

A000931 (Padovan sequence) W. Lang, Jun 21 2010 (revisited and corrected, Oct 30 2018)

I was led to consider the Padovan sequence by a paper sent to me by A. Farina (June 11 2010): "Expressing stochastic filters via number sequences", A. Capponi, A. Farina, C. Pilotto, Signal Processing 90 (2010) 2124-2132.

$p(n)=A000931(n+3)$, $n \geq 1$, is the number of partitions of the numbers $\{1,2,3,\dots,n\}$ into lists of length two or three containing neighboring numbers. The 'or' is inclusive. For $n=0$ one takes $p(0)=1$. Call the number of these lists s_2 and s_3 , respectively, where s_2 and s_3 are nonnegative integers. More precisely: s_3 from $\{0,1,\dots,\text{floor}(n/3)\}$ and s_2 from $\{0,1,\dots,\text{floor}((n-s_3*3)/2)\}$. The number of solutions of $n=3*s_3 + 2*s_2$ is $A103221(n)$, $n \geq 0$, the number of partitions of n consisting of parts 2 or 3 only. Note that $A103221(0)=1$ from the trivial solution. E.g., $A103221(8)=2$ from the two solutions $s_3=2, s_2=1$ and $s_3=0$ and $s_2=4$, corresponding to the partitions $(3,3,2)$ and $(2,2,2,2)$ of 8.

Examples for the $p(n)$ combinatorics:

| | | |
|-----------|-----------------------------------|--|
| $p(1)=0$ | because there is no solution, | |
| $p(2)=1$ | from $s_3=0, s_2=1$ and the list | [1,2], |
| $p(3)=1$ | from $s_3=1, s_2=0$ and the list | [1,2,3], |
| $p(4)=1$ | from $s_3=0, s_2=2$ and the lists | [1,2][3,4], |
| $p(5)=2$ | from $s_3=1, s_2=1$ and the lists | [1,2,3][4,5] and [1,2][3,4,5] |
| $p(6)=2$ | from $s_3=2, s_2=0$ and the lists | [1,2,3][4,5,6] and |
| | from $s_3=0, s_2=3$ and the lists | [1,2][3,4][5,6] |
| $p(7)=3$ | from $s_3=1, s_2=2$ and the lists | [1,2,3][4,5][6,7], [1,2][3,4,5][6,7], [1,2][3,4][5,6,7] |
| $p(8)=4$ | from $s_3=2, s_2=1$ and the lists | [1,2,3][4,5,6][7,8], [1,2][3,4,5][6,7,8], [1,2,3][4,5][6,7,8] and |
| | from $s_3=0, s_2=4$ and the lists | [1,2][3,4][5,6][7,8] |
| $p(9)=5$ | from $s_3=3, s_2=0$ and the list | [1,2,3][4,5,6][7,8,9] and |
| | from $s_3=1, s_2=3$ and the lists | [1,2,3][4,5][6,7][8,9], [1,2][3,4,5][6,7][8,9], [1,2][3,4][5,6,7][8,9], [1,2], [3,4][5,6][7,8,9], |
| $p(10)=7$ | from $s_3=2, s_2=2$ and the lists | [1,2,3][4,5,6][7,8][9,10], [1,2,3][4,5][6,7,8][9,10], [1,2,3][4,5][6,7] [8,9,10], [1,2][3,4,5][6,7,8][9,10], [1,2][3,4,5][6,7][8,9,10], [1,2][3,4][5,6,7][8,9,10], and |
| | from $s_3=0, s_2=5$ and the list | [1,2][3,4][5,6][7,8][9,10] . |

etc.

Note: this is a special case of the so called (general) Morse-code polynomials. In this case only s_3 3-lines (of length 2, written in the following as a double-dash --, for 3 neighboring points) or s_2 2-lines (of length 1, written as a dash -, for 2 neighboring points) in a row of n points are admitted.

