This supplementary contains the following figures and tables:

SI Figure 1. The impact of removing Poaceae and Polypodiales from the taxon set on reconstructions of (a) mean temperature of the coldest month (MTCO, °C) and (b) growing degree days above a base level of 0°C (GDD0) during MIS 4 and MIS 5a. The red line (without P/P) is the reconstructed values once Poaceae and Polypodiales are removed. The comparison shows that removing these two taxa reduces anomalous peaks, where they were particularly abundant, but has little impact on the reconstructions for the rest of the samples.

SI Figure 2. Reconstructed mean temperature of the coldest month (MTCO, °C), growing degree days above a base level of 0°C (GDD0) and square root of the moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI) after CO₂ correction. This plot differs from Figure 5 in the main text because the reconstructions for all of the samples are shown, and we show the full uncertainties rather than the sample-specific (*v1, rioja*) uncertainties. The Marine Isotope Stages (MIS) and substages are shown by vertical dotted lines and labeled; we also show the transition interval between MIS 6 and MIS 5e. Red dots indicate the modern climate calculated from the elevation-corrected climate data from the Climate Research Unit (CRU) 2.0 data set.

SI Figure 3: Identification of reconstructed climate changes during selected Dansgaard-Oeschger and Heinrich events. Reconstructed mean temperature of the coldest month (MTCO, °C), growing degree days above a base level of 0°C (GDD0) and CO₂ corrected moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI). Only samples with a Hill's N2 biodiversity index >2 are plotted. The Marine Isotope Stages (MIS) and substages are shown by vertical dotted lines and labeled; we also show the transition interval between MIS 6 and MIS 5e. Red dots indicate the modern climate calculated from the elevation-corrected climate data from the Climate Research Unit (CRU) 2.0 data set.

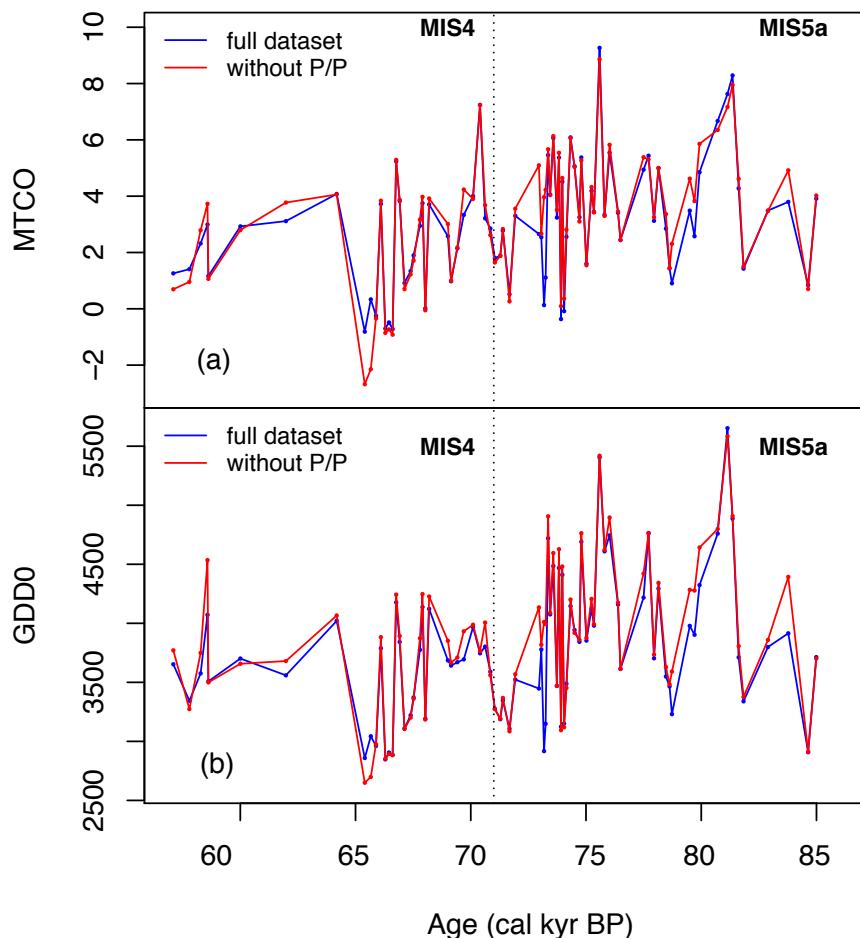

SI Table 1: Information on the 195 taxa from the SMPDS modern data set used in the TWA-PLS reconstructions, including the number of sites at which they occur and their taxonomic resolution.

SI Table 2: Leave-one-out cross-validated predictions of the weighted averaging-partial least squares (WA-PLS) regression models for 195 taxa (including Poaceae and Polypodiales). The P values are derived from a randomisation *t*-test. Selected components are marked in bold.

