promise in meeting the objectives of the program. A multimodal team of technical experts evaluate and select project proposals that meet these technology focus areas.

COST SHARING

Question. For each project funded, please specify the amount of any cost sharing.

Answer. The fiscal year 1999 AVP projects and corresponding consortia cost share are listed in the following table.

| <i>Project</i> | <i>Cost Share</i> |
|---|-------------------|
| WestStart—CALSTART: | |
| Fuel Cell Auxiliary Power Unit for Over-the-Road Trucks | \$1,055,000 |
| Electric Propulsion System for Medium- and Heavy-Duty Vehicles | 200,000 |
| Hybrid Electric Transit Bus with Flywheel Power Management | 629,975 |
| All-Purpose Electric Airport Tow Tractor | 217,596 |
| Electrochemical Capacitors Using Carbon Lead-Oxide Electrodes | 87,000 |
| ELECTRICORE: | |
| The AV-900 Cycler: A 600-900 Volt Test System for Heavy Duty Hybrid Electric Vehicles | 2,032,000 |
| Installation of Capstone Microturbines into Cape Cod Passenger Trams | 37,500 |
| Advanced Silicon Carbide Power Electronics | 675,104 |
| Hawaii Electric Vehicle Demonstration Project: | |
| Electric Vehicle Ready State | 817,395 |
| Zero-Emission 100 Passenger Electric Tram for Airports | 1,938,000 |
| Battery Cycle Life Prediction | 225,263 |
| Mid-Atlantic Regional Consortium for Advanced Vehicles: | |
| Unmanned Hybrid Electric High Mobility Multi-Purpose Wheeled Vehicle | (1) |
| 20kWh Nickel Hydrogen Segmented Battery for Hybrid Electric Military Vehicles, Commercial Trucks, and Buses | 165,778 |
| Optimization of a Compression Ignition Engine Generator System for Heavy-Duty Hybrid Electric Vehicles | 308,000 |
| Integrated Simulation and Testing System for Electric Vehicle Batteries | 532,224 |
| Smaller, Better Inverters with Polymer Multi-Layer Capacitors | 227,536 |
| Hybrid Electric Bradley Fighting Vehicle Demonstrator Testing and Model Refinement | (1) |

| <i>Project</i> | <i>Cost Share</i> |
|---|-------------------|
| Northeast Advanced Vehicle Consortium: | |
| Model Park for the 21st Century | 570,000 |
| Heavy-Duty Hybrid Electric Vehicle Emission Test Certification Protocol | 300,000 |
| Battery Electric Dominant Heavy-Duty Hybrid Electric School Bus ... | 312,000 |
| Jet Vapor Deposition for Catalyzing Fuel Cell Membranes | 350,000 |
| Southern Coalition for Advanced Transportation: | |
| Utility Industry Trouble Truck and Mobile Power Source | 545,029 |
| Hybrid Electric High Mobility Multi-Purpose Wheeled Vehicle Improvements | (1) |
| Demonstration of Advanced Components on the Advanced Technology Transit Bus | (1) |
| Sacramento Electric Transportation Consortium: | |
| Nickel Metal Hydride Battery System for an Electric Bus | 650,000 |
| Plastic Lithium Ion Hybrid Electric Vehicle Battery | 821,000 |

¹Match not required. These projects did not require a consortia match because they are continuations of projects under the DARPA EV/HEV Program, and the products/vehicles resulting from these projects will be solely for military use.

EVALUATION OF THE ADVANCE VEHICLE PROGRAM

Question. What measures have you developed to evaluate the success or progress of this program? What are your initial indications of the value of this investment?

Answer. One of the major goals of AVP is to assist in the commercialization of electric and hybrid electric vehicles, and to help develop the supporting industrial and technological base and infrastructure. To evaluate the success or progress of this program, DOT has started to establish the current electric and hybrid electric vehicle commercial and technology “baselines”, from which future progress can be measured. This is similar in approach to what DARPA did at the start of its program in 1993–1994. “Success and progress” for this program will include all aspects—growth and health of the U.S. industrial base in this market area; technological advancements such as improved range, energy efficiency, and reduced emissions; the introduction of enabling technologies such as improved auxiliary components and cheaper manufacturing capabilities; and deployment of the advanced vehicles and supporting infrastructure. The vehicles already in use are being quantified and will establish a baseline for future comparisons. The same can be said for key technology specifications of key components such as batteries, fuel cells, and more efficient engines and drive trains.

Initial indications show good return on the Federal investment in the AVP. The success of this program builds on that already realized under DARPA’s EV/HEV Program. Both New York City and Tempe have recently procured or announced the intent to purchase hybrid electric transit buses in quantity. The company (AVS, Chattanooga, TN) that is filling the Tempe bus order has been a direct beneficiary of the AVP, and the DARPA program before it, and would likely not be in this position today without the Federal investment. Allison Transmission has recently teamed with AeroVironment to develop through the AVP a 600–900 V battery cyclers—essential new hardware for testing batteries and drive system integration for higher voltage systems—the direction that the industry is starting to move toward. The Army has announced an intent to purchase a prototype high power, compact inverter that will be completed under the AVP. Initial tests of using a small fuel cell in a class 8 truck designed to take the auxiliary load (thus eliminating the need for costly, inefficient, and environmentally unfriendly overnight engine idling) have looked promising. If successful, the opportunity for including a fuel cell as part of the propulsion system for a hybrid electric truck may be closer to reality. Also, some early results for high power switching devices based on Silicon Carbide materials (being conducted at Rutgers University) look very promising and could eventually result in some dramatic reductions in size and weight of systems for electric vehicles and hybrid electric vehicles, and revolutionize other markets as well.

NATIONAL TECHNOLOGY DEPLOYMENT INITIATIVE

Question. Please specify how the fiscal year 1999, fiscal year 2000, and fiscal year 2001 funds were or will be used.

Answer. Technology deployment is made up of two primary parts: the Technology Deployment Initiatives and Partnerships Program (TDIPP) and the Innovative Bridge Research and Construction Program (IBRCP). These programs also allow discretionary funding to foster alliances and support efforts to stimulate advances in transportation technology including testing and evaluation of Strategic Highway Re-

search Program (SHRP) products, further development and implementation of technology in areas such as the SHRP Superpave system, support for SHRP's long-term pavement performance product implementation and technology access, and other activities in support of the five national goals of the TDIPP program. For presentation purposes in response to this question, this discretionary funding will be referred to as "other."

In fiscal year 1999—\$30,905,000 available (Note: All funds reflect a reduction of 11.7 percent for the obligation limitation ceiling):

- 86.2 percent of the \$4,989,000 in TDIPP funds were obligated for designated recipients (5 of 6) under 5116. The remaining 13.8 percent (1 of 6—The principal investigator passed away and the university is reconsidering their proposal) may be awarded before the end of fiscal year 2000.
- 100 percent of the \$5,092,000 in TDIPP funds were obligated for the five designated recipients under § 5117.
- 100.0 percent of the \$4,415,000 in TDIPP funds were obligated for the designated recipient under § 3015(c)
- 50.0 percent of the \$1,060,000 in TDIPP funds were obligated for the designated recipient under Senate Bill S.2307 [CAST/Auburn University].
- 89.0 percent of the \$14,128,000 in IBRCP funds were obligated under § 5103.
- 90.0 percent of the \$1,221,000 in "other" funds were obligated.

In fiscal year 2000—\$34,840,000 available (Note: All funds reflect a reduction of 12.9 percent for the obligation limitation ceiling):

- 100.0 percent of the \$5,021,150 in TDIPP funds will be obligated for designated recipients (6) under § 5116
- 100.0 percent of the \$4,823,157 in TDIPP funds will be obligated for designated recipients (5) under § 5117
- 100.0 percent of the \$4,355,000 in TDIPP funds will be obligated for the designated recipient under § 3015(c)
- 100.0 percent of the \$14,807,000 in IBRCP funds will be obligated under § 5103. The remainder will be obligated before the end of fiscal year 2000.
- 100.0 percent of the \$5,833,693 in "other" funds will be obligated.

In fiscal year 2001—\$36,217,000 available (Note: All amounts following are projected. No obligation limitation ceiling estimated):

- 100.0 percent of the \$5,151,000 in TDIPP funds will be obligated for designated recipients (6) under § 5116
- 100.0 percent of the \$4,367,000 in TDIPP funds will be obligated for designated recipients (5) under § 5117
- 100.0 percent of the \$5,000,000 in TDIPP funds will be obligated for the designated recipient under § 3015(c)
- 100.0 percent of the \$21,000,000 in IBRCP funds will be obligated under § 5103
- 100.0 percent of the \$699,000 in "other" funds will be obligated.

All of the projects designated under Sections 3015(c), 4021, 5103, 5116, 5117, and Senate B. S2307 will be funded as part of the Technology Deployment Program.

In fiscal years 1999 and 2000, \$36.9 million of Innovative Bridge Research and Construction (IBRC) Program funds were allocated to 40 State Departments of Transportation (State DOT) in order to pay the Federal share of 116 projects to repair, rehabilitate, or replace bridges or structures using an application of an innovative material. In fiscal year 2001, \$20.0 million of IBRC funds will be allocated to the State DOTs for similar bridge projects which also demonstrate the application of innovative materials. Approximately 60 new projects will be funded in fiscal year 2001. In fiscal years 1999 and 2000, \$2.5 million of IBRC funds were/will be allocated to research, development, and technology transfer (R, D & T) activities which include: documentation and evaluation of performance of innovative material bridge applications; dissemination of performance results to the U.S. bridge engineering community; development of material specifications and design codes to support successful innovative material applications; and research into issues critical to further development of innovative materials. In fiscal year 2001, \$1.0 million will be allocated to similar efforts.

TECHNOLOGY DEPLOYMENT

Question. Which projects will be funded and how will those benefit the states? Please provide specific examples of the tangible benefits and expected costs that are expected to result from that initiative.

Answer. Designated projects will benefit states by using advanced materials and innovative technologies to extend infrastructure durability and reduce life-cycle costs. Also, of benefit to States are "quality of life issues" where these innovative technologies can reduce the human costs of run-off-the-road crashes and trauma-re-

lated injuries; reduce user delays and improve safety during constructing and maintaining surface transportation facilities; reduce the impact of severe weather events on users of surface transportation systems; and improve community-oriented transportation and sustainable development and support and enhance the environment.

Four of the designated grant recipient institutions under the Technology Deployment Initiatives and Partnership Program (TDIPP) are doing research into trauma and crash related injury mitigation. Physicians define the "Golden Hour" as the time immediately following a crash where access to appropriate medical care is critical to patient survival. After considering the research to be performed by these institutions, in a "holistic" sense, they all can be synergistically tied to giving those injured in vehicular crashes a better chance of survival. These technologies relate to improved monitoring and coordination in emergency response; improved drugs to stabilize and prevent deterioration of crash victims' injuries while at the crash scene; improved vehicle occupant protective system operation and deployment; and improved vehicle sensors to identify crash severity and potential occupant injury.

Three of the designated grant recipient institutions under the TDIPP are doing research related to developing and advancing prototype deployment of operational intelligent transportation infrastructure systems for measuring various transportation system activities to aid in transportation planning and analysis in two major metropolitan areas. Once these prototypes are operational and proof-of-concept questions have been resolved; deployment of similar systems are planned for deployment in 40 more major metropolitan areas.

Under the Innovative Bridge Research and Construction (IBRC) Program many States are involved in developing new, cost-effective innovative material highway bridge applications; reducing maintenance costs and life-cycle costs of bridges, including the costs of new construction, replacement, or rehabilitation of deficient bridges; developing construction techniques to increase safety and reduce construction time and traffic congestion; developing engineering design criteria for innovative products and materials for use in highway bridges and structures; developing cost-effective and innovative techniques to separate vehicle and pedestrian traffic from railroad traffic; developing highway bridges and structures that will withstand natural disasters, including alternative processes for the seismic retrofit of bridges; and developing new nondestructive bridge evaluation technologies and techniques.

This program is intended to demonstrate the application of innovative material technology in the construction of bridges and other structures—grants are made to the states to pay the Federal share of the cost of repair, rehabilitation, replacement, and new construction of bridges or structures that demonstrate the application of innovative materials. Also grants, cooperative agreements and contracts are entered into with states, other Federal agencies, universities and colleges, private sector entities, and nonprofit organizations to pay the Federal share of the cost of research, development, and technology transfer (R, D & T) activities related to bridge applications of innovative materials.

The following information pertains to continuing initiatives being funded in fiscal year 2001:

Center for Advanced Vehicle Technology.—The objective is to form a well-equipped interdisciplinary capability at the University of Alabama at Tuscaloosa to address a range of issues related to advanced vehicle development and operation. During the first year of operation, progress has been made to develop the administrative structure for the Center. Equipment has been purchased to improve the measurement of key engine properties including emissions. Five grants were awarded on various vehicle issues and a lecture series was introduced which brings experts from other parts of the country to share insights. Several presentations have been made throughout the country to introduce the Center to others and to begin build partnerships. Expected cost for fiscal year 2001 for this initiative is \$400,000.

Smart Bridge Research Project.—The principle purpose of this grant is to research, design, and demonstrate technically feasible, economically acceptable and environmentally compatible Smart Bridge systems to enhance the nation's highway system safety and reduce its life cycle cost. A medium-scale deck section has been constructed. They are currently working to develop and validate advance modeling software. The research team is refining their deck heating system design. Continuous investigations are underway into systems to measure and analyze weather data, including sensor testing and development of integrated control strategies. Work has also begun on corrosion assessment, life-cycle economic analysis, and an operational web site for technology transfer. Expected cost for fiscal year 2001 for this initiative is \$1,000,000.

Advanced Trauma Care.—The Alabama Trauma Registry (ATR) has been established. Hospitals in the state that see a sizeable number of trauma patients each year were identified and contacted to obtain their support in collecting data using

the American College of Surgeons (ACS) trauma registry database (TRACS). A protocol and time line has been developed to transfer the data to the ATR. The transfer of data from the participating hospitals to the ATR is presently in the pilot phase. However, it is expected that all major trauma hospitals in the state will be providing trauma data to the ATR by July 2000. Data from this project and others will be used to make recommendations and establish protocol for the routine collection of data to provide better patient care. Expected cost for fiscal year 2001 for this initiative is \$750,000.

Transportation Injury.—The Center for Transportation Injury Research (CentTIR) projects are underway to provide real-world demonstrations and evaluations of advanced technologies, systems and programs. These projects are advancing crash detection and notification technologies with crash injury assessment. They are also improving the process of providing emergency triage, transport, and treatment of crash injured people. The CentTIR research has advanced technical and governmental understanding of technological opportunities for, and institutional hurdles to, improving the safety of U.S. motorists. The CentTIR research has helped define the safety potential for automatic crash notification technologies and the need for providing enhanced wireless 9–1–1 service nationwide. The CentTIR research is being used at the Federal, State and local levels. At the Federal level, the CentTIR communications on the safety potential of using wireless technologies to improve crash safety has been used in the NHTSA, FHWA, and JPO. In addition, the CentTIR research has been a part of the deliberations of the NTSB, the FCC, and the Congress. On October 26, 1999, the President signed into law the Wireless Communications and Public Safety Act of 1999 that found “emerging technologies can be a critical component . . . to reduce emergency response times and provide appropriate care.”

Grantees are in their second year of effort of interdisciplinary research on ways to reduce the occurrence, severity, and consequences of crash related injuries that now amount to nearly five million people each year in the U.S., including 42,000 deaths. Expected cost for fiscal year 2001 for this initiative is \$2,000,000.

Head and Spinal Cord injury.—The Neuroscience Center for Excellence and the Virginia Transportation Institute collectively are working on the development and implementation of a motor vehicle crash victim data registry, the investigation of mechanisms of neurotrauma, and the exploration and evaluation of novel neuroprotective drugs relative to this project.

Work has commenced in collision avoidance research and crash analysis research. Under collision avoidance, the following tasks are underway: (a) literature review of collision avoidance methods and developments, (b) development of a driving simulator laboratory, and (c) review and comparison of specific adaptive or intelligent cruise control systems. In the category of crash analysis research, the following tasks are underway: (a) finite element modeling of vehicles, (b) development of a folded/vented airbag model, (c) mathematical simulation of crash test dummy certification procedures and comparison to equivalent laboratory data, and (d) airbag modeling code evaluation and validation.

The motor vehicle crash data base now contains data on 400 victims with more than 2000 documented injuries. A Microsoft Access database is maintained on an Internet server, providing 24-hour update capability and access. An improved percussion apparatus has been developed to support experimental head trauma experiments utilizing a rat model. Preliminary studies have been conducted to identify up-regulation of the CO_x2 gene in the brain preceding irreversible injury. Experimental strategies for screening and evaluation of neuroprotective drugs have been devised.

Preliminary collision avoidance literature review is completed. All components required to assemble the driver simulator are now available for assembly. Portions of vehicle model development have been completed. Air bag code evaluation has begun. Expected cost for fiscal year 2001 for this initiative is \$500,000.

Motor Carrier Advanced Sensor Control System.—The initial task of the study is underway. It includes a literature review and related analyses of accident databases. The detailed project scope is under development. The Truck Manufacturers Association is working with the Federal Motor Carrier Safety Administration and the contractor to implement this program. The first task under the contract, which is nearly complete, was an assessment of several potential safety and operationally-oriented categories of sensors and sensor systems. A meeting with interested original equipment manufacturers (OEMs) and Commercial Motor Vehicle operators was held in late February, and the draft task report is currently under review. A statement of work is being prepared as a follow-on assessment for several of the sensor categories reviewed in Task 1, and adding some others in response to stakeholder input. The plan is to follow on with tasks to arrange hands-on work in the lab and test track, and possible work in the field environment. Expected cost for fiscal year 2001 for this initiative is \$700,000.

Intelligent Transportation Infrastructure System.—This project provides for the development and deployment of a system that collects and distributes real time traffic conditions data for operations purposes; and archives this data for planning, analysis, and maintenance purposes. The project design is well underway in Pittsburgh and will begin later this year in Philadelphia. Authorization to proceed in Philadelphia will be granted upon approval of the Pittsburgh design. Given current progress, system implementation is expected around July 2000 in Pittsburgh, and in November 2000 in Philadelphia. The local user needs have been identified and the overall system requirements have been defined in Pittsburgh. The sensor siting and design are near completion and software development is under way. The evaluation of the project will begin once the system is deployed. Expected cost for fiscal year 2001 for this initiative is \$1,700,000.

Advanced Traffic Monitoring and Emergency Response.—The first phase of the project has begun and involves a feasibility and needs study to identify appropriate Intelligent Transportation Systems (ITS) user service requirements. Also, this phase involves defining the overall scope of the project. Interviews with individual stakeholders are being completed. To provide guidance for the feasibility study, an Oversight and Technical Advisory Committees has been established. The design phase will begin upon completion of the study, which is anticipated by July 2000. An assessment of needs, along with relevant technologies and best practice models, will be available upon completion of the feasibility study. A conceptual plan and the appropriate next steps will also be defined at that time. Expected cost for fiscal year 2001 for this initiative is \$1,667,000.

Technology of Transportation Economic and Land Use System (TELUS).—The New Jersey Institute of Technology is currently in the development and deployment phase of this program. The objective is to support State governments and Metropolitan Planning Agencies by developing an automated data base to report on the status of projects. A Beta test group, composed of 15 MPOs, has been formed and is currently testing an early release of TELUS. The Beta test group has reported very good results and is anxious to receive the final version. Expected cost for fiscal year 2001 for this initiative is \$1,000,000.

Innovative Bridge Research and Construction Program.—Under this program repair, rehabilitation, and new construction projects involving several different innovative materials and a broad range of structural applications are being funded. Materials include fiber reinforced polymer (FRP) composites; high performance 70ksi weathering steel (HPS 70W); FRP reinforced wood glulam members; high strength, durable concrete (HPC); stainless steel clad reinforcing bars; innovative bridge coatings; innovative anodes for cathodic protection, etc. Applications include durable, lightweight bridge decks; HPS 70W steel bridge beams; HPC concrete bridge decks; durable concrete bridge decks reinforced with FRP reinforcing bars or stainless steel clad bars; understrength and/or deteriorated bridge members reinforced externally with FRP sheets or FRP prestressing tendons; bridge columns, susceptible to seismic damage retrofitted with FRP “wraps”; etc.

One example of tangible benefits is installation of new lightweight bridge decks which allow for increased load limits on posted bridges—an example is the Maryland State Route 24 bridge over Deer Creek; replacement of the concrete deck with a lightweight FRP deck will enable the DOT to maintain this 1934 historic truss in service at minimal cost and mitigate the need for more costly rehabilitation. Deck installation is expected to require one week versus 5 to 6 weeks with a reinforced concrete deck. Another example is new bridge decks reinforced with stainless steel clad reinforcing bars, such as the State Route 82 bridge over Red Creek in Delaware, where the deck is expected to be resistant to salt induced corrosion and deterioration of concrete decks reinforced with mild steel. On this project, the understrength steel beams will also be reinforced with carbon FRP sheets.

Technology transfer efforts such as an International Symposium on High Performance Concrete for Bridges (co-sponsored with the Prestressed/Precast Concrete Institute—PCI) and a National Conference on High Performance Steel for Bridges (co-sponsored with the American Iron and Steel Institute—AISI) will keep the bridge engineering community abreast of developments in deploying innovative materials in bridges. Total expected cost for fiscal year 2001 for this program is \$21,000,000.

Advanced Technology Pilot Program.—To date, one project group has been selected. General Atomics Corporation (GA) will lead a team to develop Maglev technology for the purpose of providing a solution to urban and regional transportation problems. The GA team will develop low speed magnetic levitation technology in the following main task areas: (1) system studies, (2) base technology development (including technical risk identification and resolution), (3) route specific requirements, and (4) projection of overall system performance and a preliminary design for a full scale demonstration system concept. The team is comprised of federal, state, and

local government representatives along with many industrial organizations. Expected cost for fiscal year 2001 for this initiative is \$5,000,000.

EVALUATION OF THE ADVANCED VEHICLE PROGRAM

Question. What measures have you developed to evaluate the success or progress of this program?

Answer. We have a Legislative Implementation Plan in effect whereby Core Business Units and Service Business Units within FHWA (and program offices in other modal administrations within U.S. DOT) have technical representatives identified to track achievements and monitor progress for each of these identified initiatives. Additionally, we develop summary reports on progress of these initiatives and submit the reports biennially to the Congress. Success of the IBRC program will be demonstrated in 4 ways: (1) selection and funding of projects which support the program goals established in TEA-21; (2) construction of each innovative material bridge application in the field; (3) monitoring and evaluation of the performance of each application during short and long term service; (4) dissemination to the bridge engineering community of "lessons learned" and material, design and construction specifications developed so successful applications can be deployed on a widespread basis.

Project selection is based on a set of criteria which incorporate the TEA-21 IBRC program goals and which have undergone critical review by the State DOTs, by the industries which produce innovative materials and by the bridge engineering community at-large. The IBRC funded projects including the 116 different projects already funded are being conducted on varying schedules according to the individual States' construction programs. Some projects have already been let for construction. One example is the replacement of the deteriorated concrete deck on the Salem Avenue Bridge over the Great Miami River Bridge in Dayton, Ohio, which will be reopened for traffic in May 2000. Most other projects are underway or will be let for construction in the Spring of 2000. The FHWA division offices are closely monitoring the implementation of each project.

The State DOTs are strongly encouraged to include instrumentation and post-construction monitoring of the innovative material applications in each project request. All of the 116 IBRC funded projects have such a phase incorporated in the project plan. Most of the evaluation efforts are being conducted by either State DOT research agency and/or by University staff with extensive experience in the innovative material being used. In addition, FHWA will initiate regional and/or national evaluation studies for applications where several projects are underway in different states and different operating conditions. Examples include a coordinated evaluation of the performance of at least 24 bridge decks constructed of fiber reinforced polymer (FRP) composites and a coordinated evaluation of stainless steel clad reinforcing steel used in concrete bridge decks.

FHWA is developing a comprehensive database of all projects funded under the IBRC. A wide range of information (as appropriate) will be collected/measured on each project: type and size of bridge; traffic volumes and loadings; innovative material and material specifications; details of structural application; design loads and design codes used; costs of fabrication and installation; cost and construction time savings compared to "traditional" solutions to the projects being built; performance data; etc. Progress and success of the program and of individual project applications will be done on a continuing basis. Dissemination of results, "lessons learned", etc. will be done continually, via an IBRC web site and the IBRC database as well as through engineering conferences, papers and presentations and site specific technical assistance to State DOTs and local highway agencies pursuing similar innovative material bridge applications.

TECHNOLOGY DEPLOYMENT PROGRAM

Question. What are your initial indications of the value of this investment?

Answer. Technology Deployment program funds are a significant part of FHWA's overall R&T program, as they help to create of an environment for innovation among our partners and customers through encouraging the application of new technologies and approaches.

This is especially true for the IBRC program, where initial indications point to a high degree of success. Two solicitations for bridge projects resulted in 289 applications with over 88 percent of these eligible for IBRC funding. Total funds requested were in the order of \$190 million (versus \$37 million available for allocation). The degree of innovation is notable with many previously untried applications including FRP composites, stainless steel clad reinforcing, etc. being proposed. State DOTs and local agencies have seen the program as not only a source of funds for

innovation, but also as helping to offset the risk of utilizing higher risk (in terms of cost and technical performance) applications. Projects such as the Salem Avenue bridge in Dayton are proving that the innovative applications are feasible to build and do produce tangible benefits. Projects such as the HPS 70W steel bridge on Tennessee State 58 over the Clinch River are documenting the technical case for HPS steel as well as the potential for lower capital construction costs. Other projects in other states are expected to produce similar findings.

The TDIPP program also does contribute to innovation, as the initiatives strengthen current relationships and broaden the range of contacts which benefit FHWA in defining and executing R&T programs. The Department's overall strategy is to sharpen the focus on delivering innovation, and to work with all representatives of the transportation community to ensure an effective and efficient transportation system. The significant number of designated recipients of TDIPP funds has limited our ability to focus these program resources on high-priority areas, but we do actively work with program participants to advance innovation and to maximize support of US DOT goals and objectives.

Question. For both fiscal year 2000 and fiscal year 2001, how much of the funds will be used for research purposes and how much for grants to states and local governmental entities?

Answer. In fiscal year 2000, \$700,000 was provided for TCSP research, evaluation and technical assistance. A total of \$871,000 has been requested for research, evaluation and technical assistance in fiscal year 2001.

Question. Please highlight some of the innovative strategies and projects selected for fiscal year 2000.

Answer.

Colorado.—Denver Union Station Work and Entertainment Connection—Cost effective and community-friendly alternative transportation connections at a primary intermodal transportation center.

Delaware.—Centerville Village Plan—Innovative strategies to preserve and revitalize historic community and protect surrounding open space.

Florida.—Teenagers, Transportation Planners and Residents Team Together to Tackle the Treasure Coast Transportation Plan.

Illinois.—A Sustainable Transportation and Land Use Plan for the Route 47 Kishwaukee River Corridor Developed with a Watershed-based Approach Through Community Consensus.

New Mexico.—Santa Fe/Solana Neighborhood Center B: A Model for Growth Without Sprawl.

Oregon.—Oregon Telecommunity Center Project: A Replicable Model for Sustainable Rural Communities.

TRANSPORTATION AND COMMUNITY AND SYSTEM PRESERVATION PILOT PROGRAM (TCSP)

Question. What is the need and demand for the additional \$25 million in LGOE funds requested for the TCSP?

Answer. Requests for TCSP Program funding has consistently exceeded the available TCSP funds. In fiscal year 2000, applicants from 48 states and the District of Columbia submitted 292 proposals totaling \$151 million for funding consideration. TEA-21 authorizes \$25 million for this program in fiscal year 2001. Applicants from 46 states, the District of Columbia and Puerto Rico submitted 298 proposals totaling more than \$196 million for consideration in the fiscal year 2001 TCSP Program. This overwhelming response indicates a pressing need in communities to leverage resources to make their communities more livable. The increased funds would expand the number of communities that are able to participate in the program and the range of strategies that are implemented to improve linkages among transportation and community planning and system preservation practices.

Question. What measures have you developed to evaluate the success or progress of this program?

Answer. The evaluation of TCSP projects will focus on the following key areas: process evaluation, product evaluation and outcomes. However, appropriate goals and objective, performance measures and evaluation methods will differ for each project because of the broad range of initiatives as well as the diverse mix of geographic areas and project scopes. The lessons learned from project evaluations will be used in evaluating the overall TCSP Program. Lessons learned from this pilot program will be shared with other communities across the country.

Question. What are your initial indications of the value of this investment?

Answer. The TCSP Program allows States, Metropolitan Planning Organizations and local governments to compete for funds to develop and test new transportation approaches for addressing the relationship between transportation and community

and system preservation. The TCSP program is meeting a critical need for funds to support community-based planning and implementation projects. These funds are often used by applicants to leverage other public and private moneys in order to maximize transportation and community development investments. Lessons learned from this pilot program will be shared with other communities across the country.

SURFACE TRANSPORTATION RESEARCH FUND CATEGORIES

Question. Please provide a table showing carryover funds for each of the last two years for each of the traditional surface transportation research fund categories.

Answer. The carryover funds for each of the last three fiscal years are shown below by subaccount or research categories.

[In thousands of dollars]

| Program | Fiscal years— | | |
|--|---------------|-------|-----------------|
| | 1999 | 1998 | 1997 Carryovers |
| Surface Transportation Research: | | | |
| Safety | 594 | 100 | 1,235 |
| Pavements | 1,873 | 1,408 | |
| Structures | 2,212 | 1,634 | 88 |
| Environment | 251 | 370 | 95 |
| Real Estate Services | 3 | | |
| Policy | 60 | | 30 |
| Planning | 172 | | |
| Motor Carriers | 454 | 858 | 2,327 |
| Basic Research | 441 | 72 | 72 |
| Technology Assessment and Deployment | 937 | 65 | 300 |
| Long-Term Pavement Performance | 16 | 11 | |
| R&T Technical Support | 1,419 | 345 | |
| Local Technical Assistance Program | 242 | 407 | |
| National Highway Institute | 718 | 130 | 669 |
| Eisenhower Fellowship | 335 | 116 | 1 |
| Advanced Research | 34 | | |
| Highway Operations | 41 | | |
| Minority Business Enterprise | | | 14 |
| International Transportation | 101 | 191 | 168 |
| Russia Technical Assistance | | | 2 |
| Federal Lands Contamination Clean-up | | 1,774 | 1,774 |
| ITS Research and Development | 38,129 | 3,773 | 351 |

APPROVAL FOR FUNDING SHIFTS OF MORE THAN 10 PERCENT

Question. In House Report 104–177, reprogramming guidelines state that congressional approval is required for funding shifts of ten percent or more among programs, projects and activities. Please show the amounts, nature, and source of any funding shifts that were implemented in fiscal year 1999 and thus far in fiscal year 2000.

Answer. There were no funding shifts in fiscal year 1999 or thus far in fiscal year 2000 which fall within the reprogramming guidelines in House Report 104–177.

PURPOSE AND COSTS OF FOREIGN TRIPS

Question. Please provide a table listing the purpose and costs incurred for each of the foreign trips taken by each of the Core Business Program Directors during fiscal year 1999 and thus far during fiscal year 2000.

Answer. The information is summarized in the table below.

| Core Business Unit | Fiscal year | Destination | Purpose | Cost |
|----------------------|-------------|--|--|------------|
| Infrastructure | 1999 | Sweden, Denmark, Germany, Netherlands, France. | To participate in the Recycled Secondary Materials Scanning Mission. | \$4,934.50 |

| Core Business Unit | Fiscal year | Destination | Purpose | Cost |
|------------------------------|-------------|----------------|---|----------|
| Operations | 1999 | Sweden | Participation in the World Road Association (PIARC) bi-annual meeting of the Intelligent Transport Committee. | 2,388.34 |
| Environment and Planning ... | 2000 | Mexico | To participate in the 12th Joint Working Committee meeting. | 1,326.03 |
| Infrastructure | 2000 | Mexico | To make a technical presentation at the Asphalt Recycling and Reclaiming Association's 24th annual meeting. | 1,529.03 |
| Operations | 2000 | Malaysia | To participate in the PIARC XXIst World Road Congress. | 3,546.60 |
| Operations | 2000 | Canada | To participate in the annual ITS World Congress. | 1,878.34 |

GENERAL ADMINISTRATION AND OVERSIGHT

Question. Please list each of the completed 1998 and 1999 reports prepared by your Corporate Management Office. Also summarize the key recommendations of each report. Please indicate how FHWA responded to each of those recommendations.

Answer.

1. Review of the Dwight David Eisenhower Transportation Fellowship Program, (Internal Draft Report), February 1998—Internal report concluded that both the Graduate Fellowship element and the minority serving institutions elements (HBCU, HSI, and Tribal Colleges) of the program are meeting the objective of “attracting qualified students to the field of transportation.” Activities are underway to respond to the recommendations to expand and improve advertisement of the program, assure timely and reliable stipends, improve mentoring by transportation professionals, improve and update the database of participants and enhance networking opportunities for participants.

2. FTA/FHWA Metropolitan Office Status Review, March 1998—Internal report concluded that “the LA Metro Office is a success and has markedly improved service to FTA and FHWA partners in the LA region.” The report was used as a model for assessing the success of other Metropolitan Offices.

3. The Role of the Federal-Aid Division in Highway Safety, April 1998—Recommendations focused on how to integrate highway safety across all functions and through all organizational levels. A number of activities have resulted from these recommendations including a national conference for Federal Motor Carrier Safety Administration and FHWA highway safety specialists, development of new training curriculum, planning a leadership seminar for FHWA management, greater involvement by field staffs with non-traditional partners, and improved information sharing among both FHWA field offices and FHWA field offices and headquarters. All of these activities have increased the emphasis within FHWA for integration of highway safety issues in other highway functions and advocacy activities by FHWA field highway safety specialists.

4. Meeting the Customer's Needs for Mobility and Safety During Construction and Maintenance Operations, September 1998—The report recommended a variety of actions from development of improved technology to working with our partners and customers to employ work zone management principles to improve work zone operations. The report established an operational baseline for FHWA to measure existing conditions and future improvement. It also developed a “Model Work Zone Traffic Management Program and Self Evaluation Guide” for use by State and local units of Government. The report, and Executive Summary and Guide were distributed to cities, counties, States, and industry. A cross-functional team was created that has extensively used the report recommendations identify its work. Activities of the team include the following, all of which respond to recommendations of the report: (1) a best practices guidebook which presents a collection of highway community best practices, submitted from across the Nation has been created in partnership with AASHTO, (2) in partnership with AASHTO and the American Traffic Safety Services Association the FHWA sponsored National Work Zone Safety Awareness Week, April 3–7, 2000, (3) is developing user friendly computer software tools which accurately analyze and reliably predict work zone impacts, (4) encouraging FHWA field offices to engage states in assessment of their traffic management program using the Self Evaluation Guide developed in this review, and (5) developing a new driver work zone safety awareness education program.

5. Evaluation of the Office of Motor Carrier's National Training Center, May 1999—This internal evaluation concluded that the processes and procedures in place at the NTC for the administration, management, development, delivery, and evaluation of the motor carrier training program met the Systematic Approach to Training (SAT) criteria and compared favorably to other Federal agency's safety inspectors/investigators training programs.

OFFICE OF THE ADMINISTRATOR AND PUBLIC AFFAIRS POSITIONS

Question. Please prepare a table listing the average number of positions for the immediate Office of the Administrator and Office of Public Affairs for each of the last three years.

Answer.

| Unit | Fiscal years— | | |
|--|---------------|------|------|
| | 1998 | 1999 | 2000 |
| Office of the Administrator: | | | |
| Office of the Administrator | 5 | 7 | 7 |
| Office of the Deputy Administrator | 3 | 3 | 4 |
| Office of the Executive Director | 8 | 8 | 7 |
| Total Staff | 16 | 18 | 18 |
| Office of Public Affairs: Office Staff | | | |
| | 7 | 10 | 10 |

ADMINISTRATIVE EXPENSES

Question. Please provide separate tables breaking down administrative expenses into PC&B, permanent change of station, travel, communication, information systems, training, ADP, non-mandatory awards, and other administrative categories for each of the last four years and the fiscal year 2001 budget request. Please present a table showing net administrative expenses for each of the last four years and the fiscal year 2001 budget request.

Answer.

LIMITATION ON ADMINISTRATIVE EXPENSES

| | Fiscal years— | | | | |
|---------------------------------|---------------|-----------------|-----------|-----------|-----------|
| | 1997 | 1998 | 1999 | 2000 | 2001 |
| Salaries & Benefits | \$167,977 | \$174,369 | \$169,245 | \$193,939 | \$201,890 |
| Performance Awards | 891 | 996 | 1,020 | 1,117 | 1,158 |
| PCS Moves | 5,967 | 5,800 | 9,749 | 7,700 | 7,700 |
| Travel | 9,660 | 9,273 | 9,387 | 9,473 | 9,473 |
| Transportation | 548 | 556 | 1,506 | 663 | 465 |
| Rental Payments to GSA | 17,408 | 17,480 | 18,475 | 20,275 | 16,537 |
| Other Rent & Comm. & Util | 8,512 | 9,369 | 9,676 | 9,955 | 9,857 |
| Printing & Graphics | 3,072 | ¹ 89 | 2,607 | 1,609 | 1,512 |
| ADP Services | 15,356 | 16,615 | 17,005 | 16,800 | 19,200 |
| Other Services | 11,649 | 16,629 | 26,908 | 35,798 | 39,074 |
| Supplies | 3,181 | 2,079 | 2,973 | 2,079 | 2,021 |
| Equipment | 3,811 | 6,303 | 2,841 | 4,947 | 6,947 |
| Totals | 248,032 | 259,558 | 271,392 | 304,355 | 315,834 |

¹ Funding for Printing and Graphics are also captured in TASC with Other Services.

EDUCATIONAL AND TECHNOLOGY TRANSFERS

Question. For each of the last three years, please specify the amount spent on the promotion of educational or technology transfer activities in Russia, the Republic of South Africa, the Garrett-Morgan initiative, technology transfer to Turkey, a summer jobs program related to transportation, the support of possible careers in the transportation field, and environmental cleanup at any FHWA-related sites. What is the planned fiscal year 2001 level of expenditure for each of these activities?

Answer. FHWA funding for the Russia Program, South Africa Program, Turkish Program, and other programs are summarized in the chart below.

| Country or region | Fiscal years— | | | |
|--|---------------|------------|------------|------------|
| | 1998 | 1999 | 2000 | 2001 |
| South Africa | \$220,000 | \$160,000 | \$150,000 | \$125,000 |
| Russia | 300,000 | 55,000 | 50,000 | 100,000 |
| Turkey | | | 10,000 | 35,000 |
| Environmental clean-up of lab ¹ | 930,000 | 1,300,000 | 1,500,000 | 2,900,000 |
| The Summer Transportation Internship Program for Diverse Groups (STIPDG) | 85,780 | 415,000 | 700,000 | 850,000 |
| National Summer Transportation Institute (NSTI) | 500,000 | 1,356,000 | 2,000,000 | 2,000,000 |
| Transportation and Technology Academy (TRANSTECH) | 75,000 | 100,000 | 200,000 | 200,000 |
| On-the-Job Training Support Services | 8,239,775 | 5,350,278 | 5,710,000 | 7,960,287 |
| National Urban Sustainable Employment in Transportation (NUSET) | 15,000 | | | |
| Garrett A. Morgan Technology Transportation Futures | 44,688 | 24,050 | 24,050 | 20,000 |
| Dwight David Eisenhower Fellowship | 1,782,000 | 1,766,000 | 1,742,000 | 1,742,000 |
| University Programs | 3,000,000 | 22,590,648 | 23,734,750 | 23,734,750 |

¹ Includes partial funding from the General Services Administration (GSA) through a Memorandum of Understanding.
² Planned.
³ Includes costs associated with closing FHWA's Moscow Office.

Question. Please indicate the exact source and amount of funding for each activity listed above and discuss how those expenditures affected the amount of funds available during fiscal year 1999 and fiscal year 2000 for research, development, or technology transfer programs that were justified in your budget requests.

Answer.

| Country or region | Fiscal years— | | |
|--|---|---|---|
| | 1998 | 1999 | 2000 |
| South Africa | International Outreach Program funds. | N/A | TEA-21 International Outreach Program funds. |
| Russia | International Outreach Program funds. | TEA-21 International Outreach Program funds. | TEA-21 International Outreach Program funds. |
| Turkey | N/A | N/A | TEA-21 International Outreach Program funds. |
| FHWA, CFLHD Groundwater & soil contamination clean-up. | G.O.E. Public Law 105-205 & project overhead charges. | G.O.E. Public Law 105-205 & project overhead charges. | G.O.E. Public Law 105-205 & project overhead charges. |
| On-the-Job Training Support Services. | 23.USC. 140 | 23.USC. 140 | 23.USC. 140. |
| Garrett A. Morgan Technology Transportation Futures. | Limit. On General Operating Expense. | Limit. On General Operating Expense. | Limit. On General Operating Expense. |
| Dwight David Eisenhower Fellowship Program. | TEA-21, 5001(c)(3)(C) | TEA-21, 5001(c)(3)(C) | TEA-21, 5001(c)(3)(C). |
| University Programs | TEA-21, 5110 | TEA-21, 5110 | TEA-21, 5110. |

These expenditures did not affect the amounts available for research, development, or technology transfer programs that were justified in the FHWA's budget request.

Question. Please indicate the amount of fiscal year 2001 funds requested for any of those activities.

Answer. FHWA funding for the Russia Program, South Africa Program and Turkish Program and other programs are summarized in the chart below.

| Country or Region | Fiscal year 2001 |
|--------------------|------------------|
| South Africa | \$125,000 |
| Russia | 100,000 |
| Turkey | 35,000 |

| <i>Country or Region</i> | <i>Fiscal year 2001</i> |
|--|-------------------------|
| Environmental clean-up of lab ¹ | 2,900,000 |
| The Summer Transportation Internship Program for Diverse Groups (STIPDG) | 850,000 |
| National Summer Transportation Institute (NSTI) | 2,000,000 |
| Transportation and Technology Academy (TRANSTECH) | 200,000 |
| On-the-Job Training Support Services | 7,960,287 |
| National Urban Sustainable Employment in Transportation (NUSET) | 20,000 |
| Garrett A. Morgan Technology Transportation Futures | 1,742,000 |
| Dwight David Eisenhower Fellowship Program | 23,734,750 |
| University Programs | |

¹Includes partial funding from the General Services Administration (GSA) through a Memorandum of Understanding.

NEW INITIATIVES

Question. During fiscal year 1999 or fiscal year 2000 were any funds taken away from any RD&T activity to pay for any expenses related to new initiatives that were not presented in the budget justification?

Answer. In fiscal year 2000, \$331,000 R&T funds were used to support the new DOT Climate Change and Forecast Center which was not a part of the budget justification for that year.

CARRYOVER FUNDS

Question. Did you use any carryover funds to pay for shortfalls in the management and coordination area during either fiscal year 1999 or fiscal year 2000? If so, how much was allocated each year?

Answer. No carryover funds were used to pay for shortfalls in the management and coordination area during fiscal year 1999 or fiscal year 2000.

REVENUE ALIGNED BUDGET AUTHORITY (RABA) DISTRIBUTION

Question. For each of the contract programs specified in TEA-21, please prepare a table showing the amount of increase that would be provided under current law resulting from the RABA of TEA-21 as specified in Section 1105 and contrast that to the amount actually specified in TEA-21's contract authority amounts.

Answer.

TRANSPORTATION RESEARCH

[Fiscal year 2001]

| Contract programs | TEA-21 author- ization | RABA | Total |
|---|---------------------------|-------------|---------------|
| Surface Transportation Research | \$98,000,000 | \$9,044,350 | \$107,044,350 |
| Technology Deployment Program | 45,000,000 | 4,153,018 | 49,153,018 |
| Training and Education | 18,000,000 | 1,661,207 | 19,661,207 |
| Bureau of Transportation Statistics | 31,000,000 | 2,860,968 | 33,860,968 |
| ITS Standards | 100,000,000 | 9,228,928 | 109,228,928 |
| ITS Deployment | 118,000,000 | 10,890,135 | 128,890,135 |
| University Transportation Research | 27,250,000 | 2,514,883 | 29,764,883 |

GENERAL OPERATING EXPENSES

Question. Please break out in detail your request for an additional \$2.4 million for information technology. What is the analytical basis of this request? How much is in the base for similar investments? Are not computer costs continuing to decline per unit of information or processing capability? Why is this amount of an increase requested at this time?

Answer. The detail and basis for the expenditure is as follows:

| Number of each | Total | Comment |
|-------------------------------|-------------|---|
| 1,000 PCs at \$1,700 | \$1,700,000 | Replaces 1/3 of agency PC's annually. |
| 24 servers at \$7,500 | 180,000 | Replaces 1/3 of agency file & printer servers annually. |
| 150 printers at \$1,500 | 225,000 | Replaces 1/4 of agency networked printers annually. |

| Number of each | Total | Comment |
|-------------------------------|------------------|---|
| 12 networks at \$25,000 | 300,000 | Replaces 1/5 agency field network hardware. |
| Total | 2,405,000 | |

Basis: (Support for Baseline End-User Computing in FHWA).
 Line 1 3000 FTE (post-FMCSA separation); replacement cycle is 3 years.
 Line 2 60 field offices with file/print servers (52 Divisions, 4 Resource Centers, 3 Federal Lands, LAST).
 Line 3 one printer for 5 employees; replacement cycle 4 years.
 Line 4 60 field office networks; replacement cycle 5 years.

As FHWA re-writes its major information systems it is moving them from a main-frame-based programming environment, to server-based systems accessed with a personal computer over a local or wide-area network. FHWA has not previously had a planned technology refresh rate for its desktop computing environment. As the desktops become part of the mission-critical support environment, they must be supported in a planned rather than an ad-hoc fashion.

FHWA has reduced its per-unit computer costs in-line with industry trends. Because FHWA bases its systems, which are used by States and other external partners as well as the agency's staff, as much as possible on commercial available off-the shelf software running on industry standard computers and operating systems, the selected refresh rate is necessary to maintain technology which is supported by the hardware and software vendors.

TRAINING INCREASE

Question. What is the analytical basis for the \$4.33 million increase requested for training? How much is in the base for training already? Why is this amount of an increase requested at this time?

Answer. The budget includes an increase of \$4,330,000 for training. The fiscal year 2000 budget base for the requested increase is \$3 million dollars. The requested increase (which is not a one-time increase) represents the resources needed agency-wide to expand training and development in critical areas supporting FHWA's program delivery and deployment of technology. We must not only maintain and replace our current level of expertise, but build more depth in skills and expertise to meet our charge as a leader in transportation technology and program expertise. Following is a description of the training requirements which currently exist and which will be met through fiscal year 2001 and future budgets. We anticipate that future fiscal year budgets will reflect a comparable level of investment, as we hire and develop staff to meet program needs.

Using a variety of approaches, we aim to fully equip our employees with the skills and experiences needed to work effectively in new roles with the states and our other partners, to serve as a key resource for technical advice and expertise, and to effectively develop and deploy solutions to new and emerging transportation issues.

Our focus will be on developing our employees' skills in several key areas and on investing in developmental programs for long-term results. Included will be investments in technology-based learning mechanisms as one way to expand access and availability of training.

Technical expertise.—Covering a wide range of disciplines including safety, pavements, structures, planning, logistics, environment, and civil rights. Resources will go to such programs/initiatives as academic study in technical disciplines; technical training and expansion of rotational and developmental assignments for the gain of applied knowledge and experience by employees.

FHWA's business processes.—Providing training and development activities in agency systems and processes in areas such as strategic planning; budgeting and financial management, program performance management, continuous improvement and measurement; and information management.

Professionalism and related personal/interpersonal skills.—Addressing core employee skills needed by employees to effectively deliver program and technical expertise, including such areas as negotiation, mediation, communication, making effective presentations, and working collaboratively in our restructured organizational environment.

Leadership and management.—Continuing to provide skills training and development for a changing cadre of managers, supervisors and team leaders. As our current generation of leaders moves toward retirement, we need expanded resources to prepare a new generation to replace them. We also anticipate participating in new Department of Transportation-wide training initiatives as we seek to integrate a

broader Departmental perspective into our leadership and management development programs.

Succession planning/career development.—Addressing future staffing needs through implementing a redesigned career development/intern program (known as the Professional Development Program). Additional resources are needed to provide newly hired participants in this program with a strong foundation of FHWA program delivery and technical skills that will prepare them to quickly assume positions of responsibility in the FHWA organization.

DELTA INITIATIVE

Question. Please provide additional justification to further explain the request for \$1 million for the Delta Initiative on page III-27. How did this request originate? Why can't the LTAP centers conduct some of these activities?

Answer. Some of the work to be supported by this funding is simply an increase in existing activities, e.g., developing training and technical assistance. Some of the work is new and directly transportation related, e.g., developing a regional transportation plan while some is less directly transportation related, e.g., developing a tourism marketing plan.

The request to fund these activities under one program came about based on the comments of members of delta region organizations and the public in general at meetings sponsored by the U.S. DOT. The U.S. DOT, in turn, acted as the lead agency on behalf of all cabinet members who were part of the executive branch Delta Initiative task force. The comments were, in part, informed by the historic role transportation has had in tourism and other aspects of the region. For example, Congress established the Great River Road program in 1973 based on a Mississippi River Parkway program funded under the Federal Aid Highway Act of 1954. During the administrative life of the Great River Road program (1973-1991), over a billion dollars in Federal, state and local funds were used for the Great River Road and various scenic overlooks, bike trails, historic preservation, parks and recreation trails.

QUESTIONS SUBMITTED TO THE NATIONAL RAILROAD PASSENGER CORPORATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

AMTRAK'S ROUTE SYSTEM

Question. Please provide the most recent route-by-route performance statistics for all short and long distance routes, similar to that found on pages 217-218 of Senate Hearing 106-221, the Senate Appropriations Committee's fiscal year 2000 hearing record.

Answer.

Financial and Statistical Performance of Amtrak Routes
 (Financial Data Excluding Depreciation)
 FY1999 vs. FY1998
 (in millions)

| Description | FY99 Total Revenue (in millions) | FY99 Total Expense (in millions) | FY99 Profit/Loss (in millions) | FY98 Profit/Loss (in millions) | P/L % Change | FY99 Load Factor | FY98 Load Factor | Change in Load Factor | FY99 Ridership (in thousands) | FY98 Ridership (in thousands) | % Change in Ridership | FY99 Train Miles (in thousands) | FY98 Train Miles (in thousands) | % Change in Train Miles |

FUNDING HISTORY AND AVAILABILITY

Question. Please prepare a table outlining federal funding to Amtrak for fiscal years 1998, 1999, 2000, and requested in fiscal year 2001. (Please include only the "glidepath" capital request for fiscal year 2001, and not the expanded intercity rail passenger service funding request from Revenue Aligned Budget Authority funds.) Please be sure to include funding made available by the Taxpayer Relief Act. Characterize the eligible uses for these funds, and display a column or row which shows how much of each year's funding is available for obligation in each fiscal year.

Answer.

[In millions of dollars]

| | Fiscal years— | | | |
|-----------------------------------|---------------|------------|------------|------------|
| | 1998 | 1999 | 2000 | 2001 |
| Federal grants: | | | | |
| Operating grant | 202 | | | |
| Capital funding | | 609 | 571 | 521 |
| NECIP/NHRIP funding | 250 | | | |
| Taxpayer relief act | 2,184 | | | |
| Total Federal grants | 2,636 | 609 | 571 | 521 |
| Available for obligation: | | | | |
| Operating grant | 202 | | | |
| Capital funding | | 243 | 594 | 551 |
| NECIP/NHRIP funding | 250 | | | |
| Taxpayer relief act | 2,184 | | | |
| Total available | 2,636 | 243 | 594 | 551 |

MARKET BASED NETWORK ANALYSIS

Question. On February 28, 2000, Amtrak announced its comprehensive market based assessment of the railroad's route structure, which identifies opportunities for Amtrak to expand its national network and improve the use of its assets. Please outline what routing and service changes will be made by Amtrak during the next six months, before the end of fiscal year 2000. What are the major challenges to implementing each of these planned changes?

Answer. A chart indicating routes, approximate starting dates, equipment needs, freight partners that would be necessary and infrastructure needs is attached.

| Train | Description of Activity | Implementation Date | Freight Partner(s) | Rolling Stock Needed | Infrastructure Requirements |
|------------------------------|---|---------------------|------------------------|---|--|
| Kentucky Cardinal | Extended Service to Louisville | Completed | L&I, CSX | | |
| Crescent | Split Train in Meridian Mississippi to Dallas/Ft. Worth and New Orleans | Summer, 2000 | KCS, UP, NS | 2 L, 1 B, 2 SC, 1 D, 1 Dm, 1 SL S | Track Improvements |
| Chicago / Janesville, WI | New Train Between Chicago and Janesville | Summer, 2000 | WBS, Metra, (MRI) | 2 C | Passenger Platform, Track Improvements |
| Detroit / Toledo | Reconfigures Train from Detroit to Toledo through Dearborn | Summer, 2000 | NS | | Track Improvements |
| New York / Chicago | Additional Trains | Summer, 2000 | NS | 12 C, 1 E-60, 6 L, 3 B, 9 SC, 3 C, 3 SL S | Roadrailer Ramps |
| Hiawatha | Extend Chicago to Milwaukee Train | Summer, 2000 | WC, CP | 4 CM | Track Improvements, Station Work |
| Texas Eagle | Daily Frequency Chicago to San Antonio | Summer, 2000 | UP, BNSF | 3 L, 2 D, 3 C, 2 B, 2 SC, 1 SL L | |
| Silver Service (New England) | Extends Line from New York to Boston | Fall, 2000 | CSX, MetroN, MBTA, Nec | 2 L | |

| Train | Description of Activity | Implementation Date | Freight Partner(s) | Rolling Stock Needed | Infrastructure Requirements |
|--|--|---------------------|------------------------------------|-----------------------------|-----------------------------|
| Monterrey, Mexico/San Antonio | Daily Frequency, Links to Chicago and elsewhere | Winter, 2001 | UP, TFM | 2 L, 4C | Some New Facilities |

Question. Please outline what MBNA-based routing and service changes will be made by Amtrak during fiscal year 2001. What are the major challenges to implementing each of these planned changes?

Answer. Amtrak is in the process of analyzing additional routes and re-examining existing routes. The MBNA analytical process is a complex one requiring significant inputs from most every Amtrak business unit and department. Moreover, it is a dynamic process with continuous analysis of alternative network configurations and schedules. Later in this calendar year Amtrak anticipates announcing High Speed Rail Corridors for further discussion with appropriate governments, rail companies and other agencies. These routes will have been examined via the MBNA analytical process. Also later in the year Amtrak will announce additional traditional route additions and changes under the Network Growth Strategy initiatives. Thus, at this time there are no specific additional routing or service changes other than those indicated in the table provided for in the previous question.

HIGH SPEED RAIL CORRIDORS

Question. Please update the Committee on all proposed regional high-speed rail corridors which Amtrak is supporting through Strategic Business Plan or Market Based Network Analysis actions. Please provide detailed information on each proposed corridor, including: (1) total projected cost for each corridor, as well as anticipated timeframe; (2) the amount of capital funding committed by Amtrak, the affected States, the freight railroads and other interested parties; (3) the level of current services and what service improvements the high-speed corridor will bring about; (4) each project's primary proponent, as well as other parties in the coalition of forces; and (5) current ridership figures, and estimated ridership growth.

Answer. Attached is a summary prepared by Amtrak that describes the high-speed rail efforts current underway around the country. The following chart addresses costs that have been identified by state studies for these projects and funding commitments:

[In millions of dollars]

| Corridor program | Long-term cost | Amtrak commitment | State commitments |
|-----------------------------|------------------|-------------------|-------------------|
| Empire Corridor | 500 | 85 | 85 |
| Keystone Corridor | 500 | 75 | 75 |
| Southeast HSR: | | | |
| WAS-Charlotte | ¹ 1.2 | 75 | 130 |
| Charlotte-Atlanta | TBD | | |
| Midwest Regional Rail | ¹ 5 | 25 | 140 |
| California | ¹ 5 | 25 | ² 700 |
| Cascades | ¹ 1.8 | 35 | 60 |

¹ In billions of dollars.

² Proposed by Governor Gray Davis.

The BNSF Railroad has invested some \$15 million to improve infrastructure for the Cascades services. CSX has committed to some \$35 million for improvements between Washington and Richmond. Discussions with freight railroads are on going with respect to partnering to improve the high-speed rail corridors.

Question. An option that has been discussed for Amtrak operations both "on and off" the Northeast Corridor is the use of dual-powered locomotives that can operate under electric catenary as well as with fossil fuel, thus avoiding the need for an engine change when moving from electrified to non-electrified right-of-way. On which Amtrak routes would the use of dual-powered locomotives be appropriate? Is this option being considered on all these routes? Is there currently a dual-powered locomotive in revenue service? If so, who is the manufacturer, and where is this type of power car in service?

Answer. Amtrak did purchase several P-32 DM locomotives from General Electric. These are used exclusively in service along the Empire Corridor where electric power is transmitted through a third rail and not by overhead catenary.

With completion of the New Haven-Boston electrification system, Amtrak no longer requires a change of engines in New Haven for its Northeast Corridor trains. However, the railroad is not electrified south of Washington to Richmond and Charlotte, north from New Haven to Springfield, or north of New York to Albany. As

a result, passengers either must change trains at these locations or await time-consuming locomotive changes.

Amtrak is considering options for avoiding the need for these delays, particularly for service between Charlotte/Richmond and Washington. Options include:

- development of a dual-power locomotive that can operate under electric catenary or fossil-fuel generated power;
- operation of trains with both an electric and a fossil fuel locomotive;
- addition of an electric power unit to fossil-fuel trainsets arriving in Washington from the south.

Amtrak expects to develop a specification for a dual power locomotive this year for review by potential vendors. A decision on which approach to pursue for these trains would follow.

NORTHEAST CORRIDOR OPERATIONAL AND SAFETY QUESTIONS

Question. Please provide historical data from fiscal years 1991 through 1999 on trespasser and crossing fatalities on the Northeast Corridor.

Answer.

| STATE | FY91 | | FY92 | | FY93 | | FY94 | | FY95 | | FY96 | | FY97 | | FY98 | | FY99 | |
|-------|------|----|------|----|------|----|------|----|------|----|------|----|------|----|------|----|------|----|

 Note: GCF = All FRA Class of Persons Involved in Grade Crossing Accidents that Resulted in a Fatality

Question. Please describe the efforts Amtrak is making to educate the public concerning the north end electrification project. Since Amtrak inaugurated electrical service on the North End of the corridor on January 31, 2000, have there been any accidents or fatalities related to electrification?

Answer. Amtrak has two structured outreach programs, one for school children and one geared toward emergency responders such as fire, rescue and police. The following is a numerical summary of our efforts in public education concerning the electrification and high speed rail operations.

NUMBER OF SCHOOLS/PRESENTATIONS—1998–99

| | Schools | Presentations |
|-------------|---------|---------------|
| MA | 39 | 94 |
| RI | 94 | 246 |
| CT | 34 | 76 |
| Total | 167 | 416 |

These presentations are conducted primarily by Amtrak Police Officers, are on going, and closely follow the guidelines of the Operation Lifesaver training course.

SAFETY AND SECURITY TRAINING FOR FIRE, RESCUE AND POLICE—SINCE MARCH 2, 1999

| | Classes | Attendees on record |
|--------------------|------------|---------------------|
| MA | 91 | 778 |
| RI | 58 | 874 |
| CT | 131 | 1,368 |
| Total | 280 | 3,020 |

Other than a few remaining classes to be conducted west of New Haven, training is now complete in these states. In fact, the program is continuing south, down the Northeast Corridor to Washington, D. C. To date, we have trained over 9,836 participants in 539 classes. This project is unprecedented in its magnitude and scope. We will soon follow up on this work with a video that is being made to supplement our training classes.

In addition to the four-hour classroom training, Amtrak purchased and sent copies of OREIS Emergency Responder Software, developed by Operation Respond, to one hundred and twenty “911”-type dispatch centers in the Northeast Corridor effectively blanketing our railroad territory with this responder tool.

Besides these two major outreach programs, Amtrak has also participated in Another forty-three Community Outreach Programs involving displays and public events.

Finally, Amtrak developed and closely follow a detailed notification process to both internal and external parties prior to energizing any section of new catenary on the north end project. In addition to verifying full compliance with the National Electric Code, this final sign-off process ensures that notification to affected employees, contractors, sub-contractors, adjacent utilities, communities and emergency services occurs.

There have been no accidents or fatalities related to the electrification project since the first section of catenary was energized.

Question. Please describe the conversion to electrified service on the North End of the corridor. Provide a schedule of electrified locomotive integration, and milestones for the conversion process through full implementation. What are the associated time savings for electrified North End service (both for Acela Regional and Acela Express)? What are the top running speeds for both services on the South End and on the North End.

Answer. The remaining North End trains will be converted to electric service as high horsepower locomotives are accepted. The Consortium’s estimate for the delivery of trainsets is as follows:

Trainset 1—July 2000; Trainset 20—March 2001; and Delivery rate is 2 to 3 trainsets per month.

Locomotive schedule: Locomotive 1—May 2000; Locomotive 15—October 2000; and Delivery rate is 2 or 4 locomotives per month.