Because the recurrence for $p(n)$ has no $p(n-1)$ term, there are no dots (1-lines of length 0). The classical Morse case with only dots and 2-lines of length 1 (dashes) shows up for Fibonacci type recurrences.

E.g., the $p(8) = 4$ codes for $n=8$ are: -- -- -, - - - -, -- - -, and - - - -. The numbers 1,...,8 are put at the borders of the dashes, e.g., 1-2-3 for the first double dash, or 4-5 for a second dash, etc.

Because of this combinatorial interpretation the sequence

$$p(n) = 0 \cdot p(n-1) + 1 \cdot p(n-2) + 1 \cdot p(n-3) \text{ with inputs } p(-2)=0, p(-1)=0, \text{ and } p(0)=1$$

is the fundamental sequence. As mentioned above $p(n) = A000931(n+3) = [1, 0, 1, 1, 1, 2, 2, 3, 4, 5, 7, 9, 12, 16, \dots]$.

The o.g.f. $P(x) = \sum(p(n) \cdot x^n, n=0..infy) = 1/(1-x^2-x^3)$, also showing that this is the fundamental sequence.

###

$a(a,b;n)$ Padovan sequences:

The sequence $a(n) = a(n-2) + a(n-3)$ with input $a(-2)=a, a(-1)=b, \text{ and } a(0)=1$ (hence $a(1)= a+b, a(2)= b+1$) is

$$a(n) = a(a,b;n) = p(n) + (a+b) \cdot p(n-1) + b \cdot p(n-2).$$

Therefore, $A000931(n) = a(1, -1 ;n) = p(n) - p(n-2) = p(n-3) = [1, 0, 0, 1, 0, 1, 1, 1, 2, 2, 3, 4, \dots], n \geq 0.$

Similarly, $A000931(n+5) = a(1,0;n) = p(n) + p(n-1) = p(n+2) = [1, 1, 1, 2, 2, 3, 4, 5, 7, 9, \dots], n \geq 0,$

also $A007307(n+1) = a(2,0;n) = p(n) + 2 \cdot p(n-1) = p(n+2) + p(n-1) = [1, 2, 1, 3, 3, 4, 6, 7, 10, 13, \dots], n \geq 0,$

also $A00931(n+7) = a(1,1;n) = p(n) + 2 \cdot p(n-1) + p(n-2) = p(n+4) = [1, 2, 2, 3, 4, 5, 7, 9, 12, 16, 21, \dots], n \geq 0,$

also $A141038(n+1) = a(-1,2;n) = p(n) + p(n-1) + 2 \cdot p(n-2) = p(n+3) + p(n-2) = [1, 1, 3, 2, 4, 5, 6, 9, 11, 15, 20, \dots], n \geq 0.$

also $A084338(n+1) = a(0,2;n) = p(n) + 2 \cdot (p(n-1)+p(n-2)) = p(n) + 2 \cdot p(n+1) = p(n+3) + p(n+1) = [1, 2, 3, 3, 5, 6, 8, 11, 14, 19, 25, 33, 44, \dots], n \geq 0.$

etc.

General input case: $a(a,b,c;n)$ Padovan sequences:

$a(n) = a(n-2) + a(n-3)$ with input $a(-2)=a, a(-1)=b, \text{ and } a(0)=c$ (hence $a(1)= a+b, a(2)= b+c$) is

$$a(n) = a(a,b,c;n) = c \cdot p(n) + (a+b) \cdot p(n-1) + b \cdot p(n-2),$$

with $p(n) := a(0, 0, 1; n)$.

The o.g.f. is $P(a, b, c; x) = (c + (a+b)x + b^2x^2)/(1-x^2-x^3)$.

