THE ENCYCLOPEDIA AMERICANA

Clarence Harbor, a bay on the west coast of Alaska. about 50 miles southeast of the Cape Prince of Wales. An Eskimo village is situated on the shore of the bay; and the United States government established a reindeer park nearby, with the intention of providing food for the natives.

Clarence Island, an island south of South America and west of Tierra del Fuego; lat. 54° 10′ S.; lon. 71° 20′ W. It is of rocky formation, and the coast is indented with numerous bays.

Clar'endon, Edward Hyde, EARL OF, English statesman: b. Dinton, Wiltshire, 18 Feb. 1608; d. Rouen, France, 9 Dec. 1674. He commenced his political career in 1640, when he was returned to Parliament. In this Parliament he argued in favor of a grant to the king, which was successfully opposed by Hampden. He was returned to the Long Parliament (November 1640) by the borough of Saltash, and laid aside his legal business to devote himself to his parliamentary duties. At first he acted with the more moderate of the popular party, but soon found reason to change his course. A dread of democracy seems first to have led him to oppose his former friends, but his speeches and votes soon attracted the notice of the court, into the favor of which he passed. He was offered the solicitor-generalship, which he declined, but agreed, at the king's request, to consult with his regular advisers, Falkland and Colepepper. Hyde was an honest and independent supporter of the royal authority, disposed to make moderate concessions to the popular demands, and in no way responsible for the rash measures of the king, which were often taken without consulting any of his advisers. Upon the breaking out of the civil war he attached himself to the king's party, became chancellor of the exchequer and member of the privy-council; and after vainly attempting to bring about a reconciliation between the contending parties, was appointed by the king to wait upon the Prince of Wales, who was first sent with an army to the west. Afterward, on the continued ill success of the royal party, he retired to Jersey. Here he remained for two years, while the prince was in France, and during that time began his 'History of the Rebellion.' He likewise composed at Jersey the various writings which appeared in the king's name as answers to the manifestoes of the Parliament. On the capture of the king, Hyde received orders to rejoin the Prince of Wales, but was becalmed and taken prisoner by pirates from Ostend. In September 1649 he rejoined Charles at The Hague, who sent him to Madrid to see if any assistance could be obtained from the Spanish court. On the failure of this negotiation he retired to Antwerp, but soon resumed the business of the exiled court, of which he continued to be the most trusted adviser, first at Paris, and afterward at The Hague, where Charles II. appointed him lord-chancellor of England in 1657. After Cromwell's death Edward Hyde contributed more than any other man to the success of the measures which placed Charles II. on the throne. He subsequently possessed the entire confidence of the king, who loaded him with favors. In 1661 he was made peer, and Baron Hyde, Viscount Cornbury, and Earl of Clarendon. Many events occurred to disquiet him in the licentious court of Charles II.; among these was the marriage of the Duke of York, the king's brother, to his daughter. The Duke, while at Breda, the residence of his sister, the Princess of Orange, became acquainted with Anne Hyde, Clarendon's eldest daughter, maid of honor to the princess, and married her secretly 3 Sept. 1660 to legitimize their first child, born on 22 October. Anne was acknowledged as Duchess of York in December 1660, and two daughters, Anne and Mary, were the fruit of this marriage, both of whom ascended the British throne. In 1663 Lord Bristol made an attempt to impeach the chancellor in Parliament, which, though some of the acts of Clarendon's administration were questionable, proved unsuccessful. The Duke of Buckingham, moreover, was continually laboring to make the chancellor ridiculous in the eyes of the king, and his station as prime minister made the nation regard him as answerable for all the faults of the administration. The ill success of the war against Holland, the

sale of Dunkirk, and other events, excited public indignation. The king's displeasure was changed into hatred when he saw his plan of repudiating his wife and marrying Lady Stuart defeated by Clarendon, who effected a marriage between this lady and the Duke of Richmond. The king deprived him of his offices, and an impeachment for high treason was commenced against him. The lords refused to imprison him on a general accusation by the Commons. This gave rise to a dispute between the two houses, to end which Clarendon retired to Calais, leaving an exculpatory letter to the lords, which they communicated to the Commons, who ordered it to be burned by the common hangman. The lords still refused to join in his attainder, but agreed with the Commons in an act of banishment and incapacity. The hatred of the nation pursued him even to the Continent. At Evreux he was attacked by some British sailors, dangerously wounded, and with difficulty rescued from their hands. He lived six years at Montpellier, Moulins, and Rouen, at which latter place he died. His remains were afterward carried to England, and buried in Westminster Abbey. Lord Clarendon, as long as he was minister, was the friend and supporter of the king against the factious, and the defender of his country's freedom against the abuse of the royal power. Ingratitude and prejudice the more easily ruined him, as his stern and proud character prevented his gaining friends. Among his many writings, the most important is the 'History of the Rebellion, from 1641 Down to the Restoration of Charles II.' It is a very able work, although not free from prejudices. Consult Lister, 'Life of Lord Clarendon' (1838).

Clarendon, George William Frederick Villiers, 4TH EARL OF, English statesman: b. 12 Jan. 1800; d. 27 June 1870. By his mother Lord Clarendon was indirectly related to the Hydes, the family of the great Earl of Clarendon, author of the 'History of the Rebellion.' He was educated at Cambridge, entered the civil service at an early age, and in 1833 was appointed minister-plenipotentiary to the court of Madrid. He was instrumental in negotiating a treaty, signed in 1834, called the Quadruple Alliance, in which the four contracting parties — England, France, Spain, and Portugal — agreed to unite in expelling Don Carlos and Don Miguel, pretenders to the Spanish and Portuguese crowns, from the peninsula, and was subsequently much consulted by the Spanish government.

In 1839 Lord Clarendon, having succeeded during the previous year to his uncle's title, returned home to take his seat in the House of Lords. In January 1840 he was appointed lord privy-seal; and was lord-lieutenant of Ireland from May 1847 to February 1852. The most notable events of the period were the great Irish famine, and the rebellion headed by Smith O'Brien, M.P., which ended in the defeat of the rebels by the police, after months of threatening and systematic publication of sedition in the newspapers which espoused their cause. Lord Clarendon's administration in regard to both of these difficulties has been deemed by dispassionate observers both firm and philanthropic; but his early popularity somewhat declined in Ireland, which was perhaps due to his impartiality in declining to favor the zealots either of the Roman Catholic or the Orange party. He became secretary of foreign affairs in 1853, retaining office until 1858. During this period the Russian war was brought to a successful termination, and Lord Clarendon, in conjunction with Lord Cowley, the British ambassador at Paris, conducted the peace negotiations at Paris as joint-plenipotentiary of Great Britain, and signed the Treaty of Paris 30 March.

In 1861 Lord Clarendon was sent as ambassador-extraordinary to the coronation of the king of Prussia; in 1868 was sent on a special mission to the Pope and the king of Italy. In the ministry of Mr. Gladstone, which succeeded Mr. Disraeli's, Lord Clarendon again occupied the post of foreign secretary, and continued in office till his death.

For the office of foreign secretary, which he held so long, Lord Clarendon was generally admitted to possess high qualifications; but it was complained, even by his admirers, that he adhered too long to the tradition of secrecy attaching to the foreign office. As a statesman he was remarkable rather for a liberality and largeheartedness, which gave a conciliatory tone to his negotiations with foreign powers, and for the undeviating rectitude of his conduct, than for any commanding qualities of intellect.

Clarendon, Ark., town, county-seat of Monroe County, situated on the White River, on the St. Louis & S., and the Arkansas M. R.R.'s, 58 miles southeast of Little Rock. It is a trade centre for lumber and agricultural products. The manufacturing of wagons, staves, and other articles of wood supplies the local demands. Pop. 2,000.

Clarendon, England, a lodge in Wiltshire, near Salisbury. It is noted chiefly for being the place where were written, in 1164, the 'Constitutions of Clarendon,' defining the limits between the jurisdiction of the civil and ecclesiastical courts. Henry II. called together the bishops and barons of his kingdom, and they held council at Clarendon.

Clarendon, Vt., a town in Rutland County, on the Rutland R.R., noted for its medicinal springs, the waters of which are of value in the treatment of kidney, liver, and skin diseases. Its industries are fruit-raising, dairying, and maple-sugar making. Pop. (1900) 911.

Clarendon, Colony of. This title represents a repeated effort to found the settlement near the mouth of Cape Fear River, N. C., later flourishing as Wilmington. If successful from the outset, it would have been a counterpart of Albemarle (N. C.), and Ashley River (S. C.), and very likely given us a State of Middle Carolina under some name. The first colony was of New Englanders, in 1660: they had trouble with the Indians and abandoned the place by 1663, leaving a post with a placard on it highly disparaging to the region. Early in October 1653, however, the river was explored for 150 miles by Sir John Yeamans, a Cavalier adventurer from Barbadoes. He was delighted with the country, cared nothing for other people's opinions of it, and asked the lords proprietors of Carolina for a grant. They gave it, made him governor of it, and in May 1665 he returned with several hundred settlers from Barbadoes. But Yeamans had wider interests, and could not stay with the colony — from 1672 to 1674 he was governor of Carolina; trade was insufficient

for more than the northernmost and southernmost settlements; and Clarendon (so named from the famous Lord Clarendon, one of the proprietors) was gradually abandoned, ending with 1690.

Clarendon, Constitutions of, a code of laws adopted in the 10th year of Henry II. (1164), at a council of prelates and barons held at the village of Clarendon, in Wiltshire, in January of that year. These laws, finally digested into 16 articles, were brought forward by the king as "the ancient customs of the realm," and were enacted as such by the council. They consisted, however, partly at least, of reforms introduced by the king himself. Ten of the articles were condemned, and six allowed by Pope Alexander III. The six articles approved of were of comparatively slight importance, mostly confirming the privileges of the ecclesiastical order; among the condemned articles the most important were the first, providing that disputes between laymen and ecclesiastics as to advowsons should be tried in the king's court; third, that ecclesiastics accused of any offense against justice should be answerable to the civil courts for the civil offense, and to the ecclesiastical courts for the ecclesiastical offense; fourth, that ecclesiastical dignitaries should not go out of the kingdom without the king's leave; eighth, that appeals should be made from the court of the archbishop to the king's court, and should not go further (that is, to the Pope) without the king's consent; ninth, that in the event of a dispute between a layman and an ecclesiastic as to whether the civil or ecclesiastical court should have jurisdiction in certain cases of tenure of property, the tribunal should be determined by the king's chief justice upon a recognition of 12 lawful men; 12th, that pleas of debt should belong to the king's jurisdiction. Notwithstanding the entreaties of the other prelates, and in defiance of the king, Becket, after a momentary appearance of yielding, peremptorily refused his signature to the articles. After the murder of the archbishop, the king, on his reconciliation with the Pope in 1172, was compelled to promise the abolition of all laws and customs hostile to the clergy; and at the Council of Northampton in 1176 the constitutions of Clarendon were materially modified in favor of the ecclesiastical order.

Clarendon Press, Oxford, the name by which the press of the University of Oxford is distinguished. In January 1586 delegates *de impressione librorum* were appointed by the Convocation of the University. About this time Joseph Barnes was styled "Printer to the University," and others bore the title after him. In 1633 Archbishop Laud procured letters patent granting a large license in printing to the university, with a view to the publication of manuscripts from the Bodleian Library. The work was carried on from 1713 to 1830 in the building known as the Clarendon, the cost of which was defrayed partly from the sale of Lord Chancellor Clarendon's 'History of the Rebellion,' the copyright of which was given to the university. The management of the printing-office is committed to a board consisting of the vice-chancellor and 10 other members of Convocation, nominated by the vice-chancellor and proctors, as vacancies occur. Five are perpetual delegates, and five are nominated for a term of seven years. The south side of the present building (the additional accommodation required and opened) is appropriated to the printing of Bibles and prayer-books. The north, called the "learned" or "classical" side is assigned for the printing of university documents, books printed by authority of the delegates, and those sent in by private authors and publishers. Those printed for the university itself (but no others) bear on the imprint "E Typographeo Clarendoniano," or "At the Clarendon Press." Some admirable specimens of typography have been produced by the Clarendon Press.

Clarens, klä-räṅ, Switzerland, in the canton of Vaud, on the northeastern coast of Lake Geneva, about 50 miles from Geneva. The healthfulness of the climate, and the beauty of the place make it a resort for invalids. Tourists often visit it, for its being the scene of Rousseau's 'Nouvelle Héloise.'

Clares, Poor. See POOR CLARES.

Claret, a name originally given to wines of a light-red color, but now applied to the red wines imported from France, chiefly from Bordeaux. These wines vary in composition according to the locality, season, and age, but the produce of each vineyard usually retains its own peculiar characteristics. The most esteemed are those produced at the vineyards of Lafitte, Latour, Chateau Margaux, and others. Many of the clarets formerly sold in the United States were nothing more than the *vin ordinaire* used by the French peasants and working classes, but since the development of the California grape industry as good domestic claret can be obtained here as anywhere. A genuine claret should contain from 16 to 20 per cent of proof spirit.

Fictitious clarets were sometimes prepared by mixing a rough cider with a cheap French wine, and coloring with cochineal, logwood, elderberry, hollyhock, indigo, litmus, red cabbage, beet-root, or ros-aniline. To detect these coloring matters the following method may be adopted: Make a jelly by dissolving five grams of gelatine in 100 cubic centimeters of warm water, and pour it into a square flat mold. From this cake of jelly cubes about three fourths of an inch square are cut with a sharp, wet knife, and are immersed in the wine; they are taken out after 24 to 48 hours, washed slightly, and sections cut in order to see how far the coloring matter has penetrated. If the wine is pure, the color will be confined to the edges of the slice, or will not have penetrated more than an eighth of an inch. The coloring matters mentioned above permeate rapidly, and color the jelly.

Claretie, Arsène Arnaud, är-sān är-nō klăr tē, called **Jules,** zhül, French novelist and dramatist: b. Limoges 3 Dec. 1840. He has written a long series of very successful novels, the most noteworthy of them being: 'Madeleine Bertin' (1868); 'The Million' (1882); 'Monsieur the Minister' (1882); 'Noris, Manners of the Time' (1883); 'The American Woman' (1892). He wrote also some striking chapters of contemporary history, as 'The Revolution of 1870–1'; 'Paris Besieged'; 'Five Years After: Alsace and Lorraine Since Annexation.' His dramatic compositions relate mostly to the time of the great Revolution. He

became administrator of the Comédie Française in 1885, and was chosen member of the Academy in 1888.

Clar'ibel. (1) The bride of Phaon, as told in Spenser's 'Faerie Queene.' Philemon endeavors to injure her by false stories to which Phaon gives credit and kills Claribel. When he learns the deception he murders Philemon. (2) A poem by Tennyson.

Claribel, Sir, a knight who figures in Spenser's 'Faerie Queene.' One of four knights who fight for the false Florimel. Bretomart enters the combat with them; Arthur ends the fray, or it is "stinted" by him.

Clarification, the separation of the insoluble particles that prevent a liquid from being transparent. It may be performed by depuration, filtration, or coagulation. In the first of these operations the liquid is permitted to subside, without being in the least disturbed, until all the particles which were in suspension are precipitated; it is then decanted. This mode of clarification can be used only when the substance operated on is in a large quantity, or is of a nature not to be altered during the time necessary to complete the operation, and when its specific gravity is less than that of the particles which render it turbid. Filtration is a process by which a liquid is strained through a body, the interstices of which are small enough to stop the solid particles contained in it. Filters of wool, linen, paper, powdered glass, sand, or charcoal, may be used, according as the liquid is more or less dense, or of a nature to operate upon any one of these bodies. Clarification by coagulation is performed with the assistance of albumen (as isinglass or white of eggs) added to the liquor for this purpose, which, by the action of heat, of acids, etc., becomes solid, forms a mass, and precipitates the extraneous substances. Clarification is also now commonly effected by centrifugal machines.

Clarinda, Iowa, city, county-seat of Page County; situated on the Nodaway River, and the Chicago, B. & Q. R.R.; and is 45 miles east of the Missouri River. It is surrounded by an agricultural and stock-raising country, and contains carriage factories, brick works, flour-mills, iron works, and two banks. Valuable coal beds are near the city; also a State asylum for the insane. Pop. (1900) 3,500.

Clarinet, or **Clarionet,** a wind-instrument of the reed kind, with a trumpet-formed mouth, and played by holes and keys. Its scale, though including every semitone within its extremes, is virtually defective. Its lowest note is E below the F clef, from which it is capable, in the hands of good performers, of ascending more than three octaves. Its powers through this compass are not everywhere equal; the player, therefore, has not a free choice in his keys, being generally confined to those of C and F, which indeed are the only keys in which the clarinet is heard to advantage. The music for this instrument is therefore usually written in those keys. There are, however, B flat clarinets, A clarinets, D clarinets, B clarinets, and G clarinets; the three latter are not ordinarily used.

Clarion, a musical instrument of the trumpet kind, with a narrower tube and a higher and shriller tone than the common trumpet.

Clarissa Furiosa, a story by W. E. Norris, first published in 1896. It may be regarded in the light of a satire on the "New Woman," and is perhaps the least successful of the clever author's novels. The most of the story is taken up with the semi-public life to which the heroine devotes herself after she has separated from her husband. The workmanship is good, but the writer's want of genuine interest in his characters is felt.

Clarissa Harlowe, a novel by Samuel Richardson, published in 1751. It is a story of a noble-minded young woman, whose good reputation is compromised by her lover, Lovelace. The scene is laid in rural England of the first half of the 18th century. The story is largely told by letters exchanged between Clarissa and her confidante Miss Howe, and between Lovelace and his friend Belford. To the present-day reader, the tale seems slow and prolix; but it is a truthful picture of the conventions and ideals of its period, while it possesses a perennial life because it deals with some of the elemental interests and passions.

Clark, Abraham, American patriot: b. Elizabethtown, N. J., 15 Feb. 1726; d. Rahway, N. J., 15 Sept. 1794. He studied for the bar and practised in his native State with success. After serving as sheriff of Essex County, he was chosen a delegate to the Continental Congress in 1776 and signed the Declaration of Independence. He was a member of the Constitutional Convention of 1789, and aided in framing the Constitution of the United States.

Clark, Alexander, American clergyman and writer: b. Jefferson County, Ohio, 10 March 1834; d. Georgia 6 July 1879. He was editor of the 'Methodist Recorder' (1870–9). He wrote: 'The Old Log Schoolhouse' (1864); 'Workaday Christianity' (1870); 'Rambles in Europe' (1877); 'Ripples on the River,' verse.

Clark, Alonzo, American physician: b. Vermont 1 March 1807; d. New York 1887. He graduated at Williams College 1828, and at the College of Physicians and Surgeons, New York, 1835, entering at once upon the practice of his profession, of which he became an eminent member. He was professor of the theory and practice of medicine in the University of Vermont, of anatomy and pathology in the University of the City of New York, of pathology and practical medicine in Columbia University 1860–87, and dean of its medical faculty 1875–84. He was also president of the College of Physicians and Surgeons, and filled various offices in the societies and associations of which he was a member. Besides many contributions to medical periodicals, he published 'Presidential Address Before the New York State Medical Society' (1853); 'Lectures on Diseases of the Heart' (1884).

Clark, Alonzo Howard, American scientist: b. Boston 13 April 1850. He left his studies at Wesleyan University to enter the service of the United States Fish Commission, making a thorough study of the work. He has written: 'History of Fishery Industries of the United States'; 'Whales and Sea Fisheries'; 'History of the Mackerel Fisheries'; 'Food Industries of

the World.' Since 1881 he has been connected with the Smithsonian Institution.

Clark, Alvan, American astronomical-instrument maker: b. Ashfield, Mass., 3 March 1804; d. Cambridge, Mass., 9 Aug. 1887. He was at one time a portrait painter in Boston; but in 1844 his attention was turned to telescope making. Two years later he definitely adopted the business of astronomical-instrument making, and in time achieved a world-wide reputation. His famous telescopes include the Chicago 18½-inch, the Washington 26-inch, the Russian 30-inch, and the California 36-inch.

Clark, Alvan Graham, American astronomer: b. Fall River, Mass., 10 July 1832; d. Cambridge, Mass, 9 June 1897. He was a son of Alvan Clark (q.v.), and became associated with him under the firm name of Alvan Clark & Sons. In 1859 they began work on an object glass with an aperture of 18½ inches, which ultimately became the property of the Astronomical Society of Chicago. With this instrument Clark discovered the companion of Sirius, for which the French Academy awarded him the Lalande medal. Other telescopes constructed largely under his supervision were: that for the Naval Observatory, a 26-inch instrument with which Prof. Asaph Hall discovered the two satellites of Mars; the McCormick telescope for the University of Virginia; the great 30-inch one for the St. Petersburg Imperial Observatory; the powerful Lick telescope, with an aperture of 36 inches, at Mount Hamilton, Cal. (1886), with which Jupiter's fifth satellite was discovered; and finally, the greatest of his achievements as a maker, the wonderful Yerkes lens of 40 inches, the gift of C. T. Yerkes to the University of Chicago, and installed in the observatory at Lake Geneva, Wis. As an astronomer he made many discoveries of double stars.

Clark, Sir **Andrew,** Scotch physician: b. Aberdeen 28 Oct. 1826; d. London 6 Nov. 1893. He was educated at Aberdeen and Edinburgh. After an unusually brilliant career as a student of medicine at Edinburgh, he assisted Dr. Hughes Bennett and Dr. Robert Knox, the anatomist, and next had charge for four years of the pathological department at the Haslar Naval Hospital. After graduating at Aberdeen in 1854, he settled in London. He will live in remembrance as the "beloved physician" of George Eliot.

Clark, Anson Luman, American eclectic physician and surgeon; b. Clarksburg, Mass. 12 Oct. 1836. In 1858 he graduated as B.A. in Lombard University, and as A.M. in 1868 in medicine, at the Eclectic Medical Institute of Cincinnati, Ohio, in 1861. He served during the Civil War as assistant surgeon, and was a member of the House of Representatives of the 27th General Assembly of Illinois. Since 1868 he has filled the chair of Diseases of Women and Obstetrics in the Bennett Medical College of Chicago, Ill. He wrote 'Clark's Diseases of Women' (1878).

Clark, Champ, American politician: b. Anderson County, Ky., 7 March 1850. He was graduated at Bethany College and Cincinnati Law School, and in 1873–4, was president of Marshall College, W. Va. He has attained distinction as a Democratic campaign speaker, and since 1893 has been, with an intermission of one term, a member of Congress from Missouri.

Clark, Charles Dickson, American jurist: b. Laurel Cove, Tenn., 7 Oct. 1847. He was graduated at Cumberland University in 1875, and practised as a lawyer in his native State until 1895, when he was appointed judge of the United States court for the eastern and middle districts of Tennessee.

Clark, Charles Edgar, American naval officer: b. Bradford, Vt., 10 Aug. 1843. He entered the naval service in 1860; took part in the battle of Mobile Bay and in the bombardment of Fort Morgan; and was promoted captain in 1896. In March 1898 he took command of the battleship Oregon at the Mare Island navy yard, San Francisco, and when war with Spain was deemed inevitable, received orders to proceed to Key West, Fla., with all haste. After a voyage of over 14,000 miles, he joined the American fleet in Cuban waters on 26 May, and on 3 July commanded his ship at the battle of Santiago. In March 1899 he was assigned to duty at the League Island navy yard. He was promoted rear-admiral 16 June 1902.

Clark, Charles Heber ("Max Adeler"), American journalist: b. Berlin, Md., 11 July 1841. He is the editor of the 'Textile Record' in Philadelphia, and has written much on economic themes, but is best known to the general public as a humorist under the pseudonym Max Adeler. He has published: 'Out of the Hurly Burly'; 'Elbow Room'; 'The Fortunate Island'; 'Capt. Bluitt' (1902).

Clark, Daniel, Canadian pathologist: b. Granton, Scotland, 29 Aug. 1836. He went to Canada when a child; was graduated at Victoria University in 1858; and practised medicine in Ontario with great success. He has paid especial attention to mental diseases and the care of the insane. Since 1875 he has been at the head of the Provincial Asylum for the Insane at Toronto, and was later made professor of psychology and mental diseases in Toronto University. He was also twice elected president of the College of Physicians and Surgeons of Ontario. He has written 'Pen Photographs' (1873); 'Josiah Garth,' a novel.

Clark, Edson Lyman, American Congregational clergyman: b. Easthampton, Mass., 1 April 1827. He was graduated from Yale in 1853, and from Union Theological Seminary in 1858, and has filled several Congregational pastorates in New England. He has published: 'The Arabs and the Turks'; 'The Races of European Turkey'; 'Fundamental Questions, Chiefly Relating to the Early Hebrew Scriptures.'

Clark, Edward, American architect: b. Philadelphia 1822; d. Washington, D. C., 6 Jan. 1902. He studied architecture under Thomas W. Walter, and after serving as assistant, was made chief architect of the United States capitol in 1864, serving continuously till his death. He was a member of the leading architectural commissions of the national government, including that for the completion of the Washington monument.

Clark, Edwin Charles, English jurist: b. Yorkshire, England, 5 Nov. 1835. He was educated at Shrewsbury School and Trinity College, Cambridge, where he became scholar and Fellow.

He practised for a short time as a conveyancer in London, being called to the bar at Lincoln's Inn 1860. In 1873 he was appointed regius professor of civil law at Cambridge, where he is also a professional fellow of St. John's College. His books are: 'Early Roman Law: Regal Period' (1872); 'Analysis of Criminal Liability' (1880); 'Practical Jurisprudence: a Comment on Austin' (1883); 'Cambridge Legal Studies' (1888).

Clark, Francis Edward, American clergyman: b. Aylmer, Quebec, 12 Sept. 1851. He was graduated from Dartmouth College in 1873, and continued his studies at Andover Theological Seminary. He became pastor of a Congregational church at Portland, Maine, and there organized the first Young People's Society of Christian Endeavor 2 Feb. 1881. He was pastor of the Phillips Congregational Church in South Boston, Mass, 1883–7, and in 1887 was made president of the United Society of Christian Endeavor and also became editor of the 'Golden Rule,' the official organ of the society.

Clark, Frederick Thickstun, American novelist: b. Pennsylvania 1858. He has published: 'A Mexican Girl'; 'In the Valley of Havilah'; 'On Cloud Mountain'; 'The Mistress of the Ranch.'

Clark, George Hunt, American poet: b. Northampton, Mass., 1809; d. Hartford, Conn., 20 Aug. 1881. He was a frequent contributor to 'Putnam's,' 'Knickerbocker,' and other journals. His published poems include 'Now and Then'; 'The News'; and a collection of humorous and sentimental pieces, entitled 'Undertow of a Trade-Wind Surf.'

Clark, George Rogers, American pioneer: b. Monticello, Va., 19 Nov. 1752; d. near Louisville, Ky., 18 Feb. 1818. He studied surveying, and at 20 settled in Ohio, serving in the Indian wars of that time and region. He removed to Kentucky in 1775, procuring the organization of that Territory. On the outbreak of the Revolutionary War he led the patriot army on the frontier, campaigning vigorously against the British throughout Illinois, Ohio, and Kentucky. His success in this saved much territory to the colonies in the final treaty of peace with Great Britain. He subsequently supported the cause of the French of the Mississippi valley against the Spaniards. He fell into penury in his latter years, and died in neglect. See CLARK, WILLIAM (1770–1838).

Clark, Henry James, American naturalist and prose-writer: b. Easton, Mass., 22 June 1826; d. Amherst, Mass., 1 July 1873. He was associated in work with Agassiz for several years; and was professor in several leading colleges and universities. Among his many contributions to literature are 'Mind in Nature, or the Origin of Life (1863); 'Mode of Development of Animals' (1865); 'Claims for Scientific Property.'

Clark, Imogen, American novelist: b New York. She has published: 'Will Shakespeare's Little Lad' (1897); 'The Victory of Ezry Gardner' (1897); 'The Heresy of Parson Medlicott' (1900); 'God's Puppets' (1901).

Clark, J. Scott, American educator: b. Copenhagen, N. Y., 23 Sept. 1854. He was graduated from Syracuse University in 1877, was professor of rhetoric there, 1882–92, and has been professor of English in Northwestern University, Evanston, Ill., from 1892. He has published: 'A Practical Rhetoric' (1886); 'The Art of Reading Aloud' (1892); 'A Study of English Prose-Writers' (1898); 'A Study of English and American Poets' (1900).

Clark, SIR **James,** Scottish physician: b. Findlater, Banffshire, 14 Dec. 1788; d. Bagshot Park 29 June 1870. He studied medicine at the University of Edinburgh, and entered the navy as assistant-surgeon in 1809, and continued in the service till 1815, when he returned to Edinburgh. After devoting some time to foreign travel, he settled in Rome, where he continued to practise from 1818 to 1826. He returned to England in 1826, and became physician to the Duchess of Kent in 1835, and on the accession of Queen Victoria was appointed first physician in ordinary to the queen, and shortly afterward made a baronet. He retired from practice several years before his death, but continued till near the close of his life to act as consulting physician to the royal family.

Soon after his return to England Sir James Clark published, as a result of his continental observations, a work 'On the Sanative Influence of Climate' (1829), and in 1835 a 'Treatise on Pulmonary Consumption and Scrofula.'

Clark, James Gowdy, American balladist: b. Constantia, N. Y., 28 June 1830; d. Pasadena, Cal., September 1897. He was well known as a concert singer and song writer, and among his most popular songs are: 'Star of My Soul'; 'The Awakening'; 'The Beautiful Hills'; 'The Children of the Battlefield'; 'Freedom's Battle Hymn'; 'The Evergreen Mountains of Life'; and 'The Old Mountain Tree.'

Clark, John Bates, American economist: b. Providence, R. I., 26 Jan. 1847. He was graduated at Amherst in 1872, and has been prominent as a political economist since the publication of his 'Philosophy of Wealth'; 'Wages'; 'Capital and Its Earnings'; and 'The Distribution of Wealth.' In 1900 he became professor of political economy at Columbia University.

Clark, John Emory, American scientist: b. Northampton, N. Y., 8 Aug. 1832. He was graduated at the University of Michigan in 1856, and studied at Heidelberg. After serving in the Civil War as captain and colonel, he became professor of astronomy at Antioch College. Since 1873 he has been professor of mathematics at the Sheffield Scientific School of Yale University.

Clark, John Willis, English writer, registrar of the University of Cambridge from 1891. He is the author of 'Cambridge' (1880); 'Architectural History of the University and Colleges of Cambridge' (1882); 'Libraries in the Mediæval and Renaissance Periods' (1894); 'Augustinian Priory Observances' (1897); 'Old Friends at Cambridge and Elsewhere' (1900); 'The Care of Books' (1901).

Clark, Jonas Gilman, American philanthropist: b. Hubbardston, Mass., 1 Feb. 1815; d. Worcester, Mass., 23 May 1900. He began life as a carriage maker and acquired a fortune in business and real estate investments. He is noted as the founder of Clark University (q.v.), at Worcester, Mass., which he endowed with $2,000,000 in 1887. He also conferred gifts on his native town. He bequeathed $200.000 to

Clark University outright and $1,000,000 and the residue of his estate conditionally.

Clark, Joseph, English painter: b. Cerne Abbas, Dorsetshire, 4 July 1834. He was educated by "The Dorset Poet," William Barnes (q.v.), went to London at 18 and became a student at the Royal Academy. He first exhibited at the Royal Academy in 1857, and has exhibited there nearly every year since. Among well-known pictures by him are: 'The Return of the Runaway'; 'Hagar and Ishmael'; 'Three Little Kittens.'

Clark, Lewis Gaylord, American journalist and humorous writer: b. Otisco, N. Y., 5 March 1810; d. Piermont, 3 Nov. 1873. In 1834 he became editor of the 'Knickerbocker Magazine,' and with Irving, Bryant, Longfellow, Halleck, and Willis, as contributors, made it the foremost literary publication of that time, and an inspiration to a higher standard of periodical literature. The 'Editor's Table,' written by him, overflowed with amusing stories and witty sayings. The 'Knickerbocker Sketch-Book' (1850), and 'Knick-Knacks from an Editor's Table' (1853), are his only publications in book form.

Clark, Lewis George, American slave and freedman: b. about 1811; d. Lexington, Ky., 16 Dec. 1897. He was reared a slave, but escaping, lectured for emancipation in 1841–50. He claimed to be the original of "Uncle Tom" in Mrs Stowe's novel, but this the authoress denied.

Clark, Theodore Minot, American architect: b. Boston, Mass., 20 Aug. 1845. He was graduated from Harvard in 1866, and has been professor of architecture in the Massachusetts Institute of Technology in Boston for many years. He has published 'Building Superintendence'; 'Owner and Builder Before the Law'; 'Rural School Architecture.'

Clark, Thomas March, American Protestant Episcopal bishop: b. Newburyport, Mass., 4 July 1812; d. Sept. 7, 1903. He was graduated at Yale in 1831, and four years later entered the Presbyterian ministry, but in 1836 took orders in the Episcopal Church. He was successively rector of Grace Church, Boston, 1836–43; St. Andrew's, Philadelphia, 1844–7; Trinity Church, Boston, 1847–51; and Christ Church, Hartford, Conn., 1851–4. In the year last named he was consecrated bishop of Rhode Island. Since 1899 he has been the presiding bishop of the Episcopal Church. He has written: 'Formation of Character'; 'The Efficient Sunday-school Teacher'; 'The Dew of Youth'; 'Early Discipline and Culture'; 'Reminiscences' (1895).

Clark, Walter, American jurist: b. Halifax, N. C., 19 Aug. 1846. He was graduated at the University of North Carolina in 1864; became a lawyer in 1868, judge of the superior court in 1885, and of the supreme court in 1889. He is a contributor to leading magazines on current topics and a law writer of authority, his best known work being 'Overruled Cases' (1884). Other works by him are: 'Annotated Code of Civil Procedure'; 'Laws for Business Men.' In 1896 the North Carolina Democratic convention indorsed him as a candidate for the vice presidency, and in 1903 Mr. William J. Bryan expressed his preference for him as a possible candidate for the presidency.

Clark, William, American explorer; brother of George Rogers Clark (q.v.): b. Virginia 1 Aug. 1770; d. St. Louis, Mo., 1 Sept. 1838. He emigrated with his family at the age of 14 to the falls of the Ohio, in Kentucky, on the present site of Louisville. In 1808 he was appointed in conjunction with Capt. Meriwether Lewis to the command of an expedition designed to explore the northwest territory lying between the Mississippi and the Pacific Ocean. He acquitted himself with consummate ability in this hazardous employment, which required the combination of military and scientific skill. His journal and the account kept by him of the astronomical observations made by him and Capt. Lewis have been published. He was appointed in 1813 governor of the Northwest Territory and superintendent of Indian affairs, which offices he retained till 1820, when Missouri was created a State. Two years afterward he was again appointed commissioner and superintendent of Indian affairs.

Clark, William, American thread manufacturer: b. Paisley, Scotland, 1841; d. Portland, England, 7 July 1902. Entering the Scottish thread mills established by his family, he made himself conversant with all details of the business and in 1860 came to the United States. Here he joined his brother, George A. Clark, who had preceded him by four years, and established at Newark, N. J., a small branch of the Scottish business. From this was built up in time the great Clark thread mills of Newark. After the death of George Clark, in 1873, the business was solely managed by his brother William. At the latter's death he left bequests of $10,000 to each of three Newark benevolent institutions, $6,000 to a fourth, and $10,000 to Rutgers College.

Clark, William Andrews, American politician: b. near Connellsville, Pa., 8 Jan. 1839, of Protestant Irish farmer stock. His preparation for college was interrupted by the removal of his family to Iowa, where he attended an academy at Birmingham and studied law two years, but never practised. He taught school in Missouri 1859–60; was a miner in Colorado 1862–3; and in 1863 migrated to Idaho, where he set up in trade, and was soon one of the chief merchants in the Territory. In 1867 he contracted for a Star Route in Montana; and in 1868 formed a copartnership for a mercantile and banking business there. To qualify for the mining business, he took a complete course at Columbia School of Mines 1872–3. Since then he has been identified with mining interests in every mining region of the West, and has for many years been the largest individual metal producer of the world, besides having interests in manufacturing, railroading, mercantile business, etc. He was State orator to represent Montana at the Philadelphia Centennial of 1876, and a commissioner of the New Orleans Exposition of 1884; was Masonic Grand Master of Montana in 1877; in 1878 was major in the Nez Percé war against Chief Joseph; and was president of the constitutional convention when Montana was admitted to the Union. In 1898 he was elected to the Senate from Montana, but a protest was filed and an investigation ordered; before a report was made he resigned, returned to Montana, and was re-elected for the term 1901–7. He has been placed on many of

the most important senatorial committees, including that on foreign relations.

Clark, William Bullock, American scientist; b. Brattleboro, Vt., 15 Dec. 1860. He was graduated at Amherst College in 1884. After a course of European study he became instructor in geology at Johns Hopkins University in 1887, and since 1894 has been professor of geology there. In 1891 he was appointed director of the Maryland Weather Service.

Clark, William George, English scholar: b. March 1821; d. York 6 Nov. 1878. He was educated at Trinity College, Cambridge, took orders in the Established Church but gave up his orders in 1869, explaining his reasons therefor in a pamphlet 'The Present Dangers of the Church of England' (1870). He assisted in founding the 'Journal of Philology' in 1868, but is best known for his editorship with William Aldis Wright (q.v.) of the noted 'Cambridge Shakespeare' (1863–6). The 'Globe Shakespeare' (1864) was also edited by Clark and Wright. Clark published also 'Lectures on the Middle Ages and the Revival of Learning' as well as lesser works.

Clark, Willis Gaylord, American poet, twin brother of Lewis Gaylord Clark (q.v.): b. Otisco, N. Y., 5 March 1810; d. Philadelphia, Pa., 12 June 1841. He became associate editor of the Columbian Star, a religious weekly paper (1830), but resigned shortly after to take charge of the Philadelphia Gazette. His longest poem is 'The Spirit of Life' (1833). A complete edition of his poems, edited by his brother, appeared in 1847.

Clark River (named after Capt. William Clark), a river of the United States, rising in the Rocky Mountains in western Montana, about lat. 45° 30′ N. After a winding northwest course of about 650 miles between the Missouri and Bitter Root ranges, during which it expands into an extensive lake, it falls into the Columbia, in the State of Washington, lat. 48° 50′ N., lon. 117° 50′ W. It is also called Clark Fork of the Columbia River.

Clark University, a co-educational institution in Atlanta, Ga.; organized in 1870 under the auspices of the Methodist Episcopal Church; reported at the end of 1902: Professors and instructors, 20; students, 580; number of volumes in library, 1,000; value of property, $250,000; president, Charles M. Melden, D.D.

Clark University, Worcester, Mass., founded in 1887 by the gift of Jonas G. Clark (q.v.), and the work of instruction began in 1889. At first the institution was devoted wholly to post-graduate work, those only were admitted as students who had taken a first degree and who gave promise of high attainment in some department of science. No entrance examination was required. The design and organization of the university were intrusted to G. Stanley Hall (q.v.) formerly a professor of philosophy at Johns Hopkins University, Baltimore, and for years a close observer of schools and school methods in America and Europe.

But few departments have been organized, namely, mathematics, physics, anthropology, biology, philosophy, and psychology. Pedagogy (1899) was made one of the sub-departments of psychology. One of the characteristic features in the design is that professors and students should meet on the same plane, the professors to be as older students, the students to lecture occasionally on special subjects. Original work is encouraged and demanded, and a number of fellowships and scholarships have been founded so that worthy students of limited means might devote themselves to research along special lines, and not be hindered or hampered by doing outside work for the purpose of continuing their studies. No attempt has been made to secure large numbers of students; in such a school a small number is desirable. In 1892–3 there were 53 students; in 1896–7, 38; in 1898–9, 48.

There are 11 professors, 16 fellowships, and 16 scholarships. In the library are 18,000 volumes, and the following publications are issued by the university, but not officially: 'American Journal of Psychology'; 'Pedagogical Seminary'; 'Mathematical Review.'

In 1902 a collegiate department was opened with Carroll D. Wright as president. G. Stanley Hall is president of the university. See HALL, G. STANLEY.

Clarke, Adam, Methodist clergyman and scholar: b. Moybeg, County Londonderry, Ireland, 1762; d. London 26 Aug. 1832. He became an itinerant Methodist preacher in 1782, and continued to travel in various circuits till 1805, when he took up his residence in London, where he passed a considerable part of his subsequent life. He was learned in the Oriental languages, and published a commentary on the Scriptures (1810–26), and various other works, among the rest a 'Bibliographical Dictionary' (1802).

Clarke, Annie, American actress: b. Boston, Mass., 1845; d. Chicago 22 May 1902. Her first appearance was at the Boston Museum in 1853 as the Duke of York in Richard III. For several years she acted in juvenile parts in various places, but from 1861 till 1892 was a member of the stock company at the Boston Museum, soon becoming the leading actress there. She was a general favorite, but until 1892 was seldom seen outside of Boston. After that date she played in Chicago and other cities.

Clarke, Augustus Peck, American physician: b. Pawtucket, R. I., 24 Sept. 1833. He was graduated at Brown University in 1861, and at the Harvard Medical School in 1863. He was an army surgeon during part of the Civil War, and subsequently entered private practice. He has been sent to every International Medical Congress since 1887, and since 1894 has been dean of the College of Physicians and Surgeons in Boston. He has attained special eminence in the domain of obstetrics and gynecology.

Clarke, Benjamin Franklin, American educator: b. Newport, Maine, 14 July 1831. He was graduated at Brown University in 1863, and subsequently became professor of mechanical engineering there. In 1898–9 he was acting president of the university.

Clarke, Charles Cowden, English writer: b. Enfield, Middlesex, 15 Dec. 1787; d. Genoa, Italy, 13 March 1877. His father kept a small school and had John Keats as one of his pupils; but in 1810 gave it up and removed to Ramsgate. The son frequently went up to London,

where he came into contact with Leigh Hunt, Shelley, Hazlitt, the Lambs, and Vincent Novello, and in 1828 he married Mary, the eldest daughter of Novello. He engaged for some time in business as a bookseller and a music publisher, and from 1834 till 1856 lectured throughout the country, mainly on poets and poetry. His publications include his 'Hundred Wonders' (1814); 'Adam the Gardener' (1834); 'Shakespeare Characters,' chiefly those subordinate (1863); and 'Molière Characters' (1865), the two last being collections of some of his lectures. He is best known, however, by the edition of Shakespeare which he annotated in conjunction with his wife, and by the 'Shakespeare Key' (1879).

Clarke, Creston, American actor: b. Philadelphia 20 Aug. 1865. He is a son of John Sleeper Clarke (q.v.), and was educated at academies in Paris and London with a view to the stage, and made his début in London 1882. He has attained success in tragic roles, and has written 'The Last of His Race' and other plays.

Clarke, Edith Emily, American librarian: b. Syracuse, N. Y., 5 Nov. 1859. She was graduated at Syracuse University in 1881, and after teaching school some years, took up library work. Having served as cataloguer at Columbia University Library and at the Newberry Library in Chicago, she became chief cataloguer of public documents for the National Government in 1895, and librarian of the University of Vermont in 1898.

Clarke, Edward Daniel, English traveler: b. Willingdon, Sussex, 1769; d. London 9 March 1822. In 1799 he started on an extensive and laborious tour through Denmark, Sweden, Lapland, Finland, Russia, Tartary, Circassia, Asia Minor, Syria, Palestine, Egypt, Greece, and Turkey, returning in 1802 through Germany and France. On his return he obtained from Cambridge University the honorary degree of LL.D., in consideration of the services rendered to its public libraries and institutions by his liberal contributions, among which the greatest, perhaps, in value is the celebrated manuscript of Plato's works, with nearly 100 others, and a colossal statue from Eleusis, believed by him to be that of Demeter (Ceres). To him also the British nation is indebted for the acquisition of the famous sarcophagus of Alexander the Great, which he discovered in the possession of the French troops in Egypt, and which was by his means surrendered to the British army. In 1807 he commenced a course of lectures on mineralogy at Cambridge, and in 1808 a professorship of mineralogy was instituted there in his favor. He himself had made a splendid collection of mineralogical specimens, which was purchased after his death by Cambridge University. In 1805 he became vicar of Harlton, and in 1809 rector of Yeldham, Essex. In 1817 he was appointed librarian of Cambridge University. A complete edition of his travels appeared in 6 volumes (1810–23), and another in 11 volumes (1816–24), under the title of 'Travels in Various Countries of Europe, Asia, and Africa.' His 'Travels,' which are the most popular of his works, are attractive from the enthusiasm of the writer and his prolific imagination.

Clarke, Sir Edward George, English legal writer: b. London 15 Feb. 1841. He was admitted a barrister of Lincoln Inn in 1864, and was solicitor-general 1886–92. He sat in the House of Commons for Southwark in 1880, and for Plymouth 1880–1900. He has published 'Treatise on the Law of Extradition' (1866, 3d ed. 1888), and three collections of 'Public Speeches.'

Clarke, Frank Wigglesworth, American chemist: b. Boston, Mass., 19 March 1847. He was graduated from the Scientific School of Harvard University in 1867, was instructor at Cornell 1869, professor in Howard University 1873–4, and professor of chemistry and physics, University of Cincinnati 1874-83. He has been chief chemist of United States Geological Survey and honorary curator of minerals, United States National Museum, since 1883. He is a member of many American and foreign scientific societies, and was a member of the International Jury of Awards at the Paris Exposition of 1900, and received from the French government the decoration of the Legion of Honor. He has published: 'Weights, Measures and Money of All Nations'; 'Elements of Chemistry'; 'A Report on the Teaching of Chemistry and Physics in the United States,' the Smithsonian 'Constants of Nature,' and various official bulletins. He is also author of more than a hundred scientific essays and memoirs published in magazines and scientific journals. His most important contributions to science have been his 'Revaluation of Atomic Weights,' and his investigations upon the constitution of the natural silicates. He is joint author with L. M. Dennis of two recent works, 'Elementary Chemistry' and 'A Laboratory Manual.'

Clarke, Sir George Sydenham, English soldier and colonial governor: b. Lincolnshire 4 July 1848. After being educated at Haileybury College he entered the Royal Engineers' service and served in the Egyptian expedition in 1882, in the Sudan expedition 1885, at Suakin and elsewhere, and was knighted in 1893. Since 1901 he has been governor of Victoria, Australia. He has published: 'Practical Geometry and Engineering Drawing'; 'The Principles of Graphic Statics'; 'Plevna'; 'Fortification: Past, Present, and Future'; 'The Last Great Naval War'; 'The Navy and the Nation'; 'Imperial Defense'; 'Russia's Sea Power.'

Clarke, Helen Archibald, American writer: b. Philadelphia. She graduated from the musical department of the University of Pennsylvania 1884; began writing literary articles for the magazines in 1887, and in 1889, with Charlotte Porter, founded 'Poet Lore,' a journal devoted to the study of literature, and to literary criticism, which has maintained a high degree of excellence under her editorship. She has devoted herself especially to the study of Browning, and has edited several editions of his works in part or as a whole, and written a score of interpretative articles on the man and his work. She has composed considerable piano music, and contributed frequently to the various musical journals. Her work has appeared in 'Shakespeariana,' the 'Browning Society Papers,' 'Open Court,' 'Popular Science Monthly,' 'The Conservator,' 'Philadelphia American,' 'Music Review,' etc.

Clarke, Hyde, English philologist: b. London 1815; d. there 1 March 1895. In diplomacy, civil engineering, and scholarship he was equally at home, his versatility being conspicuous in 'Theory of Railway Investment', 'Colonization in our Indian Empire' (1857), 'Comparative Philology' (1858), and 'Examination of the Legend of Atlantis' (1886); 'Early History of the Mediterranean Populations,' etc. He also compiled a useful abridged English Dictionary.

Clarke, James Freeman, American Unitarian clergyman and author: b. Hanover, N. H., 4 April 1810; d. Boston, Mass., 8 June 1888. His first pastorate was at Louisville, Ky., 1833–40. He then settled in Boston in 1841; and was pastor of the Church of the Disciples which was organized especially for him, and of which he had charge till his death. He was a clear thinker and a leader in all reform and educational movements. From 1867–71 he was professor of natural religion and Christian doctrine in Harvard University. Together with Emerson and William H. Channing, he prepared the 'Memoirs of Margaret Fuller d'Ossoli.' His chief work was 'Ten Great Religions.' Among others were: 'Service Hymn-book and Hymn-book of the Church of the Disciples'; 'Christian Doctrine of Prayer'; 'The Hour Which Cometh'; 'Orthodoxy: Its Truths and Errors'; 'Steps of Belief'; 'Events and Epochs in Religious History'; 'The Ideas of the Apostle Paul'; 'Self-Culture'; 'Anti-Slavery Days'; 'Every-Day Religion'; and 'Vexed Questions.'

Clarke, John, American clergyman: b. Suffolk, England, 8 Oct. 1609; d. Newport, R. I., 26 April 1676. He was a physician in London, and came to Massachusetts soon after its first settlement; but being one of the friends of Anne Hutchinson, was obliged to flee with her and her associates from that colony. Proceeding to the south, they were welcomed by Roger Williams to his vicinity, formed themselves into an organization, and obtained from the Indians a district to which they gave the name of the Isle of Rhodes or Rhode Island. The settlement commenced in 1638, at Pocasset, and Clarke began to employ himself as a preacher. In 1644 he founded at Newport the second Baptist Church in America, and became its pastor. Venturing a few years later to preach in the vicinity of Boston, he was arrested by an officer of the government, was called first before a parish meeting and then before the court, and was condemned for what were adjudged false teachings, to pay a fine of 20 pounds or be publicly whipped. In 1651 he was sent to England in company with Roger Williams as an agent of the colony of Rhode Island, and published there a book entitled 'Ill News from New England, or a Narrative of New England's Persecution.' He succeeded in obtaining a revocation of Mr. Coddington's commission as governor, and remained in England after the return of Williams, till at the end of a 12 years' mission he had procured a second charter for the colony, which secured to every person at all times his own judgment and conscience in matters of religious concernment. Bancroft alludes to him in his history as "the modest and virtuous Clarke, the persevering and disinterested envoy." Upon his return in 1663 he resumed the pastorate of his church at Newport, which he retained till his death. In his will he left his farm for charitable purposes, the income of it only to be expended; and it has since produced annually about $200.

Clarke, John Mason, American scientist: b. Canandaigua, N. Y., 15 April 1857. He studied at Amherst and Göttingen and from 1881 to 1884 was professor of geology at Smith College. He subsequently became State palæontologist of New York, and has written numerous pamphlets and papers on geology and palæontology.

Clarke, John Sleeper, American actor: b. Baltimore, Md., 3 Sept. 1833; d. London, Eng., 14 Sept. 1899. He began his stage career in childhood and played comedy parts with success from 1851 to 1869. He then became a theatrical manager and with his brother-in-law, Edwin Booth, made paying ventures in various houses of amusement in the United States and England.

Clarke, Joseph Ignatius Constantine, American journalist and playwright: b. Kingstown, Ireland, 31 July 1846. He emigrated to the United States in 1868, and was on the editorial staff of the New York *Herald* 1870–83; edited New York *Journal* 1883–95; and the 'Criterion' 1898–1900. His plays include: 'Heartsease'; 'For Bonnie Prince Charlie'; 'The First Violin'; 'Her Majesty'; and he has also published 'Robert Emmet,' a tragedy in blank verse (1888); 'Malmorda, a Metrical Romance' (1893).

Clarke, McDonald, American poet: b. Bath, Maine, 18 June 1798; d. New York 5 March 1842. He was an eccentric character, familiarly known as "the mad poet"; and was the subject of an amusing poem by Halleck, called 'The Discarded.' The subjects of Clarke's verses were usually the belles of the city and topics of the day. His works include: 'Poetic Sketches' (1826); and 'The Belles of Broadway' (1833). One of his poems was 'Now Twilight Lets Her Curtain Down.'

Clarke, Marcus Andrew Hyslop, Australian novelist: b. London 24 April 1846; d. Melbourne, Australia, 2 Aug. 1881. He went to the island in his 24th year, took up journalism and acquired the experience of bush life and the knowledge of antipodean men and things of which such brilliant use is made in 'His Natural Life,' a striking convict story; 'Holiday Peak'; 'Old Tales of a New Country,' and other vivid fictions.

Clarke, Mary Bayard, American author: b. Raleigh, N. C., about 1830. While living in Cuba, she published verses signed "Tenella" in the periodicals. After her return in 1855 she wrote 'Reminiscences of Cuba' for the 'Southern Literary Messenger.' Among her works are war lyrics and translations from Victor Hugo; also prose articles signed "Stuart Leigh." In 1870 was published her poem, 'Clytie and Zenobia, or the Lily and the Palm,' and 'Wood Notes,' a compilation of North Carolina verse.

Clarke, Mary Victoria Novello Cowden, English story-writer, essayist, and Shakespearean scholar: b. London 22 June 1809; d. Genoa, Italy, 12 Jan. 1898. She married in 1828 Charles Cowden Clarke, with whom she wrote the 'Shakespeare Key' and compiled an edition

of Shakespeare's plays. Her best known work is her 'Concordance to Shakespeare,' published in 1845, which cost 16 years' labor. Other works from her pen are: 'The Girlhood of Shakespeare's Heroines' (1850); 'World-noted Women' (1857); and several stories and novels, including 'The Adventures of Kit Bam, Mariner' (1848); 'The Iron Cousin' (1854); 'The Trust and Remittance' (1873); 'A Rambling Story' (1874). See Mrs. Clarke's memoir of her husband (1887), and 'Her Autobiographic Sketch' (1896).

Clarke, Rebecca Sophia ("SOPHIE MAY"), American novelist and writer of children's stories: b. Norridgewock, Maine, 22 Feb. 1833. She has written 'The Dotty Dimple' series; 'Flaxie Frizzle' stories, etc., for children; and the novels, 'Her Friend's Lover'; 'The Asbury Twins'; 'Quinnebasset Girls,' etc.

Clarke, Richard Henry, American author: b. Washington, D. C., 3 July 1827. He was made president of the Society of American Authors in 1891. He has published 'The New Crusade of the Nineteenth Century,' relating to the Church and slavery; 'Socialism in America'; 'Biography of Commodore John Barry, Founder of the American Navy'; 'Father Sebastian Rale,' an answer to Gladstone on 'Maryland Toleration'; an 'Illustrated History of the Catholic Church in the United States'; 'Lives of the American Catholic Bishops'; and 'Old and New Lights on Columbus.'