Acela Regional will save one to one and a half hours from the previous multiple stop diesel service. The Acela Express is planned to save approximately just under another hour. The top running speed for Acela Express will be 150 mph on the North End. The top speeds on the South End will be 135 mph. The top running speed for Regional Service is 125 mph.

Question. Amtrak is the lead contractor for construction of the “third track” freight rail line paralleling the Northeast Corridor between Quonset Point/Davisville and Central Falls, Rhode Island. In last year’s hearing record, Amtrak testified that the completion date for the third track, as determined by the Rhode Island Department of Transportation, is the last quarter of fiscal year 2001; Amtrak was in the process of reviewing that schedule. Is this construction project on schedule to be completed sometime in July-September, 2001? Has a site been selected for the location of the Warwick Train Station at T.F. Green Airport?

Answer. The Freight Rail Improvement Project (FRIP), or “third track”, will not be completed in 2001. Beginning in July of 1999, the Rhode Island Department of Transportation (RIDOT) began a value engineering effort on the FRIP, which revisited many of the basic premises and criteria associated with the project. Amtrak worked closely with the State in this process, and as a result of that effort, RIDOT has decided to focus on the Track 3 (milepost 168 to milepost 184) portion of the project. In April, Amtrak will begin the mainline track undercutting necessary to accommodate tri-level and double stack clearances. RIDOT is continuing their design efforts in the Track 3 segment, however these efforts are primarily related to

bridge modifications required for the project. In the Track 7 portion of the project (milepost 184 to milepost 190), although Amtrak has completed the 90 percent design, RIDOT has requested a suspension of all work while they review options relating to the scope of work. Based on the above, RIDOT has established summer of 2002 as the in-service date for this project.

The Warwick Train Station at T.F. Green will be located at approximately milepost 176.5, which is west of Coronado Road.

NORTHEAST CORRIDOR ELECTRIFICATION AND HIGH-SPEED RAIL TRAINSET
PROCUREMENT

Question. Due to findings of excessive wheel wear and a slower trainset testing schedule than originally envisioned by Amtrak, the Acela Express high-speed service, originally scheduled to begin by the end of the calendar year 1999, has been delayed until July 2000, a delay of more than six months. What is the adjusted timetable for the delivery of Amtrak's 20 new high-speed rail trainsets and 15 new electric locomotives? What is Amtrak's payment schedule for this procurement?

Answer. The Consortium's estimate for the delivery of trainsets is as follows:

Trainset 1—July 2000; Trainset 20—March 2001; and Delivery rate is 2 to 3 trainsets per month.

Locomotive schedule: Locomotive 1—May 2000; Locomotive 15—October 2000; and Delivery rate is 2 or 4 locomotives per month.

Payment will be made as each unit is accepted.

Question. What are Amtrak's remaining challenges to meeting the new start-up date of July 2000? Will the railroad meet this delayed implementation schedule?

Answer. The primary focus is to successfully complete the required qualification tests necessary to start the service on the NEC. The Consortium is projecting that they will meet this schedule.

Question. Please update the Committee on the trainset testing. Is all TTC-based testing completed? What on-corridor testing remains to be done? Please prepare a table comparing the original trainset testing schedule with the revised schedule, specifying detailed testing benchmarks.

Answer. All scheduled TTC testing is complete. The remaining on-corridor testing is primarily propulsion qualification testing, brake qualification testing, high-speed stability testing and the shakedown testing (60,000 mile test). There is other testing scheduled but propulsion, braking, high-speed stability and shakedown are on the critical path.

The schedule comparison between the contract and current schedule:

| | Contract | | Consortium's revised schedule | |
|---|----------|---------|-------------------------------|---------|
| | Start | Finish | Start | Finish |
| Engineering and Qualification Tests | 7/10/99 | 9/27/99 | 5/28/99 | 8/10/00 |
| Shakedown (60,000 mile test) | 8/28/99 | 1/24/00 | 3/2/00 | 6/28/00 |

Qualification testing required to start revenue service will be completed by early July 2000. Qualification testing for operating a double trainset will be completed by August 10, 2000. This testing is not required to be completed for the start of revenue service since Amtrak's current operating plan does not include operating a double trainset.

Question. Is testing of the North End electrification complete? Do any segments of the total electrification project remain incomplete? If so, where are these segments and what is the timetable for their completion, testing, and integration into revenue service?

Answer. The following segments of the total electrification project remain incomplete:

Mainline Track 2 between View and Shaw's Cove Interlocks.—Completion of testing and energization of this segment in the New London West electrical section is scheduled for June 2000.

Mainline Track 2 from Cranston Interlock to Norton Switching Station.—Completion of testing and energization of this segment in the Warwick East electrical section is scheduled for May 2000.

Mainline Track 2 from Norton Switching Station to Sharon Substation.—Energization of this segment in the Sharon West electrical section is complete, but testing with AEM-7 locomotives prior to revenue service is scheduled for May 2000 after the energization of the Warwick East electrical section.

Mainline Track 2 from Sharon Substation to Transfer Interlock.—Completion of testing and energization of this segment in the Sharon East electrical section is scheduled for June 2000.

Crossovers between Mainline Tracks 1 and 2 at Plains and Cove Interlocks.—Completion of this segment in the Sharon East electrical section is scheduled for July 2000.

Incomplete items in the Boston Terminal Area (BTA) are as follows:

- Station Tracks 1–6 and 11–13.
- Track B5 between Cove and Tower 1 Interlocks (Block 25).
- Tracks D1, D2 12, 14 and 19 (Block 26).
- Wet and Dry Loop Tracks (Block 27).
- Southampton Yard Tracks (Block 28).

Substantial completion of testing and energization of the above items in the Boston Terminal area is scheduled for June 2000.

Question. Is testing of the track and other on-the-ground infrastructure on the North End complete? What is a “CPM schedule?”

Answer. Testing of the track for high-speed operation began in January 2000 and occurs thereafter on a routine basis as mandated by existing FRA regulations (49 CFR Part 213, Subparts A–G). Additional track testing, “GRMS” (gauge restraint measurement system) has begun and will be completed in the near future.

Signal testing of new/rehabilitated interlockings and other signal improvements is an integral part of the initial installations and occurs thereafter on a routine basis as mandated by existing FRA regulations (49 CFR Part 236). A “Critical Path Method” schedule calculates a single, early and late start and finish date for each activity based on specified, sequential network logic and a single duration estimate. The focus of CPM is on calculating float in order to determine which activities have the least scheduling flexibility.

In summary, a CPM schedule determines the longest path through the project, which is also the shortest time required to complete the project.

Question. Please list all non-Amtrak railroads or commuter agencies that will need to be equipped with ACSES civil speed enforcement under FRA’s mandate. Who is responsible for paying for the installment of these systems? Please describe any cost-sharing or reimbursement agreements.

Answer. The testing requirements are: On board installation and verification; Wayside installation and verification; Proof of Design Test Program and Commissioning for revenue operation; and Regular Testing and Inspection.

A copy of the “AMTRAK TEST PLAN FOR ACSES” is attached. The ACSES system must be operational and testing results must be approved by the Federal Railroad Administration prior to implementation of high-speed rail service. Eighty five percent (85 percent) of the wayside transponders have been installed along the tracks.

ACES ON-BOARD INSTALLATION AND VERIFICATION

On board installation and verification will be divided into two phases. Phase I will be to install the complete ACSES hardware less the cardfile. Phase 2 will be to install the cardfile and initialize the system.

Manufacturer of the ACSES equipment will document testing of components and assemblies with serial numbers of each item shipped for installation.

Phase I will consist of installation of the main ACSES box including all the internal power supplies, ACSES antenna, CTV junction box, speed sensors, aspect display unit, air brake manifold, MCP radio, MCP antenna, audible alarm, acknowledgement push button, stop bypass button, and all the necessary pneumatic and electrical connections.

Installation document will include locomotive number, serial numbers of each of the major components, location and date installation completed.

Upon completion of the enclosure installation and before plugging the cardfile, all wires will be verified for continuity, and grounds. A special test box (designed for this application) will be used to verify power supplies, wiring and cable termination. Operation of the pneumatic magnet valve, suppression pressure switches, and cut-in and cut-out functions will be verified. This will be documented and records will be kept at the location where locomotive installation is taking place.

Phase 2 will require a laptop loaded with ACSES setup software to initialize the system. Upon installation of the cardfile, setup software will allow input of unit number, wheel diameter, speed sensor type(s) and train type(s). ACSES self-tester will be then activated to verify the internal and external system operation. This will include verification of the software version, antenna and speed sensor checks. Mag-

net valve operation, all the indications on the ACSES aspect display unit, and alarm condition.

Records of these tests will be kept at the locations where locomotives are undergoing modification. Upon completion of the above tests, locomotive will be ready for revenue service.

Records of the Phase 1 and Phase 2 testing will be kept at the designated Amtrak location.

ACSES WAYSIDE INSTALLATION AND VERIFICATION

Wayside installation and verification will be divided into two phases. Phase I will be to install the transponders in the track structure, insert the plugs and verify the messages. Phase 2 will be to install the MCP data radios at the interlocking central instrument houses, wire in the encoders and verify the data radio messages.

Manufacturer of the ACSES system will design and document the transponder layouts, the message structures to be contained in each plug, the wiring of the encoders, and the format structure contained in the data radio messages.

Phase I will be divided into two parts.

Part I involves installation of the transponders at correct locations and will require detailed transponder layouts from the manufacturer. These will be prepared by the manufacturer from the detailed layout engineering which determines deceleration curves by train type, considering maximum authorized speeds, grades, interlocking signal location, and location of the "hs", "ds", "pds", and other intermediate transponder sets on each track. Amtrak Standard Plans will be also prepared to insure proper location of the transponders within each set. These plans show the correct distances between the individual transponders in a set and between the first transponder in the set and the nearest insulated joints, as recommended by the manufacturer.

Amtrak C&S employees will install the transponders according to the detailed transponder layouts from the manufacturer and the Amtrak Standard Plans. These documents will also be used to verify that the installed locations of all transponders are correct.

Part 2 involves the insertion of the programmed plugs into the transponders and verification of the messages on each transponder. A programming tool is used to:

- Enter all pertinent transponder information from the detailed transponder layouts provided in Part I (Railroad, line, M.P. location in feet, track number, position within the set, linkage distance to next transponder set in feet, etc.).
- Enter appropriate revision letter.
- Enter packages using pop down menus.
- Verify information.
- Compile plug information.
- Print transponder content.
- Print special plug label in indelible ink.
- Print hexadecimal bitmap for the transponder plug.

Programming of transponder plugs will be performed only by qualified employees under the direct supervision of the Amtrak C&S Design office in Philadelphia, PA, or by qualified employees of the supplier. All documentation of individual transponder information, bitmaps, and detailed engineered transponder layouts will be kept in the Amtrak C&S Design office in Philadelphia, with copies to the appropriate Division supervision and field personnel, as required.

Amtrak C&S employees will insert each plug into its appropriate transponder, using the printed label on the plug to insure that each transponder receives the correct plug. Each installation is then verified at the site with the Transponder Reader. As each plug is inserted, the Transponder Reader is placed on the transponder and the bitmap, printed for that transponder is compared with the bitmap displayed on the Transponder Reader screen, character by character. If all hexadecimal characters on the Reader screen match the printed bitmap for the transponder, the plug is the correct one for that transponder. When all the transponders in a set have been verified to contain the required message information, the required documentation is signed off by the responsible C&S employee in accordance with AMT-27, Test 28B.

Phase 2 will also be divided into two parts.

Part I involves radio coverage tests by Amtrak's Radio Department to determine optimum antenna location and height to develop adequate MCP data radio coverage throughout each interlocking area, out to the distant signals approaching each interlocking. MCP data radios and antennas are installed and signal strength throughout the coverage area is verified to be adequate for reliable data message exchange between train and wayside.

Part 2 involves installation and wiring of the Encoders at each interlocking. Wiring of the Encoders will be verified by traditional C&S point-checking from detailed signal circuit wiring plans prepared by Amtrak from information furnished by the Manufacturer. Actual vital messages to approaching trains via data radio will be in the same formats as messages read from the transponders. A method to verify radio messages similar to the method used to verify transponder messages is to be developed and furnished by the manufacturer.

Records of these tests will be kept at the same locations on each Division as all other AMT-27 Test Records, and will become part of Amtrak's over-all C&S Test Documentation Files.

PROOF OF DESIGN TEST PROGRAM AND COMMISSIONING ACSES FOR REVENUE
OPERATION

Following is the procedure to fully implement the ACSES as per FRA final order of particular applicability.

Testing and implementation are divided into two phases. Phase I will prove design parameters and the test program. Phase 2 will be commissioning of ACSES for revenue service.

Phase I will be divided into three parts.

Part I will be initial testing to verify the design concepts. This will be done at AAR Pueblo test track.

Following parameters will be tested:

- Relationship between antenna and transponder at different heights and power levels
- Consistency of reading transponder messages
- Transponder linking distances
- Enforcing civil speeds
- Running release
- Direction reversal
- Positive stop application without ATC
- Transponder plug programming tool

During the testing, the system will be demonstrated to Amtrak operating department for refining ACSES operating rules and planned training. FRA will be invited to receive initial comments.

Upon completion of these tests, modification will be made to the initial design. Any remaining message "packages" will be added for final design verification at the AAR test track. At this time ACSES will be installed on a High Speed, High Horsepower Locomotive. This will verify the wiring interface with the Cab signal system.

During this period, the system will be tested for functionality of all ACSES features.

As a minimum, proper execution of the following features will be verified:

- Train type dependent civil speed restrictions
- Enforcement of civil speeds for each train type
- Correct braking profile for initial speeds throughout the speed range and for various grade configurations
- Dirction reversal
- Transponder linking and missing transponder(s)
- Positive stop application with and without ATC
- Temporary speed restrictions with temporary transponders
- Miscellaneous packages to verify train operation during catenary phase break and voltage changes, and tilt enable and disable operation
- ACSES territory entrance/exit validation
- Validation of communication link (Lonworks) between HST and ACSES
- High Speed operation to validate correct reading of the transponders at maximum operating speeds

Test data will include:

- Name of the manufacturer
- Version number of the software
- Equipment in which software is installed
- Test location and date
- Test results and corrective action taken

Record of such test will be kept at the Amtrak designated Amtrak NEC headquarters.

Part 2 will be to test the system between County and Ham Interlocking in Amtrak NEC territory. One AEM-7 will be equipped with final version of ACSES. Wayside location will have all the transponders with proper messages necessary as per final design.

For the first two weeks, locomotive will be used in normal revenue service with ACSES pneumatic valve cutout. During this period every time the locomotive travels between County and Ham, the on board data logger will monitor transponder messages, and verify linking distances, civil speed restrictions, track numbers, and direction of travel. Information collected will be downloaded every third day and forwarded to the manufacturer for further analysis. Manufacturer will issue the final report of this testing within four weeks. On-board and/or wayside parameters will be changed accordingly to data collected.

Detail test plans will be used to verify proper execution of all the features, and sheets with the test results will be signed off and kept at designated Amtrak NEC headquarters.

Part 3 will be to validate the complete system using system simulator in the lab environment. The manufacturer will perform complete V. & V. FRA will then be given a demonstration and proof of testing at the manufacturer's designated location.

Phase 2 will be commissioning of ACSES between New Haven and Boston and designated four sections south of New York for revenue service. At this time new ACSES operating rules will be made effective. This will be contingent upon receipt of the final software for the On-Board Computer and completion of electrification and all the related track and signal work in that region.

Phase 2 is divided in to six parts scheduled to conform to other related activities in the NEC. These include the track and station improvements, electrification, signal work, availability of high-speed train sets, equipping MBTA control units, and training. This will allow the system to mature, gain operating experience, and make adjustment without going through major rework.

Testing and commissioning procedure will be same for all six parts.

Part 1: One AEM-7, one High Speed Train Set, one P. & W. RR diesel and one MBTA commuter car will be equipped with ACSES to verify all the speed restrictions, train types, and positive stop scenarios at all the interlocking home signals between New Haven, CT and Providence, RI.

Each train type will run at full track speed in each direction on Track I and Track 2. Also shorter portions of Track 3 and Track 4 will be run in each direction, so that all ACSES equipped main tracks will be tested in each direction with each train type. During these runs the ACSES pneumatic valve will be cut out. During each run, a qualified employee will determine that all permanent speed restrictions are being correctly displayed at the correct locations, checking these on test sheets. ACSES will monitor all the transponder messages and speed restrictions to verify the design parameters. Positive stop commands will be generated internally, and the location where each positive stop command occurs will be recorded to verify proper location and stop distances, but trains will not be brought to a stop. The "on-board" data logger will be used to gather all the data necessary to confirm all these functions following the test runs.

Proper braking distances for positive stop for example, will be confirmed by logging the points where ACSES first warns the engineer and then initiates the penalty approaching each interlocking home signal, while running at track speed. The location of the transponder set at the interlocking home signals will also be recorded; giving an accurate recorded distance between each ACSES calculated point of application and its corresponding stopping point. Following each test run, qualified employees will review each of these ACSES calculated braking distances to verify that each recorded braking distance is adequate to stop the train for the speed recorded at the application point. Proper braking distances for the civil speed reductions will also be reviewed to back-up the on-board test sheets, which were filled out while the test train was running at track speed.

The detailed test plan along with all test results will be kept at Amtrak NEC Engineering Headquarters in Philadelphia, PA. Final on board installation drawings will be kept at locomotive maintenance facilities. Transponder installation drawings will be retained with other signal plans at Amtrak NEC headquarters in Philadelphia, PA.

When all of the ACSES safety features have been validated, and all MBTA, CDOT, P. & W. RR, CSX RR and Amtrak ACSES equipped units are identified and verified with the final on-board software, ACSES will be placed in service with ACSES Operating Rules in service.

Part 2: Testing between Providence, RI and Boston, MA.; Part 3: Testing between County and Ham (New Brunswick, NJ to Trenton, NJ); Part 4: Testing between Ragan and Prince (Wilmington, DE to Perryville, MD); Part 5: Testing between Morris and Holmes (Morrisville, PA to Holmesburg, PA); Part 6: Testing between Grove and Landover (Odenton, MD to Landover, MD).

Test Procedure:

Test procedure will have following minimum guidelines.
 Test records will indicate: Test date, Location, Locomotive number; Equipment in which software is installed; Name of the lead test engineer; System description; Test results; and Comments, which should indicate pass/fail criteria and any corrective action taken.

Test records will be kept at designated Amtrak location. Copy will be forwarded to FRA.

Test Schedule

Phase 1, Part 1.—November 1, 1998 to October 31, 1999. Location: TTCI (AAR) Test Center, Pueblo, Colorado. Tracks: Initially Transit Loop, later on High Speed Loop. Locomotive: Amtrak No. 199 with test car 10501 and HH locomotive 11.

Phase 1, Part 2.—July 26, 1999 to September 10, 1999. Location: “County” Intlg. (New Brunswick, NJ) to “Ham” Intlg. (Trenton, NJ). Tracks: No 2 and No.3 Main Tracks. Locomotive: Amtrak AEM-7 No. 906.

Phase 1, Part 3.—December 1, 1999 to February 29, 2000. Location: Simulator at PHW, Inc., Pittsburgh, PA. Tracks: All main tracks between New Haven and Boston, and tracks 2 and 3 between County and Ham will be simulated.

Phase 2, Part 1.—April 1, 2000 to May 31, 2000. Location: New haven, CT to Providence, RI. Tracks: All main tracks.

Phase 2, Part 2.—June 1, 2000 to August 31, 2000. Location: Providence, RI to Boston, MA. Tracks: All main tracks.

Phase 2, Part 3.—September 1, 2000 to September 30, 2000. Location: County, NJ to Ham, NJ. Tracks: No. 2 and No. 3 main tracks.

Note: Use of MCP for stop bypass, route dependency, and temporary speed restrictions will be activated in stages between October 1, 2000 and October 1, 2001.

Phase 2, Parts 4, 5, and 6.—Dates will be provided at later time.

REGULAR TESTING AND INSPECTION STANDARDS FOR ACSES

On-Board Equipment

Daily Test and Inspection.—Record the railroad (Amtrak), unit number, date, time, location, and type of test on the proper form; Visual inspection of the ACSES and MCP Radio antennas; Visual inspection of the speed sensor; Secure and record the seals on Pneumatic cut-out cock in cut-in position and ACSES cut-out switch in cut-in position; With the power on, observe that the ACSES cut-in light is lit on the ADU; Operate the self-test switch. (This will initiate the following series of steps); Step 1, Observe that each LED in ADU is illuminated; Step 2, ACSES antenna is powered; Step 3, ACSES magnet valve is de-energized; Audible alarm will sound; Push and release the acknowledge button; Reset the brakes by moving the brake handle to suppression; Step 4, ACSES will request PTS; This will cause the penalty application; Reset the brakes; This completes the self test and ADU will only show the current status; Record any corrective action; Inspection form to be signed by the qualified inspector performing this Daily Test and Inspection.

Periodic Test.—Every 92 days the ACSES event log should be downloaded to verify the ACSES activities.

Yearly Inspection and Test.—Verify the self tester operation as per manufacturer specification; Verify the Pass/Fail ACSES antenna strength; Sign off the proper form indicating the corrective action.

AMT-27, Test 28:

| | |
|--|--|
| AMTRAK | C&S MANUAL AMT-27 Instructions for Testing Signal Apparatus and Signal Systems |
| TEST 28: ACSES TRANSPONDER AND ENCODER INSPECTION AND VERIFICATION | |
| LEVEL OF MANDATE: STANDARD | Regulating Docs: FRA Final Order of Particular Applicability; Federal Register/Vol. 63, No.140 / Wednesday, July 22, 1998 / Notices – Pages 39355-39357 |

Purpose:
Test 28A.—To insure that ACSES transponders are in good condition for reading by ACSES—equipped trains.
Test 28B.—To insure that ACSES—equipped trains receive the correct messages at each transponder upon new installation, modification, or any disarrangement of a transponder that would require a new programmed plug or require changing the programmed plug.
Test 28C.—To insure that ACSES—equipped trains receive the correct messages from the encoder at each interlocking through the MCP data radio upon new installation, modification, or any disarrangement of the encoder, wiring of the encoder, wiring of the encoder, or software in the encoder or MCP data radio.

Responsibility:
Test 28A.—Maintainer C&S.
Tests 28B & 28C.—Foreman C&S, Inspector C&S, Assistant Inspector Test, Maintainer C&S Test, Signal Inspector or Maintainer C&S.
 Records: Results of Test 28A shall be recorded on Form C&S 27. Results of Test 28B shall be recorded on Form C&S 27 in duplicate with one copy left in the house or case with the information sheet and hexadecimal bitmap for each transponder at that location, and a copy forwarded to the office of the Supervisor C&S. Results of Test 28C shall be recorded on Form C&S 27 in duplicate with one copy left in the house where the encoder is located with the information sheet and hexadecimal bitmap for each encoder at that location, and copy forwarded to the office of the Supervisor C&S.

Results: Any defects or discrepancies shall be noted on the test form and corrected immediately. If defects cannot be immediately corrected, the Supervisor C&S must be notified and arrangements must be made to make the corrections as soon as possible.

TEST 28A—ACSES TRANSPONDER INSPECTION

Frequency: At least once every three months.
 Inspection Procedure: Inspect all transponders adjacent to an insulated joint location to insure they are operative and in good condition. If the perimeter of any transponder is damaged so as to not properly protect the imbedded antenna loop, the transponder must be replaced.

TEST 28B—ACSES TRANSPONDER PLUG VERIFICATION

Frequency: Before a new or modified transponder and/or plug is placed in service, or when a damaged transponder is replaced.
 Procedure: 1. To insert a new or re-programmed plug into a transponder:
 a. Examine the label to insure that the plug for the right Railroad, Line, Location, Track, Transponder Position within the Set, Version, and CRC Number.
 b. When all of the above parameters have been verified, and with time on the track involved, insert the plug into the transponder.
 c. Place the Transponder Reader on the center of the transponder. Compare the hexadecimal bitmap on the Transponder Reader screen with the printed bitmap furnished by the Amtrak C&S Design office, line by line and character by character.
 d. If all characters read on the Transponder Reader screen match the corresponding characters on the bitmap furnished for the transponder, the plug is the correct one for that transponder.
 e. When all plugs in all transponders in the set have been verified, the track may be placed in service. Record this test on Form C&S 27 as Test 28B.I.

f. If any character(s) in the bitmaps do not match properly, the plug must be immediately removed from the transponder.

2. To change out a single transponder:

a. Remove the transponder to be replaced from the track structure and place it alongside the transponder which is to replace it, in a location close to the track structure where it was located. Insure that the old and new transponders are carefully isolated from all other transponders throughout this process.

b. Immediately remove the plug from the old transponder. Examine the label to insure that the plug shows the correct Railroad, Line, Location, Track Transponder Position within the Set, Version and CRC Number. If these parameters are correct, immediately insert the plug into the new transponder. Care must be exercised that this plug is kept isolated from all other plugs throughout this process.

c. Immediately place the new transponder, with the original plug for that transponder location, attaching the transponder to the track structure at that location.

d. If a, b, and c have been completed in sequence, with the responsible employee in constant attendance and involved only in this process, the track may be returned to service. Record this process on Form C&S 27 as successful completion of Test 28.13.2 for the transponder changed out.

e. If any doubt arises during the changeout process concerning the correct handling of the plug, the transponder must be tested with the Transponder Reader before returning the track to service for ACSES—equipped trains. Test 28B. I must be followed and recorded on Form C&S 27.

TEST 28C—ACSES ENCODER AND MCP DATA RADIO VERIFICATION

Frequency: Before a new encoder/data radio package is placed in service, when an encoder, or a radio is changed out, or when any wiring to an encoder is changed.

Procedure:

1. Examine the encoder, MCP data radio, antenna, coax cable and connectors to insure that all components of the system are in good operative condition.

2. Point check all wiring to the encoder to insure that all new or modified circuitry added to drive the encoder is installed exactly according to the authorized circuit plan.

3. Use the Data Radio Reader supplied by the manufacturer. Compare the hexadecimal bitmap displayed on the Data Radio Reader screen with the printed bitmap furnished for each aspect displayed on each signal at the interlocking being tested.

4. Line routes and shunt track circuits to display each signal aspect on each signal in the interlocking, comparing the bitmaps as outlined in 3 above. Record the results of the test on each signal on Form C&S 27.

Note: During the first two years of ACSES operation, the inspection and test results will be checked for any adjustments in the procedure or the frequencies.

Question. Please list all non-Amtrak railroads or commuter agencies that will need to be equipped with ACSES civil speed enforcement under FRA's mandate. Who is responsible for paying for the installment of these systems? Please describe any cost-sharing or reimbursement agreements.

Answer. The non-Amtrak railroads or commuter agencies that will have their locomotives equipped with the Advanced Civil Speed Enforcement System include the Massachusetts Bay Transportation Authority (MBTA), the Providence & Worcester Railroad Company (P&W), Connecticut DOT's Shoreline East service, and the CSX Transportation Company.

Amtrak is currently paying all costs associated with the installation of ACSES, at least at the outset. Amtrak believes the costs for ACSES should be paid by the federal government. The Federal Railroad Administration mandated the requirement for ACSES as a stipulation to allow operation of any passenger railroad trains in the New Haven to Boston territory where some trains would operate above 110 mph.

The costs for the infrastructure portion (or wayside) of the system were incorporated into the improvements to the north end infrastructure and paid by Amtrak. But the costs for computer control and telecommunications equipment on each train should be the responsibility of each operator using the Northeast Corridor.

In the interest of meeting the high-speed rail implementation schedules, Amtrak has been forced to fund the acquisition and installation of ACSES equipment for each operator listed above and to determine funding responsibility after the installation. Amtrak funded the installation of ACSES equipment on the High-speed trains sets and other Amtrak locomotives that will be providing Acela service.

Question. Does the trainset procurement delay have a domino effect on the implementation of high speed Acela services in fiscal year 2001, as well, because the trainset delivery schedule has been set back?

Answer. The implementation of service is driven by the contractor's delivery schedule, and yes, there is a "domino" effect. The Consortium's estimate for the delivery of trainsets is as follows: Trainset 1—July 2000; Trainset 20—March 2001; and Delivery rate is 2 to 3 trainsets per month.

Locomotive schedule: Locomotive 1—May 2000; Locomotive 15—October 2000; and Delivery rate is 2 or 4 locomotives per month.

Payment will be made as each unit is accepted.

Question. Last year, Amtrak testified that the budget result improvement in fiscal year 2000 due to implementation of high-speed service was projected to be \$150,000,000. The fiscal year 2002 improvement was project to be \$180,000,000. What are the financial effects of this delay on Amtrak's revenue projections for fiscal years 2000, 2001, and 2002?

Answer. Amtrak has identified the revenue impact in fiscal year 2000 to be \$156 million. The full financial impact for fiscal year 2001 is currently being assessed and will be determined upon finalization of the Acela Express phase-in and operating plans.

We anticipate that fiscal year 2002 will be the first full year of high-speed rail service in the NEC. It is in this fiscal year that the implementation of high-speed rail results in an incremental bottom line improvement of \$180 million. It is not expected that the delay continuing into 2001 will negatively impact fiscal year 2002, however this assumption will be further assessed in the upcoming budget cycle.

Question. How has the Corporation made up for the lost revenue due to the delay in implementing high-speed service in fiscal year 2000? How do you plan to make up for lost revenue due to the delay in 2001?

Answer. For Amtrak's fiscal year 2000, the passenger revenue shortfall resulting from the delay in the delivery of the new trainsets is estimated to be \$156 million. The budget gap created by this revenue shortfall was resolved by identifying measures that offset this deficit and was incorporated as part of the company's business plan.

These items include revenues associated with liquidated damages to be paid to Amtrak by the consortium pursuant to the contractual agreement between the two parties and equipment leasing transactions. Interest expense savings stemming from the late delivery of the new trainsets and operating cost savings for Acela Express due to the later implementation of the service are also included.

Similar measures will be employed to offset revenue shortfalls occurring in fiscal year 2001.

Question. What percentage of the trainset costs are "Made in America?" Please break out material and labor?

Answer. Pursuant to its Agreements for the design and manufacture of high-speed trainsets and high-horsepower locomotives, the "United States Content" of the trainsets and locomotives is required to be at least 67 percent and 63 percent respectively. These requirements exceed significantly the statutory requirements of both Amtrak's Domestic Buying Preferences, 49 USC Section 24305(f) and the Buy American Act, 41 USC Section 10a–10c. Amtrak will conduct a post delivery audit to determine the actual percentage of the United States content of the equipment. Such an audit will include a breakdown of appropriate labor and material costs. Each Agreement carries penalties for non-compliance. Moreover, as required by law, final assembly of the trainsets and locomotives is being performed in the United States.

Question. Please outline the construction schedule and related costs for the three high-speed maintenance facilities. Please describe the cost-sharing arrangements for the construction and operation of these maintenance facilities with Bombardier.

Answer. Amtrak issued a partial substantial completion for the Ivy City and Southampton Facilities in February 2000. Amtrak will issue substantial completion for Ivy City when the consortium completes the Wheel Diagnostic, Trainset Washer and Split Rail Systems. The consortium expects the Wheel Diagnostic and Trainset Washer to be completed by the end of May 2000. The Split Rail System for is expected to be completed by June 15, 2000. Amtrak will issue substantial completion for Southampton when the consortium completes the Split Rail System, estimated to be early June 2000. The consortium expects to present the Sunnyside Facility to Amtrak for substantial completion in late May 2000.

The Maintenance Facilities cost \$112 million. There are no cost sharing arrangements. Amtrak's contract with the Consortium is to design and construct the facilities. Amtrak's contract with the Consortium for Management Services requires the consortium to operate and maintain the Maintenance Facilities.

Question. Please describe the contractual penalty clauses that Bombardier is subject to regarding trainset delivery and maintenance. What level of recoveries have been made to date due to the delay in the trainset procurement? Given the current

rollout schedule, what total level of recoveries is Amtrak assuming in fiscal year 2000?

Answer. Amtrak's contract with the Bombardier-Alstom consortium for high-speed trainsets provides liquidated damages for late delivery. The relevant contractual provisions provide Amtrak with the right to obtain reimbursement or offset payments otherwise due the contractor with liquidated damages beginning at \$1,000 per day for each day an individual trainset is delayed and escalating to \$13,500 per day.

Amtrak's contract with Bombardier-Alstom for the management of maintenance services also contains various liquidated damages provisions relating to trainset availability, reliability, and performance. As service has not yet commenced, no liquidated damages have been incurred to date.

Question. Since Amtrak signed its procurement agreement with Bombardier in 1996, have any contract changes or change orders been made to the trainset and maintenance facility contract—either financial or technical in nature? Please describe these changes and when they were made.

Answer. In May of 1996, the original contract was signed for: 12 trainsets, 15 locomotives, 2 facilities.

September 1996—the Management Services option (trainset maintenance) portion of the Contract was exercised.

October 1997—an option was exercised for a facility at Sunnyside, NY, bringing the total to three.

December 1997—there was an interior change order adding the first class car, café car and the Acela image to the train interior and exterior.

March 1998—an option for six additional trainsets was exercised to bring the total number of trainsets on order to 18.

July 1998—an option for two additional trainsets was exercised, bringing the total number of trainsets to 20. The trainset simulator was upgraded to a full motion simulator.

The Trainset Contract had five minor change orders for the month of September 1997. These minor change orders consisted of items such as printer and refrigerator in the operating cabs and five pairs of coach seats for marketing purposes.

The Maintenance Facilities Contract had sixteen minor change orders from the period of July 1997 to November 1997. These minor change orders consisted of items such as the Split Rail System, Sanding System and Vacuum System.

There was one minor Maintenance Facility change order in July 1998 relating to the yardmaster office in Sunnyside.

There are several relatively minor changes under price negotiations.

SOUTH END CAPITAL NEEDS

Question. Please outline the Amtrak's Northeast Corridor South End short term plan (fiscal years 2001–2005) to address high priority rail infrastructure needs between New York and Washington, DC. Include a detailed cost sheet of major projects, sorted by benefit category (i.e., life safety/mandated, operational reliability, high-speed rail, shared benefit/capacity, and commuter/freight).

Answer. A copy of the South End Projects—Summary of Short Range Plan for fiscal years 2001–2005 is attached.

| Report Total | | 3,190.2 |

Question. Amtrak had proposed paying 50 percent of the costs associated with these improvements, and having commuters and freights pay the other 50 percent. What has the reception been from the commuters and freights to this split cost proposal? Please describe any project cost agreements that are negotiated at this time.

Answer. There has been no response from the commuter railroads or the freight railroads regarding the proposed cost sharing proposals. A presentation of the South End report to all South End stakeholders is planned for May 17 to discuss the contents, assumptions and further development of a jointly funded capital investment program for the South End of the Northeast Corridor.

Amtrak's intent is to define a process and enter negotiations with each carrier to develop the scope, schedule, budget and funding share for the next five years (fiscal year 2001-2005) and the longer range as well. The requirement to perform safety/mandated and operational reliability is central to the adequate delivery of existing services that affect all operators on the Corridor and the funding responsibility for these investments must be shared. Further improvements to maximize the potential of the South End from a travel time and capacity viewpoint are also needed and should be apportioned among the operators generally in proportion to the relative benefits that result. A combined funding and development plan is required to respond to these challenges.

The report incorporates the infrastructure improvements needed to meet all operators' future needs-Amtrak, commuter railroads and freight railroads. The infrastructure improvements (additional tracks, new interlockings, improved switches, etc.) to accommodate future operating plans were shared with the stakeholders. But the costs and funding assumptions had not been shared with stakeholders as noted

in the report. The challenge is to develop a five-year funding plan that will ensure safe, quality service delivery as well as develop the plan for infrastructure improvements needed for the future. The South End Plan is the first step in this process and will be periodically updated as agreements are reached or priorities change.

CSX TRACK CONDITION

Question. What Amtrak routes operate over CSX-owned track? Has Amtrak experienced track condition-related delays or slower running times? What are the Corporation's alternatives for redress when the condition of non-Amtrak owned track causes delays or even derailments?

Answer. CSX owns all or a portion of the trackage on the following routes: Orlando—Los Angeles/Washington—Chicago via Pittsburgh/Washington—Chicago via Charleston/New York—Chicago/Boston—Chicago/Chicago—Jeffersonville/Sanford—Lorton/Boston—Newport News/New York—Charlotte/Boston—Richmond/Chicago—Grand Rapids/New York City—Niagara Falls/New York City—St. Albans/New York City—Rutland/Washington—Albany/Syracuse/Schenectady/Washington—Boston via Springfield.

Particularly since CSX's merger with Conrail, Amtrak trains regularly experience delays and slower running times which result in late trains.

When freight railroad delays cause late trains, the freight railroad foregoes incentive payments it would otherwise earn from Amtrak for good on-time performance. If a freight railroad's on-time performance falls below 70 percent on a route in a given month (as measured based on exclusion of certain delays not within the railroad's control), the railroad is penalized. For example, during February 2000, CSX did not earn any of the \$1.65 million in on-time incentive payments it was eligible to earn, and was assessed penalties of \$46,557. In addition, virtually all of the operating agreements that Amtrak has negotiated with freight railroads require the railroad to maintain the rail lines over which Amtrak's trains operate to a "level of utility" that will enable those trains to operate at specified speeds and schedules. The CSX Agreement has such a provision, with exceptions for several "low density" segments of CSX rail lines. If a railroad fails to maintain the required level of utility, Amtrak can initiate an arbitration proceeding to obtain an order requiring the railroad to restore its tracks to the contractually mandated level. Where appropriate, Amtrak can also ask the arbitrators to award damages.

CATERING CONTRACT

Question. It has been one year since Amtrak commissaries were turned over to Dobbs International Services, which has a seven-year contract with Amtrak to provide food and beverage labor and management services for all Amtrak-operated intercity trains. In last year's record testimony, Amtrak estimated a net savings ranging from \$21,500,000 to \$28,100,000 over the length of the contract. What level of savings has been realized in the first year of this contract? Are you on track to realize savings over the life of the contract within the range estimated in last year's testimony?

Answer. Of the \$5.2 million net labor savings targeted in the first year of the contract, Amtrak has realized \$2.548 million through February 2000. Amtrak is ahead of the projected annual savings of \$5.21 million by \$0.377 million year-to-date. There was an additional savings in fiscal year 1999 of \$1.54 million as a result of funds budgeted but not spent for employee buyouts.

AMTRAK REVENUE SOURCES

Question. Please update the table on pages 225–226 of Senate hearing 106–221, showing the actual versus budgeted revenues for fiscal years 1998, 1999, and anticipated for 2000, including all revenue sources broken out by type.

Answer.

| | 1998 | | 1999 | | 2000 | |
|--------------------|---------|---------|---------|---------|------------------------|---------|
| | Actual | Budget | Actual | Budget | Fore-cast ¹ | Budget |

Question. Please update the table on page 226 of last year's hearing record that breaks out commuter service revenue by route location for fiscal years 1998, 1999, and anticipated for 2000.

Answer. The following schedule shows the breakout of commuter services revenues by SBU by commuter agency:

[In millions of dollars]

| | Fiscal years | | |
|--|----------------|----------------|----------------|
| | 1998 Actual | 1999 Actual | 2000 Actual |
| Mass. Bay Transportation Authority (MBTA) | 154 | 164 | 165 |
| Connecticut Dept. of Transportation (CDOT) | 5 | 6 | 5 |
| Maryland Dept. of Transportation (MARC) | 18 | 18 | 19 |
| Virginia Railway Express (VRE) | 8 | 10 | 11 |
| Total NEC Commuter | 186 | 198 | 200 |
| Metrolink Commuter Rail Service | 27 | 16 | 17 |
| Caltrain Commuter Service | 37 | 40 | 41 |
| Coaster Commuter Service | 7 | 7 | 7 |
| Total West Commuter Service | 71 | 83 | 65 |
| Total Commuter Revenue | 257 | 281 | 265 |

The figures for 1998 above do include the Florida Fun Train for which Amtrak earned \$4 million in revenue in that year. The train service was terminated after that.

Question. Please update the table on pages 226–227 of last year's hearing record that lists the Corporation's rent and retail locations, amount of space, and associated income in fiscal years 1998, 1999, and projected for fiscal year 2000. Are all of Amtrak's commercial and retail development assets on the Northeast Corridor?

Answer.

AMTRAK NORTHEAST CORRIDOR COMMERCIAL DEVELOPMENT DEPARTMENT

[In thousands of dollars]

| Revenue category | Fiscal year | |
|--------------------------|-----------------------|----------------------------|
| | 1999 Actual | 2000 Forecast ¹ |
| Real Estate | ² 2,536.4 | ³ 1,800.0 |
| Retail | ⁴ 7,952.5 | ⁴ 7,700.0 |
| Telephones | 476.6 | 400.0 |
| Pipe & Wire | 3,609.0 | 3,900.0 |
| Parking | 4,150.9 | 4,000.0 |
| Advertising | 3,108.4 | 3,000.0 |
| Telecommunications | ⁵ 25,463.0 | ⁶ 19,200.0 |
| Other | ⁷ 15,810.8 | |
| Total | 63,107.6 | 40,000.0 |

¹ Actuals through February and forecast March through September.

² Includes: \$1,280.0 one-time revenue events (i.e. property sales).

³ Includes: \$575.0 one-time revenue events (i.e. property sales).

⁴ Includes: All Amtrak owned NEC Stations.

⁵ Includes: \$4,800.0 flagging protection and \$900.0 one-time payments.

⁶Includes: \$1,250.0 flagging protection and \$3,800.0 one-time payments.

⁷Includes: \$14,100.0 Providence Sale, \$1,300.0 MA Condemnation, \$350.0 32nd Street Sale.

No. Amtrak does have commercial and retail development assets off of the North-east Corridor.

Question. Please update the table on page 227 of last year's hearing record showing the actual and estimated income from express freight and mail service for fiscal years 1999 through 2002.

Answer. [Information follows]

[In Millions of dollars]

| | Fiscal year | | | |
|---------------|-------------------|-------|-------|-------|
| | 1999 ¹ | 2000 | 2001 | 2002 |
| Mail | 80.6 | 103.8 | 114.5 | 118.2 |
| Express | 17.2 | 72.2 | 78.0 | 99.5 |
| Total | 97.8 | 176.0 | 192.5 | 217.7 |

Question. For fiscal years 1998, 1999, and anticipated through 2000, please break-out the level of state support by State, with totals for each year.

Answer.

[In millions of dollars]

| | Fiscal year | | |
|---|-------------|-------|-------|
| | 1998 | 1999 | 2000 |
| Total operating subsidies from States | 82.6 | 99.9 | 112.2 |
| Total Capital subsidies from States | 107.6 | 302.9 | 218.5 |
| Grand total | 190.2 | 402.8 | 330.7 |

AMTRAK CONTRACTS WITH FREIGHT RAILROADS

Question. Please describe all contracts between Amtrak and the freights wherein the Corporation makes payments on a contractual or incentive basis. Prepare a table that breaks out the types of payments and the amount paid, by freight railroad and total, for fiscal years 1997, 1998, and 1999, and projected for 2000.

Answer. Based upon 49 United States Code 24101, et. Seq. (the Rail Passenger Service Act, as amended) and as otherwise agreed by the parties, Amtrak's agreements with the freight railroads spell out both Amtrak's and the railroad's rights and obligations, provide for payment for the railroad's incremental costs, and includes an incentive provision to allow the railroads to earn payments above incremental costs for quality service measured by on-time performance. Payments for the fiscal years 1997, 1998, and 1999 and projected payments for 2000 are attached.

AMTRAK'S PAYMENTS TO RAILROADS¹

[Fiscal year 1999]

| | Cost reimburse- ment | Incentives earned | Total payment |
|-------------------------------------|-------------------------|----------------------|---------------|
| Railroads with incentive contracts: | | | |
| BNSF | \$16,190,206 | \$12,231,404 | \$28,421,610 |
| CN—Grand Trunk | 307,716 | | 307,716 |
| CN—Illinois Central | 2,452,508 | 1,118,038 | 3,570,546 |
| CP—D&H | 534,121 | 405,110 | 939,231 |
| CP—Soo Line | 1,407,621 | 722,232 | 2,129,853 |
| CSX | 13,520,071 | 3,002,421 | 16,522,492 |

| All Railroads | 75,003,487 | | 98,782,232 |

¹ Based on today's railroads after mergers.

Question. Please update the information on page 232 of last year's hearing record describing all contracts between Amtrak and freight railroads wherein freights are given access to routes over Amtrak-owned tracks. What are the most recent payment levels from freight railroads?

Answer. Freight service is provided over the rail lines in the Northeast and Michigan that Amtrak acquired in connection with Conrail's formation in 1976 pursuant to trackage rights that were granted to freight railroads at the same time. Certain of these rights have subsequently been transferred to other railroads, most recently as a result of the division of Conrail's rights between Norfolk Southern and CSXT during 1999.

The terms of these rights are set forth in various agreements between Amtrak and the freight railroads. The compensation Amtrak receives under these agreements is for the most part based upon the number of car miles (one freight car travelling one mile) that the railroads operate over Amtrak-owned lines.

The following is a summary of the rights covered by these agreements. Certain of these rights, including all of Delaware & Hudson's rights, were not exercised during 1999.

- Norfolk Southern has rights between New York, NY, and Washington, DC; Philadelphia, PA, and Harrisburg, PA; and Kalamazoo, MI, and Michigan City, IN.
- CSXT has rights between New Rochelle, NY, and Washington, DC, and over certain trackage in Southern Connecticut.
- Conrail has retained rights to provide local service on behalf of Norfolk Southern and CSXT between Newark, NJ, and Philadelphia, PA.
- Delaware & Hudson Railway, a subsidiary of Canadian Pacific Railway, has rights between Perryville, MD, and Washington, DC, and over short track segments in New York, NY, Philadelphia, PA, and Harrisburg, PA.
- Springfield Terminal Railway, a subsidiary of Guilford Rail System, has rights between New Haven, CT, and Springfield, MA.
- Providence & Worcester Railroad has rights over certain Amtrak-owned lines in southern Connecticut, Rhode Island, and near New Rochelle, NY.
- Connecticut Southern Railroad has rights between New Haven, CT, and Springfield, MA.

Freight Railroad Payments for fiscal year 1999 Operations

| | |
|------------------------|--------------|
| Conrail | \$11,180,222 |
| Norfolk Southern | 5,523,868 |

Freight Railroad Payments for fiscal year 1999 Operations—Continued

| | |
|------------------------------|-------------------|
| Connecticut Southern | 1,285,378 |
| CSXT | 221,226 |
| Providence & Worcester | 167,509 |
| Springfield Terminal | 127,304 |
| Total | 18,505,507 |

Certain of the above payments have not yet been made, and the dollar amounts shown are subject to audit.

RIDERSHIP AND EMPLOYMENT BY STATE

Question. Please provide a breakdown of fiscal year 1999 Amtrak ridership by State, as well as the number of residents employed directly by Amtrak in each State.

Answer.

| State | Boardings | Alightings | Total | Employees |
|----------------------|-----------|------------|-----------|-----------|
| Alabama | 26,052 | 25,152 | 51,204 | 26 |
| Arkansas | 8,442 | 8,767 | 17,209 | 28 |
| Arizona | 45,023 | 46,177 | 91,200 | 23 |
| California | 3,258,809 | 3,248,256 | 6,507,065 | 3,490 |
| Colorado | 132,461 | 130,146 | 262,607 | 90 |
| Connecticut | 434,360 | 450,500 | 884,860 | 751 |

| Illinois | 1,442,702 | 1,436,791 | 2,879,493 | 2,066 |
| Indiana | 55,507 | 59,688 | 115,195 | 1,232 |
| Kansas | 17,829 | 18,127 | 35,956 | 21 |
| Kentucky | 5,289 | 4,982 | 10,271 | 3 |
| Louisiana | 95,507 | 96,825 | 192,332 | 338 |
| Massachusetts | 589,063 | 563,646 | 1,152,709 | 2,299 |
| Maryland | 820,280 | 813,379 | 1,633,659 | 2,494 |
| Maine | | | | 16 |
| Michigan | 293,593 | 292,166 | 585,759 | 155 |
| Minnesota | 78,264 | 79,604 | 157,868 | 77 |
| Missouri | 230,291 | 230,751 | 461,042 | 96 |
| Mississippi | 45,198 | 46,783 | 91,981 | 57 |
| Montana | 65,245 | 66,086 | 131,331 | 48 |
| North Carolina | 262,395 | 259,713 | 522,108 | 132 |
| North Dakota | 40,841 | 41,016 | 81,857 | 12 |
| Nebraska | 20,969 | 21,492 | 42,461 | 17 |
| New Hampshire | 888 | 933 | 1,821 | 166 |
| New Jersey | 1,747,445 | 1,750,297 | 3,497,742 | 1,724 |
| New Mexico | 51,807 | 51,304 | 103,111 | 62 |
| Nevada | 42,106 | 51,118 | 93,224 | 31 |
| New York | 4,709,895 | 4,687,881 | 9,397,776 | 2,064 |
| Ohio | 85,007 | 84,795 | 169,802 | 68 |
| Oklahoma | 14,601 | 13,816 | 28,417 | 3 |
| Oregon | 304,671 | 303,109 | 607,780 | 73 |
| Pennsylvania | 2,338,445 | 2,338,083 | 4,676,528 | 3,120 |
| Rhode Island | 181,274 | 188,963 | 370,237 | 399 |
| South Carolina | 91,800 | 90,929 | 182,729 | 53 |
| Tennessee | 22,220 | 22,335 | 44,555 | 14 |
| Texas | 84,718 | 83,463 | 168,181 | 180 |
| Utah | 16,694 | 17,871 | 34,565 | 45 |
| Virginia | 467,711 | 468,950 | 889,162 | 792 |

| State | Boardings | Alightings | Total | Employees |
|---------------------------|------------|------------|-------------------------|-----------|
| Vermont | 48,927 | 51,073 | 100,000 | 12 |
| Washington | 467,711 | 468,950 | 936,661 | 428 |
| Wisconsin | 250,670 | 250,011 | 500,681 | 79 |
| West Virginia | 18,479 | 19,859 | 38,338 | 32 |
| United States Total | 21,386,663 | 21,379,538 | ¹ 42,766,201 | 25,326 |

¹The above figure represents total boardings and alightings in the United States. Since each trip contains two endpoints, total ridership is equal to half of total boardings and alightings.

STATION RENOVATION

Question. Please update the tables on pages 234 and 235 of last year's hearing record, providing data on station renovation costs for fiscal years 1999, 2000, and planned for fiscal year 2001.

Answer. [Information for fiscal years 1999 and 2000 is attached.] The fiscal year 2001 Capital Budget is currently under development and therefore no specific information relating to station renovation costs have been included.

FISCAL YEAR 1999 STATION RENOVATIONS

| Station | Amtrak | Funding other | Total |

FISCAL YEAR 2000 CAPITAL INVESTMENT

Question. The Federal Railroad Administration was appropriated \$3,000,000 in fiscal year 2000 for the Michigan high-speed positive train control project (a joint FRA/Amtrak/Michigan DOT and Harmon Industries project). What level of funding

for this project is provided by each of the four partners for fiscal years 1999, 2000, and projected for 2001? Is the project on track for completion in May 2001?

Answer. Attached is the funding allocation matrix for the complete Michigan High-Speed Positive Train Control Project. The designated fiscal years are actually based on the FRA funding granted to the project. Funding agreements are in place through Phase 5 between the FRA and Michigan DOT and Michigan DOT and Amtrak.

All funding agreements for Phase 5 (FRA fiscal year 1999 funding and Amtrak fiscal year 2000 capital funding) indicate that Amtrak's contribution to the project will be supplemented by \$1 million. However, during Amtrak's fiscal year 2000 capital authorization process, only \$900,000 was authorized, resulting in a shortfall of \$100,000. The FRA and Michigan DOT agreement and the Michigan DOT and Amtrak agreement indicate the funding level of \$1 million by Amtrak. These agreements will require that Amtrak fund the shortfall.

Michigan DOT has submitted a grant application to the FRA for the Phase 6 (fiscal year 2000) funding grant in the amount of \$3 million. Once the FRA and Michigan DOT have executed the funding agreement for the FRA fiscal year 2000 funding, Michigan DOT and Amtrak will execute the funding agreement for the supplemental monies.

Based on the FRA funding grant and the Michigan DOT and Amtrak Agreement, the project completion date was extended as follows: Project Completion: August 2001; Final Report Due: December 2001.

Phase 1 of ITCS (Incremental Train Control System) revenue service implementation commenced on March 20, 2000 at 12:01 a.m./ET.

| Funding | Percentage | Phase | | | | | | Total |
|--|---------------|-------------------|------------------|------------------|--------------|-----------------------|-----------------------|-------------------|
| | | 1 | 2 | 3 | 4 | 5—Fiscal year 1999 | 6—Fiscal year 2000 | |
| FULL FUNDING COMMITMENT & PLAN: | | | | | | | | |

TALGO TRAINSETS

Question. Has FRA issued a final rule regarding railroad passenger car safety equipment? What are the potential implications for the use of Talgo equipment in the United States if the rulemaking is promulgated in the same form as the September 1997 proposed rule?

Answer. The final FRA rule regarding railroad passenger equipment safety was published in May 1999. The regulations established a procedure for obtaining permanent permission to operate equipment that did not meet the newly promulgated buff strength requirements, and allowed continued operation pending action by FRA on requests for relief. Pursuant to those provisions of the final rule, Amtrak petitioned the FRA for permanent permission to continue operating (i.e., "grandfathering") five Talgo trainsets which were already built and in operation at the time the final rule was issued. Four of those trainsets currently operate in the Pacific Northwest Corridor; one trainset will be used for Amtrak's Las Vegas Service. Amtrak's grandfathering petition is still pending before the FRA. Because the final rule called for a May 8, 2000 deadline for operation of non-compliant equipment, and it does not appear that FRA will make a determination by the May 8 deadline, Amtrak has submitted a separate waiver petition requesting extension of the May 8 deadline in order to continue to operate the Talgo trainsets pending final action by FRA on our grandfathering petition. Amtrak's request for extension is currently pending.

Question. What level of investment has Amtrak made or is Amtrak planning to make in the Talgo leases for the Northwest Seattle to Vancouver corridor and for the Los Angeles to Las Vegas service?

Answer.

Pacific Northwest Corridor.—Currently, Amtrak owns one Talgo trainset and leases a second Talgo trainset for Amtrak's Pacific Northwest Corridor operations. The Washington State Department of Transportation owns two Talgo trainsets used in this service. Lease payments on the trainset leased by Amtrak are \$175,000 per month. All lease payments made by Amtrak for the leased trainset will be applied to the purchase price of the trainset if the Secretary of the U.S. Department of Transportation grants Amtrak's pending request for a waiver of the requirements of 49 U.S.C. 24305(f) (Amtrak's Buy America requirements). The purchase price for the leased trainset is \$11,124,000.

Los Angeles to Las Vegas Service.—Amtrak has entered into a lease agreement with Talgo for one Talgo trainset to be operated in the Los Angeles to Las Vegas Service for up to four (4) years. The lease payments for the trainset, which are not to be paid until the service begins, will be as follows: Year 1—\$700,000; Year 2—\$1.2 million; Year 3—\$1.2 million; and Year 4—\$1.2 million.

Question. Last year Amtrak testified for the record that Los Angeles-Las Vegas service could start as early as the first quarter of fiscal year 2000. Has this service been inaugurated? If not, what has slowed down the initiation of this service and when will it begin?

Answer. Amtrak held a ceremony for the Los Angeles-Las Vegas service on December 14, 1999. Amtrak has announced that service is expected to begin this fall.

In November, 1999, Amtrak signed an agreement with the Union Pacific Railroad to construct about 20 miles of double track to ensure a competitive run time. The contract allowed for up to 12 months to complete construction. However, the Union Pacific has encountered delays related to obtaining the necessary environmental permits for construction of the 20 miles of double tracking and the twelve month time frame for construction has been delayed. Amtrak has retained the services of an attorney to assist the Union Pacific with obtaining the permits. We are confident that the necessary permits can be obtained and construction can be completed with few additional delays. While Amtrak plans to run special trains prior to the initiation of regular service, we are hopeful that the service will begin regular revenue service by the end of the year.

Question. Are the cost sharing arrangements for the operation of the Los Angeles to Las Vegas Talgo service which were described in last year's hearing record still in place?

Answer. Operating funds for the service will come from four primary areas: passenger revenues, gaming partners, state support and marketing partners. The State of Nevada has allocated \$2 million in Congestion Mitigation and Air Quality funds to support operating costs for the start-up of the service. We are aggressively pursuing partnerships with gaming properties. While the delay in service and transferring ownerships have postponed the commitment of the properties who had previously signed letters of intent to pre-purchase seats, Amtrak continues to discuss a host of partnership agreements with specific gaming properties.

Seat purchase negotiations continue with RIO Hotel and Suites as well as other key Las Vegas properties. The Las Vegas Convention and Visitors Authority remains committed to cooperative marketing programs. A local firm, FFE Advertising, has also been retained for sales for onboard advertising as a way to supplement the cost of the service and revenue is already being generated through this program.

The combination of public and private funding—working with gaming and resort properties, state elected officials and transportation agencies and the railroads has created a business partnership unlike any other in current Amtrak service.

Question. Please describe the capitalization issues that must be resolved to make this service possible. What level of cooperation and investment is being made by Union Pacific Railroad? What level of capital support has Amtrak committed (in fiscal years 1999 and 2000)?

Answer. Amtrak and the Union Pacific Railroad have agreed to provide \$28 million of capital improvements prior to commencement of service. Amtrak has agreed to fund half of that amount—\$14 million—for the two-year demonstration period. If service continues beyond two years, Amtrak will provide the balance of those funds. The first \$14 million is provided by \$9 million of Taxpayer Relief Act funds and \$5 million of federal funds secured in the 1999 Appropriations Omnibus bill. Amtrak is also funding the construction of a new platform near the Strip.

CAPITAL NEEDS BEYOND FISCAL YEAR 2002

Question. On an annual basis, approximately what level of capital funding from federal sources will Amtrak require beyond the end of fiscal year 2002? This question was not answered satisfactorily in last year's hearing record.

Answer. Amtrak is currently in the process of developing a long-term capital plan as part of its fiscal year 2001 strategic planning process. The capital plan will incorporate the funding required to maintain basic operations, to address state-of-good-repair needs, to take advantage of market opportunities that exist today for the national network, to develop high-speed corridors across the country and to address excess RRTA requirements. Federal funding would be used to support debt service, life/safety, operational reliability, equipment overhaul and reflecting, infrastructure, state-of-good-repair, high-speed corridor development and other capital investment needs. The long-term capital program and budget will be included in Amtrak's fiscal year 2001 business plan, issued in the fall of this year, the annual value of which will be greater than \$521 million.

BMW LABOR COSTS AND CARRY-THROUGH TO OTHER UNIONS

Question. Have Amtrak's other unions used the BMW agreement as a blueprint? Which unions have reached agreement? What are the costs are associated with these other agreements?

Answer. We have concluded negotiations with all of our bargaining units for the round of bargaining that began in 1995. The BMW labor agreement set a conceptual framework that has been followed in our subsequent labor agreements. Our agreements contained wage packages valued at approximately 90 percent of those reached nationally by the freight railroads. Additionally, wage increases will be offset by productivity, work rule and/or other wage changes. Through fiscal year 1999 these savings have amounted to about \$22.5 million. Preliminary results for the first quarter of fiscal year 2000 show we will reach or exceed our goal of \$26 million this year. Additionally about \$4 million of the increased wage cost will be paid on reimbursable accounts. Projections show the increased cost of the new agreements will be about \$260 million.

QUESTIONS SUBMITTED TO THE FEDERAL MOTOR CARRIER SAFETY ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

STAFFING LEVELS

Question. Please provide a table that delineates the current fiscal year 2000 and proposed fiscal year 2001 staffing levels by office, and break down the allocation by state and resource center.

Answer.

| | Fiscal years— | |
|---|---------------|------------|
| | 2000 | 2001 |

FEDERAL INSPECTORS

Question. What are the relative tradeoffs of increasing the number of federal inspectors at the border in fiscal year 2001 versus assigning those additional positions to other areas of the country based solely on safety risks and number of motor carriers?

Answer. The out-of-service rate for Mexican domiciled vehicles at the border is 39 percent compared to the national average of 25 percent. Even though the border rate is an improvement over past years, it remains substantially higher than the national average. The Federal inspectors assigned at the border were specifically hired to augment the state enforcement presence already there to increase enforcement and compliance activities and address border safety concerns. To continue to address these safety concerns, we plan to increase the Federal inspection presence at the border from 40 to 60 inspectors. As the states' safety inspection facilities become operational and fully staffed within the next 5 to 7 years, the Federal presence at the border will be decreased and inspectors will be reassigned to other respon-

sibilities. At this time, assigning the Federal inspectors to other areas is not possible without compromising safety along the southern border.

TRUCK AND BUS SAFETY

Question. How does FMCSA propose to address each of the findings and recommendations specified in the recent IG and GAO reports which pertain to the effectiveness of the federal truck and bus safety programs.

Answer. Provided below are the recommendations from the 1999 IG and GAO motor carrier safety reports and the status of actions taken by FMCSA.