Therefore the Perrin sequence $A001608(n) = a(1, -1, 3; n) = 3p(n) - p(n-2) = 2p(n) + p(n-3) = [3, 0, 2, 3, 2, 5, 5, 7, 10, 12, 17, 22, 29, 39, 51, 68, 90, 119, 158, 209, 277, \dots]$, $n \geq 0$,

with o.g.f. $P(1, -1, 3; x) = (3-x^2)/(1-x^2-x^3)$.

#####

Generalized (A,B)-Padovan sequences with general input: $a(A, B; a, b, c; n)$ (June 24, 2010)

$a(n) = Aa(n-2) + Ba(n-3)$ with input $a(-2)=a$, $a(-1)=b$, and $a(0)=c$ (hence $a(1) = A^2b + B^2a$, $a(2) = A^2c + B^2b$) is

$a(n) = a(A, B; a, b, c; n) = c^2p(A, B; n) + (A^2b + B^2a)p(A, B; n-1) + B^2b^2p(A, B; n-2)$.

with $p(A, B; n) := a(A, B; 0, 0, 1; n)$.

The o.g.f. is $P(A, B; a, b, c; x) = (c + (A^2b + B^2a)x + B^2b^2x^2)/(1-A^2x^2-B^2x^3)$, especially $1/(1-A^2x^2-B^2x^3)$ for $p(A, B; n)$.

#####

Instances:

(2,1)-Padovan: $P(2, 1; a, b, c; x) = (c + (2b + a)x + b^2x^2)/((1-x-x^2)(1+x))$.

$(a, b, c) = (0, 0, 1)$: $A008346(n) = \text{Fibonacci}(n) + (-1)^n$.

$(a, b, c) = (0, 1, 0)$: $A008346(n+1)$, $n \geq 0$.

$(a, b, c) = (1, 0, 0)$: $A008346(n-1)$, $n \geq 0$, with $\text{Fibonacci}(-1) = 1$.

$(a, b, c) = (1, 0, 1)$: $A000045(n+1) = \text{Fibonacci}(n+1)$.

$(a, b, c) = (0, 1, 1)$: $A000045(n+2) = \text{Fibonacci}(n+2)$.

$(a, b, c) = (1, 1, 0)$: $[0, 3, 1, 6, 5, 13, 16, 31, 45, 78, 121, 201, 320, 523, \dots]$.

$(a, b, c) = (1, 1, 1)$: $A066983(n+3)$, $n \geq 0$.

$(a, b, c) = (1, -1, 1)$: $A033999(n) = (-1)^n$.

etc.

(1,2)-Padovan:

(a,b,c)=(0,0,1): A052947(n); (a,b,c)=(0,1,0): A052947(n+1); (a,b,c)=(1,0,0): 2*A052947(n-1) .

(a,b,c)=(1,0,1): A052947(n+2); (a,b,c)=(0,1,1): A159284(n+2); n>=0.

(a,b,c)=(1,1,0): [0,3,2,3,8,7,14,23,28,51,74,107,176,255,390,607,900,1387,2114,3187,4888,...]

(a,b,c)=(1,1,1): A159284(n+3) .

(a,b,c)=(1,-1,1): A078026(n+2).

etc.

#####

Factorization of the type $(1 - A*x^2 - B*x^3) = (1 - al*x - (A-al^2)*x^2)*(1 + al*x)$ (June 28 2010).
Input al (alpha) and A with $B = (A-al^2)*al$.

Special case i)

$A = 3*(al/2)^2$ and $B = -2*(al/2)^3$ with $((1 - (1/2)*al*x)^2)*(1 + al*x) = 1 - (3/4)*(al*x)^2 + (1/4)*(al*x)^3$
with partial fraction decomposition for the o.g.f.

$Pfrac(3*(al/2)^2, -2*(al/2)^3, x) := (3/(1 - al*x/2)^2 + 2/(1-al*x/2) + 4/(1 + al*x))/9$ leading to

$p((3/4)*al^2, -(1/4)*al^3; n) = ((3*n+5 + (-2)^(n+2))*al^n)/9$.