Clarke, Samuel, English theological and philosophical writer: b. Norwich, 11 Oct. 1675; d. London 17 May 1729. He became chaplain to Dr. More, bishop of Norwich, and between 1699 and 1701 published 'Essays on Baptism, Confirmation and Repentance,' replied to Toland's 'Amyntor,' and issued a paraphrase of the Gospels. He was then presented with two livings, and in 1704 and 1705 twice delivered the Boyle lectures at Oxford on 'The Being and Attributes of God,' and on 'The Evidences of Natural and Revealed Religion.' In 1706 he published 'Immortality of the Soul', and a Latin version of Newton's 'Optics.' He was then appointed rector of St. Bennet's, London, and shortly afterward rector of St. James' and chaplain to Queen Anne. In 1712 he edited Cæsar's 'Commentaries,' and published his 'Scripture Doctrine of the Trinity,' which became a subject of much controversy and of complaint in the Lower House of Convocation. His chief subsequent productions were his discussions with Leibnitz and Collins on the 'Freedom of the Will,' his Latin version of part of the 'Iliad,' and a considerable number of sermons. His philosophic fame rests on his *a priori* argument for the existence of God, his theory of the nature and obligation of virtue as conformity to certain relations involved in the eternal fitness of things, and his opposition to Hobbes, Spinoza, Locke, Leibnitz, and others.

Clarke, William Horatio, American organist: b. West Newton, Mass., 1840. He filled positions as organist in Dedham, Boston, and Woburn; was for some years superintendent of schools at Dayton, Ohio; was organist of Tremont Temple, Boston, Mass., 1878–87, when he retired to Reading, Mass., where he built the fine four-manual organ in Clarigold Hall. He has published: 'New Method for Reed Organs' (1869) of which over 100,000 copies sold within 20 years, and 'Outline of the Structure of the Pipe Organ' (1877).

Clarke, William Newton, American Baptist clergyman: b. Cazenovia, N. Y., 2 Dec. 1841. He graduated at Colgate University 1861, and at Hamilton Theological Seminary 1863. He filled Baptist pastorates at Keene, N. H., Newton Centre, Mass., Montreal, and Hamilton, N. Y., 1863–90, and was a professor in Toronto Baptist College 1883–7. Since 1890 he has been professor of Christian theology at Colgate University, Hamilton, N. Y. He has written: 'Commentary on Mark' (1881); 'Outline of Theology' (1897); 'What Shall We Think of Christianity?' (1899); 'Can I Believe in God the Father' (1899); 'A Study of Christian Missions' (1900).

Clarksburg, W. Va., a city and county-seat of Harrison County, on the main line of the Baltimore & O. R.R., about 20 miles west of Grafton. It is pleasantly situated on the Monongahela River, in a country singularly favored by nature with an abundance of oil, coal, and natural gas. The manufactures are many and varied, decorated china, glass, tin-plate, and ironware being the leading products. The city is proud of having been the birthplace of the famous "Stonewall" Jackson (q.v.). The educational advantages are of the best, the common schools being supplemented by the Broadus Classical and Scientific Institute, a secondary school of the best type. Pop. (1900) 3,008.

Clarkson, Matthew, American soldier and philanthropist: b. New York 17 Oct. 1758; d. there 25 April 1825. Both his father and grandfather were prominent colonial officials. He was with the Northern army in 1777; was wounded at Fort Edward; at Saratoga acted as aide-de-camp to Gen. Benedict Arnold, and was present at Burgoyne's surrender. He also took part in the campaigns in the Carolinas 1781, and was aide to Gen. Benjamin Lincoln at Yorktown. He was brevetted a lieutenant-colonel, and for 14 years was major-general of the New York militia. In private life he was associated with many notable enterprises of a benevolent or educational nature. He was president of the Bank of New York for 21 years, a member of the State legislature, and at one time Federalist candidate for United States senator. Consult Memorial History of New York City (1893).

Clarkson, Thomas, English philanthropist and emancipationist: b. Wisbeach, Cambridgeshire, 28 March 1760; d. Playford Hall, near Ipswich 26 Sept. 1846. He was originally intended for the Church, and studied at St. John's College, Cambridge, where he gained the vice-chancellor's prize for a Latin essay on the theme, 'Anne liceat invitos in servitutem dare?' (Is it lawful to make slaves of men against their will?) In the course of collecting materials for this dissertation his feelings had been greatly roused by the accounts of the miseries inflicted on the unhappy Africans; and the project of accomplishing their relief, and the abolition of the slave-trade, took possession of him as the leading principle of his life. He formed a connection with a Quaker

association for the suppression of negro slavery, and was introduced to Mr. Wilberforce and other distinguished individuals. While the latter advocated the cause of abolition in Parliament, Mr. Clarkson was indefatigable in obtaining information and evidence on the subject, in attending meetings in different parts of the country, and generally conducting the agitation throughout England for the suppression of the slave traffic. In 1788 a committee of the privy council made an inquiry into the state of the African trade, and in that year a bill mitigating some of the worst cruelties of the traffic was passed. In 1791 a motion by Wilberforce in favor of putting an end to the traffic was lost by 163 to 88; but his labors, and those of his party, were at last successful in England, the slave-trade being abolished by a bill passed 25 March 1807. This point gained, their next effort was to procure the total abolition of slavery in the British colonies, and in this also, after a long struggle, they succeeded, by the passing of the emancipation act in 1833. He published, 'A Portraiture of Quakerism' (1806); 'History of the Abolition of the African Slave-trade' (1808); 'Memoirs of the Private and Public Life of William Penn' (1813); 'Researches, Antediluvian, Patriarchal, and Historical' (1836).

Clarksville, Tenn., a city and county-seat of Montgomery County, situated on the Louisville & N. R.R. near the junction of the Red and Cumberland rivers. It is the trade centre of a large tobacco-growing district, and has a number of tobacco factories, being one of the 10 leading cities of the United States in the manufacture of snuff. It has also lumber and flour mills. It is the seat of the Southwestern Presbyterian University, and of a Methodist school for girls. Pop. (1900) 9,431.

Clarksville, Tex., the county-seat of Red River County, on the Texas & P. R.R., about 15 miles south of the Red River, and 100 miles northwest from Dallas. It is the centre of a fertile cotton country, and its industries are such as are related to the raising and marketing of this staple, with some traffic in grain, hides, and live stock. Pop. (1900) 2,069.

Clary, klā'rĭ, the name of several species of the genus *Salvia,* of the mint family (*Labiatæ*). The plants are natives of countries bordering on the eastern Mediterranean, but are common in all civilized countries, and are cultivated for their aromatic or medicinal qualities. The wild clary, or wild sage, (*S. verbenaca*), is found wild in waste places imported from Europe. Clary, clear-eye, or sea-bright (*S. sclarea*), a native of Europe, is a common plant in Pennsylvania, where it has escaped from cultivation. It receives its common names from the employment of its mucilaginous seeds to remove specks from the eyes. In Europe the plant is used for flavoring soups and confectionery. Its flowers were formerly used with brandy, sugar, cinnamon, and a little ambergris, to make clary-water, regarded as a cardiac to help digestion.

Class, Classifying, Classification. When the domain of a science comprehends a very great number of objects which it is necessary to describe, or whose analogies and differences require to be assigned, it is always useful, and sometimes indispensable, to make a methodical distribution of these objects, to group those which present the greatest number of common characters, to form with these groups new assemblages, continuing the process till a limit is reached where this mode of generalizing may be stopped. The highest assemblage in this ascending series is a "class" (though this term may not be technically applied to it); the procedure necessary in forming it is "classifying," and the result, extending over some entire branch of natural science, is a "classification." We do not begin to classify till we feel the need of it, for the task requires analysis, multiplied comparisons, and researches as to the means of generalizing the particular and isolated notions which we had previously been contented to amass without regular arrangement. It is only, however, after the revision necessary for such arrangement has been undertaken that science can be said to have begun. The first attempts at generalization and classification often exercise a very important influence on the future progress of any science, and may even extend to the period when it seems to be approaching its perfection. A science consists principally in the relations of the facts observed, or knowledge acquired in connection with it. If the relations thus established are founded on accurate observations, they become in fact laws of nature. the most important and most prolific truths which human reason is able to discover. But if the imagination has been allowed to take part in the work, if it has either furnished the materials or directed the construction of the edifice, it must sooner or later be demolished, and rebuilt with better selected materials and on more solid foundations. In modern times geology commenced with faults of this description, and still seems to have difficulty in avoiding them. Natural history, to which a good classification is so essential, was not very fortunate in its first combinations: systems took possession of it, and too often blinded the inquirer to great truths which otherwise he could hardly have failed to discover. Influenced by this love of system, many, instead of submitting to the laborious investigation of facts, have come forward with some new fanciful combination, and made it almost their sole business to secure the credit of their particular classifications by overthrowing those of their predecessors or rivals. In a subject so comprehensive as natural history it seems vain to hope for a perfect classification until the resources of embryology are exhausted. Zoology is gradually tending toward a consistent system of classification, the basis of which is the resemblances of animals at various periods of their growth. The impulse to this line of research was given by Darwin. Being a strictly natural method, inasmuch as the affinities by common descent are sought after to the neglect of mere outward resemblances at a later period of life, the arrangements suggested by it to different naturalists show a considerable amount of harmony, and even those who oppose Darwin acknowledge the simplicity and consistency of embryological or genealogical classification. For the classification of the animal kingdom see ANATOMY.

Classic (Lat. *classicus,* the *classici* in ancient Rome forming the highest of the six classes into which the people were divided see CENSUS), the Greek and Roman authors of the first rank; models of literature. There is

of course a great diversity of value among them; but their superiority to the writers of modern Europe at the time of the revival of letters was so great that it was very natural for their admirers to give them collectively the name of «classics.» Subsequently the word "classical" came to be employed in a wider sense, being applied both to the standard works of any nation, and to ancient literature and art in contradistinction to the modern, and especially to the romantic.

On the revival of learning in Europe the manifest superiority of the ancient classics to the crude productions of a semi-barbarous period gave rise to a large amount of servile imitation. This was especially the case in those countries whose languages most nearly approximated to the classical models, the Latin-speaking nations of southern and central Europe, among whom the revival of classical learning first took place. German literature, which sprung into existence more recently, has perhaps most completely escaped the infection. In England the trammels of this sort of literary despotism were most experienced in the higher education, which was cast completely in a classical mold, and from force of habit has in great measure retained it, but the form and substance of the native literature have on the whole been wonderfully little affected by this exotic discipline. In Italy the early literature was very strongly penetrated with the classical spirit, but the powerful imagination of the people rejected a servile imitation, and a bold originality characterizes the best Italian writers. It was in France, where taste assumes an empire in literary matters somewhat hostile to originality, that the spirit of imitation took the strongest hold of the national genius, and so completely penetrated as to become almost indigenous to it. In the reign of Louis XIV., the golden age of French literature, classical subjects and classical models were run upon with a dreary monotony. Classical rules were received with an unquestioning allegiance, as if they had been the laws of Nature herself, and the chief glory even of those who boasted of excelling the ancients was to follow more rigidly the canons of ancient art than the ancients themselves. Admirable as much French literature in many respects is, it has not escaped the consequences of this false start. There is an inevitable coldness and unreality about the imitation of forms which have lost their original meaning, and even the vivacity of French genius hardly suffices to animate the rigidity of the models demanded by French taste, while a great deal of the older French criticism is nearly unintelligible elsewhere in Europe. Under the influence of Hugo and others, however, France has latterly escaped from the trammels of her classical age.

Classical Greek Poetry, The Growth and Influence of, a work by Prof. Richard C. Jebb (1893). Delivered originally as lectures at Johns Hopkins University, these chapters compose a brilliant sketch of the history and character of Greek poetry, epic, lyric, and dramatic. To the student who seeks to know what Greece and her literature means to the present age, but who has no time for superfluous dates or facts, or disquisitions, this book is indispensable.

Classification and Cataloguing. See LIBRARY ADMINISTRATION.

Classification of Animals, See ANATOMY (*Comparative*).

Claude, Jean, zhŏn klōd, French Protestant theologian: b. La Sauvetat, near Agen, 1619; d. The Hague 13 Jan. 1687. He officiated as pastor at Nimes and Montpellier, but owing to his opposition to the government scheme for the reunion of the Protestants and Roman Catholics, was interdicted from preaching. The controversial abilities of Claude rendered him formidable and obnoxious to the Catholic party. He wrote against Arnauld and Nicole on the doctrine of transubstantiation, and in 1678 held a discussion with Bossuet in presence of Mlle. de Duras, a Protestant lady connected with the court, and niece of Turenne, who wished to review the grounds of her faith by hearing the arguments of these distinguished champions. Bossuet published an account of the conference, which was answered by Claude. On the very morning on which the revocation of the edict of Nantes was registered at Paris, he was ordered to leave France within 24 hours. He retired to Holland, where he was received by the Prince of Orange, who settled a pension upon him. The most important of his works is his 'Défense de la réformation' (1673). He also published a well-known 'Essay on the Composition of a Sermon.'

Claude, St., France, a town in the department of the Jura, at the confluence of the Bienne and Tacon, 25 miles southeast of Lons-le-Saunier. It owed its origin to a celebrated Benedictine abbey, founded in the 5th century, and possessed of very large and even very oppressive privileges. The town is well built, is the see of a bishop, and has several handsome edifices, among others a cathedral and communal college, and a fine promenade along the Bienne. It is celebrated for its fancy turnery, snuff and fancy boxes, cutting of precious stones, etc. Pop. 9,200.

Claude Lorraine, klōd lōr răn, or **Lorrain,** so-called, French landscape painter: b. Chamagne, Vosges, France, 1600; d. Rome 21 Nov. 1682. His real name was CLAUDE GELLÉE: he was called *Lorraine* from the province of this name, where he was born. Not much is known of the particulars of his life, some of which are differently given by different writers. When 12 years old it is said he went to live with his brother, an engraver in wood, at Freiburg. Afterward a relation of his took him to Rome, where the sight of some paintings of Gottfried Wals enchanted him so much that in spite of his poverty, he traveled to Naples to study with the artist. Returning to Rome after a stay of two years, he was employed by the landscape-painter Agostino Tassi, as a color-grinder and otherwise. He is next said to have studied, in Lombardy, the paintings of Giorgione and Titian, whereby his coloring and chiaroscuro were greatly improved. After making a journey into his native country, and residing for some time at Nancy, he settled in 1627 in Rome. Here he attracted the notice of Cardinal Bentivoglio, and was introduced by him to Pope Urban VIII., who gave him orders for four paintings. His position being now assured, he had many other eminent patrons, and was enabled to live much at his ease. The

principal galleries of England, France, Spain, Russia, and Germany are adorned with his productions. The public and private galleries of England are richest in these works, a number being in the National Gallery, others at Dulwich, at Windsor Castle, and elsewhere. Claude possessed the greatest power of invention, by which he gave an inexhaustible variety to his paintings, united with an ardent and persevering study of nature. The truth with which he portrays the effect of the sun in every part of the day, soft breezes playing through the tops of the trees, and all the delicate beauties of nature, is surprising; and all his rivals fell far short of equaling the dewy humidity which he threw over dark, shadowy places. His figures are poor, and he used to say — "I sell my landscapes, and give my figures into the bargain." In a great number of his paintings the figures are the work of other artists. Claude most frequently chooses views in which the eye loses itself in agreeable prospects, without being able to define their limits. He often introduces grand architectural structures, and makes his landscapes the scenes of mythological and historical events. Claude himself made a collection of some 200 drawings of his pictures. This record, now in the collection of the Duke of Devonshire, is known as the 'Liber Veritatis.' Consult Lady Dilke, 'Claude Lorrain, sa Vie et ses Œuvres' (1884); Dullea, 'Claude Gellée, le Lorrain' (1887).

Claudian. See CLAUDIANUS.

Claudianus, klâ-dĭ-ā'nŭs, **Claudius** (commonly known as **Claudian**), Roman poet: b. Alexandria about 365 A.D.; d. about 408. He went to Rome in 395 A.D., where his poems gained him such renown that a statue was erected to his honor in the forum of Trajan. Besides several panegyrical poems on Honorius, Stilicho, and others, we possess his epic, the 'Rape of Proserpine,' an unfinished Gigantomachia, idyls, epigrams, epistles, and occasional poems. Claudian, whose native tongue was Greek, possessed a remarkable command of the Latin language, and displays poetic powers of a high character, brilliancy of diction, truth of description, and richness of illustration. The best editions of his works are those of Gesner (1759); Burmann (1760); Jeep (1876-9); Koch (1893). There is a metrical translation of his works by A. Hawkins (1817).

Claudius, klâ'dĭ ŭs (often also called **Clodius**), the name of a distinguished Roman family, which under its head Attus Clausus, a Sabine, settled at Rome about 504 B.C., and soon branched off into a patrician and a plebeian stock. Attus, admitted among the patricians, changed his name to Appius Claudius. The patrician Claudii were characterized throughout their whole history by their haughty and tyrannical bearing, displayed particularly toward the plebeians; while the plebeian branch were equally distinguished for the resolute assertion of the rights of their order. The patrician Claudii counted among their members 28 consuls, 5 dictators, 7 censors, etc. The most distinguished members of the plebeian branch bore the cognomen of Marcellus.

Clau'dius, or in full, **Tiberius Claudius Drusus Nero Germanicus,** 4th Roman emperor: b. Lyons, 10 B.C.; d. 54 A.D. He was the youngest son of the elder Claudius Drusus Nero and Antonia the younger, the daughter of Augustus' sister. His early education was left to women and slaves; owing to his ill health it was thought he would never become a robust man. He lived as an unimportant private man, and occupied himself with literature. Among other works he wrote a Roman history, embracing the period from the death of Cæsar to his own time, in 43 volumes, and also his own life. After the murder of Caligula, the body-guard, who were ransacking the palace, discovered him secreted in a corner, dragged him out, and proclaimed him emperor (41 A.D.). The senate, who had determined on the restoration of the republic, were forced to confirm the appointment. Claudius, suddenly transferred from retirement and oppression to uncontrolled power, distinguished the beginning of his reign by some praiseworthy acts; he recalled the exiles and restored their estates to them; embellished Rome and erected several large buildings for the public good. He made Mauritania a Roman province; his armies fought successfully against the Germans, and kept possession of several strong places in Britain. But he sunk into debauchery and voluptuousness; and his wives, particularly the infamous Messalina, together with his freedmen, administered the government, sold offices and places of honor, and committed the greatest atrocities unpunished. He died of poison administered by his fourth wife, Agrippina (mother of Nero), at the age of 63, 54 A.D. His deification was the cause of Seneca's pasquinade entitled 'Apokolokynthosis.'

Claudius II. (MARCUS AURELIUS FLAVIUS), surnamed GOTHICUS, Roman emperor: b. Illyria; d. 270 A.D. He was raised to the throne on the death of Gallienus, in 268, and by his virtues as well as his splendid victories over the Goths, he proved himself worthy of his exalted station.

Claudius, Appius, surnamed **Cæcus** ("the blind"), an ancient Roman, elected censor in 312 B.C., in which office he made himself notorious by his arbitrary proceedings, for the purpose of weakening the influence of the plebeians, by admitting into their number the sons and grandsons of freedmen, and others of the lowest of the people. He performed an important service, however, by the construction of the road and the aqueduct which bear his name, though he is said to have procured the removal of his colleagues from office that he might be able to appropriate the whole honor of these works to himself. Selfish ambition was the distinguishing feature in his character. In his old age he became blind; but when Cineas, the deputy of Pyrrhus (280 B.C.), had gained over the senate, which was on the point of accepting peace on the terms offered by him, Appius caused himself to be led into the senate-house, and in a celebrated speech, of which Cicero speaks in the highest terms, insisted and induced the senate to resolve that they would listen to no proposals of peace in which the evacuation of Italy was not made an essential condition. From his two sons spring the two best known branches of the Claudian family, the one distinguished by the surname of Pulcher, and the other by that of Nero.

Claudius, Matthias, mat-tē'äs klow'dĭ-ŭs, German poet: b. Rheinfeld 15 Aug. 1740; d. Hamburg 21 Jan. 1815. His prose and poetry bear a peculiar stamp of humor, frankness, and

cordiality. In 1775 he made a collection of his compositions, which had appeared in the 'Wandsbeck Messenger' and other periodicals, with the addition of some which had not been printed, and gave the collection the title 'Asmus omnia sua Secum Portans,' or 'Complete Works of the Wandsbeck Messenger.' All his works are written in a natural, intelligible, and often humorous style, and support the cause of good morals, benevolence, patriotism, and piety, while they attack folly and vice with the weapons of ridicule and scorn. Many of his songs have been set to music by the first composers, and have become a part of the national melodies. He occupied several public offices. In the latter part of his life he became a convert to religious mysticism.

Clausel, Bertrand, bĕr-träń klō-zĕl, France, a marshal: b. Mirepoix 1773; d. 1842. After gaining a high reputation by his services on the Pyrenees, in Haiti, Italy, and Dalmatia, he accompanied Junot and Massena to Spain in 1810. He laid siege to Ciudad Rodrigo, and was wounded at Salamanca. By his skill and conduct the army of Portugal was preserved and led into Spain. In 1813 Napoleon rewarded his valor by conferring on him the chief command of the forces in the north of Spain. On the restoration of the Bourbons he came to the United States, and lived here for a long time in retirement, but when Charles X. was overthrown in 1830 he received from Louis Philippe the command of the French troops in Algeria, which he retained till 1836, when he resigned in consequence of the defeat he had sustained at Constantine.

Clausen, klow'sĕn, **George,** English artist: b. London 1852. After studying at South Kensington 1867–73, he was for some time in Paris under Bouguereau and Fleury and subsequently visited Holland and Belgium, exhibiting at the Royal Academy in 1876, 'High Mass at a Zuyder Zee Village.' Besides many paintings of Dutch themes he has painted among other works: 'Laborers at Dinner'; 'Brown Eyes'; 'Evening Song'; 'Turning the Plow.'

Clausewitz, klow'zĕ vĭts, **Karl von,** Prussian military officer: b. Burg 1 June 1780; d. Breslau 16 Nov. 1831. He served with distinction in several campaigns in the Prussian and Russian services in 1815, became chief of a Prussian army corps, and was ultimately director of the army school, and inspector of artillery. Of his works the best known are his great book 'Of War' (3 vols.), and his life of Scharnhorst.

Clausius, klow'zĕ-ŭs, **Rudolf,** German physicist: b. Köslin, Pomerania, 2 Jan. 1822; d. Bonn 24 Aug. 1888. He studied at Berlin and afterward lectured on natural philosophy as *privat-docent* at Berlin, and as professor at the Zürich Polytechnic School. In 1869 he was appointed to the chair of Natural Philosophy at Bonn. He was elected a foreign member of the Royal Society in 1868, and in 1879 was given its highest honor, the Copley medal. His scientific labors cover parts of the field of optics and of electricity, but his especial work was his contribution to the science of thermo-dynamics, the honor of establishing which on a scientific basis he divides with Rankine and Thomson. His mathematical methods he also applied to the theory of the steam-engine, the dynamical or kinetic theory of gases, and to electricity and electro-dynamics. His great work is his 'Theory of Thermo-Dynamics.'

Clausthal, klows'täl, Prussia, a mining district and town in the province of Hanover. It is situated on the Zellerbach, 26 miles northeast of Göttingen. It stands in a bleak district, on the top and slopes of a hill, about 1,800 feet above the sea. It is regularly laid out, having been frequently burned down and rebuilt, but the houses are generally of wood. It contains a government mining school, with a good collection of models of mines and minerals, a library of 30,000 volumes, a mint at which 14,000 silver dollars are coined weekly, and over 600 gold ducats yearly, and it has also a church, court-house, and gymnasium. One of the mines reaches 500 feet below the level of the Baltic, and is drained by a tunnel cut through the mountain to a distance of six miles. The machinery of the mines is worked by water power, and every stream in the vicinity is carefully appropriated to this purpose; the various canals, which extend from mill to mill throughout the mines, have an aggregate length of 125 miles. These mines have been worked since the 11th century. The mines furnish employment to the men, and a number of knitting mills give employment to the women. Pop. 9,200.

Clava Coronæ, klā'va kō-rō'nē ("the Key of the Crown"), one of the names given to the star Alpha Coronæ Borealis, the brightest in the Northern Crown. The more common name is that of Arabic derivation, Alphecca.

Clavagel'la. See GASTROCHÆNIDÆ.

Clavaria, klā-vā'rĭ a, a genus of fungi, many of them edible. Some of the species are branched, some club-shaped. One species (*C. botrytis*), growing in Germany, is a common article of food. It has a sweetish taste, and is said by Liebig to contain mannite (q.v.). Another species is the goat's-beard fungus.

Claverack, klăv'ĕr-ăk, N. Y., a town in Columbia County, on the Boston & A. R.R., about 28 miles south of Albany. The town was settled in 1660, and has a church building dating from 1767, and a court-house erected in 1784. The town is the seat of a well-known school called the Hudson River Institute, established in 1854. Pop. (1900) 4,416.

Claverhouse, klăv'er ŭs. See GRAHAM, JOHN.

Clav'erings, The, a novel of contemporary English life, by Anthony Trollope, published 1867.

Clav'ichord, a keyed musical instrument, now out of use, somewhat in the form of a spinet, the strings of which are supported by five bridges. One distinction in the clavichord is that the strings are covered with pieces of cloth, which render the sound sweeter, and at the same time deaden it, so as to prevent its being heard at any considerable distance. On this account it was formerly much used by the nuns, who could practise on it without disturbing the dormitory. It is sometimes called the "dumb spinet."

Clav'icle, or Collar-bone, a bone situated immediately above the first rib, stretching from the upper border of the manubrium of the sternum, outward and backward to the acromium

process of the scapula or shoulder-blade. It connects the upper limb, the arm, with the trunk, and is so fastened that while its inner end rests on the sternum and cartilage of the first rib the outer end is associated with the scapula, supporting it firmly in its varied positions and preventing it from falling forward from the chest. The clavicle is a long bone, and in men is much heavier than in women. It is absent or imperfectly developed in those animals which do not use lateral movements of the fore-limbs and is very much exaggerated or modified in animals such as birds, that exercise the arms very extensively. The clavicle is very frequently broken in children from the results of a direct fall, and as it does not always occasion a marked deformity the diagnosis is at times difficult. Consult Morris, 'Human Anatomy,' 3d ed.; Gerrish, 'Text-Book of Anatomy by American Authors,' 2d ed.; Spalteholz, 'Anatomy.' See SHOULDER-GIRDLE.

Clavigero, Francisco Xavier Saverio, frän-thēs'kō hä-vē-ār' sä-vā-rē'ō klä-vē-hā'rō, Mexican historian: b. Vera Cruz, Mexico, about 1720; d. Cesena, Italy, 1787. He was educated as an ecclesiastic, and resided 36 years in the provinces of New Spain, where he acquired the languages of the Mexicans and other indigenous nations, collected many of their traditions, and studied their historical paintings and other monuments of antiquity. The first of his researches was a 'History of Mexico,' written in Italian, of which an English translation was published in 1787. This is a most comprehensive work, affording a great deal of information relative to the natural and civil history, antiquities, and religion of Mexico; but it displays more industry than judgment on the part of the author. On the suppression of the Jesuits by the Spanish government in 1767 Clavigero went to Italy, the Pope assigning him a residence in Cesena.

Clavijo y Fajardo, José, hō-sā' klä-vē'hō ē fä-här'dō, Spanish scholar: d. 1806. He lived in Madrid, where he had the reputation of an intelligent scholar, and had published a journal, 'El Pensador,' and other useful works, when his connection with the sister of Beaumarchais, whom he had loved and then forsaken, gave rise to an affair of honor between him and the brother of the lady, who was formidable for talent rather than courage. This affair, in which he narrowly escaped with his life, deprived him of his office and the good opinion of his fellow-citizens. He passed the remainder of his days under a kind of dishonor, which the representations of his adversary had brought upon him. For more than 20 years he superintended the publication of the 'Mercurio Historico y Politico de Madrid,' with which he had been intrusted as early as 1773. He likewise translated Buffon's 'Natural History' into Spanish (1785–90). He was vice-director of the Cabinet of Natural History, and director of the Theatre de los Sitios, when he died. Far from resembling the detestable portrait which Beaumarchais draws of him, Clavijo was of a mild disposition, pleasing manners, and a clear understanding. Goethe founded his tragedy 'Clavigo' on Beaumarchais' story.

Clavis, klā'vĭs (Lat. "key"), a drawing, index, etc., which serves as a guide to the understanding of another work; for instance, *clavis Ciceronia, clavis Homerica,* etc.

Claws, sharp hardenings of the skin at the end of the limbs of animals. The term is often applied to the chelæ and similar structures at the end of arthropod limbs, but is best restricted to the horny nails found at the end of the digits in most reptiles, on the toes, and often on the thumb and first finger of birds, and seen in perfection in many mammals, such as the carnivores, insectivores, rodents, edentates, and others, where the nails are sharp and serve for scratching and clinging. See HOOF; HORN; NAIL.

Claxton, Alexander, American commodore: b. Maryland about 1790; d. Talcahuana, Chile, 7 March 1841. He entered the navy as midshipman in 1806, was promoted to a lieutenancy in 1813, and served in the sloop of war Wasp in her action with the British sloop of war Frolic, on 18 Oct. 1812. He was promoted to the rank of master commandant in March 1820, and to that of captain in 1831, performing much active service in both grades. He died while in command of the squadron in the Pacific Ocean.

Claxton, Kate (STEVENSON), American actress: b. New York 1850. She was the daughter of Spencer Wallace Cone, and was married to Charles Stevenson in 1878. She made her début at Daly's Theatre before she was out of her teens, but her success dates from 1873, when she acted Mathilda in 'Led Astray.' As Louise in 'The Two Orphans' she attained great celebrity. She was playing the part at the Brooklyn Theatre when, on the night of 5 Dec. 1876, that structure was destroyed by fire with great loss of life. Since 1896 she has been touring the country in emotional plays.

Clay, Cassius Marcellus, American diplomatist: b. Madison County, Ky., 19 Oct. 1810. He was graduated at Yale College in 1832, and three years later was elected to the legislature of Kentucky. The improved jury system and the common school system of Kentucky are in large measure due to his efforts while in the legislature. He denounced the scheme of Texan annexation as designed for the extension of slavery, and in 1844 traversed the northern States, addressing immense audiences in favor of the Whig presidential candidate. On 3 June 1845 he issued in Lexington, Ky., the first number of the 'True American' a weekly newspaper, devoted to the overthrow of slavery in that State. It aroused indignant opposition, and in August following his press was seized by a mob and sent to Cincinnati. He was threatened by public resolution with assassination, but revived his paper, printing it in Cincinnati and publishing it in Lexington. Public sentiment came gradually to support the principle of the freedom of the press, and Clay was able to keep an anti-slavery journal in the field, first at Lexington, and afterward at Louisville. He served in the Mexican war, was an opponent of slavery, and supported Lincoln for the presidency. From 1862 to 1869 he was minister to Russia. In 1886 he published his speeches, edited by Horace Greeley. In 1896 he supported the "gold" Democratic ticket.

Clay, Clermont Claiborne, American senator: b. Huntsville, Ala., 1819; d. there 3 Jan. 1882. He graduated at the University of Alabama in 1835, and after studying law in the University of Virginia, was admitted to the bar in 1840. He was elected to the Alabama legis-

lature, 1842, 1844, and 1845; was judge of the Madison County court 1846–8. He was chosen United States Senator in 1853, and re-elected in 1859, receiving every vote in the legislature. In the Senate he supported the admission of Kansas under the Lecompton resolution, and was an ardent advocate of the State sovereignty doctrine. He was formally expelled in 1861, and became a senator in the Confederate Congress. In 1864 he was a secret agent of the Confederacy in Canada, but in May 1865 gave himself up to the United States authorities and was a fellow prisoner of Jefferson Davis at Fort Monroe. After his release in April 1866 he returned to the practice of law in Huntsville.

Clay, Frederic, English composer: b. Paris 3 Aug. 1840; d. London 27 Nov. 1889. He studied music at Paris, and settled in London as a composer for the stage, his most successful production being 'The Black Crook.' He composed several popular songs, the best known being 'She Wandered Down the Mountain Side.'

Clay, Green, American soldier: b. Powhatan County, Va., 1757; d. Kentucky 31 Oct. 1826. He was a cousin of Henry Clay (q.v.). He went to Kentucky early in life and there acquired a fortune as a surveyor. He filled many local offices, was a member of the convention that ratified the Federal constitution, of the Kentucky Constitutional Convention of 1799, and served for many years in the State legislature. On 16 March 1813, Gov. Shelby commissioned him a brigadier-general, and in May of that year, when Gen. Harrison was besieged by the British at Fort Meigs, on the Maumee River, Clay came to his relief with 3,000 volunteers. He was left in command of the fort and successfully defended it against a combined attack of British and Indians under Gen. Proctor and Tecumseh.

Clay, Henry, American statesman: b. Hanover County, Va., 12 April 1777; d. Washington, D. C., 29 June 1852. He was the son of a Baptist preacher who died in 1782, leaving but a small property to his widow and children. His early education was of a very limited character, and at 15 he was placed in a small retail store in Richmond. In a short time, however, he secured employment as a lawyer's clerk and after becoming a student of law was licensed to practice at the Virginia bar before he was 21 years of age. In less than a year later he removed to Lexington, Ky., and there began the practice of his profession, securing a lucrative business almost immediately. His success at this period is sometimes explained by reference to his frank, cordial, attractive manners, but no doubt his signal abilities had quite as much to do with it. In boyhood he had acquired the art of ready speech by solitary practice in the forest, barn, or cornfield, and the easy self-confidence which this had produced now stood him in good stead. In 1800 he was sent as representative to the Kentucky legislature and in 1806 was for a year United States senator to fill the unexpired term of Gen. Adair, who had resigned. He returned to the State legislature in 1807 and the next year, as the outcome of a dispute between himself and another member, Humphrey Marshall, challenged his opponent to a duel in which both were slightly wounded. In 1809 he was a second time chosen to fill a vacancy in the national Senate, remaining there two years, making his first speech at this time in favor of protection. In 1811 he was elected to the House of Representatives and on his appearance there was chosen speaker by a large majority, a post which he retained till 1814. During this period Clay took an active part in the congressional debates respecting the second war with England, vigorously sustaining the war measures of the administration by his eloquence. In January 1814 Clay resigned his speakership, having been appointed one of the commissioners to negotiate a peace with England at Ghent, in Belgium. In this matter he was instrumental in securing to the United States the free navigation of the Mississippi. After the signing of the treaty he spent some time in Paris, and also in London, where he was cordially received, returning to America in September 1815. He was again elected to Congress and again chosen speaker, and at this time was a strenuous advocate of the independence of the Spanish-American republics, as well as of the stimulation of American industries by a protective tariff. Slavery was now becoming one of the most important of political questions as regarded its limitation or extension, and the admission of Missouri into the Union brought controversy to a white heat, the contention being whether or not it should be admitted as slave or free territory. Clay, if not the author of the celebrated "Missouri Compromise," establishing the line of 36° 30′ as the northern limit of slave-holding territory, was its most earnest supporter. In 1824 he was a candidate for the presidency, in opposition to John Quincy Adams, Andrew Jackson, and William Crawford, and the Electoral College failing to make a choice, the election devolved upon the House of Representatives. On this occasion the election was secured for Adams through Clay and his friends voting in his favor. He was subsequently charged with bargaining by his enemies, in respect to his attitude at this time, but there is no evidence sustaining such a claim. John Randolph was the most persistent of Clay's defamers and after he had termed Clay's course in securing Adams' election as a "coalition of Puritan with blackleg" he was challenged to a duel by the other. During Adams' administration Clay was secretary of state, filling that office to general satisfaction, and in 1831 entered the Senate, where he led in the opposition to President Jackson's administrative policy, and attempted to prevent the removal of the deposits from the United States Bank. Largely through his influence the "Compromise Bill" was carried through Congress, which closed debate on the nullification question, through its partial reversal of the protective tariff. In 1832 Clay was for the second time a presidential candidate, but the popularity of Gen. Jackson was so great at this time that any other candidate had small chances of success, Clay receiving the votes only of Massachusetts, Rhode Island, Connecticut, Delaware, Maryland, and Kentucky. In March 1842 he resigned from the Senate and retired to private life, permanently, as he hoped. He was, however, in 1844, nominated a third time for the presidency and defeated after an intensely exciting political contest. The numerical majority was very small and his defeat was attributable in some degree to the influence of the administration. The primary cause, nevertheless, was the annex-

ation of Texas, a measure to which Clay had been opposed. After spending several years in retirement on his estate of Ashland, near Lexington, Ky., he was returned to the Senate in 1849, where he took an active part in the dispute between the slave-holding power and its opponents on the question of the admission of California, and devised the "Compromise of 1850," which terminated the long and bitter struggle. It has been sometimes urged against him as a reproach that he was always ready with a compromise in political emergencies, but in these matters he may have been wiser than his critics. For the greater part of his life he wielded a great political influence, acquired partly by his eloquence as an orator, partly by the fact that he never left his position in doubt on questions of national moment. By throwing the entire weight of his talents and influence in favor of a *via media* he more than once ended the violence of party strife which had reached so high a pitch as to endanger the national peace and the continuance of the government. In the crucial matter of slavery his counsels were moderate and his policy always pacificatory. In his latest years, however, this question had become too overwhelmingly important to be handled in any but the most resolute fashion and although the "Compromise of 1850" served its immediate turn, the day for compromises was nearly over, and this the great Kentuckian may have realized. This was his latest political effort and his death resulted, in effect, from the exhaustion induced by the controversy at this time. His political career extended over half a century and for much of that period he ranked as one of the foremost orators of the time. He was the subject of much adulation as well as of bitter slander. The latter was certainly undeserved, and if he does not bulk so largely in the minds of men at present as his admirers fondly anticipated, a juster estimate than any of which they were capable may find in him a truer greatness than they recognized. There were serious limitations in his character: He reflected the violence of his time, the tendency to unrestrained invective, once common among public men, but he also reflected much of its nobility, and his devotion to the real interests of his country can scarcely be doubted. Consult Cotton, 'Life and Times of Henry Clay'; Schurz, 'Henry Clay' (1887); Parton, 'Famous Americans.'

OSCAR FAY ADAMS.

Clay Center, Kan., the county-seat of Clay County, is situated on the Union P., and Chicago, R. I. & P. R.R.'s, and on the Republican River, which supplies ample water-power. The principal industries are the manufacture of foundry and machine-shop products and flour, and the cultivation of nursery stock. The city is somewhat noted for its greenhouses. Pop. (1900) 3,069.

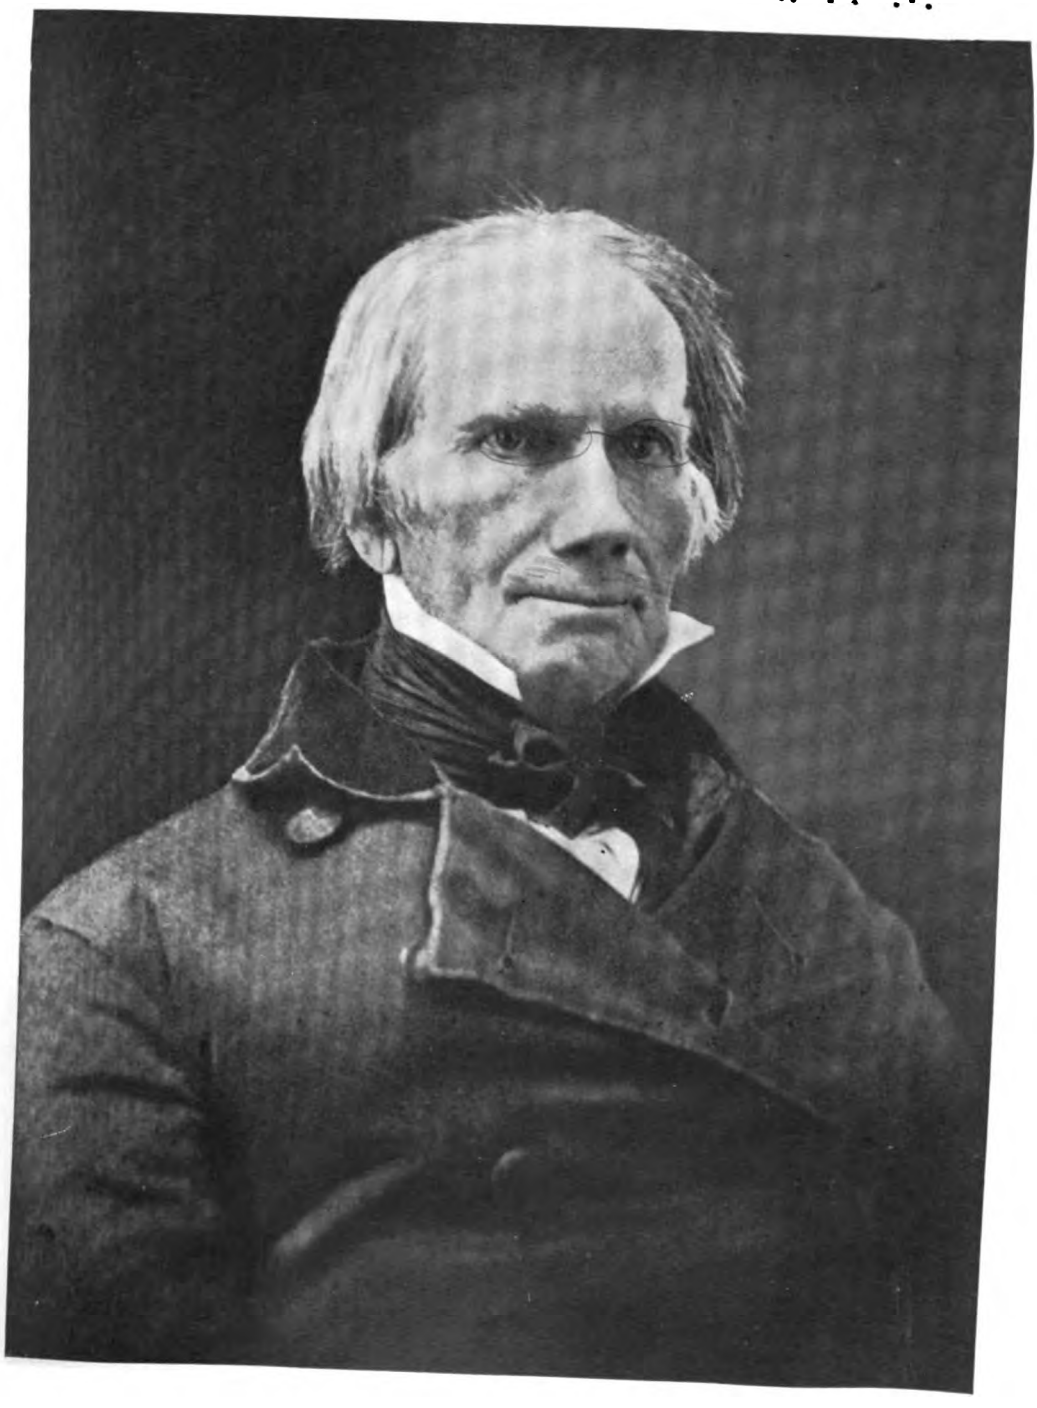
Clay, any aluminous silicate having plasticity; that is, which can be molded, when moist, into forms which become stone hard after exposure to a red heat or higher temperature. Plasticity is a physical quality, apparently having little relation to chemical composition, and the exact reason why one clay is more plastic than another is even yet largely a matter of speculation. In a broad way clays may be divided into: (1) Pure clays, mostly silica and alumina, with small amounts of iron, lime, magnesia, soda, and potash; (2) sandy clays or loams, comprising much of the arable soil of the world; and (3) limy clays or marls, clays containing a high per cent of lime. Clays are also given a great variety of names, according to special characteristics and economic use. The important divisions, based on use in the arts are: Kaolin, or China clay, pottery clay, fire clay, and brick clay.

Origin of Clay.— The base of all clays is the mineral kaolinite, having the formula $Al_2O_3.2SiO_2+2H_2O$, giving silica 46.3 per cent; alumina, 39.8 per cent; water, 13.9 per cent. It is made up of minute hexagonal plates. It results from the decay of feldspathic rocks, particularly granites and gneisses. Surface waters percolating through such rocks leach out the potash in the feldspar; some silica is also leached out and left in a hydrated state Kaolinite results from the union of the broken-down alumina of the feldspar with the hydrated silica. Thus were formed in place the kaolin deposits of Cornwall, England, and some of the kaolin of North Carolina and Pennsylvania. By the erosion of the land the kaolin and other products of rock decay are carried away and deposited as silts in lakes or in the ocean. Also, under the grinding of glaciers, rocks are reduced to a fine rock flour, forming glacial clays (boulder clay or till). The beds of clay laid down in the ocean may be buried deeply under other deposits, and by heat and pressure be changed to shale. When the sea bottom is elevated and the new land surface eroded, the shale may disintegrate into clay again, or the shale itself may be mined by man, ground, and used as clay.

Varieties of Clay.— Pure kaolin or China clay is rare. It is pure white and almost free from iron salts. The common chemical impurities in the crude material are silica, iron, lime, alkalies, magnesia, and titanium, and the common mineral impurities are quartz, feldspar, mica, calcite, magnetite, limonite, and pyrite. If the product is white, contains very little iron, and is low in alkalies it passes in the trade as kaolin. Kaolin has little plasticity, and in making pottery other clays are often added to give this quality. It may occur as residual kaolin in the position of the original feldspar body, a vein or dike, or, if transported by streams and deposited at a distance in beds, as sedimentary kaolin. Residual kaolin is apt to be of better quality than sedimentary, containing less iron and other impurities.

The United States imported about 130,000 tons of kaolin in 1902, the production for 1901 having been 97,253 short tons. Kaolin is mined in De Kalb and Jefferson counties, Ala.; at Hockessin, Del.; in Taylor County, Ga.; at Blandford, Mass.; in Macon, Jackson, and Montgomery counties, N. C.; in Chester and Delaware counties, and in the South Mountain region, Pa.; in Aiken County, S. C.; and in Lake County, Fla.; and there are deposits in Missouri, Tennessee, and several other States.

Besides being used in making pottery and white tiling and brick, kaolin is largely employed in the manufacture of paper, for weighting the paper and giving a better surface. The largest pottery manufactures in the United States are at Trenton, N. J., and East Liverpool, Ohio. Nearly all the Chester County, Pa., kaolin goes



HENRY CLAY.

to those places. The South Carolina kaolin is nearly all used in paper-making.

ANALYSIS OF VARIOUS CLAYS.

	SiO_2	Al_2O_3	H_2O	Fe_2O_3	CaO	MgO	Na_2O, K_2O	TiO_2
1	53.10	33.06	11.32	1.18	0.38	0.08	0.83	—
2	73.80	17.30	4.69	.35	—	1.18	2.49	—
3	59.83	24.58	7.83	1.66	0.28	0.87	3.11	1.17

1. Crude kaolin, West's Hill, N. C. 2. Refined kaolin, Mt. Holly, Pa. 3. Fire clay, Bolivar, Pa. 4. Pottery clay, Zanesville, O. 5. Paving brick clay, Bloomington, Ill. 6. Front brick clay, Sayreville, N. J. 7. Brick clay, Milwaukee, Wis. 8. Terra-cotta clay, Glens Falls, N. Y.

Fire Clays differ much in color, hardness, texture, and composition, and some clays used in making fire brick are not particularly refractory, but are used for their high plasticity. Strictly a fire clay is a nearly pure mixture of sand and clay with only traces of iron, lime, and magnesia, and hence makes white or light colored bricks which can stand very high temperatures. According to Ries a clay should not be considered refractory unless its fusing point is above 2,700° F. Fire clays are divided into plastic and flint, the former, if hard when dug, becoming plastic when ground and mixed with water; the latter, though sometimes having nearly the same composition, do not become plastic when similarly treated. Fire clays, like kaolins, are sometimes residual products of the decay of feldspar veins, but most are of sedimentary origin. Some form the underclay of coal seams, but all such underclays are not refractory. The underclays of the Michigan coal beds are not. Fire clays in the United States are found in rocks of many geological periods, but chiefly in the Carboniferous and Cretaceous. Workable deposits are known in 18 States; important deposits being in western Pennsylvania; in the coal-mining region of Ohio; in a belt across New Jersey from Perth Amboy to Trenton; in Cecil, Garrett, and Allegany counties, Md.; near St. Louis, Mo.; near Woodstock and Aniston, Ala.; and near Golden, Colo.

Potters' Clay.— Clays for potters' use, apart from the materials used in accessory work, such as fire-brick, saggers, etc., are divided into two classes, kaolins and ball clays. The former term is derived from the Chinese Kao-ling, meaning lofty hill. The Chinese porcelain clay was found in quantities in a hill thus named, and the term applied to the clay served to define it. The word kaolin is now applied by common consent to a residual clay which remains white after burning. A residual clay is one which lies as it was formed. Masses of feldspar have been decomposed, the contained potash has been gradually dissolved by carbonated waters, and the residue of silica and alumina has been left. There is usually more or less undecomposed feldspar and grains of quartz associated with the clay, and hence most kaolins are washed before being put on the market.

Kaolin is well known as forming one of the ingredients in Oriental porcelain, the other ingredient being a quartzose feldspathic rock called in China *petuntze*. For Sèvres porcelain kaolin is obtained from Limoges.

Ball clay,— probably corrupted from bowl clay,— is a sedimentary clay, having been washed up and redeposited. It is valued for a high plasticity which kaolin does not possess. The purest ball clay is found in Florida and is sold under the name of "plastic kaolin." Most of these clays burn to a cream or almost a stone color. They are mined in New Jersey, Kentucky, Missouri, and Colorado, in addition to the Florida clay already mentioned. Ball clays are not usually washed before use.

Pure clay is a hydrated silicate of alumina containing about 46 per cent silica, 39 per cent alumina, and 14 per cent water. There is no clay known, however, which contains more than 98 per cent of this silicate, even after washing.

Brick Clays are mixtures of sand and pure clay with lime, magnesia, iron, potash, and soda; in fact, bricks are often made from sandy mixtures which are not properly clay. A mixture with considerable iron burns red, from the oxidation of the iron. Carbonate of lime, or magnesia, by forming light-colored silicates, counteracts this red color. Thus the red clays of Wisconsin, which sometimes contain 20 per cent of lime, make the cream-colored Milwaukee brick. The sedimentary glacial clays are largely used for brick-making in the northern States, sedimentary surface clays and loams in the western States, and residual clays in the southern States. All that is required is that the brick shall be of good color, dense, hard, and of regular form. Brick material of good quality is found in nearly every State of the Union.

For making paving-brick a clay or shale should be relatively high in lime, iron, and the alkalies, that it may vitrify well in burning. When ground and mixed the clay or shale should be fine-grained and plastic, and should shrink but little when burned. Of the western States Illinois leads in the production of paving-brick, with Missouri second.

The very plastic clay known as gumbo in the southern States, besides other clays, are burnt in small lumps and used as ballast by a number of railroads.

Terra cotta, used in fire-proof construction and for decoration, may be made of any clay that will make good, strong brick, and contains no excess of soluble salts that will "whitewash" on weathering.

Methods of Mining.— The clay, if it lies at or near the surface, is first stripped of soil or sand and gravel; sometimes as much as 30 feet being removed. In New Jersey the clay is often dug in pits as deep as the thickness of the bed by hand labor. Usually clay beds are worked either by digging the clay entirely from the base of the bank, by working the bank on an incline of about 30° or, where the bank is over 30 feet high, by working in benches six to eight feet wide and seven to nine feet high. Steam shovels are sometimes used. Where the clay is tough it is often worked by undermining several feet and then breaking a foot or more from the face by wedges. Blasting is used in very tough clay and in shale. If the clay lies at some depth, drifts large enough for a man and a wheelbarrow are driven in to the bank side by side.

Sometimes a shaft is sunk and drifts driven from the base, this method being used in Pennsylvania and Ohio and in the fire-clay beds of Missouri.

Egyptianized Clay.— A discovery which gives good promise of affecting the clay industry and its various branches has been made by Mr. E. G. Acheson of Niagara Falls. While experimenting in crucible manufacture, Mr. Acheson had occasion to search for a clay possessing certain qualities. After a series of experiments the account of Egyptian brick-making given in the fifth chapter of Exodus attracted his attention, and conceiving the idea that some property in the straw used in brick-making in Egypt might give him the result he sought, he boiled a quantity of straw, obtaining a dark-red liquid which he used in the treatment of clay, finding it excellent for increasing its plasticity. He sought out the principle, and determined that the agent was tannin. He treated other clays with water in which tannin was in solution, and realized that he had made an important discovery.

The name given by Mr. Acheson to clay treated by his process is "Egyptianized clay." He has discovered that it is practicable so to treat clay and other earthy materials as to ensure greater strength in the products made therefrom, also to greatly reduce the shrinkage and warping in the process of drying and baking, and to increase the solubility and the plasticity of the material. By his process, non-plastic clays may be rendered plastic, and plastic clays made more plastic by treatment with tannin or an agent having the astringent principles of tannin.

It has been found by experts of the highest standing that clay so treated is changed in a remarkable manner. Even one half of 1 per cent of tannin develops a wonderful effect, requiring 13 per cent less water to make the clay soft. The maximum effect of the process and treatment, however, seems to be obtained by the use of 2 per cent of tannin in a 10-day treatment, consisting in keeping the clay wet, so that the tannin is dissolved. In the burned form the strength of the clay is increased 50 per cent, while in the sun-dried form it is increased in tensile strength 350 per cent. It is also observed that the Acheson treatment removes the crackling tendencies of many clays. In cases where clay articles are to be made of a certain size, they can be made more exact by the Acheson process, as there is less shrinkage. All parts intended to carry loads may be greatly increased in strength, while there is decreased porosity. Many of the plastic clays are off color, but non-plastic clays of desired color will be brought into service by the Acheson process. In making glass pots it now takes months to "age" or temper the clay, while with the Acheson process the maximum effect is obtained in a 10-day treatment. It is told of the Chinese that the people of one generation prepare the clay for the use of the next, all of which time is spent in making the clay plastic. Under the Acheson process the results are said to be more pronounced in 10 days than obtained by old methods in years.

The following States in 1901 manufactured clay products to the value of $3,000,000 or over. The figures are from 'The Mineral Industry.'