IG Recommendation A1.—Strengthen its enforcement policy by establishing written policy and operating procedures to take enforcement action against motor carriers with repeat violations of the same acute or critical regulation. Strong enforcement actions would include assessing fines at the statutory maximum amount, the issuance of compliance orders, not negotiating reduced assessments, and when necessary, placing motor carriers out of service.

Status.—Enforcement guidance was issued in April 1999 and June 1999 which doubles the number of compliance reviews performed by safety specialists and increases penalties as provided in TEA-21. The Federal Motor Carrier Safety Administration (FMCSA) established a repeat violators policy and a limitation on negotiated settlements except in unusual circumstances in June 1999. FMCSA issued an NPRM in August 1999 to implement the TEA-21 shutdown authority and expects to complete a final rule by Fall 2000. At that time, new policy guidelines will be issued to FMCSA field staff to ensure shutdown procedures are utilized to the fullest extent. In the interim, the agency will follow current procedures on compliance orders and out-of-service orders. The enforcement manual identifies when out-of-service orders are used, penalties, hearing procedures, and appeal rights. Out-of-service orders are prepared by the legal staff in the Regional Service Centers, based on the evidence collected by the field investigator and are signed by the Area Administrator. The orders are prepared case-by-case, each case is based on legal precedent and preparation of the order is specific to the case. Compliance order directions are also contained in our enforcement manual. A limited number of senior enforcement staff at the Regional Service Center have the responsibility for preparing the compliance orders. These officials are well versed in preparing and issuing compliance orders. The FMCSA expects to publish a final rule requiring motor carriers determined to be unfit to correct safety problems within 60 days or face a shutdown. This requirement will provide the FMCSA with its strongest enforcement tool yet.

IG Recommendation A2.—Remove all administrative minimum fines placed in the Uniform Fine Assessment (UFA) program and increase the maximum fines to the level authorized by TEA-21.

Status.—Congressional direction set in Section 222 of the Motor Carrier Safety Improvement Act (MCSIA) of 1999 recommends that the Secretary establish minimum and maximum civil penalties for violations where there are repeated violations or a pattern of violations of critical or acute regulations. A study of the effectiveness of penalty provisions is also required by the Act. FMCSA will begin the study in fiscal year 2001 and a report to Congress will be prepared by September 30, 2002. Guidance was issued in June 1999 that updates the UFA model with the TEA-21 fine schedule, including progressive sanctions for repeat violators.

IG Recommendation A3.—Establish stiffer fines that cannot be considered a cost of doing business and, if necessary, seek appropriate legislation raising statutory penalty ceilings.

Status.—Completed. FMCSA updated the Uniform Fine Assessment model with the TEA-21 fine schedule and set progressive sanctions for repeat violators with an effort to obtain settlement for the full amount of the assessment. Guidance was issued to FMCSA field offices in June 1999 to establish a repeat violators fine policy and to limit negotiated fines settlements. FMCSA continues to monitor the appropriateness of fine levels. The average fine settlement has now increased from \$3,650 in 1998 (as calculated by FMCSA) to \$4,479 in the first quarter of fiscal year 2000. The difference between the average amount claimed for enforcement cases compared to average settlement was 17 percent in fiscal year 1998. The difference between these two figures is now only 3 percent, demonstrating the effectiveness of the FMCSA policy limiting negotiated settlements.

IG Recommendation A4.—Implement a procedure that removes the operating authority from motor carriers that fail to pay civil penalties within 90 days after final orders are issued or settlement agreements are completed.

Status.—Section 206 of the MCSIA of 1999 includes authority to take strong sanctions, including removing operating authority, against carriers that fail to pay civil

finer. The statute established a deadline of December 9, 2000 to issue regulations by implementing this provision.

IG Recommendation A5.—Establish criteria for determining when a motor carrier poses an imminent hazard.

Status.—Section 208 of the MCSIA of 1999 revises the definition of imminent hazard. A rulemaking to implement this provision will be issued by summer 2001.

IG Recommendation A6.—Require follow-up visit and monitoring of those motor carriers with a less-than satisfactory safety rating, at varying intervals, to ensure that safety improvements are sustained or, if safety has deteriorated, that appropriate sanctions are invoked.

Status.—FMCSA enforcement policy is to target high-risk carriers for enforcement. The Agency employs the Safety Status Measurement System (SAFESTAT), using motor carrier crash, roadside inspection and compliance review data to target carriers for review. Given limited staff resources, we believe this is the most effective safety strategy. At present, follow-up is required only on carriers with enforcement actions. Current policies dictate that enforcement follow-ups must be recorded, tracked, and prioritized and the manner of handling follow-ups must be documented. FMCSA has calculated the resource requirements to conduct follow-up visits with all motor carriers receiving less-than-satisfactory ratings. Our estimate is that 31 additional Safety Investigators will be required to meet this requirement. If current staff resources were diverted to meet this requirement, we estimate that 1,500 fewer compliance reviews would be performed annually.

In the near future carriers with unsatisfactory safety ratings will be subject to shutdown orders under a TEA-21 rulemaking requirement. The final rule is under Departmental review and concurrence. The FMCSA will issue a full operational policy, including follow-up provisions, in advance of implementation of the rule, which will become effective 90 days after its publication in the Federal register.

The agency's priority program is the nationwide implementation of the Performance and Registration Information Systems Management (PRISM) program. A key component of PRISM is the Motor Carrier Safety Improvement Process (MCSIP). The MCSIP tracks high-risk carriers through compliance reviews and applies progressive sanctions, if safety improvements are not made. An eight month follow-up is required for those carriers with an enforcement case. Additional funding was requested by the Administration to rapidly expand PRISM. In addition, carriers with unsatisfactory safety ratings will be subject to shutdown orders under TEA-21.

IG Recommendation A7.—Establish a control mechanism that requires written justification by the FMCSA State Director when compliance reviews of high-risk carriers are not performed.

Status.—Completed. Consistent with FMCSA policy to focus enforcement on problem carriers, each State Director is expected to complete reviews on all high-risk carriers identified by semi-annual reports. An eight month follow-up review is required for those carriers with an enforcement case. A review may not be performed if the carrier has been subject to a review within the previous 12 months. If a review is not performed on a high-risk carrier, the Director must have evidence of corrective action taken by the motor carrier. Completion of compliance reviews on all high-risk carriers is monitored by FMCSA headquarters.

IG Recommendation A8.—Establish a written policy and operating procedures that identify criteria and time frames for closing all enforcement cases, including the current backlog.

Status.—Enforcement guidance has been issued on closing the backlog of enforcement cases. To date, FMCSA has reduced the overall backlog by over 86 percent to 138 cases U.S. carriers and 43 foreign cases. Written procedures for closing routine enforcement cases are described in the FMCSA enforcement manual. The agency will reaffirm these procedures with its field staff.

IG Recommendation B1.—Require applicants requesting operating authority to provide the number of commercial vehicles they operate and the number of drivers they employ and require all motor carriers to periodically update this information.

Status.—FMCSA requires applicants for operating authority to submit a Motor Carrier Identification Report, Form MCS-150, which captures vehicle and driver data. Section 217 of the MCSIA of 1999 requires that motor carriers update their motor carrier identification report one year from enactment. FMCSA is proposing to update the motor carrier census by the statutory deadline of December 9, 2000 and require periodic updates of the information. Also, to ensure that the information is updated periodically, FMCSA is implementing the PRISM program. States participating in PRISM require carriers to update their MC-150 annually when their commercial vehicles are registered.

IG Recommendation B2.—Revise the grant formula and provide incentives through the Motor Carrier Safety Assistance Program grants for those states that

continue to report accurate, complete and timely commercial vehicle crash reports, vehicle and driver inspection reports, and traffic violation data.

Status.—FMCSA issued the March 1999 MCSAP Notice of Proposed Rulemaking including incentive funding to encourage states to meet the target deadlines for reporting accurate, complete, and timely data. The final MCSAP rule is now in Departmental review.

IG Recommendation B3.—Withhold funds from the Motor Carrier Safety Assistance Program (MCSAP) grants for those states that continue to report inaccurate, incomplete, and untimely commercial vehicle crash data, vehicle and driver inspection data, and traffic violation data within a reasonable notification period, such as one year.

Status.—FMCSA is using incentive funding in the MCSAP program as a means of prompting states to improve the timeliness and completeness of commercial vehicle reports. In addition, FMCSA has targeted for assistance through its Division offices a number of states with the most significant data collection problems. The agency is concerned that taking MCSAP funds from states with data problems may lead to reduced levels of enforcement by the affected jurisdictions. This could have the unintended consequence of diminishing safety without improving state data collection. Studies identifying states with crash reporting problems have been completed. In fiscal year 1999, 15 of the states received special MCSAP grants to improve data collection and reporting. All states are eligible for the grants. All states participating in the MCSAP have submitted crash data improvement plans. The agency will continue to work with the states and state enforcement organizations to improve data collection.

IG Recommendation B4.—Initiate a program to train local enforcement agencies for reporting of crash and roadside inspection data, including associated traffic violations.

Status.—FMCSA has been working with the state of Minnesota to create a crash investigation course for police to improve crash investigation data collection. The course has now been expanded to include training at facilities in Florida year-round. FMCSA will offer the course more broadly in fiscal year 2000. Courses directed at MCSAP personnel in reporting crash and inspection data are open to local enforcement agencies, space permitting. Several MCSAP agencies have local government sub-grantees. These local jurisdictions must meet the same standards for roadside inspection and crash data reporting imposed on the state. The agency has been working with the Commercial Vehicle Safety Alliance to persuade local governments to participate in motor carrier safety programs, while ensuring that standards for data quality and reporting are met.

IG Recommendation B5.—Standardize OMC (now FMCSA) and NHTSA crash data requirements, crash data collection procedures, and reports.

Status.—FMCSA and NHTSA have been working together along with organizations representing state safety agencies for several years to standardize a core set of data elements that each state should include on their police crash reports. The effort is a cooperative one with NHTSA, the National Association of Governor Highway Safety Representatives, American Automobile Association, International Association of Chiefs of Police, the Commercial Vehicle Safety Alliance and others. These criteria cover all crash reports, including trucks and commercial passenger vehicles. This effort, the Model Minimum Uniform Crash Criteria, would enhance crash data quality for both FMCSA and NHTSA. The agency will continue to work with these organizations to promote adoption of the criteria, which is voluntary.

IG Recommendation B6.—Obtain and analyze crash causes and fault data as a result of comprehensive crash evaluations to identify safety improvements.

Status.—FMCSA and NHTSA have an interagency agreement to conduct a large truck crash causation study within the framework of the NHTSA National Automotive Sampling System. This effort will collect detailed crash data on a sample of serious large truck crashes and build a crash causation data base. The crash causation study is required under Section 224 of the MCSIA of 1999. Data collection methods and forms are now in development and crash data investigations will begin in four pilot sites in June 2000. The four pilot programs are in: Philadelphia, Pennsylvania; Charles and Prince Georges Counties, Maryland; Chicago, Illinois; and Yuma and La Paz Counties, Arizona.

GAO Recommendations.—The GAO recommended in their 1999 report on the motor carrier program that the Department prioritize the activities in the Agency's draft safety action plan according to their potential for reducing the number of crashes and deaths and, to ensure that the activities are completed in a timely manner, only undertake those that the Office is reasonably sure it can complete within available budgetary and human resources.

Status.—The final Safety Action Plan completed in February 2000 is a statement of the Agency's top priorities for the next three years. Within the Plan, the highest priority is assigned to strengthening targeted enforcement, completing important rulemakings, improving safety information and technology, and increasing safety awareness. Over three quarters of the actions included in the Plan are required by law in appropriations legislation, the MCSIA, TEA-21, or other laws. The Plan sets out only a subset of the agency's overall activities. Many research projects and rulemakings that are underway have not been included. Taken together the actions in the plan will materially contribute to the 50 percent fatality reduction goal Secretary Slater has set for our agency. The Department of Transportation has recommended increases in FMCSA funding and personnel levels in the fiscal year 2001 budget, and we believe these are appropriate and adequate to carry out the Plan in the near term. We believe achieving the goal will be the result of the aggregation of our efforts in targeted enforcement, data improvements, new technology, safety awareness, and strengthening equipment and operating standards along with the concerted efforts of all segments within the motor carrier industry and safety community.

MCSIA

Question. Please describe how your budget request addresses each of the new responsibilities specified in the Motor Carrier Safety Improvement Act of 1999 (MCSIA).

Answer. MCSIA requirements to establish the FMCSA are included in the proposed fiscal year 2001 budget. Both staffing and support services necessary to operate independently in fiscal year 2001 are included as part of the requested \$92,194,000. The \$65 million of increased MCSAP funding provides \$5 million for the crash causation study and \$5 million for information systems and the remaining \$55 million will be distributed similarly to the \$100 million in fiscal year 2001 MCSAP funding provided in TEA-21. The proposed fiscal year 2001 budget plans to use all of the \$5 million of MCSAP information systems funds to support crash data collection efforts. The proposal to fund CDL improvements with \$10M of RABA funds will provide needed funding to the states to improve their existing systems. The \$12 million in information systems and strategic safety initiatives requested for fiscal year 2001 broadly support both new and existing FMCSA responsibilities. The information systems funds will in part address new initiatives to update and improve carrier information. Data analysis funding plays a critical role in evaluating planned and existing safety initiatives. The evaluation of minimum and maximum penalties is typical of data analysis evaluations. PRISM's \$5 million relates directly to new enforcement of carrier registration requirements. The \$1 million in driver programs directly supports the broad mandate in MCSIA for CDL improvements.

IMPLEMENTATION STRATEGY

Question. For each new regulatory or programmatic responsibility or required study specified in the MCSIA, please detail an implementation strategy, as well as the amount of fiscal year 2000 and fiscal year 2001 funds that will be allocated to conduct each task.

Answer. The requested information is provided in the table below:

| MCSIA requirement | Implementation | Funding |
|--|---|--|
| Development of long-term strategy to improve CMV, operator, and motor carrier safety. | Performance Plan and Safety Action Plan issued in February 2000; Progress report will be issued in May 2000; Strategic Plan will be developed by Fall 2000. | \$155,000 of fiscal year 2001 funds is estimated for the strategic planning initiative. |
| Improvements in Commercial Driver Licensing (including driver disqualifications & serious traffic violations, uniform state data transmission, and strengthened state program requirements). | Comprehensive rulemaking will be conducted to establish definitions and specific state requirements to implement MCSIA CDL improvements. | FMCSA staff resources and in fiscal year 2001: \$10 million RABA \$1 million Driver Program. |
| Include medical qualification certificate in CDL. | Conduct rulemaking. NPRM is in review. | FMCSA staff resources. |

1005

| MCSIA requirement | Implementation | Funding |
|--|--|--|
| Study reporting of positive drug tests by CDL holders. | Conduct feasibility study and report to Congress. Privacy issues will be given attention in study. | Limited fiscal year 2001 funding is estimated. |
| Enforcement of carrier registration requirements. | Develop specific procedures for carrying out enforcement to ensure due process and provide guidance to field staff. | FMCSA staff resources. |
| Revocation or suspension of registration for failure to pay penalties. | Required rulemaking | FMCSA staff resources. |
| Minimum and maximum penalties; study of effectiveness. | Examining changes to Uniform Fine Assessment model and related policy changes. Preliminary proposal is in review to conduct effectiveness study. | \$150,000 of fiscal year 2001 data analysis funding. |
| Safety reviews of new motor carriers and minimum requirements to ensure new carrier applicants are knowledgeable about FMCSRs. | Establish program to assure safety fitness of new carriers including (1) background research and review of past studies; (2) design conceptual framework for new entrant safety fitness process; (3) establish minimum requirements for knowledge about safety regulations; and (4) develop procedures for safety reviews of new entrants within 18 months of beginning operation. | FMCSA staff resources in short-term and potential fiscal year 2002 funding requirements. |
| Training and certification of motor carrier safety auditors. | Required rulemaking | FMCSA staff resources. Fiscal year 2002 funding requirements. |
| Implementation of DOT Inspector General recommendations. | Detailed report addressing each recommendation issued March 9, 2000. Followup reports will be sent to Congress every 90 days. | FMCSA staff resources. |
| Issuance of small passenger van regulations. | Required rulemaking. Final rule in review. | FMCSA staff resources. |
| Staffing standards for international border areas. | FMCSA is working with Southern border states and International Association of Chiefs of Police to establish criteria (including MCSIA criteria) for setting standards. | FMCSA staff resources. |
| Definition of imminent hazard 24-hour operation of driver hotline | Technical rule change Modify agreement with hotline contractor for extended operation. | FMCSA staff resources. \$375,000 in fiscal year 2001. |
| Update of motor carrier identification reports. | Requests sent in April 2000 to carriers to update records on voluntary basis; mandatory carrier refiling will be required upon completion of final rule. | FMCSA staff resources and partial Information Systems funding. |

| MCSIA requirement | Implementation | Funding |
|--|---|--|
| Commercial motor vehicle crash causation study. | Nationally representative data on the primary and secondary causes of serious large truck crashes will be collected by teams of trained investigators from NHTSA's National Automotive Sampling System and FMCSA-funded truck inspectors. Testing in four pilot sites will begin in Summer 2000 and full data collection will begin January 2001. | \$5 million in fiscal year 2001 MCSAP funds. |
| Program to improve collection and analysis of commercial motor vehicle crash data. | FMCSA is working with NHTSA to replicate the success of the Fatality Analysis Reporting System in collecting fatal crash data from the States. Involvement will include State agencies which receive federal bus and truck safety funds, police agencies, and other State and local agencies with responsibility for traffic records collection. | \$7.75 million in fiscal year 2001 MCSAP and administrative funds. |

Question. What is the expected date of completion or initial implementation of each provision?

Answer. This information is provided in the table below:

| MCSIA requirement | Expected completion date |
|--|---|
| Development of long-term strategy to improve CMV, operator, and motor carrier safety. | Safety Action Plan and Performance Plan completed February 2000. Progress Report May 2000. Strategic Plan Fall 2000. |
| Improvements in Commercial Driver Licensing (including driver disqualifications & serious traffic violations, uniform state data transmission, and strengthened state program requirements). | NPRM Fall 2000. Final Rule Fall 2001. |
| Include medical qualification certificate in CDL | NPRM Summer 2000. Final Rule Spring 2001. |
| Study reporting of positive drug tests by CDL holders | December 2001. |
| Enforcement of carrier registration requirements | Summer 2000. |
| Revocation or suspension of registration for failure to pay penalties. | December 2000. |
| Minimum and maximum penalties; study of effectiveness | Minimum and Maximum Penalties—Fall 2000. Effectiveness Study—September 2002. |
| Safety reviews of new motor carriers | December 2000. |
| Minimum requirements to ensure new carrier applicants are knowledgeable about FMCSRs. | December 2000. |
| Training and certification of motor carrier safety auditors | December 2000. |
| Implementation of DOT Inspector General recommendations ... | Report issued March 9, 2000; Report each 90 days. |
| Issuance of small passenger van regulations | Final Rule Summer 2000. |
| Staffing standards for international border areas | December 2000. |
| Definition of imminent hazard | Fall 2000. |
| 24-hour operation of driver hotline | May 2000. |
| Update of motor carrier identification reports | Voluntary carrier update December 2000. Final Rule requiring periodic update Spring 2001. |
| Commercial motor vehicle crash causation study | Full crash causation study data collection begins January 2001. Study completion 2004. |
| Program to improve collection and analysis of commercial motor vehicle crash data.. | Pilot testing for large bus and truck data collection improvement programs in 2000. Implementation of data collection improvement programs in all states that require them in 2001. |

GPRA GOALS AND OBJECTIVES

Question. What are the FMCSA's GPRA goals and objectives and how is the fiscal year 2001 budget request designed to address each of those goals and objectives? Answer. As prescribed in the Motor Carrier Safety Improvement Act of 1999, the performance goals and indicators of the FMCSA are:

- reducing the number and rate of crashes, injuries, and fatalities involving commercial motor vehicles.
- improving the consistency and effectiveness of commercial motor vehicle, operator, and carrier enforcement and compliance programs.
- identifying and targeting enforcement efforts at high-risk commercial motor vehicles, operators, and carriers.
- improving research efforts to enhance and promote commercial motor vehicle, operator, and carrier safety and performance.

Two performance indicators are used to measure progress towards these goals: reduction of the number of fatalities in crashes involving large trucks 50 percent by the end of 2009, using a 1998 baseline of 5,374; and reduction of the number of persons injured in crashes involving large trucks 20 percent by the end of 2008, using a 1998 baseline of 127,000.

While there are no numerical goals established for the rates of fatalities and injured persons involved in motor carrier traffic crashes, the following performance indicators are also used by the FMCSA to monitor progress toward the safety goals: reduction of the rate of large truck-related fatalities per 100 million commercial vehicle-miles-traveled (VMT); reduce the rate of motor vehicle-related fatalities per 100 million commercial vehicle-miles-traveled (VMT); and reduction of the rate of motor vehicle-related injuries per 100 million commercial vehicle-miles-traveled (VMT).

In fiscal year 2001, the FMCSA will make progress towards achieving these goals by:

- increasing enforcement and better targeting high-risk carriers and commercial motor vehicle drivers;
- improving the timeliness of the issuance of vehicle equipment and operating standards;
- improving safety information and commercial motor vehicle technologies; and
- increasing the safety awareness of the driving public and motor carrier industry.

In particular, the agency will continue to move aggressively to significantly increase its targeted enforcement program. Targets for increased compliance reviews have been established for each safety investigator and guidance has been issued to limit the use of negotiated fines. The agency will also strengthen its enforcement efforts at the border by significantly increasing inspection staff in preparation for full implementation of the North American Free Trade Agreement. With respect to data deficiencies, the agency is addressing this issue through regulation and an effort to update existing census information. In addition, FMCSA is working to improve the performance of its vehicle inspection and crash data systems for the collection of commercial motor vehicle crash data. These strategic initiatives are included in the fiscal year 2001 budget request and in the Agency's fiscal year 2001 Performance Plan. Funding requests for key areas of the National Motor Carrier Safety Program include MCSAP (\$165M), Information Systems (\$22M) and General Operating Expenses (\$92.2M) for staff enhancements and research and technology.

NAFTA IMPLEMENTATION

Question. Please provide an update on activities or efforts that are intended to open up the southern border in order to implement the NAFTA, being certain to address progress to date, remaining concerns, and the status of each of the following: efforts to improve safety monitoring of Mexican carriers, exchange of driver licensing information, frequency and quality of training of Mexican inspectors, out-of-service rates of Mexican carriers, and safety management systems for Mexican carriers. Please provide quantitative data to support your answer.

Answer. Although the United States and Mexico have been engaged in safety consultations since 1996, the pace of the talks has slowed considerably as the countries await a hearing before an arbitration panel under the NAFTA's dispute resolution procedures. The panel met on May 17, 2000 to examine Mexico's claim that the United States has violated the NAFTA by not lifting restrictions on cross-border trucking and bus services as provided in the Agreement's access liberalization schedule. In an effort to prepare for the eventual implementation of the NAFTA's land transportation provisions, the Department has increased inspection capacities at the border. We believe, however, that given the high volume of cross-border truck

traffic, this step alone is not sufficient to assure the highest level of safety compliance. Adequate assurances of safety also require that Mexico adopt safety controls within its own borders. Thus, the restrictions on Mexican carrier operations will continue until Mexico has established an effective motor carrier safety oversight program for carriers seeking U.S. operating authority. The Department is committed to continue to work cooperatively with Mexico to achieve this goal and ensure safe cross-border operations.

The U.S. and Mexican Governments have agreed that Mexico will complete the following actions before the Department begins to process Mexican motor carrier applications for operating authority: (1) issue final standards requiring a log book to record drivers' hours of service; (2) use the Commercial Vehicle Safety Alliance's criteria for inspecting vehicles; (3) establish a roadside vehicle inspection program near the U.S. border; (4) implement databases to provide DOT with specific data on carrier applicants—including information on their drivers and vehicles; and (5) put in effect a carrier safety oversight program and provide the results to DOT. Mexico has taken significant steps to improve its carrier safety program, but work still remains to be done. For example, although Mexican inspectors have been trained (with DOT's help) to conduct commercial vehicle inspections in accordance with U.S. standards and procedures, Mexico does not yet have a fully functioning vehicle roadside inspection program. Mexico has developed an integrated information system linking driver, vehicle and carrier safety and economic information. This information system includes inspection/supervision, accident, and infraction modules. Several of the modules are in final testing and Mexico anticipates they will be fully operational in the summer of 2000. The carrier economic data base information has been fully entered and the driver license data base information is being entered now. This information system will be electronically connected to the U.S. systems providing enforcement officials with real-time access to the information.

In addition to our bilateral efforts with Mexico, we have been working closely with the border states to increase their inspections and other compliance and enforcement activities. Over the past 5 years, we have allocated over \$15 million in special funding for border commercial motor vehicle safety programs and projects. These efforts have helped improve compliance with federal safety requirements and reduce the out-of-service rate of Mexican vehicles from over 50 percent in 1995 to 39 percent in 1999. DOT also is working cooperatively with the state enforcement agencies in the border states to make certain that the long-term needs of the enforcement agencies—including funding for inspection facilities and electronic clearance technologies—are given priority consideration in the state's application for grants made available under the Transportation Efficiency Act for the Twenty-First Century's (TEA-21) National Corridor Planning and Development Program (Section 1118), the Coordinated Border Infrastructure Program (Section 1119) and other Federal Aid programs. Under the corridor and border program, \$10 million is being made available to the General Services Administration (GSA) for the construction of transportation infrastructure necessary for law enforcement in the border states. Also, in fiscal year 2000, \$10 million has been set aside for the states of Arizona, California, New Mexico, and Texas for safety and enforcement projects.

States are effectively leveraging their own revenues with federal funds available under these programs to address the need for permanent facilities along the border. California has state-of-the art facilities at their two major commercial ports of entry. Arizona has purchased land to construct a facility at Nogales. New Mexico plans on building a facility at Santa Teresa. Texas intends to build facilities at eight key locations.

MEXICAN DOMICILED COMMERCIAL VEHICLES

Question. What are the safety parameters that must be reached before the Department is likely to open up the border to the entrance of Mexican-domiciled commercial vehicles beyond the commercial zone? How far along are the Mexicans in reaching these parameters? What are the remaining concerns? How do the Department's fiscal year 2000 activities contribute towards the attainment of those safety assurances?

Answer. The U.S. and Mexican Governments have agreed that Mexico will complete the following actions before the Department begins to process Mexican motor carrier applications for operating authority.

(1) *Issue final standards requiring a log book to record drivers' hours of service.*—Mexico's Secretariat of Communications and Transportation (SCT) recently issued regulations mandating log book requirements. In addition, SCT has established a committee to analyze Mexico's current labor law to determine if work hour require-

ments can be made more specific to commercial motor vehicle driver operations. This work is yet to be completed.

(2) *Use the Commercial Vehicle Safety Alliance's (CVSA) criteria for inspecting vehicles.*—On June 9, 1999, SCT published proposed inspection standards that are very similar to the CVSA criteria. The requirements are being prepared for publishing criteria in final form.

(3) *Establish a roadside vehicle inspection program near the U.S.-Mexico border.*—SCT maintains that it is conducting inspections at locations near the U.S. border.

(4) *Implement databases to provide DOT with specific data on carrier applicants—including information on their vehicles and drivers.*—SCT has developed a state of the art information system that integrates databases containing carrier, driver, and vehicle information. SCT officials are currently entering information into these databases and developing an electronic link to the U.S. system to enable DOT and SCT to share carrier safety information.

(5) *Put in effect a carrier safety oversight program and provide the results to DOT.*—SCT is in the process of developing a program for carriers seeking authority to operate in the United States and for carriers that transit the United States on the way to Canada.

SCT continues to make progress in achieving the agreed actions. The Department's major concern is that there be a system in place in Mexico to independently verify the safety compliance of the carriers that will be operating across the border into the United States. We believe that once these actions are completed, both countries will be better able to ensure safe cross-border operations.

The Department's fiscal year 2000 activities continue to concentrate on providing technical assistance to Mexico to complete development and to populate its information systems. In addition, the Department continues to emphasize the importance of developing compatible motor carrier safety requirements throughout North America as part of the trilateral discussions with Mexico and Canada.

Question. Please break out by project or activity exactly how much the Department is allocating during fiscal year 2000 to promote the safety of Mexican-domiciled commercial vehicles and drivers that currently enter the United States. In addition to specifying the purpose and nature of each project and activity, please assess whether and how these expenditures improve safety and compliance with U.S. registration requirements and safety regulations.

Answer. In fiscal year 2000, \$4.75 million was made available to the border states to promote safety at the border. Of the \$4.75 million, \$575,000 was allocated to develop software to provide better network access to border inspectors, and to conduct a study to determine the extent of the safety problems associated with the cross-border commercial van operations commonly referred to as camionetas. Sec. 212 of the Motor Carrier Safety Improvement Act of 1999 requires that we complete rule-making to determine which small passenger vans should be covered by FMCSRs.

Consistent with our goal to optimize the level of the enforcement and compliance activities along the southern border, the majority of the funds awarded to the states are used for state personnel services and expenses to conduct inspections. Other initiatives include training, education and outreach activities, and purchase of vehicles and other equipment used by the inspectors. We estimate that these increased enforcement efforts will result in over 83,000 commercial motor vehicle inspections along the border regions.

In addition to the state grants, the FMCSA will spend approximately \$1,632,000 to support the Federal inspectors assigned at border locations. We estimate that Federal inspection efforts will result in an additional 14,000 inspections.

U.S. SAFETY AND REGISTRATION

Question. Please break out the expected allocation of similar funds requested for fiscal year 2001 and specify how fiscal year 2001 projects and activities are anticipated to further U.S. safety and registration objectives.

Answer. In fiscal year 2001, \$7,750,000 will be made available for border commercial motor vehicle safety program and enforcement activities and projects directed at improving the compliance rate of foreign commercial motor vehicle operations with both safety standards and registration requirements. The funds are being made available to both the northern and southern border states. However, in recognition of the safety concerns that still exist along the southern border, proposals received from California, Arizona, New Mexico, and Texas will receive priority consideration.

Each border state is invited to submit a performance-based proposal for these funds reflecting safety performance goals. In fiscal year 2001, priority consideration will be given to those projects that include hiring additional permanent inspectors

to increase the enforcement presence along the border and implement the staffing standards. These staffing standards are being developed in compliance with Sec. 218 of the Motor Carrier Safety Improvement Act of 1999. The goal of the standards is to ensure, to the greatest extent possible, that inspectors are on duty at all border crossings at all times the U.S. Customs Services' ports of entry are open to commercial vehicle traffic. States have been reluctant to use the special border grants to hire additional inspectors because the availability of the funds in subsequent years has been uncertain. Since TEA-21 provides support for the special border grant program through fiscal year 2003, states are being encouraged to consider using the funds to hire new personnel and establish a more permanent presence along the border.

A portion of the available program funds may be set aside to support the activities of the International Association of Chiefs of Police (IACP) to complete Spanish translation of inspection training videos, and to support other safety program activities that are of mutual benefit to all border States and the nation.

All of these projects are directed at improving the states' capabilities to increase enforcement and compliance activities and establish a permanent and consistent enforcement presence along our border.

OTHER SERVICES FUNDS

Question. Please break out in detail how FMCSA expects to spend the \$18.875 million of "other services" included within the fiscal year 2001 base. Please do the same for the fiscal year 2001 base amounts requested for supplies and equipment. How are the Department's fiscal year 2001 anticipated activities expected to contribute towards the attainment of those safety assurances.

Answer. A break out of the \$18.875 "other services" is provided in the following chart. The same chart was prepared in response to a previous question. Supplies and equipment funding supports FMCSA operations in over 75 offices nationally. The funding for supplies and equipment are allocated at the beginning of each fiscal year to headquarters and our 52 Division Offices located in each state. The allocation is generally based on size of the office and specific unique annual needs. The typical allocation provides approximately 30 percent of the funds to headquarters and 70 percent to the field offices. The break out of supplies vs. equipment for both fiscal year 2000 and fiscal year 2001 is also included in the chart that follows. In fiscal year 2001, FMCSA's proposed additional administrative staff will study and procure the support of a fiscal management and information system that will provide ready access to more detailed expenditures of all FMCSA accounts.

| | Fiscal years— | |
|---|---------------|------------|
| | 2000 | 2001 |
| Salaries & Benefits—Salaries & Benefits | 43,713,000 | 54,860,000 |
| Salaries & Benefits—Incentive Awards | 179,000 | 225,000 |
| Travel—Domestic | 3,505,000 | 4,184,000 |
| Travel—International | 15,000 | 30,000 |
| Transportation | 110,000 | 316,000 |
| Rent | | 4,561,000 |
| Communications | 419,000 | 423,000 |
| Printing | 564,000 | 667,000 |
| Supplies | 291,000 | 480,000 |
| Equipment | 1,867,000 | 2,277,000 |
| Other Services—Crash Data Collection | 4,000,000 | 2,750,000 |
| Other Services—Crash Causation Database | 3,000,000 | |
| Other Services—Census Update | 4,500,000 | |
| Other Services—Incident Management | 2,000,000 | |
| Other Services—School Bus Study | 200,000 | |
| Other Services—Operation Respond | 350,000 | |
| Other Services—Research & Technology | | 9,550,000 |
| Other Services—Training | 1,250,000 | 1,550,000 |
| Other Services—PCS | 1,000,000 | 1,124,000 |
| Other Services—ADP | 3,700,000 | 3,900,000 |
| Other Services—Intrastate Data Enhancement | | 500,000 |
| Other Services—Vision Waiver Administration | | 636,000 |

| | Fiscal years— | |
|--|-------------------|-------------------|
| | 2000 | 2001 |
| Other Services—Basic Operation Costs from FHWA | | 4,386,000 |
| TOTAL | 70,484,000 | 92,194,000 |

Question. Please break out in detail how FMCSA is allocating the \$18.875 million of “other services” included with the fiscal year 2000 appropriation. Please do the same for the amounts appropriated for supplies and equipment.

Answer. The previous answer provides the requested response for both fiscal year 2000 and fiscal year 2001.

SHARE THE ROAD

Question. Please describe in detail what FMCSA is doing during fiscal year 2000 to advance “share the road” activities. Exactly how much is being spent on each aspect of this effort?

Answer. The FMCSA, in cooperation with NHTSA, is expanding the scope of the “share the road” effort to include safety recommendations for all types of highway users (drivers of passenger cars, trucks, buses, motorcyclists, bicyclists, and pedestrians) to promote safe driving in, and around, trucks and motor coaches. We are educating highway users about the operating characteristics and limitations of commercial motor vehicles (CMVs) and developing strategic outreach efforts for specific target audiences.

In addition to the “No Zone” visibility issue, we will increase public awareness of the longer braking distances, weight differentials, acceleration variances, turning radius, structural configurations and basic survivability ratios of CMVs as compared with smaller vehicles. Each provide very good safety reasons for being aware of, and cautious around, large trucks and motor coaches. Knowledge of these characteristics may lead to reduced aggressive driving behavior, increased seatbelt use, and other improved driving practices around CMVs on the highway. In addition, we will provide recommendations to motorists about how to drive around commercial vehicles in real-life driving situations. We will devote significant attention to CMV driver behavior, by identifying and promoting best defensive driving practices, work zone safety concerns and other safe driving skills.

Estimated costs for the various aspects of our fiscal year 2000 “share the road” program include:

| | |
|---|----------------|
| Development of new outreach materials | \$100,000 |
| Campaign distribution and dissemination | 325,000 |
| Research—campaign awareness assessment | 75,000 |
| Total estimated costs | 500,000 |

COMMUNICATION, COMPUTER AND INFORMATION SYSTEMS

Question. Please submit budget justification information equivalent to that previously provided by the FHWA for the communication, computer, and information systems components of your program.

Answer.

[Dollars in millions]

| | |
|--|-------|
| 1B funding for fiscal year 2000 is as follows: | |
| ADP Services and System Support | \$3.6 |
| ADP Equipment and Supplies | 0.2 |
| Requested 1B funding for fiscal year 2001 is as follows: | |
| ADP Services and System Support | 3.6 |
| ADP Equipment and Supplies | 0.2 |
| Identify High-Risk intrastate Carriers | 0.5 |

Currently, 20 percent of the U.S. commercial fatalities are caused by intrastate carriers. We cannot meet our 50 percent fatality reduction goal until we focus on intrastate carriers. We have an opportunity to use our substantial resources to identify high risk carriers and help them improve with a relatively small marginal cost.

Including intrastate carriers in our databases does not require a software database modification. It is information system mainframe processing costs that prevent us from identifying the high-risk intrastate carriers, resulting in lives lost. Numerous states are requesting that we identify these high-risk operations using our infor-

mation systems capabilities. However, we contract for mainframe processing and do not have sufficient funding in the budget to support the annual operational mainframe expense of \$0.5M associated with maintaining and processing information on these operations.

Background on Current Initiatives

The FMCSA information technology system maintains an electronic motor carrier safety history, and national motor carrier census that systematically identifies “at risk” carriers and provides all of this information electronically to Federal and state field managers and investigators. This creates efficient, focused use of field resources with high quality and uniformity. It also provides an industry awareness that a carrier can no longer hide poor safety performance. Thus, the information systems of the FMCSA are recognized throughout the organization as extremely successful in providing crucial, daily support to motor carrier safety programs. Federal and state usage of the Motor Carrier Management Information System, (MCMIS), SAFETYNET and our field data systems such as CAPRI and ASPEN) increases continuously because these “tools” are an integral part of how the job of motor carrier safety enforcement is performed today. Examples of other enforcement system supported include CaseRite III (prepares legal cases), UFA (Ensures Uniform Fine Assessment across the U.S.), CAPRI (for compliance reviews), ASPEN v2 (for roadside inspection), Inspection Selection System (ISS v2) identifies high risk carrier at the roadside, Past Inspection Query (PIQ) v2 identifies out of service violation and driver log book falsification, and Commercial Drivers License Information System (CDLIS) roadside query v2.

MOTOR CARRIER REGISTRATION

Question. How much is specified within the fiscal year 2001 budget request for the unified motor carrier registration system?

Answer. FMCSA has requested \$1.5 million in fiscal year 2001 for the unified motor carrier registration system. An additional \$1.5 million has been requested by the ITS Joint Program Office for the project, since this project meets the program goal of the FMCSA and ITS Joint Program Office.

COMPLIANCE REVIEWS

Question. Please present data on the number of compliance reviews performed by federal investigators during each of the last five years. How has the targeting of those audits improved? How does FMCSA know it’s conducting the “right” number of compliance reviews?

Answer. During the last five years, compliance reviews by federal investigators have been performed as follows:

| Fiscal year | 1999 | 1998 | 1997 | 1996 | 1995 |
|-------------------------------|-------|-------|-------|-------|-------|
| Total reviews conducted | 6,240 | 4,587 | 4,013 | 5,414 | 5,553 |

Targeting for compliance reviews has improved by using a prioritization listing identified by SafeStat (Safety Status Measurement System) is an automated, data-driven analysis system that is designed to incorporate on-road safety performance information and enforcement history with on-site compliance review information in order to measure the relative safety fitness of interstate motor carriers. SafeStat is designed with four evaluation areas, known as SEAs (safety evaluation areas). These four areas (crash, driver, vehicle, and safety management) fuel the SafeStat score.

Reviews on interstate motor carriers are targeted to the carriers with the highest safety risks—those with high crash rates, driver and vehicle problems or safety management problems. We track the SafeStat list to ensure that the high risk reviews are being conducted. We define the highest risk carrier as those carriers who are in the worst 25th percentile of three or four of the Safety Evaluation Areas. Periodically throughout a six month time frame, we compare the SafeStat list to the Motor Carrier Management Information System database to determine the status.

The focus of compliance reviews is to improve safety performance of problem carriers. The FMCSA is conducting the “right” number of reviews by reviewing the “right” carriers—carriers which pose the highest risk to safety. Reviews on the highest risk carriers are very labor intensive, but provide the greatest safety return on the time invested.

Question. Please present data on the number of compliance reviews performed by state investigators during each of the last five years.

Answer. During the last five years, compliance reviews by state investigators have been performed as follows:

| Fiscal year | 1999 | 1998 | 1997 | 1996 | 1995 |
|-------------------------------|-------|-------|-------|-------|-------|
| Total reviews conducted | 2,677 | 2,149 | 2,900 | 3,848 | 4,022 |

IG AND GAO RECOMMENDATIONS AND CONCLUSIONS

Question. In March 2000, the IG and GAO testified before the House Committee on Appropriations and made recommendations to improve FMCSA activities. Please specify in detail how the Agency will respond to each of their recommendations and conclusions.

Answer. Testimony was presented to the House Committee on Appropriations on March 2, 2000, by Mr. Ken Mead, the Inspector General of the U.S. Department of Transportation, and Ms. Phyllis Scheinberg, the Associate Director of the Transportation Issues, Resources, Community, and Economic Development Division of the U.S. General Accounting Office (GAO). Mr. Mead recognized the progress of FMCSA to increase compliance reviews and increase civil penalties for safety violations. The Agency will continue to move aggressively to strengthen its enforcement program. Mr. Mead recommended a total Federal presence of 126 inspectors at the U.S.-Mexico border, noting that 2 inspectors should be located at each crossing during all hours of operation and additional inspectors should be stationed at high-volume crossings. The OIG's recommendations for staffing levels will be considered when the Federal Motor Carrier Safety Administration (FMCSA) prepares the border staffing standards required in the Motor Carrier Safety Improvement Act of 1999 (MCSIA, Pub.L.106-159). The statutory deadline for completing the staffing standards is December 9, 2000. FMCSA currently plans to hire 20 additional Federal inspectors in fiscal year 2001 for the U.S.-Mexico border, bringing our total contingent to 60. This is very close to the level of Federal inspectors recommended by the May 1999 "Review of the Motor Carrier Program" conducted by former Chairman Norman Mineta for the Department. We are working closely with the States to improve their border infrastructure and increase the number of state personnel they assign to this work. We have seen good progress and believe that these steps, along with the increased number of federal enforcement personnel, will substantially upgrade overall enforcement efforts at our southern border.

Mr. Mead indicated that mandatory shut down of motor carriers that cannot meet basic safety fitness requirements is an essential, potent tool for improving safety. A final rule to implement this provision, which was included in the Transportation Equity Act for the 21st Century (TEA-21) at the request of the Department, is now in the last stages of review. We intend to use our shut down authority as one of our principal methods of ensuring high-risk carriers improve their safety performance. Although it will be more common for us to use our TEA-21 shut down authority, in some cases we will still need to rely on imminent hazard authority for the immediate shut down of motor carriers that pose an extreme safety risk. We agree with the Inspector General that the circumstances which give rise to an imminent hazard should be clarified. The Department proposed a legislative change in the Motor Carrier Safety Improvement Act of 1999 (MCSIA) to facilitate such a clarification. We are making a technical change in our regulations which should make this a much more useful and effective safety enforcement tool.

The Inspector General stated that timely issuance of rulemakings will be essential to achieving our aggressive goals for fatality and injury reductions. FMCSA's new organizational structure establishes a special rulemaking development unit to expedite the rulemaking process. Also, we are filling a Regulatory Ombudsman position to help move forward particularly complex or controversial rulemakings. It should be noted that we are already making progress in rule development, with several major rules in the final stages of consideration.

The Inspector General noted that leadership positions in the Agency are still unfilled. Efforts to fill leadership positions in the organization are progressing well. Secretary Slater is making every effort to select a candidate for Administrator, and the Department has secured approval from the Office of Personnel Management for new senior leadership positions, including four Associate Administrators. But the major accomplishments of current leadership should not be overlooked. It has taken strong, focused leadership to produce the enforcement results we have achieved since last May and to swiftly establish the new FMCSA organization.

Mr. Mead's stated that major improvements are needed in commercial driver licensing (CDL). Last year, the Department proposed legislation to close loopholes

such as granting of special licenses to drivers with suspended licenses, and to include all traffic convictions on a commercial driver's official record. We will be working vigorously to develop the rules necessary to implement MCSIA's CDL reforms and a strong Federal CDL oversight program. We have requested \$10 million in fiscal year 2001 to fund a CDL Improvement Pilot Program to speed the exchange of drivers' record data, and have already begun discussions with state motor vehicle administrators and AAMVA Net to address many of the specific issues raised in Mr. Mead's testimony.

The GAO in its testimony recognized the progress of FMCSA on initiatives to reduce truck-related fatalities. In commenting on the FMCSA draft Safety Action Plan, Ms. Scheinberg of the GAO stated that no prioritization has been given to the activities contained in the Plan. FMCSA's final Safety Action Plan is a statement of the agency's top priorities for the next three years. Within the Plan, we have assigned the highest priority to strengthening targeted enforcement, completion of important rulemakings, improving safety information and technology, and increasing safety awareness. Over three quarters of the actions included in the Plan are required by law in appropriations legislation, the MCSIA, TEA-21, or other laws. The Plan sets out only a subset of the agency's overall activities. Many research projects and rulemakings that are underway have not been included. Together we believe the effects of all these actions will materially contribute to the 50 percent fatality reduction goal Secretary Slater has set for our agency and all who play a role in motor carrier safety.

In addition, Ms. Scheinberg recommended a realistic evaluation of whether expected budgetary and human resources will be sufficient to achieve the actions in the Safety Action Plan. The Department has recommended increases in our funding and personnel levels in the fiscal year 2001 budget, and we believe these are appropriate and adequate to carry out the Plan in the near term.

The GAO concluded that a comprehensive strategy is needed to achieve the Secretary's goal to reduce bus and truck fatalities by 50 percent. The agency has established targets for fatality reduction for each year to achieve this goal by the end of calendar year 2009. We believe achieving the goal will be the result of the aggregation of our efforts in targeted enforcement, data improvements, new technology, safety awareness, and strengthening equipment and operating standards along with the concerted efforts of all segments within the motor carrier industry and safety community.

COMPLIANCE REVIEWS/ENFORCEMENT CASES

Question. How many compliance reviews, enforcement cases closed with action (e.g., civil penalty), compliance orders, operations out-of-service orders, and consent orders were conducted or issued under each of the State Directors during each of the last three years?

Answer.

CVO AND PRISM

Question. Given the progress made under the PRISM, why are additional staff requested at this time?

Answer. Additional staff are requested for PRISM to be able to manage the rapid influx of new states interested in participating in the program and ensure consistent program implementation nationwide. Each new state that joins the program requires ongoing program guidance and technical assistance throughout the two year development phase of the program. Resources are needed to conduct training for each new state, assist states in the development of their implementation plans, and provide technical assistance when problems arise. In addition, as each state completes its two year program development, staff are need to conduct program reviews to monitor state implementation and ensure the terms of the grant agreement are met and maintain a level of effort in carrying out the program. Finally, technical staff will be needed to review, assess, and make improvements to the information and communication systems that support the program and ensure they provide the flexibility needed to address state needs and, if necessary, examine emerging technologies that could improve program delivery at both the Federal and state level.

Question. Please discuss the challenges, status, opportunities and issues associated with PRISM.

Answer. Twelve states are currently participating in the PRISM program. Of these, the original pilot states are Iowa, Colorado, Indiana, Minnesota, and Oregon. The remaining seven states are Pennsylvania, Connecticut, Maine, Rhode Island, Tennessee, Georgia, and Kentucky. In addition, there are twelve other states (Arizona, South Carolina, Alaska, New Mexico, North Carolina, Ohio, Utah, Idaho, Wyoming, New York, Illinois, and South Dakota) which have expressed interest in participating in the program, and the number continues to expand.

Every participating state has entered into a grant with the Federal Motor Carrier Safety Administration (FMCSA) to implement PRISM. Each of the five pilot states have implemented the program and are operational. The remaining states have received training on the program and are in various stages of the implementation process, which generally takes anywhere from 18–24 months to complete. During this period, states must modify their registration systems to be PRISM compliant, establish and update a complete census of all interstate carriers, establish automated data improvement procedures for both registration and at the roadside enforcement, and provide training to state registration and enforcement personnel.

Pennsylvania has developed its implementation plan and expects to be operational by October of this year. Maine's implementation plan has recently been approved and the implementation process is expected to begin in April. Rhode Island, Georgia, and Arizona are currently developing their implementation plans. Connecticut, Tennessee, and Kentucky have not yet developed their implementation plans, but are expected to do so within the next 3–4 months.

PRISM provides many opportunities to improving highway safety. These include:

- establishing accountability for safety by identifying the carrier responsible for the safe operation of every commercial vehicle on the road through the U.S. DOT number;
- improving overall data quality by establishing and updating the current carrier census annually;
- establishing a link between motor carrier's registration and safety fitness;
- expanding FMCSA's ability to reach a great many more carriers through issuance of Warning Letters;
- accurately identifying high risk carriers based on actual over the road performance through SafeStat, the algorithm developed under the PRISM pilot program;
- providing equitable treatment to all interstate carriers.

There are, however, challenges and issues associated with full deployment of the PRISM program. First, in most instances, new states must pass legislation that will allow them to apply state vehicle registration sanctions based upon a Federal Operations Out-of-Service Order. All participating states have not yet passed this legislation.

Second, the FMCSA has experienced difficulty in issuing OOSOs. The term imminent hazard, as defined prior to the new Motor Carrier Safety Improvement Act, was operationally unworkable and thus not effective as an enforcement tool. Clearly, without the issuance of out of service orders, PRISM cannot be as effective as it was originally designed to be. Under PRISM, states cannot suspend and/or revoke plates of a motor carrier unless the FMCSA first issues an operations-out-of-service order (OOSO) to the carrier.

In the past, the FMCSA has had difficulty in issuing out-of-service orders. New policy directives encourage increased enforcement on unsafe carriers. The new legislative definition for imminent hazard will provide us with more effective enforcement tools to remove unsafe carriers from the highways. Question. How many states are participating in the program now?

Answer. Twelve states are currently participating in the program. The states are Iowa, Colorado, Indiana, Minnesota, Oregon, Pennsylvania, Connecticut, Maine, Rhode Island, Tennessee, Georgia, and Kentucky.

Question. What is the status of each state's program?

Answer. Every state that is a member of PRISM has entered into a grant with the Federal Motor Carrier Safety Administration (FMCSA). Each of the five pilot states (Iowa, Colorado, Minnesota, Oregon, and Indiana) have implemented the program and are operational. The remaining states have received training on the program and are in various stages of the implementation process which generally takes anywhere from 18–24 months to complete. During this period, states must modify their registration systems to be PRISM compliant, establish and update a complete census of all interstate carriers, establish automated data improvement procedures for both registration and at the roadside enforcement, and provide training to state registration and enforcement personnel.

Pennsylvania has developed its implementation plan and expects to be operational by October of this year. Maine's implementation plan has recently been approved

and the implementation process is expected to begin in April 2000. Rhode Island and Georgia are currently developing their implementation plans. Connecticut, Tennessee and Kentucky have not yet begun developing their implementation plans but are expected to do so within the next 3–4 months.

CVO AND PRISM

Question. How many additional states want to participate?

Answer. Twelve additional states (Arizona, South Carolina, Alaska, New Mexico, North Carolina, Ohio, Utah, Idaho, Wyoming, New York, Illinois, and South Dakota) have expressed interest in participating in the program.

Question. Please break out in detail how the PRISM monies are expected to be allocated during fiscal year 2000. Please specify the nature and amount of each research project, training activity, outreach function, and state deployment. For the fiscal year 2001 request, please provide comparable data wherever possible. Please document how program continuity is achieved.

Answer.

ESTIMATED ALLOCATION OF PRISM FUNDS

| Activity | Fiscal years— | |
|---|---------------|-----------|
| | 2000 | 2001 |
| RESEARCH | \$500,000 | \$500,000 |
| INFORMATION SYSTEM SUPPORT AND IMPROVEMENTS | 875,000 | 1,200,000 |
| TRAINING AND OUTREACH | 800,000 | 1,000,000 |
| STATE DEPLOYMENT | 2,700,000 | 2,300,000 |
| TOTAL | 4,875,000 | 5,000,000 |

In fiscal year 2000, the research allocation will be used to conduct a technology assessment of current PRISM hardware and software and make enhancements to the SafeStat methodology; fiscal year 2001 funds will be used to identify data quality and timeliness issues and develop solutions address them.

To make improvements to the program, we plan to allocate \$875,000 in fiscal year 2000, and increase the allocation in fiscal year 2001. These funds will be used to identify and resolve all issues related to both Federal and state information systems that affect PRISM, updating the national carrier census file to reflect state registration data, and improving system specifications for States.

Approximately \$800,000 will be spent on training and outreach in fiscal year 2000 and plan to increase it to \$1 million in fiscal year 2001 to accommodate an anticipated increase in PRISM states next year. These funds will support two-day training for all new PRISM States, briefings given to new states interested in joining the program, and development and publication of a PRISM newsletter and other marketing materials for use at public exhibits.

Finally, State deployment is the core program. New PRISM states require approximately \$450–500,000 to implement the program. Based on this figure, we have set aside \$2.7 million for new State deployment in fiscal year 2000 (5–6 States) and \$2.3 million (3–4 states) for fiscal year 2001.

To ensure continuity, or uniformity, the Federal Motor Carrier Safety Administration (FMCSA) has developed a PRISM Implementation Guide for all participating states. The Guide provides a list of all registration and enforcement requirements that all PRISM states must meet in order to obtain PRISM funds. States use the Guide to help develop detailed implementation plans on not only how they will carry out each requirement, but also the anticipated costs. The plan will be used to help develop the grant to that state. Implementation plans must be completed and approved prior to entering into a grant agreement with the FMCSA. The FMCSA then uses these plans to monitor state compliance with the program requirements.

IVI TECHNOLOGY

Question. Why did FMCSA decide to request additional staff to support the IVI given the uncertainty as to whether this initiative will be reauthorized in the next highway bill?

Answer. The success of IVI and other technologies is critical to DOT and FMCSA achieving the goal of reducing the number of commercial truck-related fatalities by 50 percent over the next ten years. Thus, FMCSA is requesting additional staff to

support the IVI to provide the technical and program support necessary to ensure the success of the IVI's commercial vehicle platform. This platform will test and evaluate on-board safety systems and technologies designed to reduce commercial motor vehicle crashes and enhance commercial vehicle and driver safety. These involve complex, multi-year on-road operational tests such as the ones planned for the IVI commercial vehicle platform in the areas of drowsy driver and electronically controlled brakes. Additionally, the added staff will test and evaluate new technologies for 2010 as well as develop ways to use on-board safety information for roadside enforcement.

CVO AND PRISM

Question. Please discuss how CVO could be used to further strengthen the efficiency and effectiveness of federal and state enforcement and compliance activities if additional funds were provided for this purpose in the fiscal year 2001 budget.

Answer. In fiscal year 2001, \$500 thousand is requested within FHWA's R&D CVO program to support new technology for enforcement and compliance, \$150 thousand above the fiscal year 2000 level. These funds will be used to assess new and existing technologies in a timely fashion that will reduce crashes and improve: (1) the identification of high-risk motor carriers, vehicles, and drivers; (2) the enforcement of, and compliance with, performance-based regulations; and (3) the efficiency and accuracy of safety data collection and access at the roadside.

REAR-END COLLISION AVOIDANCE TECHNOLOGY

Question. How are you responding to the January 1995 NTSB recommendation to sponsor fleet testing of rear-end collision avoidance technology and incorporate testing results into demonstration and training programs?

Answer. The IVI program recently awarded Volvo Trucks North America a cooperative agreement to test the operational effectiveness of the bundled advanced safety system of Collision Warning System (CWS), Adaptive Cruise Control (ACC) and Electronically Controlled Brake System (EBS). The advanced safety system bundle is expected to enable truck drivers to reduce the number and severity of tractor-trailer accidents specifically associated with rear end collisions (forward crash) and lane change collisions. This project involves 100 new Volvo tractors operated by USXpress Leasing Inc. and will operationally test and evaluate the advanced safety systems in revenue generating, on road operations. The results of this operational test will be disseminated widely through reports and outreach activities. Significant market penetration of this technology will also be assisted by working with motor carriers to increase technology transfer and supporting tax incentives for the voluntary adoption of this type of on-board safety technology.

REGULATORY AND STATUTORY RESPONSIBILITIES

Question. Do you plan to establish a Motor Carrier Safety Advisory Committee in the near future? If not, please explain why. If you do, please discuss the scope and nature of the responsibilities and topics to be addressed. Would funds be needed in fiscal year 2001 to assist this advisory committee, especially if it is requested to assist FMCSA in addressing the regulatory backlog?

Answer. FMCSA has no objection to establishing a Motor Carrier Safety Advisory Committee. We are in the very preliminary stages of internal discussions on its scope and funding requirements. At this time, we do not believe any additional funds are necessary for this activity in fiscal year 2001.

Question. The Rail Safety Advisory Committee has helped FRA address more than 10 regulatory challenges or tasks during the last few years. What are the pros and cons of establishing a similar group to help the FMCSA deal with its regulatory backlog?

Answer. An advisory committee could enhance communication between FMCSA and safety organizations, industry, labor, enforcement officials, state and local governments, and other stakeholders in motor carrier safety. It could foster discussion and cooperation among stakeholders and the agency and help to disseminate information about new regulatory and safety initiatives. In some cases, an advisory committee could help facilitate the rulemaking process by bringing together appropriate interests to arrive at a consensus solution.

Establishing fair advisory committee representation may be a more manageable process for the railroad industry given the fact there are fewer than ten major railroads and approximately 500 short-line railroads in the U.S. Ensuring balanced committee representation for the large and extremely diverse motor carrier safety community could be more daunting. There are literally hundreds of thousands of motor carriers currently operating in the U.S. Also, the consensus process may not

be the most timely or successful approach in some controversial rulemakings where affected interests are deeply divided on the issues. The travel and administrative costs for an advisory committee can be quite significant, as well.

Question. Please list each of the motor carrier safety provisions of ISTEA or TEA-21 that have not yet been implemented and indicate your time table for completing or fulfilling legislative intent. Please document how your fiscal year 2001 budget request will help accomplish or implement each of these provisions.

Answer. This information is provided in the tables below:

| | Expected completion date | Funding |
|--|---|---|
| ISTEA requirement | | |
| Funding Sec. 4007(a) Training for Entry-Level Drivers of CMVs. | NPRM Summer 2000 | FMCSA staff resources. |
| Sec. 4007(b) Training for Operators and Training Instructors in Multiple Trailer Combination Vehicles. | NPRM Fall 2000 | FMCSA staff resources. |
| TEA 21 Requirement | | |
| Sec. 4004 Information availability and privacy protection policy. | Fall 2000 | FMCSA staff resources. |
| Section 4008 Requirements for Operators of Small Passenger-Carrying Commercial Motor Vehicles. | Summer 2000 | FMCSA staff resources. |
| Section 4008 Definition of CMV | Summer 2000 | FMCSA staff resources. |
| Section 4009 Procedures—Unsatisfactory Safety Ratings | Summer 2000 | FMCSA staff resources. |
| Section 4018 Insulin Treated Diabetes Mellitus Report | Summer 2000 | FMCSA staff resources. |
| Section 4019 Benefits of Graduated Licensing | December 2000 | Addressed with fiscal year 2000 funds |
| Section 4020 Post-accident Alcohol Testing Report | Summer 2000 | Addressed with fiscal year 2000 funds |
| Section 4022 Improved Flow of History Driver History Pilot Program. | December 2002 | \$10 million RABA request for CDL improvements will help fund the driver history pilot program. |
| Section 4023 Study of effectiveness of existing statutory employee protections. | June 2000 | Addressed with fiscal year 2000 funds. |
| Section 4024 Interstate School Bus Transportation Safety Rulemaking. | ANPRM December 2000 | FMCSA staff resources. |
| Section 4026 Assessment of Shipper Contributions to Violations of Safety Regulations. | Summer 2000 | FMCSA staff resources. |
| Section 4014 Safety Performance History of New Drivers | SNPRM July 2000. Final Rule January 2001. | FMCSA staff resources. |
| Section 4032 Study on the effects of MCSAP grant reductions. | June 2000 | Addressed with fiscal year 2000 funding. |

Question. How do you propose to implement each of these remaining provisions?

Answer. The information is provided in the table below:

| | Implementation |
|---|---|
| ISTEA Requirement | |
| Training for Entry-Level Drivers of CMVs | An NPRM has been drafted and is under review within the agency. |
| Training for Operators and Training Instructors in Multiple Trailer Combination Vehicles. | The agency is working on the preliminary regulatory evaluation to assess the costs and benefits of the rulemaking. An NPRM will be drafted later this year. |
| TEA 21 Requirement | |
| Information availability and privacy protection policy. | FMCSA will examine other government information and privacy policies, request stakeholder comment, and formulate and notify the public of its policy. |
| Requirements for Operators of Small Passenger-Carrying Commercial Motor Vehicles. | A final rule is under review within the Department. This rule has been combined with "Definition of CMV." |

| | Implementation |
|--|--|
| Definition of CMV | A final rule is under review within the Department. This rule has been combined with "Requirements for Operators of Small Passenger-Carrying Commercial Motor Vehicles." |
| Procedures-Unsatisfactory Safety Ratings | A final rule is under review at OMB. |
| Insulin Treated Diabetes Mellitus Report | An assessment of the feasibility of developing a protocol has been conducted. The agency is preparing a report to Congress and evaluating alternatives for implementation. |
| Benefits of Graduated Licensing | Focus groups have been conducted and a survey instrument has been developed. The agency is seeking OMB approval for conducting the survey. |
| Post-accident Alcohol Testing Report | A draft report is in development. |
| Improved Flow of Driver History Pilot Program | A pilot program will be conducted to determine the extent data covered in Section 4022(a)(2)(A), such as failures to appear, should be included in information systems. Costs, benefits, and methods for exchange of driver safety data are being evaluated in implementation of state record exchange requirements of the Motor Carrier Safety Improvement Act of 1999. |
| Study of effectiveness of existing statutory employee protections. | A draft study report is in review and the agency plans to submit a final report to Congress this summer. |
| Interstate School Bus Transportation Safety Rule-making. | An ANPRM is in development. |
| Assessment of Shipper Contributions to Violations of Safety Regulations. | A study of the role of shippers and other non-carrier entities in encouraging violations of motor carrier safety regulations has been conducted. The agency is reviewing policy options, including submission of an implementation plan to Congress. |
| Safety Performance History of New Drivers | A supplemental NPRM has been drafted in response to comments for the Small Business Administration and concerns expressed by employers about liability for releasing personal information about employees. |
| Study on the effects of MCSAP grant reductions | A study has been performed and a draft report is in development. |

SECTION 4019 OF TEA-21

Question. What is FMCSA doing to implement Section 4019 of TEA-21, which requires the Secretary to determine if the current system for commercial driver testing is adequate and to identify ways to improve testing and licensing standards? How much is in your budget request to accomplish this task?

