

***Call for White Papers,
Cadence Simulations,
& MAF Progress***

Lynne Jones

**SAC meeting
Feb 21, 2018**

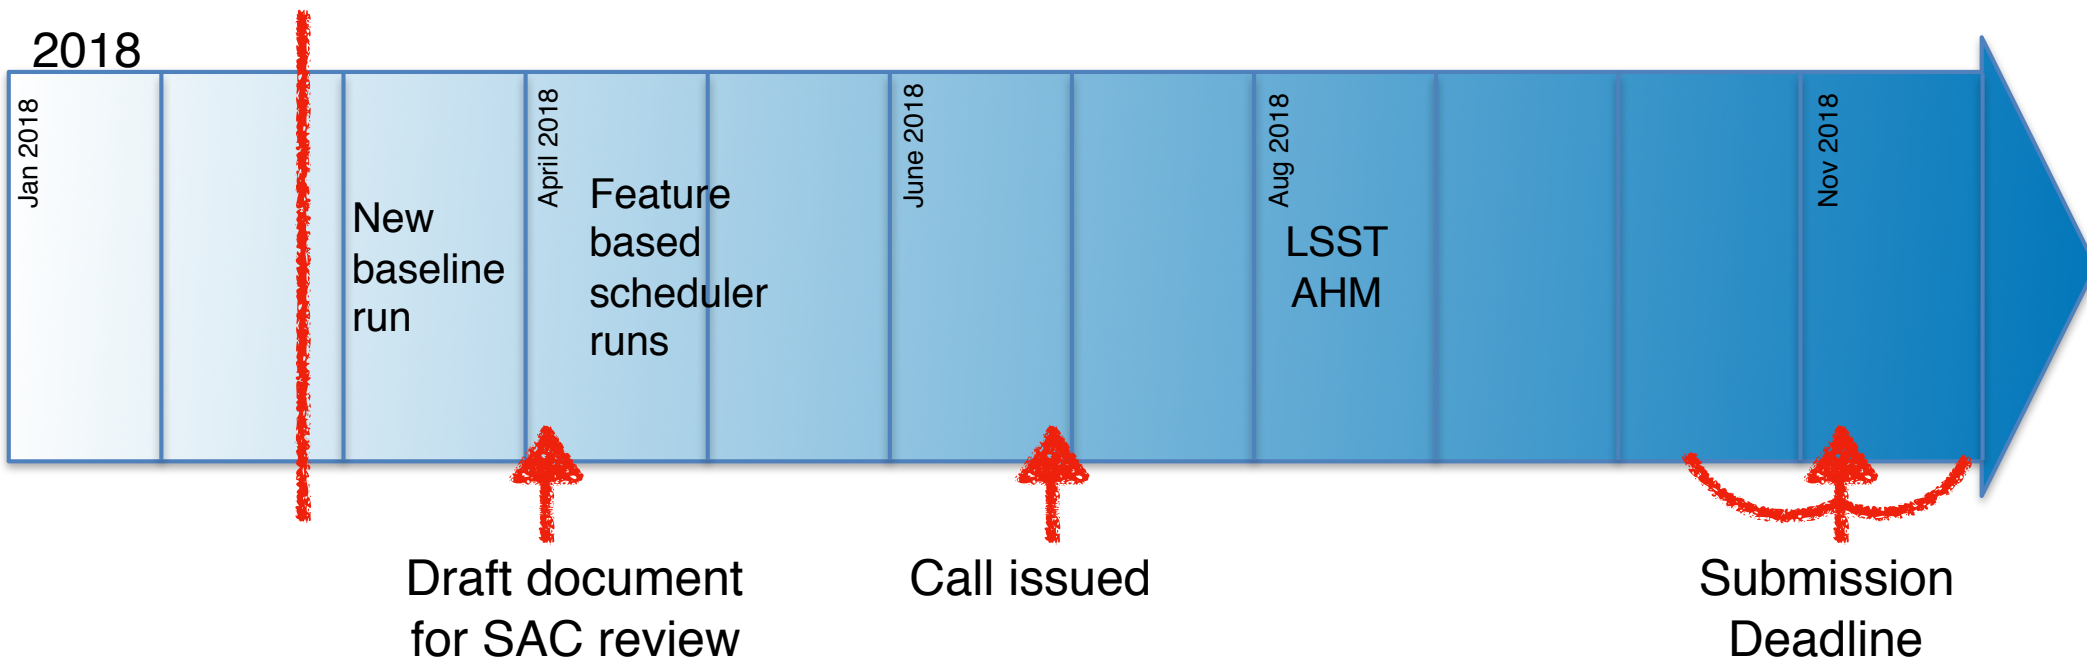

Call for white papers

- Combined call for white papers on deep drilling and mini survey strategies (as suggested by SAC)
- Call issued June 2018
- White paper deadline November 2018 +/- month