State	Brick and Tile	Pottery	Total
Ohio	$11,526,424	$10,048,561	$21,574,985
Pennsylvania	13,656,730	1,665,012	15,321,742
New Jersey	5,781,805	5,900,073	11,681,878
Illinois	8,960,041	682,449	9,642,490
New York	7,214,358	1,077,360	8,291,718
Missouri	4,409,906	64,647	4,447,553
Indiana	3,935,083	531,371	4,466,454

The total value of the clay products made in the United States in 1901 was $87,747,727, classified as follows:

Common brick	$45,503,076
Front brick	4,709,737
Fire brick	9,870,421
Paving and vitrified brick	5,484,134
Sewer and drain tile	6,736,969
Crude clay and various manufactures	15,443,390

See Porcelain; Soil.

Clay Iron-Stone, oxide of iron (hematite) mixed with clay or sand, an iron ore of importance in England. It is hard and red to brownish-black in color. The name is also given to the argillaceous carbonate of iron occurring in nodules and beds in the coal regions of Pennsylvania, Ohio, and other States. When intimately mixed with coal, as in Scotland ("blackband ironstone"), it is of importance as an iron ore (q.v.).

Clay Marl. See Marl; Soil.

Clayden, Peter William, English Unitarian clergyman and author: b. Wallingford, Eng., 20 Oct. 1827; d. London 19 Feb. 1902. After being pastor of Unitarian congregations at Boston, Lincolnshire, 1855–9; Rochdale 1860; and Nottingham 1860–8; he became one of the staff of the London *Daily News,* on which he remained till 1896, in the meantime establishing the Reading *Observer* in 1873, remaining its proprietor for six years. He published: 'The Religious Value of the Doctrine of Continuity' (1866); 'Scientific Men and Religious Teachers' (1874); 'England Under Beaconsfield' (1880); 'Samuel Sharpe, Egyptologist' (1883); 'The Early Life of Samuel Rogers' (1887); 'Rogers and His Contemporaries' (1889); 'England Under the Coalition' (1892).

Clay'more, formerly the large two-handed, double-edged sword of the Scotch Highlanders; now the name is given to a basket-hilted, double-edged broadsword.

Claypole, Edward Waller, American geologist: b. England 1 June 1835; d. Long Beach, Cal., 17 Aug. 1901. He was graduated at the University of London in 1862; was professor of geology and biology in the California Polytech-

nic Institute in Pasadena, and for a time was on the geological survey of Pennsylvania. He was the author of numerous reports on the geology of Perry County, Pa., and of papers and essays on geological and biological subjects. He was a member of a number of geological societies in London, Edinburgh, and America, and of the American Association for the Advancement of Sciences.

Claypole, Noah, the sneaking, cowardly apprentice in Dickens' 'Oliver Twist,' who robs his master's till, joins Fagin in London, and by turning state's evidence insures the conviction of Bill Sykes for the murder of Nancy.

Clayton, Augustine Smith, American lawyer: b. Fredericksburg, Va., 27 Nov. 1783; d. Athens, Ga., 21 June 1839. He graduated at the University of Georgia 1804; was admitted to the bar, and practised with eminent success. He served in the State legislature; was judge of the superior court 1819–25 and 1828–31; and a representative in Congress from 1831 to 1835. In Congress he opposed the tariff and United States bank measures. He is said to be the author of the political pamphlet 'Crockett's Life of Van Buren.' He compiled 'The Laws of Georgia, 1800–10' (1812).

Clayton, Estelle Evesson, American actress and dramatist: b. New York State; married to Charles W. Durant in 1888. She began her stage career in 1878, playing Agnes Wickfield in 'Wilkins Micawber.' She has played Nora in 'Esmeralda,' and Constance in 'Young Mrs. Winthrop' with conspicuous success. In 1885 she wrote and produced at Madison Square Theatre, New York, 'Tric-o-Trin,' and in 1888 dramatized Amelie Rives' famous novel, 'The Quick or the Dead,' and played it with great success throughout the southern States. She wrote the text for the operas 'Paulita' (1890), and 'The Viking' (1895), and a comedy, 'A Puritan Romance' (1897), which was produced in London with success.

Clayton, John, American botanist: b. Fulham, England, 1686; d. Virginia 15 Dec. 1773. In 1705 his family came to Virginia, where his father became attorney-general, and took up their residence near Williamsburg. He entered the office of Peter Beverly, clerk of Gloucester County, succeeded him, and held the office for 51 years. He was an enthusiastic botanist, and thoroughout his long life delighted in exploring and describing the plants of his region. Gronovius and Linnæus published an account of specimens of Virginia flora sent them by Clayton (Leyden 1739–43), and Gronovius' son named a genus of herbaceous plants *Claytonia* in his honor. Clayton's studies of Virginia natural history were published in the 'Philosophical Transactions' of the London Royal Society, and his descriptions of some new species of plants are to be found in the third volume of Peter Force's 'Tracts.' Two folio volumes of manuscript, almost ready for the press, were burned with the records of New Kent County during the Revolutionary War.

Clayton, John Middleton, American statesman: b. Sussex County, Del., 24 July 1796; d. Dover, Del., 9 Nov. 1856. He was elected United States senator in 1829, and held office till the close of 1836, when he resigned. He was then appointed chief justice of his native State, and continued on the bench for nearly three years. In 1845 he was again sent to the Senate, and remained there till March 1849, when he became secretary of state under Gen. Taylor. In this capacity he negotiated the Clayton-Bulwer Treaty (q.v.), adjusting the respective claims of Great Britain and this country in Central America. Clayton resigned office on Gen. Taylor's death in 1850, but remained in the Senate till his death. He was a zealous Whig, an able debater, and a statesman of high talent and upright character.

Clayton, Powell, American soldier and diplomatist: b. Bethel, Pa., 7 Aug. 1833. He received an academic education in Bristol, Pa.; later studied civil engineering, and went to Leavenworth, Kan., as engineer and surveyor in 1859. When the Civil War broke out he entered the Union army as captain of the 1st Kansas Infantry. In May 1863 he led a successful expedition against a band of guerrillas on the White River, Ark., and also to destroy Confederate stores; and in 1864 was promoted brigadier-general of volunteers. At the close of the war he settled in Arkansas; was elected governor in 1868; United States senator in 1871–7; appointed minister to Mexico in 1897, and raised to rank of ambassador in 1899.

Clayton-Bulwer Treaty, a treaty existing from 1850 to 1901 between the United States and Great Britain. It was an agreement designed to prevent either country from securing exclusive rights over any interoceanic canal across Nicaragua (See ISTHMIAN CANALS, AMERICAN). Its origin represented a supposed mutual withdrawal from positions rapidly generating war. Its lifetime has two opposite phases: (1) That in which the United States, wishing no such exclusive rights, held it and appealed to it as a bulwark against British encroachments, opposing only an injurious interpretation of it; (2) that in which the same power did wish such privileges, endeavored first to gain British assent to its abrogation, and after long and fruitless struggles and repeated threats of abrogating it without such assent, was only withheld from the abrogation by a compromise treaty which replaced the old. The three periods were as follows:

1. The English colony at Belize (now British Honduras), for a century or more had strengthened their position against the Spaniards by a vague protectorate over the Mosquito Indians, occupying the northeast coast of Nicaragua. They termed their chiefs "kings," and upheld their dominion over "Mosquitia," usually called the Mosquito Coast. In 1815 they crowned one of them at Belize and, when the Spaniards lost control of Central America in 1822, had him set up a claim to boundaries reaching down into Costa Rica, and so including the banks of the San Juan River, where the canal would run if built. In 1841 this sovereignty was enforced by raiding San Juan del Norte at the mouth of the river, and carrying off the commandant; in 1847 the "king" announced to Nicaragua that on the first of January next he should "reassume his lawful control" over the San Juan, and early in the year the English seized the town and renamed it Greytown. A new English treaty was then made with Nicaragua, recognizing this occupation. This roused great excitement in the United States, as equally a blow at the Monroe Doctrine and against American control of the

canal; and an over-zealous Nicaragua chargé of the fire-eating Polk administration drafted a treaty for United States fortification of the canal, and a guarantee of Nicaragua's sovereignty over all the territory she claimed. This, if we made its provisions active, meant war with England. The pacific Taylor administration then in power framed a milder treaty for a right of way merely, allowing Nicaragua to make similar ones with other nations. This still left Greytown as an apple of discord, and conflicted with the English treaty. Both England and America were on edge with suspicion: the former (whom events justified) that American expansion would end in a claim to entire control of the canal, which would prejudice British colonial interests; the United States, that the English recognition of a fictitious and swollen sovereignty by a tribe of savages over the Atlantic end of the canal foreshadowed the total exclusion of the United States. Each party in fact wanted only to bar the other's monopoly. John M. Clayton (q.v.), secretary of state, opened negotiations with the English minister, Sir Henry Bulwer (q.v.), in January 1850, for a joint control. Meantime Great Britain, to secure the Pacific end, sent an expedition to occupy an island in the Gulf of Fonseca (then supposed to be the natural western terminal); our then Nicaraguan representative, E. G. Squier (q.v.), obtained a temporary cession to us of Tigre Island, the nearest one to Nicaragua, to block this scheme, pending a formal treaty; shortly afterward the British expedition arrived, and seized Tigre "for debt." Clayton, in great fear lest the popular indignation should force his hand, pushed the treaty through without sufficient insistence on clear definition of the points at issue. It was signed 19 April, and passed the Senate, 42 to 11. Its provisions were that (1) neither power was to have exclusive control over the proposed canal; (2) neither was to fortify the canal or its vicinity; (3) neither was to occupy, fortify, colonize, or have dominion over any part of Central America, either directly or through any "alliance or protection, intimacy, connection, or influence" in or over it; (4) the two powers should mutually guard the safety and neutrality of the canal, and invite all other nations to do the same; (5) they should aid and protect any authorized and reasonably operated canal company; (6) the fifth article (to establish a general principle) should extend also to any other means of isthmian transit.

England did not formally withdraw her Mosquito protectorate, but with the neutralization of the canal it ceased to have any object, and was thought sure to drop. Before the ratifications were exchanged, however, Lord Palmerston wrote to Bulwer that the British government would interpret the treaty as not applying to Honduras "or its dependencies." This could include Mosquitia, and it was Clayton's duty to settle that point before proceeding; but in fear of having his statesmanlike plan wrecked, and confident of no practical evil resulting, he assumed that it referred only to the islands, did not press Bulwer for assent to this construction, concealed the three quoted words from the Senate and the attorney-general, and the ratifications were exchanged 4 July. Great Britain had won a distinct diplomatic victory; she had secured a pledge from the United States not to occupy any position in Central America, while herself retaining the entire eastern coast of Nicaragua.

2. The ambiguous interpretation of the treaty satisfying neither power, Daniel Webster (q.v.), who succeeded Clayton in 1850, undertook negotiations with Bulwer to modify it; but what each side most desired was what the other would not grant — recognition or abandonment of the bogus Mosquito claim to the mouth of the river. In 1851, to clear up the meaning of the word "dependency," Great Britain occupied Greytown; proclaimed afresh the Mosquito protectorate; and in November one of her men-of-war fired on the American vessel Prometheus for refusing to pay port dues at Greytown. England disavowed this, but the question which Clayton had shirked must be settled. About this time the English had started a project to build a ship railroad across Honduras; and to hold the approaches, their government reoccupied (August 1852) a group of islands off the northern coast, called the Bay Islands, formerly part of Belize. American suspicion once more became hot; and the new Pierce Senate in December ordered an investigation into the way the treaty had been kept, called for the papers, and for the first time found how they had been tricked — not, however, by the English diplomat, but their own. In great wrath, they denounced the occupation of the islands and the Mosquito protectorate as an infraction at once of the treaty and the Monroe Doctrine, and Marcy, now secretary of state, instructed Buchanan, minister to England, to insist on the British evacuation of all English territory in Central America except Belize. Lord Clarendon replied that Belize was not a part of Central America as understood by the treaty; that the Bay Islands were a part of Belize; that the treaty did not refer to Mosquitia, but only prohibited further colonization; and that the Monroe Doctrine was no part of international law. Just then a quarrel between the Mosquito Indians and the American settlement south of Greytown led to a United States gunboat bombarding and burning the latter. Then William Walker (q.v.), with the aid of a Nicaraguan faction, became for a time the master of the state, ostensibly in the interest of the United States, whose slaveholding government at last received a representative from his; and the British believed that this country intended to retain possession of Nicaragua. On the other hand, Costa Rican action against Nicaragua was laid to English incitement. Walker continued to make mischief till shot in 1860. Dallas, who succeeded Buchanan, drew up with Clarendon a treaty of 7 Oct 1856, which came to grief on the question of the Bay Islands. In 1857 Buchanan became President, and supported his secretary of state, Lewis Cass, in making a preferential canal treaty with Nicaragua; to which Great Britain objected as violating the Clayton-Bulwer Treaty, and it was not ratified. In the fall of that year, Buchanan announced his intention of proposing an entire abrogation of the treaty and arranging a new one on a satisfactory basis. Lord Napier, now British minister, proposed three alternatives: a mutual abandonment of the treaty and return to the *status quo ante;* submission of the question to arbitration; and the awaiting the issue of treaties pending between Great Britain and the

Central American states. The last was accepted, and the results were satisfactory enough to prevent further trouble for more than 20 years. The Bay Islands were retroceded to Honduras on condition of not parting with them to any other nation; the Mosquito protectorate was abandoned, and a reservation set up for the Indians by Nicaragua, which was to pay them $5,000 a year or else the rights reverted to Great Britain; and Greytown became a free port under Nicaraguan sovereignty. The conditional clauses of the renunciation were not pleasing to the United States, and in fact the money was never paid, partly because Nicaragua expected the United States to back its refusal; but on the whole the settlement was accepted as a happy ending to the wrangle. Up to 1880, though the growing sentiment in favor of exclusive United States control of the canal sometimes fretted against the treaty, a host of treaties and other international actions were based upon its validity, and it was more than once appealed to when British acts (as the erection of Belize into the colony of "British Honduras" in 1862) were assumed to violate it.

3. The latent feeling in favor of exclusive control was stirred into active life by the French canal at Panama, and the fear that it would give that nation the military control of Central America. In March 1880 President Hayes sent a special message to Congress enunciating the policy of "an American canal under American control," expanded later into the claim that the banks of the Nicaragua Canal would be a continuation of the United States shoreline. As a result, Congress passed several resolutions recommending the abrogation of the Clayton-Bulwer Treaty. Garfield in his inaugural of 4 March 1881, spoke (though less strongly) in the same strain; the project of a joint European neutralization of the Panama Canal was arousing much American feeling. J. G. Blaine (q.v.), then secretary of state, opened the attempt at an outright repudiation of the treaty. In a circular to the European powers, 24 June 1881, he declared that the United States would in future allow no foreign interference in the control of any isthmian canal, whose neutrality we would ourselves guarantee; and that any European action toward sharing in such guaranty would be held equivalent to an alliance against the United States. Lord Granville, for Great Britain, replied briefly that this matter was already settled by the Clayton-Bulwer Treaty, and his government relied on its observance. Meantime and afterward, 19 and 29 Nov. 1881, Secretary Blaine sent two long arguments of his position to James Russell Lowell, then minister to England. He did not, however, allege that the treaty was null, or commit the country to an open repudiation of it, but complained of it as so contradictory of interpretation, and mutually vexatious, that it ought to be no longer binding under new circumstances. He also asserted that the joint control would be virtually controlled by England, from her superior naval strength. In fact, however, the treaty provided not for a joint control, but a joint refraining from control, and prevention of any other power gaining control. Lord Granville replied by two dispatches of 7 and 14 Jan. 1882, traversing the logical and historical arguments adduced. Garfield's murder led shortly to Blaine's retirement, and F. T. Frelinghuysen's accession to his place. The outcome of further correspondence was, that England would not give up the treaty, and declared that the United States was estopped by its own acts from interfering with it, and that the Monroe Doctrine was a mere assertion of force, having no standing in international law, and had the same place in diplomatic argument as a list of the military or naval forces. Congress and the President (Arthur) were much dissatisfied with this result; and the latter proceeded to draw up a treaty with Nicaragua in flat defiance of the Clayton-Bulwer Treaty. It formed a perpetual alliance between the United States and Nicaragua, whose territorial integrity this country guaranteed; save that the United States was to build a canal and have exclusive control over it, and own in fee simple a strip on each side. The Senate shrunk from this direct repudiation, without stronger cause than yet existed, and refused, 32 to 23, to ratify the new treaty. Mr. Cleveland's accession put a stop to the agitation for many years, as he disapproved of the new movement, preferring a union of the nations in a common protection of what was for their common interest. So far from any attempt being made under his administrations to repudiate the treaty, on two important occasions it was appealed to in protest against acts of Great Britain. The first revival of the feeling of 1880–4 in practical form was in President McKinley's second annual message, December 1898, favoring a canal under American control; and few then doubted that it must be through Nicaragua. The acquisition of new territory and the increase of the navy led many who had been opposed to the movement to change their minds, and favor a canal through which the United States at all times could pass its war vessels, and from which it could exclude its enemies. Others continued to argue that if the country were not superior in naval force it could not maintain that privilege against its enemies, and if it were, could enforce it against them in any event, and that an exclusive control only made the canal the instant mark of our enemies. But the dominant feeling was strongly against the treaty; congressional resolutions declared it void; the press denounced it; and the sentiment was in favor of President Arthur's old scheme of acquiring a strip of land along the canal outright. The British feeling was by no means strong for the treaty, but it preferred a modification by decent diplomatic forms rather than a violent abrogation. To take the movement out of the hands of newspapers and demagogues, the American and British governments hastened to devise a new arrangement which should not throw all old principles to the winds, and a treaty was negotiated by Secretary John Hay on our side and Sir Julian Pauncefote on the other, known as the first Hay-Pauncefote Treaty, signed 5 Feb. 1900, and sent to the Senate. The majority were astonished and indignant, as the new treaty not only did not abolish the old, but proclaimed it in force and binding; adhered to its principles of neutralizing the canal, which were what the growing sentiment wished to reverse; and was in fact only the Clayton-Bulwer Treaty in new and tighter form, in all the points which had become most obnoxious. The "Davis Amendment," proposed in committee, practically nullified the neutrality feature, but neither it nor the main treaty had

been acted upon when the Senate adjourned in June. The period for ratification was extended to 5 March 1901; but the platforms of both parties insisted on exclusive American control. The amendments added to it in the following session of Congress made it unacceptable to Great Britain, which refused to ratify it, and it expired by its own limitation. The two statesmen, however, drew up another, less satisfactory in some respects than the old, and which specifically abrogated the Clayton-Bulwer Treaty, but succeeded in saving its general principles of neutralization (see HAY-PAUNCEFOTE TREATY); and it was ratified 16 Dec. 1901. By the irony of fate, this question of the control of a Nicaragua canal, so burning for half a century, and menacing war more than once, seems to have been dealing with a contingency never to happen, as the entire subject-matter is apparently set aside in favor of the Panama canal.

Clayto'nia, a genus of plants of the purslane family (*Portulacaceæ*), so named in honor of the American botanist John Clayton (q.v.). It is among the earliest and most beautiful of the American wild-flowers, these two qualities giving it its common name of spring beauty. There are at least 25 species, most of them natives of North America. The plants grow in damp woods and wet places, and are found at all elevations up to 5,000 feet, in the region of Nova Scotia, south to the Gulf, and westward to the Pacific coast. *C. perfoliata,* Spanish lettuce, common from British Columbia to Mexico, is used as an anti-scorbutic in household medicine. *C. tuborasa,* a native of Siberia, supplies a root that is eaten by the natives.

Cleanthes, klē-ăn'thēz, Greek Stoic philosopher of the 3d century B.C. He was a native of Assus, in Lydia, but, visiting Athens, became a zealous disciple of Zeno. In order to attend on that master in the day, he was accustomed to labor by night. His mental and his bodily strength were immense, and despite all obstacles, he studied so successfully as to become Zeno's successor, 263 B.C. Of his writings only some fragments remain, among which is his noble 'Hymn to Zeus.'

Clear, Cape. See CAPE CLEAR.

Clear Lake, a body of water lying in a picturesque region in Lake County, Cal.; 110 miles north of San Francisco. It is 25 miles long, and from two to six miles wide.

Clearance of Vessels, the examination of them by the proper custom-house officers, and the giving of a certificate that the regulations have been duly complied with. Vessels are said to clear inward or outward according as they arrive or depart.

Clearchus, klē-ăr'kŭs, Spartan general who commanded about 13,000 Greeks in the army of Cyrus the Younger when that Persian prince tried to wrest the throne of Persia from his brother, Artaxerxes II. When Cyrus was defeated at Cunaxa (401 B.C.), Clearchus and his chief officers were seized by treachery and put to death.

Clear'field, Pa., the county-seat of Clearfield County, on the Susquehanna River (west branch), and on the Pennsylvania R.R. It is situated in the west-central part of the State, and is surrounded by a rich agricultural region, underlying which are deposits of coal, fire-clay, and limestone. Its manufactories include flour-mills, tanneries, foundries, and lumber mills. Pop. (1900) 5,081.

Clearing-house, an institution for balancing daily the mutual obligations of a number of banks in a single city, with the least possible transfer of actual cash from "debtor" to "creditor" banks. At a central office the various accounts are canceled against each other on the blanks of the clearing-house, which is thus made the one debtor and creditor of all; and each settles the day's transactions by giving or receiving in a single payment the balance due. Some clearing-houses do not even require cash in the settlement: in London it is made by transfers on the banks' accounts with the Bank of England (which is not a member of the clearing-house); in Philadelphia by United States or clearing-house gold certificates. In one shape or another, however, the final payments must represent gold; this has been so from the foundation of the system, and in every country and every State of the United States. The institution as developed has come to serve other purposes more valuable even than its primary ones; but those relieved a situation vexatious then, and quite incompatible with the volume and character of banking at present. Indeed, in America for many years the need of it was indefinitely greater than where and when it originated — Great Britain, in the latter part of the 18th century. Each bank sent a messenger daily to each of the others, to collect its checks on them and bills payable at them; and the amounts were paid by each to each in cash — Bank of England notes — which the messengers carried back through the streets. This was not only costly and wasteful of time, but involved danger of accident or robbery in transit. In Edinburgh, which claims priority in the clearing-house device, a still more curious reason is alleged: that rival banks accumulated a mass of each others' obligations and presented them in a lump, to break each other. (Something like this actually was done about 1850 by Overend, Gurney & Company to the Bank of England — accumulating a great deposit and withdrawing it all at once — not to bankrupt it, but to frighten it into rescinding a rule not to lend to brokers except at certain seasons.) Hence it was agreed to adjust their claims to date twice a week only. But the first historical appearance of the system is in London. About 1770 the clerks evolved the idea (perhaps from the custom among French merchants of making their bills payable at the annual fair of Lyons, where they mostly canceled each other) of economizing their time and labor by meeting daily in a room and exchanging obligations, settling only for the balance. This obviously enabled on an average one half of the clerks to dispense with their errands, and reduced the needful stock of real money. Many years later a great English bank reduced its reserve of daily cash from £150,000 to nearly nothing by admission to the clearing-house; and the ratio of balances in money to the total obligations in American clearing-houses has varied all the way from 20 per cent down to 3.9 per cent (in New York, where it has never risen to 7). In 1775 a special building in Lombard Street, London, was assigned to this department; at first it was merely a meeting-place of the clerks for ex-

change; but shortly the further step was taken of appointing paid clerks to receive and balance checks and bills. In 1858, on the suggestion of Sir John Lubbock, the system was extended to include the country banks of Great Britain, by means of their London correspondents.

The New York clearing-house was not established till 11 Oct. 1853. The conditions were so bad previous to this, that it is scarcely intelligible how they could have been endured so long. There were 52 banks, each sending messengers back and forth; there was no national currency, and balances had to be paid in gold coin; the labor of counting and carrying this was so onerous that actual transfers of cash were made but once a week, though the accounts were balanced on the pass-books and the bills exchanged daily; and the bags of coin were so heavy and precious that they were often transported in wagons guarded by militia. The average daily clearings for the first year of the New York establishment were $19,104,594.94, which would have weighed over 70,000 pounds avoirdupois, or 35 tons; in other words, a week's settlements would have demanded 422,486 pounds of coin, or 211 tons. The actual payments in gold were $988,078.06, a little over 5 per cent. If all the average daily clearings of the United States in 1902 ($381,650,000) can be imagined paid in coin according to the practice prior to 1853, it would need 1,406,653 pounds, over 700 tons; or if settled weekly, 4,220 tons. Further, the formation of the clearing-house enabled the banks to close 2,500 regular ledger accounts, to be posted up daily. Since then the system has spread to every part of the Union, all the large cities and several minor ones having clearing-houses, and all the leading States having at least one; while the more sparsely settled ones, or those with slightly developed industrial systems, utilize those in the nearest centre. But nearly two thirds of all the clearings in the United States are done in New York, that being the most convenient settling-place of cities with cities. In 1902 the total clearings of the United States were $116,021,618,003, of which $74,753,189,436 was in New York, a daily average of $245,898,649. The balances settled in money were $3,377,504,072, or 4.51 per cent. The next highest clearings, in order of volume, were in Chicago, Boston, Philadelphia, St. Louis, San Francisco, Baltimore, and Kansas City, Mo., each over $1,000,000,000 except the last, which was just below it. In 1902 the New York clearing-house had 60 members, besides the assistant treasurer of the United States; and 79 banks and trust companies in the city or vicinity not members used its members as agents.

The methods in different countries and centres are not exactly alike; but the differences in detail are matters of interest to bankers rather than to the public. It is interesting, however, to know that an English expert pronounced the American (New York) system the best. In brief, it is as follows: each bank, before the day's work begins, must have prepared and ready to hand in — first, its checks for collection, made up in as many packages in envelopes as there are bank members of the clearing-house; second, a schedule of its amount due from each; third, a debit ticket to be given to each; fourth, a schedule of its aggregate claim on all the members together for the day, which goes to the manager or the proof clerk. Each sends two clerks to the clearing-house, a delivery and a settling clerk. The latter sit at desks in rows, the former in front of them, and they assemble at about 9.50. At 9.58 a bell is struck, and any clerk not in place is fined $2. At 10 it strikes again, and each delivery clerk begins handing his envelopes of checks to the settling clerks in succession as he passes along, at the same time dropping the corresponding debit ticket into a slit in the desk. This takes about 10 minutes; and the proof clerk at his desk enters the claims of each bank against the clearing-house on a "proof sheet," which must show a total the same as that of all the debit tickets put into the desk slits. Next, the settling clerks set down the sums on these tickets, foot them, and pass the total to the proof clerk, who arranges them on his proof sheet with each bank's debit opposite its credit; the difference being the sum due to or from the clearing-house in each case. This takes about half an hour. If accurately computed, the debit and credit columns must foot alike in both cases, as to bank claims and as to clearing-house claims. The manager reads off the balances due, and the settling clerks write them down. At 10.45 the work must be completed, and if errors in the footings prevent the proof being correct, the culprit is fined, with the fines doubled after 11.15 and quadrupled after noon. The balances are paid with gold coin, gold certificates (either of the United States treasury or of the clearing-house against gold in its vaults), or legal-tender notes. In Boston balances are borrowed and lent by members at call, being transferred by a written order on the manager; more than half of them are thus employed, the clearing-house rate of interest being a regular stock quotation. If a bank denies liability on any check presented to it by another member, the clearing-house takes no cognizance of the denial, that being a matter between the banks, to be settled outside. But the clearing-house determines the class of claims to be accepted, and different clearing-houses have different rules.

The strength and the comity of these associations, however, have given them both the power and the disposition to accomplish ends much more momentous than saving money and time in doing business. The power of disciplining their members and deciding on their qualifications is inherent: a majority of the members can expel a member, the Standing Committee can suspend without notice, and the moral power exercised is very great. A fraudulent return to the United States internal revenue commissioner caused the expulsion of one bank; and a watchful lookout is kept on the financial condition of all. The New York clearing-house requires a weekly, the Philadelphia a daily, report on their standing. There is usually an arbitration committee to settle disputes between members. But far more important is the financial strength given by the union of the banks, when they are willing to act together, in checking or preventing "runs" and tiding over panics. That a run on one bank may precipitate runs on others, and in the mad fright thus started pull down a series of perfectly sound banks, is not more obvious now than ever; but for many years there was not sufficient unity of purpose, or confidence in the strength of the others, to enable the stronger or the unimperiled to help the others; and still

more, it was not seen how this could be done and the others be secured for their advances. Of late years, however, the clearing-houses have acted in this matter with signal success, by means of clearing-house loan certificates. The method is to allow a member bank to turn in its bills receivable or other securities approved by the Loan Committee, with its own note for sums loaned, and be granted in exchange certificates for a large portion of the face value, which shall be accepted as cash in paying clearing-house balances. These bear the highest legal rate of interest, 6 per cent, to operate as a restraint on borrowing more money or retaining it longer than is absolutely needed; and they can be used for no other purpose. The reserves of the member banks are thus made a common treasury; and not only is all the cash at the service of whoever needs it most, but the fact that this is known breaks nine runs out of ten, because people do not wish to take out their money, but only to know that it is safe. The last panic in the United States in which there was a general suspension of the banks was in 1857; and the five panics since then have been prevented from resulting in this largely by the use of these loan certificates; of which in the last panic, that of 1893, over $40,000,000 were issued. A further use of this combined credit is to aid government action in critical places. The Union would have been repeatedly in most intense embarrassments to maintain its credit but for the banks of the New York clearing-house, which floated its loans and advanced money, and probably prevented a collapse for a time of apparent financial resource.

The clearing-house system is also applied to other business than banking. In England there is a general railway clearing-house, which pools traffic facilities, and the shares of each of the railway companies in through business; has weekly reports of the passenger tickets taken up, and the weight, destination, and payment of through freight; and arbitrates between companies on claims for damages or disputes over liability. In London also there is a stock exchange clearing-house.

Consult: Cannon, 'Clearing-Houses' (1900); White, 'Money and Banking' (1902).

WILLIAM SHERER,
Manager New York Clearing-House.

Clearing-nut, a small tree (*Strychnos potatorum*) of the same genus as the *nux vomica,* the seeds of which are used in India for settling or clearing muddy water. The seeds are rubbed upon the inside of the water-vessel, and within a few minutes after the water has been introduced it becomes clear, the sediment and non-soluble ingredients having sunk to the bottom. The wood is very hard and heavy, and is used for cabinet-making and house-building.

Clearstory. See CLERESTORY.

Clearwing, a small moth with transparent wings, the caterpillars of which are the borers that destroy peach-trees and fruit-bushes. Although common in America they are mostly importations from Europe or Asia.

Cleary, James Vincent, Canadian clergyman: b. Waterford, Ireland, 18 Sept. 1828. He was educated at Royal College, Maynooth, and ordained to the Roman Catholic priesthood in 1851. He became president of St. John's College, Waterford, in 1873, and in 1880 was appointed bishop of Kingston, Canada, the see being made an archbishopric in 1889. In 1896 he reopened the Theological Seminary of Regiopolis College in Kingston.

Cleavage, in mineralogy and geology, the mode in which any body may most readily be, or naturally tends to be, split up into fragments. The regular structure of most crystallized bodies becomes manifest as soon as they are broken. Each fragment presents the form of a small polyhedron, and the very dust appears under the microscope an assemblage of minute solids, regularly terminated. In this process common salt and galena break up into small cubes, fluor-spar and the diamond into octahedrons, sulphate of barytes and the topaz into rhomboidal prisms, calcite and other related mineral carbonates into rhombohedrons, etc. The directions in which all those bodies thus break up are called their planes of cleavage. It must not be supposed, however, that all inorganic crystallized substances possess this property. Several of them break up only into irregular fragments, as the rock-crystal, the garnet, the emerald, etc. In others the cleavage is only in two directions, and sometimes only in one, and consequently produces no regular solid. Cleavage often indicates the different bodies which belong to the same system of crystallization, or distinguishes between those which belong to different systems, even when their external forms happen from any cause to be disguised or destroyed. The term is employed by geologists in a somewhat different sense, and applied to non-crystallized bodies, as clay-slate. In this sense it means the tendency of rocks to split along planes which either coincide with the original plane of stratification or may cross it at any angle up to a right angle. This tendency is the consequence of the readjustment (by pressure and heat) of the components of rocks. See PHYSICAL CRYSTALLOGRAPHY: MINERALOGY.

Cleaveland, klēv'land, **Moses,** American pioneer: b. Canterbury, Conn., 29 Jan 1754; d. there 16 Nov. 1806. He was graduated at Yale in 1777, and began the practice of law in his home town, being several times elected to the legislature, and in 1796 commissioned a brigadier-general of militia. He was a leading shareholder in the Connecticut Land Company which had bought for $1,200,000 the land in northeastern Ohio reserved to Connecticut by Congress, and subsequently known as the Western Reserve. In 1796 Cleaveland went out with a party of 50 to survey the tract and arrange for its settlement by white emigrants. After successfully negotiating with the Indians who claimed certain rights to the region, the party arrived at the present site of Cleveland, 22 July 1796. Cleaveland immediately chose it as a place for his settlement, surveyed it into town lots, and the members of the party named it Cleaveland in his honor. In 1830, when the Cleveland *Advertiser* was founded, the headline was found too long for the form, the editor therefore dropped the letter "a" in the first syllable of the city's name, and the new spelling of Cleveland was soon generally adopted.

Cleaveland, Parker, American mineralogist: b. Rowley, Mass., 15 Jan. 1780; d. Brunswick, Me., 15 Oct. 1858. He graduated at Harvard 1799, and was appointed tutor there 1803.

In 1805 he was chosen first professor of mathematics and natural philosophy at Bowdoin College. Applying himself with energy to the new sciences of chemistry and mineralogy, his studies resulted in a treatise on 'Mineralogy and Geology' (1816; 2d ed. 1822; 3d ed. 1856), which brought him the offer of the chair of mineralogy in Harvard, which he declined, as he likewise did the presidency of Bowdoin in 1839. He stood first in his subject in this country, was a popular and lucid lecturer, an enthusiastic and inspiring teacher. When the medical school was founded at Bowdoin in 1820 he was made its dean and librarian.

Cleavers, one of the 70 common names applied to certain species of goose-grass (q.v.), of the madder family, occurring throughout the whole United States; troublesome weeds, probably naturalized from Europe. Other names by which they are known are catchweed, beggar-lice, burhead, clover-grass, cling-rascal, scratch-grass, wild hedge-burs, stick-a-back or stickle-back, gosling-grass, gosling-weed, turkey-grass, pigtail, grip or grip-grass, loveman, and sweethearts. They are as common in Europe as in America, and seem to be useless except in Sweden, where for many years their prickly stems have been used as strainers for milk. Cleavers was formerly of repute in household medicine as a diuretic, but is now so used only in the most remote settlements.

Cle'burne, Patrick Ronayne, American soldier: b. Cork County, Ireland, 17 March 1828; d. Franklin, Tenn., 30 Nov. 1864. While a student at Trinity College, Dublin, he ran away and enlisted in the English army, in which he served for three years. He came to America, settled in Helena, Ark., studied law, and practised successfully until the Civil War. Joining the Confederate army as a private, he rose rapidly to a brigadier-generalship, commanded a brigade at Shiloh, was wounded at Perryville, and commissioned major-general, December 1862. He distinguished himself greatly in many fierce engagements, notably at Murfreesboro, Chickamauga, Ringgold Gap, and Missionary Ridge, receiving the thanks of the Confederate Congress. He was killed at the battle of Franklin, after carrying two lines of Union works, and shortly after saying to Gen. Hood: "I have more hope in the final success of our cause than at any time since the first gun was fired." He was a soldier of quick perception and strong character, and early and boldly advocated freeing the slaves, and the enlistment of the young and able-bodied negroes in the Confederate service. He was called the "Stonewall of the West," and instituted the Order of the Southern Cross.

Cle'burne, Texas, the county-seat of Johnson County, on the Gulf, C. & S. F. R.R., whose division offices and shops are located in the town. It is a distributing centre for a large agricultural region, and has flour-mills, machine-shops, and cotton-gins. Pop. (1900) 7,493, being more than double that of 1890, when it had a population of 3,278.

Cleckheaton, klĕk'hē'-tŭn, England, a town in the county of York, West Riding, situated on a declivity in the Spen Valley, 10 miles west of Leeds. It is well built, lighted with gas, and has a technical institution, handsome premises belonging to the co-operative association, a fine town-hall, and three large and beautiful churches. The industries include the worsted and machine-card trades, machine-making, engineering works, etc., and coal is mined in the neighborhood. Pop. (1901) 12,523.

Cleef, klāf. 1. Joost (yoost-) Van, called Zotte (crazy) Cleef: b. Antwerp 1480; d. 1529. He was one of the most celebrated painters of his time, and in regard to beauty of coloring may challenge comparison with the most distinguished Italian masters. His excessive vanity and eccentricity caused him to be described as "mad." 2. Jan (yän) Van, a painter: b. Venloo, Guelderland, 1646; d. Ghent 1716. He was a pupil of De Cræyer, and belongs to the Flemish school, of which he is one of the most eminent masters. His works, which resemble those of Poussin, are particularly remarkable for beauty of design and coloring. The churches of Ghent are adorned with many of his paintings, in which the heads of children and the countenances of women are very beautiful.

Cleeve, Lucas, English author; daughter of Sir Henry Wolff, and wife of Col. Howard Kingscote. She has traveled widely and has published: 'Tales of the Sun'; 'English Baby in India'; 'Life of Eugenie Berni'; 'In the Ricefields'; 'Woman Who Wouldn't' (1895); 'Lazarus'; 'Epicures' (1896); 'Water Finder'; 'The Monks of the Holy Tear' (1898); 'Plato's Hand-Maiden'; 'The Real Christian' (1901); 'Blue Lilies' (1902); 'Anglo-Americans' (1903).

Clef (Fr. for key), a character placed at the beginning of a staff to show the elevation of that particular staff in the general claviary or system, and to determine the names of the notes according to their positions on the staff. There are three Clefs; the G Clef, generally known as the treble Clef, which is placed on the second line of the treble staff; the C Clef, which is used either as the alto, tenor, or (rarely), soprano Clef, according to its posi-

G Clef. C Clef. F Clef.

tion on the third, fourth, or first line of the staff; and the F Clef, which is either base or baritone (rare) Clef, according to its position on the fourth or third line of the staff.

Cleft Palate, a fissure of greater or less extent existing in the roof of the mouth, extending in some instances through the jaw, the hard and the soft palate, even to the end of the uvula. Both congenital and acquired forms of cleft palate are known, but the congenital variety preponderates. It seems to be a family trait, and is much more common in Hebrews than in other peoples. Cleft palate is due to a lack of union of the intermaxillary and the supramaxillary bones. These normally join to make the bony roof of the mouth, but they sometimes fail to unite on either side of the middle line. If such failure to unite occurs on one side only, unilateral cleft palate and hare-lip results; if the developmental failure occurs on both sides bilateral cleft palate and hare-lip are produced. Very often there is only a slight depression on the edge of

the lip, showing that the soft parts have not united as they should. This constitutes the simplest form of hare-lip and is not associated with cleft palate. In cases of severe cleft palate food regurgitates through the nose, and swallowing is impossible. In these cases, children are apt to die of inanition unless surgical procedures are used to repair the defect. Modern surgery has evolved a number of plastic operations with a view to obviate these congenital mal-developments, and treatment is very satisfactory. Consult 'American Text Book of Surgery' (Phila., 1903).

Cleishbotham, klēsh'bŏth-ăm, **Jedediah,** a character in Scott's 'Tales of My Landlord,' who is represented to have collected the stories, of which Peter Pattieson is the imaginary writer.

Cleisthenes, klīs'thĕ-nēz, or **Clisthenes,** an Athenian politician who flourished about 500 B.C. He was the grandson of Cleisthenes of Sicyon, and the son of Megacles, and at the end of the rule of the Pisistratidæ (510 B.C.) was a leader of their enemies. When, with the assistance of the Delphian oracle and the Spartans, Hippias was banished from Athens, Cleisthenes, in order to secure his ascendency over his rival Isagoras, chose to defend the cause of the people and succeeded in introducing some important changes in the ancient constitution of Athens; among others, the division of Attica into 10 instead of 4 tribes, each consisting of several *demi,* under demarchs; the increase of the number of the senators from 400 to 500, 50 of each tribe; and, as some say, the law of ostracism (q.v.), so remarkable in the history of that state. Cleisthenes, being suspected of the desire of tyrannical power, was himself banished, but afterward returned and triumphed over his enemies.

Clélie, klā-lē, a romance in 10 volumes by Mademoiselle de Scudéry, published in 1656. The subject is the siege of Rome after the expulsion of Tarquin the Proud, and the heroine is the young Roman girl who was a hostage of Porsena, and swam across the Tiber to escape from him. The manners and language assigned the Roman characters in the romance are utterly ridiculous and grotesque, but if we consider the Romans as disguises for the fashionable people of the 17th century, the pictures of life are true to nature.

Clemanges, Mathieu Nicolas, mä-tė-ė nīk-ō-lä klä-mänzh, French theologian: b. Clemanges 1360; d. about 1430. He studied at Paris under Pierre d'Aille and Gerson. In 1391 he was professor of theology at the University of Paris, and in 1393 became rector there. In the hope of helping to heal the Papal Schism of the time, he accepted the position of private secretary to Benedict XIII., the anti-pope at Avignon; but when Benedict excommunicated the French king in 1407 Clemanges resigned his office and lived in voluntary exile with the Carthusian monks. Here he devoted himself to his studies and writing, endeavoring to correct abuses in the Church, and seeking to place the study of theology upon a wider basis: his writings had much influence on the deliberations of the Council of Constance. In 1425 he went back to the University of Paris, where he continued to lecture until his death. His works were collected and published by Lydius (1613).

Clematis, a genus of climbing vines or ascending herbs, of the crowfoot family (*Ranunculaceæ*). It numbers upward of 100 species, and is widely distributed throughout the temperate regions of the world. In the United States between 20 and 25 species are recognized. The best known is the virgin's-bower (*C. virginiana*), a vine that climbs over shrubs and along fences, from Nova Scotia to Georgia, and west to Kansas and Manitoba, its sprays of white flowers making a showy appearance from July through September. Other species are found west of the Mississippi River, extending to the Pacific coast, and south to the Gulf of Mexico. The only English species is called traveler's joy (*C. vitalba*). Rare foreign species are to be found in gardens, and culture and hybridizing have produced varieties that, escaping from gardens, add new species to the wild representatives of the genus.

Clémenceau, Eugène, ė-zhăn klā-mŏñ-sō, French politician: b. Mouilleron-en-Pareds 28 Sept. 1841. He studied medicine at Paris, and began the practice of his profession there. He became active in politics, joining the radical party, and in September 1870 was elected mayor of the 18th Arrondissemont (Montmartre). Not being an extreme radical, he tried to bring about a reconciliation between the Commune and National Assembly, but failing in this, resigned his office as mayor. In 1871 he was a member of the Municipal Council; in 1876 he was elected to the Chamber of Deputies, and became the leader of the Radical Republicans; though a violent opponent of several ministries, he refused to form a cabinet of his own. He was implicated in the Panama Canal scandals in 1892, and failed of re-election in 1893. He is editor of the radical journal 'La Justice.'

Clemens, Jeremiah, American politician: b. Huntsville, Ala., 28 Dec., 1814; d. there 21 May 1865. He graduated at the University of Alabama 1833, studied law at Transylvania University, Ky., and was admitted to the bar, 1834. He was United States attorney for the northern district of Alabama 1838; a member of the State legislature 1839–41, 1843–4; in 1842 raised a company of volunteer troops and went to Texas, having been appointed lieutenant-colonel, and subsequently held the same rank in the regular service. In 1848 he was governor of the civil and military department of purchase in Mexico, holding the position until the end of the war. He was a United States senator 1849–53, and held high rank as an able and eloquent debater. He took part in the Alabama secession convention, and though protesting against its action, subsequently yielded and held office under the Confederacy. In 1864 he advocated Lincoln's re-election. He wrote several novels which were popular in their day: 'Bernard Lyle' (1853); 'Mustang Gray' (1857); 'The Rivals: a Tale of the Times of Aaron Burr and Alexander Hamilton' (1859); 'Tobias Wilson' (1865), a story of the Confederacy. He left in manuscript an unfinished history of the war in northern Alabama.

Clemens, Samuel Langhorne, American humorist; more generally known by his pseudonym MARK TWAIN: b. Florida, Mo., 30 Nov. 1835. He received only a scanty school educa-

tion, and in 1848 became apprentice to a printer, subsequently working at this trade in Philadelphia, New York, and elsewhere. He afterward learned the business of pilot on the Mississippi, but left this occupation to become secretary to his brother, who had been appointed secretary of Nevada Territory. He then tried his fortune at the Nevada mines. In 1862 he became local editor of a newspaper in Virginia City, but soon went to San Francisco, where he was for some time a reporter. After meeting with slight success in the Calaveras gold-diggings he returned to journalism in San Francisco. In 1866 he went to the Sandwich Islands, and on his return commenced his lecturing career. A trip to the Mediterranean, Egypt, and Palestine followed. He edited for a time a newspaper in Buffalo, and soon after married and settled in Hartford, Conn. He has traveled widely, and many of the scenes and incidents in his works are drawn from his journeys. He lost heavily through the failure of a publishing house which he founded in 1884.

Among his chief books are 'The Jumping Frog' (1867); 'The Innocents Abroad' (1869); 'Roughing It' (1873); 'The Gilded Age' (with Warner) (1873); 'Adventures of Tom Sawyer' (1876); 'A Tramp Abroad' (1880); 'Life on the Mississippi' (1883); 'Huckleberry Finn' (1885); 'A Yankee at the Court of King Arthur' (1889); 'The American Claimant' (1892); 'Tom Sawyer Abroad' (1894); 'Puddinhead Wilson' (1894); 'Joan of Arc' (1896); 'More Tramps Abroad' (1897); 'The Man That Corrupted Hadleyburg' (1900); 'Following the Equator' (1901).

Clemens, Will M., American author: b. Paris, O., 16 Jan. 1860. Educated at Buchtel college; entered journalism at 16 and for 20 years was engaged on the leading newspapers of New York and San Francisco. Among his published works are 'Depew Story Book' (1898); 'Life of Theo. Roosevelt' (1899); 'A Ken of Kipling' (1899); 'Life of Admiral Dewey' (1900); 'Hasty Pudding Poems' (1901); 'The Gilded Lady', a novel (1903).

Clem'ent I. (CLEMENS ROMONUS), Pope and martyr and one of the apostolic fathers. By Irenæus he is reckoned the third in the line of the bishops of Rome, and Origen holds him to be the same Clement who is named by the Apostle Paul in his letter to the Philippians, iv. 3. Tradition declares that he suffered martyrdom in the reign of Trajan and that his term of episcopate extended from 93 to 101; his day in the Roman calendar is 23 November. There is extant a letter from the Church of Rome to the Church of Corinth now generally accepted as having been written by this Clement: A bishop of Corinth, Dionysius, writing about 166 to a later Pope mentions Clemens Romanus as its writer.

Clement II., Pope. He was a native of Saxony and succeeded to the papal chair in 1046 on the abdication of Gregory VI. He was the earliest of the six German pontiffs.

Clement III., Pope: b. Rome; d. March 1191. He was elected pope in 1187, and preached the third crusade against the Saracens. There was an anti-pope with this title, who died in 1100.

Clement IV. (GUY FOULQUES, gē fook), Pope: b. St. Gilles, France; d. Viterbo 29 Nov. 1268. He became pope in 1265, succeeding Urban IV., and was the friend and protector of Roger Bacon.

Clement V. (BERTRAND D AGOUST, bĕr-trän dä-goost), Pope: b. Bordeaux 1264; d. Roquemaure, Languedoc, 20 April 1314. He became pope in 1305 and at the time of his election was archbishop of Bordeaux. He transferred his see from Rome to Avignon, and thus commenced "the Babylonish captivity" of the Church, which lasted about three quarters of a century. Another memorable event of his reign was his bull suppressing the order of the Knights Templar, 1311.

Clement VI. (PIERRE ROGER, pēär rō-zhā,) Pope: b. near Limoges, France, 1292; d. Villeneuve d'Avignon December 1352. He succeeded Benedict XII. in 1342 and made an attempt to bring about a reunion of the Latin and Greek churches.

Clement VII. (GIULIO DE MEDICI, joo'-lē-ō dā mā'dē-chē), Pope: b. Florence about 1475; d. Rome September 1534. He succeeded Adrian VI. in 1523. Having by his joining in league with the French king incurred the hostility of the Emperor Charles V., the constable Bourbon, with the connivance of the emperor, invaded the papal territory with an army and sacked the holy city and held the Pope a prisoner for six months.

Clement VIII. (IPPOLITO ALDOBRANDINI, ĭp-pŏl'ē-tō äl-dō-brän'dēn), Pope: b. Fano, Italy, 1536; d. 5 March 1605. He succeeded Innocent IX. in 1592, reconciled Henry IV. to the Church and ordered the execution of Giordano Bruno. An anti-pope with this title, resigning in 1420, closed the western schism.

Clement IX. (GIULIO ROSPIGLIOSI, joo-lē'ō rōs-pē-lē-ō'sē), Pope: b. Pistoia 1600; d. 9 Dec. 1669. He followed Alexander VII. to the papal chair in 1667. In his pontificate was arranged the "Pax Clementina," which for a time closed the Jansenist controversy.

Clement X. (EMILIO ALTIERI, ā-mēl'ē-o äl-tē-ā'rē), Pope: b. Rome 13 July 1590; d. 22 July 1676. At nearly 80 he succeeded Clement IX. and during his pontificate a notable controversy arose with Louis XIV. relating to the enjoyment, during vacancy, of episcopal revenues and the right of filling such vacancies.

Clement XI. (GIOVANNI FRANCESCO ALBANI, jō-vän'nē frän-chĕs'kō äl-bä'nē), Pope: b. Pesaro, Italy, 22 July 1649; d. 19 March 1721. He was elected successor of Innocent III. in 1700, and in 1713 sent forth the celebrated bull 'Unigenitus' in condemnation of Quesnel's treatise on Grace and Predestination. The bull was opposed by the Jansenists, but approved by the Jesuits. The pretender in his efforts to obtain the English crown in 1715 was supported to some extent by Clement. See Lafitau, 'Vie de Clément XI.' (1752).

Clement XII. (LORENZO CORSINI, lō-rĕnd'-zō kôr-sē'nē), Pope: b. Florence 1652; d. 6 Feb. 1740. He was the successor of Benedict XIII. in 1730, and was the first pontiff to oppose Freemasonry.

Clement XIII. (CARLO DELLA TORRE REZZONICO, kär'lō dĕl-lā tôr'rā rĕt-sō-nē'kō), Pope: b. Venice March 1693; d. February 1769. He succeeded Benedict XIV. in 1758. He published a bull in behalf of the Jesuits after their expulsion from France and Spain in 1767.

Clement XIV. (GIOVANNI VINCENZO ANTONIO GANGANELLI, jō-vän'nē vēn-chĕnd'zō än-tō'nē-o gän-gä-nĕl'lē), Pope: b. Saint Arcangelo, near Rimini, Italy, 31 Oct. 1705; d. 22 Sept. 1774. He was a Franciscan friar, a man of great piety and worth; the friend and confidant of Benedict XIV. He was elected Pope in 1769 after a struggle in the conclave in which cardinals influenced by various of the Catholic powers made interest in favor of the suppression of the Society of Jesus. When the new Pope showed an unwillingness to do the will of the powers the charge was made that he had received the support of many members of the conclave upon his promise to suppress the order; but this charge has been conclusively proved to be without foundation in fact; yet such was the urgency of the powers, he felt himself constrained in the interest of peace and of the Church to disband the Jesuit order which he did in the apostolic brief *Dominus ac Redemptor* which declares the Society of Jesus dissolved forever. The fact that the brief had been drawn up and completed in November 1772, but was not published till July 1773 is proof that he was loth to publish so severe a decree against the order. After its issue he fell into a rapid decline, presumably from remorse, and though all his life he had been exceedingly vigorous, died little more than 12 months after the brief was published. It was this pontiff who founded the Clementine Museum in Rome. See Caraccioli,' Vie de Clément XIV.' (1775); Theiner, 'Geschichte des Pontificats Clements XIV.' (1853).

Clément, Jacques, zhäk klā-môn̈, French assassin: b. Sorbon, France, about 1565; d. Saint Cloud, 1 Aug. 1589. He was a Dominican monk, and the fanatical tool of the Dukes of Mayenne and Aumale and the Duchess Montpensier. Having fatally stabbed the king, Henry III., he was at once killed by the courtiers.

Clem'ent, William Henry Pope, Canadian lawyer: b. Vienna, Ont., 13 May 1858. He was graduated at Toronto University in 1878, and became a lawyer in 1880, practising with success in Toronto. He has written: 'The Law of the Canadian Constitution' (1892), a work that was made a text-book in the principal colleges and universities of the Dominion.

Clement of Alexandria, Saint (CLEMENS ALEXANDRINUS), Greek theologian, one of the most eminent and learned of the fathers of the Church. Very little, almost nothing, is known regarding his life. The first mention of him by a writer living in or near his time is made by Eusebius of Cæsarea and by Photius; they give his name as Flavius Titus Clemens, and later writers add to the name the designation Alexandrinus, "of Alexandria." From his names and surname one might infer that he was of Latin race; but he wrote in Greek, and his writings do not indicate any special acquaintance with Roman life or thought. Whether he was a native of Alexandria or of some Grecian city cannot be decided. He was a convert from paganism and had an intimate acquaintance with the literature of Grecian philosophy, but of the circumstances of his conversion to Christianity, we know nothing. He was supposably a disciple of Pantænus, director of the Catechetic school of Alexandria and became his successor, and had among his pupils Origen, who in turn succeeded him. Further, Clement was a priest of the church of Alexandria. A list of his writings is given by Eusebius, St. Jerome, and Photius. It contains the titles of ten separate works, namely: 'Hortatory to the Greeks'; 'The Tutor'; 'The Stromates' (usually called *Stromata*): this as its title indicates is a patch-work or collection of miscellaneous observations; 'Who is the Rich Man that is Saved?' These four works have come down to us complete or nearly so. The remaining six titles are of works that have been lost: 'Outlines'; 'On the Passover'; 'On Fasting'; 'On Slander'; 'Exhortation to Patience'; 'The Church Rule.' The 'Hortatory to the Greeks' exposes the absurdities and immoralities of the pagan religions; but the Grecian philosophers and poets had a notion of the true author of the universe. 'The Tutor' sets forth the rule of Christian living. 'The Stromates' is a miscellany but it consists of the author's own studies of questions and problems in philosophy, literature, history, etc., not of passages taken from other authors. The treatise on the Rich Man is a very judicious exposition of the passage in the Gospel of Mark x. 17–31.