Answer. The FMCSA through a cooperative agreement with the American Association of Motor Vehicle Administrators (AAMVA) is reviewing the current CDL testing process. Over the past 18 months, the AAMVA in cooperation with the FMCSA and the National Highway Traffic Safety Administration (NHTSA), has conducted a series of meetings and forums with state licensing agency administrators, state test experts (chief examiners) and the commercial motor vehicle industry (bus and truck carriers, training schools and insurance companies) to identify perceived problems with the testing process. AAMVA will use this information in an 18-month in-depth study to review and revise, as needed, the current CDL skills tests. AAMVA will conduct field testing and revise, as needed, the current CDL examiner's manual.

The FMCSA is also conducting a feasibility study to identify the costs and benefits of a graduated CDL. To accomplish this, focus groups have been held and a survey will be distributed later this year to state, industry, insurance, driver, safety and other interested groups.

No new funding is being requested in our budget request to accomplish these tasks. However, if a graduated CDL is feasible, we may request funding in the future for implementation.

SECTION 4026 OF TEA-21

Question. What is the status of the assessment required under Section 4026 of TEA-21? What are you doing to further the development of a plan and an enforcement strategy to deal with shippers and others encouraging violation of motor carrier safety regulations?

Answer. The report on the Assessment of Non-Carrier Encouraged Violations of Motor Carrier Safety Regulations is currently under review by FMCSA. The purpose of the study was to examine the extent to which commercial shippers and others involved in interstate commerce impose demands for the timely delivery of goods that may result in commercial motor vehicle operators' violation of Federal Motor Carrier Safety Regulations, including commercial driver hours of service (HOS).

The report recommends various options, which include legislative, regulatory, and non-regulatory actions (e.g., education, outreach, encouragement of industry best practice standards), to deal with shippers and others encouraging violation of motor carrier safety regulations.

The findings of the study and resultant proposals will be forwarded to the Congress.

REGULATORY AND STATUTORY RESPONSIBILITIES

Question. Please describe what FMCSA is doing to implement Sections 4018, 4020, 4022 and 4026 of TEA-21? What is the status, progress made or results of each of those efforts? Please specify the amount set aside in your fiscal year 2000 spending plan to implement each of those sections.

Answer. Section 4018 of TEA-21 directs FHWA (now FMCSA) to determine if it is practical and cost-effective to have a program that allows individuals with insulin-treated diabetes mellitus (ITDM) to operate commercial motor vehicles in interstate commerce. This summer the FMCSA will forward to the Congress, a report on the feasibility of allowing ITDM drivers to operate CMVs in interstate commerce. This report include a description of the components of a screening protocol. The FMCSA's fiscal year 2000 and 2001 budgets do not include a specific set aside for implementing section 4018 of TEA-21.

To implement Section 40201, FHWA (now FMCSA) published, in the Federal Register of January 27, 1999, a request for comments on the feasibility of using law enforcement officers to perform post-accident alcohol testing currently required of industry under the provisions of 49 CFR 382.303. Comments have been received from the law enforcement community, motor carrier industry, and other interested parties. The required report to Congress is now being prepared. The motor carrier industry noted that, in many instances, it is impossible for them to have the testing performed within the required two-hour time period. However, there was virtually unanimous agreement among law enforcement respondents that no testing can be performed in the absence of "probable cause." Since it appears that there are serious obstacles to non-probable cause testing by law enforcement officials, it is anticipated that the current provisions of 49 CFR 382.303 will remain in effect.

We have developed technical capabilities to support a plan we are finalizing to conduct a pilot program with one or more states to respond to Section 4022(a)(1) and (2)(A). The remainder of Section 4022 is being incorporated into our efforts to satisfy the requirements of Section 221 of the Motor Carrier Safety Improvement Act of 1999. To date, we have allocated no fiscal year 2000 funds for this project.

A report on the analysis required by Section 4026, on the Assessment of Non-Carrier Encouraged Violations of Motor Carrier Safety Regulations, is currently under review by FMCSA. The purpose of the study was to examine the extent to which commercial shippers and others involved in interstate commerce impose demands for the timely delivery of goods that may result in commercial motor vehicle operators' violation of the Federal Motor Carrier Safety Regulations (FMCSRs), including driver's hours of service (HOS).

The report recommends various options and policy options, which include legislative, regulatory, and non-regulatory actions (e.g., education, outreach, encouragement of industry best practice standards) to deal with shippers and others encouraging violations of the FMCSRs. The findings of the study and an agency proposal will be forwarded to the Congress. We have set aside no fiscal year 2000 funds to implement this section. We do, however, plan to allocate \$150,000 for such an effort in fiscal year 2001.

Question. If there is a specific funding set aside in the fiscal year 2001 budget to implement each of these sections, please list the amounts.

Answer. There are no specific funding set asides in the fiscal year 2001 budget for any of these activities. Staff resources are associated with each of these activities and the costs associated with the assigned staff are attributable to these initiatives.

REGISTRY OF MEDICAL EXAMINERS

Question. Have you requested funds to begin to establish a registry of medical examiners in fiscal year 2001? If not, is this a worthwhile activity or is the idea premature? How much would be required to initiate this project?

Answer. No. The FMCSA will publish a notice of proposed rulemaking (NPRM) this fall, requesting comments on its proposal to link the driver physical qualification determination with the commercial driver's license (CDL) process. After the FMCSA has reviewed the comments to that docket, it will determine if a registry of medical examiners should be established and what it would cost to initiate and maintain such a registry.

REGULATORY DOCKETS

Question. Please list each of the open regulatory dockets pertaining to motor carriers.

Answer. The following table lists each open regulatory docket of the Federal Motor Carrier Safety Administration. We have included regulatory identification numbers for each rulemaking action; both the old RINs assigned when the rules were initiated by the FHWA and the new RINs assigned for the FMCSA. We have also included a brief description of each rulemaking action and the current status of the open dockets.

REGULATORY ACTIONS

Question. Please list each of the regulatory actions taken during fiscal year 1999 and thus far during fiscal year 2000.

Answer. The following table lists all rulemaking notices published in fiscal year 1999 and in fiscal year 2000, as of May 19, 2000. The table presents the title of the rulemaking notice, identifies the type of rulemaking action, and provides the Federal Register cite for reference.

| Title of rulemaking action | Type of action | Federal register cite |
|---|--|---------------------------------|
| Fiscal Year 1999 Rulemakings | | |
| Safety Fitness Procedures | Final rule, corrections | 63 FR 62957; November 10, 1998. |
| Federal Motor Carrier Safety Regulations; Waivers, Exemptions, and Pilot Programs; Rules and Procedures. | Interim final rule; request for comments. | 63 FR 67600; December 8, 1998. |
| General Requirements Inspection, Repair, and Maintenance; Intermodal Container Chassis and Trailers. | Advance notice of proposed rulemaking; request for comments. | 64 FR 7849; February 17, 1999. |
| Motor Carrier Safety Assistance Program (MCSAP) | Notice of proposed rulemaking (NPRM); request for comments. | 64 FR 11414; March 9, 1999. |
| Parts and Accessories Necessary for Safe Operation; Lighting Devices, Reflectors, and Electrical Equipment. | Final rule | 64 FR 15588; March 31, 1999. |
| Qualifications of Motor Carriers to Self-Insure Their Operations and Fees to Support the Approval and Compliance Process. | Notice of proposed rulemaking (NPRM); request for comments. | 64 FR 24123; May 5, 1999. |
| Safety Fitness Procedures | Notice of proposed rulemaking (NPRM); request for comments. | 64 FR 44460; August 16, 1999. |
| Parts and Accessories Necessary for Safe Operation; Rear Impact Guards and Rear Impact Protection. | Final rule | 64 FR 47703; September 1, 1999. |
| Commercial Driver Disqualification Provision | Final rule | 64 FR 48104; September 2, 1999. |
| Federal Motor Carrier Safety Regulations; Definition of Commercial Motor Vehicle. | Interim final rule; request for comments. | 64 FR 48510; September 3, 1999. |
| Federal Motor Carrier Safety Regulations; Requirements for Operators of Small Passenger-Carrying Commercial Motor Vehicles. | Notice of proposed rulemaking; request for comments. | 64 FR 48518; September 3, 1999. |

| Title of rulemaking action | Type of action | Federal register cite |
|--|------------------|--------------------------------|
| Fiscal Year 2000 Rulemaking Notices | | |
| Organization and Delegation of Powers and Duties; Recission of Delegation of the Administrator, Federal Highway Administration and Redelegation to Director, Office of Motor Carrier Safety. | Final rule | 64 FR 56270; October 19, 1999. |
| Organization and Delegation of Powers and Duties; Redelegation to the Director, Office of Motor Carrier Safety. | Final rule | 64 FR 58356; October 29, 1999. |
| Motor Carrier Safety Regulations | Final rule | 64 FR 58355; October 29, 1999. |
| Rules of Practice for Motor Carrier Proceedings; Violations of Commercial Regulations. | Final rule | 65 FR 7753; February 16, 2000. |
| Safety Fitness Procedures; Safety Fitness Rating Methodology. | Final rule | 65 FR 11904; March 7, 2000. |
| Motor Carrier Safety Assistance Program | Final rule | 65 FR 15092; March 21, 2000. |
| Hours of Service of Drivers | NPRM | 65 FR 25540; May 2, 2000. |
| Federal Motor Carrier Safety Regulations: Technical Amendment. | Final Rule | 65 FR 25285; May 1, 2000. |

MOTOR CARRIER RESEARCH AND TECHNOLOGY

Question. In House Report 106–180, DOT was directed to improve the budget justification for the motor carrier research area. The House Committee stated that: “Future budget requests should delineate the specific projects that will be funded and the exact amount for each project, similar to the format used by the Federal Railroad Administration’s next generation high-speed rail program.” How was this requirement implemented? How do you propose to further improve the fiscal year 2002 research budget justification?

Answer. The FMCSA (formerly, FHWA’s Office of Motor Carriers) has significantly improved its budget requests over the past two years, and will make further improvements in the fiscal year 2002 Motor Carrier Research and Development (MCR&D) budget request. These improvements are summarized below:

Fiscal year 2000.—The MCR&D program, and budget justification, were reorganized by focus areas to provide better information on the safety problems targeted by MCR&D projects.

Fiscal year 2001.—In accordance with the Congressional request and in a similar manner to the Federal Railroad Administration, FMCSA provided, for each of nine focus areas, a matrix listing all projects receiving funding over three years (fiscal years 1999, 2000, and 2001) and the amount(s) received or requested. A summary chart compared total funding levels for each focus area across the three years. Each focus area write-up included information on the most important FMCSA programmatic safety goals being addressed (i.e., FMCSA Safety Action Plan items), and each project receiving fiscal year 2000 and/or fiscal year 2001 funding was described.

Fiscal year 2002.—The FMCSA MCR&D budget justification will be expanded by the inclusion of paragraph summaries of all projects receiving funding in the three years addressed (fiscal years 2000, 2001, and 2002). In addition, more detailed explanations and justifications will be provided for new fiscal year 2002 initiatives and for major changes in focus area funding.

SCHOOL TRANSPORTATION SAFETY AND OPERATION RESPOND

Question. In the fiscal year 2000 conference report, the conferees stated that: “\$200,000 shall be available to conduct the school transportation safety study and \$350,000 shall be available for Operation Respond.” How much money was allocated for each of these activities in fiscal year 1999, how much is planned in fiscal year 2000, and how much is requested for fiscal year 2001. What progress has been made in implementing each directive?

Answer.

| | Fiscal years— | | |
|---|---------------|---------|-------|
| | 1999 | 2000 | 2001 |
| School Transportation Study (NHTSA) | 50,000 | 200,000 | |
| Operation Respond (FHWA) | 375,000 | 350,000 | |

FMCSA did not include funding for either of these initiatives in the proposed fiscal year 2001 budget.

The Transportation Safety Board (TRB) School Transportation Safety study mandated in TEA-21 (Sec. 4030) began with the award of \$50,000 from NHTSA to TRB at the end of fiscal year 1999. An additional \$200,000 of fiscal year 2000 funds transferred from FHWA to NHTSA is currently in the award process. A final amount of \$200,000 is planned to be awarded in fiscal year 2001. Currently TRB is finalizing the selection of committee members. The first committee meeting will be held at the beginning of June. The study is expected to be completed by October 2001.

The funds for Operation Respond have been allocated to support a detailed Statement of Work (SOW) recently completed and agreed to by FMCSA, FHWA and Operation Respond. The Tasks in the SOW include:

- building an internet based version of the Operation Respond Emergency Information System (OREIS);
- building an interface with intermodal technology initiatives being conducted by FHWA;
- continued integration and installation of OREIS into two additional Traffic Management Centers (TMCs); and
- to incorporate OREIS into select border crossing sites on the Northern and Southern border, to promote the safe movement of vehicles across our international borders.

SMART COMMERCIAL DRIVER'S LICENSE

Question. In the fiscal year 2000 conference report, the Committee requested that FMCSA provide up to \$1,000,000 for the testing and development of a smart commercial driver's license, utilizing smart card and biometric elements to enhance safety and efficiency. What has FMCSA done to implement the objective? How much will be allocated during fiscal year 2001 on those activities?

Answer. The FHWA began to implement this objective in 1996 with a study of the feasibility of smart cards for commercial drivers licenses. The study's final report concluded that: "Analysis shows that enhancing the CDL is most feasible through the use of a smart card for all drivers, not only commercial drivers. However, smart card tracking of hours of service was not found to be institutionally feasible. Although beneficial to law enforcement, smart card tracking of hours of service could be effectively opposed by drivers and carriers at several stages of system implementation." The American Association of Motor Vehicle Administrators is working to standardize smart card technology. One Canadian province is scheduled to issue smart cards beginning in calendar year 2001.

Currently, the FMCSA is evaluating the best biometric elements to uniquely identify a commercial driver. The FMCSA has a Cooperative Agreement with the California Department of Motor Vehicles to determine both the optimum combination of fingerprint and facial images to best detect license fraud and the optimum communication protocol to exchange fingerprint images between states electronically. California is one of 3 states which will collect a total of 32,000 sample digital facial images and sets of fingerprints from volunteers. A random sample of records will be duplicated and sent to vendors to see if they can identify the duplicate records. The project started in fiscal year 1999 with \$100,000 in research funds. Funding for fiscal year 2000 is \$100,000 in Motor Carrier Safety Assistance Program funds and \$100,000 Intelligent Transportation Systems/Commercial Vehicle Operations funds. The project is scheduled for completion in October, 2001. No further funding for fiscal year 2001 is planned.

NADS

Question. Please discuss FMCSA's expected involvement in the NADS during fiscal year 2000 and fiscal year 2001.

Answer. During fiscal years 2000 and 2001, FMCSA is conducting a National Advanced Driving Simulator (NADS) Utilization Study. The NADS Utilization Study will identify potential, but realistic, uses of the NADS as a tool to help FMCSA accomplish its motor carrier safety research goals and objectives in areas such as fatigue, hours of service, impact of drugs and alcohol on driver performance, medical conditions, driver selection, driver performance evaluation and enhancement, assessment of technologies for improving CMV driver safety, and refinement of simulation technology for driver training and licensing purposes. Specifically, this study will: (1) review the goals and planned projects of the Motor Carrier Research and Development (MCR&D) program and identify potential contributions of advanced simulation research; (2) assess and delineate the capabilities and status of the NADS for

MCR&D and for CMV safety research in general; and (3) identify specific NADS-related R&D opportunities. A "menu" of potential projects will be described in terms of objectives, background (problem discussion, summary of current knowledge, and rationale for the study), research methodology (including principal tasks or phases), critical NADS features/requirements (existing or new), critical contractor capabilities/facilities, period of performance, funding requirements, potential partners, final products and applications, and product dissemination/implementation plans. FMCSA will fund experiments on the NADS commencing in fiscal year 2002. FMCSA regards the NADS as a potentially useful research tool for addressing many CMV driver safety issues. However, like any research tool, its applicability and cost-effectiveness for a research problem is being carefully assessed prior to use.

Question. Please specify dollar amounts associated with each project by year.

Answer. The NADS Utilization Study is funded at \$100,000: \$60,000 in fiscal year 2000 and \$40,000 in fiscal year 2001.

UNSAFE CAR DRIVING PRACTICES

Question. What is the status of the DOT research project on unsafe car driving practices in the vicinity of trucks? What is the purpose of the study, and when will it be completed? What are the funding levels for fiscal year 1999 and fiscal year 2000 for that project? How much will be spent during fiscal year 2001?

Answer. The purpose of this recently completed project was to identify unsafe driving practices unique to cars traveling in the vicinity of trucks and show the relationship between these behaviors and crashes.

The study provided a list of unsafe driving acts that were recommended to be included in training materials for law enforcement officers, truck drivers, and novice operators of passenger vehicles. An Unsafe Driving Acts Guide and a draft script for a training video intended for law enforcement officers were prepared.

There were no funds expended on this project in fiscal year 1999. In fiscal year 2000, we are implementing the recommendations in the final report by developing training materials aimed at educating passenger vehicle drivers about the mechanical and operating characteristics of commercial motor vehicles (CMVs), and what to do to avoid crashes with CMVs. Funding for this effort is estimated at \$100,000.

In fiscal year 2001, we will expand the previous research to focus on developing training materials to educate CMV drivers concerning how to avoid crashes with other vehicles, emphasizing defensive driving strategies and safe practices. Funding for this research is estimated at \$250,000.

The products of these efforts will be incorporated into FMCSA's expanded share the road program, and will be distributed using a number of marketing strategies, including the internet.

FATIGUE R&D PROGRAM

Question. Which aspects of your current fiscal year 2000 and planned fiscal year 2001 fatigue R&D program will provide information useful in conducting rule-making related to each of the outstanding NTSB recommendations on truck driver fatigue? How much is being allocated for these activities?

Answer. There are four outstanding NTSB recommendations to FMCSA relating to driver fatigue. These recommendations are listed below, along with information on relevant FMCSA R&D projects:

H-95-3 Examine truck driver pay compensation to determine if there is any affect on hours-of-service violations, accidents, or fatigue.

The FMCSA began a study of the impact of pay compensation practices on safety in 1998. The Phase 1 work plan and literature review are complete. The analysis of data on the possible relationship of pay compensation method to safety is underway, and is due for completion in the Spring of 2001. This project is allocated \$100,000 in motor carrier R&D funds in both fiscal year 2000 and fiscal year 2001.

H-95-4 Complete rulemaking within 2 years to amend 49 CFR 392 and 395 to prohibit scheduling practices and the acceptance or scheduling of shipments which would require that the driver exceed hours-of-service regulations.

The report on the Assessment of Non-Carrier Encouraged Violations of Motor Carrier Safety Regulations has been completed and is currently under review by the FMCSA. The purpose of the study was to examine the extent to which commercial shippers and others involved in interstate commerce impose demands for the timely delivery of goods that may result in commercial motor vehicle operators' violations of Federal Motor Carrier Safety Regulations, including commercial driver hours-of-service (HOS). The report includes recommendations and policy options for addressing this issue. In addition to prior funds committed to this program from both

MCR&D and non-MCR&D sources, the project is budgeted for \$200,000 in MCR&D funding in fiscal year 2001.

H-99-4 A fatigue video for motor coaches to include inverted sleep periods.

FMCSA recently completed a project identifying unique factors affecting motor coach driver fatigue, such as interactions with passengers and inability to stop for naps or personal breaks, and recommended countermeasures. The project produced a video targeted to the motorcoach industry and drivers, which includes information on circadian rhythms and inverted sleep cycles, and instruction on the need for enlightened driver scheduling and on how to minimize the effects of inverted sleep schedules. This project was allocated \$149,000 in fiscal year 1999. No expenditures are planned for fiscal year 2000 and fiscal year 2001.

H-99-19 Establish within 2 years, science-based hours-of-service regulations that set limits on hours of service, provide predictable work and rest schedules, and consider circadian rhythms and human sleep and rest requirements. The revised regulations should also (a) require sufficient rest provisions to enable drivers to obtain at least 8 consecutive hours of sleep after either driving for 10 hours or being on-duty for 15 hours, and (b) eliminate 40 CFR 395.1 paragraph b, which allows drivers with sleeper berth equipment to cumulate the 8 hours of off-duty time in two separate periods.

It is widely recognized that the current hours-of-service (HOS) regulations are incompatible with current knowledge of human sleep requirements. The FMCSA has prepared a Notice of Proposed Rulemaking (NPRM) on driver HOS, whose publication is imminent, that provides, among other issues, enough daily time off for a driver to obtain sufficient sleep. The NPRM is based on the most current scientific knowledge of driver fatigue.

The split sleeper berth provision of the current HOS is one of the most problematic of HOS issues and is one for which there is little empirical data. Current Congressionally-mandated FMCSA research on sleeper berths is gathering data on the quality of sleep under various conditions, including sleeper berths in moving and parked vehicles. The next phase of this research, beginning in fiscal year 2001, will specifically address the split sleeper berth provision of the HOS.

FMCSA has allocated \$400,000 in fiscal year 2000 and \$410,000 in fiscal year 2001 for HOS support, including cost-benefit analysis of various options and related analysis and research on HOS-related operational issues. Funding for sleeper berth research includes \$242,000 in fiscal year 2000 and \$400,000 in fiscal year 2001.

Fatigue Management Technologies Pilot Test.—FMCSA has initiated, in response to Congressional direction, a pilot test of fatigue management technologies, including the actigraph (a wrist-worn sleep monitor), in-vehicle alertness monitoring, lateral lane tracking, in-vehicle “black box” performance monitoring, and fatigue-reducing vehicle steering linkage. The project will incorporate a study of individual differences in commercial motor vehicle driver susceptibility to fatigue and employ two alternative work-rest schedules. The use of alternative work-rest schedules is enabled by TEA-21 legislation granting FMCSA broader waiver/exemption authority for safety pilots. The Phase 2 data collection will begin in mid-year 2000. FMCSA believes that fatigue management technologies should be viewed primarily as aids to self and fleet management, not as instruments of surveillance. Both FMCSA Motor Carrier R&D and ITS Intelligent Vehicle Initiative funds are contributing to this project; Transport Canada is also contributing funds and participating in project management. Part of the test will be conducted in Canada and will involve international U.S./Canadian runs. This project is allocated \$518,000 in motor carrier R&D funds in fiscal year 2000 and \$518,000 in fiscal year 2001.

NEW PROJECT STARTS

Question. Please specify how each of the new project starts requested in the fiscal year 2001 research budget request will be used in direct support of current rulemakings or regulatory responsibilities.

Answer. In addition to numerous ongoing studies, the FMCSA Motor Carrier Research and Development program includes the new fiscal year 2001 starts listed below that are directly relevant to current or planned rulemakings or the agency's regulatory responsibilities:

Crash Risk Analysis.—The FMCSA is planning a fleet-based case control study in fiscal year 2001 comparing crash-involved and non-crash involved drivers and vehicles to identify and quantify risk factors relevant to FMCSA regulatory and other safety programs, such as driver medical conditions and training history. This will supplement the on-going major crash causation study being conducted by FMCSA in conjunction with the National Highway Traffic Safety Administration's National Automotive Sampling System.

Economic Model for Commercial Motor Vehicle (CMV) Safety Interventions.—This fiscal year 2001 Regulatory Research and Analysis Support project will develop and refine safety performance and cost models that could be used to evaluate the expected safety benefits and economic impacts of proposed regulatory initiatives, new enforcement strategies, technology advances, or incentive programs on CMV safety.

Performance-Based Physical Qualifications: Diabetes.—Research beginning in fiscal year 2001 will provide regulatory analysis support to new performance-based physical qualifications relating to diabetes.

IMPLEMENTING MOTOR CARRIER SAFETY IMPROVEMENT ACT

Question. Congress enacted significant legislation to establish a Federal Motor Carrier Safety Administration dedicated to truck and bus safety. What are the key challenges in implementing the new Act? What is the Department doing to meet these challenges?

Answer. The greatest challenges in implementing the Motor Carrier Safety Improvement Act of 1999 are in simultaneously, not sequentially, addressing the breadth of its new programmatic directives and establishing the new motor carrier safety agency. In fiscal year 2000, this must be done without an increase in personnel. We have succeeded in strengthening enforcement, conducting more compliance reviews and increasing penalties. We have quickly established the new agency and moved existing personnel into place. The Act requires major new initiatives in driver licensing and record exchange, safety reviews of new carrier entrants, enforcement of motor carrier licensing requirements, and enforcement at the Southern border. The FMCSA will substantially increase the number of safety investigators in the field and inspectors at the Southern border; expand its work with organizations such as the Commercial Vehicle Safety Alliance, the American Association of Motor Vehicle Administrators, and other safety partners; and enhance its regulatory process so stakeholders have a greater opportunity to communicate with the agency and participate in the initial stages of rule development.

Question. The Motor Carrier Safety Improvement Act of 1999 states that foreign boundaries of a commercial zone can be subject to civil penalties and will be disqualified from operating a commercial motor vehicle anywhere in the U.S. How should the Department ensure that this requirement is implemented and enforced?

Answer. FMCSA has already promulgated a final rule to incorporate the civil penalty provisions of the MCSIA that are applicable to foreign motor carriers discovered to be operating outside of the border commercial zones. The new civil penalty provisions were recently incorporated into a revised 49 CFR part 386. The final rule was published on February 16, 2000 and became effective on March 17, 2000. This rule is significant because FMCSA civil penalty assessment procedures now apply to Mexican motor carriers for commercial zone violations, whereas prior to the rule, the procedures were only applicable for safety violations.

FMCSA will conduct an outreach program to make all state enforcement partners fully aware of the prohibition on allowing Mexican-based motor carriers to operate outside of the border commercial zones. To aid in this effort, the FMCSA will issue a policy statement this Spring requiring each state to detail its registration enforcement activities in their respective Commercial Vehicle Safety Plans (CVSPs). The FMCSA will explore adding a provision related to commercial zone enforcement to the North American Standard Driver Vehicle Inspection Course.

FMCSA is also developing automated reports to identify Mexican based motor carriers that have been inspected outside the border commercial zones. The reports will be compiled from the FMCSA's Motor Carrier Management Information System. Preliminary plans call for these reports to be provided to the FMCSA State Directors in CA, AZ, NM and TX. Identified occurrences will be investigated and, if appropriate, enforcement action will be initiated (i.e., civil penalty assessment) by the FMCSA division offices.

FMCSA is developing training on collecting evidence sufficient to support this enforcement. FMCSA will work with the states in setting up agreements which will allow state enforcement official to participate in this enforcement.

In accordance with the Act, intentional and repeat violators, as well as foreign motor carriers that do not respond to civil penalty notices, will be disqualified from operating in the U.S. through suspension of their Certificates of Registration. FMCSA is developing procedures to implement this requirement.

Question. Please break out in detail how the administrative funds were used for fiscal year 1999 and fiscal year 2000.

Answer. The information follows.

Fiscal Year 1999 Administrative Funds

| | <i>Amount</i> |
|---|---------------|
| \$1,000,000 available: | |
| National Training Center (For state training courses and state Associate Staff travel) | \$780,000 |
| ASPEN-32 Technical Work Group (State travel funds for one person from 10 States to participate on the TWG. This is a two-year effort.) | 60,000 |
| Support for the Analysis and Information Web site | 90,000 |
| Guardian Newsletter | 14,000 |
| Miscellaneous MCSAP and FMCSA-related Services and Supplies (e.g., invitational travel, conference room rental, plaques, optical updates) | 56,000 |
| \$1,187,500 available: | |
| National Training Center (For state training courses and State Associate Staff travel) | 950,000 |
| Printing of "Stopping Safely" Pocket Manuals (100,000 manuals printed and distributed during the International Safety Week.) | 15,495 |
| Miscellaneous MCSAP-related Services and Supplies (e.g., invitational travel, conference room rental, plaques) | 37,780 |

1.25 percent of the MCSAP appropriation makes up the Administrative Take-down. Legislation requires at least 75 percent of the Administrative Takedown to be used for MCSAP State personnel training and Associate Staff Travel costs. Traditionally, we have allocated approximately 85 percent to 90 percent of the Administrative Takedown funds for these purposes. The remainder is allocated for administrative expenses.

RABA DISTRIBUTION

Question. How does FMCSA propose to use the increased funding that would be derived from the RABA distribution specified under existing law?

Answer. The FMCSA plans to use the increased funding from the RABA distribution for Commercial Drivers License (CDL) improvement grants to the states.

CRASH COLLECTION DATA BASE IMPROVEMENT PROJECT

Question. Is it correct that the fiscal year 2001 budget request includes \$2.75 million for the crash collection data base improvement project and not the \$5.0 million required under Section 225 of the MCSIA?

Answer. Yes, the fiscal year 2001 budget includes \$2.75 million from general operating expenses for the crash data improvement project. However, the fiscal year 2001 budget proposal also includes \$5.0 million from Section 225(f) Information Systems funding that FMCSA will use for this initiative for a total of \$7.75 million in fiscal year 2001. The \$7.75 million budgeted for the early stages of this initiative was considered an adequate funding level. *Question.* Does the crash collection data base improvement project include all of the required components or activities needed to implement Section 225?

Answer. Yes, the truck and bus crash data system project will include all the requirements of the subsections of Section 225 as follows: (1) Agreements will be signed with individual states to improve the collection and reporting of crash data to NHTSA and FMCSA. (2) FMCSA will sign a cooperative agreement with NHTSA to administer the program. The document will include a provision for agreements with the states for data collection and training for state and local personnel involved in the data collection. (3) NHTSA will insure that data (including driver citation data) on all truck and bus crashes are reported to the FMCSA Motor Carrier Management Information System which has links to the Commercial Drivers License Information System conviction data. FMCSA data files are and will be available to the public. (4) A report to Congress will be prepared within the three-year time frame. *Question.* How much will be spent on this effort during fiscal year 2000?

Answer. FMCSA will spend \$4 million on the Section 225 truck and bus crash data improvement project during fiscal year 2000.

SECTION 225

Question. How do you propose to implement Section 225?

Answer. FMCSA and NHTSA have begun a cooperative effort to improve the completeness, timeliness and accuracy of commercial vehicle crash reporting. The first priority is to obtain selected data on the approximately 50,000 truck and bus crash-

es each year that are not reported by the states to FMCSA. These data are essential to identify high risk carriers and improve reporting of driver citations to the CDLIS and will be uploaded through the SAFETYNET software that the states currently use. Up to ten states are expected to participate in the first phase of this effort later this year. The second priority of the project will be to collect an expanded set of truck and bus crash data elements that will allow improved analysis of the circumstances and reasons for these crashes. Efforts to collect these additional analysis data elements will not begin until the first goal of collecting data on all truck and bus crashes has been met.

SECTION 225 OF MCSIA

Question. Is the Agency legally required to allocate the amount specified in Section 225 of MCSIA?

Answer. Yes. FMCSA has reevaluated Section 225(e) and concluded that, as authorized, \$5 million of 104(a)(1)(B) is only available for the crash data improvement project. As discussed in the answer to #56, FMCSA's proposal to use only \$2.75 million was based on our assessment that the overall funding of \$7.75 million, was adequate for the early stages of this initiative. Without further Congressional direction, FMCSA will amend our spending plan to provide the full \$5 million from 225(e) and reconsider whether the entire \$5 million from 225(f) will be used for this initiative.

POSITIONS SUPPORTING MCSAP

Question. Why did FMCSA decide not to request an increase in the number of positions supporting the MCSAP? What additional workload will be placed on the staff given the substantial increase in funding and growth of the program provided under MCSIA? Are there any surveys or covert operations planned to monitor this challenge with the results being submitted to FMCSA?

Answer. FMCSA is committed to operating the headquarters office with a minimum of staff resources and rely on the field staff, located in the state Division Offices, to primarily deliver and oversee MCSAP. The increase in MCSAP funding will appropriately expand existing State programs and does not significantly impact the FMCSA overall oversight responsibility. FMCSA is confident that our Division Offices will be the front line managers of the MCSAP program and that adequate resources are programmed to provide the appropriate level of assistance and oversight to these State programs. No specific plans exist to survey this challenge. However, FMCSA's new organizational structure includes a State Programs Division and a Division that has the responsibility to perform program evaluations. MCSAP will be given full consideration for an early program evaluation.

MCSAP

Question. Please provide the empirical basis and strategic thinking that were used to determine the allocation requested on page 4.5 of the budget justification.

Answer. Of the original \$165 million in MCSAP funds (before RABA), \$5 million each is allocated for Information Systems and the Crash Causation Study. Of the remaining \$155 million, 1.25 percent (\$1,937,500) is set aside for State Training and Administration, and 10 percent (\$15,500,000) is set aside for Border and High Priority Initiatives. Of the remaining \$137,562,500, 5 percent (\$6,878,125) is set aside for Performance Incentive Grants. The remaining \$130,684,375 is reserved for Basic Motor Carrier Safety Programs.

BORDER AND HIGH PRIORITY INITIATIVES

Question. What is the rationale behind the \$15.5 million request for border and high priority initiatives? Please break out by activity how those funds will be allocated?

Answer. High Priority projects to be funded for fiscal year 2001 have not yet been selected. The agency has developed a set of criteria to use for evaluating proposed projects including the following questions:

- (1) How will this project serve to improve one or more of the MCSAP National Program Elements? (e.g., inspections, compliance reviews, traffic enforcement, data collection and analysis, and education and outreach)?
- (2) Will the project support identification of new technologies not currently available for commercial vehicle safety enforcement or safety programs?
- (3) Will the project support or promote effective state commercial motor vehicle safety program planning and implementation?
- (4) What is the programmatic impact and evaluation design for the project?

(5) How will this project serve to benefit, enrich, augment, assist, or evaluate state(s) commercial motor vehicle safety programs?

A request for proposed projects will be made late this summer. Final project decisions will be made early in the new fiscal year.

Question. Are you planning to use any of the high priority funds for this purpose? If not, please explain why.

Answer. The \$15.5 million allocated for border and high priority initiatives represents the total of \$7.75 million for each category. It is not anticipated that high priority funds will be used for border activities, since we typically receive more requests for high priority projects than can be funded each year.

Question. Please list the high priority projects that were sponsored with fiscal year 1999 and fiscal year 2000 funds and the associated amount of funding to conduct each activity or project.

Answer. The information follows:

| | <i>AMOUNT</i> |
|---|---------------|
| Fiscal Year 1999 (\$4,500,000 available): | |
| Congressionally mandated study of the effects of MCSAP grant reductions | \$175,000 |
| Performance-based MCSAP Training for state Personnel | 120,000 |
| Commercial Vehicle Safety Partnership Program (formerly JOP) | 100,000 |
| National Judicial College | 50,000 |
| Traffic Enforcement Effectiveness Study | 150,000 |
| Effective Sanctions Study | 50,000 |
| Massachusetts Training Center | 108,000 |
| Idaho Video Project | 350,000 |
| CVSP Database | 98,000 |
| Driver Diversion/Deferral Study | 225,000 |
| Pilot Test New Driver/Brake Inspection Protocol | 100,000 |
| Minnesota Crash Investigation Course | 75,000 |
| Risk Management Methodology and Safety Programs | 125,000 |
| State Intergovernmental Personnel Exchange (2) | 206,000 |
| National Traffic Law Center | 150,000 |
| FMCSA Safety Compliance Microcomputer Support (VOLPE) | 675,000 |
| Maryland's Aggressive Driver Imaging and Enforcement project | 20,000 |
| TML Information Systems work related to Mexico | 450,000 |
| Support for the Commercial Drivers License program (AAMVA) | 100,000 |
| Grants to states (WA, MN, NJ, UT, MA) to improve inspection data quality | 108,000 |
| Grants to states (FL, WV, LA, NC, OH, MS, MD, NV) to improve accident reporting data quality | 455,000 |
| Grants to states (ME, NM) for the Driver History Initiative project | 110,000 |
| Grant to Colorado to design a program to reduce commercial vehicle accidents and fatalities | 200,000 |
| Grant to North Dakota to continue the enhancement of the ASPEN-32 third generation roadside inspection software | 200,000 |
| Grant to Kentucky for Infrared Brake screening, testing, and evaluation | 100,000 |
| Fiscal year 2000 (to date) (\$4,750,000 available): | |
| DIAP Analysis (EPIC) \$64,000 Commercial Vehicle Safety Partnership Program (formerly JOP) | 156,000 |
| Risk based Commercial Vehicle Safety Plan training | 300,000 |
| Support for the Analysis and Information (A&I) Online System | 100,000 |
| Effective Sanctions Study | 75,000 |
| Development and testing of Unique Identifiers for the CDL program | 100,000 |
| Support for the Commercial Drivers License program (AAMVA) | 100,000 |
| Evaluation of Top Ten states and improve collection of comprehensive and accurate crash data | 268,000 |
| Grants to CVISN pilot states (CT, WA, MI, OR) | 2,000,000 |

MCSAP

Question. What has FMCSA done since last year to upgrade MCSAP sites with new technology to help focus inspections on high-risk bus and trucking companies?

Answer. FMCSA has devised a very effective means of focusing MCSAP enforcement resources on high-risk motor carriers. SafeStat is an information prioritization system which ranks motor carriers according to safety risk and generates a score

and rank order list every six months. This process focuses enforcement efforts on problem carriers.

SafeStat scores are now fed into the roadside prioritization algorithm which powers the Inspection Selection System. ISS is deployed in all states except California and Texas and is used along the roadside to prioritize selection of carriers for Driver/Vehicle Safety Inspections. ISS is decision assisting software which, when offered a U.S. DOT #, MC # or carrier name will display a recommendation of: INSPECT, PASS, or OPTIONAL along with a numeric risk score (0–100). This helps the roadside inspector decide whether to inspect a vehicle. In addition ISS provides a variety of additional data which can be consulted prior to an inspection. This type data includes carrier insurance status, operating authority status, past inspection out-of-service rate, past areas of excessive violations, fleet size, etc.

ISS, has been enhanced this year with introduction of ISS–2. The new ISS–2 is an overall enhanced system with more accurate scoring and easier identification of carriers. This summer FMCSA will introduce a new ASPEN v2 driver/vehicle inspection software which will expedite the inspection process even further.

ISS scores are also being used in the PrePass electronic screening system and are being considered for NorPass. This will provide a uniform safety screening process across the United States. California is also moving toward use of ISS, possibility as early as this summer. The FMCSA PRISM program to check carrier safety status during the registration process generates a sanctioned carrier list for priority inspection. ISS now flags these priority PRISM carriers and requests that they be given priority for inspection.

FMCSA is encouraging expenditures for inspection selection technology, with reimbursement under MCSAP. FMCSA continues to encourage states to test and adopt technologies that serve to improve roadside inspection effectiveness and efficiency.

Question. Please summarize the progress to date, remaining challenges, and outlook for future deployments during the next few years. Please assess the costs and benefits of those investments.

Answer. There are several projects underway to refine identification of high risk carriers and focus enforcement resources toward those companies. One ongoing project allows states to assign a U.S. DOT # to intrastate carriers. Once carriers are identified with a U.S. DOT #, all the various FMCSA data collection and analysis systems will function. ISS scores, for example, can be generated for this large group of carriers. This is particularly important because a significant number of these carriers actually move between intra and interstate commerce. There are significant additional FMCSA system costs (\$0.5 million/yr) to process this data. These costs are not currently covered in the FMCSA IT budget and that has slowed these efforts. The benefits are substantial in that they allow us to focus our resources to identify high risk intrastate carriers. Given that intrastate carriers are responsible for 20 percent of our fatalities, it is important to focus resources on them if we are to meet our 50 percent fatality reduction goal and provide this substantial benefit to the program.

A decision is being evaluated to increase the SafeStat score calculation rate from every 6-months to every three months. This will enhance data accuracy and is highly favored by the motor carrier industry because it allows their safety improvements to be more quickly reflected in the prioritization systems. Cost is a major issue here since SafeStat currently still runs on a mainframe system. FMCSA is about 2-years from fully moving these systems to an enhanced Oracle server system.

A new initiative at FMCSA is to develop a sophisticated third generation unified query system called Query Central (QC) which will allow combining six different critical safety information queries (ISS, Past Inspections, Commercial Driver License Status, PRISM, Licensing and Insurance) into a single, simple query. Targeted for early deployment on the Mexican-American border, Query Central will greatly speed delivery of decision level data to the roadside inspection sites. This system will be based on the latest web-based technology and employ considerable advanced analysis to deliver maximum information with minimum effort at the inspector level. While initial development of QC has been funded and will be done by the same group as ISS, the need remains to build a wireless infrastructure to allow roadside and carrier office queries to be entered into the web-based system.

FMCSA has a small wireless information delivery project underway, but has no funding for a full development effort or grants to states to allow procurement of a wireless infrastructure. Estimates for state deployment are \$7–\$8 million, but before that, additional development funding of \$2 million is needed. States are very interested in early deployment. FMCSA also has a small project for adding Voice Recognition technology to this effort.

Another area of active development is enhancement of data quality to further improve the prioritization systems. A new project is underway to evaluate how most effectively to use commercial driver citation data in the SafeStat system. There are also several projects underway to improve collection of commercial motor vehicle crash information.

An additional benefit that identification of out-of-service violators has increased during the operation of the SAFER Data Mailbox (SDM). While this increase is influenced by a number of factors and is not completely attributable to the SDM, anecdotal information from individual users indicates that inspection queries to the SDM does help to identify violators. Individual enforcement officers have identified multiple offenders in a single shift using the SDM, including offenders with out-of-service violations and false log books that have been inspected earlier on the same trip.

DEPLOY CVISN

Question. How are you using MCSAP funds to help the states deploy CVISN?

Answer. In fiscal year 2000, we are using \$2 million of MCSAP high priority funds to support the CVISN Level 1 deployment efforts in four pilot states. The use of MCSAP high priority funds is critical for helping the Department achieve the Congressional goal of completing CVISN deployment in a majority of states by September 30, 2003. By the end of fiscal year 2000, based on a combination of using MCSAP high priority and ITS program funds, eight states (two CVISN prototype states and six pilot states) will be fully funded to complete Level 1 deployment.

Both MCSAP and CVISN are focused on improving safety and reducing the number of crashes involving commercial motor vehicles. CVISN supports MCSAP by providing more timely and accurate safety and related credentialing information, enabling state enforcement officials to use their resources more effectively to concentrate on high-risk and previously uninspected carriers, vehicles, and drivers.

BORDER PROJECTS

Question. Please list the border projects that were awarded during fiscal year 1999 and 2000, the recipients, and the purpose and nature of each project or activity along with associated funding amounts.

Answer. The Transportation Equity Act for the 21st Century (TEA-21) authorizes the Secretary to dedicate up to 5 percent of the Motor Carrier Safety Assistance Program (MCSAP) funds for border commercial motor vehicle safety program and enforcement activities and projects. Congress has appropriated the full 5 percent for border assistance in fiscal year 1999 (\$4,500,000) and fiscal year 2000 (\$4,750,000). These funds have been made available to both the northern and southern border states. However, in recognition of the special problems faced by the southern border states in addressing the current safety concerns and in preparing for full implementation of the North American Free Trade Agreement (NAFTA), proposals received from California, Arizona, New Mexico, and Texas have received priority consideration. Of the amount made available in fiscal year 2000, we are reserving \$575,000 to fund two projects which will benefit all border states: (1) develop software to provide better network access to border inspectors (\$500,000) and (2) conduct a study to determine the extent of the safety problems associated with the cross-border commercial van operations commonly referred to as camionetas (\$75,000). Sec. 212 of the Act of 1999 requires that we complete a rulemaking to determine which small passenger vans should be covered by FMCSRs and, at a minimum, apply the safety regulations to camionetas. Following is a summary of the amount awarded to each state that applied for the funds:

| State | Fiscal years— | |
|------------------|---------------|-------------|
| | 1999 | 2000 |
| California | \$1,505,800 | \$1,418,200 |
| Arizona | 530,900 | 370,800 |
| New Mexico | 551,000 | 553,800 |
| Texas | 1,826,300 | 1,832,200 |
| Washington | 60,000 | |
| Vermont | 26,000 | |

The majority of the funds were used for personnel services to step up state enforcement activities at the border. Other specific projects funded include purchasing vehicles, laptop computers and other equipment needed by inspectors, traffic en-

forcement activities, and development of software to integrate Mexican motor carriers into the existing automated pre-clearance systems. A portion of the funds allocated to California in fiscal year 2000 will also be used to conduct inspections targeting Mexico-domiciled commercial motor vehicles traveling beyond the scope of their operating authority.

INSPECTION PROGRAM AT SOUTHERN BORDERS

Question. How have you addressed each of the findings and recommendations specified in the IG's report number TR-1999-034 which pertains to the effectiveness of the inspection program at the southern borders?

Answer. We have responded to all the OIG's recommendations as follows. Many of these activities were under way prior to the OIG's report:

Recommendation 1.—Supplement border states with requisite federal inspectors at border crossings, and provide inspection facilities including communication lines and computers.

Response 1.—We have hired 40 federal inspectors to complement the 116 state inspectors working in the Southwest border area and plan to hire an additional 20 inspectors in fiscal year 2001. In addition, we purchased modular office space, including telephone and electrical connections at six Texas locations. We continue to work with Customs and INS to address space limitations within the ports of entry.

Recommendation 2.—Establish partnerships with border states to ensure requisite inspection presence is maintained at the border and throughout the states.

Response 2.—We continue to provide the states special funding above basic Motor Carrier Safety Assistance Program (MCSAP) grants to conduct additional compliance and enforcement activities and to encourage the states to make certain that inspection facilities are given priority consideration in the state's application for grants made available under the TEA-21 National Corridor Planning and Development Program (Section 1118), the Coordinated Border Infrastructure Program (Section 1119) and other Federal-Aid programs.

Recommendation 3.—Expedite procedural changes for Mexican carriers to obtain authority to operate in U.S. and ensure carriers provide more thorough information including the procedures they will use to ensure compliance with U.S. safety regulations.

Response 3.—We have drafted three related Notices of Proposed Rulemaking (NPRMS) that include totally revised application procedures for Mexican motor carriers. The proposed three-step process involves a new application form, a safety screen, and compliance and enforcement procedures. The draft rules are currently under review within DOT.

Recommendation 4.—Develop DOT identification numbers that will distinguish between commercial zone and long-haul Mexican trucks to serve as a control at the border for safety inspections and to expedite registration and insurance verification as border entry points are equipped with electronic scanning devices.

Response 4.—One of the draft rules currently under review, contains a method for easy identification of the type of operating authority that will be granted to a Mexican carrier. We are also testing the use of technologies for the electronic identification of carriers at selected ports of entry. The goal is to be able to make available to safety inspectors at the border information related to a carrier's registration, insurance, and safety record.

Recommendation 5.—Establish a NAFTA program director to address a consistent enforcement program from state to state, to identify needed resources and infrastructure improvements, and to quickly realign resources as needed.

Response 5.—The FMCSA has established a North America Borders Safety Programs Division with a designated Chief to advance our safety interests along the border.

Recommendation 6 (addressed to the Secretary).—Establish a federal interagency group to coordinate border issues with the many federal and state agencies with jurisdiction at the border.

Response 6.—The Department regularly participates in five interagency working groups that also include Canadian and/or Mexican government officials. These groups are charged with coordinating and monitoring a wide range of issues related to cross-border operations, facilitation, and infrastructure planning. DOT chairs two of these five groups: the Joint Working Committee on Transportation Planning (JWC) and the Transportation Consultative Group (TCG). In response to the inspector general's recommendation, the Office of the Secretary, which heads the TCG, will strengthen its efforts to solicit the views of U.S. federal and state agencies at U.S. delegation meetings to ensure that U.S. interests are properly and comprehensively represented at international meetings.

ALLOCATION OF INCENTIVE FUNDS

Question. What progress have you made in developing regulations to determine the allocation of incentive funds under the MCSAP, and when are those regulations likely to be issued in final form?

Answer. The Motor Carrier Safety Assistance Program Final Rule became effective April 20, 2000. Contained therein are regulations governing the allocation of MCSAP funds to the States, including Incentive Funds. The new distribution formulas will be used to allocate Basic Program Funds and Incentive Funds for fiscal year 2001.

RESEARCH BUDGET REQUEST

Question. What aspects of your research budget request pertaining to MCSAP could legally be supported with MCSAP funding? Please break out and specify amounts and projects.

Answer. The Motor Carrier Safety Assistance Program (MCSAP) High Priority funds can be used to support Motor Carrier Research & Development (MC R&D) projects if the projects increase either the effectiveness or efficiency of state motor carrier safety activities. The FMCSA MCR&D program contains a Compliance and Enforcement focus area. The following projects in this focus area, which total \$1,625,000 in the fiscal year 2001 MCR&D budget request, address commercial motor vehicle enforcement procedures, data systems, and technologies:

| | |
|---|-----------|
| Development, Evaluation, and Application of Brake Testing Devices | \$150,000 |
| Development of Voice Recognition Technologies | 200,000 |
| Development and Testing of Unique Identifiers for the CDL Program | 200,000 |
| Data Quality Enhancement Study | 100,000 |
| Evaluation of FMCSA Compliance & Enforcement Information Process ... | 250,000 |
| Evaluation and Enhancement of CMV Driver Data Exchange | 300,000 |
| Development of SafeStat Algorithm for Motor Coaches | 75,000 |
| Technology Deployment for Improved Hours-of-Service Compliance | 350,000 |

Even though the above research projects are eligible for MCSAP high priority funding, many states also seek high priority funds for state-wide efforts. Typically, the requests exceed the monies available and only priority projects receive funding (See Q65 for High Priority Guidelines). Therefore, FMCSA believes that both MCSAP High Priority and MCR&D funding are needed to support the many improvements needed in Federal and state CMV enforcement programs.

OPENING OF SOUTHERN BORDER

Question. Why is FMCSA requesting funds to hire additional staff to inspect vehicles at the border when it appears that the opening of the southern border does not appear to be imminent?

Answer. Additional Federal staff at the border is needed to address the existing safety concerns as well as prepare for the full implementation of the NAFTA provisions. According to the NAFTA truck access provisions, the U.S. and Mexico were to have allowed access to each other's border states for the delivery and backhaul of cargo by December 1995. Also, by January 2000, all restrictions on cross-border trucking were to have been lifted providing access to and from any point in each other's country. Even though these cross-border provisions have not been implemented because of safety concerns about Mexican operations, Mexican trucks have been and continue to be allowed to enter the U.S. and operate in limited commercial zones along the border. These zones are generally within a radius of two to twenty miles from the nearest U.S. border city. The NAFTA placed a new focus on the safety concerns that exist on the Southern border and the need to increase compliance and enforcement activities in advance of NAFTA.

Our efforts in dealing with these safety concerns include both short term and long term strategies: In the short term we have hired 40 Federal inspectors to augment the existing state enforcement presence at the border and plan to hire an additional 20 inspectors in 2001. These Federal inspectors are needed until states are able to assume all enforcement responsibilities. In the long term, we believe that the most effective means to ensure safe cross-border operations is through continued strengthening of the long-standing federal-state partnership created by the Motor Carrier Safety Assistance Program (MCSAP). As the states build and staff inspection facilities along the border within the next five to seven years, the Federal presence at the border will be decreased and inspectors will be reassigned to other responsibilities. As with all performance results approaches, specific periodic evaluations will be designed to assist in this decision.

HIGHEST INCIDENT OF MOTOR CARRIER ACCIDENTS

Question. Please provide a list of the ten highway facilities with the highest incident of motor carrier accidents with loss of life over the past five years.

Answer. The following table lists the type of highway facility on which fatal crashes involving at least one large truck occurred in the last five-year period for which data are available. Almost one-fourth (23 percent) of all fatal truck crashes took place on rural principal arterial highways other than interstates. Over half of the fatal crashes took place on rural roads.

FATAL CRASHES INVOLVING LARGE TRUCKS, 1994 TO 1998

| Roadway function class | Fatal crashes | |
|--------------------------------------|---------------|------------|
| | Total | Percent |
| Rural—Other Principle Arterial | 5,066 | 23 |
| Rural—Minor Arterial | 2,932 | 13 |
| Rural—Interstate | 2,794 | 13 |
| Urban—Other Principle Arterial | 2,489 | 11 |
| Rural—Major Collector | 2,383 | 11 |
| Urban—Interstate | 2,068 | 9 |
| Urban—Minor Arterial | 1,209 | 5 |
| Rural—Local Road | 842 | 4 |
| Urban—Local Road | 690 | 3 |
| Urban—Freeway/Expressway | 785 | 4 |
| Rural—Minor Collector | 427 | 2 |
| Urban—Collector | 278 | 2 |
| Unknown | 192 | 1 |
| Total | 22,155 | 100 |

Source: Fatality Analysis Reporting System (FARS) 1994–1998.

INFORMATION SYSTEMS AND ANALYSIS SECTION

Question. How do you intend on using the \$5 million of additional funds provided for information systems and analysis that are authorized in MCSIA?

Answer. The \$5 million will be used for the Section 225 truck and bus crash data improvement project. In this project, FMCSA will work with NHTSA and the states to improve the timeliness, completeness and accuracy of commercial vehicle crash data.

COMMERCIAL MOTOR VEHICLE CRASH CAUSATION

Question. Will FMCSA allocate \$5 million during fiscal year 2001 to fund a study on commercial motor vehicle crash causation? How will these funds be used? Please detail the scope and nature of cooperative arrangements with NHTSA to improve data analysis and to conduct crash causation studies.

Answer. The budget for the Large Truck Crash Causation Study (CCS) for fiscal year 2000 and 2001 follows:

| Activity | Fiscal years— | |
|--|------------------|------------------|
| | 2000 | 2001 |
| Transportation Research Board advisory committee | \$188,000 | \$194,000 |
| Accident Expert | 100,000 | 100,000 |
| State MCSAP Agencies | 500,000 | 900,000 |
| MCSAP post crash vehicle truck inspection training | 40,000 | 100,000 |
| NHTSA—Training | 17,000 | 2,000 |
| NHTSA—Data form and coding manual development | 122,000 | 40,000 |
| NHTSA—Data collection | 1,140,000 | 2,989,000 |
| NHTSA—Software design and maintenance | 893,000 | 675,000 |
| TOTAL | 3,000,000 | 5,000,000 |

FMCSA and NHTSA have designed a crash causation study within the framework of NHTSA's National Automotive Sampling System. Beginning with the pilot study in four NASS sites this summer and continuing in all 24 sites in 2001, crash causation data will be collected on approximately 1,000 serious truck crashes. MCSAP inspectors will conduct post crash Level 1 inspections on all the trucks selected for the study. Both the NASS researchers and the MCSAP inspectors will receive special training to be able to collect the information necessary to determine the primary and secondary causes of the sampled crashes. Data will be entered in the field electronically and will be uploaded to a national database. A Transportation Research Board advisory committee will meet twice a year for three years to evaluate the study design, data collection protocol and preliminary results. FMCSA has hired a consultant who formally was in charge of NHTSA's Special Crash Investigation division and is an expert on crash reconstruction and analysis to review and evaluate every detail of the project.

INFORMATION SYSTEMS AND ANALYSIS SECTION

Question. Please break out how the fiscal year 1999, fiscal year 2000, and fiscal year 2001 funds for information systems and analysis have been or will be allocated. How much of these funds was or will be used for FMCSA-generated studies and information systems and how much was or will be allocated directly to the states?

Answer. The Information Systems budget is shown in the table below:

| | Fiscal years— | | |
|---------------------------|-------------------|-------------------|-------------------|
| | 1999 | 2000 | 2001 |
| Analysis | \$800,000 | \$1,100,000 | \$2,300,000 |
| Information Systems | 3,200,000 | 3,200,000 | 3,700,000 |
| Driver | 1,000,000 | 825,000 | 1,000,000 |
| PRISM | 5,000,000 | 4,875,000 | 5,000,000 |
| Total | 10,000,000 | 10,000,000 | 12,000,000 |

The majority of the Driver and PRISM funds go directly to the states for driver safety initiatives or to participate in the PRISM program. In general, the information systems funds do not go directly to the states, but support data systems that are used by the states to retrieve and upload safety data. In fiscal year 2000, however, one state did receive a \$500,000 grant for information systems work. The analysis funds support FMCSA-generated studies and do not go directly to the states.

PERSONNEL ISSUES

Question. Please prioritize the positions requested.

Answer. New Administration positions. FMCSA proposal to add 49 positions to "staff out" the management and administration and of this new Administration will provide a staff, that by comparison, is less than half the staffing level at similar sized DOT operating administrations. These positions are considered the minimum of additional personnel needed to effectively operate as an independent administration in fiscal year 2001. Prioritizing these necessary positions would require an evaluation of compromises to the overall delivery of FMCSA programs. The 4* "program positions" of the 49 have less priority than those needed to provide basic management and administration of the FMCSA. Additional Program Positions (prioritized below).

| | Existing | Additional positions |
|--|----------|----------------------|
| New administrative positions: | | |
| Agency Management | 1 | 9 |
| Regulatory Ombudsman | | 1 |
| Executive Secretariat | | 4 |
| Civil Rights Office | | 3 |
| Public and Consumer Affairs Office | 2 | 3 |
| Chief Counsel Office ¹ | 2 | 26 |
| Fiscal & Budget Staff | 2 | 5 |
| Personnel Staff | 1 | 6 |

| | Existing | Additional positions |
|---|----------|----------------------|
| Management Services Staff ² | 4 | 6 |
| Passenger Carrier & International Program | 8 | 4* |
| Additional Program Staff Priorities: | | |
| Safety Investigators | 220 | 42 |
| Border Inspectors | 40 | 20 |
| Crash Data Analyst | | 1 |
| UCR Specialist | | 1 |
| Technology Specialists | 7 | 4 |
| Regulatory Staff | 7 | 1 |

¹Note: 17.6 Motor Carrier Legal Positions to be transferred from the FHWA.

²Note: Includes 3 existing FOIA positions.

Question. Please provide additional justification for each of the positions requested. Please discuss each request in terms of workload, agency performance goals, impacts on not funding, ability to use existing field staff or attorneys, and number of personnel already conducting similar functions.

Answer.

New Administration positions.—The additional staff proposed to manage and administer the FMCSA is considered the minimum to deliver the critical motor carrier safety programs that have been legislatively established. The eight administrative positions that are now assigned these duties are presently complemented by the full administrative support of the FHWA. Without FHWA support in fiscal year 2001, the first 46 positions listed above are necessary to establish an FMCSA management structure and operate an Office of Administration for fiduciary responsibility, management services and human resources. It is planned that with the limited administrative staff requested, FMCSA will have to procure the majority of support services needed to operate. For example, FMCSA will procure from another DOT operating administration services for a financial management system. The impact of not funding these critical management and administrative positions includes the possibility that the operation of FMCSA will have adverse effects on program objectives. The remaining 6 positions are program positions that address Congressional priorities identified in MCSIA.

Additional Program Positions.—FMCSA has prioritized the enforcement and compliance of federal motor carrier safety regulations through increased compliance reviews of motor carriers. To advance this initiative 42 additional safety investigator are proposed to be hired and assigned to locations that will be selected based on carrier performance and existing staffing levels. In addition, 20 new border inspectors are proposed to increase our ability to better inspect the border crossings. Adding these 62 field positions is considered the highest FMCSA staffing priority. The remaining 7 positions support selected program initiatives that will deliver legislated initiatives and high FMCSA priorities for meeting the goal to reduce motor carrier related fatalities by 50 percent in ten years. The four technology positions are particularly important since technological advances in motor carrier safety are necessary to reach the 50 percent fatality goal.

FMCSA's highest priority is the effective and efficient operation of our "front line" field organization that delivers the program at the state level. Consideration is not being given to utilizing field staff to complement headquarters administrative or program operations. In addition, all motor carrier associated field legal support is obtained from the FHWA. On October 1st, FHWA will transfer 17.6 legal positions to the FMCSA comprised of FHWA staff that presently support motor carrier initiatives and vacant positions.

All of the 118 positions that are proposed to be added to FMCSA are identified and discussed in the attached report, "Justification for Additional Federal Motor Carrier Safety Administration Personnel." The comparison of existing and proposed positions is presented in the table provided in response to the previous question.

QUESTIONS SUBMITTED TO THE FEDERAL RAILROAD ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

LEGISLATIVE LANGUAGE FOR TRANSFER OF MAGLEV FUNDS

Question. Has legislative language been proposed in the fiscal year 2001 Federal Highway Administration budget to authorize this transfer of maglev funds to FRA for non-maglev program purposes? Would such legislative authority be necessary to enable this transfer?