E.g., $al=2$: $p(3, -2; n) = A077898(n)$.

Special case ii)

$A = 3*al^2$ and $B = 2*al^3$ with $(1 - 2*al*x)*(1 + al*x) = 1 - 3*(al*x)^2 - 2*(al*x)^3$
with the partial fraction decomposition for the o.g.f

$Pfrac(3*al^2, 2*al^3, x) := (4/(1-2*al*x) + 2/(1+al*x) + 3/(1+al*x)^2)/9$ leading to

$p(3*al^2, 2*al^3; n) = ((3*n+5 + 2^(n+2))*al^n)/9$.

E.g., $a_1=1$: $p(3,2;n) = A053088(n)$, $n \geq 0$.

Other cases iii) a_1 and A (not related like in case i) or case ii)) as input with $B = (A - a_1^2) \cdot a_1$.

$(1 - A \cdot x^2 - B \cdot x^3) = (1 - a_1 \cdot x - (A - a_1^2) \cdot x^2) \cdot (1 + a_1 \cdot x)$ with the partial fraction decomposition for the o.g.f.

$$\text{Pfrac}(A, (A - a_1^2) \cdot a_1; x) := (((A - 2 \cdot a_1^2) - a_1 \cdot (A - a_1^2) \cdot x) / (1 - a_1 \cdot x - (A - a_1^2) \cdot x^2) - (-a_1)^{(n+2)}) / (A - 3 \cdot a_1^2)$$

leading to

$$p(A, (A - a_1^2) \cdot a_1; n) = ((A - 2 \cdot a_1^2) \cdot U(a_1, A - a_1^2; n) - a_1 \cdot (A - a_1^2) \cdot U(a_1, A - a_1^2; n-1) - (-a_1)^{(n+2)}) / (A - 3 \cdot a_1^2),$$
 with

$U(a_1, b; n)$ generated by the o.g.f. $GU(a_1, b; x) := 1 / (1 - a_1 \cdot x - b \cdot x^2)$ ((a_1, b) -Fibonacci/Chebyshev).

E.g., $a_1=1, A=2; B=1$; $(1 - 2 \cdot x^2 - x^3) = (1 - x - x^2) \cdot (1 + x)$; $\text{Pfrac}(2, 1; x) = x / (1 - x - x^2) + 1 / (1 + x)$;

$p(2, 1; n) = F(n) + (-1)^n = A008346(n)$, with the Fibonacci numbers $U(1, 1; n-1) = F(n) = A000045(n)$.

#####

For the explicit (Binet-de Moivre type) formula for (A, B) -Padovan sequences see below.

#####

(A, B) -Padovan combinatorics (June 28 2010)

For the case $(A, B) = (1, 1)$ (Padovan $A000931(n+3)$) see the beginning of this link.

The (generalized) Morse code uses only 3-lines of length 2, namely --, connecting three neighboring points, and 2-lines of length 1, namely - (dash), connecting two neighboring points. There are s_3 3-lines and s_2 2-lines, with s_3 and s_2 non-negative integers. If $n = 3 \cdot s_3 + 2 \cdot s_2$ then has no solution $a(A, B; n) = 0$.

Hence $s_2 = (n - 3 \cdot s_3) / 2$. Each of the s_3 3-lines receives a weight A , and each of the s_2 2-lines (dashes)

a weight B . $a(A, B; n)$ is the number of possible Morse codes of this special weighted type, namely

$a(A, B; n) = 0$ if $n = 3 \cdot s_3 + 2 \cdot s_2$, else

$$\sum((1/s_3!) \cdot ((n - 2 \cdot s_3 - 1 \cdot s_2)! / s_2!) \cdot (A^{s_2}) \cdot (B^{s_3}), s_3 = 0.. \text{floor}(n/3)), \text{ with } s_2 = s_2(n, s_3) := (n - 3 \cdot s_3) / 2.$$