Clementi, Muzio, moot'sē-ō klā-mĕn'tē, Italian pianist and composer: b. Rome 1752; d. Evesham, England, 10 March 1832. As early as his 12th year he wrote a successful mass for four voices, and had made such progress in the pianoforte that an Englishman, Mr. Beckford, took him to England to complete his studies. He was then engaged as director of the orchestra of the opera in London, and his fame having rapidly increased, he went in 1780 to Paris, and in 1781 to Vienna, where he played with Mozart before the emperor. In 1784 he repeated his visit to Paris, but after that remained in England till 1802, when he went back to the Continent. He returned in 1810 to England, where he settled down as superintendent of one of the principal musical establishments in London. His most important compositions were his 60 sonatas for the pianoforte and the great collection of studies known as the "*Gradus ad Parnassum*," a work of high educative value. He represented perhaps the highest point of technique of his day, and his influence on modern execution has led to his being characterized as "the father of pianoforte playing." He was interred in Westminster Abbey.

Clem'entines, so named after Pope Clement V., who during his pontificate (1305–14) had compiled the canons of the Church, chiefly out of the canons of the 15th Council of the Church, Vienne (1311). The Clementines are one of five great collections of Church laws, examined and decided upon according to the methods employed by ecclesiastical authority. The five collections are known as: The Decretals (1234); the Sext (1298); the Clementines (1313); the Extravagantes of John XXII.; and the Extravagantes Communes (containing Decretals of 25 popes) (1484). Out of these five the 'Corpus Juris Ecclesiastici' is made up.

Clemson Agricultural College, an educational (non-sectarian) institution in Clemson College Station, S. C.; organized in 1890; reported at the end of 1899: Professors and instructors, 44; students, 503; volumes in the library, 7,350; productive funds, $80,000; income, $85,000; number of graduates, 78; president, Patrick Hughes Mell, Ph.D.

Cleobis (klē'ō-bĭs) **and Biton,** bī'tŏn, two Grecian youths, the sons of Cydippe, chief-priestess of Hera (Juno) at Argos. At the *Heraia,* a feast in honor of the goddess, it was customary for the chief-priestess to be drawn by two white oxen. Herodotus relates that on one occasion the procession had already begun to move, and the oxen had not arrived, upon which Cleobis and Biton drew the chariot of their mother for a distance of 45 stadia, up the mountain where the Temple of Hera stood. The people applauded, and the mother was so affected by this instance of filial affection that she begged the goddess to grant her sons the best gift which could be conferred on mortals. While the youths were yet in the temple a soft sleep fell upon them, and they never awoke. The Argives placed the statues of Cleobis and Biton in the temple at Delphi, and in a temple at Argolis they were represented drawing a chariot of their mother.

Cleobulus, klē-ō-bū'lŭs, one of the Seven Wise Men of Greece. He was a native of Lindus, or according to some, of Caria, and flourished 560 B.C. He traveled to Egypt to learn wisdom, like many of the sages of Greece. He was king of Rhodes, and was succeeded on the throne by his daughter Cleobulina. Several of his sayings are extant.

Cleombrotus, klē-ŏm'brō-tŭs, an ancient Greek military leader, son of Pausanias, king of Sparta. During his reign began the Theban war, in which he commanded the Spartans against Epaminondas and Pelopidas. He was killed in the battle of Leuctra, which happened 8 July 371 B.C., according to the Julian calendar. See EPAMINONDAS.

Cleome, klē-ō'mē, a genus of plants, herbs, and shrubs of the caper family, (*Capparidaceæ*), comprising about 75 species, natives of tropical America and Africa. Less than ten species are found in the United States, most of them adventitious additions from South America, escaped from gardens. The native varieties belong to the Rocky Mountain region, and when found to westward are naturalized specimens. Pink cleome (*C. serrulata*) has a stem from two to three feet in height, the pinkish-white flowers very showy and attractive. Its native location is the Rocky Mountain region from Canada to Arizona and Mexico, but it extends eastward to Lake Michigan. The spider flower (*C. spinosa*) of the eastern seaboard, from New Jersey to Florida, is a South American species escaped from culture.

Cleomedes, klē-ō-mē'dēz, ancient Greek author. He wrote a treatise, in two books, 'On the Circular Theory of the Heavenly Bodies,' which sets forth the Stoic theory of the universe, and which is remarkable as containing, amid much error and ignorance, several truths of modern science — such as the spherical shape of the earth. Nothing is known definitely regarding his life, but it seems most probable that he flourished in the 2d century A.D.

Cleomenes, klē-ŏm'ē-nēz, the name of three kings of Sparta, the most distinguished of whom is Cleomenes III., king from 236 to 220 B.C. He distinguished himself in a war against the Achæans. Returning to Sparta he put to death the ephori, made a new division of lands, introduced again the old Spartan system of education, and bestowed the full franchise upon many who had not before had it. He lived very simply, was just and friendly, and treated his enemies with generosity. He showed himself an able general in a war against the Macedonians and Achæans united, but at last lost the important battle of Sellasia (222 B.C.). He fled to Egypt, where he attempted to raise an insurrection, but finding no supporters committed suicide. With Cleomenes expired the race of the Heraclidæ which had sat on the throne of Sparta.

Cleomenes, or The Spartan Hero, a play by Dryden, acted in 1692.

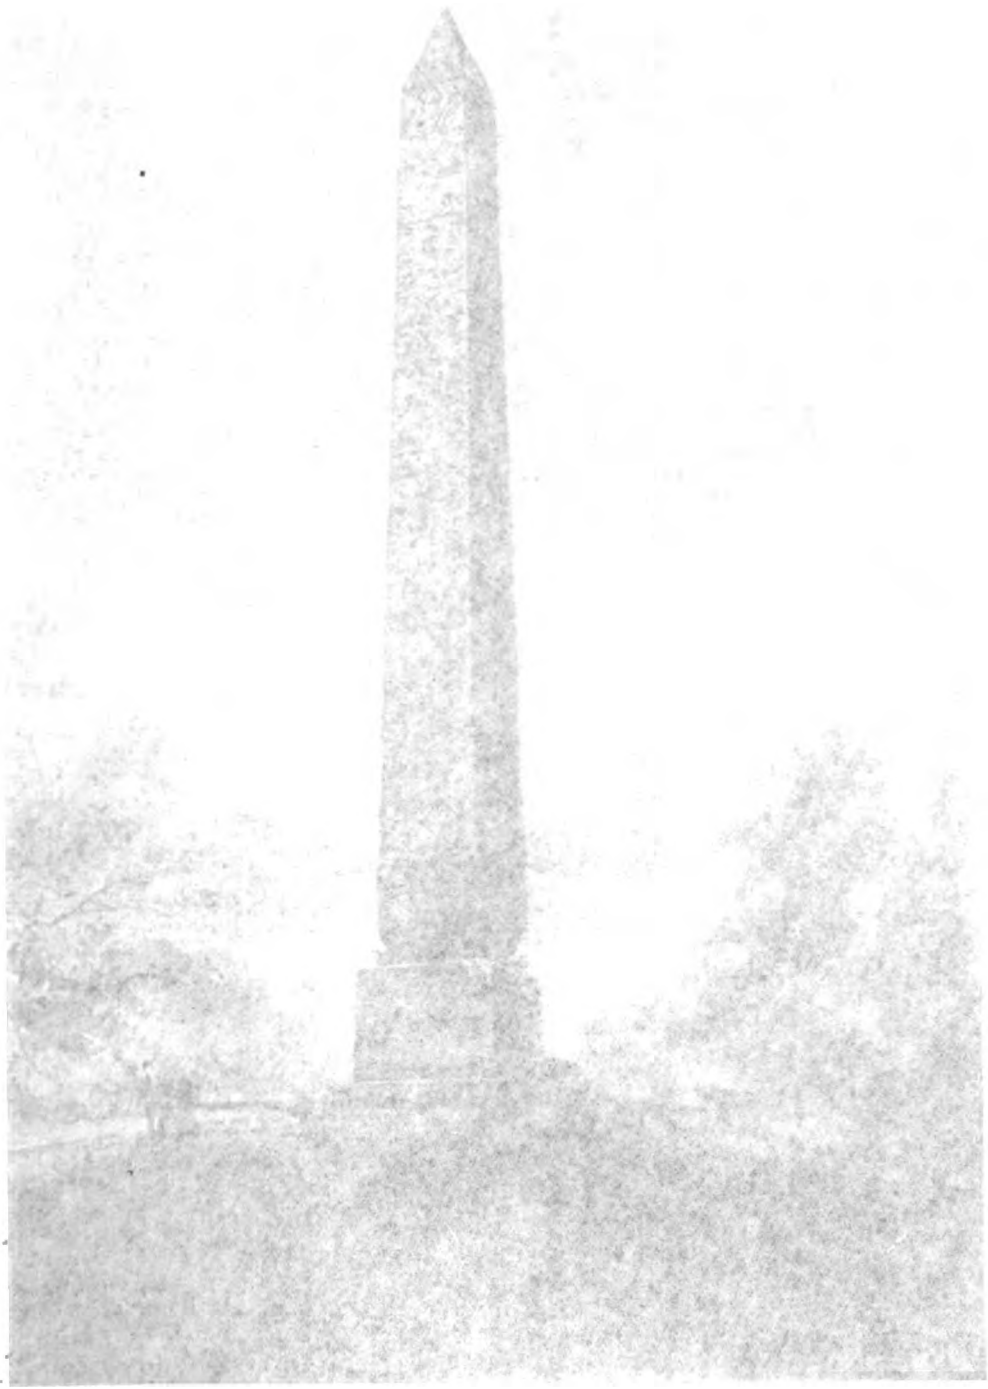
Cleon, klē'ŏn, Athenian demagogue, killed at Amphipolis, Macedon, 422 B.C. He was a tanner by trade, but became well known in public affairs before the death of Pericles. By the year 427 he was high in favor with the people, and distinguished himself by the atrocious proposal that all the adult males of the revolted Mytileneans should be put to death, and the women and children sold for slaves. In 425 he took prisoners those Spartans who had been blockaded by an Athenian force in the island of Sphacteria. The next year Aristophanes attacked him in his comedy of the 'Knights' — as he did also in the 'Wasps' in 422 — satirizing his venality, rapacity, ignorance, violence, and cowardice. The portrait was probably correct in the main. In 422 he was sent to Chalcidice against Brasidas, who was capturing the Athenian tributary cities there. He was taken unawares by a sally of Brasidas, and was slain.

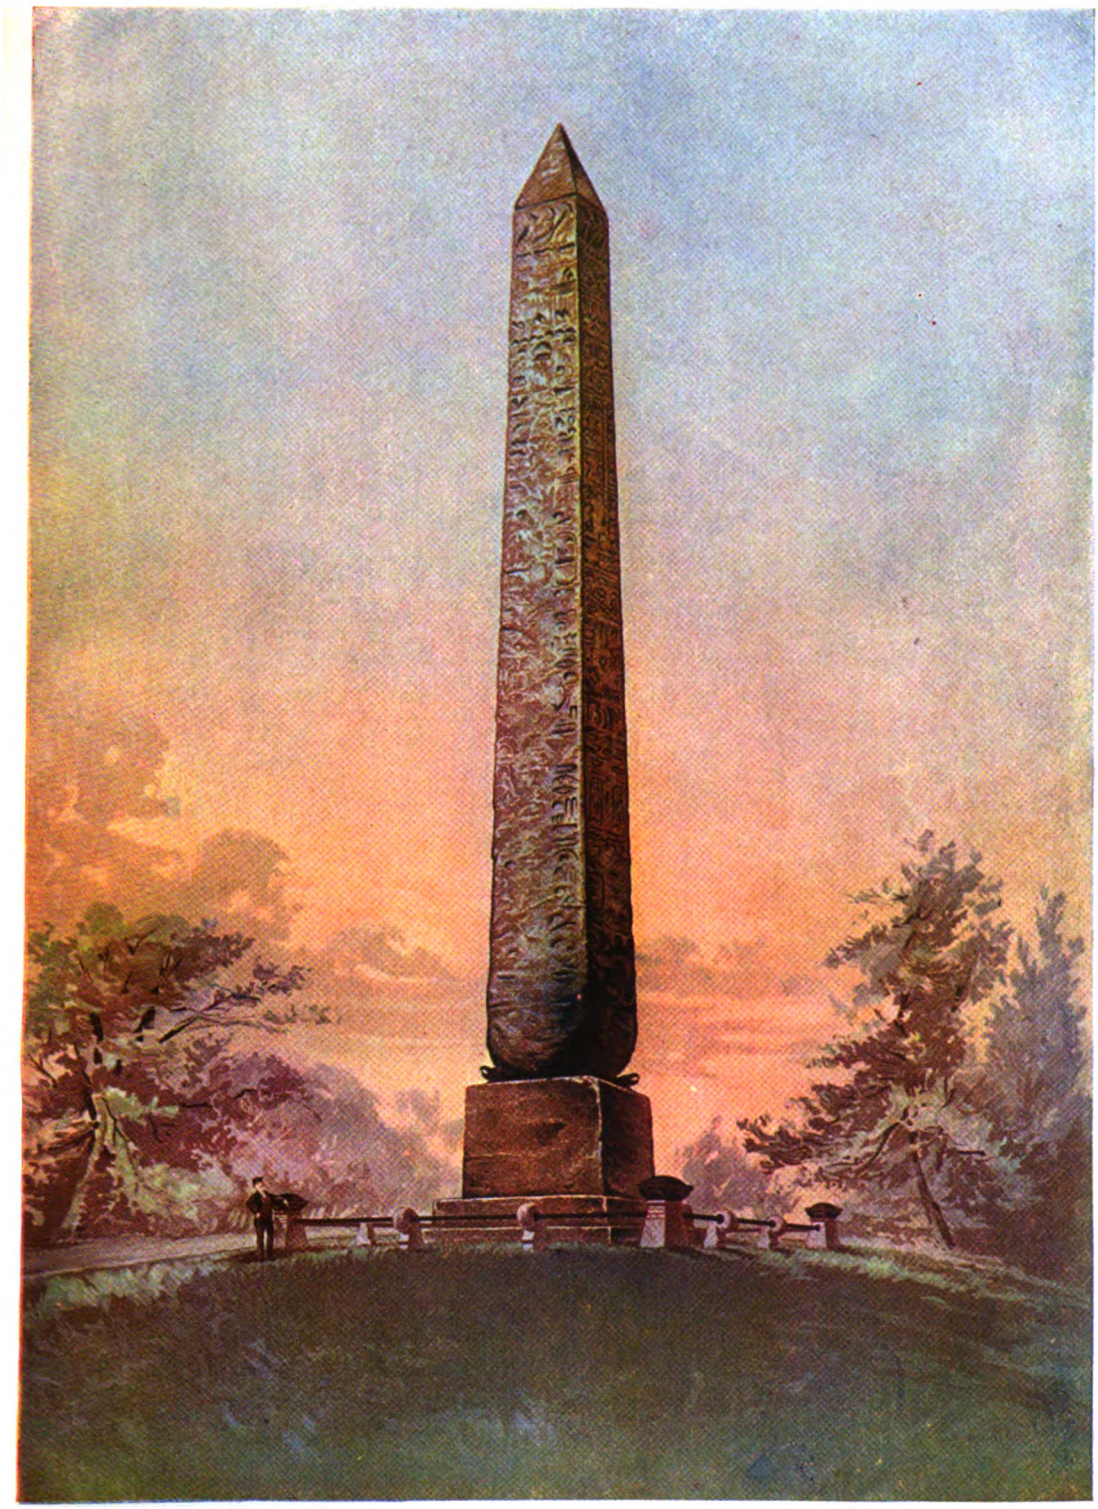
Cleopatra, klē-ō-pā'tra, the name of several Egyptian princesses, of whom the most renowned was the eldest daughter of Ptolemy Auletes: b. 69 B.C; d. 30 B.C. With her eldest brother Ptolemy she shared the throne of Egypt. Both were minors at the death of their father, and were placed under the guardianship of Pothinus and Achillas, who deprived Cleopatra of her share in the government 49 B.C. She went to Syria, and was forming plans for obtaining her rights by force, when Cæsar came to Alexandria, and captivated with her charms, successfully seconded her claims. Pothinus stirred up a second revolt, upon which the Alexandrian war commenced, in which the elder Ptolemy lost his life. Cæsar proclaimed Cleopatra queen of Egypt; but she was compelled to take her brother, the younger Ptolemy, who was only 11 years old, as her nominal husband and colleague on the throne. Cæsar continued some time at Cleopatra's court. The queen subsequently made a journey to Rome, where Cæsar received her magnificently, and erected a statue to her next to the statue of Venus, in the temple consecrated to that deity. Cleopatra remained in Rome from 46 B.C. to 44 B.C., returning to Egypt after Cæsar's death. She had by Cæsar a son, Cæsarion, afterward put to death by Augustus. When her brother, at the age of 14, demanded his share in the government Cleopatra poisoned him, and re-

mained sole possessor of the regal power. During the civil war in Rome she took the part of the triumvirs, and after the battle of Philippi she sailed to join Antony at Tarsus. She was then 25 years old, and combined with extraordinary beauty, great wit and the highest elegance of manners. She appeared in a magnificently decorated ship, under a golden canopy, arrayed as Venus, surrounded by beautiful boys and girls, who represented Cupids and Graces. Her meeting with Antony was attended by the most splendid festivals. After having accompanied him to Tyre she returned to Egypt. Antony followed her, and gave himself up to the most extravagant pleasures. She accompanied him on his march against the Parthians, and when he parted from her on the Euphrates he bestowed Cyrene, Cyprus, Cœlosyria, Phœnicia, Cilicia, and Crete on her, to which he added part of Judea and Arabia at her request. On her account he divorced his wife Octavia. After this Antony conquered Armenia, returned triumphantly to Egypt, and made his three sons by Cleopatra, and also Cæsarion, kings.

Now commenced the war between Augustus and Antony, but instead of acting promptly against his adversary, Antony lost a whole year in festivals and amusements with Cleopatra at Ephesus, Samos, and Athens, and at last determined to decide the contest by a naval battle. At Actium the fleets met. Cleopatra, who had brought Antony a reinforcement of 60 vessels, suddenly took to flight, and thus caused the defeat of her party; for Antony, as if under the influence of frenzy, immediately followed her. They fled to Egypt, and declared to Augustus that if Egypt were left to Cleopatra's children they would thenceforth live in retirement, but Augustus demanded Antony's death, and advanced toward Alexandria, which Antony hastened to defend. Cleopatra determined to burn herself with all her treasures, but Augustus pacified her by private messages. These communications, however, did not remain concealed from Antony, who, supposing Cleopatra treacherous, hastened to her, to avenge himself by her death. She, however, escaped and took refuge in the mausoleum which she had erected near the Temple of Isis, and caused the report of her suicide to be circulated. Antony now threw himself upon his sword; but before he expired was informed that Cleopatra was still living, upon which he caused himself to be carried into her presence, and breathed his last in her arms. Augustus succeeded in getting Cleopatra into his power. She still hoped to subdue him by her charms, but her arts were unavailing, and becoming aware that her life was spared only that she might grace the conqueror's triumph, she determined to escape this ignominy by a voluntary death. According to the generally received account of her death she ordered a splendid feast to be prepared, desired her attendants to leave her, and put an asp, which a faithful servant had brought her, concealed amongst flowers, on her arm, the bite of which caused her death almost immediately. There is, however, some doubt as to the exact method by which she took her life. Her body was interred near that of Antony. At the time of her death she had reigned 22 years.

Cleopatra's Needles, two obelisks, formerly at Alexandria, one of which is now in New York, the other in London. They are made of the rose-red granite of Syene, and were originally erected by the Egyptian king Thothmes III., the most celebrated king of the 18th dynasty, in front of the portico of the great temple of Heliopolis, the On of the Scriptures, and the place where Moses was born and brought up. From Heliopolis the two obelisks were removed to Alexandria not long before the commencement of the Christian era, but not, so far as we can now tell, during the lifetime of Cleopatra. We are at least informed by an inscription on the bronze supports of one of them, that they were not erected at Alexandria till the eighth year of the reign of Augustus Cæsar, and accordingly seven years after the death of Cleopatra. How, then, they came to be called Cleopatra's Needles is not apparent; but it may be conjectured that they had been removed by her order some time before they were set up on their second site, or that their removal was the carrying out of an intention formed by Cleopatra. Mr. (afterward Sir) Erasmus Wilson, to whom the credit may be awarded of having been chiefly instrumental in getting the British obelisk conveyed to London, assumes that the association of Cleopatra's name with the two obelisks represents the popularity of the queen and the affectionate regard of her subjects, rather than any participation of herself in their transport or erection. The obelisk now at London lay for a long time prostrate in the sand. In 1820 it was presented by Mehemet Ali to the British nation, but the British government, in spite of many appeals made to them on the subject, never did anything for its removal, which was at last effected solely through the public spirit of several private individuals, the obelisk being erected on the Thames Embankment in 1878. The other obelisk was presented to the United States by the Khedive of Egypt, and was transported to Central Park, New York, where it was erected in 1881. It stands upon four bronze crabs, reproductions of the original crabs upon which the obelisk formerly stood. The originals are now in the Metropolitan Museum, New York. The one in London is somewhat the taller of the two, being 68 feet 5½ inches in height, as against 67 feet 2 inches, the height of the other. The lateral measurements at the base are, in the British obelisk, 7 feet 5 inches in one pair of opposite sides, and 7 feet 10½ inches in the other pair; in the one in New York, 7 feet 9¾ inches, and 8 feet 2¼ inches. The weight of the British obelisk is rather more than 186 tons, and its mass 2,529 cubic feet. Both obelisks are inscribed with hieroglyphs, engraved to a depth of several inches and carefully polished. The hieroglyphs are inscribed in vertical colums, which are read from the top downward; and in each case the middle column is in honor of Thothmes, by whom the obelisks were first erected, and the side columns in honor of Rameses II., the most celebrated king of the succeeding dynasty, who reigned at least 200 years after Thothmes. On each side of the pyramidion, or small pyramidal top of the obelisk, is a bas-relief representing the sun-god, protector of the city of Heliopolis, receiving gifts from Thothmes.





CLEOPATRA'S NEEDLE, CENTRAL PARK, NEW YORK

Clepsydra, klĕp-sī'drạ, or **Water-clock,** an instrument for the measurement of time by the escape of water from a vessel through an orifice. Its origin is extremely ancient, and has generally been attributed to the Egyptians. Two descriptions of clepsydræ have been employed — one in which the water merely escapes through the orifice, the other in which the same level is constantly maintained by the introduction of a fresh supply of water, and a uniformity of efflux secured by retaining throughout an equal amount of pressure on the fluid as it issues from the bottom of the vessel. In one kind of water-clock the measure of time is registered on a dial-plate by means of a hydraulic apparatus acted on by the efflux of water from a cistern. These instruments are now scarcely ever constructed.

Clerc, Laurent, lō-rŏñ klār, French deaf mute: b. La Balme, Isère, France, 26 Dec. 1785; d. Hartford, Conn., 18 July 1869. At the age of 12 years his uncle took him to Paris, and placed him in the institution for the deaf and dumb. The abbé Sicard, though nominally its director, was then in prison for his alleged hostility to the republic; but Jean Massieu, himself a deaf mute, became his teacher till the release of Sicard, when he became a favorite pupil of the abbé. His intellectual condition, like that of most of the uninstructed deaf mutes, was at this time deplorable. "I had," he says, "a mind, but it did not think; I had a heart, but it did not feel. My mother had endeavored to show me the heavens, and make me know God, but her attempts were vain; I could comprehend nothing. I believed that God was a tall, big, and strong man, and that Jesus Christ, having come to kill us, had been killed by us, and placed on a cross as one of our triumphs." Under the skilful instruction of the abbé Sicard, he made rapid proficiency, and in 1805, after passing eight years in the institution, he was appointed tutor, and in 1806 a salaried teacher. His aptitude for teaching was such that in a few years the abbé confided to his charge the highest class in the institution. In 1815 while on a visit to England, Clerc formed the acquaintance of Gallaudet, who had gone thither in the hope of obtaining such instruction as would enable him to teach the deaf and dumb in this country. Failing in this, he subsequently visited France, and received instruction in the language of signs from the abbé Sicard and Clerc, and after spending some months under their tuition, persuaded the latter to accompany him to this country, here to lay the foundation of deaf mute instruction. Several months were spent by them in visiting the principal cities of the northern States, and soliciting aid for the establishment of the institution, since known as the American asylum for the deaf and dumb, at Hartford. On 15 April 1817 the asylum was opened with seven pupils, and Messrs. Gallaudet and Clerc installed as teachers. Much of the early success of the asylum is due to his patient and assiduous labors, and the greater part of the teachers sent to other institutions for the deaf and dumb, from this mother asylum received their training at his hands.

Clerc, Sébastien le, French designer and engraver: b. Metz, Lorraine, 1637; d. 1714. He acquired the elements of design from his father, a goldsmith, and by the advice of Le Brun devoted himself to engraving, in which he became so distinguished that at the suggestion of Colbert he was appointed engraver in ordinary to Louis XIV. Pope Clement XI. also conferred upon him the honor of knighthood. He formed his style on that of Le Brun, improving it, however, by a careful study of Raphael; and in his published works, which number between 3,000 and 4,000, and embrace every variety of subject he has exhibited a singularly correct and elegant execution. He also published treatises on geometry, architecture, and perspective.

Clerestory, klēr'stō-rĭ, or **Clearstory,** the upper part of the nave in churches, above the triforium where a triforium is present, and formed by walls supported on the arches of the nave, and rising above the roof of the side aisles. In these walls windows are inserted for the purpose of increasing the light in the nave. In Norman architecture the three stories of pier arcade, triforium, and clerestory are of nearly equal height, but in Gothic the clerestory becomes relatively of greater significance and in late Gothic work is often very lofty.

Clergy, in the Christian Church, that portion of the faithful which is set apart for the ministry of religion. In the Roman Catholic Church there are eight grades or distinctions of clergy, namely, that of the simple cleric, those of the four minor orders and those of the three sacred orders of subdeacon, deacon and priest. The last three are regarded as being of divine institution. The simple cleric is one who has received the ecclesiastical tonsure; by that rite he is made a clerk or cleric, and as such is entitled to certain rights, privileges and immunities, and assumes certain obligations not incumbent on the laity. See Holy Orders.

Clerk, John, Scottish naval tactician: b. Elden, near Edinburgh, 1728; d. 10 May 1812. For him is claimed the invention of the manœuvre "of breaking the enemy's line," put forth in an essay on 'Naval Tactics,' published in 1790, afterward employed with signal effect by Howe, St. Vincent, Duncan, and Nelson.

Clerk-Maxwell, James, Scottish physicist: b. Edinburgh 13 Nov. 1831; d. 5 Nov. 1879. He was a professor of natural philosophy in Marischal College, Aberdeen, in 1856–60; of physics and astronomy in King's College, London, in 1860–5; and of experimental physics in the University of Cambridge in 1871. Among his most important works are 'Essay on the Stability of Motion of Saturn's Rings'; 'Theory of Heat'; 'Electricity and Magnetism'; and 'Matter and Motion.'

Clerk, one who has charge of an office or department, subject to a higher authority as a board, corporation, etc.; a secretary, as, the clerk of the House of Representatives or Senate, clerks of the various courts, etc. In England a parish officer, a layman, whose business used to be to lead the responses in the church services and to perform other duties connected with the parish; a parish clerk

Clerke, Agnes Mary, English astronomer: b. Ireland 10 Feb. 1842. She began contributing to the Edinburgh 'Review' in 1877, and in 1888 made astronomical observations at the

Royal Observatory, Cape of Good Hope. She has published 'A Popular History of Astronomy During the 19th Century' (1885); 'The System of the Stars' (1890); 'Familiar Studies in Homer' (1892); 'The Herschels and Modern Astronomy' (1895); 'Astronomy' (1898); 'Problems in Astrophysics' (1902). In 1893 she received the Actonian prize of 100 guineas for her writings on astronomy.

Clerke, Ellen Mary, English writer: b. Ireland. She is a sister of Agnes Mary Clerke (q.v.) and has contributed extensively to English and Italian periodicals. She has published 'The Flying Dutchman,' a book of verse; 'Jupiter and His System'; 'The Planet Venus'; 'Flowers of Fire' (1902).

Clerkenwell, England, a parish of London inhabited by the better class of workingmen in the metal trades, being noted for its output of watches, optical instruments, and articles of gold and silver. The name comes from the well around which the parish clerks of London used to meet. The attempt of the Irish agitators to destroy the Clerkenwell prison was made on 13 Dec. 1867.

Clermont, The, the name given by Robert Fulton to the steamboat in which he made his first trip from New York to Albany, 11 Aug. 1807. The speed attained was only five miles per hour.

Clermont-Ferrand, klār-môn-fĕr-rān, France, a town in the department of Puy-de-Dôme, of which it is the capital. It is situated on a hill at the foot of the volcanic range in which the summit of the Puy is conspicuous. It was originally the capital of the Arverni, possessed considerable importance under the Romans, and became a bishop's see in 250. It was afterward sacked by the northern hordes, but soon recovered, and was selected in 1095 for the meeting of the great council in which the crusades originated. In 1556 it became the capital of the duchy of Auvergne. Among its natives are Gregory of Tours, Pascal, and General Dessaix. The most remarkable edifices are the Gothic cathedral, a huge, irregular, gloomy pile, begun in 1248, and recently completed by the construction of the west front and two towers; the Church of Notre Dame, founded in 580, and incrusted externally with rude mosaics; the townhouse, courthouse, theatre, general hospital, etc. There are also a medical and a theological college, technical schools, observatory, public library, botanic garden, and museums of natural history and antiques. The manufactures consist chiefly of chemicals, animal oils, table-linen, nails, hats, machinery, etc. It is an important centre of trade. Near it there are two mineral springs. Pop. 40,000.

Clermont-Tonnerre, tō-nār, the name of a distinguished ancient family of counts in Dauphiny. One of the most celebrated is Count Stanislas: b. 1757; d. 1792. At the breaking out of the Revolution in 1789 he took his place in the States-General as deputy of the nobility. He maintained the doctrine of a constitutional monarchy, and incurred the displeasure of both the aristocratic and republican parties. As a counterpoise to the influence of the Jacobins, he, in concert with Malouet and other friends of monarchy, founded the Monarchical Club; and along with Fontanes started the *Journal des Impartiaux.* The club having been denounced by Barnave as a band of conspirators, was dissolved, and the journal was suppressed after an existence of only two months. In 1791 he was arrested on the charge of having aided the king in his attempt to escape, but regained his liberty on taking an oath of fidelity to the National Assembly. The next year he was dragged by a mob before the section. As no sufficient ground of detention appeared, he was dismissed, but was pursued and murdered.

Cléry, Jean Baptiste, zhŏń bāp-tēst klā-rē, a French royal attendant: b. near Versailles 11 May 1759; d. near Vienna 27 May 1809. When in 1792 the royal family of France were imprisoned in the Temple, Cléry was one of the few servants permitted to accompany them. Louis XVI., a few days before his death, divided a loaf of bread with this faithful companion of his misfortune, the only proof of his regard which he was able to show him. After the king's death, Cléry was devoted to the dauphin. He wrote a journal of what passed in the Temple from the captivity of Louis XVI. until the death of the dauphin; it has been several times republished.

Clésinger, Jean Baptiste Auguste, zhŏń bāp-tēst ō-güst klā-zăń-zhā, French sculptor: b. Besançon 22 Oct. 1814; d. Paris 7 Jan. 1883. He obtained considerable reputation for busts of distinguished persons, and also executed statues and historical groups. His colossal bust of 'Liberty,' and his statues of 'Fraternity,' 'Woman Bitten by a Serpent,' 'The Gipsy Girl,' and of Rachael and Cruvelli in some of their principal parts, are among his best known works. He was commissioned by the French government to execute an equestrian statue of Francis I. He married a daughter of Madame Dudevant (George Sand).

Clesse, Antoine, ăń-twăń klĕs'ē, Belgian popular poet: b. The Hague 1816; d. 1889. To the day of his death he followed his trade of armorer. His first ballad, 'Godfrey de Bouillon,' won for him a gold medal. His popular songs 'Beer' and 'The Family Name' (meaning Belgian, including Fleming, Walloon, etc.), came into great favor with the people. He wrote also a comedy, 'A Poet.' Two volumes of 'Songs' (1866–88) contain all his popular ballads, with the music.

Clethra, klĕth'ra, the typical genus of the natural order *Clethraceæ,* or white-alder family. The family has but this single genus, which numbers about 30 species, indigenous to Japan, Mexico, South America, and the eastern seaboard of North America. The United States species are the sweet-pepperbush or white-alder *C. alnifolia,* found near the coast from Florida to Maine, and the mountain sweet-pepperbush (*C. acuminata*), a shrub or small tree growing in the mountain woods of Virginia, the Carolinas, and Georgia.

Clevedon, England, a watering-place on the Bristol Channel, about 15 miles southwest of Bristol. It is the burial-place of Hallam, the historian, and of his son Arthur, whom Tennyson's 'In Memoriam' made famous. Here Coleridge lived in 1795. Clevedon Court is the Castlewood of Thackeray's 'Henry Esmond.' Pop. (1901) 5,898.

Clev'eite, a variety of the mineral uraninite (q.v.), remarkable because containing yttria and the rare elements helium, polonium, and radium. It is found in the vicinity of Arendal, Norway, and occurs in cubical crystals, with octahedral and dodecahedral modifications. It has a specific gravity of about 7.5, and was named for P. T. Cleve, a Swedish chemist.

Cleveland, Charles Dexter, American writer: b. Salem 2 Dec. 1802; d. Philadelphia 18 Aug. 1869. He was professor at Dickinson College and at the University of the City of New York. His best known works are 'Compendium of English Literature' (1850); and 'Compendium of American Literature' (1858).

Cleveland, Grover, American statesman: 22d President of the United States: b. Caldwell, N. J., 18 March 1837. He was baptized Stephen Grover, but in after years dropped the Stephen. His father was a Presbyterian minister, descended from fine English stock. Mr. Cleveland's education was thorough, although he was not able to complete a college course. He began to earn his first money as a teacher, but soon developed a talent for law, and in 1859, when but 22, was admitted to the bar in Buffalo, N. Y. The sturdy, uncompromising spirit inculcated in him by his father's training stood him in good stead in his chosen profession, and he soon became known as a young man who feared nothing when principle was at stake. Four years after he began the practice of law in Buffalo he was chosen assistant district-attorney of Erie County (1863–6), thus beginning his remarkable political career, which was to carry him with rapid strides to the highest office in the gift of the American people.

In Erie County, where centres the trade of the Great Lakes, the office of sheriff is one of the most important, and in 1870 the young man who had served the county so faithfully as assistant to the district-attorney was chosen as the candidate for sheriff, and was elected by a handsome majority. Unbribable and stern in the performance of his often repugnant duties in this office, he so satisfied the people of the city and county that in 1881 he was the unanimous choice of his party for mayor of Buffalo, and was elected to that office. Here he had still greater opportunities for displaying the qualities which had won him his previous successes. When in 1882 the Democratic leaders of New York were seeking a man to lead the party, the mayor of Buffalo was suggested as a candidate for governor. He was nominated with little opposition, and elected by the immense majority of nearly 200,000 votes. This result was due partly to the divided efforts of the opposing party, but largely to Cleveland's personal popularity and to the faith which all classes seemed to feel in his character and his determination to do right. His course as governor met with the endorsement of the majority of men of all parties, and he was the logical candidate for President on the Democratic ticket in 1884. Not since the Civil War had the Democrats been as enthusiastic and united for any candidate, and Cleveland was elected, although his opponent was James G. Blaine, the idol of the Republican party, and a man of great personal magnetism. The contest was most bitter and close. New York, however, which had so believed in him and honored him in the past, stood by Mr. Cleveland, and the enormous vote polled for him in New York city and Brooklyn carried the day. He received 219 votes in the electoral college, to 182 for Blaine, as well as a majority of the popular vote, and took his seat as President of the United States in 1885, when but 48 years old. As the first Democratic President since the War, his position was one of most unusual difficulty, but the same characteristics which had previously won him the confidence of the people, proved an adequate equipment for his greater responsibilities.

Mr. Cleveland is not a man ever to hesitate when he believes a certain thing or policy to be right and proper. Immediately on his accession to office he began to redeem the promises he had made to himself and to the people. He believed that a reduction of the then high tariff on many articles was for the best interest of the nation. Accordingly he so formulated his first message to Congress as to embody in it the changes he thought wise. This was not in accordance with the opinion of many of his political advisers, but he believed it was the thing to do, and therefore he did it, regardless of personal consequences. He carried his point, making by this famous message a dividing line between the two leading political parties which was to continue to the present time. The Republicans, adhering to the policy of protection and high tariff, in 1888 nominated Benjamin Harrison to oppose Cleveland, who was renominated by the Democrats. Harrison was elected by a small plurality; but in 1892, when these two men were again opposed for this high office, Cleveland won by a large majority. His course during his two terms as President was at all times vigorous, determined, and able. His measure to secure a tax on the large incomes of individuals, so as to reduce the direct taxation of the poorer people, was bitterly opposed by the men it was proposed to tax. Finally the United States supreme court, by a majority of one vote, declared the act unconstitutional, the court standing evenly divided during several long sessions. When there was danger of complications with England over the Venezuela boundary dispute, Mr. Cleveland wrote a vigorous definition of the Monroe Doctrine, which led to the immediate appointment of an arbitration commission and averted possible war. During one of the great labor strikes, when disorder reigned, he did not hesitate, but sent Federal troops to the scene at once and quelled the uprising. He was popular in a social way, being aided in this respect by his wife, whom he had married during his first term as President.

There was talk of again nominating Mr. Cleveland for President in 1896, but the feeling against a third term was too general. He retired to private life in 1897, and to-day he is our only surviving ex-President, enjoying the respect and honor of his fellows at his home at Princeton, N. J. He has received the degree of LL.D. from Princeton University, where he occasionally lectures to the students. This was the college he had hoped to attend when a boy, and his love for it has never ceased. He is scarcely less noted as a fisherman than as statesman, being never more happy than when he can steal away for a

few weeks' enjoyment of the gentle sport. He was prominently mentioned as the Democratic candidate for the presidency (1904), as his attitude had been against the policies laid down in the recent Democratic platforms, which so failed to please the people. He is recognized as the ablest leader the Democrats have ever had, and they would, most of them, be glad to see him again the candidate, but it is not thought that he would accept another nomination. His speech at the opening of the new Tilden Club, New York, in 1902, showed his attitude, and did more to harmonize and settle the disturbed conditions existing in the Democratic party than any other utterance of recent years. His last significant public act was a speech at the opening of the St. Louis Exposition, in May, 1903.

Cleveland, John, English poet: b. Loughborough June 1613; d. 29 April 1658. He was an adherent of the Royalist party during the civil war, and severely satirized the opposite party. He was arrested and imprisoned in 1655, but was released by Cromwell.

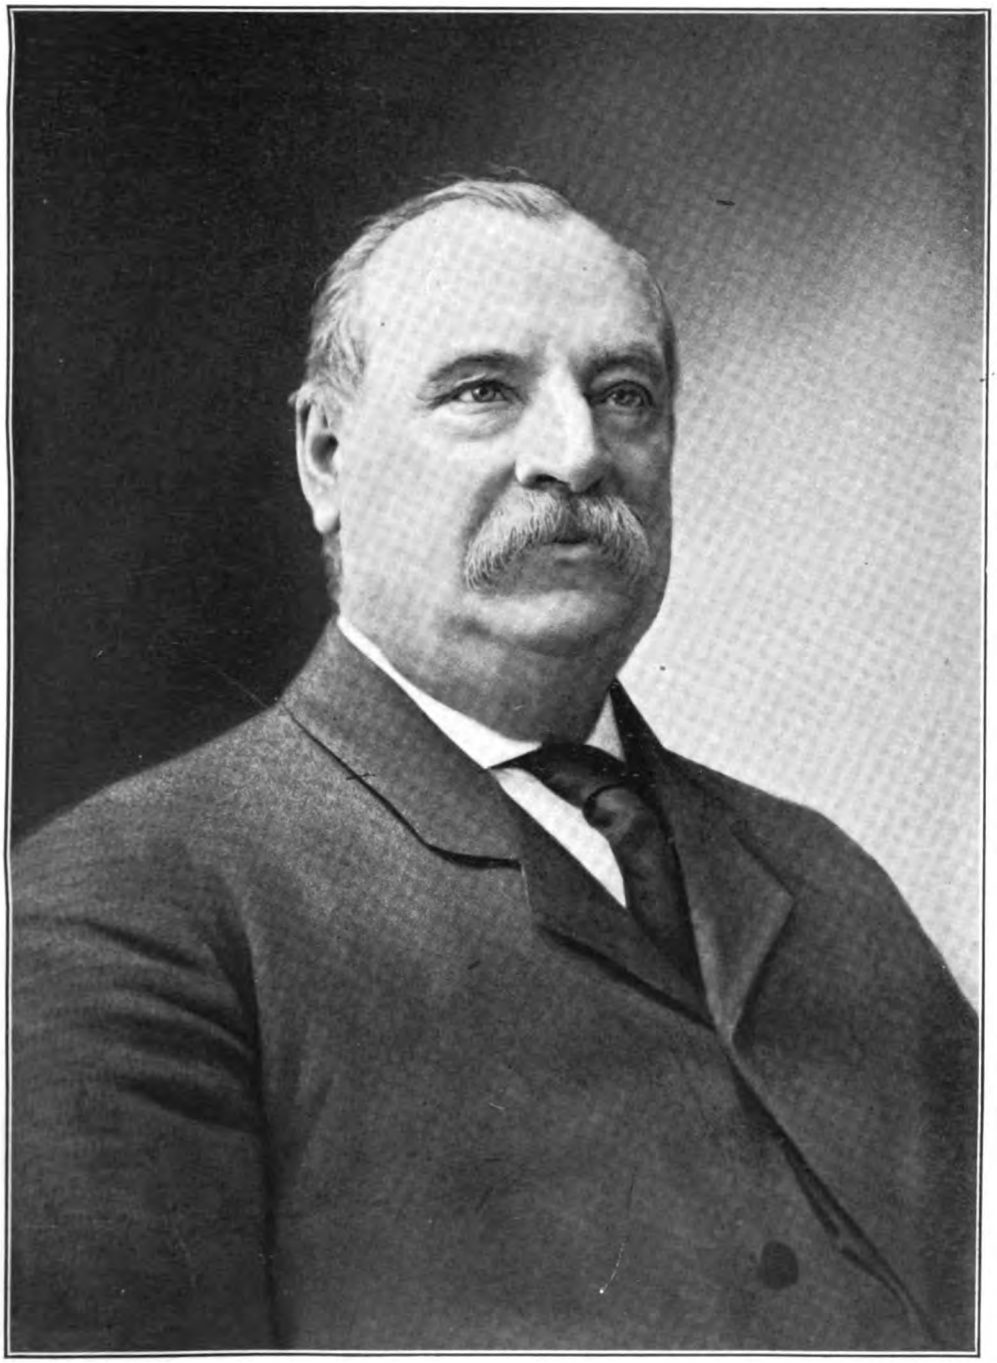
Cleveland, Rose Elizabeth, American prose writer: b. Fayetteville, N. Y., 1846. She is the sister of Grover Cleveland (q.v.), and after the inauguration of her brother (1885) she became the "mistress of the White House," remaining there until 1886. She published a book of essays and lectures entitled, 'George Eliot's Poetry, and Other Studies' (1885); and 'The Long Run,' a novel (1886).

Cleveland, England, a hilly district in the North Riding of Yorkshire, about 28 miles long and 15 broad, between the Tees and the coast at Whitby, forming one of the parliamentary divisions of the county. It has developed enormously since the discovery of its extensive deposits of iron ore, which is smelted chiefly at Middlesbrough.

Cleveland, Ohio, "the Forest City," city and county seat of Cuyahoga County; largest city in the State, second on the Great Lakes, and seventh in the United States; on Lake Erie at the mouth of the Cuyahoga River, 357 miles by rail east of Chicago and 183 west of Buffalo; 138 northeast of Columbus, 263 northeast of Cincinnati, 140 northwest of Pittsburg, 623 from New York against less than 500 overland, the Alleghanies forcing a long detour. For its great number of railroad and steamer connections, see *Commerce and Transportation,* below. Pop. 1900, 381,768.

Cleveland is on the edge of the great plateau of northern Ohio, sloping gradually from the lake to a ridge 115 feet above it and 689 above sea-level, rising much higher to the east. It extends about 10 miles along the lake, and a maximum of 6 miles back, with an area of some 33 square miles,—its annexations of Brooklyn southwest and Newburg southeast of the Cuyahoga carrying its wings south beyond the centre. About three fourths of it, and the main business part, lies east of that river, a small crooked stream with the last few miles 200 or 300 feet wide and of some depth, lined with docks for five or six miles out of an available wharfage of 16. Its valley half a mile wide, the sunken bed of a much greater stream, is filled with car tracks and car shops, lumber, coal, and ore sheds, ship-yards, etc., largely hidden from the city; and is spanned by two immense viaducts, uniting the east side with the west or south as the river runs. The lower viaduct connects Superior Street, the main business avenue, with Detroit Street west, making a sharp turn southwest west of the river; is of stone and iron, 3,211 feet long, 64 wide, and 68 above average water, with a 322-foot draw; and was completed 1878, at a cost of $1,715,000 besides $535,000 right of way. The Central Viaduct is from Ohio Street east to Jennings Avenue south, where it connects at an angle with one westward across Walworth Run, a brook running into the Cuyahoga 1½ miles above its mouth; the two have a total length of 3,931 feet (with approaches, 5,229), width 56, height 101; completed 1888, cost $675,000. Entirely on the east side is one 834 feet long, 48 wide, and 87 high, across Kingsbury Run, a brook emptying into the Cuyahoga a mile above Walworth on the other side. There are several other municipal and railroad bridges across the latter river.

Streets.— The focus of the city, the heart of the business quarter and the centre of the street-railway lines, is Monumental Square, about half a mile from lake and from river; and from this or near it radiate a fan of streets at every angle from northeast (parallel to the lake front) to southeast (toward Newburg). Two miles east, the long Willson Avenue runs north and south from near the lake to Broadway, the old Newburg highway; so that the older city is a rough triangle with the vertex at the square, the base Willson Avenue, one side the lake, and the other the river and Kingsbury Run. The rest of the city plan is largely haphazard: East Cleveland and old Brooklyn generally east and west by north and south, along Broadway a mass of short streets at right angles to it, the West Side based on the lake line and the river curves; but accidental or surface variations are endless. Monumental Square, originally a 10-acre park, is now divided into four sections by two broad avenues intersecting at right angles, Superior 132 feet (eight rods) wide, Ontario 99 feet (six rods). Superior runs from the river parallel with the lake front for two miles or so, then sheers off east; it is the great business street, the large stores extending along it from the square to the river and as far east. Ontario runs to the lake, as does Seneca along the west side of the square; St. Clair is parallel to Superior nearer the lake; Water Street runs from Superior near the river to the Union depot, as does Seneca to the other end. From the southeast corner of the square starts the world-famed Euclid Avenue, once said by travelers to be the most beautiful street in the world; named from the town of Euclid on the east to which it is the highway, and as a lake road extending to Erie, Pa., 95 miles. It widens from 80 to 99 feet, and beyond the business portion is lined with splendid and costly stone mansions set from 200 to 400 feet back from the street, amid superb grounds, "estates" rather than merely dwellings. It turns east along a low ridge, but beyond Wade Park again turns northeast. Both Superior and Euclid run to the city limits; parallel to the latter on the south is the only less fine Prospect Street, extending to Willson Avenue, itself a notable residence street, as are Case Avenue west of Willson from the lake to Kingsbury Run, East



GROVER CLEVELAND,

TWENTY-SECOND AND TWENTY-FOURTH PRESIDENT OF THE UNITED STATES.

Madison a mile east of Willson and parallel to it, and a number of shorter streets. On the South Side (Brooklyn), Jennings Avenue, reached by the Central Viaduct, is the chief residence street. The streets in general are wide, and so heavily shaded with great trees as to have given Cleveland the name of the "Forest City." The houses are nearly all detached, either tenements for the poor or flats for the richer being still comparatively few.

Municipal Conditions.— The light porous soil makes excellent drainage, and there is a good sewerage system. The death rate in 1902 was 17.1. The waterworks are owned by the city, and have cost to date above $10,000,000, which extensions under way will largely increase; there are two pumping stations and two standpipes, the water coming from a crib 8,642 feet out in the lake, through two tunnels 90 feet below the surface, to two reservoirs on the East Side, with a daily delivery capacity of 117,000,000 gallons. A new crib and tunnel 26,000 feet into the lake, or about five miles, are under construction. Of the 600 miles of streets, toward 200 are paved, largely with Medina dressed stone, also with asphalt, vitrified brick, and macadam. The street- and suburban-railway system is very extensive: not only are there over 200 miles of track in the city, but some of the longest suburban and through lines in the country start from the square,— to Akron, 39 miles, to Painesville, 29 miles, to Elyria, 25 miles, etc. They carry package freight also. The city has four public markets. The police force in 1902 consisted of 295 patrolmen, 29 lieutenants, 16 sergeants, 12 detectives. The fire department has 28 steam-engine companies, 9 hook and ladder companies, and 3 hose companies.

Buildings, etc.— Monumental Square contains a bronze statue of the city's founder, Gen. Moses Cleaveland, and the elaborate Soldiers and Sailors' Monument to the dead of the Civil War; the marble statue of Perry, formerly here, has been removed to Wade Park. The frontage on the square is occupied by the government building, one of the two court-houses, the "Old Stone Church" (First Presbyterian), the Society for Savings, the Chamber of Commerce, a hotel, etc. The public buildings are to be replaced by a new and splendid set, grouped in a quadrangle a fourth of a mile square near the centre of the city, enclosing a park. The government has authorized its new post-office building to cost $2,500,000, and a court-house costing at least $3,000,000 is assured. The entire "Group Plan" improvement is estimated at $16,000,000. The Arcade office building just east of the square, erected 1889 for $850,000, is a prominent feature: it consists of a great interior court open to the top, surrounded by tiers of offices with balconies in front, entirely around it. The Colonial Arcade, built as a companion in 1898, is near by. The Sheriff Street market is one of the largest in the country, and the stone Union Station was such when built, and is still notable,— it is on the lake a little east of the river. Of others may be noted the Central Armory, the Caxton Building housing the Case Library, the Garfield, Hickox, New England, Perry-Payne, Cuyahoga, Lennox, Rose, and Williamson buildings; besides institutional buildings,— the beautiful one of the Cleveland Medical College, the Y. M. C. A., the House of Correction, the Northern Ohio Insane Asylum, Adelbert College, and the Case School of Applied Science southeast of Wade Park, etc.; besides churches mentioned later.

Amusements and Clubs.— The chief places of public amusement are the Central Armory, the Grays' Armory, the Opera House, the Lyceum Theatre, the Colonial Theatre, the Empire Theatre, and the Star Theatre. The chief clubs, several owning their own club-houses, are the Colonial, Country (on the lake front east of Gordon Park), Excelsior, Roadside, University, Rowfant, Tavern, and Union.

Parks.— Cleveland has one of the finest park systems in the country, with 22 parks containing 1,326 acres, on which over $3,000,000 has already been spent in improvements, and authority has been granted to spend another million. The most desired improvement — to make the lake front, now occupied by the Lake Shore tracks, a boulevard — is difficult of attainment; but it would complete the chief of the park plans. Four or five miles east of the Cuyahoga, Doan Brook flows into the lake, through a valley of considerable breadth. At its mouth is the beautiful Gordon Park of 122 acres, formerly a private estate bequeathed to the city. Two miles back is Wade Park of 62 acres, on an elevation overlooking the lake,— an exquisite place, with groves of magnificent trees, a boating lake, a zoological garden, etc.; and containing also the marble monument to Commodore Perry, hero of the battle of Lake Erie, removed from Monumental Square. The whole Doan Valley between and beyond them has now been purchased and presented to the city by John D. Rockefeller and others, and turned into a broad ribbon of park three or four miles long. If the lake boulevard is ultimately built, it will connect with Lakeview Park, already extending 2,500 feet along the lake front, from Erie Street to the Union Station, and the little Clinton Park, east of it, making some eight miles of continuous park drive, with Euclid avenue as the third side. Of the large number of other parks, the chief are — on the East Side, Newburg in the south, of 160 acres; Woodland Hills, southeast of Wade Park; Forest City, between Willson Avenue and the river, at the city line; Garfield Park; on the west, Edgewater of 89 acres at the lake, with a bathing and boating beach and full summer equipment; Brooklyn of 139 acres in the south; Brookside in the southwest; and small but pretty ones like "The Circle" on Franklin Avenue, with a fountain; South Side, of nine acres, on Jennings Avenue, etc.

Cemeteries.— Of the numerous cemeteries, the finest is Lakeview, at the extreme northeast of the city six miles out, off Euclid Avenue,— one of the most beautiful in the country for site and development. It is on the crest of the ridge, rising to 250 feet above the lake: on this height stands the Garfield Memorial of Ohio sandstone, 165 feet high, with a balcony around the top commanding an immense prospect of lake and land; the lower portion is a chapel containing panels and reliefs of scenes in his life, and beneath is his tomb in the crypt. Woodland of about 60 acres lies between Willson and East Madison, a mile south of Euclid; Riverside of 120 acres is in Brooklyn, southwest of the river.

Churches.— Cleveland is the seat of a Roman Catholic bishop; and in 1902 had 319 church

societies of all denominations,— including a few mission branches, and Christian Science and Spiritualist denominations. The chief were— Roman Catholic, 43, including one Italian and one Polish, besides a monastery and five convents; Methodist Episcopal, 37, including five German, one Swedish, and one Welsh; 24 Congregationalist, including two Bohemian, one Polish, one Welsh, and one colored; 22 Baptist, including three German, one Swedish, and one Welsh; 22 Protestant Episcopal, besides three parish houses; 21 German Evangelical Lutheran; 20 Presbyterian, including one Welsh; 14 German United Evangelical; 14 Hebrew synagogues; 12 Reformed Church in the United States (Bohemian Moravian); 12 Disciples; 6 Friends; 5 United Brethren; 1 Swedenborgian, etc., showing the enormous complexity of this polyglot city. The most important church edifices are the cathedral; St. Paul's and Trinity, Episcopal; First Presbyterian ("Old Stone"), Woodland Avenue Presbyterian, with the largest Sunday-school in the city; Calvary, Second and Third Presbyterian; First and Plymouth Congregational; First Methodist; and Euclid Avenue Baptist.