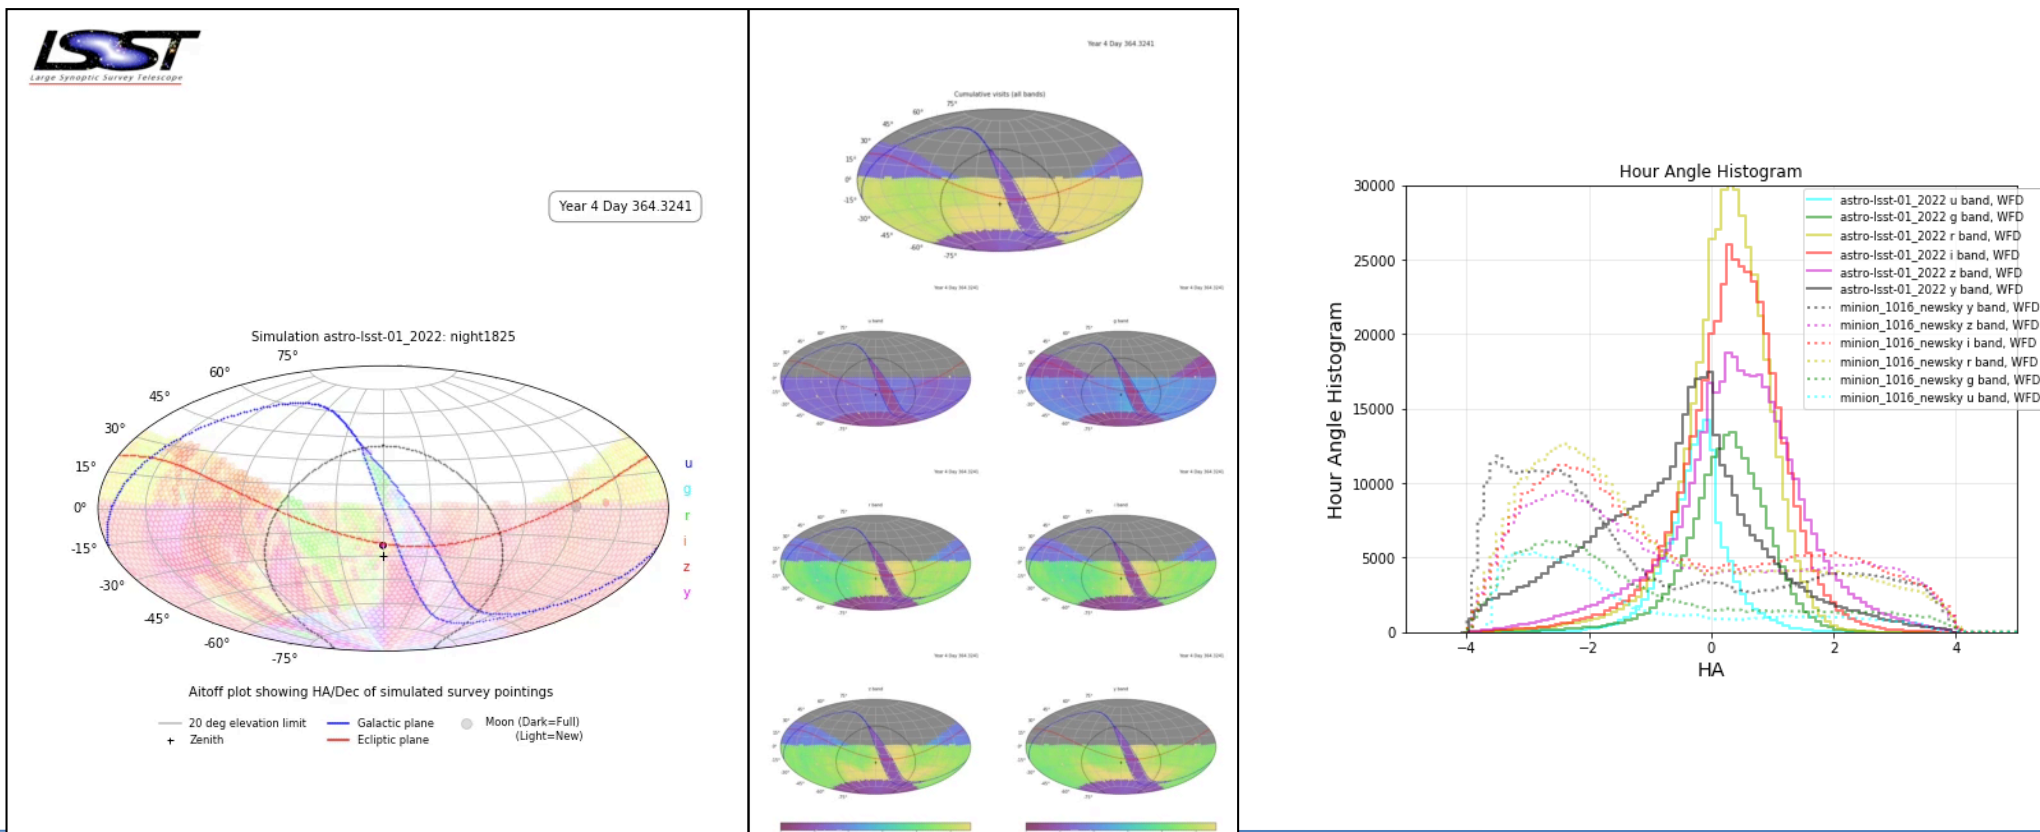

Cadence Simulations

- New baseline run with opsim v4 - “astro-lsst-01_2022”
- New sky brightness model, time balancing between proposals, and preference for observing near meridian
- MAF standard analysis @ <http://astro-lsst-01:8081>

Cadence Simulations

- Next: start work with the feature-based scheduler (see Tiago's talk)
- Baseline run
- Rolling cadence variations
- Deep drilling modifications (5 fields, 10 fields, faster cadence)
- Mini survey variations (WFD across galactic plane, no mini surveys)

MAF progress

- Run-to-run/runs comparison
- Additional abstractions to allow standard analysis scripts to run on v3 or v4 databases (or other non-standard database)
- Next:
 - Improvements in run/runs comparison
 - More documentation about available metrics / scripts
 - Deep-drilling specific analysis scripts
 - Additional metrics for time-dependent cadence evaluation

Questions for SAC

- Feedback on the call for white paper timeline
- Concerns about information included in the call?
- New opsim v4.1.0.10 baseline will be going to change control board within a few weeks; then we swap to feature-based scheduler. Any concerns with this process or timing?
- Feedback always welcome on MAF metrics for analysis

Additional Material

Call for white papers

- WIP - example of consolidating constraints:
- Also pointing, filter change, exposure, data processing & survey constraints