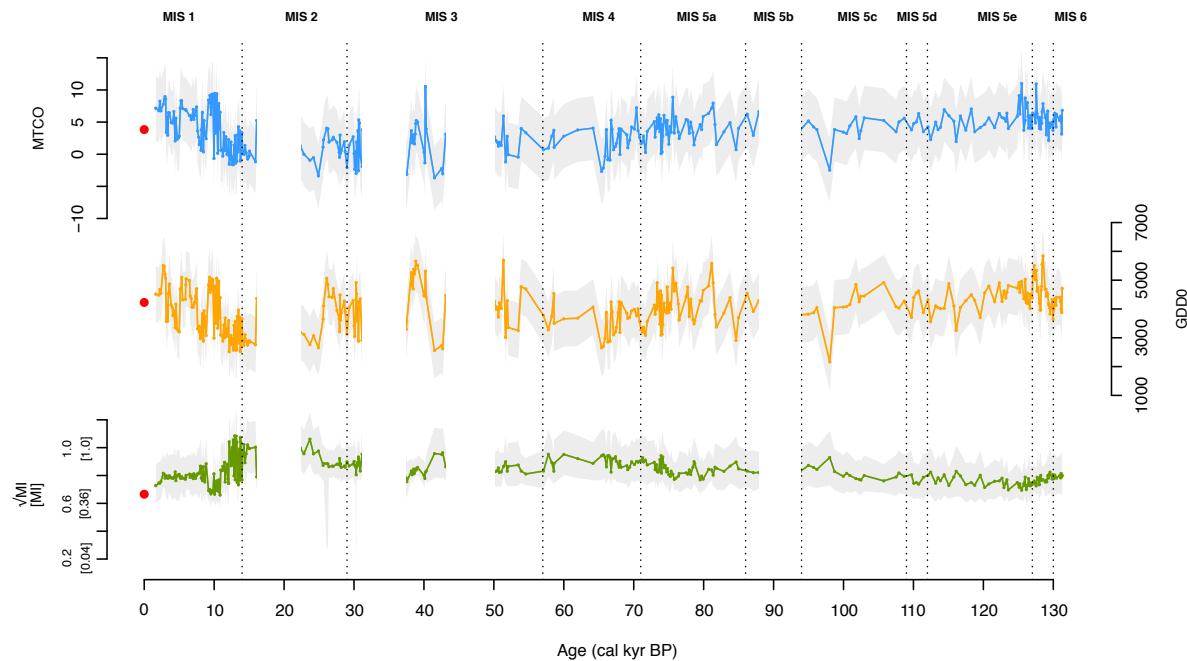

SI Table 3: Reconstructed mean temperature of the coldest month ($MTCO$, $^{\circ}C$), growing degree days above a base level of $0^{\circ}C$ (GDD_0) and the square root of the moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI) for each of the samples. We give the depth and age for each sample. For the reconstructions of \sqrt{MI} , we give values before and after the $[CO_2]$ correction. Only samples with a Hill's N2 biodiversity index >2 are listed. We include the sample-specific errors on the reconstructions based on V1 from the *rioja* package.

SI Table 4: Reconstructed average values of mean temperature of the coldest month ($MTCO$, $^{\circ}C$), growing degree days above a base level of $0^{\circ} C$ (GDD_0) and moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI) for Marine Isotope Stages (MIS) and substages, calculated from the interpolated yearly values of each variable. The transitional phase at the beginning of MIS 5 corresponding to the Zeifen-Kattegat Oscillation is labelled Zeifen in the column showing the Marine Isotopic Stages.