Charities.— Cleveland takes one of the highest places in charitable work. The most important of recent foundations is the social settlement called Goodrich House, founded in 1897, with a splendid $80,000 building; one of the best equipped and managed in the country, with library, reading-room, parlors, and clubs, gymnasium, baths, public laundry, sewing-rooms, kindergartens, etc. Of the others, the Northern Ohio Insane Asylum, founded in 1855, has accommodations for 900 patients, with a fine building and 112 acres of ground on a sightly spot. There are 16 hospitals, with dispensaries and maternity wards, several of them having training schools for nurses; the largest is the City Infirmary and Hospital, with an average of 1,000 patients a year, and an outdoor relief department; others are the Cleveland General, Cleveland Homœpathic, Lakeside, Charity (St. Vincent's, founded 1866), St. Alexis, St. Clair, St. John, etc. There are Protestant, Roman Catholic, and Jewish orphanages, children's aid societies, homes for working women and the aged poor, an inebriate asylum, a "reformatory home for unfortunate women and girls," a Bethel home for sailors, and scores of societies for relieving every relievable distress, besides a workhouse for incorrigibles.

Educational Institutions.— The Cleveland public-school system, with 70 grammar schools, six manual-training, and one deaf-mute, one normal, and five public high schools, and about 1,300 teachers, costs about $2,000,000 a year. It was reorganized in 1892; a director of schools and a school board of seven are elected by the people and elect a superintendent of schools who appoints the teachers. It is managed on the now well-known "Cleveland plan," in some respects an advanced step in accordance with irresistible modern drift, in others a reversion to an older type. The root idea is to abolish routine and automatic methods: there are no regular examinations and no punishments, and the teacher promotes scholars on a general judgment of capacity; while manual and domestic training are made a part of all grades. Besides these are a mass of private and parochial schools. Of secondary schools, besides the high schools, are the University School; two for girls, the Mittleberger School and the Hathaway-Brown School; and the Ursuline Academy.

The chief seat of higher education is Western Reserve University, an institution formed by affiliating older schools and colleges and adding new; Adelbert College, till 1882 Western Reserve College at Hudson, Ohio, founded 1826; the Cleveland Medical College, with a fine museum and library, founded 1843; the College for Women, founded 1888 by the trustees of the university, as a part of it,— not an "annex," as the university confers the degrees; the School of Law, founded 1892; and the Dental College, 1893. It had in 1902, 800 students. The Case School of Applied Science, founded in 1881, and in 1887 endowed with $2,000,000 by Leonard Case, is a highly flourishing and valuable school of technology. There are also two other law schools, that of Baldwin University (Berea, Ohio), and the Cleveland College of Law; three medical schools, the Cleveland College of Physicians and Surgeons (of Ohio Wesleyan, at Delaware, Ohio), Cleveland Homœopathic Medical College (1849), and the Cleveland School of Pharmacy; and two Roman Catholic colleges, St. Ignatius (1886), and St. Mary's Theological Seminary.

Libraries.— The chief library of Cleveland is the Public, of nearly 200,000 volumes, opened 1869; next is the Case Library (subscription), with over 50,000. The library of the Western Reserve Historical Society contains toward 25,000 volumes and pamphlets, very rich in historical value; it has also an interesting collection of historical curios. Western Reserve University has a library of 45,000 volumes. There is also a law library of some 15,000 volumes, founded 1870; and medical libraries.

Commerce and Transportation.— The violent storms of the Great Lakes made every safe harborage in the mouth of a small river a potential port of importance; and every great lake city is so located, except Detroit, on a strait off the open water. Cleveland's river gave it the first hold; but it was of little consequence till the Ohio Canal tapped the State's agriculture and made it a terminal of inter-State traffic. After railroads came, the canal gradually went out of use, and in 1879 its terminal facilities were given to the Valley R.R. (now the Baltimore & Ohio); but meanwhile the city had become of supreme importance as the nearest large lake port to the iron, coal, and petroleum of western Pennsylvania and northern Ohio (as will appear by a glance at the map), and of course as convenient for sending to them the iron and copper ore of Lake Superior. Hence it has become the greatest ore market in the world, receiving about 4,000,000 tons a year; a leading coal port, its receipts being about 6,000,000 tons a year and its shipments nearly half that; one of the chief markets for grain, lumber, and petroleum; and the greatest in the United States for fresh-water fish. Its lake traffic is enormous: 48 steamship, steamboat, and barge lines operate from here, to every port on the Great Lakes, from Duluth to Buffalo, and through the Welland Canal to Toronto and the St. Lawrence. Its clearances of vessels have been over 7,200 in one year, with a gross tonnage of nearly 9,000,000. All these lines of business have doubled since 1890. Its railroad

communications are through all the great Eastern trunk lines, and others west and south: the New York Central and its feeder the Lake Shore by Buffalo, the Pennsylvania by Pittsburg, the Baltimore & Ohio by the Valley, the Erie through Akron, the Cleveland, Cincinnati, Chicago & St. Louis, the New York, Chicago & St. Louis (Nickel Plate), the Wheeling & Lake Erie, the Cleveland, Akron & Columbus.

The natural advantages of Cleveland have been improved by the municipality and the federal government till it forms one of the finest of harbors. The lower course of the river has been widened and deepened, and near the mouth given a uniform width of 325 feet, in place of a minimum of 150; and at each side of the mouth a stone pier 1,500 feet long has been built out into the lake, affording a channel 16 feet deep. The public dock frontage on river and lake amounts to over a mile, about half of which has been improved. A western arm of the river, about a mile long, parallel to the lake shore a little way in, has been dredged to a large ship canal, with railway docks. But still more important is the great government breakwater, begun in 1879, and $8,000,000 already spent on it. Starting opposite the mouth of the western arm, it runs about 3,000 feet into the lake, then 4,000 feet northeast parallel to the shore till opposite the main mouth, then with a break of 500 feet runs for another 2,000 feet to opposite the Union Station, forming a sheltered basin of some 300 acres west of the mouth. An extension of the eastern arm 4,000 feet farther is now under way, making nearly two miles of outer wall.

Manufactures.— Cleveland is the second largest manufacturing place on the lakes, and second in the State; and in the manufacture of iron and steel and the goods made from them, is among the foremost in the country, owing to its proximity to Pennsylvania iron, Ohio coal, and limestone from the Lake Erie islands, and its being the place of receipt of Lake Superior iron. It is the centre of the malleable-iron trade of the country; first in the United States for wire and wire nails, and second in hardware: the first of lake ports in iron and steel shipbuilding, as formerly in wooden shipbuilding,— the actual number of vessels turned out being greater than in any other United States city, and some of them reaching 380 feet long and a cost of half a million dollars,— and forges a large part of the steel shafts and stern-posts of the vessels built on the Atlantic coast. The variety of its industries in this kind is almost endless,— as bridge castings and forgings, rails, car wheels, engines and boilers, cranes for unloading vessels, railway machinery of all sorts, printing presses and sewing machines, oil and gas stoves, etc. The five groups alone of "iron and steel," "bolts, nuts, washers, and rivets," "forgings," "iron work, architectural and ornamental," and "foundry and machine-shop products," aggregate over $45,000,000 a year; and electrical apparatus, over $3,500,000 more. Besides these, there is a remarkable and most valuable variety of small specialties demanding highly skilled labor, often performed by independent workmen not compacted in shops, as optical instruments, and other scientific work of delicate accuracy. The next greatest industry is that of slaughtering and meat packing, which amounted in 1900 to $7,514,470, second only to Cincinnati in the State. Men's and women's clothing, malt liquors, petroleum refining, paints, and chemicals are also of great importance and volume. The total product of its industries in 1900 was $139,849,806, employing 64,220 workmen and officials, with wages and salaries amounting to $33,624,834 yearly.

Finances and Government.— The assessed value in 1900 was $142,768,280, against $99,614,055 in 1890; the net debt (there being a sinking fund of $2,607,000), $14,121,530; tax rate, $30 per $1,000, of which slightly over one third was for schools. The expenditures are about $6,000,000 a year, with large special outlays for improvements, of which the great public-building scheme is chief. The government is by the new city code of 1903, which went into effect in May of that year, and differs materially from the former federal plan of separating executive from legislative powers, which for more than a decade was in force. The new plan comprehends a two-years' mayor; an elected Board of Public Service; a Board of Public Safety, appointed by the mayor, and a council of 32 members in a single chamber, which makes all appropriations; and the chief school and court officials and the city treasurer are elected by the people.

Banks.— In 1902 there were 71 banks of all denominations operating in the city, including 14 national banks, with combined capital of about $11,000,000, and deposits of over $50,000,000, against $15,000,000 in 1890. The savings banks have upward of $100,000,000 on deposit, against $37,000,000 in 1890.

Population.— 1820, 606; 1830, 1,076; 1840, 6,071; 1850, 17,034; 1860, 43,417; 1870, 92,829; 1880, 160,146; 1890, 261,353; 1900, 381,768, of whom 124,631 were foreign-born, and 163,570 native-born of foreign parentage,— 288,201 in all; and 87,740, or 23 per cent, were native Americans. An analysis of this influx, however, makes not quite so extreme a showing. Of these foreigners, 47,566 were Germans, 18,460 English of Great Britain or Canada, 13,579 Bohemians, 13,120 Irish, 9,558 Hungarians, 7,696 Poles, 3,607 Russian Jews, 3,065 Italians, 2,179 South Americans, 1,490 Welsh, 1,000 Swedes, etc. The immigration 1880–90 being roughly on the same lines, and assuming one third the Irish immigration to be from the North and therefore practically English, the people of English stock would be raised to 140,000, or toward 37 per cent in place of 23.

History.— For the claim of Connecticut to the territory from lat. 41° to 42° 1′ N., and 120 miles west of the Pennsylvania line, see WESTERN RESERVE. That State conveyed its title to the Connecticut Land Company, which in 1796 sent out Moses Cleaveland to survey the land and establish "New Connecticut"; and his party, having surveyed 60 miles, ran the line north to the Cuyahoga and followed it to the lake, reaching the latter 22 July. Cleaveland at once fixed on the plateau as the capital of the new State, and had it laid out, with the square and its two main streets (not intersecting) as now, with the same names, but Euclid (then called Middle Highway) only starting from Huron Street; it was not cut through to the square till 1815. The settlement was given Cleaveland's name, but not his chosen spelling, the first survey map bearing "Cleveland"; usage fluctuated, but was fixed in 1831

by the adoption of the shorter form by a newspaper, it is said because the «a» would not go into a headline. The soil being poor, most immigrants went on into the interior; early commerce was on the Ohio, and for a decade Cleveland remained a hamlet with a few dozens at most, those mainly Connecticut people. It became a part of Jefferson County in 1797, of Trumbull County in 1800,—the United States having assumed administration over the Western Reserve,—and of Geauga County, its county-seat in 1805, just after it had become a port of entry; in 1810 Cuyahoga County was formed, with Cleveland for its seat, probably having about 100 inhabitants. They must have been of good quality, however, as a library was started in 1811. In 1814 Newburg was set off, and for many years was the more important of the two, from its water power. On 1 June 1815 Cleveland was incorporated as a village; and in 1816 the first bank was started. In 1818 the first newspaper was issued, the Cleveland *Gazette and Commercial Register*. In 1820 it had grown to over 600. In 1824 the first steam vessel was launched. But two great events happened to it near the end of the decade. In 1827 the Ohio Canal was opened to Akron, and in 1832 to the mouth of the Scioto at Portsmouth; and in 1828 the cutting of a channel across the bar at the river mouth, giving it 10 feet of water, was completed. These were its making, and with about 1,000 in 1830, the town had grown to over 6,000 in 1840. In 1836 with about 4,000 people it received a city charter, two days after its neighbor Brooklyn across the river had received one as «the City of Ohio,» which lasted till 1853, and was then annexed to Cleveland. In 1834 a horse railroad with wooden rails was built to Newburg.

The same year five steam railroads were chartered from Cleveland to everywhere, and the Ohio R.R. to the Maumee sold a good deal of stock; but the panic of 1837 ended such speculations, and it was not till 1846 that more were even chartered, and about five years later before the first one was built. The advantage was immense, and it leaped from 17,000 to 43,000 within a few years. About the time of the war the iron industry began to take root, and the manufacture of iron products for the government during the war crowded its manufactories, as did that of clothing. Since then its history is mainly that of an enormously expanding industrial city, but one that has never forgotten to keep its intellectual growth and the spirit of culture abreast of its material development. In 1872 it annexed East Cleveland; in 1873 Newburg; in 1893 West Cleveland and Brooklyn. In 1896 it celebrated its centennial.

Cleveland began the new century with no abatement of its remarkable increase in population and with many evidences of expansion in a material way. The additions to the waterworks and sewerage systems, the improvement of the lake front and the river channel, the establishment of the colossal group plan of public buildings, the increase of street paving, and the continued extensions of the park and boulevard systems, indicate that Cleveland is in the midst of an era of progressive activity with which no previous period in its history can bear any comparison.

W. R. Rose,
Associate Editor Cleveland Plain Dealer.

Cleveland, Tenn., a city and county-seat of Bradley County, about 30 miles from Chattanooga, on the Southern R.R. In addition to the usual industries of a town in an agricultural region, it has stove-works and woolen and flour mills. It is the site of Centenary Female College. Pop. (1900) 3,858.

Clevenger, klĕv'ĕn jĕr, **Shobal Vail,** American physician: b. Florence, Italy, 24 March 1843. He was the son of an American sculptor of the same name. During the Civil War he was a first lieutenant in the engineer corps, and later United States deputy surveyor in Montana and Dakota, writing a 'Treatise on Government Surveying' (1874). He graduated at Chicago Medical College, 1879, established himself in practice in that city, and is a specialist in nervous and mental diseases, and a professor and lecturer in several colleges. He has written: 'Comparative Physiology and Psychology' (1884); 'Artistic Anatomy' (1885); 'Spinal Concussions' (1889); 'Medical Jurisprudence of Insanity, or Forensic Psychiatry' (2 vols. 1898), and many professional articles in scientific and medical journals.

Clèves, klāv (German *Kleve*), Prussia, chief town of the Rhine province, 70 miles northwest of Cologne, and 4½ miles from the Rhine, with which it is connected by a canal. It has manufactures of machinery, tobacco, leather, and cotton. In the centre of the town rises the old and renowned Schwanenburg (Swan's Castle), the ancient residence of the dukes of Clèves, founded, according to tradition, by Julius Cæsar. The collegiate church, dating from the 14th century, contains monuments of the counts and dukes of Clèves. Prussia (Brandenburg) acquired Clèves in 1609. Pop. 15,000.

Clew Bay, a bay on the west coast of Ireland, in County Mayo, containing a vast number of islets, many of them fertile and cultivated.

Clews, Henry, American banker: b. Staffordshire, England. At the age of 15 he left school to enter mercantile life in New York, where his father had taken him for a visit. At the outbreak of the Civil War, his firm, Livermore, Clews & Co., was invited by the secretary of the treasury to become agent to sell government bonds. In 1877 the firm of Henry Clews & Co. was formed, and its members pledged themselves never to take any speculative risk. He was a founder of the New York Union League Club, and has been connected with many financial and city institutions, and literary and charitable organizations. He has written 'Twenty-eight Years in Wall Street' (1888), 'The Wall Street Point of View' and many financial articles for the newspapers and magazines.

Cliche, klēsh, an electrotype or stereotype cast from an engraving.

Clichy-la-Garenne, klē-shē-lä-gä-rĕn, France, (Latin, *Cligiacum*), a town in the department of the Seine, near the right bank of the Seine, and on the railway between Paris and St. Germain, about four miles northwest of Paris. In the 7th century it was frequently the residence of the court. It contains a parish church, the erection of which is due to the celebrated Vincent de Paul, who was curate of Clichy in 1612; and has manufactures of white-lead, chemical products, glue, varnish, rolled lead, etc. Pop. (1901) 39,521.

Click Beetle. See WIRE WORM.

Clients, citizens of the lower ranks in ancient Rome who chose a patron from the higher classes, whose duty it was to assist them in legal cases, and to take a paternal care of them. The clients, on the other hand, were obliged to portion the daughters of the patron if he had not sufficient fortune, to follow him to the wars, to ransom him if taken prisoner, and to vote for him if he was candidate for an office. If a client died without issue, and had made no will, his property fell to the patron. Clients and patrons were under mutual obligation not to accuse each other, not to bear witness against each other, and in general not to do one another injury. This relation continued till the time of the emperors. It may be considered as the transition from a patriarchal state, in which family relations are predominant, to a well-developed political system, securing the rights and independence of the individual. In modern times the word client is used for a party to a lawsuit who has put his cause into the hands of a lawyer.

Cliff. Nearly vertical rock walls are formed in a variety of ways by natural means. In the development of a drainage system in any high-lying tract of country, ravines, gorges, and cañons are formed by the down-cutting streams, as Watkins Glen, N. Y.; the gorge of the Niagara River, and the Grand Cañon of the Colorado. After long erosion the softer rocks may be removed, leaving the harder with steep faces standing above the surrounding country, as at the Delaware Water Gap, in the Catskills, and many places in the Appalachian Mountains. In high mountains glaciers dig out deep channels. Cliffs formed in these ways may be called cliffs of erosion. Where a high coast borders any large body of water, the waves eating into the land form cliffs, as on the northern shores of Scotland, southern England, the coast of Maine, and elsewhere. Such cliffs may be called sea cliffs. Cliffs may also be formed by the rock fractures known as "faults," where the rocks on one side of a fracture rise faster than they are worn down by weathering. Such cliffs are not uncommon; they are found in many parts of the West, being especially prominent in arid regions like the Colorado plateau, where weathering is slow. Such cliffs may be called "fault cliffs."

Cliff Dwellers, a race of Indians formerly living in the cliffs bordering on the valleys of the Rio Grande and Rio Colorado. Their homes were built in the recesses of these cliffs at a height often of several hundred feet from the ground, and at the present time seemingly inaccessible, as the former paths that led to them have nearly all been destroyed by the crumbling away of the rocks. These dwellings sometimes consisted of many rooms, and in some cases were two or more stories high, hewn in the rock, with wooden lintels in the doors and windows, which were probably closed with skins or blankets. The walls were finished with a plaster of clay. How the inhabitants subsisted is not known, but probably mainly by hunting and fishing, as the soil about these localities is barren. The Pueblo Indians, who are still to be found in that section, are probably descendants of the Cliff Dwellers, and possess considerable skill in making articles of pottery, etc.

Cliff-Dwellers, The, a novel by Henry B. Fuller (1893). It is a story of contemporary Chicago; a sober arraignment of the sin and greed of a purely material civilization. The protagonists of the drama take their title of "cliff-dwellers" from their occupation of various strata of an enormous office building. The story is too sincere to be called a satire, and too artistic to be called a photograph; but it is executed with a merciless faithfulness that has often elicited both characterizations.

Cliff Haven. See SUMMER SCHOOLS.

Cliff Swallow, a species of swallow (q.v.), the *Petrochelidon lunifrons* of ornithologists. The sexes are alike, of a lustrous steel-blue color above, with a brownish white crescent on the forehead, the under parts generally grayish with a blue patch on the breast, and the throat, chin, and sides of head rust color. From most other species of the *Hirundinidæ* (q.v.) the cliff swallow is distinguished by the very short square tail, beyond which the tips of the folded primary wing feathers extend, and the thick bill. The cliff swallows inhabit North America, except Florida, to the northern limit of the tree zone, and breed in colonies nearly throughout their range; in winter they enter South America. Probably on account of their social habits, cliff swallows are distributed very irregularly, in some places being very common, in others rare. Formerly this species attached its remarkable retort-shaped nests of mud to cliffs, which have now been generally forsaken for the more convenient and accessible eaves of barns, etc.; on this account it is known in some localities as eave swallow, in others, from the material used in constructing the nests, as mud swallow.

Cliff'ord, the name of a very old English family, several members of which have played an important part in history. The founder of the family, Walter, son of Richard Fitz-Ponce, a Norman baron, acquired the castle of Clifford, in Herefordshire, under Henry II., and hence took the name of Clifford. In 1523 the Cliffords became earls of Cumberland, but in 1643 this title became extinct. The male line of the Cliffords is at present represented by the baronial family Clifford of Chudleigh. The first Baron Clifford of Chudleigh was Thomas Clifford, one of the members of the Cabal, who was raised to this dignity in 1672.

Clif'ford, George, Earl of Cumberland: b. 1558; d. 1605. A celebrated English navigator.

Clifford, Hugh, English civil servant: b. London 5 March 1866. He entered the Malay states civil service in 1883 and was British resident at Pahang 1896-9. He has published: 'In Court and Kampong' (1897); 'Studies in Brown Humanity' (1898); 'Since the Beginning' (1898); 'In a Corner of Asia' (1899); 'Bushwhacking' (1901); and is joint author with F. Swettenham of a 'Dictionary of the Malay Language.'

Clifford, John, English Baptist clergyman: b. Sawley, Yorkshire, 16 Oct. 1836. He was educated at the Baptist College, Nottingham, University College, London, and the Royal School of Mines and has been minister of the Praed Street and Westbourne Park Church, London, from 1858. He was president of the London Baptist Association, 1879; of the Baptist Union, 1888 and 1889; of the British Chau-

tauqua, 1899–1900, as well as of other assemblies. He has received degrees from several English colleges as well as of D.D. from Bates College, Lewiston, Maine, and has been for years the acknowledged leader of the Baptist faith in England. He was editor of the 'Baptist Magazine,' 1870–83 and has published 'Familiar Talks with the Young' (1872); 'George Mostyn' (1874); 'Is Life Worth Living' (1880); 'Daily Strength for Daily Living' (1885); 'The Dawn of Manhood' (1886); 'The Inspiration and Authority of the Bible' (1892); 'The Christian Certainties' (1893); 'Typical Christian Leaders' (1898); 'Social Worship an Everlasting Necessity'; 'God's Greater Britain' (1899).

Clifford, Lucy Lane, English novelist, married to William Kingdon Clifford (q.v.) 1875; after whose death in 1879 she turned to literature for support. Her writings, some of which are notably original and striking, include: 'Very Short Stories' (1882); 'Mrs. Keith's Crime' (1885); 'Love Letters of a Worldly Woman,' which attracted much attention (1891); 'The Last Touches' (1893); 'Aunt Anne' (1893); 'A Flash of Summer' (1895); 'Mere Stories' (1896); 'A Woman Alone' (1901); 'Woodside Farm' (1902); and the plays, 'The Likeness of the Night' (1900); 'A Long Duel' (1901); 'A Supreme Moment' (1902); 'Margaret Vincent.'

Clifford, Mrs. W. K. See CLIFFORD, LUCY LANE.

Clifford, Nathan, American jurist: b. Rumney, N. H., 18 Aug. 1803; d. Cornish, Me., 25 July 1881. Through his own efforts he obtained a common school and academic education, studied law, and began practice in York County, Me., 1827. He was a member of the State legislature, 1830–4; speaker of the House, 1833, and attorney-general of the State, 1834–8. He served two terms as representative in Congress 1839–43, advocated Van Buren's re-election, took part in public discussions with the leading Whig orators, and established a reputation as one of the most eloquent of democratic champions. He was United States attorney-general under President Polk, and a special commissioner to Mexico to arrange terms of peace between that country and the United States, and he negotiated the treaty which secured California as a part of the United States. He resumed law practice in Portland, Me., 1849, and won an enviable reputation for forensic ability. In January, 1858, President Buchanan appointed him associate justice of the United States supreme court. As the oldest associate judge in 1877, he presided over the electoral commission conducting its proceedings with noteworthy impartiality, though a firm believer in Tilden's election.

Clifford, William Kingdon, English mathematician: b. Exeter 4 May 1845; d. Madeira 3 March 1879. Educated in his native town and at King's College, London, he proceeded to Trinity College, Cambridge, where he graduated in 1867 as second wrangler. In 1871 he was appointed professor of applied mathematics at University College, London, a post which he held till his death. In 1876 his health gave way, but was restored by a summer spent in Spain and Algiers, though not permanently, for two years later he again broke down, and died soon afterward. In mathematics his teachings and writings are regarded as marking an epoch in the history of the science in England. His 'Canonical Dissection of a Riemann's Surface,' his theory of 'Biquaternions,' and his memoir 'On the Classification of Loci,' may be mentioned as his most important contributions to this subject. He also wrote on philosophical subjects. Among his works the most important are: 'Elements of Dynamic' (vol. i. on 'Kinematic,' 1878); 'Seeing and Thinking' (1879); and 'Common Sense of the Exact Sciences' (1885, completed by Karl Pearson). In 1882 appeared a collection of his 'Mathematical Papers,' and in 1879 his 'Lectures and Essays.'

Clif'ton, England, a popular watering-place of Gloucester County. It is a suburb of Bristol situated within the city boundary, on the summit of lofty cliffs, whence its name. A suspension bridge 703 feet long here crosses the river Avon 245 feet above its bed. Clifton contains many handsome residences but neither trade nor manufactures. It is known for its hot mineral springs. Clifton College is an important educational institution. Pop. 44,400.

Clifton Springs, N. Y., a summer and health resort in Ontario County on the New York Central and Lehigh V. R.R.'s, famous for its sulphur springs. Pop. (1900) 1,617.

Climacteric (*annus climactericus*), a critical year or period in human life wherein, according to astrologers, there is some notable alteration to happen in the body, and a person is exposed to great danger of death. The word comes from *κλιμακτήρ*, the step of a ladder or stair. The first climacteric is, according to some, the seventh year; the others are multiples of the first, as 14, 21, etc.; 63 and 84 are called the grand climacterics, and the dangers attending these periods are supposed to be great. Some held, according to this doctrine, every seventh year a climacteric; others allowed this title only to the product of the multiplication of the climacterical space by an odd number, as 3, 5, 7, 9; others considered every ninth year as a climateric. The idea of climacterics is very ancient.

A climateric disease is a disease affecting both men and women, but more obvious in the former. It may be looked for about the 63d year of age, but varies in the time of its coming, according to the constitution of the individual, the limits being in the one direction 50, and in the other 75. Its most common predisposing cause is mental anxiety or suffering. The expression of the countenance alters for the worse, the pulse becomes accelerated, the flesh wastes away without obvious cause; there are sleepless nights, and wandering pains flit through the head and chest, and sleep is either deficient or brings little refreshment. After a time recovery as a rule takes place, but the countenance never recovers its former aspect, or the constitution its vigor.

Climate (Gr. *κλίμα*, "a slope or inclination"). The term was used to denote the effect of the oblique rays of the sun on the temperature of the earth and its atmosphere. To-day it is applied to the sum of the atmospheric conditions as recorded for a long period of time; or, in other words, it is the totality of weather, while "weather" is the physical con-

dition of the atmosphere at a given time or during a limited period.

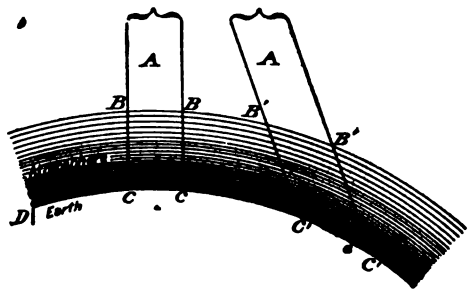
One may well speak of the weather to-day, or of last month, or of some past year; but not of the climate of a day, a month, or a year. The climate of a place is what may be expected to occur as the result of a study of its continuous weather records for a long period of years,—the atmospheric pressure, the temperature, the rainfall and snowfall, the time and frequency of frost, the extremes of heat and cold, the direction and velocity of the wind, the amount of air that flows from the different points of the compass, the amount and intensity of sunshine, the humidity and transparency of the atmosphere, and its electrification.

The study of the causes of the weather and of the laws of storms constitutes that branch of science known as meteorology; climatology is to be considered as a subdivision of meteorology.

Climates may be broadly divided into marine, continental, mountain, and plain, with the many variations produced as these conditions gradually or precipitately shade off the one into the other.

Basis of Climate.—If the axis of the earth's rotation were perpendicular to the ecliptic (the plane of its orbit) there would be no seasonal changes, for the rays of the sun would fall upon every point on a parallel of latitude with the same angle of incidence on each day of the year. There would be but one season at any place and it would never end; and there would be little variation in the intensity of storms. But as the axis of the earth is inclined at an angle of 23.5° to the plane of its orbit, and as the direction toward which it points remains nearly constant, there are but two days in each year when both hemispheres (north and south) are exactly one half in sunshine and one half in darkness, that is, at the vernal and autumnal equinoxes, when the sun crosses the equator. At all other times in each hemisphere the angle at which the sun's rays strike the earth, the depth of the air through which they pass, the length of the day, and the proportions of each hemisphere immersed in sunlight, are increasing or decreasing. As these four conditions increase in the northern hemisphere after the vernal equinox the summer grows upon us, reaching its greatest degree of heat about four weeks after the summer solstice. The lag of temperature is due to the fact that the atmosphere, being heated mainly by radiation from the earth and comparatively little by the direct action of the solar rays, does not attain its greatest heat until after the land and water have reached their maximum temperature and in turn have communicated this heat to the air above. Up to June 21, or the summer solstice, the northern hemisphere receives each day more heat than it loses, otherwise it could not gain in temperature; after the solstice the sun each day at meridian is found to have receded a little to the south. At places north of the tropic of Cancer its rays fall with increasing obliquity and pass through a greater depth of air, and impinge for a less time each day, so that within a few weeks the earth begins to radiate more heat each day than it receives. The maximum heat of summer occurs, on the average, when the loss of heat from the earth is just equal to that gained during the day from the sun. This, as previously stated, occurs several weeks after the sun is well on its way southward. About September 21 the autumnal equinox occurs, when the sun crosses the equator, and, as at March 21, the days are of equal length at all latitudes of both hemispheres. On or about December 21—the winter solstice—the sun is farthest south, and the same conditions prevail in the southern hemisphere that prevailed in the northern hemisphere on June 21. North of the equator the sun is now least effective; its rays reach the earth at the lowest angle through the greatest depth of air, and they are operative for the fewest hours during each day, of any portion of the year, but the greatest cold does not occur. This comes about four weeks later, when the increasing heat received each day by the earth from the sun is just equal to that lost by radiation.

The effect of latitude will be understood by reference to the following figure:



As the latitude increases, the rays of the sun will fall with increasing obliquity, and they lose in power by being spread over a larger surface, and by traversing a greater depth of air, which absorbs more of their heat.

The same beam A, "when the sun is vertical, is spread over a surface such as CC. When the sun is inclined at an angle as shown in the figure, the beam is spread over a surface, C' C', which is somewhat greater than the first, and it passes through a column of air, B' B' C' C', greater than that of BBCC. The intensity of insolation at midday decreases approximately as the cosine of the latitude."

Near the equator the sun's rays at midday fall perpendicular to the surface of the earth, and there is virtually no change in the length of the day, and consequently there is little variation in the daily or seasonal temperature. As the variation in the length of the day increases with the latitude, there are regions, in the temperate zone, where the length of time that the sun's rays fall upon the earth each day more than compensates for their obliquity. On this account the interior of continents may have at midday a higher temperature than prevails at the equator.

Solar energy is about seven per cent greater at perihelion (the point in the earth's orbit nearest the sun) than at aphelion (the point farthest away). As perihelion occurs in December, or the summer time of the southern hemisphere, and aphelion in its winter, that region has a greater annual range in the intensity of solar insolation than the northern hemisphere. If the land surfaces of the two hemispheres were equal in area, the southern would have colder winters and warmer sum-

mers than the northern, and this is the case in portions of the southern hemisphere where the land area is large. But the great capacity of water for heat, and the slowness with which it radiates the same, modifies seasonal extremes that otherwise would be much greater.

Variations in Climates.— If the earth were all water or all land, and if the land were everywhere of the same elevation, most of the factors that cause variations in climates — often considerable for regions closely contiguous — would be eliminated from the equation. Every point on the same parallel of latitude would have the same mean annual temperature, and the same average heat in summer and the same average cold in winter. New York and London, separated by eleven degrees of latitude, would not, as now, have about the same mean annual temperature. If it were all water, there would be no such extremes of heat and cold as we now know. It is probable that a thermometer exposed in shade four feet from the surface of the earth would not anywhere — even at the equator — ever register above 90° F.; there would be no frost within 35° or 40° of the equator, and zero temperatures would be recorded only in regions within 30° of the poles. If it were all land the heat would be much more intense than now in the tropics, and in the temperate and frigid zones the heat of summer and the cold of winter would reach extremes unknown at this time.

All the anomalies of climates are caused by the different specific heat capacities of land and water; their different powers of conduction and radiation; the irregular distribution of these two surfaces; the widely-varying elevations of the land; the trend of mountain ranges; the prevailing direction of the winds, and the carrying of large quantities of heat by ocean currents from the equator toward the poles, and the relative quantities of cloud and rain or snow. It is germane to a proper understanding of climate to know something in detail of the manner in which the air is heated. At 100 or 200 miles above the earth's surface there is only the hypothetical ether, which, while too tenuous to be detected or measured by any methods or appliances so far known, is supposed to be the medium that transmits solar energy to the earth and diffuses it through space. This energy, coming in many different wave-lengths and with widely varying intensities of vibration, produces several different phenomena as it is absorbed by or passes through the air, or as it impinges on the surface of the earth. The waves differ in their effects on different objects, depending on the length and the absorptive response of the substances upon which they fall. The waves have heating, lighting, and chemical effects simultaneously in themselves, and it is only the nature of the objects upon which they fall that tends to differentiate them. The atmosphere, even at the surface of the earth, absorbs but a small part of the heat-waves. They therefore reach the earth and warm its surface; and the earth in turn, by radiation, convection, and conduction, sends back into the air long heat-waves, which, unlike the shorter solar waves, are readily absorbed by the atmosphere. The atmosphere is thus warmed from the bottom upward. This accounts for the perpetual freezing temperatures of very high mountain peaks, although they are nearer the sun than are the bases from which they rise. At the height of one mile in free air the temperature is about the same at midday as at midnight. Only during recent years have we begun to realize how extremely thin is the stratum of air next the earth that has sufficient heat for the inception, growth, and maturity of both animal and vegetable life. The raising of the thermometer shelter at the New York City observatory from an elevation of 150 feet above the street to an elevation of 300 feet, has caused an apparent lowering of the mean annual temperature of 2.5° F. On the hottest day in summer, if one could be lifted up to a height of only 1,000 feet in free air, he would find a marked change in temperature. The United States Weather Bureau at 16 stations made a total of over 1,200 kite observations in the United States in 1897. They showed an average decrease of 7.4° F. for the first 1,000 feet of ascent during the warm months, and when the observations were taken near the hour of daily maximum heat the decrease was frequently as much as 15°. At the height of six miles the cirrus clouds common to this level are, on account of the low temperature, always composed of minute ice spiculæ, never of watery droplets like the lower cumulus clouds. In the middle latitudes of both hemispheres the air at this height is ceaselessly rushing toward the east, passing uninterruptedly over the cyclonic and anti-cyclonic systems that cause our storms and cold waves at the surface of the earth. Glaisher and an assistant ascended to a height of about 30,000 feet. They suffered greatly from the cold, which measured many degrees below zero, although the time of year was 5 September. At the height of six miles the average temperature, determined by many balloon ascensions is about —60° F.

The difference between continental and marine climates is marked. The same amount of heat will raise the temperature of a land surface four times as high as it will raise that of a water surface. Land is a good absorber and a good radiator, but it is a poor conductor and a poor reflector. The absorbed heat does not penetrate into the ground to any great depth. The land, therefore, retains its absorbed heat near the surface and quickly and freely radiates that which it has absorbed. These conditions give to large land surfaces much higher temperature during the day, and much lower temperature during the night, than obtain over a water surface of the same latitude and much colder winters and much warmer summers. As an illustration, it may be stated that the Bermuda Islands, in the North Atlantic Ocean, have a mean daily range of temperature of only 10° F., and an annual range of only about 50°; while Memphis, Tenn., near the same latitude, in the interior of a large continent, has a daily range of 17° and an annual range of 112°. At Memphis a temperature of 104° has been recorded in summer and —8° in winter. At Bermuda the temperature generally reaches 90° during the summer, but very rarely exceeds that figure, while temperatures below 45° are also very infrequent. The two places are typical of continental and of marine climates. All regions bordering closely on the sea partake of both climates, the predominating one being determined by the direction in which the coasts

trend, their elevation, and the direction and force of the prevailing winds.

In the middle latitudes of both hemispheres the prevailing winds are from the west, and therefore continents lying in these regions have a marine climate in their western coastal regions, where the air moves from the water to the land, and nearly continental climate in their eastern coastal regions, where the general movement of the air is from the land to the sea.

The distance to which moist and equable air conditions extend inland is determined by the elevation of the land and its trend relative to the incident winds, and the proximity of mountain ranges. The humid air from the Pacific meets the lofty range that skirts the western shoreline of both North and South America; it is forced up the mountain side until the cold of high elevation and the cooling of the air by expansion as it ascends cause it to precipitate its moisture mostly upon the western side of the mountain, and it passes to the interior of the continent bereft of that life-giving moisture which, were it not for the intervention of the mounains, would spread a mantle of luxuriant vegetation 1,000 miles inland. If the disintegrating effects of temperature and rainfall had worn down the Sierras, the Plateau, and the rugged crags of the Rocky Mountains to the height of the Appalachians, the vaporous atmosphere of the Pacific would flow eastward far more freely than now, and meet that which, by the convectional action of cyclones, is frequently carried from the Atlantic Ocean and the Gulf of Mexico inland to the Mississippi valley; then rain would be more abundant and the whole of the United States would have arable land.

To give a further idea of the effect of mountain systems on the climates of continents one needs only to reverse the conditions just mentioned; if the Appalachian Mountains were as high as the Rocky Mountains, and if they extended farther southward and bordered the Gulf of Mexico, then the Ohio River, the Mississippi, and the Missouri and their many tributaries would not exist, and the world's greatest granary would be a gray and nearly barren plain.

The specific heat of water is greater than that of almost any other substance. It requires ten times the quantity of heat to raise a pound of water one degree than it does to raise a pound of iron one degree. Solar rays penetrate the sea to a considerable depth; they are quite uniformly absorbed by the stratum penetrated. In consequence of these laws and conditions a vast quantity of heat is stored by the ocean in the tropics and slowly given to the air as the ocean currents carry the warm water toward the poles. In this connection the writer would correct what he believes to be an exaggerated popular idea relative to the effect of the Gulf Stream on the climate of Europe. The North Atlantic circulation, flowing northward on the western side of the ocean (except a southward current from Davis Strait that chills Labrador and somewhat affects the temperature of the New England coast), and southward along the coast of Europe, is many times more effective in modifying climate than is the Gulf Stream. That the western part of Europe is warmer, more humid, and subject to less radical changes in temperature than equal latitudes in North America, except on the Pacific coast, is due primarily to the great ocean that lies on the west of Europe. Without ocean currents of any description, this body of water would give to the air that moves from it to Europe a more equable temperature than is possessed by the eastern part of the North American continent. Continents, therefore, partake largely of marine climates on their western borders, and principally of continental climates on their eastern borders.

Climate affects the health, happiness, and well-being of people more than any other condition that goes to make up their environment. Within the broad confines of the United States there are many, but not all, shades and varieties of climate. One of the questions most frequently asked is, "Where shall I find a climate possessing both dryness and equability of temperature?" To this interrogatory reply must be made that the ideal climate as regards equability of temperature and absence of moisture does not exist in the United States, but that the nearest approach to it will be found in the great Southwest.

The temperature of the Southwest is not equable in the sense of having an extremely small daily range, but it possesses the quality of annual uniformity in a greater degree than will generally be found elsewhere except on the seacoast, and there the humidity is great.

The most equable temperature on the globe will be found on the high table-lands and plateaus of the tropics. Santa Fé de Bogota, in the United States of Colombia, has an average temperature of about 59° F. for all months of the year, and the range for the entire year is less than is often experienced in a single day in some parts of the middle latitudes. But while the ideal temperature may be found on the higher elevations of the tropics, the rainfall is much greater and more continuous than in this country.

The temperature of a place depends chiefly on three conditions,—latitude, elevation, and contiguity to large bodies of water. At sea level in the tropics extreme conditions of heat and moisture produce very great physical discomfort. But even under the equator it is possible to escape the tropical heat of low levels by ascending from 4,000 to 6,000 feet. In the economy of nature there is a certain limit beyond which the two extremes, dryness and equability of temperature, cannot coexist; thus we may find a region so deficient in moisture as to satisfy the requirements of the case, but the very lack of moisture is a condition that facilitates radiation and thus contributes to great extremes of temperature. Regions may be found, as on the lower Nile, where there is a lack of rainfall coupled with a high and moderately uniform temperature. The mean winter temperature of Cairo, Egypt, is 56° F.; mean summer temperature, 83°; a range from winter to summer of 27°. The mean winter temperature of Phœnix, Arizona, is 52°; mean summer temperature, 87°; a range of 35°. It is by no means difficult to find a counterpart of the far-famed Egyptian climate in the great Southwest.

The dryness of the air and the clearness of the sky are the conditions upon which daily ranges of temperature depend; the greater these, the greater the range of temperature

from day to night. While a high summer temperature is characteristic of the Southwest and other portions of the Rocky Mountain plateau, it is a fact that the sensation of heat as experienced by animal life there is not accurately measured by the ordinary thermometer. The sensation of temperature which we usually refer to the condition of the atmosphere depends not only on the temperature of the air, but also on its dryness and the velocity of the wind. The human organism, when perspiring freely, evaporates the moisture of its surface to the dry air of the interior arid regions, and thus lowers its temperature and prevents sunstroke, which, in the more humid regions from the Mississippi valley eastward, occur in great number with the air temperature much less than obtains in the West.

The meteorological instrument that registers the temperature of evaporation, and thus in some measure the actual heat felt by the human body, is the wet-bulb thermometer. The latter, as indicated by its name, is simply an ordinary mercurial thermometer whose bulb is wetted with water at the time of observation.

Effect of Climate on the Races.— Climate is the most potent of any factor in the environment of races. It is climate and soil, plus heredity and form of government, that produce either vigorous or weak peoples. In this respect it is a question if the United States does not possess a constant potential that, all other conditions being equal, places it in a class by itself.

Climate, soil, and good heredity may produce a race large of stature and of great physical endurance, but unless such a people exists under a liberal form of government, in which public education is fostered and the arts and sciences taught, it is unable to employ its strength in those lucrative vocations that alone give a high per capita of wealth; and wealth means power. It is also weak in defending itself, either in war or in commerce, against a people of less numerical strength that is liberally educated, skilled, and humanely governed.

If one reads of the overthrow of political dynasties and the subversion of trade and commerce, it will occur to him that the northmen have usually been conquerors. If we consider the invigorating effect of cold air and marked changes of temperature alone we might expect to find the strongest and most resourceful peoples inside of the Arctic circle; and if we consider fruitfulness of soil alone we might reasonably expect to find the dominant peoples in the tropics. But the fact is that the greatest human potentiality occurs somewhere between these two extremes. The boundaries cannot be accurately determined by the naming of certain parallels of latitude, but a close approximation is made to the truth in the statement that the most vigorous people physically and the most resourceful mentally will be found in the most northerly regions that will produce not simply cereal crops, but an abundance of them.

The sweep of the cold wave, as it is known in the United States, is quite distinctly North American. Nowhere else on fertile plains, unless it be in Russia, does the temperature show such wide oscillation within such short periods of time, nor do the icy blasts sweep over such a broad area. It is probable that much of the physical and the intellectual energy that have caused the United States to excel in agriculture, in manufacturing, and in commerce were caused by the invigorating effect of the cold, dry, highly electrified air of the North American cold wave. The anti-cyclonic systems of air that constitute cold waves have a marked downward component of motion. This motion brings from a considerable altitude to the surface of the earth some of the high electrical potential of the upper air, which is strongly stimulating to man and to other forms of animal life. These cold north winds have a much greater specific gravity than warm and humid winds, and this condition, added to the force with which they come, scatter and diffuse the befouled air near the surface of the earth. Enough has been said to indicate that climate is nearly as important a part of the environment of animal life as it is of the vegetable existence, and that a wide range of annual temperature, if it be not so great as to limit the production of cereal crops, favors the development of strong races of men.

Change of Climate.— Notwithstanding the popular notion to the contrary, there is reason to believe that there has been no appreciable change in the climate of any large area within the period covered by authentic history. Changes in the surface of the earth may be noted within the lifetime of an individual, that are thought to prove that a change of climate has taken place, when the alterations may be due to the persistent action of freezing, thawing, rainfall, and flood. Great changes have occurred during geologic periods, but it is the opinion of the writer that they take place so slowly that thousands of years must elapse before their effect is measurable.

Effect of Forests on Climate.— Extremes of temperature, both heat and cold, are slightly less over forests than over open regions, but the most important effect of forests on climate is the economic conservation of precipitation, diminishing the intensity of floods by restricting the flow-off, and by shading the snow deposited during the winter from the increasing sun of spring and early summer. More moisture is absorbed by the soil when it is covered by forest than when it is cleared of its forest cover, and it follows that deforestation, if extensive, may diminish the supply of springs and streams.

Investigations in Germany and in India seem to indicate that there is an appreciable increase in rainfall as a result of reforestation. In general forests may be looked upon as the effect rather than the cause of rainfall.

Climate and Animals.— The geographic distribution of animals is doubtless the outcome of definite laws — laws that stand in close relation with the past history of the earth through a large portion of geological time. What those laws are forms a subject of great importance in studies of evolution,— a subject, it may be remarked, entirely too great to be adequately treated in the present connection. Naturalists are generally of the opinion that all animals have been produced from those that preceded them by some slow process of transmutation or development, and that this modification of animal forms took place very slowly, as evidenced by the fact that the historical period of nearly 4,000 years has hardly produced any perceptible change in a single species. That marked

changes in the climate of the earth have occurred during the remote past there can be no doubt, and that those changes left a marked impress upon the fauna of the globe there can also be no manner of doubt. The great northern ice sheet and the accompanying cold of the glacial period, if it did not cause the extermination of the receding fauna, doubtless led to its migration to more congenial climates.

The part played in the faunal distribution of of the globe by the present climate seems to be indirect rather than direct, although there are many facts which seem to point to a direct relation. While it is true that the fur-bearing animals of the frozen north are generally to be found in arctic regions, yet they send their representatives far into the temperate latitudes, and indeed into the borders of the regions inhabited by the more exclusively tropical species. On the other hand, the tiger, whose home is naturally associated with the hot districts of India and the Indian Archipelago, is equally at home in the elevated regions of the Caucasus and the Himalayas, where his footprints are not infrequently found impressed in fields of snow. Other groups of animals are more limited in their migrations. Some are so closely adapted to an arboreal life that they never stray far beyond the limits of forest vegetation, while others are so tolerant of climatic change that the limit of their possible range is conditioned only by the character and quantity of the food supply and the interposition of impassable physical barriers.

Climate and Plants.— The factors necessary to the development of plant life are light, heat, soil, and moisture. The ideal conditions as regards these essentials do not usually obtain, or, if they do, multitudes of plants seek to take possession of the region, so that there is a continuous struggle for existence in which many more plants fail than succeed.

The climatic factors heat and moisture are combined in several ways in different parts of the globe, and these combinations give widely different vegetation; thus a maximum of heat and a minimum of water give desert conditions where only specially adapted plants can exist. If, on the other hand, a maximum of heat is combined with a maximum of water, the result will be vegetation such as exists only in the rainy tropics. The possible combinations of the two climatic factors are very numerous, as are also those of soil and the effects of animal life and human agencies. Yet the vegetation of the globe is susceptible of a fairly definite classification. Following Humboldt, and adopting such terms as express in a general manner the vegetation characteristic of each zone, we have the following classification:

Zones of	Average Temperature
1. Palms and bananas	78°—82°
2. Tree-ferns and figs	73°—78°
3. Myrtles and laurels	68°—73°
4. Evergreens	60°—68°
5. Deciduous trees	48°—60°
6. Conifers	40°—48°
7. Lichens, saxifrages, and dwarf shrubs	32°—40°
8. Lichens and mosses	32° and below

While in a general way these zones stretch around the world in wavy belts, somewhat as do the isotherms, similar belts may be found encircling mountain peaks and chains with increasing altitude above sea-level. Indeed it is possible to pass successively from tropic to arctic vegetation on a single mountain peak in the tropics.

WILLIS L. MOORE,
Chief United States Weather Bureau.

Climate and Climatic Species and Varieties. Although a half century ago it was generally held that changes of climate have not profoundly affected organisms, yet the recent detailed study of variation has shown that climate and local influences have been the causes of origin of probably a very large number of the species contained in our museums and described in biological literature. Among insects, birds, and mammals it has been estimated that from a third to a half of the known species are climatic or local species or varieties, or local races. As is well known, Americans born of foreign parentage are larger than their ancestors, whether English, Irish, Germans, or French; and Boroditch has shown that the children of Americans of both sexes born in the United States, are larger than those of foreign races. This is generally attributable to difference in the climate of the Old and New Worlds, our American climate being drier, more changeable and stimulating than that of Europe. It appears that the introduced English sparrow has undergone a gradual modification since its introduction into this country about 40 years ago. Bumpus has critically examined over 1,700 eggs of this bird, one half from England and the other half from Providence, R. I. It was found that the eggs of the American race or breed vary more than the European, that they are smaller and of a strikingly different shape, being more rounded and with a much greater amount of color variation. This is attributed by the author to a suspension of natural selection. However, this may be, it belongs with the class of facts which show that the modification is primarily due to the change from one climate to another. Cockerell has found that a common European snail (*Helix nemoralis*), introduced into this country soon begins to present variations not known to exist in England, while in the introduced butterfly, *Pieris napi*, 12 American varieties, and of *P. rapæ* four varieties have appeared on American soil within the few years which have elapsed since their appearance and spread on this continent. Where different mammals are transported from temperate to tropical countries the wool tends to become replaced by hair, and other changes occur. The turkey does not vary in temperate regions, but when acclimated in India it degenerates in size, is incapable of rising on the wing, becomes black, and with the long pendulous appendages over the beak enormously developed. Cold has naturally the inverse effect, mammals transported to the

north from the tropics become more or less woolly. As the result of the severe winters and the elevation of Angora in Asia Minor, the cats, shepherd dogs, goats and hares are clothed with a long fleece like wool.

Islands present different climatic features from the mainland being damper, etc., and hence the birds, reptiles, and other animals present slight but constant differences from their allies and probable ancestors on the nearest continents. And not only that of the same group as in the Galapagos Islands, but also each island is tenanted by a distinct local variety of birds. This has also been noticed by Wallace in the East Indian archipelago. The swallow-tail butterflies of islands tend to have shorter tails, and the outlines of the wings differ. Thus the local races become incipient species, and by being isolated are prevented from crossing with the original stock or species, and in this way geographical varieties or representative species are produced. When great changes have taken place in the topography, portions of land cut off from the continent, or continents become divided, species have arisen. Thus in the late Tertiary, Asia and America were continuous, but when Bering Strait was formed, the bison of this country and that of Europe (aurochs) became specialized, becoming different species. In this way multitudes of species have probably arisen over all parts of the world.

A. S. PACKARD,
Brown University.

Climate in the Treatment of Disease. The relations of climate to medicine are peculiarly significant. The influences of heat, cold, moisture, and sunlight are definite, and to many individuals, sound as well as unsound in mind and body, the problem of life's continuance depends on their climatic surroundings. Many people can live with comfort in Colorado who would die of tuberculosis in a comparatively short time in the Eastern States. Nor is tuberculosis the only diseased condition that demands a certain climatic environment. Chronic emphysema, Bright's disease, heart disease, etc., may be influenced for good or for evil by climate.

Medically speaking, climates may be divided into a number of arbitrary classes. Manifestly such are subject to an immense amount of variation. A physiological classification given by Solly is into the following groups. Sea climates, on the ocean, on islands, or on the coast; land climates, low, up to 2,500 feet; medium, 2,500 to 4,500 feet; high, 4,500 feet and over. Again, climates may be sub-divided into cold and hot, either being dry or moist. All such classifications are arbitrary, and their exceptions to general rules are many.

Ocean climates vary according to the latitude, and the proximity to the Gulf Stream. Apart from such particulars, however, ocean climates are characterized by their equability, not only in the daily range of temperature, but, winter and summer as well, the presence of a large body of water, tends to equalize temperature, moisture, winds, etc. Humidity is a second feature of ocean climates. The moisture in the air acts as a veil, as it were, and and this mitigates the fierce heat, and at night gives up the heat to the air. High grades of humidity with great heat are extremely prostrating. Sea air is impregnated with the vapors of salt, and perhaps those of iodine and bromine, and it is free from dirt and bacteria. Ozone is always great in amount. Ocean climates are apt to be soothing. They increase the appetite greatly; there is increased inclination to sleep and increased bodily metabolism. When not too bracing and exciting, ocean climates are well adapted to the treatment of neurasthenia.

Island climates, if the islands are not very large, are practically ocean climates. Coast climates partake of a double nature. Because of the disturbing influences of increased land heat radiation, coast climates are less equable. They are usually less humid, precipitation being more active; winds often play a very important factor in coast climates, hence a knowledge of the local conditions is essential to estimate correctly the qualities of any given coast climate, although all coast climates bear a family resemblance to ocean climates.

Low inland climates are usually characterized by high barometric pressure, lessening with the elevation, and more or less humidity, becoming less as the distance from the ocean increases. Mountain ranges modify this greatly, as in California, for instance, where the Coast Range causes the precipitation of moisture on one side of the range, leaving the other side very dry although very close to the sea. The dryest, low inland climates are those usually in the interior of the continent; the proximity of large bodies of inland water, however, modifies these. The moist, inland, low climates that are warm are the poorest for therapeutic purposes. They are enervating, depressing, and mosquito-ridden, hence malarious and noxious in many particulars. The moderately moist and warm climates, such as are found in Florida, for instance, and in many coast regions, as southern California, act as sedatives to the nervous system and are excellent in neurasthenic conditions. They are adapted to convalescents and to chronic invalids, particularly in Bright's disease, tuberculosis, and chronic cardiac troubles.