Answer. The FHWA budget contains an obligation ceiling (\$25,000,000) for the maglev program and specific authority for FRA administrative expenses and technical assistance (\$3,500,000 of the \$25,000,000). Since Section 1218 of TEA-21, which authorized the maglev program, contains no specific authorization for highway trust funds to be spent for non-maglev purposes, specific legislative authority is required to enable the contemplated transfer of \$1,500,000 to non-maglev programs. FRA would be happy to assist the Committee in drafting such legislative authority, if requested.

IMPACT OF NOT RECEIVING \$1.5M IN MAGLEV FUNDING

Question. Assuming that this proposed transfer is not enacted by the appropriation process, what budgeted programs would you cut in Safety and Operations to make up the \$1,500,000 shortfall?

Answer. If the \$1.5 million was not provided to the Safety & Operations account, FRA would be forced to reduce safety staffing and travel, other administrative costs, the Operation Lifesaver grant and the ATIP contract. These reductions would have a detrimental impact on our mission.

Therefore, it is critical that the \$1.5 million be transferred to FRA from the maglev program.

ATIP FISCAL YEAR 1998-2001 FUNDING

Question. In February 1999, FRA awarded a \$3,700,000 grant to ENSCO, Inc. of Springfield, Virginia for the acquisition of a new track geometry measurement vehicle to replace the T-10 track geometry measurement car. Please provide a detailed breakout of the program costs for ATIP in the fiscal years 1998, 1999, and budgeted for 2000 and 2001. How much of the program costs in each of these years have gone toward the procurement of the new track geometry vehicle? What is the status of this procurement. Will the T-10 track geometry measurement car be retired, or remain in use?

Answer. The program costs for fiscal year 1998 through fiscal year 2001 follow:

| | Fiscal year | | | |
|-----------------------|-------------|-------------|----------------|----------------|
| | 1998 actual | 1999 actual | 2000 projected | 2001 requested |
| Operating Costs | \$1,325,000 | \$2,061,000 | \$2,925,000 | \$3,169,000 |
| Equipment | 350,000 | 2,761,000 | 589,000 | |
| Total | 1,675,000 | 4,822,000 | 3,514,000 | 3,169,000 |

The acquisition of a new track geometry car was awarded to the lowest bidder. The purchase price, \$3.7 million, was \$700 thousand more than FRA's original estimate. To accommodate the shortfall, FRA reduced the number of miles inspected in fiscal year 1999 and fiscal year 2000 for savings of \$111 thousand, and \$589 thousand, respectively. The fiscal year 2001 request reflects the total funds needed to operate the new track geometry inspection vehicle over 25,000 miles of track per year, the bare minimum needed for an effective track inspection program.

Currently, ENSCO's subcontractor is fabricating the host vehicle. Completion is scheduled for June 2000. Following the construction of the host vehicle, ENSCO will install the computer processing equipment. FRA anticipates the delivery of the new track geometry vehicle in the Fall of 2000.

The continued operation of FRA's current T-10 track geometry car in tandem with the new car is anticipated for a brief period, to facilitate calibration of the new system. To date, no decision has been made on the final disposition of the current T-10 vehicle.

LIGHT DENSITY LINE RAIL STUDY

Question. Please update the Committee on the status of the small railroad investment needs and financial options study that was funded at a level of \$150,000 in the fiscal year 2000 conference report. Will FRA work with any other entities, such as the American Short Line and Regional Railroad Association, in conducting this study? When will the study be completed?

Answer. FRA has met with the American Short Line and Regional Railroad Association to define the approach of the study, which is costing \$150,000. The study will be completed by the North Dakota State University, the entity that manages the National Short Line Railroad Database for the American Short Line and Regional Railroad Association. FRA anticipates that the study will be completed within a year.

STUDY ON 286,000-POUND RAIL CARS

Question. Is FRA currently conducting a study regarding track and bridge requirements for handling 286,000-pound rail cars, as the agency was encouraged to do in the fiscal 2000 House report? Will the findings of the 286,000-pound railcar study be incorporated into the investment needs study?

Answer. The American Short Line and Regional Railroad Association (ASLRRA) has recently submitted its grant application to FRA, requesting funds to carry out the study of 286,000-pound cars on light density rail lines. FRA is processing the application now and expects to award the grant shortly. The ASLRRA has already selected a contractor and expects the study to be completed in mid-summer 2000.

The findings of this study of track and bridge requirements for 286,000-pound cars will be available in time for inclusion into the investment needs study.

REQUEST FOR 10 ADDITIONAL POSITIONS

Question. FRA is requesting 10 new railroad safety field positions in fiscal year 2001 (5 FTEs), with an associated dollar increase of \$564,000. Is the expected time in service in fiscal year 2001 an average of 6 months? Please detail the anticipated deployment of these ten positions—what will the job titles, GS ranking, and field office assignment be for each? What is the average personnel cost per FTE?

Answer. FRA is requesting a total of \$564 thousand for 10 positions. Funding provides salaries and expenses for 6 months (5 FTEs). Of the \$564 thousand requested, \$391 thousand is for PC&B and \$173 thousand is for expenses such as travel, IT and office equipment, training, rent, and other support costs. Depending on the grade and work performed, costs for each position range from \$42—\$77 thousand.

Exact titles have not been established for each position nor the field assignment. Grades range from GS-11–14. The ten positions will enable FRA to address several critical safety priorities, including grade crossing, rulemaking, safety enforcement, railroad security, and other RSAC/SACP related assignments.

PRIORITY OF ADDITIONAL POSITIONS REQUESTED

Question. Please prioritize the new positions requested, indicating which are most important in view of the most pressing demands on FRA.

Answer. All of the positions are important and critical in meeting the demands placed upon FRA. FRA is committed to meeting each of its safety measures. FRA's ability to achieve these goals can be attained only through a commitment to a broad array of safety initiatives. The 10 additional positions will enable FRA to keep its safety commitments.

FUNDING FOR FATIGUE COUNTERMEASURES

Question. Is FRA currently funding any partnership work on fatigue countermeasures with the North American Rail Alertness Partnership or the National Sleep Foundation, or with other organizations such as rail labor unions? If so, please detail these contracts.

Answer. Under Technical Support for Human Factor Issues, FRA's Office of Research and Development contracts the Volpe National Transportation Systems Center (Volpe) to study a variety of topics, of which fatigue may be a component. Examples of current Volpe activities where fatigue may be a study component include 1-person crew operation of Amtrak locomotives, locomotive cab ergonomics, and rail yard and terminal safety.

FRA founded and sponsors meetings of the North American Rail Alertness Partnership (NARAP) and agency representatives attend meetings with the National Sleep Foundation, where strategies for fatigue countermeasures are being discussed. The railroad industry has begun to implement innovative measures to combat the

threat of fatigue based on the findings and recommendations of NARAP. Many of these efforts are still in the embryonic stages. In March 1999, an agreement between the carriers, the United Transportation Union, and the Brotherhood of Locomotive Engineers specifically deals with addressing fatigue.

The \$300 thousand requested in fiscal year 2001 in the Safety and Operations account, will allow FRA to develop implementation strategies and facilitate partnership efforts to further the adoption of fatigue mitigation programs throughout the railroad industry. The funding also will be used to help FRA obtain more accurate and complete data regarding the role of fatigue in rail related accidents. Currently, protocols for obtaining such documentation are unreliable. Delays in addressing fatigue-related accident analysis will result in the unnecessary loss of lives.

NHTSA'S WORK ON FATIGUE COUNTERMEASURES

Question. Is FRA aware of or involved with any of the National Highway Traffic Safety Administration's ongoing work on fatigue countermeasures? Please describe the level of involvement, if any, in these efforts.

Answer. The Office of Safety has recently established informal partnerships with the National Highway Traffic Safety Administration (NHTSA), at the regional level, to discuss the exchange of information regarding fatigue related issues. FRA is interested in using the results from NHTSA's drowsy driver initiative to address the fatigue concerns of the Brotherhood of Maintenance-of-Way Employees and the Brotherhood of Railroad Signalmen. Excessive travel requirements and possible fatigue ramifications constitute a significant safety concern for the members of these two rail labor organizations.

Under Secretary Slater's ONE DOT Initiative, the entire Department coordinates its activities on fatigue and other human factors issues.

STAFFING FOR FATIGUE PROGRAM

Question. What level of commitment does FRA envision being associated with this \$300,000 program request?

Answer. The Office of Safety has allocated 1.5 FTEs to fatigue-related issues which includes the position, Transportation Fatigue Program Coordinator. FRA will use the initial funding for a systematic approach to assessing how fatigue affects the rail industry and the lives of its employees and customers. With continued annual support of this effort, cost effective approaches to fatigue issues can be developed and implemented.

In addition, the funding will provide the stimulus for expanding the Administration's fatigue awareness initiatives within the railroad industry. Initiatives associated with education and training (including the development of innovative work/rest pilot projects) could also be significantly accelerated. This will result in a reduction in injuries and fatalities. Other initiatives that could be implemented or refined include: (a) initiating near-miss pilot programs, (b) sponsoring industry-wide conferences or executive roundtable discussions to expedite solutions, (c) identifying and expediting fatigue countermeasures for non-operating employees, and (d) contracting the services of recognized experts in fatigue countermeasures to help expand outreach/partnerships to rail and non-rail entities pertaining to fatigue countermeasures.

The National Transportation Safety Board estimates that human factor-caused accidents (including those containing a fatigue component) constitute nearly 35 percent of all train accidents. An effective fatigue mitigation program could reduce human factor-caused train accidents by nearly a third.

The fundamental mandate of the Office of Safety is to undertake whatever initiatives or measures are available to ensure the safest environment within the railroad industry for employees, customers (shippers/public), and all other stakeholders. The recognition and resolution of fatigue problems is an integral issue in current and future FRA initiatives. Under DOT's Safety Strategic Goal, fatigue issues are a Flagship Initiative.

OPERATION LIFESAVER AND OUTREACH PROGRAM

Question. In fiscal year 2000, the conferees increased funding for Operation Lifesaver from \$600,000 to \$950,000, and designated the \$350,000 increase as seed money for a national public service campaign that has the financial and technical support of the railroad industry, FRA, and the law enforcement community. Have those contract funds been released to Operation Lifesaver? What is the current status of the national public service campaign effort?

Answer. Operation Lifesaver, Incorporated (OLI) operates on a calendar year budget cycle. Upon completion of a required annual financial audit, OLI applies for

the annual FRA grant. For fiscal year 2000, FRA received OLI's grant request on February 28, 2000. FRA anticipates the first release of funds under the grant in April 2000.

The national public service campaign effort is well underway. FRA, OLI, and the Association of American Railroads have met several times to discuss basic concepts and have agreed upon key campaign issues. Law enforcement interests are represented by the OLI Program Development Council's Law Enforcement Committee whose members represent various state and railroad police and a representative from the International Association of Chiefs of Police. Requests for proposals were received in January 2000, and a contractor and an advertising agency have been selected. Design of the public service announcements currently are underway. Upon completion, they will be tested on focus groups in at least four major cities across the nation before being implemented nationwide.

REQUEST FOR GRADE CROSSING OUTREACH PROGRAM

Question. In the fiscal year 2001 budget request, FRA is requesting \$500,000 for a highway-rail grade crossing safety outreach program. Is this request a follow-on to the national public service campaign, with the funds provided to Operation Lifesaver through the normal contract process? Or is this a new, unique FRA outreach program, conducted separately from Operation Lifesaver's public awareness and education efforts? If it would be a separate new program, why is this necessary? What unique and value-added contributions can FRA make that could not be accomplished by Operation Lifesaver?

Answer. The funds requested in fiscal year 2001 will be used to develop a new coordinated and branded public outreach program to promote crossing safety. This effort will build on the national public service campaign conducted by Operation Lifesaver, Incorporated (OLI). FRA's campaign will be a comprehensive, long term program, developed in coordination with OLI, the National Highway Traffic Safety Administration (NHTSA), the Federal Highway Administration, Office of Motor Carrier Safety, the Federal Transit Administration, the Association of American Railroads, rail labor and others.

The outreach program will explore the use of multiple messages targeted to specific audiences. It will utilize pilot programs and assessment tools to test the effectiveness of proposed slogans and campaigns before they are implemented on a widespread basis. Some of the funding will be used to broaden FRA's outreach to the law enforcement and judicial communities, and to develop materials to support these outreach efforts. Efforts also will be undertaken to develop outreach strategies that address initiatives that have not historically fallen within the purview of OLI. These include outreach to communities that will be impacted by the Federal Train Horn Rule, and development of educational materials concerning grade crossing safety on rail lines that are converted to shared light rail/freight rail operations. In addition, different partnerships will be developed that need unique outreach support. These include non-traditional partnerships with Metropolitan Planning Organizations (MPO's), national insurance institutes, car manufacturers, and truck manufacturers.

FRA VS OLI OUTREACH CAMPAIGN

Question. How is it considered cost-effective for FRA to seek funds to hire another firm to develop and carry out a "branded" PSA campaign containing the same elements as the OLI/FRA/AAR campaign that was approved and funded in fiscal year 2000? Doesn't this duplicate FRA's ongoing support to Operation Lifesaver?

Answer. The "branding" effort that FRA proposes does not contain the same elements as the OLI/AAR campaign approved and funded in fiscal year 2000. It would build on that existing work and involve close cooperation with OLI, the railroad industry, law enforcement, the judicial system and other non-traditional partners. The process will involve identification of a "brand" name and methods of assuring that the name recognition for grade crossing safety and trespass prevention messages resonate with the public. It would also identify and/or modify internal and external management and communication processes that facilitate delivery of a consistent message. In that sense, it focuses on the development of effective management and communication strategies that most effectively deliver that message.

OLI/AAR development and promotion of the current Public Service Announcement (PSA) campaign will be a major component of FRA's initiative. However, the proposed initiative goes beyond delivery of a single message. It includes the development of an effective message delivery system and a set of analytical tools to determine the continued effectiveness of the message and the means for assuring the re-development of new messages that consistently promote the "brand name" associ-

ated with grade crossing safety and trespass prevention. The proposal will supplement, not duplicate PSA crossing safety work underway by OLI/AAR. It will be a comprehensive, long term program, developed in coordination with OLI, the National Highway Traffic Safety Administration (NHTSA), the Federal Highway Administration, Office of Motor Carrier Safety, the Federal Transit Administration, the Association of American Railroads, rail labor, and others.

The outreach program will explore the use of multiple messages targeted to specific audiences. FRA is already working with OLI and the rail industry to prepare a demographic study of trespassers. FRA also will ask NHTSA to update their 1994 demographic study of crossing-related fatalities. The outreach program will utilize pilot programs and assessment tools to test the effectiveness of proposed slogans and campaigns before they are implemented on a widespread basis. Some of the funding will be used to broaden FRA's outreach to the law enforcement and judicial communities, and to develop materials to support these outreach efforts. Efforts will be undertaken to develop outreach strategies that address initiatives that have not historically fallen within the purview of OLI. These include outreach to communities that will be impacted by the Federal Train Horn Rule, and development of educational materials concerning grade crossing safety on rail lines that are converted to shared light rail/freight rail operations. In addition, different partnerships will be developed that need unique outreach support. These include non-traditional partnerships with Metropolitan Planning Organizations, national insurance institutes, car manufacturers, and truck manufacturers.

INCREASE IN TRAVEL COSTS

Question. In the object classification table for Safety and Operations, the request for "travel and transportation of persons" increased \$630,000 above the enacted base of \$7,126,000. Is the \$500,000 increases in safety travel part of this increase? What type of travel is the remaining \$130,000 in the request associated with?

Answer. The \$630 thousand increase reflects the following:

| | |
|---|-------------|
| Safety travel | \$500,000 |
| Ten new positions travel | 27,000 |
| Inflation and PCS-related increases | 103,000 |
| Total | 630,000 |

IMPACT OF NO INCREASE IN FRA'S TRAVEL BUDGET

Question. What steps could be taken to reduce travel expenses if the \$500,000 requested additional travel funds are not provided?

Answer. With little discretionary spending authority, FRA will need to reduce planned community outreach and railroad partnership activities if the requested travel funds are not provided. This will occur at a time when FRA's safety responsibilities continue to grow, in large part due to fulfillment of statutory mandates to conduct rulemakings and special studies.

FRA's safety programs require a balanced approach of inspections coupled with partnerships, which enlist the cooperation of rail labor and management to identify and correct safety concerns in the railroad industry.

As a result of increased public, congressional, and Administration expectations for the railroad safety program, FRA finds itself in a position of extreme vulnerability. Without sufficient travel funds FRA may find it necessary to curtail some SACP activities and random inspection activity. A travel fund shortfall would constrain FRA from assisting local communities that request FRA assistance in addressing adverse impacts of rail mergers (e.g., noise exposure, blocked highway-rail crossings and rail congestion issues) and in implementing new rules for quiet zones. The current breakup of Conrail poses potential major safety issues and FRA continues to work with communities experiencing effects of the BNSF and UP/SP mergers.

TOTAL AND INTERNATIONAL TRAVEL

Question. Please identify total agency travel expenses for each of the last five years, and list the purpose of each foreign trip and associated expenses taken by each SES and political appointee staff person in the last year.

Answer. Total FRA travel obligations for the last five years are as follows:

| <i>Fiscal year</i> | <i>Amount</i> |
|--------------------|---------------|
| 1995 | \$5,978,000 |
| 1996 | 5,673,000 |
| 1997 | 6,273,000 |

| <i>Fiscal year</i> | <i>Amount</i> |
|--------------------|---------------|
| 1998 | 6,379,000 |
| 1999 | 6,868,000 |

FRA SES and political appointees attended 10 foreign events in fiscal year 1999 as follows:

| Trip purpose | Number of travelers | Total cost |
|--|---------------------|---------------|
| Attend and participate in the Eurailspeed Conference (Berlin) | 1 | \$1,538 |
| Attend and participate in the American Public Transit Commuter Rail/Rapid Transit Conference (Toronto) | 3 | 4,242 |
| Implement technical assistance provision of Memorandum of Cooperation with the Polish Rail System (Warsaw) | 3 | 8,080 |
| Attend and participate in the Border Infrastructure Conference (Tijuana) | 1 | 1,400 |
| Assess policy and procedures for shared use of track (Karlsruhe) | 1 | 1,471 |
| Attend and participate in Safety Conference (Buenos Aires) | 1 | 458 |
| Attend and participate in Transport Canada meeting (Montreal) | 1 | 776 |
| Attend and participate in Transport Canada meeting (Toronto) | 1 | 885 |
| Attend and participate in Transport Canada meeting (Ottawa) | 1 | 818 |
| Attend and participate in International Railway Safety Conference (Banff) | 1 | 1,690 |
| Total | 14 | 21,358 |

FUNDS FOR PROGRAM EVALUATION

Question. Please prepare a table that outlines the current base level funding, if any, for each of the six initiatives outlined under this requested increase (highway-rail grade crossing closure study, highway-rail grade crossing warning device study, safety integration plan merger surveillance tracking, study to amend passenger car safety standards, switching operations fatality analysis study, and safety and health committee support). Indicate the amount of the fiscal year 2001 request, and any planned outyear costs (if known).

Answer. The information follows:

[In thousands of dollars]

| | Current base funding | Fiscal year 2001 request |
|--|----------------------|--------------------------|
| Highway-rail grade crossing closure study | | 100 |
| Highway-rail grade crossing warning device | | 100 |
| Safety integration plan surveillance of mergers tracking | | ¹ 150 |
| Study to amend passenger car safety standards | | 100 |
| Switching operations fatality analysis study | | 35 |
| Safety and health committee support | | ² 13 |
| Total—Program Evaluation | | 500 |

¹ This amount is required annually for five years (fiscal year 2001—fiscal year 2006).

² This amount is required annually and would be adjusted to reflect inflationary costs and new OSHA Safety and Health requirements, as new regulations are issued.

FISCAL YEAR 2000 IT INITIATIVE FUNDING

Question. What is the base level for the IT initiative? Please break out personnel related costs and program funding.

Answer. In fiscal year 2000, FRA was appropriated \$732,000 for the IT initiative—\$689,000 in program costs and \$43,000 in personnel related costs.

COST OF ANNUALIZED FTE FOR IT PROJECT

Question. How much of the requested increase for the IT initiative supports annualization of the new position approved in fiscal year 2000?

Answer. A total of \$35,000 is included in the fiscal year 2001 request for the annualized FTE.

IT INITIATIVE—IMPACT OF FIVE-YEAR VS FOUR-YEAR PLAN

Question. As directed by the conferees in the fiscal year 2000 conference report, FRA provided supplementary materials with the fiscal year 2001 budget request which detailed the agency's spending plan for the FRA-wide IT initiative. The total cost of this initiative is \$9,946,000 over four years (fiscal year 2000-fiscal year 2003). If budgetary constraints forced the program implementation to be spread over five years, what adjustments would be made to the fiscal year 2001 program budget?

Answer. Specific adjustments cannot be determined without knowing if funding constraints would be imposed in fiscal year 2001 or outyears. If reductions were made to the fiscal year 2001 request, FRA would be forced to delay the start of the data mart initiative and possibly the detailed transition plan to an ATM backbone.

BASE FUNDING FOR WEB-SITE SUPPORT

Question. What is the base level funding for web-site support? Please break out personnel related costs and program funding.

Answer. There are no base funds for web-site support in fiscal year 2000. Work has been absorbed by staff in various program offices. However, due to the increasing workload in this area and the need for technical expertise in enhancing and expanding FRA's web-site, FRA cannot continue to divert staff from program work to IT work, nor continue to lag behind other DOT agencies in providing up-to-date web-site information. FRA needs dedicated staff or contract support, for this new IT tool. FRA is requesting \$310 thousand in contract support in fiscal year 2001.

FRA SAFETY WEBSITE—NEW APPLICATIONS

Question. Please detail the new applications that would be added to the safety portion of the FRA website with a funding increase of \$300,000 (include associated costs for each).

Answer. The FRA Safety Data web page provides both the FRA and outside users with charts, graphs, dynamic programs where users can build their own requests for information, and retrievable databases. The FRA also has a secure page for internal use, such as Complaint Investigations and individual inspections by inspector.

There are a number of new Internet website applications which FRA would like to offer. First, FRA has started collecting information about railroad activity by county. This information could be displayed on the Internet website with the accident and inspection information. The addition of this information will provide FRA management with a better picture of railroad activities and resource considerations: approximate cost \$145,000.

The highway-rail grade crossing inventory data is already on the web site. However, many times the requestor does not know the crossing identification number. A new search application would allow the user to find any highway-rail crossing on a map with street names and railroad tracks. The user could then select that crossing and get pertinent information (i.e., accidents, if crossing has a hump, number of trains, etc.). One added benefit is that concerned citizens can be alerted to crossings that have high exposure to accidents: approximate cost \$55,000.

Finally, the current highway-rail crossing inventory is completed separately by states and railroads using FRA-supplied client software. This information is mailed into FRA for updating the inventory database. FRA would like to develop a new application that allows states and railroads to complete the highway-rail grade crossing inventory on FRA's Internet website. This would allow states and railroads to communicate quickly with each other on changes to highway-rail crossing information: approximate cost \$100,000.

INCREASE FOR EMPLOYEE DEVELOPMENT

Question. What is currently spent annually on employee development (for fiscal years 1998, 1999, and budgeted for 2000 and 2001)? Why is an increase of \$660,000 needed above the base funding for fiscal year 2001?

Answer. FRA obligated \$384 thousand and \$464 thousand for training or employee development in fiscal year 1998–1999 respectively. A total of \$662 thousand is budgeted in fiscal year 2000.

FRA is requesting a total of \$1.34 million in fiscal year 2001, an increase of \$678 thousand over fiscal year 2000. Of this amount, \$9 thousand is related to the requested ten new positions and \$660 thousand is needed to enhance FRA's employee development program and workforce planning activities.

Currently, FRA's training budget reflects only 1 percent of its annual payroll as compared to 2.65 percent provided by private industries and other Federal entities.

The requested increase will allow FRA to increase its training budget to approximately 2 percent of its payroll. More important, it will allow FRA to begin developing a comprehensive workforce planning strategy that addresses skills assessment and training, recruitment and retention of employees, diversity and other activities that support both organizational and individual goals. Due to the robust economy and resulting competition for skilled professionals, the aging workforce (more than 50 percent of FRA's employees are over 48) and the impact of technology on work conditions and skills, it is critical for FRA to begin planning for what the Comptroller General has described as the "human capital crisis" in the Federal Government.

FISCAL YEAR 1999 EMPLOYEE DEVELOPMENT ACTIVITIES

Question. Please detail all employee development activities in fiscal year 1999, describing each conference, class, workshop or training session; number of FRA employees attending; and cost. What is the budgeted funding level for employee development in fiscal year 2000 and requested for fiscal year 2001?

Answer. The FRA offers and encourages annual participation in a variety of learning and development opportunities to its employees, e.g., off-the-shelf, in-house and technical training. FRA's employee development or training is for the most part, managed at the office level and there is no central source for detailed data. Actual total obligations for training in fiscal year 1999 were \$384 thousand. The FRA also supports and provides for tuition reimbursement, as appropriate.

A total of \$662 thousand and \$1.34 million is budgeted in fiscal year 2000 and 2001 respectively. The requested increase in fiscal year 2001 will allow FRA to continue individual training and begin to coordinate agency-wide career development programs that will meet the needs of the organization.

FEDERAL COMPLIANCE AND ENFORCEMENT PROGRAM

Question. Please list the number of enforcement actions, the amount of civil penalty assessments, the amounts collected or settled, and the number and types of violation reports submitted for each of the past three years and relate these measures to your continuing efforts proposed for fiscal year 2001. What percentage of these actions have come from federal inspectors and what percentage from state inspectors?

Answer. The tables below reflect the number of cases in which FRA assessed an initial penalty for fiscal years 1997-1999, the aggregate penalty assessment in those cases, the number of cases closed, the amounts collected, and the number and types of violation reports received from inspectors, with a breakdown of the percentage of those reports received from state and Federal inspectors. Cases transmitted in a given year are often settled in a following year, so the amounts assessed in a given year do not correlate directly with the amounts collected in the same year. These tables demonstrate a substantial civil penalty program that will continue to be a major activity of FRA inspectors and attorneys in fiscal year 2001. These enforcement actions directly support achievement of the agency's safety goals.

CASES TRANSMITTED

| Fiscal year | No. of cases | Dollars assessed |
|-------------|--------------|------------------|
| 1997 | 1,014 | \$7,531,250 |
| 1998 | 1,022 | 9,991,250 |
| 1999 | 958 | 8,741,000 |

CASES CLOSED

| Fiscal year | No. of cases | Amount collected |
|-------------|--------------|------------------|
| 1997 | 972 | \$3,792,380 |
| 1998 | 1,482 | 5,213,595 |
| 1999 | 1,122 | 6,046,050 |

NUMBER OF VIOLATION REPORTS SUBMITTED BY TYPE

| Type | Fiscal year | | |
|------------------------------------|-------------|-------|-------|
| | 1997 | 1998 | 1999 |
| AD | 94 | 90 | 52 |
| AR | 128 | 142 | 286 |
| BW | 2 | 1 | 3 |
| EP | 5 | | |
| EQ | 29 | 37 | 21 |

| ROP | 25 | 38 | 17 |
| ROR | 4 | 5 | 4 |
| RSP | 13 | 3 | 3 |
| RW | 4 | 36 | 20 |
| SA | 358 | 836 | 297 |
| SI | 72 | 42 | 47 |
| TS | 66 | 82 | 93 |
| Total | 2,368 | 2,952 | 2,007 |
| Federal Inspectors (percent) | 88 | 89 | 86 |
| State Inspectors (percent) | 12 | 11 | 14 |

FISCAL YEAR 1999 SAFETY INSPECTIONS

Question. How many miles of track, freight cars, locomotives, and track miles with signals and train control systems were inspected last year? Please compare this level of inspection activity with that achieved during the two preceding years. What changes in emphasis are envisioned for fiscal year 2001 and how does the budget request demonstrate those changes?

Answer. Below is a comparison of preliminary 1999 inspection data with that of the previous two years. FRA collects the number of signal and train control devices inspected each year, but not the number of track miles with signal and train control systems.

| | 1999 ¹ | Percent change from 1998 | Percent change from 1997 |
|------------------------------|-------------------|--------------------------------|--------------------------------|
| Track Miles Inspected | 227,915 | - 10.0 | - 8.3 |
| Freight Cars Inspected | 599,376 | + 5.8 | + 5.9 |
| Locomotives Inspected | 24,819 | + 10.2 | + 12.0 |
| Signal Units Inspected | 93,842 | + 25.7 | + 30.3 |

¹ Preliminary data.

A total of 12,600 track inspections were performed in 1999, which represents a slight increase of 102 inspections above the number performed in 1998. Despite the 10 percent decline in track miles inspected, 73,000 defects were detected in 1999, which represents a 15.7 percent increase in defects from the previous year. Finding more defects over less trackage is an indication that the "Focused Enforcement" policy of FRA's Safety Assurance and Compliance program is working. It is also an indication that the ever increasing amounts of freight traffic are taking a toll on the nation's track structure.

The 10 percent decline in the number of track miles inspected can be attributed to two factors. First, with the increase in railroad traffic, it becomes increasingly

difficult to secure inspection time on the track. Second, it takes longer to perform track inspections on a section of track with many defects than on a track section with few defects. The track inspector often is required to stop and examine a defect, recording pertinent information and assuring that proper remedial action occurs. Because FRA inspections have been successfully targeted on rail lines with a greater number of defects, fewer miles of track were inspected, despite a slight increase in the number of inspections.

FRA will continue to leverage its inspector resources by coordinating the Safety Assurance and Compliance Program (SACP) and site-specific inspection duties in the most effective way. The goal of SACP and the site-specific inspection program is to improve rail safety by reducing systemic hazards in rail facilities, equipment, rolling stock, and operations. FRA believes that it has achieved the proper balance between the SACP and site-specific inspections.

SACP CHALLENGES

Question. Under the SACP, how many Class I and Class II railroads have been analyzed to date? How many railroads have had two SACP reviews? How many additional railroads need to be reviewed for the first time under the SACP? What are the successes and remaining challenges associated with the SACP? How does the fiscal year 2001 budget attempt to improve the SACP?

Answer. Since the inception of the SACP in 1995, the process has been aggressively implemented throughout the railroad industry to include all Class I carriers, a substantial number of Class II carriers, commuter rail authorities (under FRA's jurisdiction), and switching and terminal operators. In recent years, efforts have been expanded to incorporate the hundreds of short line carriers under various SACP related initiatives. With the transformation of the SACP process from a strictly audit review (with specific time frames) to the present ongoing partnership approach, the principles of SACP have been integrated into the Office of Safety's compliance and enforcement procedures. Routine inspection activities and those inspections of a "SACP nature" have now been merged together, for all practical purposes, on Class I railroads. As a result, SACP inspections are continuously underway on large rail carriers' properties. Consequently, a quantitative measurement of the number of SACP examinations or audits per carrier provides no indication of the effectiveness of the process. Effectiveness is measured by improvements to a carrier's and the railroad industry's safety record. For example, between 1993 and 1999, the railroad industry reported the following safety improvements: employee on duty fatalities declined 34 percent, employee-on-duty casualties fell 45 percent, highway-rail grade crossing fatalities dropped 36 percent, and rail-related fatalities declined more than 28 percent.

The success of SACP extends beyond the important safety indices of reductions in injuries and fatalities. Dramatic changes in the safety culture are occurring within the industry. As a consequence, changes are occurring in disciplinary procedures, measures to address fatigue, deadhead transportation issues, and staffing considerations.

The challenges facing SACP are complex. These include: (1) furthering the culture change, a slow and laborious task but one essential to the future of the industry; (2) refining the SACP process to ensure the participation of all employees, from the executive level to the newly hired rank-and-file employee; and (3) addressing complicated issues such as work/rest schedules, train lineup predictability, etc.

The fiscal year 2001 budget request will significantly help to expedite meeting the above challenges by providing: (1) additional travel funds to reach more short line carriers, (2) additional staff—to address workload demands, (3) additional IT and contract support funds—to help develop more comprehensive SACP related data bases and program evaluation initiatives, and (4) additional support for special outreach programs such as grade crossings and fatigue.

IMPACT OF SACP—FISCAL YEAR 1997–1999

Question. Please provide quantitative measures to indicate trends in railroad safety, using a variety of measures of safety performance for each of the last three years. What do you suggest is the role of the SACP in the improvement of safety statistics?

Answer.

1050

CASUALTIES IN ACCIDENTS/INCIDENTS

| Year | Fatalities | Injuries | Total casualties |
|-------------------------|------------|----------|------------------|
| 1997 | 1,063 | 11,767 | 12,830 |
| 1998 | 1,008 | 11,459 | 12,467 |
| 1999 ¹ | 915 | 11,309 | 12,224 |

¹ Preliminary data.

ACCIDENTS/INCIDENTS

| Year | Train accidents | Other incidents | HWY-rail xing impacts | Total accidents/incidents |

TOTAL TRESPASSER CASUALTIES (EXCLUDING HIGHWAY-RAIL CROSSINGS)

| Year | Deaths | Injuries | Total casualties |
|-------------------------|--------|----------|------------------|
| 1997 | 533 | 516 | 1,049 |
| 1998 | 536 | 513 | 1,049 |
| 1999 ¹ | 467 | 433 | 900 |

¹ Preliminary data.

Under SACP, examination of railroad compliance with Agency rules is more comprehensive than with site-specific inspections. SACP is a multi-discipline safety audit, whereas site-specific inspections usually involve only a single inspection discipline. In addition, compliance agreements under SACP safety audits usually apply across the entire railroad property. Compliance with a site-specific inspection may only apply to a particular point on the railroad property.

FRA believes that comprehensive safety examinations under SACP are contributing to the improvement in railroad safety statistics. Railroad operations are becoming more complex as the industry strives to attract traffic from overcrowded highways. Advanced train-control systems are being developed and tested under operating conditions, and electronic braking is being tried on some equipment. New types of equipment are being introduced to handle various types of traffic or to conduct maintenance operations more efficiently. These have complex, computerized safety systems, some of which are themselves integral parts of safety systems composing the entire railroad.

In addition, many of the issues affecting railroads over the next few years are systemic. For example, the recent Burlington Northern/Santa Fe and Union Pacific/Southern Pacific mergers and the Surface Transportation Board's approval of the acquisition of Conrail by Norfolk Southern and CSX Transportation (CSXT) all pose safety issues resulting from the blending of different corporate cultures and reconciliation of different operating rules and practices. Systems approaches to safety inspections are necessary to address these issues.

FRA'S SACP EXPERIENCE WITH SMALL RAILROADS

Question. What is FRA's experience with the SACP as applied to smaller railroads?

Answer. SACP uses a rail labor/management/FRA partnership approach in identifying and solving safety concerns within the railroad industry. The essential components of this approach—issue identification, review of options for solution, implementation and monitoring techniques—are utilized regardless of the category (Class I, II, etc.) of a carrier. However, application of these components is modified in recognition of the specific operating characteristics of a small (short line) carrier versus that of a larger carrier.

In expanding the SACP process to short line carriers, the Office of Safety has initiated a new approach. Various regional partnerships are being formed between small railroads, state DOT's, the American Short Line and Regional Railroad Association, and FRA to focus on the safety related concerns of these carriers. For example, the Northeast Short Line Railroad Council, which is comprised of representatives of the railroad related entities located in the territories of FRA's Region One and Two, is currently addressing the impact of hours of service, roadway worker, and locomotive horn issues on the operations of short line carriers. A similar council has been established in FRA Region Three. Other councils are in the process of being formulated throughout the remainder of FRA's regions.

Attention to the safety concerns of short line carriers is an essential component of the Office of Safety's overall approach for ensuring that elements of the railroad industry are in compliance with Federal rules and regulations. The SACP process and its consensus approach to alleviating safety-related problems is significantly contributing to safer practices in the industry and to the safety of employees for all carriers.

RAILROAD SAFETY ADVISORY COMMITTEE

Question. Please break down all expenses associated with the RSAC, including facilities, mailings, equipment, contract support, and the "other" support costs. Please further specify exactly how fiscal year 2000 and fiscal year 2001 monies were or will be used for RSAC. How much is requested for fiscal year 2001.

Answer. FRA is requesting \$200,000 for RSAC in fiscal year 2001, the same level as in fiscal year 1999 and fiscal year 2000. Funding supports the following:

| [In thousands of dollars] | |
|---|---------------|
| <i>Activity</i> | <i>Amount</i> |
| Travel | 5 |
| Facilitation | 10 |
| Contract Support | 70 |
| Training | 5 |
| Space & Audio Visual | 65 |
| Supplies, Printing & Mailing Services | 44 |
| Interpreter Services | 1 |
| Total | 200 |

The RSAC is comprised of voting representatives from 27 organizations. Since RSAC was chartered on March 25, 1996, an estimated 800 full Committee, Working Groups and Task Force members and alternates have participated in more than 175 meetings to address 15 tasks. Given the magnitude of the resources dedicated to this successful process, the \$200 thousand requested for Federal support is nominal.

RULEMAKING ACTIVITY IN PAST YEAR

Question. Please list all final regulations, ANPRM's, NPRM's and any new regulatory projects issued or pursued since last year.

Answer. The information follows.

Final rules issued in 1999

- Passenger Equipment Safety Standards (5/12/99)
- Steam Locomotive Inspection-general revision (11/7/99)
- Locomotive Engineer Certification-general revision (11/8/99)

Proposed rules issued in 1999

- FRA Policy Statement—Jurisdiction Over Railroad Passenger Operations and Shared Use of the General system (5/25/99)
- FRA Policy on Jurisdiction (11/1/99)

FRA did not pursue any new major regulatory projects in 1999. However, FRA did continue work on a number of other important rulemakings, including

- Train Horns (Whistle Bans)
- PTC performance standards
- Cab working conditions (sanitation, noise, temperature)
- Event recorders—data survivability and other issues
- Locomotive crashworthiness
- Power Brakes

REGULATORY BACKLOG

Question. What is the current regulatory backlog? What are the nature and status of each of those projects? Please identify which of those are statutorily mandated, and when those are due for final issuance.

Answer. Enclosed is an April 2000 summary of FRA's pending regulatory workload, showing the nature and status of each of the regulatory projects. The projects that are statutorily mandated are:

- Freight Power Brake Rules.*—The statutory deadline for revision of the power brake rules was December 31, 1993. FRA issued rules on passenger train brakes as part of its passenger equipment standards, issued in May 1999. One of the major mandates in the statute concerned equipping trains with two-way

end-of-train devices. FRA issued a rule requiring those devices in January 1997, and railroads actually equipped trains with them prior to the deadline for compliance stated in the statute. Remaining freight power brake issues were dealt with in a proposed rule issued in 1994. FRA withdrew that proposed rule and tasked RSAC with developing rules in 1996. In June 1997, with RSAC deadlocked on the rule, FRA withdrew the task from RSAC. FRA published a proposed rule on September 9, 1998, and, after public hearings and comment, is preparing a final rule. The final rule is under review within the Administration.

—*Use of Train Horns at Grade Crossings.*—The Swift Rail Development Act of 1994 required FRA to issue regulations providing for the use of train horns at highway-rail crossings. The final rule on the most hazardous crossings was due on November 2, 1996, and a final rule on other crossings was due on November 2, 1998. This second final rule would require the sounding of the locomotive horn at a crossing unless alternative safety measures are in place to compensate for its value as a warning to motorists. FRA released a report on the national impacts of local whistle bans on June 1, 1995, and has conducted an extensive program of public outreach to make communities aware of the forthcoming rulemaking and to seek information on supplementary safety measures that would support the allowance of quiet zones in communities sensitive to train horn noise. Numerous congressional offices encouraged FRA to continue outreach and data collection. FRA advised the Congress that the deadline for an initial final rule would not be met. Immediately prior to adjournment, the 104th Congress enacted the FAA reauthorization bill (PL 104–264; 10/9/96), which included amendments to the original whistle ban legislation. In general, the legislation affirms the latitude available to the Secretary to provide for phase-in of regulations and focus on safety results. FRA issued the proposed rule January 13, 2000. Written comments are due May 26, 2000. Public hearings are being held to receive oral comments. FRA published a Draft Environmental Impact Statement (DEIS) for the proposed regulation in December 1999. FRA’s proposed rule strives to achieve the law’s important safety objective in a way that will provide communities maximum flexibility and ample opportunity to maintain quiet.

In addition to the statutorily mandated rules, among the most important pending rulemakings are:

- Positive train control.
- Locomotive cab working conditions.
- Locomotive crashworthiness.
- Event recorder revisions.

FRA expects to issue proposed or final rules on each of these subjects in 2000. The enclosed overview contains specifics on each of these projects.

OVERVIEW OF THE RAILROAD SAFETY REGULATORY PROGRAM AND STANDARDS-RELATED PARTNERSHIP EFFORTS

Legend:

- ANPRM—Advance Notice of Proposed Rulemaking
- Italics*—Indicates project has been identified for development through the Railroad Safety Advisory Committee or a similar forum for collaborative rulemaking
- NPRM—Notice of Proposed Rulemaking
- RSAC—Railroad Safety Advisory Committee
- SACP— Safety Assurance and Compliance Program

NOTE

Centralized Docket Management System.—Dockets established after October 7, 1998, are available on the DOT Centralized Docket Management System facility and can be accessed over the Internet (<http://dms.dot.gov>). Detailed information is available at the Web site to assist in viewing documents.

Revised Docket Filing Procedures for FRA Rulemaking and Adjudicatory Dockets.—Final Rule (64 FR 70193)—This final rule amends certain FRA rules to provide accurate information to the public regarding filing requirements for FRA proceedings. The final rule is effective 2/14/00.

* * * * *

SUMMARY OF CONSENSUS RULEMAKING EFFORTS

Roadway Worker Safety.—Consensus achieved in formal negotiated rulemaking; final rule published 12/16/96; effective 1/15/97. Denial of AAR and APTA petitions for reconsideration published 4/21/97.

Passenger Equipment Safety Standards.—NPRM based on working group recommendations was published 9/23/97. Public hearing held 11/21/97. Written comments were due 11/24/97. Working group met 12/15–12/16/97 (general issues) and 1/6/98 (intercity and high speed issues). Final rule published 5/12/99 (64 FR 25540).

Passenger Train Emergency Preparedness.—NPRM based on working group recommendations was published 2/24/97 with significant additions, and a notice of public hearings was published 3/6/97. Public hearings were held in Chicago on 4/4/97 and in New York City on 4/7/97. Written comments were due by 4/25/97. Working group met 8/28/97 and reached agreement in principle on changes for incorporation into the final rule. Final rule published 5/4/98 (63 FR 24630).

Railroad Safety Advisory Committee:

Last full Committee meeting 1/28/1999.

Last RSAC Working Group Activity Update published in Federal Register 12/17/99 (64 FR 707656).

| Task No. | Subject | Status |
|----------|---|--|
| 96-1 | Power Brake Regulations, freight, general revision. | Working group charter extended to 1/15/97 to produce NPRM; impasse reached at 12/4/96 meeting, and subsequent efforts to renew talks were not successful. FRA withdrew task at 6/24/97 meeting. FRA published second NPRM 9/9/98 (63 FR 48294) reflective of what FRA has learned through the collaborative process. Public hearings 10/26/98 and 11/13/98; technical conference 11/23–24/98. Submission of written comments date due extended to 3/1/99. Public meeting 5/27/99 on FRA MPE database. FRA is preparing the final rule. |
| 96-2 | Track Safety Standards, general revision. | Consensus achieved; in balloting that concluded 11/21/96, RSAC voted to accept working group report and recommend NPRM. NPRM published 7/3/97; public hearing held 9/4/97; comment period closed 9/15/97. Final rule published 6/22/98; effective 9/21/98. FRA prepared final rule amendment on Gage Restraint Measurement System (GRMS) standards. Contingent upon Working Group approval, the standards will be forwarded to the full RSAC for consideration. |
| 96-3 | Railroad Communications (including revision of Radio Standards and Procedures). | Final meeting of working group was held 1/23/97. Working group provided consensus NPRM to RSAC at 3/24/97 meeting. RSAC voted to accept the NPRM and forward to the Administrator in voting concluded 4/14/97. NPRM published 6/26/97; comment period closed 8/25/97. Final rule published 9/4/98 (63 FR 47182). |
| 96-4 | Tourist Railroads | Open task to address needs of tourist and historic railroads; working group monitored steam task. |
| 96-5 | Steam-Powered Locomotives, revision of inspection standards. | Tourist & Historic Working Group met with task force representatives 9/3/97. NPRM was approved by full committee in voting that concluded 2/17/98. NPRM published 9/25/98 (63 FR 51404). Public hearing held 2/4/99. Task Force developed recommendations in response to comments received; Working Group consensus; approved by full Committee voting ballot 9/29/99. Final rule published 11/17/99 (64 FR 62828). |
| 96-6 | Locomotive Engineer Qualification and Certification, general revision. | Task accepted 10/31/96; first working group meeting held 1/7–9/97. NPRM approved by full committee 5/14/98. NPRM published 9/22/98 (63 FR 50625). Final rule published 11/8/99 (64 FR 60966). |
| 96-7 | Track Motor Vehicle and Roadway Worker Equipment. | Task accepted 10/31/96. Task Force of Track Safety Standards Working Group is finalizing a proposed rule. Contingent upon Working Group approval, the proposed rule will be forwarded to the full RSAC for consideration. |
| 96-8 | Locomotive Crashworthiness and Working Conditions (planning task). | Planning task accepted 10/31/96; planning group met 1/23/97; two task statements were accepted by the full Committee at 6/24/97 meeting [see 97-1, 97-2]. Planning task is COMPLETED. |
| 97-1 | Locomotive Crashworthiness | Task accepted 6/24/97; working group held initial meeting 9/8–9/9/97. Established task force to review collision history and design options. Working group reviewed results of research and is drafting standards for freight and passenger locomotives. |

| Task No. | Subject | Status |
|------------------------|---|---|
| 97-2 | Locomotive Cab Working Conditions. | Task accepted 6/24/97; working group held initial meeting 9/10-11/97. Noise and Temperature task forces established. Draft sanitation NPRM under review by Working Group. Noise Task Force preparing draft recommendations for noise exposure requirements. |
| 97-3 | Event Recorders (data survivability, inspection, etc.). | Task accepted 6/24/97; working group met 9/12/97. Task force established. Working group and task force actively meeting; draft proposed rule under review. |
| 97-4, 97-5, 97-6 | Positive Train Control | Tasks accepted 9/30/97 and assigned to single working group. Standards Task Force is working on proposed NPRM for positive train control performance standards. Data and Implementation Task Force completed report on the future of PTC systems; report accepted for forwarding to FRA by full Committee vote at 9/8/99 meeting. |
| 97-7 | Calculation of Damages for Reportable Train Accidents. | Task accepted with modification 9/30/97. Working group has been formed. Initial meeting held 2/8/99. |
| 00-1 | Blue Signal Protection of Workmen. | Task accepted 1/28/00; working group being formed. |

SAFETY RULES AND REPORTS—GENERAL

Accident/Incident Reporting

Summary.—The Rail Safety Enforcement and Review Act of 1992 barred FRA from adjusting the monetary threshold for reporting of train accident until the methodology was revised. In addition, FRA identified the need to comprehensively revise these regulations, which had not be revised since 1974.

Deadline.—The report of the Committee of Conference on the Department of Transportation and Related Agencies Appropriation Act, 1996, directed FRA to issue a final rule in this proceeding by 6/1/96.

History.—An NPRM was issued 8/19/94, followed by public hearings and written comment. A public regulatory conference was convened 1/30-2/3/95 in an effort to resolve outstanding issues. A notice of decision to issue a supplemental NPRM was published 7/3/95, but was withdrawn in a notice published on 1/24/96.

Status.—Final rule was issued 5/30/96 and published 6/18/96 (61 FR 30940). Stay requests were denied, and technical amendments were published 11/22/96 (61 FR 59368). A notice of availability of custom software was also published 11/22/96 (61 FR 59485). On 12/16/96, the Administrator signed final rule amendments, which were published 12/23/96 (61 FR 67477). Final rule became effective 1/1/97. Industry training partnerships have been executed.

Next steps.—FRA offered RSAC a task on 9/30/97 to review the definition of events required to be reported as train accidents, as requested by the Committee on 6/24/97. By request of the Committee, the task was limited to determination of damages qualifying an event as a reportable train accident. A working group has been formed and held its initial meeting 2/8/99.

Blue Signal Protection

Summary.—On 8/16/93, FRA published a final rule permitting one or more utility employees to associate themselves with a train crew for the purpose of performing normal operating functions that require employees to go on, under or between rolling stock, without use of blue signal protection (which is ordinarily appropriate for mechanical duties). During the proceeding it was noted that rules for locomotive engineers working alone were not clearly defined. FRA published a final rule amendment governing single engineers working alone on 3/1/95, but granted a requested suspension of the amendment on 6/9/95 pending development of additional facts. Since that time, additional blue signal issues have continued to emerge, including application of the requirements to contractors performing the subject functions on railroad property.

Status.—On 10/31/96, the RSAC advised FRA that this project should not be proposed for early tasking, given conflicting demands on the resources of member organizations. RSAC accepted task at the 1/28/00 full Committee meeting.

Bridge Displacement Detection Systems (Report)

Summary.—The Federal Railroad Safety Authorization Act of 1994 required FRA to submit a report on systems to detect bridge displacement of the type that caused the derailment of the Sunset Limited at Mobile, Alabama, 9/22/93.

Statutory deadline.—5/2/96

Status.—A technical evaluation report was published 6/23/94 and made available to the respective committees. A formal report to the Congress is in preparation.

Control of Alcohol and Drug Use; Application of Random Testing and Other Requirements to Train Crews Based Outside the United States Who Engage in Train Operations in the United States

Summary.—FRA applies only part of its regulation on control of alcohol and drug use (49 CFR part 219) to a railroad's train operations in the United States that are performed by train crews whose home terminals are outside the United States ("extraterritorial train employees"). In this notice, FRA proposes to make all of part 219 applicable to extraterritorial train employees who perform train operations in the United States.

Status.—Drafting of the Notice of Proposed Rulemaking is in its final stages, and FRA plans to send it for review soon.

Event Recorder Next-Generation Performance Standards

Summary.—The National Transportation Safety Board has noted the loss of data from event recorders in several accidents due to fire, water and mechanical damage. In issuing final rules for event recorders which became effective 5/5/95, FRA noted the need to provide more refined technical standards. NTSB proposed performance standard for data survivability.

Background.—Conducted an initial meeting of an informal working group comprised of AAR, RPI, and labor, and co-chaired by NTSB and FRA experts, on 12/7/95 to consider development of technical standards. At the RSAC meeting on 7/24–7/25/96, the AAR agreed to continue this inquiry, and on 11/1/96, AAR reported to the RSAC the status of work on proposed industry standards. On March 5, 1997, NTSB issued recommendations regarding testing and maintenance of event recorders as a result of finding in the investigation of the BNSF accident of 2/1/96 at Cajon Pass, California. On 3/24/97, the RSAC indicated its desire to receive a task to consider NTSB recommendations with respect to crash survivability, testing and maintenance.

Status.—RSAC accepted task 6/24/97. Event Recorder working group first met 9/12/97. A task force was established. Draft proposed rule under review. (Task No. 97–3).

Florida Overland Express

Summary.—FRA has received a petition for a rule of particular applicability for operations over a new high-speed railroad between Miami and Tampa via Orlando. The State of Florida had established a dedicated funding stream of \$70 million per year towards creation of this new private/public partnership.

Status.—Received petition for rule of particular applicability 2/18/97. FRA issued NPRM 12/12/97 (62 FR 65478). Comment period closed. FRA reviewed comments received and held a public hearing on 11/23/98 to discuss a variety of issues. The State of Florida withdrew its support and funding for this project 1/99, suspending all activity on development. FRA is not currently working on the final rule.

Freight Car Safety Standards; Maintenance-of-Way Cars

Summary.—Cars not in compliance with the Freight Car Safety Standards may be operated at track speed in revenue trains if they are company-owned, stenciled cars. FRA published an NPRM 3/10/94 to close this loophole. FRA requested the Association of American Railroads to amplify its comments by letter of 12/20/94.

Status.—AAR response received 8/4/95 is under review. FRA offered a task to the RSAC to resolve final rule issues on 9/30/97, but objection from the AAR prevented the matter from coming to a vote. FRA will prepare final rule.

Locomotive Crashworthiness and Working Conditions

Summary.—The Rail Safety Enforcement and Review Act of 1992 required FRA to conduct a proceeding regarding locomotive crashworthiness and working conditions and to issue regulations or submit a report. Areas for consideration included structural means of preventing harm to crew members in collisions (collision posts, anticlimbers, etc.) and matters related to safety, health and productivity (e.g., noise, sanitation).

Statutory deadline.—3/2/95

Background.—FRA conducted research, outreach, and a survey of locomotive conditions and finalized a report to the Congress transmitted by letter of September 18, 1996. The report conveyed data and information developed by FRA to date, closed out those areas of investigation for which further action is not warranted, and defined issues that should be pursued further in concert with the industry parties, either for voluntary or regulatory action. On 10/31/96, the RSAC accepted a

preliminary planning task. The Locomotive Crew Safety Planning Group met 1/23/97, and subsequent consultations led to preparation of task statements.

Status.—RSAC accepted two tasks 6/24/97. (RSAC Task 97-1, locomotive crashworthiness; and Task 97-2, locomotive cab working conditions).

Locomotive Crashworthiness.—Working Group met 9/8-9/97 and established a task force on engineering issues that has been active in reviewing collision history and design options. The Working Group has reviewed results of research and is drafting standards for freight and passenger locomotives.

Locomotive Cab Working Conditions.—Working Group met for the first time 9/10-11/97 and established task forces on noise and temperature, which have been working actively. A draft sanitation NPRM is under review by the Working Group. The Noise Task Force is preparing draft recommendations for noise exposure requirements.

Locomotive Engineer Certification; Miscellaneous Revisions

Summary.—The final rule for locomotive engineer certification became effective in 1991, but certain issues were left unresolved. Experience under the rule has raised additional issues. Examples of issues under review include the status of operators of specialized maintenance of way equipment and types of conduct for which decertification is appropriate.

Status.—An interim final rule amendment dealing with agency practice and procedure concerning engineer certification appeals was published 10/12/95. Issues related to procedures on the properties, offenses warranting decertification, periods of decertification, operation of specialized equipment, etc., are pending. The RSAC accepted this task on 10/31/96. The Working Group's initial meeting was held 1/7-1/9/97. Final meeting to review proposed rule language was held 10/7-10/9/97, and task force on hearing and vision met 10/21/97 to finalize language. The full committee voted 5/14/98 to recommend issuance of the NPRM forwarded by the Working Group. The NPRM was published 9/22/98 (63 FR 50625) (RSAC Task 96-6.) The Working Group met to resolve issues presented in public comments, and on 1/28/99 the RSAC voted to transmit recommendations regarding issues for which the Working Group had received comments. The final rule was published 11/8/99 (64 FR 60966); effective date 1/7/00. (FRA Docket No. RSOR-9. Notice 12).

Northeast Corridor (NEC) Signal & Train Control

Summary.—Amtrak is planning operations to 150 mph on portions of the NEC and is implementing improvements to the automatic train control system that will provide positive stop and continuous speed control capabilities. FRA's Northeast Corridor Safety Committee (NCSC) met 9/20/94 and approved a set of performance criteria for the new system.

Status.—On 1/30/97, Amtrak provided to FRA a draft system concept for the Advanced Civil Speed Enforcement System (ACES), including conditions for operation on designated territories on the south and north ends of the NEC. Final details were received by FRA on 7/9/97. A notice of Proposed Order for the new signal and train control system authorizing speeds to 150 miles per hour (135 mph on the South End with only high-speed trains equipped under "flanking protection") was published 11/20/97 (62 FR 62097), and written comments were due by 12/22/97. As a result of requests, a public hearing was set for 2/17/98 (63 FR 3389), and the comment closing date was extended to 2/24/98. Final Order of Particular Applicability published 7/22/98 (63 FR 39343); effective 8/21/98.

NEC System Safety

Summary.—Mixed passenger and freight operations at speeds to 150 mph have not previously been attempted in this country. Through the Northeast Corridor Safety Committee (or successor), FRA intends to develop system safety criteria for this service territory, integrating existing safety measures and identifying any areas of material risk not previously addressed.

Status.—Timing of project initiation to be determined. Will focus on enhancement and integration of individual railroad system safety plans to address complex NEC operations.

Passenger Equipment Safety Standards

Summary.—The Federal Railroad Safety Authorization Act of 1994 (enacted 11/2/94) required FRA to issue initial passenger safety standards within 3 years and complete standards within 5 years. The agency was authorized to consult with industry parties outside the Federal Advisory Committee Act, making it possible to conduct an informal negotiated rulemaking.

Statutory deadline.—11/2/97 (initial); 11/2/99 (final).

Status.—An initial meeting of the Passenger Equipment Safety Working Group (passenger railroads, operating employee organizations, mechanical employee organizations, and representatives of rail passengers) was held on 6/7/95, and the group met regularly to develop an NPRM. Manufacturer/supplier representatives served as associate members. FRA prepared an ANPRM indicating the issues under review by the working group, which was published 6/17/96 (61 FR 30672). The working group held its final meeting on the NPRM 9/30–10/2/96, having reached consensus on a portion of the issues presented. An NPRM was published 9/23/97 (62 FR 49728). The public hearing was held 11/21/97 (see 62 FR 55204; 10/23/97). Comments were due 11/24/97. Final working group meeting on the initial standards was held 12/15–12/16/97, and an additional meeting on intercity and high speed issues was held 1/6/98. The final rule was published 5/12/99 (64 FR 25540). (FRA Docket No. PCSS–1, Notice No. 5). Following issuance of the “initial” final rule, work will begin on additional passenger equipment safety standards. FRA is reviewing several petitions for reconsideration.

Passenger Train Emergency Preparedness

Summary.—The Federal Railroad Safety Authorization Act of 1994 required FRA to issue emergency preparedness standards for passenger service. Initial standards were required within 3 years and complete standards within 5 years. The agency was authorized to consult with industry parties outside the Federal Advisory Committee Act, making it possible to conduct an informal negotiated rulemaking.

Statutory deadline.—11/2/97 (initial); 11/2/99 (final)

Background: An initial meeting of the working group for passenger train emergency preparedness standards was held on 8/8/95. The group met 2/6–7/96 to develop elements of an NPRM and met jointly with the Passenger Equipment Safety Standards Working Group on 3/26/96 to consider related issues, including the implications of Emergency Order No. 20 and recommendations of the National Transportation Safety Board. The working group included representatives of passenger railroads, operating employee and dispatcher organizations, and rail passenger organizations, and an advisor from the National Transportation Safety Board. The working group approved draft rule text, which was incorporated in an NPRM forwarded for review and clearance. Changes requested during review and clearance were provided to the working group during the week of 12/16/96.

Status.—The NPRM was published 2/24/97 (62 FR 8330), and a notice of public hearings was published 3/6/97 (62 FR 10248). Public hearings were held in Chicago on 4/4/97 and in New York City on 4/7/97. Written comments were due by 4/25/97. The working group met 8/28/97 and agreed in principle to revisions for inclusion in the final rule. The final rule was published 5/4/98 (63 FR 24630), and a correction notice was published 7/6/98 (63 FR 36376). (FRA Docket No. PTEP–1, Notice No. 3).

NOTE.—The following order is closely associated with the two prior entries:

Emergency Order No. 20

Summary.—This order deals with the safety of push/pull and electric multiple unit service. The order was issued 2/20/96 (61 FR 6876; 2/22/96), and amended 2/29/96 (61 FR 8703; 3/5/96). Intercity and commuter passenger railroads were required to adopt operating rules providing for observance of reduced speed where delays are incurred in blocks between distant signals and signals at interlocking or controlled points. Marking of emergency exits and testing of emergency windows was required. Interim system safety plans were required to be filed.

Status.—The order has been fully implemented. On 3/26/96, the Passenger Equipment Safety Working Group and the Emergency Preparedness Working Group met jointly to consider implementation issues and crossover issues with the two rule-making proceedings and recent recommendations of the National Transportation Safety Board. The American Public Transit Association and its members have undertaken a number of actions in response to the emergency order, including development of comprehensive system safety plans. Codification, revision or termination of provisions will be considered during the second phase of passenger safety standards rulemaking.

Positive Train Control

Evaluation of needs and feasibility (implementation)

Summary.—These tasks involve defining PTC functionalities, describing available technologies, evaluating costs and benefit of potential systems, and considering implementation opportunities and challenges, including demonstration and deployment. (RSAC Tasks 97–4 and 97–5).

Status.—Accepted by RSAC 9/30/97. Please see entry on RSAC summary.

Performance standards for PTC systems

Summary.—Existing signal and train control regulations are built around relay-based controllers and traditional track circuits, but technology is rapidly advancing. This task requires revising various regulations, including 49 CFR Part 236, to address the safety implications of processor-based signal and train control technologies, including communication-based operating systems. The purpose of the effort is to encourage deployment of innovative technology by providing a predictable environment. (RSAC Task 97-6).

Status.—Accepted by RSAC 9/30/97. Please see entry on RSAC summary.