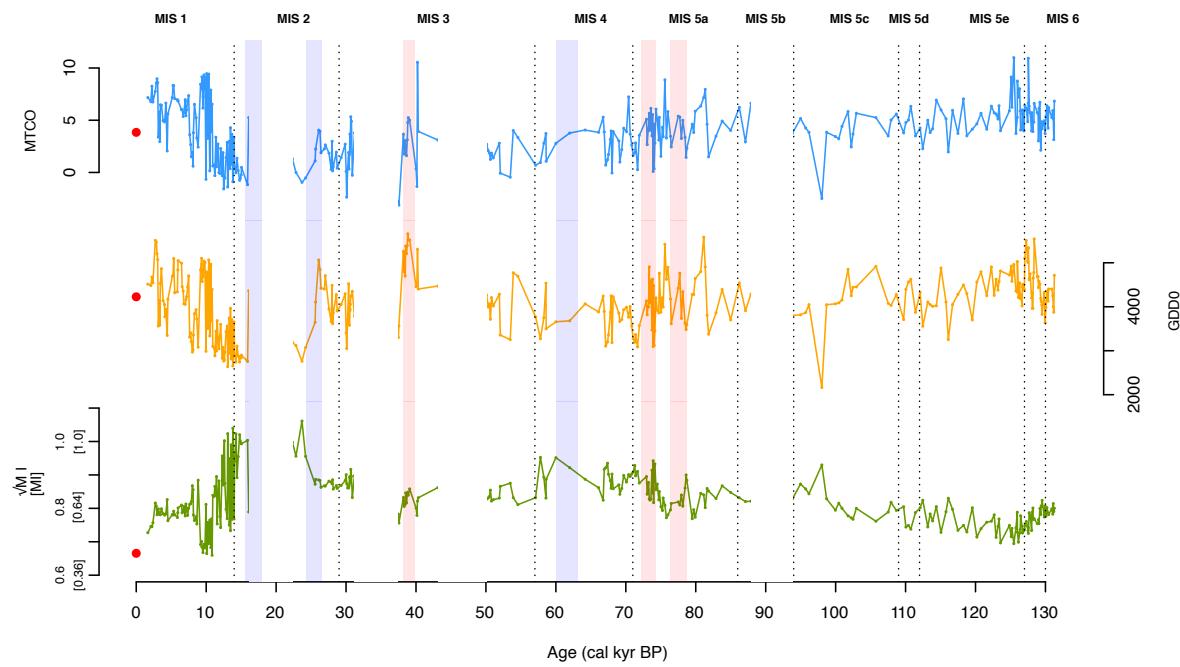

SI Figure 1. The impact of removing Poaceae and Polypodiales from the taxon set on reconstructions of (a) mean temperature of the coldest month (MTCO, °C) and (b) growing degree days above a base level of 0°C (GDD0) during MIS 4 and MIS 5a. The red line (without P/P) is the reconstructed values once Poaceae and Polypodiales are removed. The comparison shows that removing these two taxa reduces anomalous peaks, where they were particularly abundant, but has little impact on the reconstructions for the rest of the samples.

SI Figure 2. Reconstructed mean temperature of the coldest month (MTCO, °C), growing degree days above a base level of 0°C (GDD0) and square root of the moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI) after CO₂ correction. This plot differs from Figure 5 in the main text because the reconstructions for all of the samples are shown, and we show the full uncertainties rather than the sample-specific (*v1*, *rioja*) uncertainties. The Marine Isotope Stages (MIS) and substages are shown by vertical dotted lines and labeled; we also show the transition interval between MIS 6 and MIS 5e. Red dots indicate the modern climate calculated from the elevation-corrected climate data from the Climate Research Unit (CRU) 2.0 data set.

SI Figure 3: Identification of reconstructed climate changes during selected Dansgaard-Oeschger and Heinrich events. Reconstructed mean temperature of the coldest month (MTCO, °C), growing degree days above a base level of 0°C (GDD0) and CO₂ corrected moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI). Only samples with a Hill's N2 biodiversity index >2 are plotted. The Marine Isotope Stages (MIS) and substages are shown by vertical dotted lines and labeled; we also show the transition interval between MIS 6 and MIS 5e. Red dots indicate the modern climate calculated from the elevation-corrected climate data from the Climate Research Unit (CRU) 2.0 data set.

SI Table 1: Information on the 195 taxa from the SMPDS modern data set used in the TWA-PLS reconstructions, including the number of sites at which they occur and their taxonomic resolution.

SI Table 2: Leave-one-out cross-validated predictions of the weighted averaging-partial least squares (WA-PLS) regression models for 195 taxa (including Poaceae and Polypodiales). The P values are derived from a randomisation *t*-test. Selected components are marked in bold.

TWA-PLS component	RMSEP	r ²	P
MTCO			
1	5.51	0.67	0.001
2	5.4	0.7	0.009
3	5.97	0.64	1
4	6.55	0.6	1
GDD₀			
1	958.35	0.66	0.001
2	982.51	0.68	0.987
3	1091.43	0.65	1
4	1186.17	0.62	1
√MI			
1	0.49	0.45	0.001
2	0.48	0.52	0.001
3	0.49	0.5	1
4	0.51	0.46	1

SI Table 3: Reconstructed mean temperature of the coldest month (MTCO, °C), growing degree days above a base level of 0°C (GDD0) and the square root of the moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI) for each of the samples. We give the depth and age for each sample. For the reconstructions of $\sqrt{\text{MI}}$, we give values before and after the [CO₂] correction. Only samples with a Hill's N2 biodiversity index >2 are listed. We include the sample-specific errors on the reconstructions based on V1 from the *rioja* package.

Depth (cm)	Age (cal yr BP)	Mean temperature of the coldest month (°C)	Growing degree days above zero	Reconstructed $\sqrt{\text{MI}}$	Corrected $\sqrt{\text{MI}}$	Upper limit corrected $\sqrt{\text{MI}}$	Lower limit corrected $\sqrt{\text{MI}}$

SI Table 4: Reconstructed average values of mean temperature of the coldest month (MTCO, °C), growing degree days above a base level of 0° C (GDD₀) and moisture index (the ratio of annual precipitation to annual potential evapotranspiration, MI) for Marine Isotope Stages (MIS) and substages, calculated from the interpolated yearly values of each variable. The transitional phase at the beginning of MIS 5 corresponding to the Zeifen-Kattegat Oscillation is labelled Zeifen in the column showing the Marine Isotopic Stages.