Moderately moist and cold climates, such as are found at Saratoga, in the Adirondacks, in Wisconsin, at Baden-Baden, Wiesbaden, etc., may be called indifferent climates. They are valuable as changes, and, being near large centres of population, are readily reached, and amusements, games, etc., with good regimen, work benefit to those who have been overdoing. Moist and cold climates are not desirable therapeutically. Tuberculosis abounds in such climates.

Dry and warm climates are found in west Africa, Egypt, Nubia, southwestern Texas, southern California, and the less elevated regions of Utah and Arizona. Tuberculosis, chronic joint conditions related to rheumatism, Bright's disease, heart disease, neuralgias, and neurasthenias, all do well in this type of climate. It seems, as an all-around climate, the best type. Thus far in the United States the comforts to be found in cities with this climate do not commend themselves to travelers. European and African travel is much preferred, although there is little question but that the American resorts are their equals from a climatic, but not from an historic point of view, nor from «comfort to the traveler» standpoints.

Mountain climates are characterized by clean air, low humidity, increased light ozone, and

rarefied air. The effects on the body by the rarefied air are marked. There is increased respiratory activity, and increased heart action, that later may become irritable. Persons in good health usually accommodate themselves, but the aged and weak are inconvenienced by high climatic conditions. Sleep is usually improved in those able to accustom themselves to the changed conditions, and muscular and nervous power is increased thereby. To the overworked business man, a rest in the not too high mountains, if his heart can stand exercise in the rarified air, mountain climates are excellent. Consult: Hinsdale and Weber, 'Climatology.'

SMITH ELY JELLIFFE, M.D.
Editor 'Medical News.'

Climax (Gr. κλιμαξ, a ladder or stairs), a rhetorical figure in which a series of propositions or subjects are presented in such a way that the least impressive comes first, and there is a regular gradation from this to the most impressive or final; opposed to «anti-climax,» in which the ideas are presented in the reverse order.

Climbing-fern (*Schizæaceæ*), a family of ferns, mostly tropical, which have various peculiarities. It contains 5 genera and 75 species, two of which are represented in eastern North America. One, *S. pasila,* or curly grass, is a rare fern sometimes found in wet soil in the pine barrens of New Jersey during the months of August and September. The other is the Hartford fern (*Lygodium palmatum*), occurring in most thickets and open woods along the eastern seaboard of the United States during the summer months. The plant is a slender and flexible climber, with palmate leaves, surmounted by a panicle of forked pinnules, making it a very desirable decorative house-plant.

Climbing-fish, or **Climbing-perch,** a spiny-rayed fish (*Anabas acandens*) belonging to the family *Anabantidæ* which, with the *Osphromenidæ* constitute the sub-order *Labyrinthici,* characterized by the enlarged and peculiar labyrinthine structure of the superior pharyngeal bones, which are formed of excessively delicate plates of bone covered in life by a moist membrane and enclosing air-spaces between them.

In the climbing-perch the labyrinthine organ is greatly developed and extremely complex, and serves as an air-breathing organ of such great importance that the fish readily suffocates if prevented from having access to the air. To a fish which inhabits small stagnant pools, where the water contains but a small supply of dissolved air, such an apparatus is almost indispensable, and the climbing-perch, like a number of other fish which live in similar situations, regularly breathes free air. It has the very remarkable habit of leaving the water, especially during rains, and ascending the trunks of palm-trees for as much as six or eight feet, for the purpose of capturing insects. This habit is so well known to the natives of the East Indies that their name for the climbing-perch is said to mean «the fish that climbs trees.» The early accounts were, however, received with much skepticism, but have been fully and repeatedly confirmed. The feat is accomplished partly by means of the tail and spiny anal fin, but chiefly through the peculiar structure of the gill-cover, of which the opercular bone has a serrated edge, which clings firmly to surfaces, and the subopercular is so freely movable that it serves the purpose of a sort of leg, first extended forward and attached, then by appropriate muscles the body is advanced an inch or so at a time. The climbing-perch and all related forms are found only in the Indian and Indo-Malayan region.

Climbing Plants. See LIANAS.

Clinch, Charles Powell, American poet and play-writer: b. New York 20 Oct. 1797; d. there 16 Dec. 1880. For many years he was editorial writer, and literary and dramatic critic for the press; also writer of many poems, theatrical addresses, and dramas. Among the latter are: 'The Spy'; 'The Expelled Collegiates'; and 'The First of May.'

Clinch River, a stream that rises among the hills in the southwest part of Virginia, passes into Tennessee, flows through the valley between Clinch Mountain and Powell Mountain, and unites with the Holston at Kingston, to form the Tennessee. Its length is estimated at above 200 miles, for more than half of which it is navigable by small boats.

Cline'dinst, Benjamin West, American artist: b. Woodstock, Va., 1860. He is a painter of portraits and pictures in the genre style, and in 1900 was awarded the Evans prize of the American Water Color Society. He is best known as a popular illustrator of stories in the leading illustrated magazines, the 'Century,' 'Harper's Magazine,' and 'Scribner's Magazine,' especially containing much of his work.

Cling'man, Thomas Lanier, American senator: b. Huntsville, N. C., 27 July 1812; d. Raleigh, N. C., 4 Nov. 1897. He graduated at the University of North Carolina 1832, adopted the legal profession, and was a member of the State legislature 1836–40. He was elected to Congress as a Whig and with the exception of the 29th Congress, served continuously from 4 Dec. 1843 to 14 June 1858, when he was appointed United States senator. During his service in the House he took part in all the leading debates, not missing, it is said, a single day's session, and for a time was chairman of the Committee on Foreign Affairs. His speech on the causes of Henry Clay's defeat, led to a duel with William L. Yancey. He later joined the Democratic party. Entering the Confederate army as a colonel, he was promoted brigadier-general 17 May 1862, commanding the North Carolina troops, and served until his surrender with Gen. J. E. Johnston in April 1865. After the War he was chiefly engaged in mining and scientific pursuits. He made contributions to the sciences of geology and mineralogy, and in 1855 measured and made known the highest point in the North Carolina Mountains, since called «Clingman's Peak,» and in 1858 determined the highest point of Smoky Mountain, now called «Clingman's Dome.» The important mica mines in Mitchell and Yancey counties were first opened by him. He published a volume of 'Speeches and Writings' (1877); 'Follies of the Positive Philosophers' (1878); and 'The Tobacco Remedy' (1885).

Clingman's Dome, a peak of the Smoky Mountains, near the boundary between Tennessee and North Carolina. It was so named

in honor of Thomas L. Clingman. Its height is 6,619 feet above the sea-level.

Clin'ic, a place in which practical instruction in medicine is given; also the process of instruction. Clinics are usually held in dispensaries, where, by reason of free treatment, many patients congregate, thus affording good clinical material.

Clink-stone (so named from its sonorousness), grayish felspathic rock of the trachytic group, with a slaty structure, and generally divisible into tabular masses that are sometimes used as roofing-slates.

Clinometer, klī-nŏm'ę-tėr, an instrument used for taking the dip and strike of rock strata. In its commonest form it consists of a sort of protractor with a pendulum attached. When the clinometer lies horizontally the indicator points to 0°, and when inclined the amount of inclination is shown at once by the pendulum. It is most convenient to combine compass and clinometer in one instrument.

Clinopo'dium, a genus of herbs or low shrubs of the mint family (*Labiatæ*). containing about 50 species, of which 9 occur in the southeastern United States and California. The plants are known under the common names of wild basil, calamint, bed's-foot, and basil balm.

Clinton, Charles, American colonist, ancestor of the Clintons in New York: b. County Longford, Ireland, 1690; d. Ulster, now Orange County, N. Y., 19 Nov. 1773. His grandfather was an adherent of Charles I., and after the defeat of the royalists fled for refuge to the north of Ireland; and his mother was daughter of a captain in the parliamentary army. Having determined with a number of his friends to emigrate to America, he chartered a ship, and sailed for Philadelphia 20 May 1729. After a passage marked by the attempt of the captain to starve the passengers in order to possess their property, and in which after the death of several, among whom were a son and daughter of Mr. Clinton, it was proposed, but not attempted, to wrest the command from the captain, he was landed with his companions 4 October at Cape Cod. The place for a permanent settlement was selected in the spring of 1731 in Ulster County, N. Y., about 6 miles west from the Hudson River, and 60 miles north from New York. Clinton was chiefly occupied as a farmer and land surveyor, but was also judge of the county court, and in 1756 was appointed lieutenant-colonel, and served with two of his sons in the expedition against Fort Frontenac.

Clinton, De Witt, American statesman: b. Little Britain, New Windsor, Orange County, N. Y., 2 March 1769; d. Albany 11 Feb. 1828. His descent on the father's side was from English ancestors long domiciled in Ireland, and on the mother's side he was of French extraction. His education was begun in a grammar school near his home, continued at the academy in Kingston, Ulster County, and completed at Columbia College, where he bore away the college honors in 1786. He immediately engaged in the study of the law and was admitted to the bar in 1788. His ardent temper and earnest ambition carried him at once into the political field, and his sentiments, sympathies, and affections determined his position under the banner of his kinsman, George Clinton, the chief within the State of the Republican party. While the question of the adoption of the Federal constitution was yet a subject of popular discussion, he proved his zeal and controversial power by writing a series of letters signed "A Countryman," in reply to the celebrated letters of the 'Federalist.' He entered the legislature in 1797 and the State Senate in 1798, soon becoming the leader of his party in the State. In 1801 he became United States senator, resigning in 1803 to assume the office of mayor of New York. He remained undisturbed in the mayoralty from 1803 until 1807, when he was removed. He was reappointed in 1809, was displaced in 1810, was restored in 1811, and thenceforward continued therein until 1815. Within this period of nearly 12 years, Clinton was also a member of the Senate of the State from 1805 until 1811, was lieutenant-governor from 1811 to 1813, and during a portion of that time also held a seat in the council of appointment. He was an unsuccessful candidate for the Presidency in 1812. He adopted early and supported ably and efficiently the policy of the construction of canals from Lake Erie and Lake Champlain to the tide-water of the Hudson, and showed to his fellow citizens, with what seemed a spirit of prophecy, the benefits which would result from those works to the city, the State, and the whole country, in regard to defense, to commerce, to increase of wealth and population, and to the stability of the Union. In 1815 he presented a memorial to the legislature in behalf of the construction of the Erie Canal and in 1817 a bill was passed authorizing the work. In 1817 he was elected governor of New York and re-elected in 1820. He declined re-election in 1822, but was again elected in 1824, and after overcoming constant, unremitting, and factious resistance, he had the felicity of being borne, in October 1825, in a barge on the artificial river which he seemed to all to have constructed from Lake Erie to the bay of New York, while bells were rung and cannons saluted him at every stage of that imposing progress. No sooner had that great work been undertaken in 1817 than the population of the State began to swell with augmentation from other States, and from abroad; prosperity became universal; the older towns and cities expanded, new ones rose and multiplied; agriculture, manufactures, and commerce were quickened in their movements, and wealth flowed in upon the State from all directions. He was re-elected governor in 1826, dying while in office. Consult Hosack, 'Memoir of De Witt Clinton' (1829); Renwick, 'Life of De Witt Clinton' (1840); Campbell, 'Life of De Witt Clinton' (1849).

Clinton, George, Vice-President of the United States: b. Little Britain, Ulster County, N. Y., 26 July 1739; d. Washington, D. C., 20 April 1812. He was a son of Charles Clinton (q.v.) and served as lieutenant under his brother James at the capture of Frontenac, but afterward studied law. He was a member of Congress in 1776, and voted for the Declaration of Independence, but was summoned to the army as brigadier-general before it was prepared for signature. In 1777 he was elected governor and at the same time lieutenant-governor of the State of New York, which latter office was, on his acceptance of the other, conferred upon Mr. Van Courtlandt. He held the office of governor during the next 18 years, for which

eventful period the history of his life is that of the State. He was again chosen governor after spending five years in private life, in 1801, and in 1804 became Vice-President of the United States.

Clinton, Sir **Henry,** English general: b. about 1738; d. Gibraltar 23 Dec. 1795. He was the grandson of Francis, sixth Earl of Lincoln, served in the Hanoverian war, and was sent to America as major-general in 1775. He took part in the battle of Bunker Hill, and in the battle on Long Island which resulted in the evacuation of New York by the Americans; was made Knight of the Bath in 1777, proceeded up the Hudson that year in a vain effort to relieve Burgoyne, and was promoted to the chief command of the British army in America in 1778. After being forced by Washington to evacuate Philadelphia, he commanded an expedition to South Carolina in 1780, and blockaded and captured Charleston. He sailed from New York with 7,000 men to relieve Cornwallis on the very day that the latter capitulated. He was superseded by Gen. Carleton in 1781, returned to England the next year, and died soon after he had been appointed governor of Gibraltar. He wrote a narrative of his conduct in America (1782), and a rejoinder to Lord Cornwallis' observations on it (1783); also observations on Stedman's 'History of the American War' (1784).

Clinton, James, American military officer: b. Little Britain, Ulster County, N. Y., 9 Aug. 1736; d. there 22 Dec. 1812. He was the fourth son of Charles Clinton (q.v.). With his father he served at Frontenac, in 1758, as captain, and commanded in 1763 the forces raised to protect Ulster and Orange counties against the Indians. He accompanied Montgomery to Quebec in 1775, and was appointed brigadier-general the following year. While his brother George was governor of New York, he was overpowered at Fort Clinton by the superior force under Sir Henry Clinton, and being severely wounded narrowly escaped with his life. He afterward served against the Indians under Sullivan in 1779 and was present at the surrender of Cornwallis. After the peace he occupied many distinguished civil stations.

Clinton, Canada, a town of Huron County, Ontario, situated on the Buffalo & G. branch of the Grand Trunk Railway, about 32 miles northwest of Stratford. Its industries are numerous. There are salt-wells, a tannery, a grain-elevator, and a flour-mill, and factories for the production of carriages, organs, threshing-machines, fanning-mills, etc. There are several churches and a collegiate institution. Pop. about 3,000.

Clinton, Ill., city and county-seat of De Witt County, situated on the Illinois C. R.R., about 42 miles northeast of Springfield. The chief industry of the region is farming. There are machine shops here, and the city has an electric-lighting system and water-works, several churches and two public schools. Pop. (1900) 4,452.

Clinton, Ia., city and county-seat of Clinton County, situated on the Mississippi River and on the Chicago & N. W., Chicago, M. & St. P., Chicago, B. & Q., Chicago, R. I. & Pac., and Iowa Midland, 128 miles west of Chicago and 60 miles southeast of Dubuque.

Industries.— The city is a trade centre for a region of 50 miles radius and has large manufacturing and other industries, including lumber mills, furniture factories, sash and door factories, iron bridge works, gasoline engines, boats, automobiles, wagons, harness, boxes, brick, locks, and railroad machine shops.

Public and Educational Institutions, Etc.— The city has a good public library, hospitals, business colleges, Wartbury Lutheran College, Mount Saint Clare Academy, Our Lady of Angels Seminary, churches of all denominations, public schools, five banks with a combined capital of $800,000, electric lights and railways and an assessed property valuation of over $2,000,000.

Government.— The present form of government is by a mayor and a council of nine members elected biennially. Pop. (1903) 23,370.

Clinton, Mass., a town of Worcester County, 12 miles northeast of Worcester and 40 miles west of Boston; on the Nashua River, and the Boston & Maine and N. Y., N. H. & H. R.R.'s.

Industries, Etc.— The chief industries are the manufacture of wire-cloth, ginghams, and carpets. Here are located the Lancaster Mills, with 2,100 employees; the Bigelow Carpet Co., with 1,250, and the Clinton Wire-Cloth Co., with 500.

Public Institutions, Buildings, Etc.— There is a national bank, with a capital of $200,000 and average deposits of $375,000. The Bigelow Free Public Library contains 25,000 volumes. The churches are Congregational, Baptist, Methodist, Presbyterian, Unitarian, Catholic, and Adventist. There are also the Clinton Hospital and the Clinton Historical Society.

Government.— The government is administered by means of town-meetings. The board of selectmen holds office for three years and appoints the chief of police and other subordinate officials.

History.— Up to 1850 Clinton was a part of Lancaster (q.v.), but it was then incorporated as a town. Pop. (1900) 13,667; (1903 est.) 14,639.

Clinton, Miss., a town of Hinds County, about 10 miles from Jackson. Its only interest lies in its being an educational centre. Among other institutions of learning is Mississippi College (q.v.), with nearly 300 students, and a school for colored students.

Clinton, Mo., a city and county-seat of Henry County, 37 miles northwest of Sedalia, on Missouri, K. & T., the St. Louis & San F., and Kansas City, Clinton & Springfield R.R.'s.

Industries, Etc.— Clinton has 3 flour mills with a combined capacity of 3,200 barrels daily; 2 corn-meal mills, capacity 750 barrels daily; cooperage and railroad division shops, ice plant and foundry and gas-engine factory. It has 2 banks with a combined capital of $75,000, and has an annual business of $25,000,000.

Educational Institutions, Etc.— Clinton has an excellent public school system, and also colleges for men and women, including Bind College for Women and Clinton Business College.

Government, Etc.— The city was first settled in 1837, became a borough in 1858 and a city in 1876. It is governed by a mayor and a council of eight members elected for two years. Pop. (1903) 6,000.

Clinton, N. Y., a village of Oneida County, situated on the New York, O. & W. R.R. In

the neighborhood there are stone quarries. The chief interest of the place lies in its educational institutions. Here is located Hamilton College (q.v.), and there are seminaries for young women, an academy and a union school. Pop. (1900) 1,340.

Clinton Bridge Case, a case in the United States supreme court, December term 1870; a leading precedent as to the rights of railroad traffic *v.* river navigation, although it specifically decided only the right of Congress to take pending adjudications out of the hands of the courts by special acts, and to legalize any bridge as a post-road under its power to control interstate commerce. The Chicago, I. & N. R.R. Company proposed to bridge the Mississippi from Clinton, Iowa, to Albany, Ill., under authority from those States. One Gray filed a bill in equity in the circuit court of Iowa, praying for a preliminary injunction pending hearing for a final injunction, on the ground that the bridge was an obstruction and danger to navigation. Before the final hearing, however, the bridge was built, and Congress passed a special act 27 Feb. 1865, declaring it a lawful structure and a post-route, prescribing rules for the operation of the draw, and providing that all suits for obstruction to navigation should be brought in the circuit court of the State involved. The defendants on final hearing objected to the reading of proofs, on the ground that this statute closed the case, and the court so found. On appeal to the supreme court, the appellant argued that the act did not intend to legalize its maintenance in whatever condition it might be, or bar suits to abate that condition as a nuisance; and that it was unconstitutional if it did, as taking private property without compensation. The supreme court affirmed the judgment of the court below, but admitted that a suit at common law for damages would have raised a different set of questions.

Clinton Stage, in American geology, the middle member of the Niagara Series of the Silurian System. It comprises shales and shaly sandstones with some limestones, and is typically developed at Clinton, N. Y. From New York the series extends southward along the Appalachians to Alabama, reaching its maximum thickness of over 800 feet in Pennsylvania. From the Appalachians the series stretches 1,000 miles westward, except for the area of the Cincinnati anticline, to Wisconsin, where the Series is represented by limestones. From one to three beds of oölitic hematite (fossil iron ore), from 1 to 10 feet thick, are found in the Clinton at many points along the Appalachians and have yielded considerable ore. See IRON ORE; NIAGARA SERIES; SILURIAN SYSTEM.

Clinton's Big Ditch, a phrase applied to the Erie Canal, connecting the Hudson River with the Great Lakes. The name was given in derision because the canal was planned and carried to completion by De Witt Clinton.

Clinto'nia, a genus of plants of the lily-of-the-valley family (*Cornwallariaceæ*), named after De Witt Clinton, naturalist and governor of New York. It comprises six species, four of which are natives of North America, the other two being Asiatic. Yellow clintonia (*C. borealis*), has greenish-yellow drooping flowers, with blue berries. It grows in moist woods from Newfoundland south to North Carolina, and westward to Wisconsin and Minnesota. The white clintonia (*C. umbellulata*) is found in the woods of New York and New Jersey, and as far south as Georgia, and westward through Tennessee.

Clio, klī'ō, daughter of Zeus (Jupiter) and Mnemosyne (Memory), the muse of history. She is represented with a wreath of laurel upon her head and a roll of papyrus in her left hand. She was the mother of Hyacinthus and Hymenæus. There was also a sea nymph named Clio, daughter of Oceanus and sister of Beroe, who figures in Greek mythology.

Clionidæ, klī-ŏn'ĭ-dē, a family of *Pteropoda* (q.v.), which lack the shell and external gills, have the body spindle-shaped with wing-like fins situated near the head, and the head provided with short tentacles. They are pelagic animals of remarkable transparency, and live in vast numbers in the Arctic and Antarctic seas. Their chief popular interest lies in the fact that one species, *Clio borealis,* although only about an inch in length, furnishes the chief food of the great whalebone whales of the North. The whalers call the schools of these pteropods brit and deem their presence a good sign of whales.

Clipper, the word used to designate a modern construction of large sailing vessel. The peculiarities of these vessels are, their long sharp bow, their greatest beam lying abaft the centre of the ship, and their depth of keel. The speed attained by the opium and slave traders had attracted the attention of naval architects generally, and the shipbuilders of Great Britain (notably those of Aberdeen and Liverpool) and of America vied with each other in producing vessels which, while preserving fair carrying capabilities, should, as the primary requisite, be fast sailers. In this they succeeded to a remarkable extent, and the feats of the Atlantic, Australian, and China clippers, some of which attain an average speed during the voyage of over 15 miles an hour, used to be a topic of great interest and excitement among those connected with shipping and ocean traffic. Owing to the improvements in steam vessels, and the many advantages possessed by them over sailing vessels, clippers, as a special type of ship, are now little heard of.

Clissold, Augustus, English clergyman: b. about 1797; d. Tunbridge Wells, 30 Oct. 1882. He was graduated from Exeter College, Oxford, in 1823 was ordained priest, held the curacies of Saint Martin-in-the-Fields and Saint Mary, Stoke Newington, and about 1840 withdrew from the ministry. He had become a very close student of the writings of Swedenborg, and though retaining through life his connection with the Church of England, he was president of the Swedenborg Association, became a life member of the Swedenborg Society, and liberally assisted it with funds. Clissold translated and published at his own expense Swedenborg's 'Principia Rerum Naturalium' (1845–6) and 'Œconomia Regni Animalis' (1846). He wrote also many original works, the larger part on Swedenborg and Swedenborgian views.

Clisthenes. See CLEISTHENES.

Clitomachus (Gk. *Κλειτόμαχος*), Greek philosopher: b. Carthage about 190 B.C.; d. Athens about 110 B.C. He went to Athens about 146

B.C., where he became identified with the Third, or New, Academy, of whose founder, Carneades, he was one of the most distinguished disciples. On the death of Carneades in 129 B.C., Clitomachus succeeded to the academic chair. Carneades wrote nothing, and Clitomachus was the chief expositor of the system of the New Academy. Diogenes Laërtius is authority for the statement that he wrote 400 books on philosophical subjects. Cicero, who appears to have devoted considerable study to the work of Clitomachus, praises him highly in the 'Academica.' He followed in his teachings the largely skeptical views of Carneades, denying the possibility of attaining absolute truth, or any certain criterion of truth. Of his works there remain only a few titles and some renderings by Cicero in the 'Academica.' See ACADEMICS; GREEK PHILOSOPHY.

Clitus, klī'tŭs, son of Dropis, and brother of Hellanice, the nurse of Alexander the Great. He was one of the generals of Philip and Alexander, and saved the life of the latter in the battle of the Granicus by cutting off the hand of Rhosaces, who had just lifted up his arm to kill Alexander. Notwithstanding this service, however, Alexander killed him in a fit of anger.

Clive, Catherine Raftor, KITTY CLIVE, English actress: b. London 1711; d. 6 Dec. 1785. She was the daughter of a poor Irish gentleman living in London, and coming to the notice of Colley Cibber, manager of Drury Lane Theatre made her début there at 17. She achieved instant success and till her retirement from the stage in 1769 was one of the most popular actresses of the time, her forte being comedy. She married George Clive in 1732, but was separated from him later. She was intimate with many of the literary and social lights of her day, among others Horace Walpole. Consult Fitzgerald, 'Life of Mrs. Catherine Clive' (1888); Doran, 'Annals of the English Stage' (1888).

Clive, Mrs. Archer. See CLIVE, CAROLINE WRIGLEY.

Clive, Robert, BARON OF PLASSEY, English soldier and statesman: b. Shropshire, 29 Sept. 1725; d. London 22 Nov. 1774. His father obtained for him the place of a writer in the East India Company's service, and in his 19th year he went in that capacity to Madras. Two years later Madras surrendered to the French, but Clive escaped to Fort Saint David, where he entered the military service. He took part in the unsuccessful attempt to capture Pondicherry in 1748. When the British opposed Chunda Sahib, whom the French wished to make nabob of the Carnatic, and their candidate was besieged in Trichnopoly by Chunda Sahib, Clive was sent in 1751 to attack Arcot, the capital of the Carnatic, which he captured without opposition, and later compelled a detachment of Chunda's troops to retire. He then relieved Trichnopoly, and captured the forts of Covelong and Chingleput. In 1753 he went to England for a time, and on his return to India (1755) he was given the government of Fort Saint David. He was soon called to Madras to command the relief expedition sent to Bengal, where the nabob Suraj-al-Dowlah had taken Calcutta. Clive took possession of that city, and with a very inferior number of men entered the nabob's camp and captured his cannon. The nabob then offered terms of peace very advantageous to the English. Clive very shortly formed a plot to dethrone Suraj-al-Dowlah and place Mir Jaffier on the throne. In the famous battle of Plassey (21 June 1757) Clive's force of 3,000 men put to flight the nabob and his army of more than 50,000. Mir Jaffier now wished to govern without British interference, but the rebellions against him forced him to seek the aid of Clive, who was appointed governor of Bengal. Clive again went to England in 1760, where he was raised to the Irish peerage, and was elected member of Parliament from Shrewsbury. A disagreement between Mir Jaffier and the British governor officiating in Clive's absence caused Clive's return to India in 1764. He found the trouble with Jaffier settled, and devoted himself to the reform of the civil service in Bengal, and the restoration of discipline in the army. After his final return to England (1767) severe attacks were made upon him for his conduct in India, and a parliamentary inquiry followed which resulted in the passing of the resolution that he "had rendered a great and meritorious service to his country." But the worry due to the attacks and the trial, together with his failing health, so depressed him that he committed suicide.

Cloaca, a sewer, an underground drain or conduit. The Roman Cloaca Maxima (the greatest or main sewer) is said to have been constructed, or at least begun, under the auspices of King Tarquinius Priscus, about 588 B.C. It is still used in the drainage of Rome. It received numerous other branches between the Capitaline, Palatine, and Quirinal Hills. It is formed of three concentric rows of enormous stones, piled above each other without cement. The height inside is about 13 feet and its width is about the same.

In anatomy a cloaca is a part of the intestine in which the intestinal, ovarian, and urinary outlets terminate. This structure exists in birds, in reptiles, in the amphibia, and in the mammalian order *Monotremata.* In the *Rotifera* also the perivisceral cavity terminates in a dilatation or cloaca, which forms the common outlet for the digestive, generative, and water vascular system. There is a cloaca also in insects, and one also in tunicated mollusks. The latter is sometimes called the atrial chamber. In the embryonic development of man there is a period during which a cloaca, like that of the inferior animals, exists.

Clock, an instrument for measuring and indicating the time of day, sometimes also for showing the day of the month, the year, the movements of the sun, moon, planets, etc. The position of the sun in the heavens undoubtedly furnished primitive races with their first idea of time. This was followed by the invention of the sun-dial (q.v.)— a natural sequence of the observation of the length of shadows. This being of no service at night or on cloudy days, the hour glass (q.v.) followed. The clepsydra (q.v.) was invented long before the Christian era, and is said to have been in use 2,000 years. The clepsydra having been developed into a device with a dial and indicator operated by the current of water, the next improvement was the substitution of a weight for the water to operate the index. Archimedes is credited with this device. The necessity of some contrivance to regulate the descent of the weight led to the

invention of the escapement and pendulum, a rude form of which is said to have been produced by Gerbert of Auvergne, afterward Pope under the name of Sylvester II, who died in 1003. In an old chronicle it is related that Charlemagne received a clock from Harun Alraschid in 809, to which small bells were attached, and in which figures of horsemen, at the hour of 12, came forth through doors and retired again. There is a more exact description of this work of art in the Franconian annals, attributed to Eginhard, in which it is particularly said to have been a clepsydra, and that at the end of each hour little balls of metal fell upon a bell and produced a sound. In the 12th century clocks were made use of in the monasteries, which announced the end of every hour by the sound of a bell put in motion by means of wheels. From this time forward the expression "the clock has struck," is often met with. The hand for marking the time is also made mention of. Of William, abbot of Hirschau, who died at the end of the 11th century, his biographer relates that he invented a horologium similar to the celestial hemisphere. Short as this account is, it still appears probable that this abbot was the inventor of clocks. In the 13th century there is again mention of a clock given by the Sultan Saladin to the Emperor Frederick II. This was probably put in motion by weights and wheels, as it marked the hours, the course of the sun, of the moon, and the planets in the zodiac. In the 14th century there are stronger traces of the present system of clock-work. Dante mentions clocks. Richard, abbot of St. Albans, made a clock in 1326, which indicated the course of the sun and moon, as well as the ebb and flow of the tide. Large clocks on steeples were first made use of in the 14th century. In 1340 a monk named Peter Lightfoot made for Glastonbury Abbey a clock with an escapement and regulator for securing equable motion. At the time of the Reformation it was removed to Wells Cathedral, where part of it still remains. In 1835, the mechanism being entirely worn out, the clock was supplied with new works and the dial somewhat remodeled, and a minute circle and index added. At the base of the arched pediment which surmounts the square of the dial is an octagonal projection from which rises a panelled turret. Around this, fixed to two rings of wood, are sets of horsemen which formerly revolved in opposite directions as the hour was struck.

Of all horological machines, the successive clocks at Strasburg Cathedral have perhaps attracted the most attention as mechanical curiosities. These have been three in number. The first was constructed about 1352, the second in the latter part of the 16th century. Early in the 19th century it was evident that reconstruction was necessary, and this was ultimately entrusted to Charles Schwilgue, who entered on his task in 1838 and completed it about the middle of 1842. On the 2d of October of that year the new life of the resuscitated marvel was solemnly inaugurated. On the floor level is a celestial globe indicating sidereal time, and the rising, setting, and passage over the meridian of Strasburg of all stars visible with the naked eye. Behind this is a calendar showing months, days of the month, dominical letters, and all feast days. Above the calendar is a gallery with allegorical figures representing the days of the week (Sunday, Apollo drawn in a chariot by horses; Monday, Diana drawn by a stag; Tuesday, Mars; Wednesday, Mercury; Thursday, Jupiter; Friday, Venus; Saturday, Saturn), which pass in order from left to right. Above this is a dial for showing ordinary time, a planetarium, and a globe showing phases of the moon. Next come movable figures representing the four ages of man, which strike the second stroke of each quarter on a bell. A genius seated beside the ordinary dial strikes the first note of each quarter with a sceptre; the genius on the opposite side turns an hour-glass at each hour. Death strikes the hour with a bone. Above, a procession of the 12 Apostles passes at noon before Christ, bowing at his feet, while he makes the sign of the cross. During the procession a cock perched on the top of the left-hand turret flaps its wings, ruffles its neck, and crows three times.

A clock at Berne, which dates from 1527, presents some curious features. Three minutes before the hour a wooden cock crows and claps its wings; in another minute a procession of bears (baren, referring to the name "Berne") passes around a seated figure of a bearded old man; the cock (above the arch, and to its right) then crows again. The hour is struck on a bell at the top of the tower, by a foll with a hammer, and at each stroke, the bearded figure raises his sceptre and opens his mouth, while he turns an hour-glass; a bear inclines his head at the same time. Then the cock crows again.

Another celebrated clock is at Venice, dating back to the 17th century. It has a dial of blue and gold, and is surmounted by bronze figures which strike the hours upon a bell. On Ascension Day, and for 14 days after, figures of the Magi come forth in procession and salute the Virgin and Child (as shown above dial) when the clock strikes twelve.

Yet another is the clock of the English Houses of Parliament at Westminster. It was designed by Lord Grimthorpe (then Mr. E. B. Denison) and was first set going in 1860. The tower is 320 feet high, and the dials are 180 feet from the ground. Each of them is 22½ feet diameter, of opalescent glass set in an iron framework. The hour figures are two feet long and the minute spaces one foot square. The works contain three trains — one drives the hands, another the mechanism for striking the hours, the third the chimes. The pendulum is fully 13 feet long and weighs nearly 700 pounds. The going part of the clock requires winding once a week, the striking parts twice. The hour bell weighs 13 tons, the quarter bells collectively eight tons. Though there are clocks with larger dials, this clock is probably the most powerful as well as the most accurate of all large time-keepers. It cost more than $110,000.

Clock and Watch Industry. See WATCHMAKING, MODERN.

Clock-work. It is usual with writers on clock-work to consider the moving part, or that which measures the time, as independent of the striking department of a common clock; the first being called the watch, and the second the clock department. This method we shall follow, as it tends greatly to the simplification of the subject. An end view of the watch movement of a common clock is shown in the plate, fig. 1. The work-wheel is contained within two brass plates, SS.TT, connected together by four pillars, two

of which are seen in the drawing. Between these two plates a barrel, C, is placed, moving on the pivots *bb*, entering the plates, and which terminate the axis, *a, a*. A catgut band passes round the barrel, being guided in winding by a spiral groove cut on the circumference. To the end of this catgut band, or cord, a weight, P, is attached, which descending by its own weight, will uncoil the cord and cause the barrel to turn on its axis; and were no obstruction offered, this motion would continue until the catgut were exhausted or the weight reached the ground. This, however, is prevented by the action of a click fixed to the wheel DD, which click strikes against the right sides of the teeth of a ratchet-wheel attached to the barrel. The teeth of the wheel DD act upon the leaves of the pinion turning upon the pivots, *c, c*. The wheel EE is fixed upon the axis of the pinion *d*, and thus the motion given to that pinion by the wheel DD is transferred to the wheel EE, from thence to the pinion *e*, and afterward to the wheel FF, which again gives motion to the pinion *f*, upon the axis of which is fixed the swing-wheel, GH. The swing-wheel, as will be seen in fig. 2, has teeth of the ratchet form, in which the pallets, IR, play. These pallets are connected by a cross-piece, as seen in the drawing, which is fastened to an arbor going through the back plate of the frame, as seen in fig. 1, and carrying the lever, XU, which has a forked end, to receive the pendulum. To the brass bar, A, screwed to the frame of the clock, there is attached a small steel spring, *y*, by which the pendulum is suspended. The pendulum consists of a slender rod, with a heavy bob at the one end, being suspended at the other. The length of time which the pendulum takes to vibrate will depend on its length, that is, on the distance between the centre of suspension and the centre of gravity of the bob.

On the laws of the motion of pendulums, such remarks shall only be made here as are necessary for the illustration of the movement of clock-work. The length of a pendulum vibrating seconds at London has been found to be 39.1393 inches. This pendulum, although vibrating seconds at London, would not do so correctly in other latitudes, for it has been found by experiment, and may be demonstrated from the known laws of gravity, that the length of the seconds pendulum increases by a certain rate as we advance from the equator to the poles, the length at the equator being 39, and at the poles 39.206 inches. The latitude of the place where the clock is meant to go must therefore be taken into consideration by the maker, and the length of the pendulum regulated accordingly. The pendulum may be made to vibrate half-seconds, seconds, or two seconds, and the number of the teeth in the wheels made to correspond; but when a choice can be made, experience proves that preference ought to be given to a long pendulum. On this subject more shall be said toward the end of this article; meantime we return to the examination of the connection of the pendulum with the swing-wheel. When the pendulum, *y* B, fig. 1, is drawn a little aside from the perpendicular, and then let go, it will move backward and forward, the bob, B, describing the arc of a circle round the centre of suspension, *y;* and from the connection before pointed out between the pendulum and the pallets, IR, fig. 2, it is easy to see that when, by the action of the weight, P, motion is, as shown before, transmitted to the wheel GH, a tooth, H, of this wheel will act upon the pallet, R, move it, and cause that tooth to escape. The motion of the pendulum will then cause the pallet I to come into contact with the tooth G, which again will escape, and so on, each tooth in the wheel escaping the pallets. This department of the clock is denominated the escapement. Various forms of the escapement have been employed at different times, many of which exhibit great ingenuity; that which we have just described is the one in common use; it is very simple, and answers all ordinary purposes sufficiently well. In tracing the times of the revolutions of the wheels, we refer to fig. 1, where the wheel EE revolves once in an hour. The pivot, *c*, of this wheel passes through the plate, and is continued to *r*, upon which the minute hand is fixed. This extremity, *r*, which carries the minute hand, is the end of a long socket fastened into the centre of the wheel NN, the teeth of which act upon the wheel O, whose pinion, *p*, moves the wheel *gg* fixed upon the socket, which turns with the wheel N. The hour hand is fixed upon the barrel of the wheel *gg*, which, of course, turns once round in 12 hours.

From this description the reader will perceive that the whole of the wheels, as likewise the pendulum, are kept in motion by the descending of the weight, P, until the cord which is coiled round the barrel has been run out. The clock is again wound up by means of a key which fits on the square end of the arbor, Q.

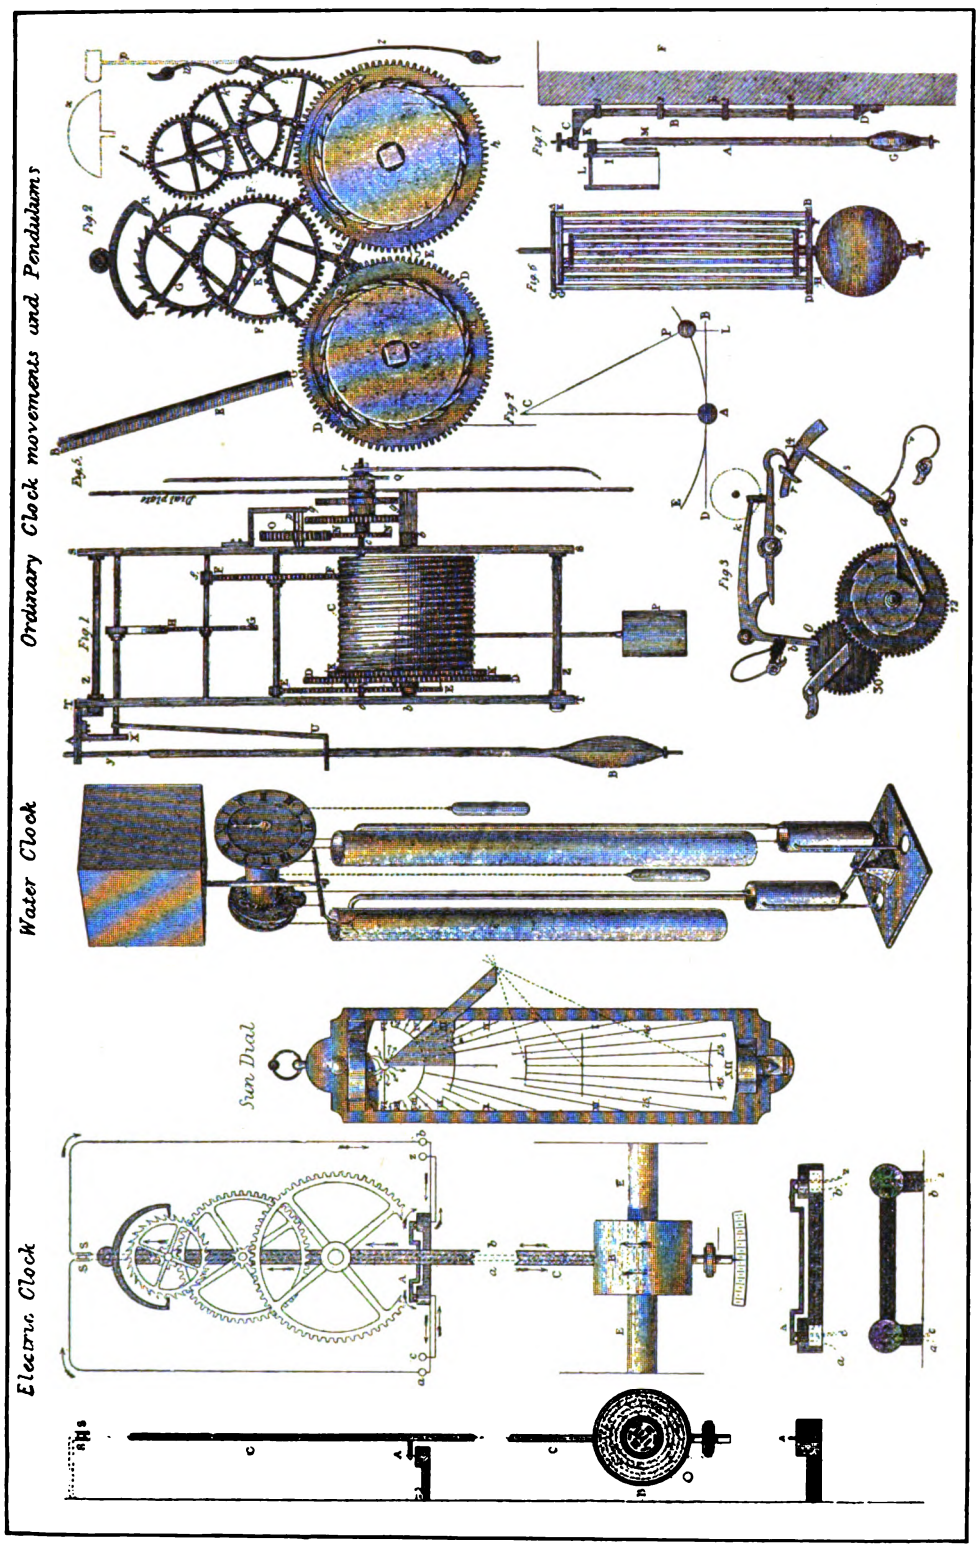
For the purpose of winding the clock, the click, *c*, fig. 2, is moved by the inclined side of the teeth of the ratchet-wheel, K, which turns with the barrel, while the wheel D is at rest, but it continues to move so soon as the cord is coiled upon the barrel. The click falls and checks the teeth, thus allowing the wheel D to move, the click being kept in the teeth of the wheel by means of the spring, A. If the pendulum of the clock be a seconds pendulum, it will make 3,600 vibrations in an hour; but a half-seconds pendulum, whose length is about 9 25-32 inches long, will make double that number, that is 7,200 vibrations in an hour; and, supposing the latter to be employed, it then follows that, since the teeth of the swing-wheel, GH, must all act on each of the pallets, each tooth causing one vibration of the pendulum, if the swing-wheel have 30 teeth, the pendulum will make 60 vibrations during one of the swing-wheel's revolutions. Hence, since 60 is contained in 7,200 120 times, the wheel GH will turn 120 times in an hour. If the wheel E have 72 teeth, and the pinion six, then the pinion will revolve 12 times for one revolution of the wheel. The pinion C turns the wheel F, which has 60 teeth; and the pinion *e*, making 10 revolutions for one of the wheel F, makes 120 while E performs one. The pinion *f* moves GH, causing it to turn round and make the pendulum vibrate 60 times for every revolution; and as the pinion *f* turns the wheel G, the pendulum must make 60 × 120 or 7,200 vibrations while the wheel E makes one turn. This last wheel, then, turns once in an hour. The wheel N, on the same axis, must likewise turn in one hour, and the minute hand is fixed upon a tube on the axis of this wheel. This is fixed on pretty tight, so that the hand, being

carried round by friction, may be moved so as to be set at any figure on the dial-plate without affecting any of the wheels. The wheel N, having 30 teeth, drives the wheel O, having the same number, which therefore revolves in an hour. O carries the pinion, P, of six leaves, acting upon the wheel *gg* of 72 teeth; and the pinion will therefore make 12 turns for one of the wheel *gg*, which must take 12 hours to revolve, and upon the axis of this accordingly the hour hand is fixed.

We have hitherto confined our attention to the going or watch part of the clock; we will now endeavor to explain the construction of the striking department. The prime mover of the striking department is a weight, attached to a cord wound round a barrel, in fig. 2, similar to the barrel in the clock department. The wheel *h* on this barrel turns a pinion of eight leaves fixed on the same arbor as the wheel *i*, which again turns a pinion of eight leaves, on the arbor of the wheel *k*, of 48 teeth. On the same arbor with the wheel *t* of 48 teeth there is fixed a pinion driven by the wheel *k*, and the wheel *t* again drives another pinion of six leaves, on whose axis a broad flat piece of metal, S, is fixed, called the fly, which in revolving strikes the air, and the resistance thence arising retards the motion of the train. Eight pins project from the side of *i*, which, as the wheel turns round, act in succession on the tail of the hammer, causing it to move out from the bell. When a pin leaves the tail of the hammer, it is returned and made to strike the bell, *x*, by the action of the spring *z*. But to prevent the hammer from continuing to press upon the bell, and thus deaden the sound, a small spring, *u*, acts upon the hammer just before it strikes the bell, and lifts it after it has struck. The pin-wheel, *i*, carries a pinion of eight leaves driven by the wheel *k*, of 78 teeth, turning once in 12 hours. On the arbor of the wheel *k*, which passes through the brass plate SS, is fixed a small pinion of one tooth, called the gathering-pallet, seen at *r*, fig. 3. The gathering-pallet, which revolves once for each stroke of the hammer, turns a larger wheel, a segment of which is seen at *s;* this wheel is called the rack, and to it is attached the arm, *b*, whose end rests upon the spiral plate, *v*, called the snail, fixed on the same tubular arbor as the wheel 72, and the hour hand. The snail is divided into 12 parts or steps, each of which corresponds to an hour; their circumferences are parts of circles struck to different radii, decreasing in a certain proportion each step, the length of each being one twelfth part of the circumference of the circle on which it is struck. These circular arcs form so many slips, constituting the snail, against which the arm *b* of the rack is pressed by the spring *w*, which is opposed by the hawk's-bill, *g*, a click acting on the teeth of the rack; *bk* is the warning-piece, being a three-armed detent, one arm of which is bent at the end and passes through the plate SS in order to catch a pin fixed in the arm of the wheel *t* (fig. 2). The other arm, *b*, takes a direction so as to meet a pin on the wheel O. In fig. 3 the parts are represented as in motion, and the motion would continue were it not that at each stroke of the hammer the gathering-pallet, *r*, lifts the rack one tooth each turn — the hawk's-bill retaining the rack until a pin in the end of the rack is brought in the way of the gathering-pallet lever, and thus stops the motion of the wheels. At the end of every hour the pin in the wheel O touches the end *b*, moving it toward the spring, thus lowering the end, *k*, to the circle of motion of the pin in the wheel *t* (fig. 2). The end of the hawk's-bill is at the same time lowered by the end of the short tail, in consequence of which the other end, *g*, is raised so as to clear the head of the rack, S, when the rack is thrown back by the spring *w*, until the end of the arm A is pressed against the snail. The wheels are set in motion by the weight, when, by the falling back of the rack, the pin in it clears the gathering-pallets; but a few minutes before the striking of the bell, the whole is stopped by the pin in the wheel *t* falling against the end, *k*. The motion of the wheels during this action produces that noise called the warning of the clock. When the hammer is about to strike at the end of the hour, the end of the arm *b* of the wheel O slips over its pin, and it is raised against the end, *k*, by a small spring. The hammer, *p*, is raised by the pin-wheel, *i*, and the bell is struck. The gathering-pallet takes up a tooth of the rack each turn, the hawk's-bill retaining it until the pin of the rack comes under the gathering-pallet, and checks the motion of the striking department until the next hour. The number of teeth that the rack falls back will depend upon the number of strokes made by the hammer, and from the form of the snail the rack falls back differently every hour, the hammer making one additional stroke each hour, from one to 12. If, by any cord or other communication, the arm *b* should be moved between any two hours, then the striking part will be put into motion, and the arm A remaining in the step of the snail, the last hour will be struck, which is called repeating.

From this description it is easy to see that a clock may be made to go for any length of time without winding up, by increasing the number of teeth in the wheels, or, what comes to the same end, diminishing the number of hours in the pinions. The same may also be effected either by lengthening the cord to which the weight is attached, or by increasing the number of wheels and pinions. The moving power in clocks with short pendulums, called time-pieces, is frequently not a weight, as is above described, but a spring, such as that employed in watches, for a description of which apparatus see WATCH.

Upon the pendulum depends the regularity of the clock's motion. A heavy body, *p*, (fig. 4) attached to the end of a cord or slender rod, PC, capable of moving round the centre C, forms the common pendulum. The body or bob, P, will, if undisturbed, remain in the lower point, A, of the arc PE, but if drawn to one side, as shown in the figure, and then let go, it will, by the action of gravity, have a tendency to fall to the centre of the earth, in the direction of PL; but because of the rod or cord, PC, it describes the arc PA, being part of a circle of which C is the centre. When the bob has reached the lowest point, A, it has acquired such velocity as to carry it on to the point E, from which it descends and rises again toward A. These alternate motions backward and forward, continue; but by reason of friction and the resistance of the air, the length of the arcs described by the bob will continually decrease until the action of gravity causes the pendulum



to cease its motion altogether. We have already seen how the stopping of the pendulum is prevented from a new impulse being given at every vibration by the action of the teeth of the swing-wheel upon the pallets. It may be demonstrated that if two pendulums describe similar arcs, the times of their vibrations are as the square roots of the lengths of the pendulums, and also that the lengths of the pendulums are as the squares of the number of their vibrations in equal times, or as the squares of the times of vibration. Wherefore, assuming the length of a seconds pendulum to be 39.1386 inches, it follows, from the foregoing statement, that the length of a half-seconds pendulum will be about 9.8, and a quarter-seconds about 2.45 inches. The bob may be dispensed with, and a simple rod, BG, (fig. 5) employed, whose length is greater by a third than the length of the pendulum with the bob.

We have before alluded to the effect of gravity in causing a difference in the time of vibration of the same pendulum in different latitudes; but there is another circumstance affecting the time of vibration of a pendulum which we must here consider — we mean the effect of heat and cold in lengthening and shortening the pendulum; so that the time of the going of a clock is influenced by variations of temperature. This circumstance for a long time rendered the clock a very unsafe guide to the navigator in determining the longitude, and accordingly several very ingenious contrivances have been made to remedy this defect. These contrivances are called compensation pendulums, because they contain within themselves means of compensating for variations in length caused by the differences of temperature. The mercurial pendulum of Graham, invented about 1721, is exceedingly simple, and serves well to illustrate the principle upon which compensation pendulums are constructed. Graham's pendulum consists of a steel rod, at the end of which is fixed a glass jar containing mercury; so that when the rod expands by heat the jar is lowered, while at the same time the heat expands the mercury, and thus the centre of oscillation is raised, and, the one expansion counteracting and compensating for the other, the length of the pendulum remains unchanged. This contrivance, though simple and ingenious, is in little use, being exceedingly difficult of adjustment. The gridiron pendulum of Harrison consists of five, seven, nine, or any odd number of rods of different metals which effect compensation in a manner that will be understod by reference to the pendulum represented in fig. 6. The two outer rods, AB, CD, are of steel, fastened by means of pins to the cross-pieces AC, BD. The rods EF, GH, are of brass, and fastened in a similar way to the lower bar, BD, and to EG, the second bar from the top. The two next rods are of steel, and fastened to the cross-bars IK and EG. The next two are fastened to the cross-bar LM and IK, and are of brass. The central rod, to which the bob is attached, is made of steel, and fastened to the cross-piece LM, and passes freely through the cross-pieces BD, IK. The effect of the steel rods is to lengthen the pendulum on expansion by heat, or to shorten it on contraction by cold; while this is compensated by the contra expansion and contraction of the rods of brass in the following manner: When, by increase of temperature, the two outer steel rods expand, the cross-bar BD, together with the rods attached to it, will descend, and thus the pendulum will be lengthened; but the two next brass rods fastened in BD will also expand and raise the cross-piece EG, whereby the next two rods of steel will likewise be raised. These two last-mentioned rods will also expand, and therefore the cross-piece IK will be lowered. To this cross-piece the two next rods of brass are fastened, and they will likewise expand and raise the cross-piece LM, which elevation will compensate for the depression of the bob by the expansion of the centre-rod. This description of pendulum answers the purpose of keeping correct time exceedingly well, and is accordingly employed where accuracy is essential, as in the clocks of observatories. In Crosthwaite's compensation pendulum A and B are two rods made of steel, similar to each other in every respect, the rod B being supported by a bracket, D, and the top formed into a gibbet at C. The rod B is firmly fixed into a large piece of marble, F, set into a wall so adjusted that the rod may be moved up or down between the brass staples 1, 2, 3, 4, which touch only in a point in front and behind. The rod A carries at its lower extremity the bob G, 24 pounds weight, the upper end being suspended by a spring at the gibbet C. All this apparatus is unconnected with the clock, to the back of the plate of which, at K, two cheeks are secured in a line with the verge, L. The maintaining power is applied in the usual way of regulators at M by means of a cylindrical stud, and here the compensation, if so it can be called, takes place. For while the rod B expands, A must raise the upper end C, the lower end being immovable, but its expansion will be accompanied with a similar expansion of the rod A, which will lower the bob. It is to be observed that the top of the rod A is attached to the gibbet by means of two slender chains which pass through between two brass plates, whose lower edges will form the centre of suspension of the pendulum. This pendulum, though much more simple, is not so invariable as a well-constructed pendulum of the gridiron construction.

Clodd, Edward, English writer: b. Margate, Kent, 1 July 1840. He entered commercial life in 1860 and has been secretary of the London Joint Stock Bank from 1872. He is the author of 'The Childhood of the World' (1872); 'The Childhood of Religions' (1875); 'Jesus of Nazareth' (1880); 'Myths and Dreams' (1885); 'Story of Creation' (1888); 'Story of Primitive Man' (1895); 'Primer of Evolution' (1895); 'Pioneers of Evolution' (1897); 'Grant Allen' (1900); 'Story of the Alphabet' (1900); 'Thomas Henry Huxley' (1902).

Clodia, one of the three sisters of Publius Clodius Pulcher. She was married about 60 B.C. to Quintus Motellus Celer, who died the following year, probably from poison. Cicero having rejected her advances, she conceived a mortal hatred against him, and, in concert with her brother, used every possible means to effect his ruin. On her accusing Cœlius Rufus of an attempt to poison her, Cicero undertook his defense, and depicted her dissolute life in a speech which is still extant.