Progress Report to the Congress

Summary.—The Swift Rail Development Act of 1994 required FRA to submit a status report on the implementation of positive train control as a follow-up to the 7/94 Report entitled Railroad Communications and Train Control.

Statutory deadline.—12/31/95

Status.—FRA has provided testimony to the committees of jurisdiction reporting the status of efforts to promote implementation of positive train control. FRA plans to utilize the results of the RSAC PTC working group and task forces efforts to provide an appropriate status report.

Power Brakes

Summary.—The Rail Safety Enforcement and Review Act of 1992 required FRA to revise the power brake regulations. The statute required adoption of requirements for 2-way end-of-train telemetry devices (EOTs) and “standards for dynamic brakes.”

Statutory deadlines.—Final rule by 12/31/93; 2-way EOTs to be used on trains operating greater than 30 miles per hour or in mountain grade territory to be equipped by 12/31/97.

Status.—FRA published an NPRM 9/16/94 and conducted six days of public hearings ending 12/94. Due to strong objections to the NPRM, additional options were requested from passenger interests by 2/27/95 and from freight interests by 4/3/95. Further action is as follows:

(1) *Passenger standards revision.*—FRA requested the Passenger Equipment Safety Standards Working Group to incorporate new proposals for revisions of the power brake regulations in the NPRM for passenger equipment safety. Working group proceedings on the elements of the NPRM concluded 10/2/96 without full agreement on power brake elements. See Passenger Equipment Safety Standards for current status.

(2) *Freight standards revision.*—On 4/1/96, the RSAC accepted the task of preparing a second NPRM. The working group initiated its efforts in May, and on 10/31/96 the RSAC extended the deadline for a final report until 1/15/97. At the working group meeting 12/4/96, an impasse was declared, and subsequent efforts to revive discussions were not successful. On May 29, FRA notified the working group by letter that the task will be formally terminated. FRA withdrew task at 6/24/97 full Committee meeting. FRA prepared second NPRM reflective of what was learned through the collaborative process. NPRM published 9/9/98 (63 FR 48294) (FRA Docket No. PB-9, Notice No. 13). (RSAC Task 96-1—terminated). Public hearings were conducted on 10/26/98 and 11/13/98 and a technical conference was held on 11/23-24/98. Final date for submission of comments extended until 3/1/99. FRA is preparing the final rule.

(3) *Two-way end-of-train devices.*—FRA published notice on 2/21/96 that this issue would be separated from the balance of the freight issues and expedited for completion of a final rule. A public regulatory conference was convened 3/5/96 to explore remaining issues, and written comments were due 4/15/96. (Railroads also agreed to an expedited schedule that will ensure application of this technology by 12/15/96 on 2 percent or greater grades and by 7/1/97 for other trains.) The final rule was published 1/2/97 (62 FR 278), (FRA Docket No. PB-9, Notice No. 6), and it became effective 7/1/97. FRA received two petitions for reconsideration (“local train” definition and implementation date for smaller railroads). A notice denying the request to delete the tonnage restriction for local trains and granting extension of the compliance date for railroads with fewer than two million work hours was published 6/4/97 (62 FR 30461). On 11/4/97, held technical conference on petition of American Short Line Railroad Association regarding operation of very light trains over grade territory (see 62 FR 52370; 10/7/97); subsequently granted limited relief and received petition for reconsideration of conditions, which is now under review.

On 1/16/98, FRA published NPRM to clarify application of two-way EOT requirements to intercity passenger trains with express equipment at the rear (63 FR 195). Final rule was issued 5/1/98 (63 FR 24130). (FRA Docket No. PB-9, Notice No. 11).

Note.—On 2/6/96, the Administrator issued Emergency Order No. 18, requiring use by the BNSF of 2-way EOTs or equivalent protection for heavy grade operations over the Cajon Pass (61 FR 505; 2/9/96).

Railroad Communications (including Radio Standards and Procedures)

Summary.—In submitting the required report to the Congress on Railroad Communications and Train Control on 7/13/94, FRA noted the need to revise existing Federal standards for radio communications in concert with railroads and employee representatives.

Status.—On 4/1/96, the RSAC accepted the task of preparing an NPRM, including consideration of communication capabilities required in railroad operations. The working group presented a consensus NPRM to the full Committee on 3/24/97, and the Committee voted to recommend issuance of the NPRM to the Administrator in balloting that ended 4/14/97. NPRM issued 6/11/97 and published 6/26/97 (62 FR 34544) (FRA Docket No. RSOR-12, Notice No. 4). Comment period closed 8/25/97. Final rule published 9/4/98 (63 FR 47182). (FRA Docket No. RSOR-12, Notice No. 5). (RSAC Task 96-3).

Regulatory Reinvention

Summary.—In response to the President's call for regulatory review, elimination and reinvention, FRA took several actions to repeal obsolete regulations and simplify agency processes that affect external customers. Major elements of this effort are included in regulatory revision efforts described under other headings.

Status.—Interim final rule amendments reducing frequency of reporting regarding signal and train control systems (49 CFR Part 233), simplifying review requirements for certain modifications of signal systems (49 CFR Part 235), and making conforming changes regarding inspection of ATC/ATS/ACS (49 CFR Part 236) published 7/1/96 (61 FR 33871). These changes should be finalized early in 1999. FRA is considering inclusion of a legislative proposal to permit flexibility for railroads to make accident/incident reports less frequently than monthly and to eliminate outdated requirements for notarization of reports in the Administration's proposed 1999 rail safety reauthorization legislation.

Roadway Worker Safety

Summary.—In requiring the review of the Track Safety Standards, the Rail Safety Enforcement and Review Act of 1992 required FRA to evaluate the safety of maintenance of way employees. In addition, the Brotherhood of Maintenance of Way Employees and the Brotherhood of Railroad Signalmen petitioned FRA to issue "on-track safety" rules.

Background.—FRA published a notice 8/17/94 initiating a formal negotiated rule-making. The negotiated rulemaking committee reported a statement of principles 5/17/95 and completed an NPRM draft 8/95. NPRM published 3/14/96 (61 FR 10528); initial written comments were due 5/13/96. Public hearing held 7/11/96.

Status.—The final rule was published 12/16/96 (61 FR 65959); effective 1/15/97. Petitions for reconsideration were denied in a notice published 4/21/97. A consolidated hearing on waiver petitions was held 5/22/97, and written comments were due by 6/9/97. FRA is issuing decisions on individual petitions as investigations and analysis were completed.

Safety Integration Plans

Summary.—In response to the proposed acquisition of Conrail by Norfolk Southern and CSX Transportation, FRA has suggested, and the Surface Transportation Board has required, that the petitioners file with the Board of Safety Integration Plans (SIPs). In coordination with the Board, FRA proposed regulations requiring preparation and FRA review of SIPs in connection with future railroad mergers.

Status.—FRA and the STB jointly issued an NPRM 12/31/98 (63 FR 72225) to institutionalize the SIP process to ensure that proper safety planning and safety investments are undertaken during a merger. The proposed rule spells out the types of transactions that will require SIPs and outlines the roles of FRA and the STB in overseeing the SIP process.

Small Railroads; Interim Policy Statement

Summary.—The Small Business Regulatory Enforcement Fairness Act of 1996 amended the Regulatory Flexibility Act and required, among other things, that each agency establish small business communication and enforcement programs.

Statutory deadline.—3/29/97

Status.—Interim policy statement published 8/11/97 (62 FR 43024). FRA is reviewing comments received and developing a final policy statement. Public meeting

to address definition of "small entity" was held on 9/28/99. FRA is preparing a final policy statement.

Steam Locomotives

Summary.—A committee of steam locomotive experts from tourist and historic railroads has sought a partnership with FRA to revise the steam locomotive regulations. Proposed revisions would relieve regulatory burdens while updating and strengthening the technical requirements.

Status.—Revision of the Steam Locomotive Inspection regulations was tasked to the RSAC on 7/24/96. A task force of the Tourist & Historic Railroads Working Group is actively working toward finalization of a final rule. NPRM rule text agreed upon within the task force was approved by the Tourist and Historic Working Group on 9/3/97 and provided to the RSAC on 9/30/97. The full RSAC approved the consensus NPRM by mail ballot 2/17/98. NPRM published 9/25/98 (63 FR 51404) (FRA Docket No. RSSL 98-1, Notice No. 1). (RSAC Task 96-5). Public hearing held 2/4/99. Task Force formulated recommendations in response to comments received. The recommendations were accepted by the working group and the full Committee voted to incorporate the recommendations in the final rule. The final rule was published 11/17/99 (64 FR 62828) (FRA Docket No. RSSL 98-1, Notice No. 3); effective date 1/18/00.

Track Motor Vehicle and Roadway Equipment Safety

Summary.—A 1990 petition to FRA from the Brotherhood of Maintenance of Way Employees asked FRA, among other requests, to propose standards for MOW equipment related to the safety of persons riding or operating that equipment. FRA elected not to pursue that issue at that time given other pending workload. However, this issue was renewed during the deliberations of the RSAC Track Safety Standards Working Group.

Status.—On 10/31/96, the RSAC accepted a task of drafting proposed rules for the safety of this equipment. A task force of the Track Safety Standards Working Group was formed to address this issue. The task force has met several times. The task force is finalizing a proposed rule. Contingent upon the approval of the working group, the proposed rule will be presented to the full RSAC for consideration at the 1/28/00 meeting. (RSAC Task 96-7).

Tourist Railroad Report/Review of Regulatory Applicability

Summary.—The Swift Rail Development Act of 1994 required FRA to submit a report to the Congress regarding FRA's actions to recognize the unique factors associated with these generally small passenger operations that often utilize historic equipment.

Statutory deadline.—9/30/95

Status.—Report submitted to the Congress 6/10/96. The RSAC authorized formation of a Tourist and Historic Railroads Working Group 4/1/96. The working group held its initial meeting 6/17-6/18/96 and has monitored completion of the steam task. (RSAC Task 96-4).

Track Safety Standards

Summary.—The Rail Safety Enforcement and Review Act of 1992 required FRA to revise the Track Safety Standards, taking into consideration, among other things, the "excepted track" provision. Other prominent issues include updating the standards to take advantage of research findings for internal rail flaw detection and gage restraint measurement. FRA also proposes to adopt track standards for high-speed service.

Statutory deadline.—Final rule by 9/1/95.

Background.—FRA published an ANPRM 11/6/92 and conducted workshops in the period 1/93-3/93. The Railroad Safety Advisory Committee accepted task of preparing an (NPRM) on 4/2/96. The Track Safety Standards Working Group reported a draft NPRM to the full committee on 10/31/96. In balloting that concluded 11/21/96, RSAC voted to accept the working group report and recommend issuance of the NPRM.

Status.—NPRM signed 6/19/97 and published 7/3/97 (62 FR 36138) (FRA Docket No. RST-90-1, Notice No. 5). Hearing held 9/4/97; comment period closed 9/15/97. Additional comment was invited regarding certain high-speed track geometry issues by notice of 12/12/97 (62 FR 65401) not later than 12/22/97. Final rule published 6/22/98 (63 FR 33991) (FRA Docket No. RST-90-1, Notice No. 8); effective 9/21/98. FRA prepared final rule amendment on Gage Restraint Measurement System (GRMS) standards. (RSAC Task 96-2). Contingent upon approval of the Track Safety Standards Working Group, the standards will be forwarded to the full RSAC for consideration at the 1/28/00 meeting.

U.S. Locational Requirement for Dispatching of U.S. Rail Operations

Summary.—New 49 CFR Part 241 would require all dispatching of railroad operation that occur in the United States to be performed in the United States, with exceptions for emergency situations and for the few limited track segments that were being dispatched from foreign countries as of December 1999.

Status.—Drafting of the Interim Final Rule has been completed, and FRA has sent it for review.

HIGHWAY-RAIL CROSSING SAFETY

Commercial Driver Disqualification—Railroad-Highway Grade Crossing Violation

Summary.—To enhance the safety of commercial motor vehicle (CMV) operations on our nation's highways and complete action initiated in response to the requirements specified in section 403 of the ICC Termination Act of 1995, the Federal Highway Administration (FHWA) revised its regulations (49 CFR Parts 383 and 384) to require that CMV drivers who are convicted of violating Federal, State, or local laws or regulations pertaining to railroad-highway grade crossings be disqualified from operating a CMV.

Status.—Final rule published on 09/02/99 (64 FR 48104).

Grade Crossing Signals (Inspection, Testing and Maintenance)

Summary.—FRA issued a final rule for inspection, testing and maintenance of automated warning devices 9/30/94, and the rule went into effect 1/1/95 (49 CFR Part 234). During the initial year, FRA worked with railroads and signal employees to disseminate information, conduct training, and identify any areas of ambiguity or weakness in the standards. At a technical resolution committee (TRC) meeting during the week of 3/13/95 that included participation by railroads, the Brotherhood of Railroad Signalmen, and States, several issues were identified that require clarification or refinement. An interim manual dated 4/14/95 incorporated the findings of the TRC.

Status.—Interim final rule amendments published 6/20/96 (61 FR 31802). FRA is preparing a notice to make the changes final which is expected to be published in the near future.

Locomotive Visibility /Auxiliary Alerting Lights

Summary.—In 1991, FRA initiated a new phase of research on locomotive conspicuity in relation to safety at highway-rail crossings. The Amtrak Authorization and Development Act of 1992 mandated that the research be completed and that a regulation be issued to apply alerting lights to locomotives.

Statutory deadline.—Final rule by 6/30/95.

Background.—FRA published a “grandfathering rule” on 2/3/93 and amendments on 5/13/94. After the research was substantially completed in early summer of 1995, FRA briefed the industry parties on the results, discussed options for regulatory action, and elicited additional information concerning railroads' progress in equipping their fleets. A Notice of Proposed Rulemaking was published on 8/25/95. The AAR and the ASLRA requested a technical conference to perfect the rule for final issuance, and that conference was held 11/28/95. Written comments were due by 12/12/95.

Status.—Final rule was published 3/6/96 (61 FR 31802). Equipping of locomotives used as lead units at speeds exceeding 20 mph was required to be completed by 12/31/97, as provided by law.

Private Highway-Rail Grade Crossings

Summary.—The Secretary's Action Plan for Grade Crossing Safety (6/94) commits FRA to conducting a special safety inquiry on private crossings.

Status.—Conducted workshop on possible guidelines 7/93; timing of further action to be determined.

Selection of Grade Crossing Automated Warning Devices

Summary.—FRA published a Notice of Proposed Rulemaking 3/2/95 (60 FR 11649) and received over 3,000 written comments through 6/14/95.

Status.—Termination notice published 8/8/97 (62 FR 42733).

Use of Locomotive Horns (Whistle Bans)

Summary.—The Swift Rail Development Act of 1994 required FRA to issue regulations providing for the use of train horns at highway-rail crossings.

Statutory deadline.—Final rule 11/2/96 (most hazardous crossings), 11/2/98 (other crossings).

Background.—This legislative mandate anticipated FRA follow up to Emergency Order No. 15, which addressed local whistle bans on the Florida East Coast Railroad between Jacksonville and Miami. FRA released a report on the national impacts of local whistle bans on 6/1/95 and has conducted an extensive program of public outreach to make communities aware of the forthcoming rulemaking and to seek information on supplementary safety measures that would support allowance of quiet zones in communities sensitive to train horn noise. Contacts have been made with 160+ jurisdictions known to have whistle bans in place. FRA representatives have met with or addressed forums of state and local officials and community groups. Met with AAR/BRS/AAHSTO/FHWA 12/13/95 to address technical specifications for 4-quadrant gates.

Numerous congressional offices encouraged FRA to continue outreach and data collection. FRA advised the Congress that the deadline for an initial final rule would not be met as a result. Immediately prior to adjournment, the 104th Congress enacted the FAA reauthorization bill (PL 104-264; 10/9/96), which included amendments to the original whistle ban legislation. In general, the legislation affirms the latitude available to the Secretary to provide for phase-in of regulations and focus on safety results.

Status.—NPRM published 1/13/00 (65 FR 2230) (Docket No. FRA-1999-6439, Notice No. 1). Written comments due 5/26/00. FRA is holding public hearings to receive oral comments.

HAZARDOUS MATERIALS

New Directions for Rail Hazardous Materials Safety

Summary.—FRA and RSPA have recently completed the two major pending rulemakings addressing hazardous materials tank car safety (crashworthiness and tank retests). With completion of these tasks, it is now possible to turn attention to recommendations of the Transportation Research Board regarding the tank car design and construction process. In order to further this work, FRA is joining with its public and private sector partners to define and prioritize short and long-range research programs, identify needs for rulemaking, and assist in development of improved industry standards.

Status.—A public workshop was conducted 2/13/96-2/14/96 in Houston, with participation by labor, railroads, tank car owners, and shippers. FRA is seeking means of advancing public/private partnerships for North American tank car safety.

Tank Car Crashworthiness and Retest

Summary.—Research and Special Program Administration Dockets HM-175A and HM-201 addressed further improvements in tank car crashworthiness, and adoption of advanced non-destructive testing to improve tank retest procedures, respectively.

Status.—Final rules published 9/21/95 (60 FR 49048).

Train Placement

Summary.—FRA is evaluating whether to recommend that the Research and Special Programs Administration publish proposed amendments to the in-train placement requirements for handling rail cars transporting hazardous materials. FRA is reviewing accident/incident data to determine whether the current non-hazardous materials buffer car requirements are still necessary and whether (as recommended by the National Transportation Safety Board) a buffer car should be required at the rear of each train.

Status.—FRA is studying the feasibility of a proposed amendment.

OTHER SAFETY PROJECTS AND PARTNERSHIP EFFORTS

Bridge Structural Safety

Summary.—Following a survey of bridge conditions and railroad inspection practices, FRA determined that regulatory action is not necessary, but that FRA should continue to exercise an oversight role regarding bridge structural safety programs. FRA issued an interim statement of policy 4/27/95, with comments due 6/26/95.

Status.—Comments support continued FRA partnership role. Final statement of policy is in review and clearance within the Executive Branch.

Note.—On 2/12/96, the Administrator issued Emergency Order No. 19, which removed from service a bridge on the Tonawanda Island Railroad in New York State pending necessary structural repairs (61 FR 628; 2/16/96).

Discolored Wheels

FRA has granted a master waiver of the Freight Car Safety Standards permitting continued use of discolored heat-treated, curved plate wheels, which have superior

resistance to thermal abuse. Data gathered under the waiver, together with results of analysis already provided, may support a permanent change in the regulation.

Environmental Impacts

FRA revised its Procedures for Considering Environmental Impacts to update or eliminate outdated references to programs or statutory authorities that no longer exist and to correct inconsistencies with the Council on Environmental Quality's National Environmental Policy Act implementing regulations. The revised procedures were published in the Federal Register on 5/26/99 (64 FR 28545).

Hours of Service Electronic Recordkeeping

Current hours of service record keeping uses paper and ink, but a major railroad has been given relief to keep electronic records. Other railroads have expressed interest, and similar waivers will involve similar issues. At FRA's invitation, the AAR submitted a petition seeking a master waiver for use of electronic record keeping. However, individual railroads have elected to proceed separately, and FRA is processing each on its merits. Permanent amendments to the recordkeeping and reporting requirements may be proposed. FRA is assisting railroads in developing electronic systems by providing guidance materials.

Remote Control Locomotives

Current regulations contemplate operation of a locomotive exclusively from within the cab, and provision for the safety of the operation is made within that context. FRA has previously proposed a test program to gather more data on various types of operations. FRA has also held an informal safety inquiry regarding use of one-person crews and remote control locomotives on the Wisconsin Central (see 61 FR 58736; 11/18/96). Further action expected.

Shared Use of General Railroad System—Joint Statement of Agency Policy

FRA and the Federal Transit Administration (FTA) have been working together to develop a policy concerning safety issues related to light rail transit operations on the general railroad system, how the two agencies intend to coordinate use of their respective safety authorities and the waiver process related to shared use operations. A proposed joint statement of policy was published 5/25/99 (64 FR 28238) with comments due on 7/30/99. Comment period extended on 7/28/99 to 10/29/99 (64 FR 40931). Additional extension on 10/28/99 to 1/14/00 (64 FR 58124) (FRA Docket No. FRA-1999-5685, Notice No. 3).

Shared Use of General Railroad System—FRA Jurisdiction Policy Statement

FRA issued a proposed statement of agency policy on 11/1/99 (64 FR 59046) (FRA Docket No. FRA-1999-5685, Notice No. 4) describing the extent of its statutory jurisdiction over railroad passenger operations (which covers all railroads except urban rapid transit systems not connected to the general railroads system) and to explain how it will exercise that jurisdiction. Comments are due by 1/14/00.

TOFC/COFC Securement

Summary.—Following a serious accident at Smithfield, N.C., on 5/16/94, FRA formed a partnership with major railroads and labor organizations to evaluate and improve securement of intermodal loads. A report to the Secretary dated 9/15/94 documented the initial results of that effort.

Status.—FRA held a meeting on 2/22/95 that focused on an item-by-item discussion of the status and progress made within the industry with respect to the seven recommendations identified in the report to the Secretary. The AAR has established an Intermodal Equipment Handling Task Force that has developed a number of training aids. A follow-up TOFC/COFC loading and securement safety survey was conducted during 1996. FRA conducted additional loading and securement field evaluations during July-August 1997. Joint training activity brought together railroads, TTX and FRA to maintain strong emphasis on compliance with AAR loading requirements. FRA continues to monitor securement of trailers and trucks in transportation and to work on this issue through SACP's on individual railroads.

Train Dispatcher Training

FRA submitted a report to the Congress on 1/5/95 regarding the functions of contemporary train dispatching offices. The report noted that traditional pools of candidates for recruitment of train dispatchers are no longer adequate to the need. In partnership with the American Train Dispatchers Department/BLE (ATDD), FRA identified the need for a model train dispatcher training program.

Experts from Amtrak, the ATDD, the Burlington Northern/Santa Fe Railroad and FRA developed a list of elements for dispatcher training programs. Required competencies and training program elements have been abstracted from this effort for

a model program. The RSAC was be briefed on this effort on 3/24/97, with participants in the training task force indicating reluctance to attempt a "one size fits all" regulatory approach. Development of curricula continues with FRA support. Initial products of this effort were presented by an FRA contractor.

Wisconsin Central R.R.; Informal Safety Inquiry

Summary.—FRA sought to gather information regarding plans by the railroad to expand use of one-person crews and remote control operations.

Status.—A notice of special safety inquiry was published 11/18/96 (61 FR 58736). A public hearing was held 12/4–12/5/96 in Appleton, Wisconsin. Written submissions were requested by 12/2/96. FRA entered into an agreement with the railroad providing for a moratorium on new single person crew and remote control operations, together with other undertakings related to compliance with FRA regulations. The railroad has completed its responsibilities under the agreement.

SAFETY ADVISORIES/DIRECTIVES/BULLETINS (FEDERAL REGISTER NOTICES)

Advisories

- 99-3—Securement of floor beam cross-members on RoadRailer trailers: Safety practices to prevent the highway tandem wheel on RoadRailer trailers from falling onto the rails on moving trains. Published 11/10/99 (64 FR 61377).
- 99-2—Not issued.
- 99-1—Lifting or jacking of railroad equipment: Safety practices related to lifting or jacking of railroad equipment in order to remove trucks or repair other components on a piece of railroad equipment which requires individuals to work beneath railroad equipment while it is raised. Published 6/16/99 (64 FR 32300).
- 98-3—Safe Use of Prescription and Over-the-Counter Drugs: Safety practices for the safe use of prescription and over-the-counter drugs by safety-sensitive railroad employees. Published 12/24/99 (63 FR 71334)
- 98-2—Emergency application of airbrakes: Safety practices to reduce the risk of casualties caused by failure to activate the available two-way end-of-train telemetry device (two-way EOT) to initiate an emergency brake application beginning at the rear of the train when circumstances require an emergency application of the train airbrakes. Published 6/5/98 (63 FR 30808).
- 98-1—Vision standards of certified locomotive engineers: Addresses the vision standards of certified locomotive engineers in order to reduce the risk of accidents arising from vision impaired engineers. Published 5/28/98 (63 FR 29297).
- 97-3—Authorization of train movements past stop indications of absolute signals: Safety practices to reduce the risk of accidents arising from conflicting train movements when train dispatchers and control operators authorize movements past a stop indication of an absolute signal. Published 9/18/97 (62 FR 49047).
- 97-2—Failure to properly secure unattended rolling equipment: Safety practices to reduce the risk of casualties from runaway locomotives, cars, and trains caused by failure to properly secure unattended rolling equipment left on sidings or other tracks. Published 9/18/97 (62 FR 49046)
- 97-1—Protection of trains and personnel from hazards caused by severe weather conditions: Safety practices to reduce the risk of casualties from train derailments caused by damage to tracks, roadbed and bridges resulting from uncontrolled flows of water and similar weather-related phenomena. Note: This was amended on November 12, 1997, by revising the recommendations concerning the transmission of flash flood warning to train dispatchers or other employees controlling the movement of trains. Published 9/4/97 (62 FR 46794).

Directives

- 97-1—Review of operational tests and inspection programs and review of train dispatching procedures in non-sigaled territory: Safety practices to evaluate the integrity of all railroads' programs of operational tests and inspections to ensure that safety-critical information is accurately conveyed and acknowledged for operations in non-sigaled Direct Train Control (DTC) territory. Published 6/30/97 (62 FR 35331).

Bulletins

- 97-2—Initiating emergency application of train airbrakes descending heavy grades: Safety practice to prevent run-away trains on heavy grades of 2 percent or greater by initiating emergency application of airbrakes whenever train speed

exceeds maximum authorized speed by five miles or more. Published 2/27/97 (62 FR 9014).

97-1—Loss of dynamic braking due to unintentional activation of emergency MU fuel-line cut-off device: Safety practices for certain locomotives equipped with emergency MU fuel-line cut-off devices located inside the locomotive control compartment at a location which enables the cut-off device to be activated unintentionally. Published 1/30/97 (62 FR 4569).

FISCAL YEAR 1999 HAZMAT ACCIDENTS/INCIDENTS TRANSPORTATION

Question. Please chronicle all major hazmat-related accidents/incidents during calendar year 1999, noting date, location, railroad, type of hazmat, any fatalities, injuries, evacuations or other complications, and the estimated cost of damage and loss for each. Please also summarize the probable cause of each accident.

Answer. The following major hazmat-related accidents/incidents occurred during calendar year 1999 (January 1-December 31, 1999):

Date.—January 9, 1999
 Location.—Milford, Nebraska
 Railroad.—Burlington Northern Santa Fe
 Type of hazmat.—Unknown
 Fatalities/injuries.—None
 Evacuations.—None
 Other complications.—None
 Estimated cost.—\$885,000
 Probable cause.—Turnout front (spring) worn or broken

Date.—January 21, 1999
 Location.—Fort Plain, New York
 Railroad.—Consolidated Rail Corporation
 Type of hazmat.—Propane
 Fatalities/injuries.—None
 Evacuations.—150 people
 Other complications.—None
 Estimated cost.—\$1,039,000
 Probable cause.—Coupler or draft system failure

Date.—February 11, 1999
 Location.—Woods Cross, Utah
 Railroad.—Union Pacific Railroad
 Type of hazmat.—Toluene
 Fatalities/injuries.—None
 Evacuations.—None
 Other complications.—None
 Estimated cost.—\$140,000
 Probable cause.—Wide gage due to worn rails

Date.—March 24, 1999
 Location.—Wartrace, Tennessee
 Railroad.—CSX Transportation
 Type of hazmat.—Cartridges for weapons and incendiary ammunition
 Fatalities/injuries.—None
 Evacuations.—Unknown
 Other complications.—None
 Estimated cost.—\$223,000
 Probable cause.—Journal (roller) bearing failure

Date.—July 2, 1999
 Location.—Hamlet, North Carolina
 Railroad.—CSX Transportation
 Type of hazmat.—Methanol
 Fatalities/injuries.—None
 Evacuations.—None
 Other complications.—None
 Estimated cost.—\$249,000
 Probable cause.—Compound fissure (track failure)

Date.—July 10, 1999
 Location.—Riverfront, Louisiana
 Railroad.—Union Pacific
 Type of hazmat: 2-ethyl hexanol

Fatalities/injuries: None
 Evacuations: None
 Other complications: None
 Estimated cost: \$11,300
 Probable cause: By-passed couplers due to crew switching failure

Date: July 11, 1999
 Location: Paradise, Montana
 Railroad: Montana Rail Link
 Type of hazmat: Asphalt
 Fatalities/injuries: None
 Evacuations: None
 Other complications: None
 Estimated cost: \$1,442,000
 Probable cause: Irregular track alignment (sun kink)

Date: July 24, 1999
 Location: Katka, Idaho
 Railroad: Burlington Northern Santa Fe
 Type of hazmat: Anhydrous ammonia
 Fatalities/injuries: None
 Evacuations: None
 Other complications: None
 Estimated cost: \$525,000
 Probable cause: Journal (roller) bearing failure

Date: August 7, 1999
 Location: Judd, Texas
 Railroad: Union Pacific
 Type of hazmat: Petroleum Distillate
 Fatalities/injuries: None
 Evacuations: None
 Other complications: None
 Estimated cost: \$392,000
 Probable cause: Irregular track alignment (sun kink)

Date: September, 30, 1999
 Location: Jens/Drummond Station, Montana
 Railroad: I & M Rail Link/Montana Rail Link
 Type of hazmat: Denatured alcohol
 Fatalities/injuries: None
 Evacuations: None
 Other complications: None
 Estimated cost: \$1,088,000
 Probable cause: Equipment failure

Date: October 7, 1999
 Location: Orpha, Wyoming
 Railroad: Burlington Northern Santa Fe
 Type of hazmat: Unknown
 Fatalities/Injuries: None
 Evacuations: None
 Other complications: None
 Estimated cost: \$134,300
 Probable cause: Track failure

Date: October 31, 1999
 Location: Canyon, Alaska
 Railroad: Alaska Railroad
 Type of hazmat: Aviation, turbine engine
 Fatalities/Injuries: None
 Evacuations: None
 Other complications: None
 Estimated cost: \$700,000
 Probable cause: Improper train make-up

GRADE CROSSING FUNDING

Question. Please update the table found on pages 421–425 of Senate Hearing 106–221, which outlines on a project-by-project basis how fiscal year 1999 and 2000 monies for grade crossing efforts were spent, who the recipients of the funds were, and

1068

what the expected results of these efforts are. Please add a column which delineates in a similar manner the funds requested in fiscal year 2001 (adding lines for new initiatives as necessary)?

Answer. See table below.

[In thousands of dollars]

| Activity | Fiscal year | | |
|---------------------------------------|-------------------|-----------------|-----------------|
| | 1999 obligated | 2000 funding | 2001 request |
| Research & Development | 830 | 1,085 | 1,435 |
| Next Generation High-Speed Rail | 4,738 | 3,897 | 4,000 |
| Safety & Operations | 2,850 | 3,487 | 3,217 |
| Total | 8,418 | 8,469 | 8,652 |

| Appropriation/Project | Fiscal year | | | Recipient | Expected results |
|--|-----------------|-----------------------------------|------------------------------------|------------------------------------|--|
| | 1999 Pobligated | 2000 funding | 2001 funding | | |
| Freight Car Reflectorization | \$6,260 | \$15,000 | \$15,000 | Volpe Ctr | Freight cars will be more visible to drivers, helping them avoid striking the train. Report published. |
| Eval Wayside Horns Optimal Acoustic Warning | 26,138 | 15,000 | 15,000 | Volpe Ctr | Locomotive horns will be optimized for sound quality and effectiveness while reducing noise pollution in surrounding communities. |
| Driver Behavior Accident Causation Driver Education. | 307,668 | 225,000 (Eq 50K) (HSR 175K) | 250,000 (Eq 140K) (Trk 110K) | Volpe Ctr | To gain a better understanding of how drivers react to grade crossings and why accidents happen in order to educate drivers. |
| Compendium of Grade Crossing Findings | 161,310 | 40,000 | 50,000 | Volpe Ctr | Develop a compendium of findings from research conducted on grade crossings. |
| Train Detection | 71,905 | 75,000 | 100,000 | Assoc. of American Railroads | Examine causes for loss of contact between rail and wheels, resulting in intermittent operation of grade crossing warning device (gate bobble). |
| Illumination Guidelines | 9,931 | 15,000 | 15,000 | Volpe Ctr | The use of street lights to illuminate trains at night so drivers can see and avoid running into the train. |
| Photo Enforcement | 6,521 | 50,000 | 50,000 | Volpe Ctr | Assess the Ohio crossbuck and traffic signals at crossings to improve warning to drivers. |
| Obstacle/Intrusion Detection | 38,489 | 75,000 | 75,000 | Volpe Ctr | Building on the HSR Crossing Technology project, examine the obstruction detection systems suitable for use at grade crossings and expand for use along the right-of-way. |
| GIS support to HSR Corridors | 10,044 | | | Volpe Ctr | Develop GIS system to support communication between grade crossing signals and Positive Train Control systems. |
| Volpe Center | | 75,000 (Eq) | 75,000 (Eq) | Volpe Ctr | Support for assessing hazard elimination projects |
| | | 50,000 | 50,000 | Volpe Ctr | Expand Corridor Risk Analysis for high-speed corridors to additional corridors. |
| Support | 14,963 | (HSR) | (TRK) | | |
| ITS Architecture & Support to ITS PO | 24,706 | 25,000 | | ITS JPO | The ITS Architecture is gaining a new User Service—User Service #30—which describes how grade crossing will be incorporated into the overall Intelligent Transportation System and which will link train control systems with advanced highway traffic control systems. Standards development. |
| Passive & Private Crossings (new) | | | 50,000 | Volpe Ctr | Examine demonstrations at passive crossings and develop the groundwork for a more extensive future program involving other modes. |

| Appropriation/Project | Fiscal year | | | Recipient | Expected results |
|---|-----------------|---------------|---------------|-------------------------------|--|
| | 1999 Pobligated | 2000 funding | 2001 funding | | |
| Review Available Data Sources (new) | | | 75,000 | Volpe Ctr | Examine data elements and data bases to determine additional information that should be collected to analyze the causes of accidents at grade crossings. |
| National Warrants (new) | | | 50,000 | Volpe Ctr | Develop criteria or warrants for analyzing grade crossings and determining the types of warning devices that should be installed. |
| Criteria & overall evaluation methodology | | | 125,000 | Volpe Ctr | Determine criteria for developing an evaluation methodology usable for all grade crossing R&D projects. |
| Test Interoperability of VPAS Systems | | 250,000 (TRK) | | Univ. of Alabama | To test the interoperability of vehicle proximity alert systems and examine potential for standards. |
| State-of-the art planning tools for crossing consolidation. | | | 100,000 | Volpe Ctr | To develop new cost/benefit planning tools for rationalizing the planning process to enable crossings to be closed and consolidated while making improvements to highways and transit systems. |
| Assess 1010 & 1036 Demos and NGHSR BAA | 127,776 | 150,000 (HSR) | 175,000 (TRK) | Volpe Ctr | Evaluate the technology demonstration projects funded under the Section 1010 & 1036 program in ISTEA (4-quad gate with obstruction detection in CT and Vehicle Arrestor Barrier in IL), and assess BAA submittals. |
| Standardized before/after evaluations | | | 115,000 | Volpe Ctr | Develop standardized before/after evaluation techniques to measure safety effectiveness of research projects. |
| Crossing Ranking Capability | | | 25,000 | Volpe Ctr | Building upon the risk assessment techniques for analyzing grade crossings, develop a user-friendly technique for evaluating and ranking grade crossings to improve allocation of funding resources. |
| HSR Crossing Tech | 24,181 | 25,000 (HSR) | 25,000 (TRK) | Volpe Ctr/Battelle Labs | To examine signaling and train control, obstruction detection and warning devices and barrier system technologies available for use in high-speed corridors. Develop methodology to evaluate improved safety provided by additional devices. |
| Subtotal Research & Development | 829,892 | 1,085,000 | 1,435,000 | | |
| Mitigating Grade Crossing Hazards | 1,370,000 | 1,500,000 | 1,500,000 | BAA Awardees | BAA awards to date will include radar vehicle detection systems/computer video traffic recording systems. |
| ITS Architecture & Support to ITS PO | 20,000 | | | ITS JPO | The ITS Architecture is gaining a new User Service—User Service #30—which describes how grade crossing will be incorporated into the overall Intelligent Transportation System and which will link train control systems with advanced highway traffic control systems. Standards development. |

| | | | | | |
|--|-----------|-----------|------------------|--|---|
| TRB HSR IDEA Program | 500,000 | 500,000 | 500,000 | TRB | The TRB IDEA Program, supported by FRA, FHWA, NHTSA, and FTA, competitively solicits concepts, conducts peer review, and awards innovative technology projects nationwide to support development of High-Speed Rail and Intelligent Transportation Systems. Examples of completed projects include a very-wide field of view camera suitable for automated monitoring of grade crossings and a scanning radar antenna for surveillance systems. |
| TRB ITS IDEA Program | 500,000 | 500,000 | 500,000 | TRB | |
| Low Cost Innovative Technologies | 1,100,000 | 947,000 | 1,050,000 | BAA Awardees | Awards under the latest BAA program have not been announced. |
| Four Quadrant Gate Deployment Assessment (new) ... | | 50,000 | 50,000 | Volpe Ctr | Analyze the 4-quadrant gates deployed in Florida and North Carolina and develop standardized criteria for their use. |
| NC Sealed Corridor | 1,000,000 | 400,000 | 400,000 | NCDOT | The North Carolina Sealed Corridor Initiative will treat every crossing in the 174-mile Charlotte to Raleigh segment of the high-speed rail corridor with innovative crossing devices like median barriers, long gate arms, and 4-quad gates. Redundant crossings will be closed. |
| NY Locked Gate | 25,000 | | | NYS DOT | To design, fabricate, test and evaluate a low-cost grade crossing gate system suitable for low volume traffic crossings on high-speed corridors. |
| Volpe Center Support | 223,301 | | | Volpe Ctr | Support of assessing hazard elimination projects. Corridor Risk Analysis for Empire Corridor. |
| Subtotal next generation high-speed rail | 4,738,301 | 3,897,000 | 4,000,000 | | |
| Operation Lifesaver | 600,000 | 950,000 | (¹) | Operation Lifesaver, Inc. | Public education about the laws regarding grade crossings and trespassing, the dangers at grade crossings and on rail rights-of-way and the importance to obey traffic and trespass laws. |
| Public Awareness and Outreach | 33,700 | 37,000 | 50,000 | Various printing contractors, packing and shipping firms, equipment rental firms, conference organizers, OL suppliers, etc.. | Promotional and audio-visual materials, conference registrations and display booth space and supplies. Materials are used or distributed when making presentations to schools, community groups, workshops, conventions, etc. |
| Police Officer Detail | 114,444 | 165,000 | 165,000 | Erie County, NY | The police officer detail is an outreach program with the law enforcement community to raise awareness of crossing safety and trespass prevention. One officer is detailed full time to Washington, and one each will be detailed part-time to four FRA regions. |
| Outreach to Law Enforcement and Trespass Prevention. | 51,700 | 50,000 | 50,000 | IACP, NSA, NFOP, etc. for conference display booth space, registration fees, and GPO printing for pamphlets, brochures, and for other promotional items. | Outreach to judges, prosecutors and law enforcement to enhance their knowledge of crossing safety and trespass prevention issues, and materials to support FRA's regional manager promotions of highway-rail crossing safety and trespass prevention programs. |
| Analysis of High-Profile Crossings | 14,600 | 15,000 | 15,000 | Univ of West Virginia and local survey firms. | Research and analysis of problems associated with and alternatives for, high-profile crossings and low-clearance vehicles. |

| Appropriation/Project | Fiscal year | | | Recipient | Expected results |
|--|--------------------|--------------|--------------|--|--|
| | 1999 Pobligated | 2000 funding | 2001 funding | | |
| Airborne survey of crossing elevations | 289,000 | 85,000 | 100,000 | US Army Corp of Engineers | For airborne measurement of ground elevation and collection of data to be used in analysis of high-profile crossings on high exposure rail corridors. |
| Highway-Rail Crossing Inventory & Data Bases | 50,000 | 80,000 | 50,000 | AMB | Simplify and refine the Highway-Rail Crossing Inventory and collision data bases reporting and report production and accident prediction procedures. |
| Information Processing | 285,000 | 285,000 | 296,400 | AMB | Supports Highway-Rail Crossing Inventory and crossing module of the Accident/Incident Report Processing. |
| Develop new outreach campaign | | | 500,000 | To be determined | Creative phase of new public awareness campaign development with focus primarily on trespass prevention, secondarily on crossing safety. |
| Regulatory Support | 25,000 | | | Auburn University | Conduct literature search of warrants, guidelines and best-practices for determining appropriate warning device(s) or grade separation for highway-rail crossings. |
| Regulatory Support | 38,000 | 40,000 | 40,000 | DeLeuw Cather | Assistance in preparation of EIS for train horn NPRM. |
| Rail-with-Trails | 50,000 | 10,000 | 10,000 | Reimbursable agreement with FHWA to fund development of best-practices for rails-with-trails, contractor not yet selected. | Best-practices for design and operation of rails-with-trails projects. |
| PC&B (Approximate) | 1,298,492 | 1,770,000 | 1,941,000 | | Supports staff dedicated to the crossing and trespasser program. |
| Subtotal Safety & Operations | 2,849,936 | 3,487,000 | 3,217,400 | | |
| Total FRA | 8,418,129 | 8,469,000 | 8,652,400 | | |

¹ \$600,000—Funded under Maglev funds.

TOP TEN STATES WITH MOST GRADE CROSSING ACCIDENTS

Question. Please list the “top ten” states that have the highest number of highway-rail crossing accidents and fatalities, for calendar years 1997, 1998 and 1999. Answer. See the table below.

| State ¹ | Collisions | | | Deaths | | |
|--------------------|------------|------|-------------------|--------|------|-------------------|
| | 1997 | 1998 | 1999 ² | 1997 | 1998 | 1999 ² |
| Texas | 421 | 320 | 364 | 54 | 45 | 41 |
| Illinois | 213 | 198 | 198 | 27 | 30 | 53 |
| Indiana | 227 | 195 | 191 | 23 | 25 | 26 |
| California | 159 | 187 | 190 | 22 | 32 | 24 |
| Louisiana | 203 | 214 | 176 | 30 | 25 | 20 |

¹Ranking is based on total number of reported collisions at highway-rail crossings, both public and private during 1997–1999.

²1999 data is preliminary.

IG AND NTSB REPORTS ON GRADE CROSSING

Question. Please discuss FRA’s response to the recent Inspector General and NTSB reports regarding grade crossing safety and how this response is reflected in the fiscal year 2001 budget request.

Answer. The Office of Inspector’s General report on the Department’s Rail-Highway Crossing Safety Action Plan included five specific recommendations. These recommendations are: implement cost-effective strategies to reduce highway-rail grade crossing collisions, develop a trespass prevention action plan, incorporate rail transit crossing and trespassing incidents into the Action Plan’s statistics, periodically reconcile FRA’s crossing collision database with the National Response Center’s rail accident reports, and update the grade crossing inventory by states and railroads.

In 1998, the National Transportation Safety Board (NTSB) published Safety at Passive Grade Crossings (NTSB/SS–98–02). One of the recommendations (H–98–028) to the Department of Transportation in the report was the installation of STOP signs at all passive crossings unless an engineering study found otherwise. While recognizing the importance of STOP signs under many circumstances, the Department responded to the NTSB with the recommendation that a system of guidelines (or warrants) be created to provide guidance for the selection of the appropriate safety treatment for all types of crossings. Treatments would range from standard crossbucks to including crossing closures and grade separations. The Board has classified the Department’s response as “Open-Acceptable.”

FRA addresses the recommendations of the OIG as follows. FRA has been actively promoting the use of traffic channelization, photo enforcement and stricter penalties for crossing violations for a number of years. Both traffic channelization and photo enforcement are included in the proposed train horn rule, and FRA is developing a model photo enforcement legislative package to help interested states implement legislation. A specific trespass prevention action plan is currently being developed within FRA and will be in place by May 1, 2000. FRA and FTA are working together to ensure that transit rail data is available for Action Plan statistics. Ways to reconcile the different reporting formats and requirements between transit agencies and conventional railroads are being explored as well. FRA has already begun the process of reconciling its database with the information in the National Response Center’s rail accident reports. FRA has committed to reconciling the two databases on a quarterly basis. FRA has proposed in its re-authorization legislation that the states and railroads be required to update the crossing inventory database. FRA and FTA are exploring methods to provide a complete and accurate database of the nation’s crossings.

To address the recommendation of NTSB, a ONEDOT Working Group has been formed. Chaired by the Office of the Assistant Secretary for Transportation Policy Development, the Working Group includes representatives from the FRA, FHWA, NHTSA, FTA, and the ITS Joint Program Office. The Working Group has developed

a comprehensive project plan for guidance to state and local traffic engineers regarding highway/rail grade crossing traffic control devices and grade separation. The Office of Secretary of Transportation (OST) has approved the formation of a technical working group (TWG) to develop the guidelines. The TWG includes representatives from the Department, NTSB, state and local highway authorities, rail labor and management, and other interested parties. A literature review funded by FRA has been completed by Auburn University in Alabama. The review documents existing guidelines, warrants, or best practices in use by recognized organizations. There have been two meetings of the TWG and a final meeting is scheduled in June 2000. A draft document containing the guidelines will be provided by October 2000.

STATUS OF MODEL STATE LAWS PROMOTING GRADE CROSSING

Question. What progress have you made on developing model state laws to promote grade crossing safety? How much is being allocated for this activity in fiscal year 2000? How much is requested in fiscal year 2001?

Answer. FRA has drafted a model state bill defining various grade crossing safety violations, setting penalties for each violation, and a model state bill regarding photographic enforcement of grade crossing safety laws. The documents are being reviewed within FRA. No specific funds are dedicated to this project in fiscal year 2000–2001.

IMPACT OF ACTION PLAN ON GRADE CROSSING CHALLENGES

Question. Is it time for the Department to prepare an updated action plan to promote grade crossing safety? How might such a plan help manage and expedite the DOT approach to grade crossing challenges? Is a separate plan needed to address trespasser challenges?

Answer. DOT's Intermodal Highway-Rail Grade Crossing Team has plans to revise the 1994 Rail-Highway Crossing Safety Action Plan. The Team will complete the revision this fiscal year. The "new action plan" can be expected to help expedite the DOT approach to the following grade crossing challenges: development of strategic outreach efforts (as contemplated by the FRA budget item for outreach), expanding partnerships to include work with Metropolitan Planning Organizations (these will help combat the proliferation of grade crossings with the coming of new/expanded transit operations that result from shared use of railroad rights-of-way for light rail/freight operations), continued/expanded Intelligent Transportation System applications for grade crossing safety, and focus on new technology. Trespass challenges will be addressed in a separate plan. While some of the methods of addressing trespass abatement are similar to crossing safety, i.e., education, enforcement, and engineering, they are not the same. Different targeting methodologies and strategies need to be developed for delivering the message about trespass prevention.

TRESPASS PREVENTION

Question. Please update the response to last year's question regarding trespass prevention found on pages 426–427 of Senate Hearing 106–221. What ongoing and new initiatives were undertaken in fiscal years 1999 and 2000? What initiatives are planned in fiscal year 2001? Are there specific funding requests in the budget associated with these ongoing or new trespass prevention initiatives?

Answer. In fiscal year 1999, FRA and Transport Canada developed pilot projects to test the effectiveness of the jointly-produced Community Trespassing Prevention Guide in Oshawa, Ontario, and Whistler, British Columbia. Both projects were very successful, with anticipated implementation of the Oshawa project by surrounding cities. A report on this project was presented at the April 2000 meeting of the American Public Transit Association. The Whistler project, which involved the British Columbia Railroad working with the community to build walkways and paths away from the tracks, was so successful that the Canadian National and Canadian Pacific Railroad will try to implement it system-wide. In addition, a Salem, Oregon, project using the new OLI trespass prevention presentation is ongoing.

In order to reduce potential trespass problems associated with recreational trails on or adjacent to active rail rights-of-way, FRA has led a ONE DOT effort to produce a Rails-with-Trails (RWT) Best Practices Report. Requests for proposals were received late spring 1999 and a 30-month contract was awarded in August to produce the report. The study has three sections: Literature Review, State-of-the-Practice Review, and Best Practices Report. To date, the Literature Review is nearly complete, and the State-of-the-Practice Review is underway. The final report is anticipated in late 2001, following review for comment by the identified stakeholders: local, State, and Federal government agencies; railroad management, labor, and advocacy groups; and trail proponents, planners, engineers, and advocacy groups.

One of the major problems facing FRA is the lack of demographic data regarding the individuals who trespass. This data is needed to focus outreach campaigns to specific "at-risk" groups. To address this problem, FRA has ongoing partnership efforts with Operation Lifesaver, Inc. (OLI), and the railroad industry to obtain better demographic information on railroad trespassers. In May 2000, FRA will meet with OLI and the railroad industry to finalize what demographic information will be collected. After the data is collected from arrest/eviction/contact reports currently recorded by railroad special agents, the information will be processed using demographic descriptor software to obtain "profiles" of railroad trespassers. This information will enable outreach efforts to reach the targeted groups.

Another major FRA initiative is to make law enforcement and judicial communities aware of the trespass problem. FRA has begun to supplement its full-time law enforcement liaison officer in Headquarters with part-time regional law enforcement liaison officers in its eight regions. These officers will work five days each month to reach out to local law enforcement agencies and judges with messages about the dangers of trespassing on railroad property. In addition, FRA continues to encourage states to pass railroad-specific trespassing laws using the model legislation developed by FRA. Another effort for more effective enforcement of trespassing laws in known high-trespass areas is the use of remote video monitoring. FRA will sponsor a demonstration project in Pittsford, New York, where video cameras and video imaging computer software will be used to capture trespassing activity. An alarm and live video image will be sent to a local dispatch center for appropriate law enforcement response. FRA expects this project to start in the spring of 2000 and to continue for one year.

Funding for FRA's trespass prevention efforts are included under FRA's highway-rail grade crossing safety and trespass prevention program. For fiscal year 2001, FRA is requesting \$500,000 for an outreach program that will help reduce highway-rail grade crossing collisions and trespass casualties. The proposed cost-effective outreach program will educate communities and highway users of the dangers that exist on railroad property and at highway-rail crossings. Fiscal year 2000-2001 funds will continue to support Police Officer Details and Outreach to Judges. These efforts will contribute significantly to the trespass prevention programs. In addition, FRA is providing about 48 percent of the funding for the contract for the RWT Best Practices Report, with the Federal Highway Administration funding 47 percent and the National Highway Traffic Safety and Federal Transit Administration contributing 5 percent. Finally, OLI will use a portion of FRA's annual grant to support trespass prevention efforts.

TRESPASS DEMOGRAPHIC INFORMATION

Question. It has been agreed that better demographic information regarding who trespasses and where would be helpful in targeting educational efforts to reduce trespassing incidents. Please update the Committee on the trespass prevention demographic information gathering process. What resources is FRA dedicating to this research? What is its status?

Answer. One of the major problems facing FRA is the lack of demographic data regarding the individuals who trespass. This data is needed to focus outreach campaigns to specific "at-risk" groups. To address this problem, FRA has ongoing partnership efforts with Operation Lifesaver, Inc. (OLI), and the railroad industry to obtain better demographic information on railroad trespassers. In May 2000, FRA will meet with OLI and the railroad industry to finalize what demographic information will be collected. After the data is collected from arrest/eviction/contact reports currently recorded by railroad special agents, the information will be processed using demographic descriptor software to obtain "profiles" of railroad trespassers. This information will enable outreach efforts to reach the targeted groups.

FISCAL YEAR 1997-2001 SECTION 130 FUNDS

Question. Please confer with the Federal Highway Administration, and report on available section 130 surface transportation program safety funds, on a state-by-state basis, for fiscal years 1997 through 2001. Please indicate unobligated balances for each state's total available section 130 funds.

Answer. The attached table shows the amount of funds available for Section 130 programs for the fiscal years 1997 through 2000 on a state-by-state basis. The funds available for fiscal year 2001 will not be calculated until later this year. It is not expected that there will be any major changes in the way funds are allocated to states. The unobligated balance under TEA-21 includes fiscal year 2000 funds.

1-800 EMERGENCY NOTIFICATION SYSTEM

Question. Section 301 of the 1994 Railroad Safety Act requires the Secretary to conduct a pilot program to demonstrate an emergency notification system using a toll-free telephone number for the public to report any malfunctions or other safety problems at railroad-highway grade crossings. Please bring us up to date on FRA's response to this requirement. How is FRA promoting railroad investment in this area and how does the FY-2001 budget contribute towards this goal?

Answer. The 1994 Swift Rail Development Act directs the Secretary to demonstrate a toll-free emergency notification system to report emergencies, malfunctions, and other safety problems, and to conduct a pilot program in two states. However, the Congress did not appropriate funds for this program. In 1995, a preliminary design concept and implementation plan was completed and preliminary discussions were held with the States of Illinois and Minnesota for a two-State pilot test project. FRA's goal was to involve two States representative of both urban and rural areas.

In 1996, \$625,000 was appropriated by Congress for the development of system hardware and software. No funds were appropriated for the installation of signs at crossings, the public education and awareness program, nor the final Report to Congress. FRA has reached an agreement with FHWA to use Surface Transportation Program Funds from the safety set-aside (Section 130) for the required signage part of this project. Meanwhile in 1996, several major railroads, at their own expense, started to install their own 1-800 Emergency Telephone Number signs at crossings to report malfunctions and/or emergencies. Some railroads are installing these at all of their public and private crossings, while others are installing them at only the public crossings, and yet others at only the active crossings (those with gates and/or flashing lights). Preliminary discussions were held with Union Pacific (UPRR) and Norfolk-Southern (NS) Railroads to evaluate methods for incorporating the railroads' 1-800 Number Systems into the overall system planned for the two pilot states.

In 1997, the FRA Administrator sent a letter to all States inviting them to participate in the two-State pilot test program. FRA received expressions of interest from only four states, California, Illinois, New Mexico, and Minnesota.

In 1998, FRA awarded a 3-year contract to design, develop, and test a 1-800 Toll-Free Emergency Notification System (ENS), capable of reporting problems at highway-rail intersections to a centralized state police emergency response communication center or railroad train dispatch center. This 1-800 ENS will be designed for, and first tested in, the State of Texas where emergency response communication center personnel are familiar and knowledgeable with how such a system should properly operate. This will also upgrade that State's currently installed system. Subsequently, the 1-800 ENS Software Package will be made available to two or more pilot States. The software package will then be modified to operate from a railroad's perspective and offered to and installed on a medium size (or larger) railroad. In October 1999, FRA delivered and installed a prototype version of the 1-800 ENS Software Package at the State of Texas Department of Public Safety (DPS), Division of Emergency Management (DEM). The State DEM has been using this software successfully to record incoming calls at the rate of about 1,000 calls per month, preferring it to their former system. The final refinements are being completed and it is anticipated that the final software package will be delivered to the State by the end of April 2000.

FRA has conducted a poll of the major railroads and found that, after completion of the Conrail merger, more than 55 percent of all public at-grade crossings will contain a posted 1-800 ENS Number, and an additional 10 percent are on railroads where an emergency telephone number has been provided to local emergency service organizations (police, fire, medical, etc.). Of the 158,784 public at-grade crossings nationwide, a 1-800 ENS Sign has been installed at approximately 84,357 (53 percent) of the public at-grade crossings on the Burlington Northern Santa Fe (BNSF), UPRR, NS, CSX Transportation and IC Railroads. This represents 78 percent of all the active crossings (those with flashing lights and/or gates) in the nation.

Since Texas and Connecticut have state-wide systems which include some of the above crossings, FRA estimates about 56 percent of all public at-grade crossings in the nation will soon be equipped. Some railroads, for example, UPRR, NS and BNSF, are voluntarily considering an expansion of their programs to include additional crossings (1) not currently equipped with automatic warning devices and (2) private crossings.

An effective emergency notification system will have a centralized manned center to receive calls. This requires a telephone system for receiving calls and a computerized system (software and hardware) for fast, efficient, and accurate identification

of the crossing location on a highway-railroad grid. The 1-800 ENS Software Package will have the ability for logging calls and accessing Inventory Files based on the U.S. DOT/AAR National Highway-Rail Grade Crossing Number and Inventory. It will also have supplemental files, incorporate a display on a map, and the capability to forward the incoming call and information to the appropriate railroad or highway authorities.

FRA is evaluating the possibility of having the railroads assume responsibility for incoming 1-800 ENS calls since they are already moving in that direction. Using this approach, FRA believes that it may be possible to implement a 1-800 ENS on a national scale rather than in just two pilot states, thereby achieving more coverage with the appropriated funds.

FRA is currently focusing on railroad-centered programs. With the developed ENS software for the State of Texas almost completed, FRA plans to modify the software for use by other state and railroad centered systems to support emergency management personnel in receiving calls by logging the problem being reported, accessing inventory files and assisting in forwarding the incoming calls to the correct control center. The 1-800 ENS Software Package will have the ability for logging calls and accessing Inventory Files for quick crossing look-up based on the U.S. DOT/AAR National Highway-Rail Crossing Inventory Number. It will also have supplemental files, incorporate a GIS capability (display on a map) and forwarding the incoming call and information to the appropriate railroad and highway authorities to correct the situation. FRA also plans to encourage railroads and States with 1-800 systems to keep their Inventory up-to-date (a key component of a 1-800 system is to correctly identify the crossing number posted on-site).

Since the original funds appropriated by Congress appear to be sufficient to develop the software packages for both state and railroad oriented systems, no additional funding was requested by FRA in the fiscal year 2001 budget.

FUNDING FOR 1-800 EMERGENCY NOTIFICATION SYSTEM

Question. Have you already used the money appropriated several years ago for this purpose? Are any of these funds still available?

Answer. Of the \$625,000 appropriated, \$618,000 has been obligated for the development of the necessary software package to operate a state system, and for the conversion of this package to a railroad oriented system by regional and shortline railroads. The remaining balance of \$7,000 may be used for computer hardware for a demonstration with a regional or shortline railroad.

ADDITIONAL FUNDS FOR 1-800 EMERGENCY NOTIFICATION SYSTEM

Question. Are seed monies necessary to advance regional emergency call centers to assist small railroads which have not invested in toll-free emergency systems? How much would be required for this effort? What are the expected benefits and costs? Does your fiscal year 2001 budget provide such funds?

Answer. In January 2000, FRA received a presentation for a proposed National Transportation Emergency Call Center (NTECC) which would establish a 24-hour 1-800 number emergency notification system center for all shortline and even medium-sized railroads patterned from the system used by BNSF. While the concept is in its infancy, the proposed center would provide national coverage for the medium (regional) and shortline railroads at a lower cost if each railroad established this service themselves. This concept is in the process of being developed and several railroads are being approached with the concept. It is estimated that approximately \$350,000 may be needed to help establish such national and regional centers and possibly \$150,000 per year to initially keep operational until they can be self-sufficient through payments from participating railroads.

FRA is evaluating the feasibility of providing seed funding or cost sharing for a national or one or more regional contract arrangements whereby smaller railroads (shortlines) could use the services of a national/regional Emergency Notification & Command Center to receive and respond to calls, and/or encourage American Shortline and Regional Railroad Association participation in establishing a national/regional emergency notification contract services.

In addition, FRA has established a partnership with the State of Pennsylvania, a group of eight shortline railroads within the State, and a County Emergency Management Authority (EMA) to create an emergency and problem notification system for the eight shortline railroads. The State of Pennsylvania is very supportive and desirous of expanding the system state-wide after the original establishment. FRA will supply the 1-800 Emergency Notification System software developed for the State of Texas (after modifications to make it applicable for railroad use) and possibly computer hardware. The State can provide funding for installation of the signs

(Sec. 130 money) and it is anticipated that FRA would provide some seed money to help establish the demonstration and center. The involved railroads are currently preparing a plan for the establishment and operation of the proposed center, determining the cost elements, and identifying the funding needed. If successful, FRA will meet Congress' mandate for implementing a 1-800 number program in two pilot States. This will also initiate the effort to implement this program for crossings that do not belong to the Class 1 railroads.

No funds have been included in the fiscal year 2001 budget for regional emergency call centers.

FISCAL YEAR 2000 AND FISCAL YEAR 2001 R&D PROJECTS

Question. Please reproduce the research and development project breakout table on page 75 of the budget justification. After each subaccount (e.g. "Train Occupant Protection"), list each research project in that category, and delineate the fiscal year 2000 enacted, current services level, new/expanded funding, and total fiscal year 2001 request for each project.

Answer.