Survey constraints

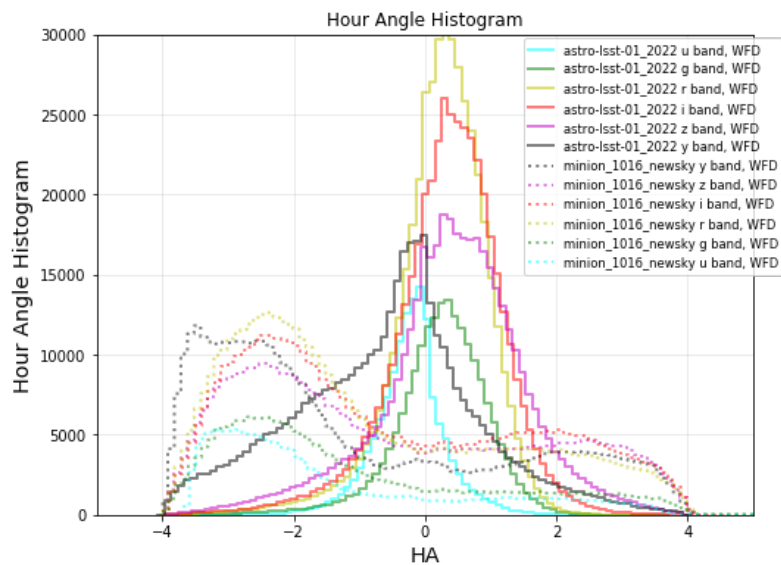

- The footprint for the WFD must be at least 18,000 sq degrees with 825 visits per field (per SRD requirements). The cadence for these observations is still flexible and rolling cadence options will be considered. There are metrics in MAF (the `f0Metric`) that will evaluate if the footprint/visit requirement is met.
- Proper motion and parallax requirements impose some requirements on the overall cadence of the WFD. For example, a sufficient time baseline is required for proper motion measurements, requiring visits to a given field to be spread over many years. There are metrics in MAF for proper motion and parallax that will signal if these requirements are met.
- Rapid revisit intervals, uniformly distributed on timescales between 40 seconds and 30 minutes, are required over at least 2000 sq degrees of the survey footprint. Note that these do not have to be consecutive visits, but this area must be sampled over these timescales over the lifetime of the survey. There are metrics in MAF regarding rapid revisits that will signal if this requirement is met.
- Deep drilling field positions. 4 of the potential deep drilling fields have been announced; these positions are fixed. The number of remaining deep drilling fields and their cadence of observations is still flexible.
- Minisurvey observations. The current baseline includes Deep Drilling, North Ecliptic Spur, Galactic Plane, and South Celestial Pole regions as minisurveys. There are many good reasons to include these regions, however their observation (or even, lack of observation) is flexible and part of the driver for this call for white papers.

Cadence Simulations

- New baseline run with opsim v4 - "astro-lsst-01_2022"

MAF progress

– Additional metrics for time-dependent cadence evaluation

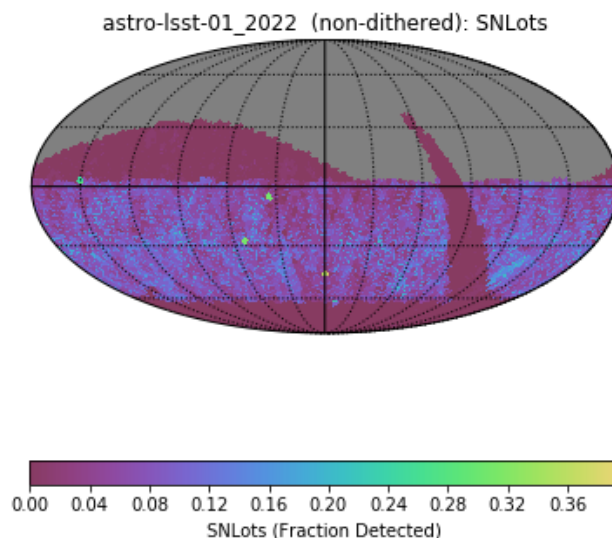

Intra-night

Heuristic-based science evaluation

Inter-night

MAF progress

- Documentation of MAF + metrics
 - Entry point <https://sims-maf.lsst.io>
 - Will add more higher-level information
 - List of all metrics <https://sims-maf.lsst.io/metricList.html>
 - Tutorial notebooks on MAF
 - Entry point @ https://github.com/LSST-nonproject/sims_maf_contrib/blob/master/tutorials/Index.ipynb
 - Will fold into sims-maf.lsst.io
 - Documentation of existing MAF analysis scripts
 - Need to write this and add to sims-maf.lsst.io