Clog-almanac, an almanac or calendar made by cutting notches or characters on a clog or block, generally of wood. The block had generally four sides, three months for each edge. The number of days is marked by notches, while various symbols are used to denote saints' days, the golden number, etc.

Cloisonne, in ceramics, a method of enameling, applies for the most part to metal, since the effects are more easily attained thus than when it is applied to porcelain; specimens of the latter sort being, indeed, chiefly regarded as curiosities. In cloisonné work (so-called from *cloison,* a partition), fine metallic walls of the same material as the basis (for example, copper) are soldered by a strong cement by one edge to the basis; and these walls in this manner form numerous cells or compartments, in which the vitrifiable enamel pastes of various colors are placed. The enamel is then vitrified by several firings — three or four generally being required before enough enamel can be applied to afford an approximately level surface — and subsequently is ground and polished to a high degree. The Gauls in Roman times and previously made cloisonné, and it was employed for decorative purposes in shrines, altar-pieces, and church plate in the Middle Ages. It has not since been used until recent experiments were attempted. The Oriental cloisonnés are well known, particularly the Japanese. The art is said to have been introduced into Japan from China in the 16th century of the Christian era. Japanese cloisonné is made chiefly at Owari, Kioto, Tokio, and Osaka. In later specimens of the Japanese work the partitions are reduced to a minimum, apparently making no separation between the color masses of the enamel. The finest examples of the Oriental cloisonnés display great brilliancy.

Cloister (O. F. *cloistre,* Lat. *claustrum,* bar, enclosed place), a court enclosed by covered walks. The latter are, strictly speaking, the cloisters, the central space being termed the cloister garth. The walks, or ambulatories, are open on the side toward the garth and when appertaining to monastic or collegiate establishments were intended for the use of monks or nuns or the clergy attached to the Church. The cloisters are usually, though not invariably, placed on the south side of the church. They are commonly square on the plan, having a plain wall on one side, a series of windows between the piers or columns on the opposite side, and covered with a vaulted or ribbed ceiling. They form part of the passage of communication from the church to the chapter-house, refectory, and other parts of the establishment. The chapter-house usually opens from the east walk, the refectory and certain other domestic buildings of a monastic house, from the south walk.

Cloister and the Hearth, The, a novel by Charles Reade, published 1861. The masterpiece of this vigorous novelist recreates the 15th century, and presents to modern eyes the Holland, Germany, France, and Italy of the Middle Ages, as they appeared to mediæval people. The dramatic quality of the story, its vivid descriptive passages, the force and individuality impressed on its dialogue, its virile conception of the picturesque brutality and the lofty spirituality of the age it deals with, the unfailing brilliancy of the novelist's treatment of his theme, and its humorous quaintness, place 'The Cloister and the Hearth' among the great historical romances of the world.

Clonmel, klŏn'mĕl, Ireland (Gælic, that is, «Vale of Honey»), a municipal borough situated on both sides of the Suir; part in Tipperary and a small part in Waterford; and 90 miles southwest of Dublin. Three stone bridges cross the Suir and connect the parts of the town; it has good streets, well paved and well lighted. Clonmel was founded by the Danes, and has long been noted for its love of learning. The fame of the schools established by the Franciscans in the 13th century extended to all the seats of learning on the Continent. The chief edifices now in the town are an Episcopal church, two Roman Catholic churches, a Franciscan abbey, the court-house, jail, barracks, free library, town-hall, convents, schools, lunatic asylum, etc. The trade is chiefly in grain, cattle and provisions; and there are flour-mills, creameries, a brewery, etc.

Laurence Sterne, the novelist, was born in Clonmel, and Lady Blessington, the writer, was born near by. Pop. 8,500.

Clontarf, klŏn'tärf, Ireland, a town in county Dublin, on the northern shore of Dublin Bay, some three miles northeast of Dublin. It is a much frequented watering-place, and is historically interesting as the scene of Brian Boroimhe's victory over the Danes in 1014. Pop. 5,200.

Cloots, Jean Baptiste von, zhŏñ bäp tēst fŏn klōts, Prussian baron, well known during the Revolutionary scenes in France under the appellation of Anacharsis Cloots; d. 24 March 1794. He was born at Cleves in 1755, and became possessed of a considerable fortune, which he partly dissipated through misconduct. He traveled in different parts of Europe, and formed an acquaintance with many eminent individuals, among whom was the celebrated Edmund Burke. The first work in which he distinguished himself was the ridiculous masquerade called the 'Embassy of the Human Race,' partly contrived by the Duke de Liancourt. On the 19th of June 1790, Cloots presented himself at the bar of the national assembly, accompanied by a considerable number of enthusiastic followers of various nationalities, English, German, Italian, Spanish, and others. He described himself as the orator of the human race, and demanded the right of confederation, which was granted him. At the bar of the assembly, 21 April 1792, he made a strange speech, in which he recommended a declaration of war against the king of Hungary and Bohemia, proposed that the assembly should form itself into a diet during a year, and finished by offering a patriotic gift of 12,000 livres. On the 12th of August he went to congratulate the legislative assembly on the occurrences of the preceding 10th, and offered to raise a Prussian legion, to be called the Vandal Legion. The 27th of the same month he advised the assembly to set a price on the heads of the king of Prussia and the Duke of Brunswick, praised the action of John J. Ankarstrœm, the assassin of the king of Sweden, and, among other absurd expressions, he said, «My heart is French and my soul is sansculotte.» He displayed no less hatred to Christianity than to royalty. In September 1792 he was nominated deputy from the department of the Oise to the national conven-

tion, in which he voted for the death of Louis XVI. "in the name of the human race." He became an object of suspicion to Robespierre and his party, was arrested and condemned to death.

Close Time, a period of the year during which certain animals are protected by law, and are not allowed to be caught or killed. Such animals are chiefly those that are killed for food or sport, and include birds, fishes, and quadrupeds, as well as certain others — crabs, lobsters, and oysters, for example.

Clo'sure (often needlessly *clôture,* the same word in French), the European substitute for the American "previous question": the power of shutting off debate when the speaker or the majority think it has exhausted legitimate argument and is used for mere obstruction. As the equity of neither deciding power can be guaranteed, it is also a possible weapon of mere "gag-law"; but it has shown itself to be the only method in which parliamentary institutions can be worked. In Congress the "previous question" exists in the House, but not in the Senate, and this possibility of indefinite blocking of public interests by a single unscrupulous member, has caused an active movement for introducing it into the Senate also. In the British Parliament no such rule existed till 1882, debate being unlimited; and the fairness of its members, and their unity of feeling as Englishmen, had prevented any serious ill results. But about 1872 Isaac Butt, the leader of the Irish Home Rule party, began the policy, carried on after his death by Parnell, of putting a stop to all legislation on English subjects until all Irish demands had been granted, by talking against time, making irrelevant motions, calling for divisions on every motion, etc. For many years Parliament struggled under this, extremely loath to tie down the immemorial freedom of debate, but was finally forced to act, and in 1882 passed a "closure" rule, which allowed the speaker, on request of 40 members, to pronounce debate closed and call for a vote. In 1887 this was modified to require the petition of 200 members, or of only 100 in case the negative vote is less than 40. The French *clôture* dates from Louis Napoleon's accession in 1851.

Clotaire (klō-tār) **I.,** son and successor of Clovis (q.v.), first king of the Franks in Gaul, reigned as sole king from 558 to 561. CLOTAIRE II., a king of the same Merovingian dynasty, reigned over the Franks 30 years later.

Cloth. See WEAVING.

Cloth of Gold, Field of the. See FIELD OF THE CLOTH OF GOLD.

Clothes-moth, a moth (*Tinea pellionella*), of the family *Tineidæ,* in which the wings are long and narrow, pointed at the end, and with a long finger. It is pale buff-yellow, with no definite markings. It may be seen flying about the house the last of May, or still earlier if the weather be warm, when it lays its eggs in woolens. The young caterpillar is whitish, and begins, on hatching, to construct a flattened cylindrical case in which it lives, dragging the case about with it. The mischief is done by the worm, the caterpillar working through the next 10 months, finally changing to a pupa in its case, and the best preventative is cold storage at a temperature of 40° F., or the use of naphthalium or camphor. Woolen garments should be carefully brushed and put away in cotton sacks or in camphor trunks, or wrapped tightly in stout paper, or stored in large pasteboard boxes rendered tight by gumming a strip of wrapping paper around the edge, so as to seal the box completely. Consult: Packard, 'Guide to the Study of Insects'; Howard and Marlatt, 'The Principal Household Insects of the United States'; 'Bulletin 4 of the United States Department of Agriculture.'

Clothing, the artificial coverings worn by human beings for protection against the weather and from motives of decency. Nothing is more necessary to a comfortable state of existence than that the body should be kept in a nearly uniform temperature. The skin, by increase of the perspiration, carries off the excess of heat; the lungs, by decomposing the atmosphere, supply the loss; so that the internal parts of the body are preserved at a temperature of about 98° under all circumstances. In addition to the important share which the function of perspiration has in regulating the heat of the body, it serves the further purpose of an outlet to the constitution, by which it gets rid of matters that are no longer useful in its economy. The excretory function of the skin is of paramount importance to health, for if the matters that ought to be thrown out of the body by the pores of the skin are retained, they invariably prove injurious. When speaking of the excrementitious matter of the skin the sensible moisture which is poured out in hot weather, or when the body is heated by exercise, is not meant; but a matter which is too subtle for the senses to take cognizance of, which is continually passing off from every part of the body, and which has been called insensible perspiration. This insensible perspiration is the true excretion of the skin. A suppression of the insensible perspiration is a prevailing symptom in almost all diseases. It is the sole cause of many fevers. Very many chronic diseases have no other cause. In warm weather, and particularly in hot climates, the functions of the skin being prodigiously increased, all the consequences of interrupting them are proportionably dangerous. Besides the function of perspiration, the skin is an organ of absorption. It is also the part on which the organ of feeling or touch is distributed. The skin is supplied with glands which provide an oily matter that renders it almost impervious to water, and thus secures the evaporation of the sensible perspiration. Were this oily matter deficient, the skin would become sodden, as is the case when it has been removed — a fact to be observed in the hands of washerwomen, when it is destroyed by the solvent powers of the soap. The hair serves as so many capillary tubes to conduct the perspired fluid from the skin. The three powers of the skin, perspiration, absorption, and feeling, are so dependent on each other that it is impossible for one to be deranged without the other two being also disordered. For if a man be exposed to a frosty atmosphere till his limbs become stiff and his skin insensible, the vessels that excite the perspiration and the absorbent vessels partake of the torpor that has seized on the nerves of feeling; nor will they regain their lost activity till the sensibility be completely restored. The danger of suddenly attempting to restore sensibility to frozen parts is well known. If the addition of warmth be not

very gradual, the vitality of the part will be destroyed. This consideration of the functions of the skin will at once point out the necessity of an especial attention, in a fickle climate, to the subject of clothing. The chief end proposed by clothing ought to be protection from the cold; and it never can be too deeply impressed on the mind (especially of those who have the care of children), that a degree of cold amounting to shivering cannot be felt without injury to the health, and that the strongest constitution cannot resist the benumbing influence of a sensation of cold constantly present, even though it be so moderate as not to occasion immediate complaint, or to induce the sufferer to seek protection from it. This degree of cold often lays the foundation of the whole host of chronic diseases, foremost among others which are found scrofula and consumption. Persons engaged in sedentary employments must be almost constantly under the influence of this degree of cold, unless the apartment in which they work is heated to a degree that subjects them, on leaving it, to all the dangers of a sudden transition, as it were, from summer to winter. The inactivity to which such persons are condemned, by weakening the body, renders it incapable of maintaining the degree of warmth necessary to comfort without additional clothing or fire. Under such circumstances a sufficient quantity of clothing of a proper quality, with the apartment moderately warmed and well ventilated, ought to be preferred to any means of heating the air of the room so much as to render any increase of clothing unnecessary. To heat the air of an apartment much above the ordinary temperature of the atmosphere, we must shut out the external air; that of the close room becomes extremely rarefied and dry; which circumstances make it doubly dangerous to pass from it to the cold, raw, external air. But in leaving a moderately well warmed room, if properly clothed, the change is not felt.

The only kind of dress that can afford the protection required by the changes of temperature to which high northern climates are liable is woolen. Those who would receive the advantage which the wearing of woolen is capable of affording must wear it next the skin; for it is in this situation only that its health-preserving power can be felt. The great advantages of woolen cloth are briefly these: The readiness with which it allows the escape of sweat through its texture; its power of preserving the sensation of warmth to the skin under all circumstances; the slowness with which it conducts heat; the softness, lightness, and pliancy of its texture. Cotton cloth, though it differs but little from linen, approaches nearer to the nature of woolen, and on that account must be esteemed as the next best substance of which clothing may be made. Silk is the next in point of excellence, but it is very inferior to cotton in every respect. Linen possesses the contrary of most of the properties enumerated as excellencies in woolen. It retains the matter of perspiration in its texture, and speedily becomes imbued with it; it gives an unpleasant sensation of cold to the skin; it is very readily saturated with moisture, and it conducts heat too rapidly.

There are several prevailing errors in the mode of adapting clothes to the figure of the body, particularly among women. Clothes should be so made as to allow the body the full exercise of all its motions. The neglect of this precaution is productive of more mischief than is generally believed. The misery and suffering arising from it begin while the child is yet in the cradle. Girls have for a while the same chance as boys, in a freedom from bandages of all kinds; but as they approach womanhood they are subjected to trammels in the form of stays. The bad consequences are not immediately obvious, but not the less certain on that account. The girl writhes and twists to avoid the pinching which must necessarily attend the commencement of wearing stays tightly laced. The posture in which she finds ease is the one in which she will constantly be, until at last she will not be comfortable in any other, even when she is freed from the pressure that originally obliged her to adopt it. In this way most of the deformities to which young people are subject originate, and, unfortunately, it is not often that they are perceived until they have become considerable, and have existed too long to admit of remedy.

Clothing and Furnishing Trade. The history of the manufacture of ready-made clothing in the United States is comprehended in a period of perhaps 70 years. There do not appear to be any records of the earliest days of the trade, and its origin is lost in the obscurity of time. It is probable, however, that the cradle of this important industry, in which vast fortunes have been made and lost, was at New Bedford, Mass., where, so far as I can learn, the first ready-made clothing was manufactured to supply the immediate and pressing needs of the sailors returning from whaling voyages, or to stock their slop-chests for new adventures on the sea. These goods were of the coarsest materials, but they served the purpose. This first systematic attempt to make up clothing for immediate wear must have been at least as early as 1830, and it is possible that it was before that date. At the beginning of the 19th century every man went to the draper, as he was called, for his raiment. Clothing ready to wear, according to our modern development of the idea, had not then been thought of. Whoever he was who first conceived the idea of ready-made clothing, though he left no name for posterity to honor, his invention was destined to have a great influence upon the industries of his day and upon the commercial history of his country. Beginning in a small way by supplying returning sailors who could not wait for the usual slow processes of shears and goose, the demands increased so that presently many dealers found it expedient to make up in advance a small stock of garments, to meet a sudden, if not over-critical, demand. The idea reached Boston in due course, and then New York, where the trade was stimulated, a few years later, by the requirements of emigrants to the newly discovered gold-fields of California. The business soon assumed a considerable importance, and the dealers began systematically to operate small factories on their premises.

In the earlier days the demand for ready-made clothing grew most rapidly in West and South. In those then somewhat remote parts of the country there were not the facilities for manufacture that existed about the commercial centres of the East. The wholesale production of ready-made clothing here naturally followed. George Opdyke, once mayor of New York, was

one of the earliest to engage in this business. About 1831 he commenced to manufacture clothing in Hudson Street, New York, opening a store in New Orleans. Some three years later his brother-in-law, John D. Scott, moved from Baptist-town, N. J., to New York, and took charge of the business of the factory, the firm being changed to John D. Scott & Company. They subsequently opened retail stores in Charleston and Memphis, which, with the wholesale store, were carried on until 1865, the firm being then dissolved by the death of Scott. They made their clothing of the coarser grades, largely for field hands in the South, but supplied the planters with garments of good quality. John T. Martin went to St. Louis, where he did a very prosperous business in the days before the War, retiring upon a large fortune many years ago. Thomas Chatterton began in New Haven as a dealer about 1840, and in 1846 he first handled ready-made clothing and entered the field as a manufacturer. In 1856 he went to New York, where his store was at 60 Liberty Street. It is interesting to note that he paid a rental for the whole building that he occupied, of but $2,800 a year. He afterward moved to Warren Street, the firm then being Lewis, Chatterton & Company. John H. Browning, the father of the writer of this article, commenced business as a dry-goods jobber in New York in 1832, under the firm name of Browning & Hull. In 1848 John H. Browning started a branch store in California, making his first shipments mostly of dry goods; but soon changed it into a clothing store and forwarded large amounts of cheap clothing, mostly gray flannel shirts and trousers for the use of the miners. The writer of this article commenced to take charge of the clothing department of his father's business in 1850, and remained with him until the spring of 1858, when he became associated with John E. Hanford, formerly of the firm of Lewis & Hanford, and engaged in the manufacture of clothing for the South and West. Their business was exceedingly prosperous until the breaking out of the War, when they had over $500,000 worth of assets in the Southern Confederacy confiscated. After the War broke out, the firm of Hanford & Browning, in the month of May 1861, procured a contract from Quartermaster-General Thomas, of Philadelphia, for $1,250,000 worth of clothing, which in those days was considered a very large undertaking. After this large contract had been entered into and the cloth purchased from the mills, one Saturday afternoon the firm received a telegram from Quartermaster-General Meigs, of Washington, repeated by Quartermaster-General Thomas, of Philadelphia, which read:

> We understand you have awarded a contract to Hanford & Browning, of New York city, of $1,250,000 for army clothing. Is it possible? If so, stop it at once, as it is largely in excess of any possible demand.
>
> QUARTERMASTER MEIGS.

John E. Hanford immediately started for Washington, and arrived there as our soldiers were returning from the unfortunate battle of Bull Run, and, on being admitted to Quartermaster-General Meigs' office, and with him going over the figures at which the contract was taken, the firm was again ordered to go ahead and supply the goods as quickly as possible. So rapid was the demand for army goods that cloth purchased from Hunt & Tillinghast for overcoats under that contract at 76 cents a yard, advanced to $1.50 a yard before the contract was completed. The original price to the government for the overcoats was $6, but the price had to be raised to $10. The firm of Hanford & Browning dissolved about 1862, and the business was conducted for the next three years under the firm name of Browning, Button & Kimball, and then changed to William C. Browning & Company, under which name it continued until 1868, when the present firm of Browning, King & Company was started. The house has retail stores to-day in 15 cities, a wholesale house in Chicago, and a large factory in New York.

It is impossible at this date to preserve anything like a chronological order in recalling the names of others of the early manufacturers whose operations developed the industry that to-day has attained such great proportions. But among them, as they are called to mind haphazard, were John T. Martin & Company, from whom, through a succession of changes, has sprung the present house of Rogers, Peet & Company, in which Mr. Martin is a special partner, and his son, William R. H. Martin, is a partner; Brooks Brothers, who started business at Catherine and Cherry streets, New York, in 1845, trading with the sailors along the waterfront, and whose descendants still conduct the business at Broadway and Twenty-second street; Lewis B. Brown & Company, who were in the southern trade, and the head of which, having been forced under by the War, went into the real-estate business and founded the New Jersey summer resort called, in imitation of his own name, Elberon; A. T. Bruce & Company; Little, Pyan & Carhart, afterward, in 1862, becoming successively Schaeffer, Whitford & Company, Carhart, Whitford & Company, and, in more recent days, Hackett, Carhart & Company; H. & J. Paret; Daniel Devlin; C. T. Longstreet & Company; Archibald Young & Company; and Garrett, Young & Scott. Among other antebellum clothiers who have since achieved distinction in other fields of activity are the late Jesse Seligman, who began as a clothing dealer, then engaged in selling British dry goods, and finally wound up in the banking business in Wall Street; and John J. Cisco, at one time assistant sub-treasurer of New York. In those early days there was but a single Hebrew in the wholesale business; but a large number of Hebrews went to California as retailers of goods made in New York. They made a great deal of money, partly by the difference in exchange. Now the big wholesale business is largely in the hands of the Jews, as one may see by the bewildering array of signs in Broadway; while the retail business is largely in the hands of Christians.

The breaking out of the War caused great changes in the clothing business. Many New York manufacturers having a large trade with the South lost enormous sums, while others, whose trade was in the West and North, derived great benefits by the sudden demand for clothing in large quantities. John T. Martin and many others did a very large business in manufacturing uniforms for the government troops. These goods were made in the homes of the workmen at first, but afterward, as the demands increased, factories were established, and the business was greatly stimulated. The unsettled conditions due to the prolongation of

the War and the depreciation of the certificates with which the government paid, made the business one of many hazards; but a few of the larger and more responsible dealers, having faith in the government, reaped their reward in the re-establishment of credit and the corresponding appreciation of the government certificates from 70 to 80 cents to par. In the fall of 1865, when the War closed, the clothing business took its greatest jump, and the manufacturers were not able to supply the immediate demand for clothing for the soldiers returning home. Millions of dollars were spent for clothes that year.

The first circumstance to increase the powers of production to a point somewhat equaling the demand for cheap clothing was the introduction of the Singer sewing-machine about the year 1850. It was not regarded as wholly satisfactory at first, because machine-stitching would rip, and the hand-made garments were much firmer. The invention of the lock-stitch, remedying the principal fault, brought the machines into general use, and made possible the manufacture of the enormous volume of clothing used during the War. Previous to the invention of the sewing-machine clothing had of necessity been made by hand, and great quantities of it were sent out to the country towns round about New York, Boston, and Philadelphia, to be sewed by the wives and daughters of farmers and sailors through the winter. This clothing was used to supply the country trade, and was not as fine as that made in the cities; for, as a rule, the labor employed in the villages was cheap and unskilled.

It was not until some years after the War — perhaps about 1870 — that cutting-machines were first introduced into the wholesale manufacture of clothing. The long knife was the first improvement upon the old-fashioned shears of former years, and this, operating something like a saw, made possible the cutting of some 18 thicknesses of clothing to one thickness cut by shears. The Fenno and Worth cutting-machines came later, the blade being a circular disk, revolving rapidly, and cutting as many as 24 thicknesses of cloth with the speed and accuracy of a buzz-saw. By these modern agencies hundreds of suits can be cut and sewed by machinery in the time formerly required by the delving draper in fashioning a single garment. The ancient goose still holds its supremacy, however, as the only accepted implement for pressing garments, no improvements having suggested themselves in its form. Electricity has, however, taken the place of the furnace, in some instances, for heating the goose.

As the industry grew apace, and the number of persons to whom it gave employment increased, a certain method was naturally evolved, and a division of labor was arranged by which specialists in different details of the work of manufacture were developed. Formerly one tailor made a whole suit; now a dozen hands may be employed to advantage on a single garment. There is, first of all, the skilled designer, upon whose taste much depends; the cutter, who in the best-regulated shops is a deft artist in his way; another sews certain parts of a garment only; there are vest makers and "hands on pants," as the phrase is; and still others make buttonholes, that difficult operation now being performed by machinery.

Clothing for boys developed separately and along its own lines. Smith & Davidson were among the earliest to devote themselves to children's garments. During the War the firm became Peck, Randolph & Smith, and in 1865, Mr. Smith went to Williamsburg and started the present house of Smith, Gray & Company. W. T. Runk & Company was another pioneer house in the manufacture of clothes for boys, and it continues to-day under the firm name of Hippel, Tillard & Runk, a son of the founder of the house perpetuating the name. Dayton & Gilbert were very large handlers of children's garments, and the house still survives as Dayton & Close. William Banks & Company, in Chambers Street, New York, and Barrett & Schaeffer, in Murray Street, were also in the business up to the time of the War. Previously children's clothing had been made at home, as women's gowns are nowadays, by dressmakers.

With all these vast improvements in the methods of manufacture came a wider demand for clothing of higher grade, and at about the time of the close of the War persons of taste began to wear ready-made garments. A few leading houses in New York led the way, and, though progress was slow, little by little the early prejudice, founded upon the character of the "slop" clothes first introduced, was overcome. Men who had fancied that they could never wear "hand-me-downs," as they were vulgarly called, soon found that in respect neither of style nor of material was the best ready-made clothing inferior to the handiwork of the merchant tailor. That point being once made clear, there was a wonderful advance in the quality of goods manufactured, until to-day one can hardly fancy what an uphill road the early manufacturers traveled before the high quality of their wares was recognized. Now perhaps nine tenths of the men and boys of the country wear clothing made ready to put on, and they are as well dressed as the other one in ten. The custom tailor still has, and I do not doubt will retain, a monopoly of those extreme fancies of the fashionable which justify their claims to exclusiveness. But the multitude is clothed by the clothier, not by the tailor, if that distinction be recognized. And if it be true, as I think it is, that the condition of a people is indicated by its clothing, America's place in the scale of civilized lands is a high one. We have provided not alone abundant clothing at a moderate cost for all classes of citizens, but we have given them at the same time that style and character in dress that is essential to the self-respect of a free, democratic people. In Europe no such advance has been made as yet, although a considerable quantity of ready-made clothing is manufactured in Germany, France, and England. They have not, however, progressed far beyond the point at which we started.

Statistically speaking, the figures of the trade are difficult of access. In 1860 there were 303 manufacturers in New York, making goods to the amount of $17,011,370; and there were 352 manufacturers in Philadelphia, producing goods worth $9,984,497. According to the census office reports we find that in 1900 woolen goods and worsteds manufactured in the United States amounted in value to $238,744,502, and cotton and silk manufactures respectively to $339,200,320 and $107,256,258.

More than three fourths of the woolen cloth made in this country is consumed in the manufacture of ready-made clothing, the remainder going to the individual merchant tailors. A considerable proportion of imported woolens is used also in goods of the better class.

The figures that follow are from the United States census returns for the six years indicated in the table. They present, more compactly than I could put the facts in any other form, a view of the extent and development of the clothing industry since 1850. It must be stated that the figures for 1850 include the clothing and tailoring trades together. Here is the summary:

PRODUCTION OF MEN'S GARMENTS.

Year	Capital	Wages	Materials	Products
1850....	$12,509,161	$15,032,340	$25,730,258	$48,311,709
1860....	27,246,093	19,856,426	44,149,752	80,830,555
1870....	50,223,380	30,746,579	86,794,706	148,660,253
1880....	79,861,696	45,940,353	131,363,282	209,548,460
1890....	128,253,547	51,075,837	128,846,857	251,019,609
1900....	120,620,351	45,505,778	145,295,248	276,861,607

It was about the year 1870 that art entered definitely into the manufacture of clothing. Following the panic of 1873 there was a great increase in the patronage of the ready-made clothing dealers. At that time the quality of the goods made was raised, and the competition between the clothiers and tailors was more nearly on even terms.

Of the furnishing-goods trade I can speak only at second-hand. In the year 1820 nearly all of New York's wholesale business was located in Pearl, Water, Cliff, and adjacent streets south from Fulton Street; and William Street was the great thoroughfare of the New World metropolis — then a city of 120,000 inhabitants. Two years later, in 1822, was established the firm of Luke Davies, which later became Luke Davies & Son, and subsequently passed out of existence with the failure of their successors, Robert K. Davies & Company, in 1890. Luke Davies was not only the father of what has since grown to be a large branch of trade, but also the godfather, as he gave the industry its name of "furnishing goods." It was in a building at the corner of William and John streets that this firm had its rise. At that time traveling salesmen had not been invented, and the annual or semi-annual visit of the country merchant to New York was an event for him,— and for the jobber,— for during the spring and fall seasons the rush of trade was enormous. Of the country buyers visiting New York, those from the east and north came by Long Island Sound or the North River on sloops or schooners. Over the wholesale and retail stores were boarding-houses where the country merchants stayed while buying goods. There were not many American manufacturers then, and nearly everything that one could wear was imported.

The origin of the men's furnishing trade began with the demand for custom shirts; and as the business of manufacturing shirts increased, other lines were added, as, for example, the making of "stocks" (for neckwear), suspenders, and jean underwear.

Out of the house of Luke Davies have come nearly all of the long-established houses now existing in the trade. In 1857 Joseph S. Lowrey left Davies to organize the firm of Lowrey, Donaldson & Company, which is now conducted under the firm name of Joseph S. Lowrey & Company; in 1867 Messrs. Fisk and Flagg also left the Davies establishment and founded the present firm and business of Fisk, Clark & Flagg; and from these two branches have grown many of the firms which now control the largest lines in special departments in the manufacture of men's wear.

In 1832 the shirt trade of America was founded as a systematic industry by David & Isaac N. Judson, at that time prosperous clothing merchants in William Street. They had considerable trade with the south,— for in that day luxurious expenditure was mainly confined to that section,— and orders for clothing were frequently accompanied by orders for "custom-made" shirts, whose execution they entrusted to casual seamstresses. Orders for this class of goods increased steadily, and soon a regular department became necessary; and out of this grew the manufacture of "stock" shirts, in distinction to custom-made. What was incidental before 1832, in that year had become of sufficient importance to require a separate establishment, and the first shirt factory in America was founded at the corner of Cherry and Market streets, New York. The old building is standing yet, in a district not much altered by the passage of 60 years, and looking much as it did then, except for the change in the human surroundings that attends the expansion of a little city into a great metropolis. For eight years the Judsons were the only manufacturers of shirts. In 1840 the house of Davies established their factory, and the firm of T. A. Morrison & Company also began operations, the latter firm still existing under the title of Hutchinson, Pierce & Company. The manufacture of each of the articles which are comprised in the aggregation known as men's furnishing goods has become a separate industry within the last decade, and the trade is now divided into many branches, of which shirts, collars, and cuffs, underwear, neckwear, hosiery, etc., each forms a distinct industry, requiring special skill and special machinery in its manufacture.

It is interesting to recall the fact that the inventor of the Winchester firearms was one of the early manufacturers of shirts; and the circumstances under which he found himself in the business are curious. He was a carpenter in Baltimore, and had fitted up a furnishing-goods store there for a man who had previously failed. Mr. Winchester took the stock as security for his bill, and came to New York for advice as to the expediency of continuing the business himself. He went to New Haven in the early forties to open a shirt factory, and began with one assistant to cut out shirts. It was not long before he was turning out 2,000 dozen a week. But Mr. Winchester was a restless genius, and with the outbreak of the War he turned his attention to firearms, and became interested in the manufacture of the weapon that has since made his name famous.

WM. C. BROWNING,
Browning, King & Company, New York.

Clotho, one of the three Fates or Destinies who are represented by the ancient classical writers as spinning the thread of life. Clotho held the distaff, Lachesis spun the thread which Atropos cut when the span of life was reached.

In zoology, Clotho is a genus of snakes of the tribe *Viperina*, family *Viperidæ*. *C. arietans* is the puff-adder of the Cape of Good Hope. In astronomy, Clotho, is the name of the 97th asteroid, discovered by Tempel 17 Feb. 1868.

Clotil'da, St., the daughter of Chilperic, king of Burgundy: b. 475; d. Tours 545. In 493 she became the wife of Clovis, king of the Franks. She was the chief means of securing the conversion of her husband to Christianity, and largely influenced his life. After his death she lived a life of austerity at Tours. She was canonized a few years after her death. Her remains were buried in the Church of St. Géneviève at Paris, and burned at the Revolution to prevent their desecration; the ashes are still in the Church of St. Leu.

Clôture, klō-tür. See CLOSURE.

Cloud, St., or **Clodoald,** son of Clodomir, and grandson of Clovis, king of France. After the death of his father, and the murder of his two brothers, he became a monk, and found refuge in a monastery near Paris, which took from him the name of St. Cloud. He died there in 560.

Cloud'berry, a plant (*Rubus chamæmorus*) called also knobberry, mountain bramble, and mountain raspberry, is found in peat-bogs and swamps from Maine and New Hampshire westward and northward to Alaska. The plant is of humble growth, the leaves few, large-lobed, and kidney-shaped, the flower large and white, the fruit orange-red, and of an agreeable flavor. It is a native of the northern parts of America, Europe, and Asia. In Great Britain it is chiefly confined to elevated moors. In Norway and Sweden it is much more abundant; the fruit is highly valued, and makes excellent preserves.

Cloud-burst, a sudden and violent rainfall, covering a limited territory, and of brief duration. It occurs in the hottest season, and most frequently on the slopes of mountains and in arid regions, and is generally accompanied by severe and continuous lightning. The cloud-burst is caused by the contact of a warm current of air, surcharged with moisture, with a cold current, the result being swift condensation and immediate precipitation of the water formed.

Clouds, masses of minute globules of water or crystals of ice and snow suspended in the atmosphere.

The minute globules of water that make the cloud are evidently condensed from the invisible moisture that is always present in the air in greater or less quantities. The studies of Aitken, J. J. Thompson, Wilson, and others have thrown considerable light on the processes of condensation. If pure, dry air,—that is, air from which all dust and traces of electricity have been removed,—be mixed with pure vapor of water, and the moisture be cooled below the temperature of saturation, it will be found that condensation of water vapor does not generally occur. If, however, fine dust be injected into the pure mixture without altering its temperature or pressure, a fine mist is developed at once. It has also been discovered that if a charge of electricity, however small, be introduced, condensation takes place at once. From these experiments it is inferred that nuclei of some sort, such as dust particles or electric particles, are necessary for the formation of water globules, other conditions being favorable.

The original classification of clouds by Howard in 1803 took account of form only. A more recent classification—the one now in general use—takes account of both the form of the cloud and its altitude. In this system three principal forms are recognized, namely, cirrus, cumulus, and stratus, with their modifications. These three main classes present the most obvious differences in form and shape; they develop at widely different altitudes and move with varying velocities. It is possible to further subdivide each class into a number of varieties, and in practice this is done when an observer becomes skilled in distinguishing the special forms and subdivisions of the main types.

The definitions of the principal types as recommended by the International Cloud Committee, and generally adopted by meteorologists, are given below.

Cirrus (Ci.).— Isolated feathery clouds of fine fibrous texture, generally of a white color, frequently arranged in bands, which spread like the meridians on a celestial globe over a part of the sky and converge in perspective toward one or two opposite points of the horizon. (In the formation of such bands Ci. S. and Ci. Cu. often take part.)

Cirrus clouds are the highest of all and move with the greatest velocity. They develop up to a height of about 10 miles, although their mean height is a little over 6 miles, being higher in summer than in winter. Their average velocity in winter is about 75 miles per hour, and in summer 65 miles per hour. They may be formed by mixture of air strata of different temperatures, or by the cooling of a moist streak in the upper atmosphere by expansion and radiation. In the latter case, if the surrounding air be very dry, the newly formed cloud is soon dissipated.

Cirro-stratus (Ci. S.).— Fine whitish veil, sometimes quite diffuse, giving a whitish appearance to the sky, and called by many cirrus haze, and sometimes of more or less distinct structure, exhibiting tangled fibres. The veil often produces halos around the sun and moon.

This cloud, as its name indicates, is one of the composite forms. Its structure is much on the same order as that of pure cirrus; in fact it is generally composed of cirrus fibres tangled and interlaced in a most complex manner. The variety of forms, however, is practically unlimited, and it undergoes rapid changes, especially in advance of a cyclonic disturbance. Like cirrus, it is composed of crystals of snow or ice, develops at a great elevation and moves with high velocity.

Cirro-cumulus (Ci. Cu.).— Fleecy cloud. Small white balls and wisps without shadows, or with very faint shadows, which are arranged in groups and often in rows.

This is a broken layer of cloud, of which the component masses are not fibrous, like cirrus, but more or less rounded. A second, although rather rare form of cirro-cumulus is the mackerel sky of northern Europe. The cloudlets in this case are rounded, but not fleecy. The altitude of cirro-cumulus ranges from four to six miles, and its movement, like cirrus and cirro-stratus, is quite rapid.

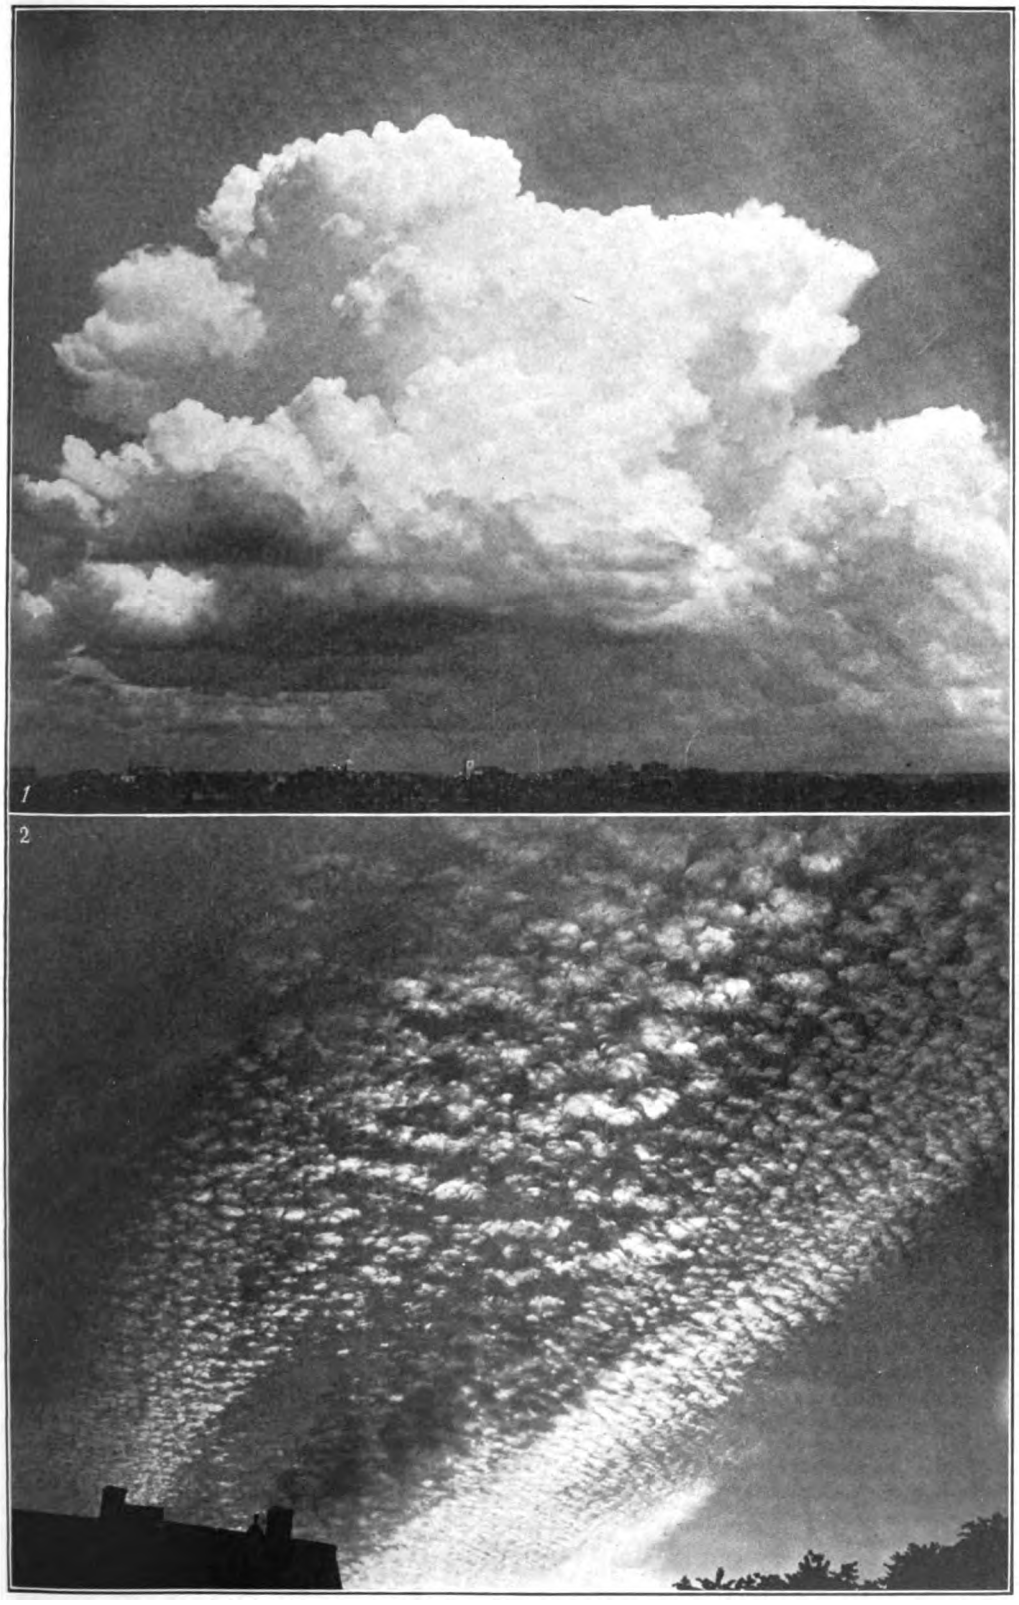
1. CUMULUS. 2. STRATO-CUMULUS.



1 CUMULUS

2. CIRRUS

Cumulus (Cu.).— Woolpack clouds. Thick clouds whose summits are domes with protuberances, but whose bases are flat. These clouds appear to form in a diurnal ascensional movement which is almost always apparent. When the cloud is opposite the sun the surfaces which are usually seen by the observer are more brilliant than the edges of the protuberances. When the illumination comes from the side this cloud shows a strong actual shadow; on the sunny side of the sky, however, it appears dark with bright edges. The true cumulus shows a sharp border above and below. It is often torn by strong winds, and the detached parts (fracto-cumulus) present continual changes.

This cloud is undoubtedly formed by the condensation of water vapor in the summit of an ascending column of air. The flat base of the cloud marks the level when the condensation temperature is reached, and the upper dome-shaped summit represents the head of the air column protruding into colder space. In the temperate latitudes it is usually a cloud of the warm season and forms at an altitude of about a mile above the surface of the earth. Its average rate of movement ranges from about 20 miles per hour in summer to 30 in winter. There are many special varieties and forms of cumulus cloud.

Alto-cumulus (A. Cu.).— Dense fleecy cloud. Larger whitish or grayish balls with shaded portions, grouped in flocks or rows, frequently so close together that their edges meet. The different balls are generally larger and more compact (passing into S. Cu.) toward the centre of the group, and more delicate and wispy (passing into Ci. Cu.) on its edges. They are very frequently arranged in lines in one or two directions.

Alto-cumulus clouds may occur when the ascending currents are not strong enough or do not persist long enough to form thick cumuli, or they may represent the vapor that is condensed in the upper portion of a series of atmospheric waves as suggested by Von Helmholz. The alto-cumulus level ranges from one and a half to two miles. It is higher than the cumulus level, although the summits of cumulus clouds often penetrate into and above it. The mean velocity of alto-cumulus clouds is about 40 miles per hour, being somewhat higher in winter and lower in summer.

Cumulo-nimbus (Cu. N.).— Thunder cloud; shower cloud. Heavy masses of clouds, rising like mountains, towers, or anvils, generally surrounded at the top by a veil or screen of fibrous texture ("false cirrus") and below by nimbus-like masses of clouds. From their base generally fall local showers of rain or snow, and sometimes hail or sleet. The upper edges are either of compact cumulus-like outline, and form massive summits, surrounded by delicate false cirrus, or the edges themselves are drawn out into cirrus-like filaments. This last form is most common in spring showers. The front of thunderstorm clouds of wide extent sometimes shows a great arch stretching across a portion of the sky, which is uniformly lighter in color.

Cumulo-nimbus clouds are of massive dimensions and the most impressive of all clouds in the realm of nature. The upper surface of this cloud, which is sharp and well defined in the earlier stages of its formations, becomes soft and wispy soon after rain begins to fall from its base. The cloud itself may be divided into three planes, namely, the lower, consisting of vapor, the middle of water, and the upper of ice or snow. The tops of some of these clouds reach 6 or 8 or even 10 miles into the atmosphere. Prof. Bigelow computes that the temperature in one of the loftiest of these clouds ever observed fell from 79.5° F. at the ground to —74° F. at a height of nearly nine miles.

Stratus (S.).— Lifted fog in a horizontal stratum. When this stratum is torn by the wind or mountain summits into irregular fragments they may be called "fracto-stratus."

This cloud, as its name implies, is merely a horizontal sheet floating at a low elevation and without any special structure. It is generally formed by the intermingling at the surface of contact of air strata of different temperatures, and it indicates a horizontal flow of air rather than an ascensional movement in the case of cumulus clouds.

The average elevation of stratus clouds is less than half a mile, and their average velocity about 15 miles per hour.

Strato-cumulus (S. Cu.).— Large balls or rolls of dark cloud, which frequently cover the whole sky, especially in winter, and give it at times an undulated appearance. The stratum of strato-cumulus is usually not very thick, and blue sky often appears in breaks through it. Between this form and the alto-cumulus all possible gradations are found. It is distinguished from nimbus by the ball-like or rolled form, and because it does not tend to bring rain.

This cloud is not sufficiently uniform to be called stratus, nor sufficiently lumpy to be called cumulus. It is a cloud of moderate elevation, about 9,400 feet in summer, and 7,800 feet in winter, and its rate of movement varies from 20 to 30 miles per hour. It is often a thin cloud through which patches of blue sky can be seen. Again it covers the sky completely, and presents a gentle undulating surface with a tendency to break up into long parallel rolls or bars.

Alto-stratus (A. S.).— Thick veil of a gray or bluish color, exhibiting in the vicinity of the sun and moon a brighter portion, and which, without causing halos, may produce coronæ. This form shows gradual transitions to cirro-stratus, but, according to the measurements made at Upsala, was only one half the altitude.

The average height of this cloud is about three and a half miles in summer and three miles in winter. Its average velocity ranges from 40 to 50 miles per hour.

Nimbus (N.).— Rain cloud. Dense masses of dark formless clouds with ragged edges, from which generally continuous rain or snow is falling. Through the breaks in these clouds there is almost always seen a high sheet of cirro-stratus or alto-stratus. If the mass of nimbus is torn up into small patches, or if low fragments of cloud are floating much below a great nimbus, they may be called "fracto-nimbus" ("scud" of the sailors).

As soon as rain falls from a cloud it is called a nimbus, whatever its form before the beginning of rain, with one exception, namely, when rain begins to fall from a lofty cumulus cloud it is called a cumulo-nimbus to distinguish it from a system of pure nimbus clouds, the latter being flatter and more in the nature of a sheet cloud.

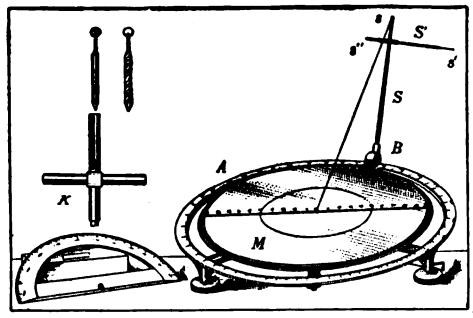
Colors of Clouds.— The brilliant colors sometimes assumed by clouds at sunrise and sunset are probably caused by selective absorption and reflection of light by dust particles or vapor haze in the atmosphere. The clouds of the day-time, especially those having a great elevation, are white, since they reflect the greater part of the light incident on them.

The bases of cumuli are generally of a dark shade, while the portions in shadow are mostly of a pearl gray.

Thunder clouds sometimes have an olive-green tint, and this is thought by some observers to portend high winds and heavy rainfall.

Utilization of Clouds in Weather Forecasts. — This subject has been the subject of considerable study by Ley, Abercromby, and others in Europe, and by McAdie, Clayton, and the writer in the United States. In forecasting weather changes from synoptic charts the clouds frequently show the advance of a cyclonic disturbance, but not before the same information is given by the circulation of the surface winds and the fall in the barometer. Unfortunately it is not possible to fully describe and telegraph the significant features of the various cloud forms so that they may be available at a central weather station; in the case of a solitary observer, however, some skill in making local predictions of the weather may be attained by a careful study of cloud forms in connection with falling weather.

Methods of Observation. — The kind, amount, and direction of clouds form a part of meteorological observations whether made for purposes of weather forecasting or for purely climatic studies. In the last-named event it is chiefly desired to know the extent of sky covered with cloud on the average of the season, since one is then able to judge of the nature of the climate with respect to sunshine. In weather forecasting it is important to know, not only the kind of cloud observed, but both its direction and apparent velocity, although in actual practice the last named is rarely attained. This information is best obtained by means of the nephoscope. An excellent form of nephoscope was devised by Prof. C. F. Marvin, United States Weather Bureau, in 1896. Prof. Marvin's nephoscope is shown in the illustration.



The Improved Nephoscope.

The circular frame, A, is mounted upon three leveling-screws, and its upper surface is graduated to degrees, numbered from 0 to 360, the numbers increasing in a direction contrary to the direction of motion of clock hands. The plate and mirror, M, revolve smoothly within the circular rim, A, being carried upon a hollow vertical axis at the centre. The arm, B, carrying the sighting staff, S, also revolves upon the central axis, the outer end traversing the narrow annular space between the mirror and graduated rim. The staff, S, is telescopic in construction, and is attached to the arm at B by a hinge which permits the staff to be inclined from the vertical to any extent, but always in a plane perpendicular to the mirror. The top portion of the staff is provided with a crosshead, which is surmounted by a small sighting-knob, s. The crosshead is adapted to receive the secondary staff, S', which slides with gentle friction through the crosshead, and is tipped at either end with small secondary sighting-knobs, s' and s''. By reason of the telescopic construction of the staff, S, the crosshead can not only be turned about in any direction, but it and the sighting-knob, s, can be raised by various amounts, being held in place by friction. The hinge at B is made in such a manner that when the staff, S, is placed in a vertical position, the small rod sliding inside can be forced down into a hole in the hinge, the effect of which is to lock the hinge so that the staff is held rigidly in a vertical position.

In using the nephoscope the observer looks down upon the mirror, M, and observes the reflection of the cloud. By moving his eye he brings a point of the cloud image and the reflection of the sighting-knob, s, into coincidence at the centre of the mirror. The head should be held so that the knob is always seen at the centre of the mirror. The cloud image will then appear to move away from the centre of the mirror. The mirror is then revolved until the graduated line becomes parallel with the motion of the cloud, when its direction of motion may be read off and its apparent velocity determined by timing the image as it passes along the graduated scale of the mirror.

Other forms of the nephoscope have been devised and used, mostly in European countries, and Prof. Cleveland Abbe, of the United States Weather Bureau, has devised a very convenient form of nephoscope for use on vessels at sea.

In determining the height of clouds, direct observations of their angular altitude are made by two observers at the ends of a measured base-line, whence the altitude may be computed by trigonometric formulæ. The same results may be obtained by photography, but the method is not so direct, and the computations are more laborious.

ALFRED J. HENRY,
Prof. of Meteorology, U. S. Weather Bureau.

Clouds, The, a comedy by Aristophanes; acted in 423 B.C. Though one of the most interesting and poetic of the author's plays, the people refused to hear it a second time. But its literary popularity counterbalanced its failure on the stage.

Clouet, kloo-ā, French family of artists, descendants from Flemish ancestry. 1. JEHAN, yā'hän, the first known of the family, was in 1475 a resident of Brussels. 2. His son JEHANNET, yā-hän'nĕt: b. 1485; d. 1541, migrated to France and located at Tours. In 1518 he went to Paris and became court painter to Francis I. A portrait of the king, in the Louvre, is said to have been painted by this artist, also another portrait of the king, in the Pitti Gallery, Florence, is credited to him. Several other pictures in European galleries are said to have been painted by him. In all the style is that of the Flemish school. 3. FRANÇOIS, frän-swä, son of Jehannet: b. 1510; d. 1572. succeeded his father as court painter to Francis I., and retained the position under Henry II., Francis II., Charles IX., and Henry III. His

works are mentioned in the records of the court. Some authorities mention a brother of François, but of him nothing positive is known.

Clough, Anne Jemima, English educator: b. Liverpool, Eng., 20 Jan. 1820; d. Cambridge 27 Feb. 1892. She was a sister of Arthur Hugh Clough (q.v.), and after a girlhood spent in Charleston, S. C., opened a day school in 1842. Becoming interested in the general subject of education the North of England Council for Promoting the Higher Education of Women was founded through her efforts, and from this sprang the idea of the Cambridge higher local examinations. Lectures for women having been established at Cambridge in 1869 Miss Clough, in October 1871, took charge of a house of five women students, out of which grew the present Newnham College, over the administration of which she presided until her death. During her busy career she accomplished much for the higher education of English women. See B. A. Clough, 'Memoir of Anne J. Clough' (1897).

Clough, klŭf, **Arthur Hugh,** English poet: b. Liverpool 1 Jan. 1819; d. Florence, Italy, 13 Nov. 1862. He studied under Arnold at Rugby, then at Balliol College, Oxford, and became a fellow of Oriel College in 1842. In 1848 he visited Paris, and spent the winter of the following year in Rome. In 1849 he became head of University Hall, London, but resigned in 1852 and went to America, where he lived for a few months at Cambridge, Mass. On his return next year he was appointed an examiner in the education office. His poems were published, along with a genial memoir, by F. T. Palgrave in 1862; his poems and prose remains, with letters and a memoir, were also published by his wife in 1869. 'The Bothie of Tober-na-Vuolich' (1848), is his best known poem; others are 'Dipsychus' and 'Amours de Voyage.' They are masculine and vigorous in tone, and contain many noble thoughts, and strokes of genuine humor, alternating with passages of deep pathos and tenderness. He is affectionately commemorated in Matthew Arnold's 'Thyrsis' and 'Scholar Gipsy.'

Clough-Leighter, klŭf'-lā'tėr, **Henry,** American organist and composer: b. Washington, D. C., 13 May 1874. He studied at Columbia University 1887–9, and at Trinity University, Toronto, Canada. He was organist at various Washington churches 1890–99, of Grace Church, Providence, R. I., 1899–1900, and since 1900, has been instructor in musical ethics and theory in the Howe School of Music, Boston, Mass. Among his many compositions are a Festival Service in D major (1896); 'Te Deum Laudamus,' G major (1898); 'Te Deum Laudamus,' G minor (1901); song, 'Like a Rose Should Be' (1901).