[Dollars in thousands]

| Program activity/project | Fiscal year | |
|---|--------------|--------------|
| | 2000 enacted | 2001 request |
| EQUIPMENT, OPERATIONS, & HAZMAT | | |
| Train Occupant Protection: | | |
| Locomotive Safety | 1,800 | 2,950 |
| Develop model to evaluate, test, and validate locomotive crashworthiness features for oblique and raking collisions; conduct full-scale tests to validate; models; analyze fuel tanks; conduct laboratory and full-scale testing of upgraded locomotive nose configuration. | | |
| Passenger Rail Car Safety/Performance | 1,800 | 2,400 |
| Test passenger rail car crashworthiness features; conduct full-scale testing of multi-car models; assess safety performance of light-weight commuter rail vehicles. | | |
| Rolling Stock Safety Assurance & Performance: | | |
| On-Board Monitoring Systems | 480 | 480 |
| Evaluate brake system safety; evaluate on-board monitoring system via ECP brake lines; evaluate train-health monitoring; develop additional sensors for on-board application. | | |
| Wayside Monitoring Systems | 532 | 532 |
| Evaluate NDE techniques for wheels; evaluate improved wayside inspection/detection methods for bearings and suspension components; evaluate prototype wayside inspection station. | | |
| Material & Design Improvements | 275 | 275 |
| Evaluate advanced braking subsystems, including a fully automatic coupler and cushioning devices. | | |
| Human Factors: | | |
| Train Operations | 2,178 | 3,028 |
| Evaluate napping strategies and vigilance monitoring techniques for locomotive engineers; evaluate new technologies for information management in regular and high-speed operations; evaluate the use of digital communications in high-speed operations; evaluate post-accident stress in locomotive engineers; study teaming of operating personnel; initiate research on the application of behavior-based safety to the railroad environment; evaluate high-speed rail simulator. | | |
| Yard & Terminal | 550 | 550 |
| Evaluate yard and terminal accidents to reduce injuries to railroad operating personnel, including maintenance-of-way workers and ergonomic issues. | | |

1081

[Dollars in thousands]

| Program activity/project | Fiscal year | |
|---|--------------|--------------|
| | 2000 enacted | 2001 request |
| Hazardous Materials Transportation: | | |
| Hazmat Transportation Safety | 400 | 600 |
| Evaluate low temperature impacts on tank cars; evaluate the tank car service environment, including accident forces; study tank car reliability engineering. | | |
| Damage Assessment & Inspection | 300 | 300 |
| Evaluate new non-destructive techniques for inspecting tank car welds and the tank car shell for cracks and flaws; evaluate techniques to replace the periodic hydrostatic test; evaluate tank car fatigue and critical flaw size; develop and evaluate overload impact sensors. | | |
| Tank Car Safety | 300 | 300 |
| Evaluate new tank car steels; evaluate proposed 286,000GRL tank car designs. | | |
| Grade Crossings Human Factors: Grade Crossings | 435 | 835 |
| Evaluate optimal acoustic warning systems; evaluate driver behavior at highway-rail grade crossings for freight, commuter rail and high-speed operations; analyze accident causes; evaluate innovative grade crossing warning devices. | | |
| Montana University Project: Real Time Diagnostic Monitoring | 250 | |
| Development of a Locomotive Health Monitoring System to determine the operating condition of the locomotive and to provide the information to maintenance professionals via a remote communications link. | | |
| Subtotal, Equipment, Operations & Hazmat | 9,300 | 12,250 |
| TRACK & VEHICLE TRACK INTERACTION | | |
| Track & Components Safety: | | |
| Material & Rail Inspection | 1,600 | 1,850 |
| Prevent and improve the detection of material and structural defects in track and its components; develop new methods for reducing occurrence of fatigue cracks and other failure modes in rail and for improving inspection and monitoring protocols; assess the safety of new track materials and components; develop technologies for detecting track hazards such as broken, misaligned, obstructed, or weakened rails ahead of a moving train. | | |
| Track Strength | 1,900 | 1,900 |
| Deploy FRA track-testing vehicle to assess performance-based method of inspecting track gage strength along mainline and shortline railroads; develop risk-assessment methods to prevent lateral buckling of track due to thermal and vehicle-induced stresses; develop and demonstrate methods for the detection and prevention of weak vertical track support. | | |
| Bridge Safety | 250 | 400 |
| Develop non-destructive evaluation techniques for safety inspection of steel and timber railroad bridges; investigate the use of composite materials in railroad bridge repair. | | |
| Track—Train Interaction Safety: | | |
| Track Geometry | 700 | 700 |
| Assess vehicle performance safety due to anomalies in track geometry and overall track geometry degradation; assess vehicle/track interaction safety due to commutative track panel shift. | | |
| Wheel/Rail Interaction | 800 | 800 |

1082

[Dollars in thousands]

| Program activity/project | Fiscal year | |
|--|--------------|--------------|
| | 2000 enacted | 2001 request |
| Assess vehicle/track interaction safety due to variations in wheel to rail forces, wheel/rail profile and contact conditions, as well as wheel climb and other related derailment modes. | | |
| Special Trackwork | 500 | 500 |
| Assess vehicle/track interaction safety in turnouts and other special trackwork; examine safety performance of flange bearing frogs; foster the development of field retrofits to reduce high forces generated in turnouts. | | |
| Electrification Safety | 100 | 100 |
| Foster the development of a prototype non-destructive inspection systems for catenary wire and third rail installations. | | |
| Interaction under Heavy Axle Loads | 300 | 300 |
| Assess vehicle/track interaction under heavy axle loads. | | |
| Vehicle/Track Interaction Safety Standards | 500 | 650 |
| Provide research and other technical services for the development and implementation of performance-based vehicle/track interaction, track geometry, and track strength safety standards. | | |
| Grade Crossings—Infrastructure: | | |
| Grade Crossings, Infrastructure | | 600 |
| Develop methods to mitigate potential safety failures in commonly used signal systems; investigate alternate technologies for train presence detection. | | |
| Train Control: | | |
| Advanced Train Control | 464 | 500 |
| Foster the development and implementation of advanced but cost-effective train control technologies to reduce the risk of train collisions. | | |
| University of Alabama Project: Vehicle Proximity Alert System | 250 | |
| University of Nebraska Project: Track Subsurface Stability | 250 | |
| University of Missouri Project: Advanced Composites for Bridge Repair | 250 | |
| Subtotal: Track and Vehicle Track Interaction | 7,864 | 8,300 |
| RAILROAD SYSTEMS SAFETY | | |
| Grade Crossings: | | |
| High-Speed Rail Safety Support | 200 | 200 |
| Evaluate the reliability, safety record, and maintenance costs of high-speed rail systems and disseminate this information. | | |
| Environmental Impact Analysis | 200 | 200 |
| Evaluate effect of noise in HSR operations and develop a facility to evaluate mitigation measures; evaluate EMF effects. | | |
| Safety of HSGT: | | |
| Accident Avoidance | 1,800 | 1,800 |
| Assess the safety of prototype high-speed rail positive train control demonstrations; evaluate migration paths for existing train control to commuter rail and advanced systems; assess the corridor risk; assess system safety support; develop fire safety analysis program. | | |
| Grade Crossing & Infrastructure | 700 | 300 |
| Evaluate driver behavior at high-speed grade crossings; evaluate innovative grade crossing warning devices; support development of track safety standards for high-speed operations. | | |
| Accident Survivability | 1,400 | 1,400 |

[Dollars in thousands]

| Program activity/project | Fiscal year | |
|--|--------------|--------------|
| | 2000 enacted | 2001 request |
| Model crash energy management for occupant protection; test new fire safety standards for seats and other materials; assess system safety and emergency preparedness evaluations; evaluate of glazing and platform safety issues associated with high-speed operations; analyze vehicle track interaction. | | |
| High-Speed Test Support Equipment | 500 | 500 |
| Acquire advanced test support equipment to maintain the safety of the high-speed test track structure and to ensure safe testing at the FRA's Transportation Technology Center. | | |
| Performance-Based Regulations | | 500 |
| Evaluate methods for developing performance-based regulations for their applicability to FRA's regulatory safety process. | | |

R&D FIVE-YEAR PLAN

Question. The fiscal year 1997 Senate report (S. Rpt. 104-117) directed FRA to prepare and submit a 5-year strategic research plan that also incorporated next generation high speed rail research initiatives. This plan has never been formally submitted to the Committee. Why not? Will the plan, when it is submitted, reflect the ongoing review of FRA's research program by the Transportation Research Board?

Answer. FRA undertook the development of a 5-year plan for research and development and for the next generation high-speed rail program following the direction of the fiscal year 1997 Senate report and has been updating it annually in draft form ever since. The R&D and next generation staff have benefitted from the discipline of preparing these drafts, and our budget requests reflect the updated plans. These drafts have never reached final form in a time frame useful to the Committee, since the R&D budget has changed during this time, and would have been obsolete if submitted. FRA staff is working on another updated draft, which we plan to submit to Congress this summer.

FUNDING OF TRB REVIEW

Question. What is the funding status and outlook for continued support of the TRB review of the R&D and next generation programs? Will you continue that activity during fiscal year 2001? Are there sufficient funds?

Answer. The TRB review of FRA's R&D and Next Generation programs is funded through fiscal year 2000, and FRA intends to continue the activity in fiscal year 2001 even though no funding is explicitly requested in the fiscal year 2001 budget request. FRA will fund this support by using project funds from each area of its R&D and Next Generation programs. The TRB activity is important in the project selection and program evaluation process.

FRA RAILROAD RESEARCH AND DEVELOPMENT

Question. Please update the Committee on FRA's responses to each of the recommendations issued by the Transportation Research Board Committee for Review of the FRA R&D and High Speed Rail Program. In your answer please be certain to show how changes are reflected in the fiscal year 2001 budget request.

Answer. Following are FRA's responses to the most recent recommendations issued by the TRB Review Committee:

Recommendation 1.—The committee recommends that the FRA Administrator, in coordination with the Office of Safety and the Office of R&D, take the necessary steps to improve FRA's data collection so that the multiple contributing factors involved in an accident can be correctly identified and analyzed and the sequence of events characterized. One of the numerous benefits of more accurate and complete accident data would be the ability to conduct R&D in closer balance with actual safety risks. This effort could be initiated with a research project that would define the need for improved safety data and develop a taxonomy of causes. (A random sample of actual accidents could be analyzed to provide a basis for identifying root causes. For example, in conjunction with the American Public Transit Association, FRA is conducting a full causal analysis of a sample of low-speed commuter rail accidents.) Consideration should be given to collecting data on incidents (near-misses), in addition to accidents, that could indicate areas in which accidents might be avoided or prevented (recognizing the limitations of voluntarily reported data). To the extent that they are not fully exploited now, additional data sources that could be used to determine accident causes include National Transportation Safety Board reports, Office of Safety railroad audits, and FRA dossiers on individual accidents. [Analysis of incidents can be useful in determining mechanisms that helped prevent an incident from becoming an accident, as well as in identifying new trends and developing countermeasures. Companies have such information, but generally do not share it with government agencies. It might be possible for a neutral third party to serve as a repository for this information, with company and individual identifiers being removed (similar to the Aviation Safety Reporting System, administered for the Federal Aviation Administration by the National Aeronautics and Space Administration through its contractor Battelle Memorial Institute).]

FRA's Response.—While FRA recognizes that better accident data would be helpful, FRA does not intend to undertake a rulemaking in the near future to change the reporting of accidents and incidents. The most recent rule on data collection was issued only three years ago. There are a number of regulatory topics that are of higher priority at the present.

Current reporting thresholds for Railroad Accident and Incident Reporting System of \$6,500 in equipment damage allows for collection of accident data on many incidents that have no fatalities or injuries. From a safety perspective, these are indeed near misses. Collecting additional information on the sequence of events that result in harm should be focused on events that result in injuries or fatalities. This is already the case since, between FRA and NTSB, investigations are conducted in all incidents which result in an employee fatality and many others involving passenger and highway fatalities.

FRA R&D managers review FRA and NTSB accident reports on a regular basis. That is, the R&D program is conducted with an understanding of the sequence of events that result in accidents and harm. Also, railroads often share data with the FRA to support focused research objectives. FRA does not believe that a neutral third party information repository is necessary.

Recommendation 2.—[The harm index for grade crossings was reduced, and losses associated with trespassers were excluded, even though each of these represents a large proportion of railroad-related fatalities and injuries.] The correlation between budget allocation and total risk should be improved by including all sources of loss (or harm).

FRA's Response.—Property damage, trespassers, and highway user fatalities are included in the updated analysis. In fact, trespassers and highway user harm was included in the previous analysis. Research has been conducted on many of grade crossing-related topics, including lowering the cost of improvements for grade crossings. FRA has satisfied the TRB committee that, taken together with other things the Department is doing, FRA is investing an appropriate amount in R&D related to grade crossing.

Recommendation 3.—As the next step, FRA should assess how to connect the separate approaches used for risk assessment of the program areas and for project evaluation.

FRA's Response.—Project evaluations were intended as a tool for individual project selection, not as a way to aggregate risk to the program areas. In the current

process, specific risk attributes are connected with each project. A specific accident may result or be connected to a number of projects, such as engineman vigilance, train control, crashworthiness, and emergency preparedness. When aggregating the risk to the program level, there will inevitably be some level of double counting. The real value in the process is in assuring that all understood risk is considered in developing research plans.

Recommendation 4.—Once the above improvements to the risk assessment process have been made, the committee recommends that FRA begin using this process to assess the R&D projects slated for the fiscal year 2001 budget.

FRA's Response.—The Volpe Center will attempt to complete a failure analysis for FRA for all accident types during the summer of 2000, in time for the fiscal year 2002 budget proposal. The analysis was not available to assess projects slated for the fiscal year 2001 budget.

Recommendation 5.—The committee recommends that FRA continue to use the regulatory analysis outlined by the R&D staff at the meeting to encourage R&D efforts in support of the move toward performance-based standards and procedures. With respect to Recommendation 1 above, accurate safety data are also critical to the development of metrics and measurements needed to support performance-based standards. (For example, in the commuter rail analysis mentioned above, most of the accidents have been attributed to wheel/rail causes. The data generated by this analysis could be used to support the development of performance-based standards.)

FRA's Response.—FRA recognizes the need to use more performance-based standards and procedures and has begun working with the FAA to get their insight on the issue of performance-based regulations. FRA has requested funding for performance based regulations research in its fiscal year 2001 budget. In the meantime, we expect to continue with meetings and in-house staff analyses.

Recommendation 6.—The committee recommends that FRA engage in discussions with researchers in these other fields (e.g., aviation) to a greater extent than is currently the case in order to utilize existing knowledge and avoid replication of available research.

FRA's Response.—The process presented will identify multiple causes of harm. Consequently, human factors issues will receive proper emphasis. FRA will consider human factors research from other domains when addressing incidents with human factors components. FRA has been an active participant in the Department's Human Factors Coordinating Committee (HFCC) and the Fatigue Working Group. Both of these groups, which are made up of representatives from all of the DOT Operating Administrations including FAA, share research ideas and results. Dr. Thomas Raslear, of FRA's Office of R&D, is the current HFCC Chair. FRA has worked closely with the highway mode in particular in the fatigue vigilance monitoring effort.

Recommendation 7.—The committee recommends that the FRA Administrator, in coordination with the Office of R&D and the Office of Policy and the appropriate offices within FHWA, should develop a plan for policy research related to grade crossings and aggressively press for research related to standardization of grade separations and crossing elimination. This research should draw on successful practices in individual states, as well as other countries. These efforts would not necessarily be costly, and should involve both state officials and researchers exploring new concepts and approaches. The committee encourages the initiation of such research as soon as possible, with a project proposal being included at least in the fiscal year 2001 budget.

FRA's Response.—The FRA Administrator takes the recommendation very seriously and FRA is coordinating efforts of the Offices of Policy, R&D, and Safety with other Federal agencies and the states to aggressively reduce hazards presented by grade crossings. In particular, FRA will be working closely with the ITS Joint Program Office to develop a strategic plan for the development, demonstration, and deployment of ITS technologies at highway-railroad grade crossings. The development of standards for ITS and grade crossings was initiated at a well-attended workshop this summer. FRA has included \$500 thousand in its fiscal year 2001 budget for a national grade crossing outreach program.

Recommendation 8.—The committee urges that in the future, the staff of the Next Generation High-Speed Rail Program provide the committee with more complete reports on program developments, including technical progress reports.

FRA's Response.—The Next Generation High Speed Rail Program staff made a detailed presentation to the Committee at its most recent meeting to keep it apprized of all developments.

RESEARCH AND DEVELOPMENT COST SHARING

Question. Please prepare for each of the R&D categories and subaccounts the amount of cost sharing and the amount of federal funding for each of the last three years.

Answer. The amounts of cost-sharing include estimated values of services, equipment, and materials contributed in-kind to the FRA R&D projects. The following tables list the estimated R&D cost-sharing (in thousands of dollars) with non-Federal entities for fiscal years 1998 through 2000:

TRACK, AND VEHICLE TRACK INTERACTION

| Fiscal year | Federal funds | Non-Federal funds |
|-------------|---------------|-------------------|
| 1998 | \$6,950 | \$5,750 |
| 1999 | 6,950 | 4,640 |
| 2000 | 7,864 | 3,849 |

EQUIPMENT, OPERATIONS, AND HAZARDOUS MATERIALS

| Fiscal year | Federal funds | Non-Federal funds |
|-------------|---------------|-------------------|
| 1998 | \$5,659 | \$2,296 |
| 1999 | 7,468 | 1,300 |
| 2000 | 9,300 | 676 |

RAILROAD SYSTEMS SAFETY

| Fiscal year | Federal funds | Non-Federal funds |
|-------------|---------------|-------------------|
| 1998 | \$4,650 | \$60 |
| 1999 | 4,800 | 246 |
| 2000 | 4,800 | 236 |

R&D FACILITIES & EQUIPMENT

| Fiscal year | Federal funds | Non-Federal funds |
|-------------|---------------|-------------------|
| 1998 | \$770 | \$1,040 |
| 1999 | 500 | 901 |
| 2000 | 500 | 1,000 (est) |

RATIONALE FOR LOCOMOTIVE SAFETY RESEARCH INITIATIVE

Question. What is the needs-based rationale for the locomotive safety research initiative? Will there be a regulatory follow-on reflecting the findings of this project?

Answer. An examination of railroad accident reports shows the need to protect locomotive crews against the full range of collision scenarios including oblique/raking collisions, rear end collisions, and grade crossing collisions in addition to head on collisions. Hence most of the work involves simulation modeling and testing of locomotive structures in these different types of collisions. The Office of Safety has a concurrent RSAC Working Group on crashworthiness with the objective of developing regulatory requirements for locomotive crashworthiness. Technical support is also being provided to this working group through the locomotive safety research

initiative. FRA anticipates taking regulatory action, if necessary, based on the findings of this research.

FUNDING FOR THE LOCOMOTIVE SAFETY RESEARCH INITIATIVE

Question. Is the locomotive safety research initiative an ongoing or new research project? If it is ongoing, what prior research efforts and funding have been committed? What is the anticipated fiscal year 2002 cost of the project?

Answer. The locomotive safety initiative is an ongoing research effort. FRA's prior research efforts have focused on head-on-collisions with finite element analyses of the force and crush resulting from the collision. The force and crush indicates the extent to which the crew cab space is invaded and the severity of the collision. FRA's more recent efforts have focused on developing a new, dynamic collision modeling approach suitable for oblique/raking collisions and rear end collisions. This effort is continuing with comparisons of modeling results with actual collisions. Also, parametric evaluation of improved locomotive structures is anticipated. In addition, the FRA R&D supports an ongoing Railroad Safety Advisory Committee Working Group's efforts on Locomotive Crashworthiness, with research for model development, design improvements, and fuel tank crashworthiness evaluation. The funding for these efforts was \$600,000 in fiscal year 1996, \$300,000 in fiscal year 1997 and fiscal year 1998, and \$600,000 in fiscal year 1999. The current fiscal year 2000 budget is \$1,800,000. Fiscal year 2000 funds are committed to planning a locomotive component test program, designing the testing fixtures, and planning one or more full scale train to train collision tests at TTCI in Pueblo, Colorado. Simulations of the proposed tests, to be conducted, will be used to select the train consists and precisely predict the outcome.

In fiscal year 2001 and fiscal year 2002, the full-scale locomotive structural components crashworthiness tests and one or more full-scale train-to-train collision tests would be conducted and the results evaluated. The findings will complete the development of crashworthiness regulatory requirements. In addition, some efforts would be devoted to emergency egress and fire safety. For fiscal year 2001, \$2,950,000 in funding is requested.

FULL-SCALE CRASH TESTING

Question. What is the status of your full-scale crash testing of rail passenger and locomotive equipment? What is the anticipated schedule for implementing this project? Please detail the funding history for this program, and outline what follow-on cost will be required to complete the project.

Answer. On November 16, 1999, FRA conducted a test of a single passenger rail car crash into a rigid barrier at the Transportation Technology Center (TTC). On April 4, 2000, a second test was conducted with two coupled passenger cars crashing into the barrier. Before the end of fiscal year 2001, two more impact tests are planned in which passenger cars will strike locomotives. In addition, collision tests of modified equipment and tests of oblique collisions will be conducted are planned in future years.

In fiscal year 1999, the impact testing for passenger rail cars was funded at \$2 million. In fiscal year 2000, passenger car and locomotive impact testing is continuing, utilizing \$3.6 million in funding. In fiscal year 2001, a total of \$5.4 million is included for this project. This project will continue into fiscal year 2004.

GRANT TO MONTANA STATE UNIVERSITY AT BOZEMAN

Question. In the fiscal year 2000 appropriations bill, Congress directed that \$250,000 be provided to Montana State University at Bozeman to pilot real-time diagnostic monitoring of rail rolling stock. Has this contract been awarded? How does this contract complement FRA's ongoing work with on-board freight car condition monitoring systems?

Answer. The FRA is currently reviewing the grant application from Montana State University. The grant award has not been made. The draft Statement of Work describes their effort to develop a locomotive health monitoring system as an add-on device for older locomotives or as original equipment for new locomotives. The system would determine the operating condition of locomotive electrical, mechanical, and air brake systems and be able to provide the information to shop forces over a digital communications link. The initial components of this system will be an on-board intelligent lubrication prognostics system and a communication system capable of sending the information from the locomotive to control centers and maintenance facilities. The locomotive health monitoring system will provide for improved equipment operation and reliability for the railroads and may improve safety.

FRA's on-board freight car condition monitoring system is aimed at collecting information on safety-related parameters such as brake piston travel, bearing temperatures, vibrations, and the like. The information will be sent from the freight cars to the locomotive cab over the communications channel of new electronically-controlled pneumatic (ECP) brake systems. The information can then be sent to control centers and maintenance facilities over the same radio channels used by the locomotive health monitoring system.

FISCAL YEAR 1998–2000 FUNDING FOR HUMAN FACTORS PROGRAM

Question. Please provide an update of the progress that has been made in the human factors program since last year. How much of the fiscal year 1998, 1999, and 2000 allocated funds have been spent, and for which purposes?

Answer. Following is a summary of the progress on projects during fiscal year 2000, project objectives, and funding for fiscal years 1998 and 1999 and 2000. New phases or extensions of on-going research are identified where applicable.

Train Operations

1. A study design for Engineer Napping Strategies was finalized in June 1999. A pilot test of the study design was scheduled to follow immediately, resulting in refinements to test and analysis approaches by the end of the year. This work has been put on hold due to a catastrophic failure of the RALES simulator, where a majority of the work was to be conducted. The primary purpose of this research is to determine to what extent and what types of on-duty napping can improve locomotive engineer performance and safety. Realistic guidelines can then be developed for the implementation of strategic napping policies in the industry. Future year funding will be needed to complete this project.

Fiscal year:

| | |
|------------|-----------|
| 1998 | \$400,000 |
| 1999 | 100,000 |
| 2000 | 150,000 |

2. A preliminary catalogue of Vigilance Monitoring devices, suitable to non-obtrusively measure alertness in on-duty locomotive engineers, was completed in January 1999. Three devices have been selected for testing and efforts continue to identify other promising technologies. Suitable devices will be used in simulated and revenue operations to gather data and test their usefulness in the railroad-operating environment. The purpose of these tests is to provide information on the validity and reliability of such devices, for the use on railroads, which may wish to use this technology to manage employee fatigue.

Fiscal year:

| | |
|------------|-----------|
| 1998 | \$300,000 |
| 1999 | 200,000 |
| 2000 | 250,000 |

3. The Dispatcher Workload, Stress and Fatigue, Phase III project, to determine the factors that affect workload, stress and fatigue, has been completed and the final report is expected in June 2000. Phase IV, to study staffing and scheduling issues, has begun and will be completed in September 2000.

Fiscal year:

| | |
|------------|-----------|
| 1998 | \$225,000 |
| 1999 | 200,000 |
| 2000 | 50,000 |

4. New technology in the form of communications and computerization is changing the way the railroads operate. Previously, the effects of new technology, such as automation, and information-mediated fatigue on locomotive engineer vigilance (High-Speed Operator Stress and Fatigue), were only considered in high-speed operations. Two reports on high-speed operations and technology were completed by the Volpe Center and will be revised per FRA comments. These studies evaluated situational awareness and the monitoring of equipment failures under three operational conditions: manual control, cruise control, and full automation, and examined the role of preview displays in operator workload and performance. The project focus was expanded to include all railroad operations because of the rapid introduction of technology throughout the industry, and the project was renamed (Information Management and Control in Railroad Operations). The project will determine the safety implications of increased information flow and new information management technology in normal and high-speed operations for locomotive engineers and dispatchers. Out year funding will be needed to evaluate related issues.

Fiscal year:

| | |
|------------|-----------|
| 1998 | \$200,000 |
| 1999 | 200,000 |
| 2000 | 308,000 |

5. The final report on Dispatcher Training Evaluation was published in 1998, and a workshop on the findings of the report was held in Chicago in October 1998. Workshop participants expressed a need for information concerning the selection of personnel for dispatcher training, and this issue is currently being addressed in Phase III, which will develop selection criteria for dispatchers and also develop training materials for readback/hearback, based on an FAA program for air traffic controllers.

Fiscal year:

| | |
|------------|----------|
| 1998 | \$57,000 |
| 1999 | 200,000 |
| 2000 | |

6. A new initiative, Evaluation of Human Factors Safety Issues in Digital Communications, was begun in fiscal year 1999. This multi-year project will examine the human factors implications of using digital communications between locomotive engineers and dispatchers. Currently, such communications are by voice, which has proven to be less efficient and precise than digital communications. Transition from voice to digital communications will change the task of the locomotive engineer. Therefore, the human factors effects of this transition need to be evaluated. A report on datalink party line communications between dispatchers and locomotive crews is in preparation, and work began on a datalink tool for maintenance-of-way crews.

Fiscal year:

| | |
|------------|-----------|
| 1998 | |
| 1999 | \$100,000 |
| 2000 | 300,000 |

7. The Advanced Display Interface project develops innovative information displays to improve information management by locomotive engineers, dispatchers, and traffic managers. Virtual reality displays and associated software were developed and completed in January 1998. A video demonstration of the displays was completed in September 1998. Software, which was previously developed under this project, is being converted to a Windows operating system, and a stringline interface and planning tool is under development. Future work will explore a test site in which to demonstrate the applicability of the display to revenue service.

Fiscal year:

| | |
|------------|-----------|
| 1998 | \$200,000 |
| 1999 | 78,000 |
| 2000 | 400,000 |

8. A new initiative, Post-Accident Stress in Locomotive Engineers, began in fiscal year 1999. The first phase, which will be completed in December 2000, will determine the descriptive epidemiology (incidence and prevalence) of Post-Traumatic Stress Disorder (PTSD) in locomotive engineers resulting from on-duty crashes. PTSD is debilitating and may compromise safety, so the magnitude of the problem is important to determine for future resource allocation. The second phase will develop a model treatment intervention for locomotive engineers immediately following crashes that result in traumatic injuries or loss of life.

Fiscal year:

| | |
|------------|-----------|
| 1998 | |
| 1999 | \$100,000 |
| 2000 | 50,000 |

9. Operating rules form the basis of safe operations in the railroad industry. Previous work on the Operating Rules Evaluation and Safety Rules Consolidation project has focused on the influence of railroad corporate culture on compliance with operating rules. A final report on rules compliance and corporate culture was published in October 1999. All safety procedures, including operating rules, continuously expand and increase in numbers to avoid past accidents and incidents. These additions to the rule books become increasingly restrictive over time and reduce the range of permitted actions to far less than what is necessary to complete a job under normal conditions. As a result, compliance with rules decreases, and the rules no longer function to promote safety. A major railroad has requested assistance to consolidate all their safety rule books currently in use (8) into a single book. The con-

solidation should enhance safety and provide a model for other railroads. This effort will also serve as a platform from which to launch projects on teaming and behavior-based safety. This work was begun in fiscal year 1999 and is expected to continue into fiscal year 2001.

Fiscal year:

| | |
|------------|----------|
| 1998 | \$50,000 |
| 1999 | 50,000 |
| 2000 | 70,000 |

10. The Switching Operations Fatality Analysis project in conjunction with FRA's Office of Safety, rail labor and rail management, completed a review and evaluation of the causes of fatal accidents involving switching operations. A final report was produced and follow-on work will continue.

Fiscal year:

| | |
|------------|-----------|
| 1998 | |
| 1999 | \$200,000 |
| 2000 | 200,000 |

11. The Teaming of Operating Personnel project will define crew resource management for the railroad industry. This project, which will begin in fiscal year 2000, will use the base of labor-management cooperation established in the Safety Rules Consolidation project to develop group dynamics that enhance the safety of railroad operations.

Fiscal year:

| | |
|------------|-----------|
| 1998 | |
| 1999 | |
| 2000 | \$300,000 |

12. The High-Speed Rail Simulator project will begin in fiscal year 2000. The project will evaluate the Amtrak High-Speed Training Simulator to determine its usefulness as a research tool for future research projects. In out years, the project will fund changes to the simulator to allow its use as a research tool (if necessary) and to conduct studies on human factors in high-speed operations.

Fiscal year:

| | |
|------------|-----------|
| 1998 | |
| 1999 | |
| 2000 | \$100,000 |

Yard and Terminal

13. A final report on the multi-phase Yard and Terminal Safety study is expected by the end of fiscal year 2000. The report will characterize the practices and conditions that contribute to yard and terminal injuries so that remedial actions can be investigated. For instance, slips, trips, and muscles strains were determined to constitute almost 50 percent of injuries in the yard and terminal environment, and this information will serve as the basis for a new project focused on ergonomic issues.

Fiscal year:

| | |
|------------|-----------|
| 1998 | \$150,000 |
| 1999 | 100,000 |
| 2000 | 150,000 |

14. The Ergonomic Issues project will build on the results of the Yard & Terminal Safety project to focus on ergonomic means to avoid the slips, trips, and muscle strains that constitute almost 50 percent of all yard and terminal injuries. The project will start in late fiscal year 2000.

Fiscal year:

| | |
|------------|-----------|
| 1998 | |
| 1999 | |
| 2000 | \$200,000 |

15. The Maintenance-of-Way Safety project will begin late in fiscal year 2000. The project will focus on fatigue issues for maintenance-of-way workers and will be conducted cooperatively with the industry through the auspices of the North American Rail Alertness Partnership.

Fiscal year:

| | |
|------------|-----------|
| 1998 | |
| 1999 | |
| 2000 | \$200,000 |

RAILROAD FATIGUE COUNTERMEASURE PROGRAMS

Question. What is FRA doing to either monitor or evaluate working schedule pilot programs or other fatigue countermeasures now being implemented by various railroads? What is the relationship between this work and the \$300,000 requested for the fatigue countermeasures campaign under the "Safety and Operations" account?

Answer. Staff from the Human Factors program regularly attend meetings of the North American Rail Partnership (NARAP) and serve on several of its standing committees. NARAP has monitored programs for fatigue management since its inception and publishes a report, "Current Status of Fatigue Countermeasures in the Railroad Industry", on a regular basis. The evaluation of working schedule pilot programs, however, has not yet begun, although NARAP recognizes the necessity of this process. The Human Factors program has facilitated the start of an evaluation program at NARAP by providing a one-day seminar on program evaluation, complete with materials, and taught by a nationally recognized expert on program evaluation. The "Safety and Operations" funding request for \$300,000 would, in part, assist NARAP to implement a systematic program evaluation of its various fatigue countermeasures. The Human Factors program staff would serve as consultants to this effort, but the Human Factors program would not provide funds.

GRADE CROSSING SAFETY RESEARCH FUNDING

Question. Please provide a break down of how the \$835,000 requested for grade crossing safety research will be allocated.

Answer. The requested \$835,000 for grade crossing safety research will be allocated as follows:

| | |
|---|----------|
| Compendium of Grade Crossing Research | \$70,000 |
| Evaluation of Driver Education Programs | 155,000 |
| Freight Car Reflectorization | 30,000 |
| Railroad Horns | 30,000 |
| Optimal Acoustic Warning | 70,000 |
| Causal Analysis of Accidents | 110,000 |
| Evaluation of Driver Behavior | 90,000 |
| High Speed Rail Crossing Technologies | 35,000 |
| Review of Data Sources | 60,000 |
| Evaluation of School St 4-Quad Gates | 100,000 |
| CRAMCAT ¹ | 60,000 |
| Technology Transfer with Other Research Organizations (UIC, ERRI, etc.) | 25,000 |
| Total | 835,000 |

¹ Corridor Risk Assessment Methodology Crossing Analysis Tool.

EVALUATION OF PTC AND ITS SYSTEMS

Question. The budget justification states that research support is needed in fiscal year 2001 to continue evaluating PTC and ITS for use in grade crossing safety. Please discuss the scope and nature of this research and relate this activity to that conducted during fiscal year 1999 and thus far during fiscal year 2000. What are the initial results of this investment?

Answer. Implementation of PTC on high-speed corridors in Michigan and Illinois and on the Alaska Railroad is behind schedule and no evaluations were conducted in fiscal year 1999. Now that revenue service testing of the Incremental Train Control System, which incorporates monitoring and advanced activation of grade crossings, has begun in Michigan, FRA will soon be able to initiate evaluation activities.

FRA has worked with DOT's ITS Joint Program Office to develop an architecture for ITS at highway-rail intersections and to initiate work on standards. FRA has been meeting with Standards Development Organizations, who are being instructed to incorporate PTC systems into the standards they develop.

VOLPE GRADE CROSSING PLAN

Question. What is the status of the work of the Volpe National Transportation Systems Center on a research plan regarding the safety of highway-railroad grade crossings? Was the plan ever published? How is the Volpe work different from Operation Lifesaver activities?

Answer. The Volpe National Transportation Systems Center (VNTSC) assists the FRA's Office of Research and Development with all programs in developing a process for project selection and program development with a strategic focus on safety.

For the grade crossing safety program, this process is approximately 75 percent complete. The process involves five steps: a review of historical and potential sources of accidents and incidents; a failure analysis; a determination of countermeasures requiring research and development; the development and prioritization of individual projects; and the selection of projects for funding. The process results in an on-going, internal working document that is not intended for publication.

Operation Lifesaver is primarily a public awareness and driver education program related to grade crossing safety, whereas the VNTSC program addresses all aspects of grade crossing safety, including human factors, grade-crossing technology, and accident causation.

IMPACT OF TRACK RESEARCH ON REGULATIONS

Question. How is your proposed track research related to the development of new regulations at the FRA? What track-related regulations have been recently issued or are being considered for future issuance?

Answer. All FRA proposed research on track and vehicle/track interaction is related to the development of new performance-based safety regulations as well as the implementation of newly issued or revised rules. During the past two years, revised track safety standards were issued for conventional classes of track supporting speeds of up to 80 mph. In addition, new rules were developed and published for tracks supporting speeds up to 200 mph.

Below are some proposed research activities and their relationship with newly issued standards and/or future rulemaking activities:

Rail Defect Replacement Time.—In the fiscal year 2001 budget, research is proposed to continue work on factors that influence the formation and growth of internal rail defects. This research would allow FRA to better predict the growth of rail defects. Based on this research, regulations are likely to be modified to reflect rail defect removal based on a prioritized schedule.

Gauge Widening.—In the fiscal year 2001 budget, research is proposed to develop data for inspection frequency and to monitor the implementation of new standards on gauge widening inspection. In fiscal year 1999, safety standards for high-speed rail were issued that require a yearly inspection using a gauge restraint measurement device, along with twice weekly visual inspections. Safety rules for lower class tracks are being developed now to provide an alternate tie inspection requirement that combines gauge restraint measurement with less frequent visual inspection.

Track Degradation Model.—In the fiscal year 2001 budget, the proposed research would focus on the development of a comprehensive track surface degradation model. Safety rules and potential waivers for inspection frequencies could be developed with results from this model. Rail Wear Limits: In the fiscal year 2001 budget, the proposed research will investigate actual or potential problems associated with worn rails to determine whether there should be wear limit standards. If standards are required, the rail wear limits also would be determined.

Passenger Wheel and Rail Profile Standards.—In the fiscal year 2001 budget, the proposed research would continue to support the development of safety standards and guidelines for passenger car wheels, rail profiles, and surface conditions with APTA. From the past work of this joint research, a recommendation was produced for a minimum flange angle on passenger wheels to prevent and reduce wheel climb derailments. Future research would develop profile measurement standards and investigate the feasibility of a way-side monitoring system.

Buckling of Continuously Welded Rail.—In the fiscal year 2001, the proposed research would continue to support the development of safety standards and guidelines for maintaining and repairing continuously welded rail tracks to prevent buckling.

TRACK AND COMPONENTS RESEARCH

Question. What track and components research would be deferred if FRA did not receive the requested \$500,000 increase for the vertical support assessment project, and the agency was directed to follow its own priorities within the current services funding level?

Answer. If FRA did not receive the requested \$500,000, the vertical support assessment project would be deferred. Deferring this work would adversely impact other related track structure and subsurface condition assessment research currently in progress. The most significant is the development of a comprehensive track degradation model which would be delayed due to the lack of adequate data for the vertical modulus, a key parameter. Also, the completion and validation of complementary work currently in progress under FRA's university research grants program would be seriously impacted. This work includes subsurface evaluation of

track using ground penetrating radar and vibratory rail tomography to detect weak locations.

It should be noted that FRA's past research produced a family of instrumented railcars which are capable, at normal track speeds, of measuring track geometry parameters against Federal Track Safety Standards, and produced the GRMS which measures the ability of track to maintain gage to preclude wide gag derailment. New developments in technology in the areas of both data acquisition and processing make it now possible to consider the inclusion of track vertical deflection measurements. In this regard, the proposed project is in consonance with FRA R&D's efforts to apply/adapt existing or emerging technologies to specifically address track related accidents.

RESEARCH ON ADVANCED COMPOSITE MATERIALS

Question. What is the status of the contract for research on advanced composite materials for use in repairing and rehabilitating aging railroad bridges, for which the conferees provided \$250,000 to the University of Missouri-Rolla in fiscal year 2000?

Answer. FRA staff is working with University of Missouri-Rolla staff to define the project scope and objective. The University developed a cooperative research package that includes significant non-FRA resources, both cash and in-kind donations over \$100,000. On March 14, 2000, FRA received a draft technical proposal from the University. The grant currently is being reviewed by FRA staff and is expected to be awarded by July 2000. This deadline is at the suggestion of the University to coincide with the start of their fiscal year.

PROXIMITY ALERT SYSTEMS

Question. What is the status of the contract for vehicle proximity alert systems interoperability for which the conferees provided \$250,000 to the University of Alabama in fiscal year 2000?

Answer. The scope of work for the contract is under development. A white paper prepared by the principle investigators at the University of Alabama on potential railroad crash avoidance technologies was reviewed, and information regarding vehicle proximity alert systems (VPAS) and the Intelligent Transportation System architecture was sent to the University. The development of VPAs system is difficult because none of the vehicle proximity alert systems tested at the Transportation Technology Center (TTC) in Pueblo, Colorado, several years ago worked well enough to continue with field testing in an actual railroad environment.

Two VPAS systems are being tested now. The system developed by Dynamic Vehicle Safety Systems (DVSS) is testing a warning system in school buses and other priority vehicles as part of the Minnesota Guidestar system (the State's overall Intelligent Transportation System program). However, this system does not conform to the architecture of Intelligent Transportation System User Service #30 developed for highway-rail grade crossings. The testing of the University of Alabama system recently started in the Chicago area, but it is too soon to determine if the system will work as designed. FRA will continue to work with the principal investigators at the University of Alabama to develop a suitable scope of work from the interoperability contract.

INTEGRATED TRACK STABILITY

Question. What is the status of the contract for the development of integrated track stability assessment and monitoring systems using site-specific geo-technical/spatial parameter and remote sensing technologies, for which the conferees provided \$250,000 to Marshall University and the University of Nebraska in fiscal year 2000?

Answer. On December 13, 1999, FRA met with representatives from Marshall University and the University of Nebraska-Lincoln to develop a research grant framework and implementation plan. FRA staff agreed to assist in the development of a statement of work. The contract will serve as a basis for a single R&D cooperative agreement to be awarded to the two Universities. The railroads, the railroad suppliers' industry, and agencies in both states are to be encouraged to participate and contribute resources, in-cash and/or in-kind. The formal grant application is expected in April 2000, with the grant to be awarded by May 31, 2000.

GRADE CROSSING HAZARD REDUCTION TECHNOLOGIES

Question. Please detail the grade crossing hazard reduction technologies and the associated program costs funded by the \$500,000 request for grade crossing infrastructure. Please list these projects in priority order.

| | |
|---|-------------------------------------|
| Answer. | |
| <i>Project</i> | <i>Fiscal year 2001 funding</i> |
| Four-Quadrant Gate Assessment Model | \$150,000 |
| <p>This research fosters development of appropriate and useful analytic tools for future use by State agencies. These funds will support a study to be conducted by the University of Illinois at Champagne-Urbana to develop a theoretical model of safety issues related to the use of four-quadrant gate systems. A four-quadrant gate roundtable discussion is proposed as the initial phase of this work to provide a focused approach to the model's development and possible enhancements.</p> | |
| Detection of Trains and Vehicles within the Highway Rail Intersection Limits | 175,000 |
| <p>This initiative supports the deployment of "off-the-shelf" technologies in the highway-rail grade crossings environment. The current funds support actual operational testing activities at the Transportation Technology Center (TTC), in Pueblo, Colorado, of prototype systems that utilize technologies new to the grade crossing application, yet proven in other fields.</p> | |
| Photo Enforcement | 75,000 |
| <p>Fiscal year 2000 funding will provide a synthesis of techniques, results, and effectiveness of photo enforcement at crossings. The synergies of work by NHTSA and/or FTA will be explored, along with the possibility of joint funding. The fiscal year 2001 budget request would support the development of guidelines for use of photo enforcement at highway-rail grade crossings.</p> | |
| Guidelines for Obstacle/Intrusion Detection | 100,000 |
| <p>This initiative is an overview of system requirements and ongoing work in the area of obstacle/intrusion detection, and will involve the railroad right-of-way in general, as well as grade crossings. The fiscal year 2001 budget request would support the development of systems requirements for obstacle/intrusion detection devices.</p> | |

IMPACT OF NO FUNDS FOR PERFORMANCE-BASED REGULATIONS

Question. What railroad systems safety research would be deferred if FRA did not receive the requested \$500,000 increase for performance-based regulations, and the agency was directed to follow its own priorities within the current services funding level?

Answer. If FRA did not receive the requested \$500,000 for performance-based regulations, FRA would delay this activity until fiscal year 2002. This, in turn, would delay the application of performance-based concepts in FRA's rulemaking processes and might also impede FRA's ability to facilitate the introduction of new and more effective technology.

FUNDING FOR TAMPER/LINER MACHINE

Question. How much of this new funding program request of \$850,000 will be used to purchase a tamper/liner machine to maintain the TTC's high speed test track?

Answer. FRA had originally planned to spend \$430 thousand for a tamper in fiscal year 2001. However, because the need for a tamper became critical at the end of fiscal year 1999, FRA purchased a new tamper using funds generated from the sale of the aluminum reaction rail at TTC. FRA had planned to spend the funds from the sale of the aluminum reaction rail on other TTC needs, however, the purchase of the tamper was accelerated because (1) the old tamper was becoming increasingly unreliable and was inadequate for the precision required on the high-speed test track, and (2) the test track was essential for testing Amtrak's new high-speed trains for service from Washington to Boston. In fiscal year 2001, FRA plans to spend the \$430 thousand on the items delayed from fiscal year 1999 including:

| | |
|--|-----------|
| Repairs to roofs (some of which are currently leaking) | \$180,000 |
| Upgrading the fire alarm systems to eliminate deteriorating components and to meet current code requirements | 150,000 |

| | |
|--|---------|
| Engineering and update of facility drawings and site master plan, including facilities, utilities, environmental compliance systems, and communication lines | 100,000 |
| Total | 430,000 |

TESTING USING THE HIGH-SPEED TEST TRACK

Question. What publicly-owned passenger railroads have performed testing on the high-speed test track over the past two years? What tests are scheduled for the next year?

Answer. Passenger equipment test programs conducted on the high-speed test track by publicly-owned railroads over the past several years include:

| | |
|--|---------------------------|
| Long Island Railroad—Tests of EMD dual-mode locomotive and single-deck Kawasaki commuter cars | 7-1-97 through 9-1-97 |
| MARC (Maryland Mass Transportation Administration)—Tests of double-deck Kawasaki commuter cars | 5-28-97 through 8-1-97 |
| Amtrak Talgo Trainset | 11-98 one week |
| Amtrak High-Horsepower Locomotive | 11-16-98 through 2-28-00 |
| Amtrak Acela High-Speed Trainset | 3-15-99 through 2-28-00 |
| Amtrak Advanced Civil Speed Enforcement system tests | 11-30-98 through 12-18-98 |
| Japanese RTRI Gauge-Change Trainset | 6-01-99 through 3-31-01 |

Proposed Passenger Equipment test programs on the high-speed test track for 2000:

| | |
|---|------------|
| Amtrak Surfliner | April 2000 |
| FRA/Bombardier Gas Turbine Locomotive (for service on Amtrak) | Late 2000 |

NGHSR OST/OMB BUDGET REQUEST

Question. Please present the Next Generation High-Speed Rail Program budget request as it was submitted by FRA to OST and OMB.

Answer. FRA's fiscal year 2001 Budget Request for the Next Generation High-Speed Rail Program was the same at each stage of the budget process, including the OST/OMB budget submissions.

TOTAL NEED FOR DESIGNATED HSR CORRIDORS

Question. What level of funding does the FRA estimate will be needed to develop high-speed rail systems in each of the 12 FRA designated corridors in the U.S.? How much has already been spent and what is the source of those funds? What is FRA's role in developing, promoting or funding these corridors?

Answer. Only eight corridors have been designated thus far: five in 1992, under the ISTEA legislation, and three in 1998, as directed by Congress in TEA-21. The FRA has developed preliminary estimates for implementing high-speed rail at various service levels in the initial five designated corridors.

For the three recently designated corridors, the FRA has preliminary estimates for the Empire Corridor (New York-Albany-Buffalo) and is well along in developing such estimates for the Keystone Corridor (Philadelphia-Harrisburg). For the Gulf Coast Corridor (Houston-New Orleans-Mobile with a branch linking New Orleans and Birmingham), feasibility studies are still ongoing and no comprehensive estimate exists. Table 1 summarizes the known cost estimates for future development of high-speed rail at various service levels in the designated corridors. Except where noted, the source is FRA's commercial feasibility study report, High-Speed Ground Transportation for America (1997).

TABLE 1.—ESTIMATED FUTURE INVESTMENTS TO ATTAIN HIGH-SPEED RAIL

[Cost Estimate—Dollars in millions unless otherwise noted]

| Corridor | Year designated | 90 mph | 110 mph | 125 mph | Comments |
|-------------------------|-----------------|--------|---------|---------|---|
| Pacific Northwest | 1992 | \$598 | \$859 | \$1,233 | Corridor links Eugene-Portland, Ore., Seattle, Wash., and Vancouver, B.C. |

TABLE 1.—ESTIMATED FUTURE INVESTMENTS TO ATTAIN HIGH-SPEED RAIL—Continued

[Cost Estimate—Dollars in millions unless otherwise noted]

| Corridor | Year designated | 90 mph | 110 mph | 125 mph | Comments |
|------------------------------|-----------------|--|------------------|------------------|---|
| California North-South | 1992 | \$25 billion (State estimate) for a new, 200 mph system. (Source: High-Speed Rail Authority, Building a High-Speed Rail System for California, Draft Business Plan, January 2000.) | | | The State of California (High-Speed Rail Authority) is actively pursuing a possible new high-speed rail (200 mph) system, for which their most recent published estimate is shown. Maglev (300 mph) is also being considered; the technology selection would be made as part of pending environmental work. |
| Chicago Hub Network | 1992 | 1,062 | 1,487 | 2,438 | Estimate covers three spokes radiating from Chicago to: Detroit, Milwaukee, and St. Louis. (The recent extensions from Milwaukee to the Twin Cities, and from Chicago to Cincinnati, are not included in the estimate.) |
| Florida | 1992 | 1,235 | 1,305 | 1,494 | Corridor links Tampa, Orlando, West Palm Beach, and Miami. |
| Southeast Corridor | 1992 | (¹) | 1,047 | (¹) | Estimate covers line between Washington, D.C., Richmond, Va., and Raleigh-Greensboro-Charlotte, N.C. (Subsequently designated extensions to Hampton Roads, Va., Atlanta-Macon, Ga., and Columbia, S.C.-Savannah, Ga.-Jacksonville, Fla. are not included in the estimate.) |
| Empire Corridor | 1998 | (¹) | (¹) | 1,932 | Estimate covers entire route between New York City, Albany, and Buffalo, N.Y. |
| Keystone Corridor | 1998 | (¹) | (¹) | (¹) | Estimate will be available later in calendar 2000. |
| Gulf Coast Corridor | 1998 | (¹) | (¹) | (¹) | Preliminary studies are ongoing; estimates not yet available. |

¹Not available.

Table 2 presents actual investments in improved rail passenger service, by State, corridor, and funding source, in the decade of the 1990s.

TABLE 2.—PAST INVESTMENTS TO IMPROVE RAIL PASSENGER SERVICE IN DESIGNATED CORRIDORS

[Funding by source (dollars in millions) in 1990s]

| State | Corridor | State | Local | Amtrak | Federal | Railroads | Total |
|----------------------|--|---------|-------|--------|---------|-----------|---------|
| Washington | Pacific Northwest | \$120.0 | \$6.4 | \$80.0 | \$3.7 | \$225.0 | \$435.1 |
| California | California Corridor and connecting lines: improvements to existing conventional rail segments. | 1,215.1 | 161.0 | 390.1 | 69.2 | 95.2 | 1,930.6 |
| Illinois | Chicago Hub Network | 34.0 | 1.0 | | 37.3 | | 72.3 |
| Michigan | Chicago Hub Network | 42.0 | 3.0 | | 19.4 | | 64.4 |
| North Carolina | Southeast Corridor | 112.7 | 1.5 | | 52.4 | | 166.6 |
| Virginia | Southeast Corridor | 3.9 | 6.5 | | 41.7 | 5.0 | 57.1 |
| New York | Empire Corridor | 153.4 | 10.0 | 70.6 | 55.2 | | 289.2 |
| Pennsylvania | Keystone Corridor | | 0.5 | 30.0 | | | 30.5 |
| Totals | | 1,681.1 | 189.9 | 570.7 | 278.9 | 325.2 | 3,045.8 |

The FRA has endeavored to assist the States, with both appropriated funding and technical support, in developing and promoting these corridors. In recent years, the Congress has made available \$5.25 million annually in highway-rail grade crossing improvement funds under Section 1103(c) of TEA-21. In each of fiscal years 1996 and 1997, \$1 million was made available to the FRA, and allocated to the States, for corridor planning. For fiscal year 2001, the FRA has requested \$468 million to increase train speeds on track nationwide, which would be matched on at least a 50/50 basis by the States and/or Amtrak. Some of these funds might be used on these corridors.

Independent of funding levels, however, the FRA has served as a catalyst for high-speed rail development nationwide. The FRA has considerable expertise in high-speed rail planning as a result of its over three decades' experience in North-

east Corridor planning, engineering, and implementation, and in its capacity as the Federal agency concerned with railroad safety. As a result, FRA has been able to provide expert advice to the States and Amtrak on the design and prioritization of corridor investments; on the environmental processes as they relate to high-speed rail; on the evaluation of alternatives; and on the safety aspects of infrastructure and equipment improvements.

For example, the FRA applied this expertise to its commercial feasibility study of high-speed ground transportation, which continues to provide both Amtrak and the States with a blueprint they can use for the future development plans. FRA successfully completed the environmental process for the electrification extension in the Northeast Corridor, thus making possible this quantum leap forward in Amtrak's performance. More recently, FRA has assisted Amtrak and the States with focused staff assistance in the preparation of detailed planning reports on specific corridors. The FRA stands ready to continue its critical role of catalyst in response to the expressed interest of the States and Amtrak.

CORRIDORS WITH HIGH BENEFIT-TO-COST RATIOS

Question. Which high-speed rail corridors offer the highest benefit-to-cost ratios? What factors would FRA use to judge the benefits and costs of high-speed rail projects? Will FRA develop a list of funding priorities for high-speed rail projects, and how will this list be tied to the projects' benefits and costs? If not, how can FRA target limited funding to the corridors that offer the most benefits?

Answer. The Administration believes that Federal investments should be justified by examining public benefits versus public costs. The designated high-speed rail corridors produce highly favorable ratios under this test. A list of the highest-performing designated corridors in order of decreasing benefit-to-cost ratios follows:

| Corridor | Portion | Top speed (mph) | Ratio of public benefits to public costs |
|--------------------------|--|-----------------|--|
| Southeast Corridor | Washington, DC—Charlotte, NC | 110 | 207.0 to 1 |
| Empire Corridor | New York—Albany—Buffalo | 125 | 3.7 to 1 |
| California | Los Angeles—San Diego only | 90 | 3.3 to 1 |
| Chicago Hub Network .. | Chicago to: Detroit, Milwaukee, St. Louis only | 110 | 2.8 to 1 |
| California | Bay Area—Los Angeles (via Coast Line)—San Diego | 90 | 2.0 to 1 |
| Pacific Northwest | Eugene, OR—Portland—Seattle, WA—Vancouver, BC ... | 90 | 1.6 to 1 |

The extremely high ratio for the Southeast Corridor (Washington-Charlotte) reflects the fact that the denominator of the ratio approaches zero when revenues very nearly approach costs. This occurs here because of connecting traffic to the Northeast Corridor. FRA does not have benefit/cost projections for the recently-designated Keystone and Gulf Coast corridors.

The Expanded Intercity Rail Passenger Service Program is not targeted towards the 8 high-speed rail corridors. It is available for improved rail services nationwide, including increasing speeds at levels below high-speed.

Since the funding program will require at least a 50 percent contribution from State or other Amtrak funds, the FRA anticipates that much of the project screening will occur at the level of State/Amtrak partnership negotiations. States will only apply for projects that justify significant State involvement, and Amtrak will need to manage its corporate funds so as to secure the maximum return from its own high-speed rail investments. Furthermore, as FRA's commercial feasibility report indicates, the States are uniquely positioned to consider localized benefits and costs (such as economic, job, and land-use impacts) in evaluating whether to proceed with high-speed rail. For all these reasons, the FRA anticipates that the States and Amtrak will have significant input into the Secretary's decisions regarding grants under the proposed program.

FRA would use a combination of factors, as described in the commercial feasibility study report, to judge the benefits and costs of high-speed rail projects. These factors would include but not be limited to:

- Projected passengers, passenger-miles, and efficiency factors;
- Percentage of initial investment covered by operating surpluses;
- User benefits as measured by projected system revenues and consumer surpluses;
- Airport congestion delay savings (from reductions in operational delays and passenger delays);
- Highway congestion delay savings;

- Emission savings;
- Energy impacts; and
- Quality and realism of the State/Amtrak project schedule and financial plan for each project, including the amount of overmatch beyond the minimum 50 percent share.

FISCAL YEAR 2001 FUNDING FOR RADIO SPECTRUM

Question. Radio spectrum must be available for many PTC. How does your fiscal year 2001 budget request address this challenge?

Answer. FRA is working closely with the railroad industry to address this need, as well as other issues related to radio spectrum availability. The Association of American Railroads (AAR) sponsors a Wireless Communications Task Force (WCTF) which has representation from all major railroads, Amtrak, and communications suppliers. The FRA and WCTF are working in partnership with the State of Oregon to install state of the art digital radio communications in the Portland area, as well as along both Union Pacific and Burlington Northern Santa Fe railroad routes between Eugene, OR, and Vancouver, B.C. This project addresses new spectrum-efficiency requirements recently imposed by the Federal Communications Commission, assures spectrum availability for railroad operations in general, and also will be used to test digital communications technologies to assure spectrum availability for future PTC systems.

In fiscal year 2001, FRA expects to work with WCTF as well as with the Transportation Technology Center, Inc., both to complete a digital-radio-based equipment location system at TTCI (as proposed in the Research and Development portion of the 2001 request), and to use a part of the funding requested under the Innovative Technologies portion of the NGHSR program, to establish communications test facilities at TTCI. Such facilities are needed to compare the many and varied potential forms of digital radio, which may be either railroad-owned or commercially supplied, to assure the industry that future communications investments provide the necessary capabilities, transmission quality, and spectrum availability for future PTC requirements. A total of \$250 thousand will be devoted to radio spectrum projects in fiscal year 2001.

INTEGRATION OF NGHSR TECHNOLOGIES

Question. The NGHSR account includes non-electric locomotive development, train control technologies, and innovative signal and grade crossing technologies. How close are FRA and the industry to integrating these technologies in a revenue setting, i.e., a non-electric locomotive pulling a train over track that includes smart signal and grade crossings, dispatched and controlled by positive train control technologies? When will it be appropriate to work specifically on this kind of technology integration?

Answer. The developing corridors around the Nation are at widely varying performance levels. No single corridor is presently ready to apply all of the developing NGHSR technologies. FRA is working with the various corridors to provide demonstrations which meet the earliest key needs. For example, the Albany to New York City portion of the New York Empire Corridor already has a conventional cab signal train control system, therefore, FRA is working with New York on motive power and grade crossing issues. In Michigan and Illinois, the demonstration train control systems must become operative to permit higher speeds. While each NGHSR demonstration project must take local conditions into account, each project is selected for its general applicability on all corridors. Each project is taken to completion to assure that results are valid and, where possible, provide incremental benefits as a result of the project alone. It is therefore not necessary to focus all efforts on a single corridor to attain ultimate integration of the technology development effort.

TRAIN SEPARATION SYSTEM AND POSITIVE TRAIN CONTROL

Question. Are there any integration or interoperability opportunities between the Northeast Corridor ACSES train separation system and the positive train control technologies being developed in Illinois and Michigan?

Answer. Yes. The Amtrak technical personnel who are directing the development and installation of the Northeast Corridor ACSES system are intensely involved in the Michigan and Illinois (North American Joint PTC) projects. As the North American project develops industry standards and a modular onboard approach, needs for freight locomotives to operate into the ACSES territory are constantly monitored. Ultimately, the industry standard platform should provide the basic computer processing power, displays, and other locomotive interfaces so that ACSES capability

can be added to an industry-standard locomotive at minimum cost on a plug-in basis. In addition, the ACSES design has already been modified to employ digital data radio making use of industry standard methods, permitting future addition of other industry standard features to the baseline ACSES system.

TRAIN CONTROL AND LIABILITIES ISSUES

Question. Please outline any legal or liability concerns among the industry concerning the application of positive train control technology in revenue service. Does FRA's budget request or any part of the project budget for the NAJPTC program address this issue? Should resources be allocated to this issue?

Answer. FRA is not aware of any extraordinary legal or liability concerns in the industry related to implementing PTC in revenue service beyond those associated with any new train control system. Control system suppliers and vendors have traditionally dealt with these issues by extensive design verifications and product testing which will also be followed for the NAJPTC demonstration system, in addition to following the safety monitoring processes recommended by the Railroad Safety Advisory Committee, specifically for new microprocessor-based control systems. The liability issues associated with operating the innovative NAJPTC demonstration train control system during the test and installation phase are expected to be covered by insurance obtained by the System Design and Integration (SDI) contractor. Costs for the insurance are expected to be charged to the NAJPTC program; FRA and the other program sponsors will have better estimates of these costs, as well as any other major issues, after April 2000, when the SDI bids are expected.

ILLINOIS PTC PROJECT

Question. Please update the Committee on the status of the Illinois flexible block high-speed train control system (now renamed the North American Joint Positive Train Control Program). Why has the line item description of this project in the fiscal year 2001 budget justification changed from "flexible block operation" to "radio-based train control systems?" Please list all the project participants and outline the project's cost-sharing agreement (if any). Please present the funding history for this project, and specify any unobligated federal balances.

Answer. The line item description has changed to indicate that the project objectives have expanded beyond flexible block operation on the Chicago to St. Louis corridor, although the flexible-block objective continues to be a key component of the program. Other issues now being addressed include development of industry-wide standards for PTC. In recognition of the value to the entire industry, the railroads through the Association of American Railroads have pledged \$20 million over four years, or 33 percent of the estimated \$60 million cost for the program. The State of Illinois has pledged \$12 million (20 percent) of the estimated cost, and is also providing \$70 million in related funding to upgrade the corridor to make it suitable for high speed operations. Illinois is preparing a grant request for the \$6.5 million appropriated to FRA for this project in fiscal year 2000.

The project funding history is as follows:

(In thousands of dollars)

| | Federal | State | AAR | Total |
|--------------------------------|---------------|---------------|---------------|---------------|
| Fiscal year 2000 & prior | \$17,800 | \$8,000 | \$10,350 | \$36,150 |
| Fiscal year 2001 | 7,000 | 3,000 | 5,000 | 15,000 |
| Outyears | 3,200 | 1,000 | 4,650 | 8,850 |
| Total | 28,000 | 12,000 | 20,000 | 60,000 |

ILLINOIS PTC PROJECT

Question. For the NAJPTC project, please provide an estimate of project costs for fiscal year 2001 and the out-years. Please specify federal funds, industry share, and monies provided by the state of Illinois.