E.g., $(A, B) = (2, 1)$ $a(2, 1; n) = A008346(n)$ (Fibonacci(n) + $(-1)^n$), $n=5$:

One solution of $5 = 3 \cdot s_3 + 2 \cdot s_2$: $s_3=1, s_2=1$ with the two codes -- - and - --, weighted each with $2^1 \cdot 1^1 = 2$, i.e.,

$$a(2, 1; 5) = 2 + 2 = 4.$$

#####

The explicit formula for $p(n)$ (analogon to the Binet- de Moivre formula for Fibonacci type sequences).
See also the formula for $A000931(n) = p(n-3)$ given by Keith Schneider. Here the formula is made explicit.

$$p(n) = (r^{n+2} + c \cdot z^n + cb \cdot zb^n) / (3r^2 - 1), \quad n \geq 0,$$

with the complex number $c := ((2r^2 - 1) + (r/s) \cdot I) / 2$ and its complex conjugate $cb = ((2r^2 - 1) - (r/s) \cdot I) / 2$, and the complex solution z to $x^3 - x - 1 = 0$. i.e., $z = e \cdot u + eb \cdot v$, with the complex number $e := (-1 + \sqrt{3} \cdot I) / 2$ and its complex conjugate $eb = -(1 + \sqrt{3} \cdot I) / 2$ (the two solutions to $x^2 + x + 1 = 0$) as well as the two solutions to $x^2 - x + 1/3 = 0$, namely $u^3 := (1 + \sqrt{69}) / 9$ and $v^3 := (1 - \sqrt{69}) / 9$.
 $r := u + v$ and $s := \sqrt{3} \cdot (u - v)$.

Some numbers which appear in this formula are approximately given by (10 digits, maple13):

$u: 0.9869912063, \quad v: 0.3377267510,$
The so called plastic number $r: 1.324717957, \quad s: 1.124559024, \quad r/s: 1.177988820, \quad 3r^2 - 1: 4.264632998.$
The complex coefficient $c: -.6623589787 + .5622795122 \cdot I, \quad c / (3r^2 - 1): -.1553144148 + .1318471044 \cdot I.$

#####

For the (A,B) -Padovan sequences $p(A,B;n)$, defined above, the analog explicit formulae for the case

$D(A,B) := (B^2) / 4 - (A/3)^3 > 0$ is:

$$p(A,B;n) = (r(A,B)^{n+2} + c(A,B) \cdot z(A,B)^n + cb(A,B) \cdot zb(A,B)^n) / (3r(A,B)^2 - A), \quad n \geq 0,$$

with the complex number

$c(A,B) := (2 \cdot (3r(A,B)^2 - A) - A) / 6 + (A \cdot r(A,B) / (2 \cdot s(A,B))) \cdot I$ and its complex conjugate

$cb(A,B) = ((2 \cdot (3r(A,B)^2 - A) - A) / 6 - (A \cdot r(A,B) / (2 \cdot s(A,B)))) \cdot I$ and

the complex solution z to $x^3 - A \cdot x - B = 0$. i.e., $z(A,B) = e \cdot u(A,B) + eb \cdot v(A,B)$, with the complex number $e := (-1 + \sqrt{3} \cdot I) / 2$ and its complex conjugate $eb = -(1 + \sqrt{3} \cdot I) / 2$ (the two solutions to $x^2 + x + 1 = 0$) as well as the two solutions to $x^2 - B \cdot x + (A/3)^3 = 0$, namely

$u(A,B)^3 := b/2 + \sqrt{D(A,B)}$ and $v(A,B)^3 := b/2 - \sqrt{D(A,B)}$, with $D(A,B)$ from above.

$zb(A,B)$ is the complex conjugate of $z(A,B)$ and

$r(A,B) := u(A,B) + v(A,B)$ and $s(A,B) := \sqrt{3} * (u(A,B) - v(A,B))$.

e.o.f.