Answer. The total program cost is estimated at \$60 million. Funding includes:

(In thousands of dollars)

| | Federal | State | AAR | Total |
|--------------------------------|----------|---------|----------|----------|
| Fiscal year 2000 & prior | \$17,800 | \$8,000 | \$10,350 | \$36,150 |

(In thousands of dollars)

| | Federal | State | AAR | Total |
|------------------------|---------|--------|--------|--------|
| Fiscal year 2001 | 7,000 | 3,000 | 5,000 | 15,000 |
| Outyears | 3,200 | 1,000 | 4,650 | 8,850 |
| Total | 28,000 | 12,000 | 20,000 | 60,000 |

MICHIGAN PTC PROJECT

Question. Please summarize and assess the results to date of the Detroit-Chicago Corridor incremental train control system. What are the remaining technical and institutional challenges to adapting the technology to meet industry interoperability standards so that the Michigan project can integrate with the Illinois project? How does the fiscal year 2001 budget request address these challenges?

Answer. The Incremental Train Control System (ITCS) will support revenue-service high-speed operation for passenger trains on about 80 miles of the Detroit—Chicago corridor. Providing a demonstration system for this specific territory was originally proposed by the team of Michigan DOT, Amtrak, and Harmon Industries in 1995, and can be called the “baseline” system.

The controlling units, both locomotives and cab cars, of all passenger trains on the corridor are now equipped with operating ITCS units. Six Norfolk Southern freight locomotives are also equipped, to power the local freight service on the line. As of March, 2000, wayside equipment is installed on virtually the entire 80 mile zone and is operating on the first 20-mile segment. Test trains have operated at over 110 mph. The remaining tasks to accomplish full high-speed operation of the baseline system are associated with: (1) safety verification and validation of the system design and software; (2) the necessary testing to “cut in” the remaining wayside sections; and (3) initiation of the system for freight trains. All participants in the joint project are confident that the baseline system can deliver the necessary levels of safety and reliability to support revenue service, as intended. The demonstration has already shown that introducing these complex new systems is very challenging to accomplish, since they affect all aspects of railroad operations both on the demonstration segment and at the terminals, such as Chicago and Detroit, where the equipped trains originate.

The technical and institutional challenges associated with adapting the baseline system technology to industry interoperability requirements relate to the original nature of the baseline system, which utilized relatively limited computer capabilities aboard the locomotive and needed to operate on only a limited route structure consisting primarily of single track. To be more generally applicable, the system will need more capable onboard computers and improved location system capabilities to deal with multiple track routes. These technical needs can be accomplished while conforming the system to the new modular industry-standard onboard platform being developed as part of the North American Joint PTC Project for the Illinois corridor. The \$3,000,000 requested by FRA in fiscal year 2001 is to adapt the ITCS system approach to the new platform and new industry standards, thereby making this approach more widely available for other developing high-speed corridors as well as for the so-far unequipped portion of the Michigan corridor.

FUNDING FOR MICHIGAN PTC PROJECT

Question. What are the funding needs of the Michigan incremental train control system (ITCS) high-speed passenger rail demonstration project during fiscal year 2001 and subsequent years? Who are the partners in this effort, and what cost-sharing agreements are in place?

Answer. FRA has requested \$3 million in fiscal year 2001 to adapt the ITCS system to the developing industry standards from the North American Joint PTC project. Partners in the project are Michigan DOT, Amtrak, and Harmon Industries, which is supplying the system hardware. To date, Michigan DOT has invested over \$22 million in upgrading the infrastructure in the test section to permit speeds up to 110 mph. Harmon Industries has contributed over \$5 million in development efforts, and Amtrak has supplied in-kind support such as test train operations and crews as well as installation labor. New cost sharing agreements will be needed as the baseline 80-mile system is completed and the requirements of the developing industry standards and modular onboard approach are defined in the North American Joint PTC Project.

STATUS OF HSR NON-ELECTRIC LOCOMOTIVE PROJECTS

Question. Since last year, what specific progress has been made and what contracts have you signed in each of these three areas: (a) research on flywheel turbine technology; (b) development of non-electric locomotive concepts; and (c) evaluation of the potential of the recently developed locomotive car bodies at speeds of 150 miles per hour. Please state the purpose of each relevant contract along with the fiscal year 1999 and fiscal year 2000 funding amount for each contract. Please describe the progress in each of these three areas of research.

Answer. In fiscal year 1999, FRA entered into a \$2.4 million Cooperative Agreement with the University of Texas Center for Electromechanics (UT-CEM) to continue the Advanced Locomotive Propulsion Systems (ALPS). An fiscal year 2000 agreement in the amount of \$3.9 million is expected to be awarded shortly. In addition, FRA provided \$275 thousand and \$250 thousand in fiscal year 1999 and fiscal year 2000 respectively to the Naval Business center for activities in support of the ALPS program, including the load testing of the ALPS high-speed generator.

As of March 2000, fabrication of the full-scale flywheel is well underway and the assembly of the high-speed generator is nearly complete. Generator testing will begin shortly and is expected to be completed by July 2000. Design of an integrated turbine/alternator package to be installed and tested in the FRA/Bombardier High-Speed Non-Electric Passenger Demonstration Locomotive is underway. Assembly of the basic turbine-alternator components and control system will be completed by the end of fiscal year 2000. Development of controls to interface with the locomotive will take place in early fiscal year 2001 and the package will be ready for integration into the FRA/Bombardier locomotive Demonstrator by June 2001. Final assembly of the flywheel is planned for November 2000. Laboratory testing and integration of the flywheel into a platform suitable for demonstration with the Bombardier locomotive is expected to be completed by the end of fiscal year 2001.

In fiscal year 1998, FRA entered into a Cooperative Agreement with Bombardier Transit Corporation (Bombardier) to develop and demonstrate a high-speed turbine electric locomotive. A total of \$10 million was provided in fiscal year 1999 (\$7M) and fiscal year 2000 (\$3M) for this project. These funds will be split between the existing Cooperative Agreement with Bombardier Transit Corporation and the Transportation Technology Center Inc. (TTCI) in Pueblo, Colorado, to pay for testing of the locomotive at TTC in late CY 2000 and early CY 2001. The split of the funds between these two recipients has not yet been finalized. FRA and Bombardier have shared equally in the development costs of this locomotive.

Assembly of the FRA/Bombardier High-Speed Non-Electric Passenger Demonstration Locomotive is well underway and expected to be completed by the end of April 2000. After assembly is completed, the locomotive will undergo extensive static and rolling tests and evaluation. Initial operating capability at speeds up to 90 mph is expected by late September. Extensive high-speed and operational testing will begin in late 2000 at TTC, after which the locomotive will be capable of entering revenue service demonstrations at speeds up to 150 mph.

CONSENSUS ON NON-ELECTRIC LOCOMOTIVE DESIGN

Question. How is the non-electric locomotive program developing a consensus about a common design that could serve several markets and generate sufficient demand?

Answer. The locomotive is being developed in partnership with Bombardier Transit Corporation (Bombardier), with Bombardier and FRA each funding 50 percent of the cost. FRA has conducted extensive outreach meetings to states which are potential users of the locomotive technology. Due to this substantial investment by Bombardier, they have a strong commercial interest in assuring the marketability of the design and have undertaken the marketing and outreach efforts necessary to assure that the design appeals to a broad base of potential high-speed rail customers.

STATUS OF FLYWHEEL PROJECT

Question. What is the status of and challenges facing the flywheel project, and what are the planned activities for fiscal year 2000? How many additional years will be required to complete work on the flywheel project, and how much will this cost? Please provide costs for both development and large-scale testing. What are the cost-sharing arrangements for this project? What is the likelihood that this technology will be commercialized during the next five years?

Answer. The ALPS system consists of two major elements: a high-speed gas turbine driven generator and an energy storage flywheel. The project is currently well

into the hardware fabrication of both these elements, and preparations for demonstration in the FRA/Bombardier Non-Electric Locomotive are underway.

Specifically, final assembly of the high-speed generator will be completed by April 2000, and the associated no-load and static load testing of the generator will be completed by the end of July 2000. The challenges associated with this effort are technical: having the generator rotor survive the very high rotational speeds associated with direct drive from the turbine, while simultaneously handling extremely high levels of electrical power and the resulting high temperatures in the generator components.

Design of an integrated turbine/alternator package for insertion into the Bombardier system is underway and assembly of the basic turbine-alternator components and control system will be completed by the end of fiscal year 2000. Development of controls to interface with the locomotive will take place in early fiscal year 2001 and the turbine-alternator package will be tested and ready for integration into the Bombardier High-Speed Non-Electric Locomotive by June 2001. The challenges associated with this activity include matching the new turbine-alternator package to the existing locomotive and achieving proper control of the system by adapting necessary control software.

Final assembly of the flywheel is planned for November 2000. Laboratory testing and integration of the flywheel into a platform suitable for demonstration with the Bombardier locomotive will be completed by the end of fiscal year 2001. These schedules are consistent with the current plan for demonstration of the Bombardier High-Speed Non-Electric Locomotive, allowing for demonstration of the ALPS system during fiscal year 2002. The major challenge for the flywheel effort is achieving satisfactory sustained flywheel operation despite the dynamic forces associated with a moving train.

As outlined above, the basic ALPS technologies will be completed and tested in the laboratory by the end of fiscal year 2001. Demonstration of the ALPS system can be completed during fiscal year 2002. To complete the planned activities for fiscal year 2001 and fiscal year 2002, funding of approximately \$4 million per year will be required.

A significant cost share for the program was originally provided by GM-EMD, along with contributions by the State of Texas Match Pool, Honeywell International (formerly AlliedSignal), and the US Navy. From the inception of the project in 1995 through 1997, the project was cost shared by the program participants at greater than 50 percent. In 1998, Bombardier replaced GM as the locomotive integrator for the effort and cost sharing by direct ALPS participants was reduced to about 15 percent. Bombardier, however is providing 50 percent cost share for the development of the High-Speed Non-Electric Locomotive which will be used for demonstration of the ALPS system.

There is a good chance that technology developed on the ALPS program will be commercialized during the next five years. The turbine and high-speed generator package is likely to be purchased for future units of the high-speed locomotive. Successful demonstration of the benefits of the flywheel energy storage system will address two key issues concerning operation of gas turbines in the locomotive environment: the relatively poor fuel economy at partial power and turbine maintenance requirements due to thermal cycling. The ALPS system also will help the rail industry meet future exhaust emissions limits that may be difficult for diesel-electric locomotives to achieve. In addition to the locomotive propulsion applications, additional commercial and military applications of ALPS components and technology are likely because of the extremely high power capability offered for the size and weight of the system components.

TECHNICAL PROGRESS IN GRADE CROSSING HAZARD MITIGATION

Question. Please assess the technical progress made as a result of FRA's investment in grade crossing hazard mitigation technologies. How would the fiscal year 2001 proposal promote the transfer of this knowledge to potential users?

Answer. FRA's investment in grade crossing hazard mitigation technologies is now paying off on several levels. The North Carolina Sealed Corridor Project has already demonstrated enormous success employing innovative low-cost techniques to reduce driver misbehaviors, such as running around closed crossing gates, by over 80 percent. Additional demonstrations of advanced technologies are showing similar success rates. Work with New York State has produced a comprehensive approach to reducing corridor grade crossing risk despite increases in train numbers and speeds. FRA is working with California DOT on the San Joaquin corridor to apply the new methodology, as well as new laser-based mapping techniques to provide the necessary information to better assess the risks of each crossing. The fiscal year

2001 request will be used, in part, to complete evaluation and reporting activities to make these results available to additional states and corridors as they become interested in high-speed rail. In addition, FRA will continue the successful broad agency announcement (BAA) solicitation to assure that worthwhile new demonstration projects which apply the techniques can be pursued.

GRADE CROSSING HAZARD MITIGATION PROJECTS

Question. Regarding the development of grade crossing hazard mitigation technologies, please prepare a table indicating separately the status, problems, and challenges, along with the fiscal year 1999, fiscal year 2000, and planned fiscal year 2001 FRA investments for each major project in this program. Please display this information organized by subaccount, that is, mitigating grade crossing hazards, low cost, innovative technologies, and North Carolina sealed corridor initiative.

Answer. The information is contained in the following table:

FUNDING

| | Fiscal year | | |
|---|------------------|------------------|------------------|
| | 1999 enacted | 2000 enacted | 2001 request |
| Mitigating Grade Crossing Hazards | \$2,500,000 | \$2,500,000 | \$2,500,000 |
| Low-Cost Innovative Technologies | 1,100,000 | 997,000 | 1,100,000 |
| Sealed Corridor Initiative | 1,000,000 | 400,000 | 400,000 |
| Total, Grade Crossing | 4,600,000 | 3,897,000 | 4,000,000 |

STATUS

| Project area | Status | Issues |
|--|--|---|
| Locked gate at private crossing. | Being conducted by New York DOT, underway | No significant issues. |
| Vehicle counting and characterization at crossings. | Demonstration project to be awarded shortly | The ability to characterize the types of vehicles using a crossing as well as their number greatly improves risk prediction ability. |
| Crossing occupancy detection. | Project to adapt and evaluate an ultrasonic-based crossing occupancy detection system to be awarded shortly. | Reliable crossing occupancy detection can greatly reduce risk to both highway and rail vehicles. |
| Grade crossing topographical characterization. | Laser-mapping of crossing topography conducted on two corridors, data analysis underway. | Rapidly acquired accurate data will permit easy identification of humped crossing and those with limited sight distance or other characteristics affecting risk, allowing better targeting of risk-reduction efforts. |
| Locked gate at private crossing. | Being conducted by New York DOT, underway | No significant issues. |
| Broad Agency Announcement to solicit additional proposals in this technology area. | To be released shortly | No significant issues at this time. |

STATUS—Continued

| Project area | Status | Issues |
|--------------------------|--|-------------------------------------|
| NC Sealed Corridor | <p>The second long gate arm test is complete with an 84 percent reduction in violations. Video ticketing complete with 67 percent reduction in violations. Implementation of median separators, longer gate arms and four quadrant gates at crossings between Greensboro and Charlotte continues. Five additional crossings closed since April 1999. Design and engineering has begun on 10 crossings on CSXT's portion between Raleigh and Cary.</p> <p>Four quadrant gates: 12 constructed, 2 authorized for construction, 6 under design, 6 in planning Median separators: 15 constructed, 3 under design Longer gate arms: 1 constructed, 17 under design, 11 auth. for const. Stop signs (temporary): 2 (to be closed in next 1-4 years) Closures: 26 completed, with plans to close 8 more in the next 2 years..</p> | No significant issues at this time. |

RESULTS OF SEALED CORRIDOR APPROACH

Question. Please assess the results thus far on the sealed corridor approach and discuss how the fiscal year 2001 budget request will continue those advances.

Answer. The Sealed Corridor approach has very successfully tested and documented the results for deploying innovative, low cost grade crossing warning and protection systems. The project has conclusively demonstrated that these very practical approaches can reduce driver misbehavior at grade crossings by 80 percent or more. The results are now being analyzed for publishing, to be used by other states and in the development of high-speed corridors. The fiscal year 2001 funding will enable the construction of enhanced crossing devices and closure efforts to be extended along the designated Southeast High-Speed Rail Corridor between Raleigh and Charlotte, and completion of the analysis and reporting activities now underway.

STATUS OF HAZARD ELIMINATION PROJECTS

Question. What is the status of each of the high speed rail corridor crossing hazard elimination projects funded in fiscal year 1999 and fiscal year 2000 under TEA-21 section 1103(c)? How much contract authority is available within the highway firewall in fiscal year 2001 under current law?

Answer. The DOT is in the process of allocating \$5.25 million authorized in fiscal year 2000 according to the earmarks outlined in the Conference Report. The status of the fiscal year 1999 projects is presented in the following table and are for the funded amount of \$6.95 million. A total of \$5.25 million is available in fiscal year 2001.

FISCAL YEAR 1999 PROJECT STATUS

| State | Amount allocated | Project status |
|------------------|------------------|---|
| Washington | \$500,000 | Close two crossings, install median barriers at 12 crossings, and support the construction of a pedestrian overpass. All projects are in preliminary engineering. |
| Oregon | 400,000 | Conduct planning and updating the national inventory (\$125,000). With the balance, \$275,000, fund the construction of an access road to link seven properties to a major road with a public grade crossing, and close seven private crossings. Work on this is underway. |
| California | 250,000 | Close the last ungated crossing on the San Diego line at Dana Point (\$30,000), plus use \$220,000 for feasibility studies and preliminary engineering for the egregiously unsafe crossing in Martinez. Preliminary engineering and environmental reviews for these projects is underway. |

FISCAL YEAR 1999 PROJECT STATUS—Continued

| State | Amount allocated | Project status |
|-------------------|------------------|--|
| Wisconsin | 500,000 | Upgrade four crossings between Milwaukee and Chicago with new lights, gates and constant warning time devices (CWT). |
| Illinois | 350,000 | Install flashing lights, gates and CWT at two crossings and close one crossing. No action has been taken on these projects due to the need to support the Vehicle Arresting Barrier project. |
| Indiana | 200,000 | Study alternative routes for the Cincinnati-Indianapolis-Chicago corridor and to identify improvements needed and crossings for consolidation. |
| Michigan | 500,000 | Close and upgrade crossings between Kalamazoo and Grand Beach, MI near the Michigan/Indiana border. Preliminary work is underway. |
| Texas | 125,000 | Study alternative routes for the corridor, identify improvements needed and crossings for consolidation, and update the national grade crossing inventory. |
| Louisiana | 325,000 | Update the national inventory (\$75,000) and upgrade one very dangerous crossing at Gentilly Road in New Orleans (\$250,000). The latter is viewed as part of the known alignment that the Gulf Coast Corridor must adopt through New Orleans. Preliminary design is underway. |
| Mississippi | 355,000 | Update the national inventory (\$75,000) and upgrade two grade crossings in Gulfport (rated #4 in accident prediction ranking in the state) and Long Beach (rated #7 in the state) (\$280,000). Preliminary design is underway. |
| Alabama | 345,000 | Update the national inventory (\$75,000) and upgrade two grade crossings (\$270,000). Preliminary design is underway. Florida 300,000 Upgrade two crossings, one with four-quadrant gates and one with median gates. Preliminary design is underway. |
| Georgia | 250,000 | Fund one half of the total cost of the action plan for upgrading and consolidating all crossings in Georgia's high speed rail corridors. South Carolina 150,000 Develop the action plan for upgrading and consolidating all crossings in South Carolina's high speed rail corridors. |
| North Carolina | 1,000,000 | Realign two streets and close two crossings, install median barriers at four crossings and install long gate arms at four crossings. |
| Virginia | 500,000 | Construct grade crossing improvements and support construction of a pedestrian overpass in Prince William County to eliminate trespassing on the CSX mainline on the high-volume Richmond extension of the Northeast Corridor. |
| Pennsylvania ... | 500,000 | Begin design for the highway grade separation and bypass road. Design is now underway. |
| New York | 400,000 | Conduct design and preliminary engineering for grade separations, the first step needed to implement the State's grade crossing improvement plans based on safety risk analysis. Design is underway. |
| Total ... | 6,950,000 | |

STATUS OF TRACK AND STRUCTURES TECHNOLOGY

Question. Please prepare a table indicating separately the status, problems, and challenges, along with the fiscal year 1999, fiscal year 2000, and planned fiscal year 2001 FRA funding (and other funding sources, when applicable) for each project in the track and structures technology program.

Answer.

TRACK AND STRUCTURES FUNDING

| | Fiscal year | | |
|--------------|-----------------|-----------------|-----------------|
| | 1999 enacted | 2000 enacted | 2001 request |
| Amount | \$1,200,000 | \$1,200,000 | \$1,200,000 |

TRACK AND STRUCTURES STATUS AND ISSUES

| Project area | Status | Issues |
|--|---|--|
| Risk-based scheduling of ultrasonic testing for high-speed tracks. | Underway | Potential reduction in track maintenance costs and safety improvements. |
| Increasing speeds through special trackwork. | Underway | Techniques to increase speeds through existing special trackwork without replacing entire units to permit higher speeds at minimal cost. |
| Evaluation of techniques to address subgrade failures. | 3 different projects underway or to begin shortly—in service demonstration of the first to begin shortly. | Advanced techniques to stabilize weak subgrade can reduce life-cycle cost and the frequency of slow orders. |
| Demonstration of low-cost techniques to improve ride quality and increase speeds over areas with large stiffness variations. | Demonstrations underway | Low-cost techniques such as tie-pads and drainage improvements offer opportunities to improve ride quality and permit higher speeds at minimal cost. |
| Broad Agency Announcement to solicit additional proposals in this technology area. | To be released shortly | No significant issues at this time. |

STATUS OF MAGLEV PROGRAM

Question. Please update the Committee on the accomplishments, results, cooperative agreements, and challenges associated with the maglev program funded under TEA-21.

Answer. FRA has made considerable progress since the enactment of TEA-21. In October, 1998, FRA published an interim final rule setting forth the procedures for the application for pre-construction planning grants by interested states or state authorities. Eleven applications were received and evaluated. On May 24, 1999, Secretary Slater announced the seven projects that would receive grants. FRA signed seven cooperative agreements providing \$12.7 million in fiscal year 1999 funds and is in the process of finalizing amendments to those agreements adding \$14.8 million in fiscal year 2000 funds.

Last year, FRA selected a consulting firm, MK Centennial, to monitor the planning work underway by the seven project sponsors and to provide engineering support in subsequent phases of the program. The Volpe National Transportation Systems Center is another member of the team. Volpe will prepare the Environmental Impact Statements and assist a Departmental technical evaluation panel in rating the plans and recommending the best ones.

On February 29, 2000, FRA received an Environmental Assessment from each of the seven applicants and by June 30, we expect to receive seven detailed Project Descriptions. By 2003, the Secretary will select a project as required by TEA-21. In fiscal year 2001, the President's Budget does not include funding for construction.

MAGLEV FUNDING

Question. Please prepare a summary of authorized and appropriated funding for the maglev program. What cooperative agreements have been announced, what funds have been released and to which grantees? When will the fiscal year 2000 cooperative agreements and related federal funding be announced?

Answer. Following is a summary of the fiscal year 1999 and fiscal year 2000 funding for the Maglev Deployment Program.

| | Fiscal year | |
|----------------------------------|--------------|--------------|
| | 1999 | 2000 |
| Contract Authority | \$15,000,000 | \$20,000,000 |
| Obligation Limit (percent) | 88.3 | 87.1 |
| Available for Obligation | \$13,245,000 | \$17,420,000 |
| California | \$1,430,000 | \$1,959,750 |
| Florida | 1,400,000 | 1,959,750 |
| Georgia | 1,400,000 | 1,959,750 |
| Louisiana | 1,400,000 | 1,959,750 |
| Maryland | 1,300,000 | 1,959,750 |
| Nevada | 1,400,000 | 1,959,750 |
| Pennsylvania | 4,415,000 | 3,048,500 |
| Subtotal | 12,745,000 | 14,807,000 |
| Other | 499,970 | 871,000 |
| Total Contract Authority | 13,244,970 | 17,420,000 |

On May 24, 1999 the Secretary of Transportation announced grants to seven states and authorities for preconstruction planning. Cooperative agreements between the various selected applicants and the FRA have been executed, obligating \$12.745 million in fiscal year 1999. An additional \$14.8 million in fiscal year 2000 funds will be obligated in fiscal year 2000. The following lists the project sponsors, a short description of the project, and the date amendments allocating fiscal year 2000 funding were signed by the Federal Railroad Administrator. Each of the first four project sponsors were advised of the amendment to their cooperative agreement providing the additional federal funding, by a letter from the FRA Administrator at the time that the agreement was signed. The amendment to the cooperative agreement for the project in New Orleans was announced by the Secretary of Transportation on March 3, 2000. The amendments for the projects in Los Angeles and Pittsburgh have not yet been signed or announced.

—*California-Nevada Super Speed Train Commission*.—A 42-mile project linking Las Vegas to Primm, Nev.; 02/02/00.

—*Florida Department of Transportation*.—A 20-mile project linking Port Canaveral to the Space Center and the Titusville Regional Airport; 02/02/00.

—*Atlanta Regional Commission*.—First 40 miles of 110-mile project from Atlanta to Chattanooga, Tenn.; 02/15/00.

—*Maryland Department of Transportation*.—A 40-mile project linking Camden Yard in Baltimore and Baltimore-Washington International Airport to Union Station in Washington, D.C.; 2/15/00.

—*Greater New Orleans Expressway Commission*.—A 40-mile project linking New Orleans Union Passenger Terminal to the airport and across Lake Pontchartrain to the fast-growing northern suburbs; 03/02/00.

—*State of California*.—A 70- to 75-mile system connecting Los Angeles International Airport to Union Station in downtown Los Angeles to Ontario Airport and further east into Riverside County; Pending signature by FRA.

—*Port Authority of Allegheny County*.—A 45-mile project linking Pittsburgh Airport to Pittsburgh and its eastern suburbs; Pending negotiation of a Scope of Work.

MAGLEV ADMINISTRATIVE COSTS

Question. How much of the contract authority for the maglev program in the fiscal year 2001 budget request will be used for administrative needs? Please break out these costs.

Answer. A total of \$3.5 million has been earmarked for administrative expenses. Of this amount, \$2M will provide contract support for the maglev program. The remaining balance of \$1.5million will support other FRA administrative expenses.

FISCAL YEAR 2000–2001 NDGPS FUNDS

Question. In fiscal year 2000, \$5,000,000 was provided for the NDGPS program from Federal Highway Administration administrative expenses funds. For fiscal year 2001, the budget requests \$18,700,000 from FHWA research and technology program funds. Who will administer both the fiscal year 2000 and fiscal year 2001 funds? Please break out in detail both how the fiscal year 2000 funds are being spent (categorize capital and operating expenses), and how the requested fiscal year 2001 funds would be spent.

Answer. Both the fiscal year 2000 and fiscal year 2001 funds will be administered by the United States Coast Guard. Fiscal year 2000 funds are being spent as follows: \$1.8 million for capital costs, and \$3.2 million for operating expenses. The requested fiscal year 2001 funds would be spent as follows: \$13.2 million for capital costs, and \$5.5 million for operating expenses.

INCREASE IN FISCAL YEAR 2001 NDGPS COSTS

Question. Why is the request for fiscal year 2001 (\$18.7 million) so much higher than the level requested in fiscal year 2000 (\$10.4 million)? Is \$5.4 million of the request meant to make up the shortfall between last year’s request and subsequent appropriation?

Answer. The request for \$18.7 million in fiscal year 2001 is based on FRA’s plan to install 28 NDGPS sites in fiscal year 2001. This is the same amount submitted in last year’s funding summary for fiscal year 2001, despite the fact that the funding requested for fiscal year 2000 was subsequently cut by more than half from \$10.4 million to \$5 million. Now that all of the Air Force Ground Wave Emergency Network (GWEN) towers, equipment, and real estate have been conveyed from the Air Force to the Coast Guard, the Coast Guard is obligated to pay the costs of leasing and maintaining the sites, even where they are not yet converted to NDGPS sites. Any funding limitations on the conversion efforts results in the federal government paying the lease and maintenance costs without receiving the benefits of operation.

NDGPS FUNDING HISTORY

Question. Please update the Committee on the status of the nationwide differential global positioning system and FRA’s role in that initiative. Provide a funding history to date, as well as a 5-year schedule of benchmarks, anticipated costs, and anticipated funding sources (please specify which DOT or other federal agencies will be providing funds).

Answer. On March 15, 1999, the Secretary of Transportation and the Commandant of the U.S. Coast Guard announced Full Operational Capability of the Maritime DGPS Service, which provides differential coverage along the coasts, the Great Lakes, and the Mississippi River. At the same time, the Secretary and the Commandant announced the expansion of that Service into a Nationwide DGPS (NDGPS) with the addition of eight operational inland GWEN sites. FRA’s role in this initiative is to request funding for NDGPS because the Secretary of Transportation delegated his authority to the FRA to determine the Federal requirements for the NDGPS. A Memorandum of Agreement among the Office of the Secretary, FHWA, FRA, and the Coast Guard gave to FRA, the responsibility to submit and defend funding requests for implementation, operation, and maintenance of the NDGPS. FRA was given this responsibility because railroads especially need a continuous, uniform, accurate, high-quality radionavigation signal for new Positive Train Control systems. The funds are transferred to the Coast Guard which is responsible for the actual construction, operation, and maintenance of the NDGPS.

The NDGPS project will take 5 years to complete (1998–2002) at an estimated cost of \$37.1 million in capital funding. Once fully implemented, the system is estimated to cost approximately \$6.9 million per year to operate and maintain. The allocation of Capital and Operating costs by fiscal year is detailed in the table below:

[In millions of dollars]

| Fiscal year | Capital costs | Operating costs |
|-------------|---------------|-----------------|
| 1998 | 12.4 | |

[In millions of dollars]

| Fiscal year | Capital costs | Operating costs |
|---|--------------------------|------------------|
| 1999 | ¹ 5.5 | |
| 2000 | ¹ 1.8 | ¹ 3.2 |
| 2001 | ² 13.2 | ² 5.5 |
| 2002 & Beyond | ³ 14.2 | ³ 6.9 |
| Total Capital & Annual Costs | ³ 37.1 | 46.9 |

¹ Appropriated.² Requested.³ Estimated.⁴ Annual Estimate.

Based on the funding made available in the fiscal year 1998–1999, nine GWEN sites, including one that was converted at Macon, Georgia on March 17, 2000, have been integrated into the NDGPS. The fiscal year 2000 funding phase of this five-year project will expand the NDGPS by an additional 14 transmitting sites by the end of calendar year 2000, and complete the NDGPS Master Control Station installations at Alexandria, Virginia, and Petaluma, California. The estimated cost avoidance to the government resulting from the reuse of GWEN property and equipment is \$16 million. The current plan is for the establishment of an additional 28 sites in fiscal year 2001, and 16 sites in fiscal year 2002, for a total of 67 NDGPS stations. As required by Public Law 105–66, Section 346, the new sites will all be integrated into the Continuously Operating Reference Station (CORS) and Precipitable Water Vapor System (PWVS) networks operated by the U.S. Department of Commerce.

NON-DOT AGENCIES INTEREST IN NDGPS

Question. Seven federal agencies are signatories to a memorandum of agreement which outlines the federal governments commitment to the establishment and long-term operation, management, and maintenance of the NDGPS. Three of these agencies are not Department of Transportation: the National Oceanic and Atmospheric Administration, the U.S. Army Corps of Engineers, and the U.S. Air Force. Please summarize each of these agencies interest in NDGPS technology, describe benefits that accrue to the agency's activities, and the level of financial or other support that each agency has contributed or is planning to contribute to NDGPS establishment, operation, management and maintenance. What level of funding is requested for the support of NDGPS in fiscal year 2001 budget requests other than the Federal Highway Administration?

Answer. The National Oceanic and Atmospheric Administration will integrate each NDGPS reference station into Continuously Operating Reference Station (CORS) system and will add Integrated Precipitable Water Vapor System equipment to NDGPS. The U.S. Army Corps of Engineers will provide real estate services and property management services to the NDGPS program including, but not limited to, real property, planning, appraisal, acquisition, leasing, management, engineering, design, environmental assessment, and construction management. The U.S. Air Force is transferring decommissioned Ground Wave Emergency Network (GWEN) sites and spare hardware to the Department of Transportation for use as NDGPS reference stations. For more details, the interest of these agencies in NDGPS technology and the benefits that accrue to their activities were described in a report to the House and Senate Committees on Appropriations titled "The Department of Transportation on Civilian Use of the Global Positioning System (GPS): The Nationwide Differential Global Positioning System and Additional Civilian GPS Signals," submitted on July 1, 1999, by the Federal Railroad Administration in cooperation with the Office of the Secretary of Transportation, the Federal Aviation Administration, the Federal Highway Administration, and the United States Coast Guard.

The Department of Transportation is the only department requesting funding for NDGPS. The seven signatory Agencies agreed that FRA/DOT should be the program sponsor for requesting funding. As noted above, every participating Agency is contributing resources, in staff or in-kind, for this project.

NON-DOT FINANCIAL SUPPORT FOR NDGPS

Question. The Committee has expressed its concern that "DGPS-related expenses should not be derived solely from the Federal highway trust fund or other DOT ac-

counts.” (Senate report 106–55, p. 101). How has the administration responded to this concern?

Answer. The seven signatory Agencies are providing support for this project either through staffing, equipment or other in-kind services. In addition, FRA described in some detail in a report submitted to Congress on July 1, 1999, the significant contributions that the other Agencies have made and continue to make to the establishment of NDGPS. Unfortunately, the report was delivered after the Senate Report was published.

The Department has proposed cost sharing from other Agencies; however, the task group agreed that FRA/DOT should be the program sponsor responsible for requesting funding since this is a transportation navigational system. Further, it is believed that cost sharing a relatively small project through seven Departments, and many more Congressional Committees, only to transfer the funds back to the Department of Transportation is counterproductive, increases administrative costs and reflects government at its worst.

NDGPS AND PTC

Question. How is the NDGPS program being integrated with positive train control efforts already underway?

Answer. All modes of transportation need precise positioning information. This information must be in real time and must be accurate to permit safe control of vehicles—trains, ships, aircraft, trucks, automobiles, transit, and emergency response. Intelligent Transportation Systems are being designed to incorporate precise positioning information. Coverage and integrity are important attributes of a positioning system.

Over a 7-year period, railroads experienced at least 876 collisions and other accidents, which fully-implemented communications-based positive train control (PTC) systems would likely have prevented. In fact, the National Transportation Safety Board has listed PTC as one of its “ten most-wanted” initiatives for national transportation safety. FRA is facilitating the deployment of PTC within the railroad industry by completing the installation of a Nationwide Differential Global Positioning System (NDGPS) network, which FRA and several railroads have determined to be a prerequisite for PTC.

In July, 1994, FRA published a report to Congress, entitled Railroad Communications and Train Control, as required by the Rail Safety Enforcement and Review Act. In that report, FRA outlined an action plan and time line to advance PTC deployment by the end of the century. FRA indicated that in fiscal year 1997 it would commence rulemaking regarding the installation PTC on identified railroad corridors. That rulemaking has begun and is taking place under the auspices of the Railroad Safety Advisory Committee.

In June, 1995, FRA published another report to Congress, entitled Differential GPS: An Aid to Positive Train Control, in response to a request from the Senate and House Appropriations Committees. It concluded that if the Coast Guard’s DGPS service were expanded nationwide, it could satisfy the location determination system requirements for PTC systems. Full nationwide deployment of the Coast Guard DGPS network would significantly aid the development and deployment of PTC systems by providing an affordable, uniform, continuous, accurate, reliable, secure, real-time location determination system throughout the United States. PTC systems that would use positioning information from the NDGPS are being installed in Alaska, Illinois, Michigan, South Carolina, and Georgia, and are being considered in other areas of the country because of the need to handle growing railroad freight, intermodal, intercity passenger, and commuter rail traffic at higher levels of safety.

IMPACT OF REDUCING NDGPS SITES IN 2001

Question. Please discuss whether it is critical to PTC deployment to fund the additional 28 NDGPS stations next year. What are the safety implications of only funding half of these this year?

Answer. On December 8, 1998, the Federal Railroad Administrator determined that, “The FRA has an operational requirement for NDGPS in the continental United States and Alaska to support Positive Train Control for railroads.” What is most critical to PTC deployment is not so much the funding of 28 or some other specific number of NDGPS stations next year, but that the project be completed no later than fiscal year 2002 so that the investments to date are not wasted, the ultimate costs are not increased, and the safety and economic benefits (to railroads and a myriad of other users) are not lost. A delay in nationwide coverage adversely impacts on FRA’s ability to issue a nationwide PTC rule.

STATUS OF RRIF RULE

Question. TEA-21 expanded the Railroad Rehabilitation and Improvement Financing program to permit non-federal entities to provide the subsidy budget authority needed to support a loan through the payment of a credit risk premium. Has a final rulemaking been issued which outlines the structure of the expanded loan program? Is FRA aware of industry and commercial interest in utilizing this expanded loan program?

Answer. A Final Rule, has been drafted and is currently in the clearance process. The 92 comments received in response to the Notice of Proposed Rulemaking reflected a wide range of interest in the program. Of the comments received, 57 small railroads indicated an interest in participating in the program. A total of 13 State Departments of Transportation wrote of the need for the program. In fact, Iowa and Washington are considering requesting state appropriations for the payment of credit risk premiums, required pursuant to the Credit Reform Act of 1990.

RHODE ISLAND AUTHORIZATION

Question. Please cite the current authorization for the Rhode Island Rail development improvement project, including the date enacted.

Answer. The authorization for the Rhode Island Rail Development Project is Section 9 of the "Water Resources Development Act of 1999-Technical Corrections" (Public Law 106-109). It was enacted on November 24, 1999.

RHODE ISLAND FUNDING

Question. Between fiscal years 1995 and 2000, the Rhode Island rail development project has received \$38,000,000 in federal appropriations. What level of funding remains unobligated?

Answer. A total of \$28 million was available through fiscal year 1999 and all the funds have been obligated. The \$10 million provided in fiscal year 2000 will be obligated by year-end.

STATUS OF RHODE ISLAND CONSTRUCTION

Question. Construction of 5 miles of Track 7 replacement track was scheduled to begin in April 1999 and continue for 15 months. Did this construction begin on schedule? When is it scheduled to be completed?

Answer. Beginning nearly a year ago, Rhode Island DOT (RIDOT) undertook a comprehensive review of construction cost estimates to complete the Freight Rail Improvement Project. It was evident from this analysis that building vital sections of a new third track and increasing clearances at bridges were likely to cost more than had earlier been estimated. Because track 7 is currently in service, RIDOT decided to postpone upgrades until work on the more important new tracks and bridge clearances was complete. Track 7 will now be upgraded near the end of the Project—mid-2001—when other, more vital work is well underway and all costs are known. The exact scope of work on Track 7 will be determined by the available budget at the time.

STATUS OF THIRD TRACK CONSTRUCTION

Question. Is Third Track construction scheduled to begin in April 2000 and continue for 18 months, as outlined in last year's hearing record? If not, why not?

Answer. Work on the third track has been delayed due to time spent on the review of cost estimates and work on completing the NEC electrified high-speed operations (Amtrak is RIDOT's primary construction contractor.)

Amtrak has nearly completed all construction related to electrified, high-speed operations and is now available for RIDOT construction. A master schedule prepared by Rhode Island DOT's Freight Rail Improvement Project office in early February 2000 shows third track construction beginning late this calendar year.

STATUS OF BRIDGE CONSTRUCTION

Question. Have any bridge construction package contracts been awarded? If so, which ones, and what are their schedules? Is the project on track for construction of bridge construction packages to be completed by summer of 2001, with high and wide operations commencing in fall of 2001? If there have been setbacks to this anticipated schedule, please outline the challenges and what steps Rhode Island DOT and the FRA intend to take to complete the project within budget and on, or close to, schedule.

Answer. No bridge construction contracts have been awarded. The first, jacking of the Rocky Hollow bridge, is scheduled to be awarded this summer with a construction "notice to proceed" issued by late August. The last, Dexter Street bridge jacking, is being deferred as part of the Track 7 decision. Two bridges, Hunt's River and Cranston Street, will be improved using highway funds. All construction schedules have been impacted by the comprehensive review of construction cost estimates. This exercise was extremely important to the ultimate success of this project because it addressed potential cost overruns at the start of the process, eliminated non-critical scope in order to free up funds to insure that the most essential improvements are funded, and rescheduled certain less critical work to the end of the project when the actual amount of remaining funds will be known and assigned without fear of budget shortfalls. FRA and RIDOT will monitor actual construction costs very closely and be in a position to adjust scope and schedule so that a useable product that meets the goal of accommodating high and wide loads will result.

IMPACT OF SPLIT FUNDING RHODE ISLAND PROJECT

Question. What would the affect be of appropriating the remaining \$17 million of federal commitment total into two equal appropriations of \$8,500,000 in fiscal year 2001 and \$8,500,000 in fiscal year 2002?

Answer. All construction packages are currently scheduled to be awarded by Spring 2001. A delay of twelve months in the appropriation of \$8,500,000 will push the last of these awards into 2002. Not only would this end up increasing project costs, but also force significant changes to construction schedules which have been coordinated with Amtrak, the owner and operator of the adjacent Northeast Corridor high-speed tracks, and RIDOT's prime construction contractor. Amtrak is unlikely to support disruptions to its high-speed service, which is a key source of revenue to eliminate its need for operating subsidy.

CURRENT COST ESTIMATE OF PENNSYLVANIA STATION PROJECT

Question. What is the current cost estimate for the Pennsylvania Station project? How have the project cost estimates increased since this project was first funded in fiscal year 1995? What is the level of federal "commitment" to this project? What legal form does this commitment take?

Answer. The current cost estimate for the Pennsylvania Station Redevelopment Project is \$788 million. The increase in cost, since fiscal year 1995, is attributable to: additional project scope including an expanded West End concourse with a new commuter level concourse, an intermodal ticketing hall, improved loading facilities for the United States Postal Service (USPS), increased retail area; the addition of passenger handling facilities for airport access; lease payments to USPS, including the cost of Amtrak force account; USPS construction costs; financing costs; and contingency costs. The direct Federal funding commitment is \$348 million of which \$128 million was previously appropriated funds, \$60 million was provided in advance appropriations beginning in fiscal year 2001 and \$160 million provided in Transportation Infrastructure Finance and Innovation Act credit assistance. In addition, the Pennsylvania Station Redevelopment Corporation expects to receive certain Federal funds apportioned to the State of New York, including \$20 million from the Surface Transportation Program and \$64 million from the Congestion Mitigation and Air Quality Program. To date, the Federal Railroad Administration has entered into grant agreements with Amtrak totaling \$48 million and the Pennsylvania Station Redevelopment Corporation totaling \$29 million in previously appropriated funds. In addition, Amtrak has invested \$20 million of its capital funds in Pennsylvania Station life safety improvements.

FEDERAL SUPPORT FOR PENN STATION PROJECT

Question. Please detail all federal appropriations and other federal funding(e.g. authorizations that carry contract authority, TIFIA) to the Pennsylvania Station project to date? What level of federal funding remains unobligated?

Answer. A detailed list of federal appropriations and other federal funding to the Pennsylvania Station project follows:

| | | |
|--|--------------------------|-------|
| | [In millions of dollars] | |
| Fiscal Year 1994 Supplemental Appropriations Act | | 10.00 |
| Fiscal Year 1995 Supplemental Appropriations Act | | 21.50 |
| Fiscal Year 1996 DOT Appropriations Act | | 9.00 |
| National Highway System Designation Act | | 24.75 |
| Taxpayer Relief Act | | 11.00 |

| | |
|--|---------------|
| Fiscal Year 1998 DOT Appropriations Act | 12.00 |
| Transportation Equity Act for the 21st Century | 40.00 |
| Transportation Infrastructure Finance and Innovation Act | 160.00 |
| Fiscal Year 2001 Advance Appropriations | 60.00 |
| Total | 348.25 |

Note: A total of \$91 million remains unobligated.

PROJECT BUDGET FOR PENN STATION

Question. Please provide a project budget that outlines all sources of funding, whether these funds are on hand or planned, what amount of funding in each category has been obligated to date, construction schedule milestones, and date of completion.

Answer. The project budget and sources of funding for the Pennsylvania Station Redevelopment Project follows:

Project Budget

[In millions of dollars]

| | |
|--|------------|
| Construction and contingencies | 573 |
| Financing and reserves | 109 |
| Professional services (architectural/engineering, risk management and development manager) | 68 |
| Lease costs | 20 |
| Administrative and consultants | 18 |
| Total | 788 |

Sources of Funds

[In millions of dollars]

| | |
|--|---------------------|
| Federal funding to Amtrak | 168 |
| Federal funding to PSRC | 56 ¹ 129 |
| Advance Federal appropriation | 260 |
| Transportation Infrastructure Finance and Innovation Act | 3160 |
| New York State Department of Transportation: | |
| Congestion Mitigation and Air Quality | 464 |
| Surface Transportation Program | 20 ¹ 10 |
| State Multi-modal | 420 |
| Metropolitan Transportation Authority | 335 |
| New York City Economic Development Corporation | 125 |
| United States Postal Service | 4125 |
| New York State Urban Development Corporation | 3155 |
| Total | 788 |

¹Obligated.

²Appropriated.

³Planned.

⁴Committed.

It is expected that the Pennsylvania Station Redevelopment Project will begin construction in the fall of 2000 with a construction period of approximately 48 months. The West End Concourse is expected to be opened for pedestrian traffic by December 2003, with substantial completion of the station by December 2004.

PENN STATION—RENOVATION VS LIFE SAFETY REPAIRS

Question. Amtrak recently released a report to Congress on the planned infrastructure improvements to the South End of its Northeast Corridor (Washington, D.C. to New York City). Life safety improvements to the tunnels below Pennsylvania Station in New York City are estimated to cost more than \$300 million over the next ten years or so. In FRA's budget, \$20 million is requested—and was already funded as an advance appropriation in fiscal year 2000—for the Penn Station Redevelopment Project. Will any of the \$20 million in the administration's budget for Penn Station be used for life safety improvements to the tunnels? Please justify the administration's decision to place a higher priority on funding the renovation of a building (much of which will be for commercial use), than on funding life safety repairs and improvements. How will the needed tunnel repairs and improvements be paid for?

Answer. Both the upgrade of passenger related facilities at Pennsylvania Station (Penn Station) and safety improvements to the six tunnels providing access to Penn Station from New Jersey and Long Island are necessary for the long term vitality of all passenger rail service, commuter as well as intercity serving New York City. Both initiatives share important attributes. They address the need to invest in aging infrastructure and they require partnerships at the Federal, state and local level. The Pennsylvania Station Redevelopment Project (Project) includes fire and life safety improvements to the portion of the tunnels beneath Penn Station and the James A. Farley Post Office building (Farley building). The \$20 million funded by the Congress as an advance appropriation for fiscal year 2001 is not specifically targeted for improvements to the tunnels. However, a total of approximately \$54 million in life safety improvements below Penn Station and the Farley building are included in the Project plan. The need to invest in Penn Station is well documented, including the inadequacies of the existing facility in terms of the safety of egress and the inability to create any additional capacity through the construction of new tracks and platforms. If the region's transportation and environmental needs are to be met, then the existing facilities must be expanded now. The Pennsylvania Station Redevelopment Corporation is endeavoring to do so through its innovative design for combining parts of the Farley building with the existing Penn Station.

Upgrading the rail passenger tunnels accessing New York Penn Station is vital to the long-term future of all rail passenger service in the Northeast. The Department as well as Amtrak, New Jersey Transit (NJT) and the Long Island Rail Road (LIRR) are mindful of the need to upgrade the tunnels. Since 1976, a total of \$106 million has been invested in their upgrade by Amtrak and its partners and another \$43 million will be invested in fiscal year 2000. Amtrak is also working with NJT and LIRR to prioritize long-term tunnel improvement investments and to develop an appropriate mechanism for allocating the resulting costs which reflects Amtrak's ownership but minority use of the tunnels.

CAPITAL GRANTS TO AMTRAK

Question. Please provide a funding history, by fiscal year, of Amtrak's federal appropriations and other federal funds from the Corporation's creation to present.

Answer. The information of Amtrak's Federal appropriations including the Northeast Corridor Program follows:

Amtrak Federal Appropriations Including the Northeast Corridor Program

[In millions of current dollars]

| <i>Fiscal year</i> | <i>Amount</i> |
|--------------------|---------------|
| 1971 | 40.0 |
| 1972 | 170.0 |
| 1973 | 9.1 |
| 1974 | 140.0 |
| 1975 | 276.5 |

AMTRAK'S YEAR-END NET OPERATING LOSSES

Question. Please provide a table displaying Amtrak's net end-of-year operating losses, by fiscal year, from the Corporation's creation to present.

Answer. Amtrak's net end-of-year operating losses by fiscal year are as follows:

[In millions of dollars]

| <i>Year</i> | <i>Net Operating Loss</i> |
|-----------------------------|---------------------------|
| 1971 (Year end 12/31) | 92 |
| 1972 (Year end 12/31) | 151 |
| 1973 (Year end 12/31) | 159 |
| 1974 (Year end 12/31) | 273 |
| 1975 (Year end 12/31) | 353 |
| 1976 (Year end 9/30) | 343 |
| 1977 (Year end 9/30) | 537 |
| 1978 (Year end 9/30) | 582 |
| 1979 (Year end 9/30) | 620 |
| 1980 (Year end 9/30) | 27 |
| 1981 (Year end 9/30) | 179 |
| 1980-1981 Adjustment | ¹ 41 |
| 1982 (Year end 9/30) | 795 |
| 1983 (Year end 9/30) | 805 |
| 1984 (Year end 9/30) | 763 |
| 1985 (Year end 9/30) | 774 |
| 1986 (Year end 9/30) | 702 |
| 1987 (Year end 9/30) | 699 |
| 1988 (Year end 9/30) | 650 |
| 1989 (Year end 9/30) | 665 |
| 1990 (Year end 9/30) | 703 |
| 1991 (Year end 9/30) | 722 |
| 1992 (Year end 9/30) | 712 |
| 1993 (Year end 9/30) | 731 |
| 1994 (Year end 9/30) | ² 1,077 |
| 1995 (Year end 9/30) | 808 |
| 1996 (Year end 9/30) | 764 |
| 1997 (Year end 9/30) | 762 |
| 1998 (Year end 9/30) | ³ 353 |
| 1999 (Year end 9/30) | 702 |

¹ This adjustment was due to a change in Amtrak's method of accounting for track structure depreciation which had the effect of increasing net losses for fiscal year 1983, 1982, and 1980-81 by \$35 million, \$24 million and \$41 million, respectively.

² Includes \$244 million of one-time expenses.

³ Offset of \$577 million of TRA receipts, including interest earned.

GRANTS TO THE NATIONAL RAILROAD PASSENGER CORPORATION

Question. Please provide a table displaying Amtrak's net end-of-year debt load, by fiscal year, from the Corporation's creation to present.

Answer. Amtrak's net end-of-year debt loads by fiscal year are as follows:

[In millions of dollars]

| <i>Fiscal year</i> | <i>Federal debt</i> | | | | <i>Grand total paid-in capital items³</i> | |
|--------------------|------------------------------|-------------------------------|--|----------------------|--|--------------|
| | <i>Less non-Federal loan</i> | | <i>NECIP/NHRIP funding²</i> | <i>Grand capital</i> | | <i>Total</i> |
| | <i>Debt</i> | <i>Guarantees¹</i> | | | | |
| 1971 | 0.7 | 25.0 | 25.0 | 25.7 | 25.7 | |
| 1972 | 7.1 | 7.1 | 7.1 | 7.1 | 7.1 | |
| 1973 | 30.9 | 78.6 | 78.6 | 109.5 | 109.5 | |
| 1974 | 76.6 | 220.9 | 220.9 | 297.5 | 297.5 | |
| 1975 | 107.1 | 377.8 | 377.8 | 484.9 | 484.9 | |
| 1976 | 232.7 | 533.3 | 533.3 | 766.0 | 766.0 | |

| 1994 | 770.3 | 1,119.6 | 2,787.6 | 3,907.2 | 4,677.5 | 770.3 |
| 1995 | 837.0 | 1,119.6 | 2,906.9 | 4,026.5 | 4,863.5 | 837.0 |
| 1996 | 987.0 | 1,119.6 | 3,154.3 | 4,273.9 | 5,260.9 | 987.0 |
| 1997 | 1,336.4 | 1,119.6 | 3,563.4 | 4,683.0 | 6,019.4 | 1,336.4 |
| 1998 | 1,637.9 | 1,119.6 | 4,012.0 | 5,131.6 | 6,769.5 | 1,637.9 |
| 1999 | 1,887.2 | 1,119.6 | 4,046.4 | 5,166.0 | 7,053.2 | 1,877.2 |

¹Note in the amount of \$1,119.6 million was signed on October 5, 1983 in return for FRA payment of Loan Guarantees. At that time, \$238.7 million of deferred interest was also folded into this note. Note comes due November 1, 2082 and is secured by Amtrak rolling stock.

²These are borrowings under NECIP/NHRIP fundings.

³Amounts in this column reconcile to Amtrak's Annual Reports.

⁴Beginning fiscal year 1988 (with fiscal year 1987 restated for comparability), federal debt was reclassified as "federal paid-in capital (in italics)" for financial reporting purposes.

LOANS TO AMTRAK

Question. Please list the loans made to Amtrak in fiscal year 1999 and thus far in fiscal year 2000 (through February 29). Please include information on the lending institution, amount of loan, repayment period, and interest rate.

Answer. The list of loans made by Amtrak during fiscal year 1999 and fiscal year 2000 is as follows:

[Dollars in millions]

| Lender/lessor | Description | Amount | Term (years) | Interest rate (per year) |
|---|---|--------|--------------|----------------------------|
| Fiscal year 1999: | | | | |
| Export Development Corp. & MBK Rail Finance Corporation (of Japan). | High-speed trainsets (additional draws). | 164.1 | 20 | LIBOR (6 mos) Plus 75 bp. |
| Export Development Corp. & MBK Rail Finance Corporation (of Japan). | High-speed trainsets (additional draws). | 64.0 | 20 | LIBOR (6 mos) Plus 75 bp. |
| First Union National Bank Capital Lease | (19 F-59 locomotives) | 42.8 | 20 | 5.6 percent. |
| Wabash National Finance Corporation | Capital Lease (4 inter-bogies) | .1 | 20 | 6.0 percent. |
| New York Air Brake Corporation | Capital Lease (5 simulators). | 1.0 | 5 | 4.3 percent. |
| The Fuji Bank, LTD and MBK Finance Corp. (of Japan). | AEM-7 Rebuild (additional draws). | 10.7 | 3 | LIBOR (6 mos) Plus 110 bp. |
| Wabash National Finance Corporation | Capital Lease (173 Road Railers & Equipment). | 8.1 | 9 | 6.0 percent |

(Dollars in millions)

| Lender/lessor | Description | Amount | Term (years) | Interest rate (per year) |
|---|--|--------|--------------|----------------------------|
| Kreditanstalt für Wiederaufbau und Bayerische Landesbank. | Richmond Static Frequency Converter (additional draws). | 10.9 | 15 | LIBOR (6 mos) Plus 110 bp. |
| Fiscal year 2000 (thru February 29, 2000): | | | | |
| Wabash National Finance Corporation | Capital Lease (173 Road Railers & Equipment). | 5.0 | 9 | 6.0 percent |
| The Fuji Bank, LTD and MBK Rail Finance Corp. (of Japan). | AEM-7 Rebuild (additional draws). | 4.5 | 3 | LIBOR (6 mos) Plus 110 bp. |
| Kreditanstalt für Wiederaufbau und Bayerische Landes bank. | Richmond Static Frequency Converters (additional draws). | 5.5 | 15 | LIBOR (6 mos) Plus 110 bp. |
| Export Development Corp. & MBK Rail Finance Corporation (of Japan). | High-speed Trainsets (additional draws). | 39.6 | 15 | LIBOR (6 mos) Plus 75 bp. |
| Export Development Corp. & MBK Rail Finance Corporation (of Japan). | High-speed Trainsets (additional draws). | 1.8 | 20 | LIBOR (6 mos) Plus 75 bp. |

FISCAL YEAR 2001 FUNDING WITH EXPANDED DEFINITION

Question. If the Federal Transit Administration's expanded capital definition were applied to Amtrak capital, what is the maximum amount of the \$521,000,000 in fiscal year 2001 request that could be used for: maintenance of equipment, maintenance of facilities and maintenance of way?

Answer. Amtrak's business plan projects that it will use the expanded capital definition to fund approximately \$242 million of maintenance of equipment, maintenance of facilities and maintenance of way expenses from the capital grant that would otherwise be funded from operating revenues.

DOT VS. ARC BUDGET REQUEST

Question. What was the funding request sent to OMB for the Amtrak Reform Council? What is the ARC's own request for funds in fiscal year 2001.

Answer. The ARC proposed a request of \$1.4 million to OMB.

AMTRAK REFORM COUNCIL STAFFING

Question. How many full time staff are currently at the Amtrak Reform Council? How many staff are represented in the funding level requested in the 2001 budget? Are the costs associated with the 2000 and 2001 cost of living increases (4.4 percent and 4.5 percent respectively) reflected in the budget request? Is there any provision for locality pay and benefit adjustments?

Answer. The Amtrak Reform Council is an independent agency. The Department has no role in developing, reviewing, or approving their budget requests or staffing plans. Questions such as this should be directed to the Council. To the best of our knowledge, the Amtrak Reform Council has five employees on board. The fiscal year 2001 budget includes funding for 5 positions. Cost of living expenses for fiscal years 2000 and 2001 are reflected in the budget request, as well as the locality pay and benefit adjustments.

AMTRAK REFORM COUNCIL SUPPORT COSTS

Question. What level of funding is assumed in the request for travel and meeting costs?

Answer. A total of \$980,000 is requested in fiscal year 2001 for the Amtrak Reform Council (ARC); of which \$32,000 is for travel. We do not know how much is for meeting costs. This question should be directed to the ARC.

QUESTIONS SUBMITTED TO THE FEDERAL TRANSIT ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR RICHARD C. SHELBY

TEA-21 PROGRAM GUARANTEES

Question. Do any of your fiscal year 2001 transit program budget requests differ from the guaranteed levels in TEA-21? If so, please outline the guaranteed program

funding levels, and show the proposed increase request. Why has the administration requested increased funding levels in these programs?

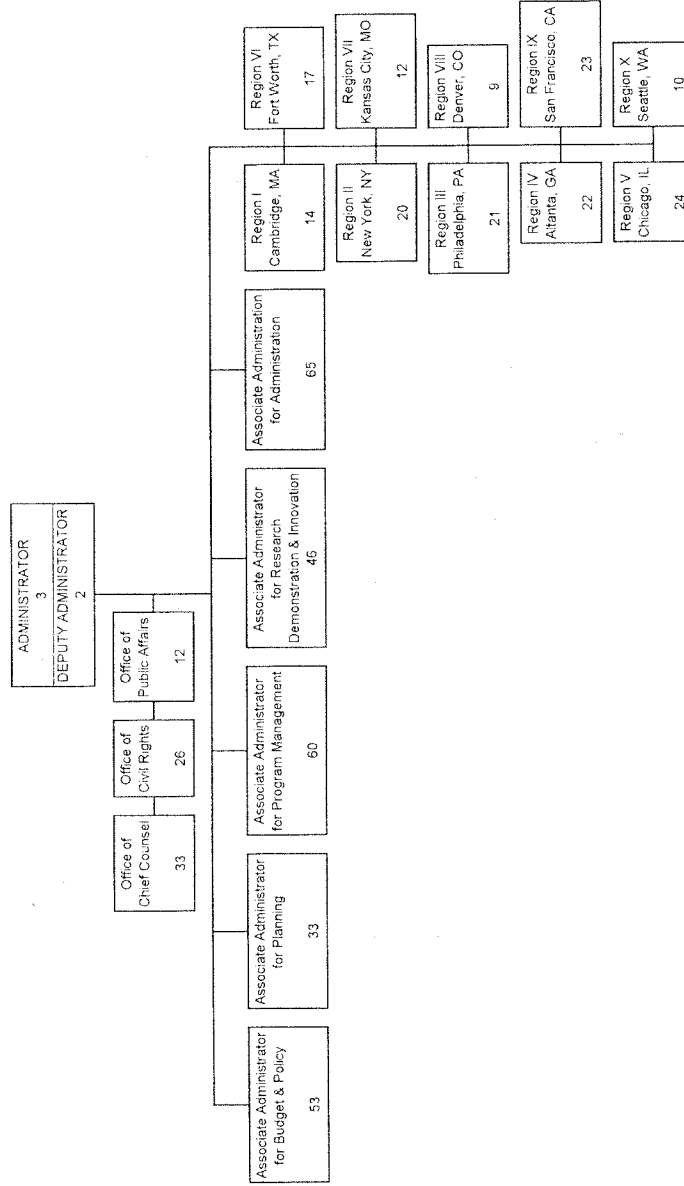

Answer. The only program FTA requests above the TEA-21 Guaranteed level is the Job Access and Reverse Commute Program. For this program FTA requests the full authorized level of \$150 million. The guaranteed level for this program in fiscal year 2001 is \$100 million, therefore FTA requests \$50 million in addition to fully fund the program. The administration requests these additional funds as part of the redistribution of realigned budget authority (RABA) made available under the Federal-aid Highway program. This program is a priority of the administration and is critical to the success of Welfare Reform.

ADMINISTRATIVE EXPENSES

Question. Please prepare an organizational chart for the Federal Transit Administration, showing the office structure and regional office locations, as well as the current number of FTEs currently assigned to each office.

Answer. The following table provides current Federal Transit Administration organizational chart information:

FEDERAL TRANSIT ADMINISTRATION Authorized Statistics

Question. Please break out Administrative Expenses by activity and sub-activity. Prepare a table showing fiscal year 1999 funding for each activity, fiscal year 2000 funding estimated, and fiscal year 2001 funding request.

Answer. The following chart shows fiscal year 1999, fiscal year 2000 and fiscal year 2001 Administrative Expenses by activity/sub-activity:

FEDERAL TRANSIT ADMINISTRATION—ADMINISTRATIVE EXPENSES

[In thousands of dollars]

| Activity/sub-activity | Fiscal year | | |