Clous, John Walter, American soldier: b. Germany 9 June 1837. He came to America in 1855 and engaged in business. He enlisted in the United States army 2 Feb. 1857, and was promoted second lieutenant 29 Nov. 1862. He took part in the siege of Yorktown, the Seven Days' battles in June 1862, Malvern Hill, Second Bull Run, Antietam, Frederickburg, Chancellorsville, and Gettysburg, being twice brevetted for gallant conduct at the latter. He served on the frontier and in Indian campaigns 1868–86, as judge advocate in many important trials and cases 1862–86, was assistant to the judge advocate-general 1886–90, and professor of law at West Point 1890–6. During the Spanish-American war he was appointed a brigadier-general of volunteers, and served on the staff of Maj.-Gen. Miles. He attained his lieutenant-colonelcy 12 Feb. 1892. He is the author of lectures on 'Military and Martial Law and Suspension of the Writ of Habeas Corpus,' delivered at Union College in the Butterfield lecture course.

Clove, the unexpanded flower-bud of an East Indian tree (*Caryophyllus aromaticus*) somewhat resembling the laurel in its height and in the shape of its leaves. The flowers grow in clusters, and the petals are small, rounded, and of a bluish color; the seed is an oval berry. The Molucca Islands, where the raising of different spices was formerly carried on by the Dutch colonists to a great extent, appear to be the native land of the clove, and the best are still brought from that quarter. At one time, however, in order to secure a lucrative branch of commerce in this article to themselves, the Dutch destroyed all the trees growing in other islands, and confined the propagation of them to that of Ternate. But both clove- and nutmeg-trees were transplanted from the Moluccas into the islands of Mauritius and Bourbon, and the clove is now cultivated with success in many warm countries, including Zanzibar and the West India islands. At a certain season of the year the clove-tree produces a vast profusion of flowers. The operation of gathering is performed between the months of October and February, partly by hand, partly by hooks, and partly by beating the trees with bamboos. The cloves are subsequently dried by exposure to the smoke of wood fires, afterward to the rays of the sun. When first gathered they are of a reddish color, but by drying they assume a deep-brown cast. This spice yields a very fragrant odor and has a bitterish, pungent, and warm taste. It is most frequently used in culinary preparations. When fresh gathered, cloves will yield, on pressure, a fragrant, thick, and reddish oil; and by distillation a limpid essential oil.

The medical value of cloves is due to the presence of eugenol, $C_{10}H_{12}O_2$, in the volatile oil. Eugenol is extremely active, acting like the phenol, or carbolic acid group, to which it is related. Clove is a marked local anæsthetic, a strong antiseptic and bactericide, an excellent stimulant to the sympathetic nervous system, expelling flatus from the stomach and the intestines, by increased peristalsis, and increasing the flow of the gastric and intestinal juices. Its value in toothache is due to its anæsthetic and bactericidal properties. A number of new compounds of eugenol are on the market. Benzoyl-eugenol and cinnamyl-eugenol are used in the treatment of tuberculosis.

Clove-bark, the bark of various aromatic trees, used in the manufacture of drugs and spices. A tree (*Dicypellium caryophyllatum*) of Brazil supplies a cinnamon-like cylinder which is commonly known as clove-bark in the American markets, and is used in medicine as cassia caryophyllata. The name is often given also to culilawan and cinnamon.

Clove-pink, or **Clove gilly Flower,** the carnation (*Dianthus caryophyllus*), more especially a whole-colored, clove-scented variety of it.

Clover, Lewis Pierre, American lawyer and journalist: b. Springfield, Ill., 1864. He was educated at Racine College, Wisconsin, and admitted to the bar of Illinois in 1885. He is a great-grandson of Ninian Edwards, a former governor of Illinois, and grandson of Ninian W. Edwards, a distinguished Illinois lawyer. He is a grand-nephew of Mary Todd Lincoln. He has been a member of the staff of the New York *Evening Sun* for several years, writing upon legal subjects and proceedings.

Clover, species of the genus *Trifolium,* belonging to the pea family (*Papilionaceæ*) and to the natural order *Leguminoseæ.* Of *Trifolium* about 300 species have been described; they are most abundant in the north temperate zone, a few in South America and South Africa. Some are very important in agriculture, either for pasturage, fodder, or for soil-improvement.

The word "clover" is also applied to species of related genera, as bur-clover (*Medicago*), sweet clover (*Melilotus*), bush and Japanese clovers (*Lespedezas*), prairie clover (*Petalostemon*), etc.

The true clovers (*Trifolium*) are herbs with mostly three foliate leaves; purple, pink, white, or yellow small flowers in dense heads or spikes; and straight membranous pods containing one to four seeds.

The most important species to the farmer is the common red clover (*Trifolium pratense*), now naturalized here, but believed to be a native of Europe and northern Asia. It has been grown in England for over 300 years. It is a more or less hairy perennial, growing from six inches to two feet high. The leaflets are usually three in number, short-stalked, springing from the same point, oval, and often having a whitish horseshoe mark in the centre. The flower-heads are dense, oval or ovoid, about one inch long; florets sessile or nearly so, red, rarely white, remaining erect in fruit; calyx sparingly hairy. It is one of our best forage plants for nutritive value, high yield, and good range of adaptability; it is commonly found in meadows and pastures, and is used as a green manure. It flowers from April to November. The seed weighs about 60 pounds to the bushel, and, if sown alone, 10 to 12 pounds will sow an acre.

Perennial red clover (*Trifolium pratense perenne*) may be regarded as an offshoot of common clover, from which it differs in being of longer duration and hardier. Zigzag clover, Cow-grass and Marl-grass or Mammoth clover (*Trifolium medium*) may be an offshoot of *T. pratense,* from which it differs in being a larger plant, having zigzag stems, the flower heads larger, longer stalked, and often of a deeper purple color, with a practically smooth calyx tube. The leaflets have no horseshoe mark. It is native of Europe and Siberia and blooms during the summer.

Alsike or Swedish clover (*Trifolium hybridum*) is an erect perennial, growing one to two feet high. Its flowers are pink to white and are open about the same time as those of timothy. It is suited to heavy clay soils and is the only clover that will stand irrigation. It has smaller and shallower roots than common clover. It is sometimes sown alone, when, owing to its small seed, four pounds per acre is sufficient. It is better suited to mixtures. It was introduced into Great Britain from Sweden in 1834.

White, Dutch, or honeysuckle clover (*T. repens*) is a common perennial, low-growing plant with white to pinkish flowers, native of Europe, Siberia, and perhaps of the northern United States. Its method of seeding makes it permanent. As its yield is small it is seldom grown alone, but is often incorporated in mixtures. It is a bee-plant and is common on nearly all soils. See DUTCH CLOVER.

Crimson, carnation, Italian or scarlet clover (*T. incarnatum*) is an erect, hairy annual, growing six inches to three feet high. The leaflets are nearly sessile, the flower-heads are terminal, oblong, or ovoid, one to two and a half inches long; flowers red, purple, pink, or white, sessile; calyx hairy. It is often grown as a catch or cover crop in orchards, etc., and sometimes for grazing and hay. It is quite ornamental and is now grown by the florist.

Yellow clover or hop clover (*T. agrarium*) is a hairless or slightly hairy annual clover, growing 6 to 18 inches high, with small yellow flowers which are open between May and September. It is common along roadsides and waste places.

T. procumbens is also called yellow clover, or hop clover; it is more spreading and hairy than the above. It is common on dry soils.

Alexandrian or Egyptian clover (*T. alexandrinum*) is an annual, bearing oval, pale yellow, or whitish flowers. As it is an important fodder in Egypt it is presumed that it will be of value for the southern States.

Moliner's clover (*T. molineri*) is a biennial with pale flowers. Rabbit-foot, stone or old field clover (*T. arvense*) is a common annual of no value.

T. dubium or *minus* is the least hop clover or hop-trefoil, also called yellow suckling clover, and is regarded by some as the true shamrock.

Uses and Feeding Value.— Clovers are grown for hay, pasture, soiling, silage, green-manuring, cover-crops, and soil improvement. Clovers or some other legume should have a place in every rotation, because of their deep, fleshy root system and capacity for appropriating free nitrogen from the air in the soil by means of bacteria on their roots. Their deep roots penetrate the subsoil and transfer valuable plant food to the surface soil, which is liberated when they decay. It has long been known that the growing of legumes improved the soil; Pliny recommended that such crops be grown previous to grain crops. The wisdom of this is now supported by recent research. In 1888 it was announced that the nodules on the roots of leguminous plants were colonies of bacteria, and that their work was to take up nitrogen from the soil-air for the benefit of their host; hence we have the fact that a large quantity of nitrogen may be removed from the soil for a series of years in the form of clover-hay or alfalfa hay — yet the surface soil be richer in nitrogen at the end of the period than it was at the beginning. Plowing a crop of clover under as green-manure is a very effective way of enriching the soil in humus. This is now practised in orchards to a considerable extent; the tillage they receive and the

crops removed rapidly deplete the fertility of the land, hence the introduction of the practice of seeding down the orchards during the summer with some legume, as crimson clover, cow-peas, soy-beans, etc., to add humus, protect the land from washing during the fall and winter, and in wet seasons, by using up the moisture, to aid in maturing the buds of the trees and enable them to stand the winter; the crop being plowed under the following spring when cultivation begins.

The average percentage composition of clover is given as —

	Protein	Nitrogen-free extract	Ether extract	Crude fibre	Ash	Water
Red clover, green..	4.4	13.5	1.1	8.1	2.1	70.8
Alsike clover.....	3.9	11.0	0.9	7.4	2.0	74.8
Red clover, silage..	4.2	11.6	1.2	8.4	2.6	72.0
Red clover hay....	12.3	38.1	3.3	24.8	6.2	15.3
Alsike clover hay..	12.8	40.7	2.9	25.6	8.3	9.7

With ruminants the average coefficient of digestibility is —

	Dry matter	Protein	Nitrogen-free extract	Crude extract	Crude fibre
Red clover, green..	66	67	78	65	53
Red clover hay....	61	62	69	62	49

At the Wisconsin station, clover cut three times in one year yielded 25 tons of green forage per acre; this may be regarded as a maximum yield. The first cutting, made 29 May contained only 8.2 per cent of dry matter, and was on this account unsatisfactory as a soiling crop, although, generally speaking, this crop is a most valuable one for this purpose, being relished by all stock. The total dry matter contained in the three crops was nearly four tons per acre.

If given in excess while green, or grazed, it is liable to cause bloat. To prevent this, give dry fodder in addition, and do not turn the animals out when they are very hungry or the dew is on. Clover pasture is excellent for growing pigs, and they may be fattened on it.

Experience has shown that the best time to cut clover for hay is when one third of the heads are turning brown. As ordinarily cured it is liable to be dusty, hence it is not considered a satisfactory feed for horses. For growing and idle horses, bright, clean clover hay is both economical and valuable. Hay from over-ripe crimson clover is dangerous for horses; the bristly hairs, accumulating in the intestines, form balls, causing stoppages and death. Clover hay is a most valuable forage for cattle, especially milch cows; 10 to 12 pounds may be fed daily, its high nitrogen content permitting a reduction of the amount of concentrated feed. It is one of the best coarse fodders for sheep, and when chaffed fine is used for feeding laying hens in winter.

Clover Diseases.—The common diseases are: Clover rust (*Uromyces trifolia*), which appears in various stages on the leaves, leaf-stalks, and stems of the plant, particularly white clover. White minute cups appear in spring or early summer, accompanied or followed by small brown spores, which are finally followed by darker spores which live through the winter and germinate the following spring.

Clover rot (*Sclerotinia trifoliorum*) attacks many legumes. The disease causes a browning of the stem and leaves, which are soon spotted with a white mold, which ultimately forms solid, wavy black bodies often half an inch long. These produce mushroom-like bodies the following spring. Burning over the infested field and a proper rotation of crops are advocated for both diseases.

A leaf-spot (*Pseudopeziza trifolii*) is often destructive, especially during a wet fall. The leaves are covered with small black spots. Dodder (q.v.) is a parasitic plant responsible for considerable loss in some places.

Clover Insects.— Of the various insects which injure clover the following are prominent: The clover-root borer (*Hylastes trifolii*) which has in some sections killed out the clover the second year, thus necessitating a change in the rotation of the crops. The clover-stem borer (*Languria mozardi*) is widely distributed. The clover-leaf beetle (*Phytonomus punctatus*) is a weevil which feeds at night, consuming all parts of the plant. The clover-leaf midge (*Cecidomyia leguminicola*) is one of the worst pests; the eggs are laid in the blossoms, where the larvæ feed on what should be the seed. They pupate in the ground or in the seed. There are two or three broods annually. Various insects attack the stored hay, the most common being the clover-hay worm (*Asopia costalis*).

S. Fraser,
Instructor in Agronomy, Cornell University.

Clover-weevil, a kind of weevil, of the genus *Apion,* different species of which, or their larvæ, feed on the leaves and seeds of the clover, as also on tares and other leguminous plants. *A. apricans,* of a bluish-black color and little more than a line in length, is especially destructive. See Weevil.

Cloves, Oil of. See Cloves.

Clo'vis, king of the Franks: b. 465; d. Paris 27 Nov. 511. He succeeded his father Childeric in the year 481, as chief of the warlike tribe of Salian Franks. He united with Ragnacaire, king of Cambray, declared war upon Syagrius, the Roman governor at Soissons, and utterly routed the Romans near Soissons, in 486. Soissons was then made the capital of the new kingdom of the Salian Franks. Clovis married Clotilda of Burgundy, who had been educated in the Christian faith, and was desirous that her husband also should become a Christian. When he was hard pressed in a battle against the Alemanni at Tolbiac in 496, Clovis called on the God of Clotilda and the Christians. Consequently, when the victory was won, and territory of the Alemanni submitted to him, he was solemnly baptized at Rheims, 25 Dec. 496, with several thousand Franks, men and women. Hos-

tilities soon broke out between Alaric, king of the Visigoths, and Clovis. In the battle fought at Vouglé, near Poitiers, the latter gained a complete victory, slaying his enemy with his own hand. After this victory Clovis received the honor of the consulship from the Emperor Anastasius. In the last year of his reign Clovis had called a council at Orleans, from which are dated the peculiar privileges claimed by the kings of France in opposition to the Pope.

Clovis II., king of Neustria and Burgundy: d. 655. He was the second son of Dagobert, whom he succeeded in 638.

Clovis III., king of France: d. 695. He was the son of Thierry III., whom he succeeded in 691 at the age of nine. He reigned five years, under the guardianship of Pepin d'Heristal, mayor of the palace.

Clowes, klowz, **Frank,** English chemist: b. Bradford, Yorkshire, 1848. He was educated at the Royal School of Mines, London; Royal College of Science, Dublin; and the University of Würzburg, and was professor of chemistry at University College, Nottingham, 1881–97, and emeritus professor since 1897. He has published: 'Text-book of Practical Chemistry and Qualitative Analysis'; 'Text-book of Quantitative Analysis'; 'Elementary Practical Chemistry'; 'Introductive Quantitative Analysis' (1890); etc.

Clowes, Sir **William Laird,** English naval critic and miscellaneous writer: b. London 1 Feb. 1856. He was educated at King's College, London; and from 1876 to 1895 was correspondent for various newspapers. He has written much on naval development and on art and sociology. His works include: 'The Naval Pocket Book,' issued annually; 'The Needs of the Navy'; 'Four Naval Campaigns' (1902); and the novels, 'The Captain of the Mary Rose' (1892); 'Blood is Thicker Than Water' (1894); 'The Great Peril' (1893); 'The Double Emperor' (1894); 'Told to the Marines' (1902); and also 'The Miniature Cyclopedia' (1888); 'Black America' (1892); 'Eclogues' (1889). He has been editor and chief contributor to 'The Royal Navy; a History from the Earliest Times to the Present' (1897–1902). He was knighted in 1902.

Clown, a role peculiar to the stage of English-speaking people, but bearing some resemblance to the *gracioso* of the Spaniards, and the *Hanswurst* of the Germans. The origin of the word is uncertain, some deriving it from the Latin *colonus,* in the sense of a peasant farmer, and others connecting it with certain Scandinavian and other Teutonic words. On the old English stage the clown was the privileged laughter-provoker, who, without taking any part in the dramatic development of the piece represented, carried on his improvised jokes and tricks with the actors, often indeed addressing himself directly to the audience instead of confining himself to what was going on on the stage. In Shakespeare, on the contrary, a distinct part was assigned to the clown, who no longer appears as an extempore jester, although the part he plays is to a certain extent in keeping with his traditional functions. At a later period the clown was altogether banished from tragedy, and allowed to appear only in the after-piece, performing grotesque dances, singing comic songs, etc. He is now confined to the pantomime and the circus, in the former of which he plays a part allied to that of the French Pierrot.

Cloyd's Mountain, Battle of. On 3 May 1864 Gen. George Crook of the Union army marched from Fayette, W. Va., to break the Virginia & T. R.R. at the New River bridge. He had 11 regiments of infantry and 2 batteries of artillery, in all about 6,100 men, brigaded under Col. H. G. Sickel, C. B. White, and R. B. Hayes. He marched through Raleigh, drove a small Confederate cavalry force from Princeton, and on the 8th reached Shannon's Bridge, seven miles from Dublin, where he was joined by 400 cavalry. Here he found next morning that the Confederates — three regiments and a battalion of infantry and two batteries — under Gen. A. G. Jenkins and Col. John McCausland, were barring his way, strongly posted behind log and rail breastworks, on a steep and thickly wooded spur of Cloyd's Mountain, with guns sweeping the road and open country in front. Crook opened on the position with artillery, and then, under cover of the timber, sent White with his own brigade and two regiments of Sickel's to turn the enemy's right, and the moment they were engaged Sickel and Hayes charged directly to the front across a meadow swept by artillery and musketry fire, and up the steep ridge. Parts of the line were repulsed, again to rally and go forward, and after a hard contest, in which bayonets and clubbed muskets were used across the works, they were carried, the Confederates retreating to Dublin, leaving, as Crook reports, 230 unwounded men as prisoners, and two guns, in his hands. The Union loss was over 600, that of the Confederates about 500. Gen. Jenkins was mortally wounded and left on the field. Crook followed the retreating troops, and when near Dublin encountered about 500 of Gen. John H. Morgan's command, under Col. Smith, that had come from Sattville, and endeavored to cover McCausland's retreat. These Crook drove back, and at night he occupied Dublin. On the 10th he marched to Newborn and thence to New River Bridge, which McCausland tried to save, but after a two-hours' artillery duel in which Crook had 11 men killed and wounded, he seized and destroyed the bridge and the railroad for a considerable distance, then marched by way of Union, Alderson's Ferry, and Lewisburg to Meadow Bluff, which he reached on the 19th, his march harassed by the enemy's cavalry. Crook's entire loss was 109 killed, 513 wounded, and 72 missing. On his return march he was obliged to leave 200 of his wounded, with surgeons, who were captured. The Confederate loss, as reported, was 76 killed, 262 wounded, and 200 missing or captured. Consult: 'Official Records,' Vol. XXXVII; Pond, 'The Shenandoah Valley in 1864.'

E. A. Carman.

Cloyne, Ireland, a town 16 miles southeast of Cork. It has an ancient cathedral, near which is a round tower, a Roman Catholic chapel, a free school, founded by Bishop Crow in 1726; besides national schools. From 1638 to 1833 it was the see of a bishop belonging to the Established Church of Ireland, but in the latter year it was united with Cork and

Ross. 'From 1734 to 1753 George Berkeley, the philosopher, was bishop of Cloyne. Pop. 1,300.

Club, a company of persons associated for some common object — social, literary, political, etc. It has been claimed that social clubs were known to the ancient Romans, but the evidence of their existence is scanty. Inscriptions tell of clubs of Roman citizens in foreign cities, and also of military clubs. For several centuries the club has been a peculiar institution in England, and of late it has become a prominent feature in American life. It is not easy to determine at what time clubs originated in England, but Occleve mentions one to which he belonged (during the reign of Henry IV.), called "La Court de Bone Compaignie." In 1659 Aubrey explained the word "clubbe" as meaning "a sodality in a taverne." He adds, "Here we had a balloting-box and balloted how things should be carried." The earliest London club of any celebrity was established about the beginning of the 17th century, at the Mermaid Tavern, Friday Street (otherwise known as Bread Street). Among its members were Shakespeare, Sir Walter Raleigh (the founder), Beaumont, Fletcher, Donne, and Selden. Ben Jonson figured at another club, which met at the Devil Tavern, near Temple Bar. It appears certain that clubs existed alongside of coffee-houses in the 17th and 18th centuries. At that time, however, their character was very different from what it is now. The coffee-houses of those days were the nearest representatives of the modern clubs, while the clubs were commonly nothing but a kind of restaurants or taverns where people resorted to take their meals. There was one feature, however, which was peculiar to clubs from the first, and distinguished them from coffee-houses; namely, that while anybody was free to enter a coffee-house, it was absolutely necessary that a person should have been formally received as a member of a club, according to its regulations, before he was at libery to enter it. Almack's, Brooks', and White's were among the best known coffee-houses. Among the earliest of the London clubs was the Kit-Cat Club, formed in the reign of Queen Anne. Among its 40 members, who used to meet at the shop of a pastry-cook (Christopher Cat or Katt), in order to do justice to certain mutton pies for which he was famous, were six dukes, among them the Duke of Marlborough; five earls; many of the most distinguished leaders of the Whig party, such as Sunderland, Halifax, Sir Robert Walpole, and others; and several of the leading authors of the day, among them, Vanbrugh, Congreve, Addison, and Steele, the last two owing to the club idea the form given to the 'Spectator.' Another club formed about the same time was the Beefsteak Club. Originally these two clubs had no pronounced political views, but in the end they began to occupy themselves with politics, the Kit-Cat Club being Whig, and the Beefsteak Club, Tory. There have been several Beefsteak clubs since. During the last century it was common to give eccentric names to clubs, and the conditions of being admitted to membership in any one of these clubs were as a rule equally remarkable. Among these may be mentioned the Surly Club; the Split-farthing Club; the Ugly Club (of which Wilkes was elected president for life, and Mirabeau was an honorary member); the Unfortunate Club; the Lying Club, the members of which were not permitted to utter a single truth during their sittings, unless they had been expressly authorized to do so by the president. Perhaps the most celebrated club of the 18th century was that which was first called The Club, but which was afterward known as the Literary Club. It was founded in 1764, and numbered among its members Dr. Johnson, who was for a long time its president, Sir Joshua Reynolds, Edmund Burke, Oliver Goldsmith, Edward Gibbon, and other distinguished men. In 1864 the 100th anniversary of its foundation was celebrated. In the rules which Dr. Johnson wrote for another club, the Apollo, he coined the still-serviceable word, "clubbable." In 1800 there were only half a dozen clubs existing in London, and within a century there were 100, with a total membership of 80,000. The most important London political clubs of the present day are the Carlton Club, founded by the Duke of Wellington, and the Reform Club. The former is the principal club belonging to the Conservative party in the kingdom, and the building in which its members meet, which is the most palatial edifice of the kind in the kingdom, may be regarded as the headquarters of the Conservative party. This club was founded in 1832, and the number of its members is 1,600. The Reform Club, the building belonging to which stands next to that of the Carlton Club, was long the great club of the Liberal party, founded in 1837, members 1,400. Among the other important London clubs are the National Liberal (7,000 members), Constitutional (6,550), United Service, Athenæum, Army and Navy, Travelers, Garrick, Primrose (5,600), etc. Similar clubs were started in the chief cities of England and in the colonies.

The first French society to take the name club was Le Club Politique, established in 1782, and a few years later, Le Club de Boston, or Club des Américains, was formed in Paris. The political clubs had no regular form, as they were tolerated only during revolutionary epochs. The Club des Jacobins, the Club des Feuillants, the Club des Cordeliers, and the Club de Montrouge were the most famous clubs of the time of the first French Revolution, and formed the storm-centres of that movement. None of the French clubs survived the *coup d'état* of 9 Nov. 1799, by which Napoleon overthrew the Directory. Two clubs were formed during the revolution of 1830, but they were both dissolved by the law relating to associations. At the revolution of February 1848 hosts of clubs started into existence, the most celebrated of which was the Central Republican Society (*Société centrale républicaine*), but their duration was short, for the Constituent Assembly in the following year ordered them all to be closed.

About the same periods as in France, political clubs were introduced into Italy, Germany, and Spain, especially during the time of the first French Revolution and that of 1848. In Germany, however, they were put down by a law of the empire in 1793, and in 1832 a federal decree was issued prohibiting all kinds of political societies and assemblies. In 1848 the number of clubs found in Italy, and particularly

in Germany, was very great, but their collapse was as sudden as their rise. Later in the century municipal clubs, somewhat on the "good government" order arose in Prussia. The city of Berlin had 75 such organizations in 1896. Some of these clubs maintain death-benefit and savings-bank features. Social clubs of the English type have not spread rapidly on the Continent. In France the name *cercle* was given to clubs of this nature. The most fashionable clubs of Paris are Le Cercle de la rue Royale and the Jockey Club. Many sports besides horse-racing are represented in the club life of the French capital. The automobilists, and the devotees of yachting, fencing, etc., have their separate organizations. There are also cercles for army officers, for literary men, for artists, and one connected with agricultural interests. Alpine clubs (q.v.) are found in many European countries. The French society of that name has numerous branches. Catholic clubs of workingmen exist in different parts of the country.

Although clubs were not unknown in the United States toward the close of the 18th century (the Hoboken Turtle Club dating back to that period), yet their spread and development were slow previous to the Civil War. Among those ante-dating the War may be named, the Union Club of New York (1836), the Somerset Club of Boston (1857), and the Maryland Club of Baltimore (1857). The Union League Club of New York (1863) grew out of the purpose to defend and perpetuate the national integrity, to encourage loyalty to the Federal government. Other Union League clubs were formed later in Philadelphia, and other cities; and in all the important centres of the country there grew up large and flourishing societies of a political or social nature, or such as combined the two features. The Manhattan Club became the chief social Democratic club of New York. The St. Nicholas Club represented a different type, a society founded upon a similarity of ancestry or antecedents and endeavoring to preserve historical associations. As these organizations have increased in number they have become more varied in character, until not only politics, science, art, music, literature, sociology, religion, philanthropy, and professional, commercial, social and sporting life are all represented, but the subdivisions are bewildering and continually increasing. Athletic clubs of various kinds are numerous and popular, abroad as well as in America, especially those for golfers and cyclists. The Cycling Tourists' Club, with headquarters in London, has a membership of 45,000.

University clubs draw together the college-bred men of various sections or cities. The largest one of the kind in the United States is that in New York, which had in 1902, 2,566 members. The city has also a Yale, a Harvard, and a Princeton Club. The Reform Club, organized in 1878, works for good government and agitates the tariff question. Among the largest clubs of the metropolis in addition to those already mentioned are the following: New York Athletic, 2,800 members; New York Yacht, 1,300; Century, 1,172; Army and Navy, 1,200; Metropolitan, 1,040; Players, resident 500, total 1,000; Lotus, resident 600, total 956. Others noteworthy for special characteristics are: The Knickerbocker Club, Authors' Club, Press Club, Grolier Club, Catholic Club, Holland Society, etc. The Chicago Athletic Club has 2,500. In Philadelphia, in addition to the Union League, the Manufacturers' Club, the Art Club, the Rittenhouse, and the New Century, are numerically strong. Clubs devoted to the cultivation of vocal music are largely formed of the German element in our cities. Prominent among these societies are the Liederkranz, the Arion, and the Mendelssohn.

Wherever the Anglo-Saxon race is represented in sufficient numbers, even in the remotest parts of the globe, the club idea has taken root, and we find English-speaking clubs or such as are suggested by or modeled upon English originals. India has more than 140 clubs; Pekin has its Reform Club; Cairo its Cycling Club, and Zanzibar its Golf Club. The Scotch Thistle Club of Hawaii shows its origin in its name and springs from the same source as the Caledonian clubs of America. Indeed, the tendency of men of a common blood to seek, when on a foreign soil, a social bond of unity, accounts for a special type of club. The line between organizations calling themselves societies and those known as clubs, is not always distinctly marked, but in general it may be said that where the social element is slight or lacking, the term club is inappropriate. This element entered largely into organization of many women's clubs in the early history of such societies, but their literary, professional, and especially their philanthropic features have become more prominent of late years. See Boys' Clubs; Girls' Clubs; Mothers' Clubs; Women's Clubs; Workingmen's Clubs.

Club-fingers. See Hand.

Club-foot (Lat. *Talipes*), a congenital distortion of the foot, of which there are several varieties. Sometimes the foot is twisted inward (*T. varus*); sometimes the heel is raised and the toes only touch the ground (*T. equinus*); sometimes the foot is twisted outward (*T. valgus*); or it rests only on the heel (*T. calcaneus*). The deformity consists at first in the contraction of the muscles and tendons of the feet, but ultimately the bones become distorted. If attended to in time, the foot may be gradually coaxed to its natural shape, and even in more advanced cases the deformity is usually curable by modern surgery.

Club-moss, the common name of the *Lycopodiaceæ,* a natural order of the mosses, containing four genera and 110 species, two of which, lycopodium and psilotum, are found in America, and two in Australia only. The club-mosses are found as gigantic fossils in the Upper Silurian, Devonian, and Carboniferous periods, and are a marked feature of the rocks of the two latter periods. See Lycopodium.

Club-root, Anbury, or **Finger-and-Toe** (*Plasmodiophora brassicæ*). This fungous disease is known under the above common names; it attacks turnips, cabbages, cauliflowers, and allied plants, often seriously injuring the crop. The term "club-root" arose from the club or wart-like excrescences which result from a plant being infested; owing to the tendency of the root to split up in this manner the term "finger-and-toe" is also applied. In Europe these knob-like growths cannot be regarded as conclusive evidence of this disease, as they may be

due to attacks of a gall insect. This fungus belongs to a very low order known as the slime-fungi; it can readily enter the young host plant, where it grows and reproduces rapidly; by the time the host should be mature, in fall, the fungus has formed millions of spores, which live over winter. The fungus can live for years in the soil, and no means of killing it is known, although applications of lime and potash reduce its ravages considerably. Methods of prevention are advocated, as, keeping the land free from cruciferous weeds, as wild mustard, etc., and destruction of all affected roots by burying with quicklime, or burning.

Clumber Spaniel, a short-legged spaniel averaging from 30 to 35 pounds in weight. Its legs are somewhat bowed, and its feet are large. It is a good swimmer, and is valued for its retrieving qualities, and its silence while hunting.

Cluniacs, or **Congregation of Cluny.** See CLUNY.

Cluny, klü-nē, or **Clugni,** a monastery of that branch of the Benedictine order known as the Congregation of Cluny, or as Cluniacs. It was founded in 912, at Cluny, 15 miles from Macon on the Saone. In the 12th and 13th centuries Cluny was perhaps the most notable monastic foundation in Europe: it had many hundred monasteries under the jurisdiction of its abbot. The first Cluniac house in England was founded by the Earl of Warenne, companion-in-arms of William the Conqueror. The church of the mother, established at Cluny, built in the 11th century, was regarded as one of the wonders of the world: this monument of gothic architecture was at the Revolution secularized by the republican government and was sold to the commune of Cluny, and by them was leveled with the ground. Napoleon, on being invited by the townsmen to visit the place, made reply, «No; you are vandals.» There were suppressed by Henry VIII. in England and Wales 35 Cluniac houses, one of them a convent of nuns.

Cluperidæ, kloo-pē'ĭ-dē, the herring family, fishes of the order *Isospondyli* (q.v.). The oblong, compressed, or nearly rounded body is covered with usually very thin, delicate, and easily detached cycloid scales, but the head is scaleless; the caudal fin is forked, the dorsal and specially the anal fins, elongated, and the last dorsal ray sometimes thread-like and prolonged. The skeleton is remarkable for the great number of delicate rib-like intermuscular bones; the maxillary bone forms the greater part of the upper jaw, and, like the rest of the mouth, is toothless or provided with only minute teeth; the gill-rakers are usually elongated and numerous, and there is no gular plate or bony piece in the floor of the mouth. There are nearly 30 genera and 150 species now known, most of them marine, but many migrating into fresh water to spawn. North America has 15 genera and 40 species. The most important of all food fishes belong to this family, of which the alewife, herring, shad, menhaden, and sardine (qq.v.) may be named.

Cluricaune, kloo'rē-kôn, in Irish mythology, an elf of evil disposition who usually appears as a wrinkled old man, and has knowledge of hidden treasures.

Cluseret, Gustave Paul, güs-täv pōl klüzė-rā, French officer and Communist: b. Paris 13 June 1823; d. Toulon 23 Aug. 1900. He came to the United States soon after the breaking out of the Civil War, and after serving on Gen. McClellan's staff became a brigadier-general. In 1864 he edited the 'New Nation,' in New York. Subsequently he returned to Paris, and was war minister of the commune in April 1871. From Paris he fled to England and Mexico, and was condemned to death by a military tribunal in 1872. He was, however, pardoned and allowed to return to Paris in 1880.

Cluse, Charles de la, shärl dė lä klüz (CLUSIUS), French botanist: b. Arras 18 Feb. 1526; d. Leyden 4 April 1609. He traveled extensively in Europe in pursuit of his favorite science, and by over-exertion and numerous grave accidents, he ruined his health and became a cripple. He was made keeper of the Botanical Gardens at Vienna, and in 1593 accepted the chair of botany at Leyden. His principal works are: 'History of Rare Plants'; and 'History of Plants,' a translation from Dodoens.

Cluster-cup. See ÆSCIDIUM.

Clustered Column, in architecture, a pier which appears to consist of several columns or shafts clustered together; they are sometimes attached to each other throughout their whole height, and sometimes only at the capital and base.

Clutha, kloo'thą, sometimes called MOLYNEUX, the largest river of New Zealand, in the southern part of the South Island. It receives the waters of lakes Hawea, Wanaka, and Wakatipu, and flows in a southeasterly direction through the counties of Vincent and Tuapeka, and then between those of Clutha and Bruce, till it reaches the sea in Molyneux Bay, after a course of 150 miles.

Clut'terbuck, Captain Cuthbert, the feigned editor of three of Scott's novels: 'The Monastery'; 'The Abbot'; and 'The Fortunes of Nigel.'

Cluver, kloo'vėr, or **Cluverius, Philipp,** German geographer and antiquarian: b. Danzig 1580; d. Leyden 1623. He applied himself first to the study of law, but afterward, against the will of his father, almost exclusively to history and geography. Being on that account left without support by his father, he was compelled to enter the service of the Austrian army, but at the end of two years he returned to his favorite pursuits. He now traveled through England, Scotland, France, Germany, and Italy, and then settled in Leyden, where he gave himself up entirely to literary labors till his death. His first geographical work, 'Germania Antiqua,' was published in 1616. Two carefully prepared antiquarian works, one upon Sicily, Sardinia, and Corsica, the other upon Italy, followed. His most important work was not published till after his death. It is entitled 'Introductio in universam Geographiam tam Veterem quam Novam,' and is the first successful attempt at a systematic treatment of geography in the whole extent of its historical and political relations. The first edition appeared at Leyden

in 1629, but it has been frequently republished. The most complete edition is that of Bruzen de la Martinière (1729).

Cluysenaar, Alfred, Belgian artist: b. Brussels 24 Sept. 1837; d. there 23 Aug. 1902. He was the son of a noted architect, with whom he at first studied sculpture, but he was more attracted to painting and subsequently studied art in Brussels and Paris, exhibiting 'A Dominican Meditating' in 1861. Other pictures of his are a 'Vocation,' now in the Brussels Museum, and a 'Mazeppa,' and six large mural paintings for the University of Ghent.

Clwyd, kloo'id, Wales, a river in County Denbigh, rising on the northeast of the Bronbanog, and entering Abergele Bay, after a course chiefly northwest of about 30 miles, during which it is joined by several small tributaries. It is navigable at high water for vessels of 80 tons burden to the town of Rhuddlan, two miles from its mouth.

Clyde, Lord. See CAMPBELL, SIR COLIN.

Clyde, klīd, Scotland, a river which has its sources amid the hills that separate Lanarkshire from the counties of Pebbles and Dumfries, flows by Lanark, Hamilton, Glasgow, Renfrew, Dumbarton, Greenock, etc., and forms finally an extensive estuary or firth before it enters the Irish Sea at the southern extremity of the island of Bute. From its source to Glasgow, where navigation begins, its length is 70 or 80 miles. Its principal tributaries are the Douglas Water, the Mouse, the Nethan, the Avon, the Calder, the North Calder, the Kelvin, the White and Black Cart, and the Leven, Near Lanark it has three celebrated falls — the uppermost, Bonniton Linn, about 30 feet high; the next, Corra Linn, where the water takes three distinct leaps, each about as high; and the lowest, Stonebyres, also three distinct falls, altogether about 80 feet. The Clyde, by artificial deepening, has been made navigable for large vessels up to Glasgow, and is the most valuable river in Scotland for commerce.

Clydebank, a police burgh and town of Scotland, in Dumbartonshire, on the north or right bank of the Clyde, about six miles west by north of Glasgow. It is of modern origin, its chief industry being ship-building. Pop. (1901) 18,654.

Clydesdale, a breed of horses named from the valley of the Clyde in Lanarkshire, Scotland. Clydesdales are about 16 hands high, are compact and muscular in build, and have a long, easy stride. They vary in color, being black, gray, brown, or bay, and are used for draft-horses. Specially fine specimens of this breed are found in the eastern United States, in the service of the municipal fire departments of large cities.

Clydesdale, or **Paisley Terrier.** See DOG.

Clymene, klīm'ę nē, the daughter of Oceanus, and mother of Atlas and Prometheus.

Clymer, klī'mėr, **Ella Dietz,** American poet: b. New York. She began her career as an actress in 1872, but in 1881 she abandoned the stage. She has published three volumes of poems: 'The Triumph of Love' (1878); 'The Triumph of Time' (1884); and 'The Triumph of Life' (1885). She was one of the founders of the «Sorosis» Society, and its president in 1889.

Clymer, George, American statesman: b. Philadelphia 1739; d. Morrisville, Pa., 23 Jan. 1813. He entered mercantile life when a lad and acquired a competence. He was prominent in public affairs prior to the Revolution, and in 1775 became one of the first Continental treasurers. He was chosen in 1776 to succeed a member of the Continental Congress who had refused to sign the Declaration of Independence, to which he promptly affixed his signature, the 38th after John Hancock's. He was active in the patriot cause during the Revolution, was a member of the convention that framed the federal constitution, and in 1788 was elected a member of the first congress under that instrument. In 1790 he declined a re-election, and in the succeeding year was appointed collector of the excise duties on spirits, the collection of which in Pennsylvania led to the whiskey riots. Clymer acted firmly, yet temperately in the troubles, till finding the office distasteful, he resigned it, and was appointed, with Pickens and Hawkins, to negotiate a treaty with the Cherokees and Creeks in Georgia. No man was more averse than he to the assumptions of aristocracy, to the excellencies, honorables, and esquires, who, he said, abounded more in the United States than in any other country in the world. He seldom spoke in public, but when he did his ideas were expressed in language, keen, pithy, and laconic.

Clysters, medicaments introduced into the lower bowel, usually for the purpose of expelling its contents. When used in ordinary cases of constipation a syringe of a peculiar construction, capable of injecting water in a lukewarm state, and either pure or mixed with soap, is often employed with immediate effect; but all kinds of clysters require to be used with moderation, as they have a tendency to impair the energy of the alimentary canal. Enemas are also used to supply nourishment when it is impossible to administer it by the mouth, as in cases of tetanus, spasmodic closure of the œsophagus, etc.

Clytemnestra, klīt-ĕm-nĕs'tra, daughter of King Tyndareus and Leda, and half-sister of Helen. She bore her husband Agamemnon two daughters, Iphigenia and Electra, and one son, Orestes. During the absence of Agamemnon in the war against Troy she bestowed her favors on Ægisthus, and, in connection with him, murdered Agamemnon on his return from Troy, and, together with her paramour, governed Mycenæ for seven years. Her son, Orestes, killed them both.

Clytie, klī'tē, the daughter of Oceanus and Thetis, who pined away through love for Apollo, and was changed by him into a sunflower.

Cnicus (Latin for safflower, which name was first given to the thistle), a monotypic genus of the natural order *Compositæ*. The plant is an annual herb which came originally from the southern part of Europe, and occurs from May to August in waste places along the Pacific coast as well as on the eastern seaboard from Maryland to Nova Scotia. *C. benedictus,* or, as it is sometimes called, St. Benedict's thistle, was formerly used as a febrifuge, but is now rather considered a tonic and diaphoretic.

Cnidus, nī'dŭs, or **Gnidus,** Asia Minor, a town in the province of Caria, and a favorite resort of Aphrodite (Venus), who was hence surnamed the Gnidian Goddess. She had there three temples. In the first, probably erected by the Lacedæmonian Dorians, she was worshipped as Doritis. The second was consecrated to her under the name of Aphrodite Acræa. The third, called the Temple of the Gnidian Aphrodite, and by the inhabitants, the Temple of Aphrodite Euplæa, contained Praxiteles' marble statue of the goddess, one of the masterpieces of art. This was afterward removed to Constantinople, where it perished in a conflagration in 1461.

Cnossus, nō'sŭs, or **Gnossus,** more anciently CNOSUS, or GNOSUS, now MAKRO TEIKHO, the capital of Crete in the time of Minos, was built on the Cæratus, a short distance from the northern coast, and founded by Dorians, who diffused their institutions over the island. Homer mentioned it as already a great city, and the residence of the celebrated Cretan king; it long maintained its preponderance, until it was weakened by the growing importance of Cydonia and Gortyna. It was renowned in mythology by numerous legends of Jupiter, born, married, and buried in its vicinity; of Minos, Ariadne, the minotaur, and the labyrinth. In later times it became a colony of the Romans. Ænesidemus, the skeptic philosopher, and Chersiphon, the architect of the temple of Diana in Ephesus, were born there.

Coach, a large, close, four-wheeled vehicle, generally constructed to carry passengers inside and outside; used for purposes of state, for pleasure, or for traveling. It cannot be determined at what time covered carriages first came to be used, but they were in use among the Romans. The earliest carriages appear to have been all open, if we may judge from the figures of Assyrian and Babylonian chariots found on the monuments discovered amid the ruins of Nineveh and Babylon. At Rome the matrons used to be conveyed on festal occasions in covered carriages called *carpenta,* which was a high distinction, since during the republican period the use of carriages in the city was entirely prohibited. At a later period covered carriages, richly ornamented, were used by the Romans on occasions of state and ceremony. After the fall of the Roman empire they went out of use again, and during the feudal ages the custom was to ride on horseback, the use of carriages being considered effeminate. Although mention is made of them again before the end of the 13th century, they do not appear to have become common until about two centuries later, when, however, they were regarded exclusively as vehicles for women and invalids. But a little later they seem to have been looked upon as appendages of sovereignty, and the German princes vied with one another in the splendor of their equipages, while their use was prohibited to the nobility and their vassals. About 1282 the Queen of Charles of Anjou entered Naples in a caretta, which seems, in some respects, to have resembled a modern coach. In England a kind of carriage called a "whirlicote" was in use in the reign of Richard II.; but coaches, properly so called, are stated by Stow to have been introduced in 1564 by a Dutchman, who became coachman to Queen Elizabeth. Stow adds:

> After a while, divers great ladies, with as great jealousie of the queene's displeasure, made them coaches, and rid in them up and downe the countrie, to the great admiration of all the beholders; but then by little and little they grew usual among the nobilitie, and others of sort, and within twentie years became a great trade of coach-making.

They were, however, for a long period confined to the aristocracy and the wealthy classes. Sometimes six or even eight horses were harnessed to the coach, partly no doubt for the sake of display, but chiefly because the wretched state of the roads required that number. At first coach-wheels were very low, which circumstance also contributed to prevent the attainment of any considerable speed, and to make it necessary to use several horses to draw them; and no one seems to have pointed out the advantages of large wheels until, in 1771, a Mr. Moore for a short time attracted a good deal of attention by pointing out the fact that it was much easier to draw a coach or cart with large wheels than with small ones, and by actually constructing a coach "very large and roomy," which was "drawn by one horse, and carried six persons and the driver, with amazing ease, from Cheapside to the top of Highgate Hill," coming back "at the rate of 10 miles an hour, passing coaches-and-four, and all other carriages it came near on the road." A contemporary account states that this coach had two large wheels, 9½ feet in diameter.

Hackney-coaches were first used in London in 1625. They were then only 20 in number, and were kept at the hotels, where they had to be applied for when wanted. In 1635 an attempt was made to restrain their use by a proclamation of Charles I.; but, this being found unsuccessful, their number was limited, and a commission was given to the Master of the Horse to grant licenses for their use. In this year only 50 were licensed. In 1634 one Capt. Baily, who had formerly been a sea-captain, hit upon the plan of keeping a number of hackney-coaches, with drivers in livery, standing at a particular place (the "Maypole," in the Strand), where they might be had whenever they were wanted. Hackney-coaches now rapidly became more general. The four started by Capt. Baily in 1634 had increased to 200 in 1652, to 800 in 1710, and to 1,000 in 1771.

The following facts relating to the history of stage-coaches are taken from Chambers' 'Book of Days': Stage-coaches were introduced into England about the same time as hackney-coaches. The first stage-coach in London appears to have run early in the 17th century, and about the middle of the same century they appear to have become general both in London itself and in the better highways in the neighborhood. Before the end of the century they were started on three of the principal roads in England. Their speed at first was very moderate, about three or four miles an hour. They could run only in the summer, and even then their progress was often greatly hindered by floods and by the wretched state of the roads generally. In 1700 a week was considered a marvelously short space of time to take to travel from York to London; and even 60 years later a fortnight was spent in going between Edinburgh and London. The first stage-coach

that traveled between Glasgow and Edinburgh, which was set on foot in 1749, occupied two days in the journey. The first efforts to accelerate the speed of traveling was made by a body of Manchester merchants in 1754, who started a conveyance to which they gave the name of the "Flying Coach," and which was intended to cover the distance between Manchester and London in the unusually short period of four days and a half. In their prospectus, the proprietors of the new vehicle made the following announcement:

> However incredible it may appear, this coach will actually (barring accidents) arrive in London in four days and a half after leaving Manchester.

Thirty years later, Mr. Palmer, of Bath, after a considerable amount of opposition, succeeded in inducing the government to put in practice certain suggestions which he made, by which he showed that great saving both in time and money in the conveyance of passengers and letters would be effected. The result was the establishment of the system of mail-coaches, which continued to be the means of traveling in England until their place was taken by the railways. The first mail-coach started between London and Bristol on 8 Aug. 1784.

The manufacture of elegant coaches is a proof of much wealth and mechanical skill in a place, many different artists being employed in their construction, who become skilful only when the demand for their work is considerable. Brussels was once famous for the manufacture of carriages, and many are built there still. Vienna-made coaches, etc., are also in good repute. See also CARRIAGE; CARRIAGE AND WAGON INDUSTRY.

Coach, or **Dalmatian Dog,** a short-haired dog of moderate size and rather handsome shape, white, with numerous round black spots, kept as an attendant upon carriages, and of no use otherwise, except in some parts of northern Europe, where it is used to draw milk-peddlers' carts and other small vehicles. Although called Dalmatian, the breed is believed to have originated in Spain.

Coach-whip Snake, an American snake (*Masticophis flagelliformis*), characterized by a long, narrow head, projecting upper jaw, superior orbital plates large and projecting much over the eyes; nostrils large, lateral, and near the end of the snout; eyes large, iris dark gray; neck small, body long, and tail attenuated like a whip-cord, which it also resembles in the braided appearance produced by the arrangement and dark border of the scales. The color of the head, neck, and a third of the body is glossy black, becoming paler toward the tail, which is tawny brown; the scales of the tail have dark margins; the lower surface in front is bluish slate, behind white clouded with brown; the colors vary in their shades, but near the head it is always black. They sometimes attain the length of seven feet. It moves with great swiftness, and feeds on young birds and small animals; though inoffensive to man, it defends itself bravely, twining its long folds around its enemy. The species is rare, and appears to be confined to South Carolina, Georgia, and Florida. In its general form, in the scales, and in the plates on the head, it somewhat resembles the black snake.

Coadju'tor, a Latin term, nearly synonymous in its original meaning with assistant, and applied by the Romans to a kind of deputies or lieutenants given to magistrates to assist them in a press of business, or supply their place in absence. The term was afterward introduced into the Church and given to persons who were associated with prelates, archbishops, or bishops, to assist them or act as substitutes for them in the discharge of their functions. The appointment usually made the coadjutor the successor of his principal, and in this way great abuses arose. At first the coadjutor was nominated by the king on the presentation of the archbishop or bishop with whom he was to be associated, and who generally took care to present some nephew or cousin, who had been or was about to be ordained, and thus the highest ecclesiastical positions became in a manner hereditary in a certain number of families, contrary to the ecclesiastical maxim which declared them to be purely elective. The abuse once begun made rapid strides until the Council of Trent introduced several reforms, by providing that the nominations of a coadjutor should not take effect except in cases of necessity or manifest utility, the Pope being made sole judge of these cases. Coadjutors, as now understood, are of two kinds, one temporary and revocable, allowed on account of illness or other incapacity, and allowing no right of succession; the other irrevocable and carrying with it the right of succession. The Council of Trent did not favor the "irrevocable right of succession," but the Pope grants it in special cases. A coadjutor differs from a "suffragan," and the words have slightly different meanings in different countries. The term and the office is not confined to the Roman Catholic Church; it is in use also in the Anglican Church.

Coagula'tion (Latin, "to curdle"), the peculiar change from the state of a liquid to that of an amorphous solid, exhibited, under certain conditions, by proteid bodies and their solutions. The hardening of an egg by boiling is a familiar instance of the process. In this case the change is induced by heat, and begins when the temperature reaches 160° F. or thereabouts. Another familiar case is the clotting of blood, which occurs from a very different cause. The blood contains two albuminous substances which are concerned in the phenomenon, and which are known respectively as "fibrinogen" and "fibrinoplastic substance." These are normally held in solution; but as soon as the blood is removed from the body they undergo a change whose nature is not well understood, the product of which is a stringy, elastic, fibrous or jelly-like solid known as "fibrin." In the pure state fibrin is white or gray, but in the blood-clot it appears strongly red, because its fibres imprison multitudes of the red corpuscles of the blood unless special care is taken to prevent this action. Casein, the principal proteid constituent of milk, does not coagulate from the direct application of heat, but it coagulates very quickly when rennet is introduced, and it also coagulates spontaneously under the influence of certain of the products of fermentation that develop in the milk after it has been exposed to the air for a time.

Coahuila, kō-ä-wē'lä, Mexico, a state bounded on the north by the United States, on the east by Nuevo Leon, on the south by San

Luis Potosi and Zacatecas, and on the southwest, west, and northwest by Durango and Chihuahua. Its area is about 60,000 square miles. The capital is Saltillo. The principal mountain ranges are in the districts of Rio Grande and Monclova. Besides these we may mention the Sierra Madre, in the Saltillo district; the Sierra Paila, in Parras; and Sierra Noas, in Viesca. The rivers are: Rio Grande (also called Rio Bravo), forming the boundary line with Texas; the Sabinas, forming the boundary between the districts of Monclova and Rio Grande; the Alamos, Monclova, Patos, Saltillo, Aguanaval, Nazas, and their tributaries. The principal lagoons are those in the districts of Parras, Viesca, and Monclova. Extending from the foot of the mountains northward are sterile plains, where the heat is intense; to the southeast lies the Laguna region, fertile and temperate; the mountainous district, rich in minerals, has frequent frosts. In general the climate is not healthful, the most common diseases being malarial fevers, typhus, rheumatism, and affections of the respiratory and digestive organs. Mining has recently become one of the chief industries. Silver, lead, coal, iron, copper, and gold are found. The first position, however, is still held by agriculture. Cotton, corn, wheat, sugarcane, etc., grow readily; and grape-culture is attracting special attention. The grapes of Parras are considered by some experts equal if not superior to the Malaga and Granada varieties. The state's output of cotton in 1897 was valued at $6,264,632. The value of ixtle produced in the same period was $2,430,338. Cattle-breeding is carried on quite extensively. The export trade is principally with the United States, to which, among other products, are brought ixtle and its various manufactures. The commerce of Coahuila is in the hands of Americans, Spaniards, Germans, and Frenchmen; its total trade is of the estimated value of $11,000,000, or $12,000,000, silver, per annum. Manufactures are: cotton and knitted goods, wines, tanned skins and hides, soap, candles, cheese, shoes, molasses, furniture, pottery, carriages, wagons, and chocolate. The railroad system includes a number of important lines. There are good wagon roads; also telegraph and telephone service and an efficient mail-service. The state is divided into five districts, subdivided into 33 municipalities. Pop. 285,000.

Coaita, kō-ī'ta. See SPIDER-MONKEY.

Coal. No suitable definition of the mineral substance called coal exists. Such a definition as «anything dug out of the ground that will burn» is obviously too loose; at the same time a definition based strictly on chemical composition is of slight value, since coal is a very complex substance and good coals vary greatly in composition. Generally speaking, coal is believed to represent the remains of various kinds of plants. It is found in seams or beds, separated by other beds or strata of clay, shale, grit, or sandstone. Inasmuch as all plant life depends on the energy received from the sun, and as, through the sun's rays, plants are enabled to fix in more or less stable form the carbon of the carbon dioxide from air and soil, it is permissible to define coal as buried sunshine. Such a definition at least indicates the great source of the energy given off as heat and light from a coal fire.

Origin.— Many theories have been advanced as to the origin of coal. Thus coal beds have been attributed to the drying up of petroleum lakes on old land surfaces, to the separation of carbon by some fanciful chemical process from limestone, and to accumulation of seaweeds along old ocean beaches. These theories may be dismissed without discussion; they may help explain some particular instance, but are so unsupported by facts that they are of no wide application. The generally accepted theory applies to practically all kinds of coal deposits and is, briefly, as follows:

When the woody material, cellulose, of the leaves and stems of plants, falls on the ground, it soon oxidizes or decays, and the oxygen, hydrogen, carbon, and nitrogen present pass into the air or soil as gases, the hydrogen and oxygen chiefly as water vapor, the carbon as carbon dioxide, and the nitrogen as ammonia. Finally of the original material, say the trunk of a great tree, only the ash, composed chiefly of silica, alumina, and iron oxide, is left. Thus it happens that the leaves, twigs, and branches that have fallen for thousands of years in a forest are represented by a few inches of vegetable mold or humus, plant substance not yet oxidized to ash. If, however, the ground be covered by water, as in a swamp, air is partly excluded, and decay proceeds so slowly that vegetable or animal remains may be preserved for long periods of time. Still oxidation goes on: the dead plants gradually give up their hydrogen, oxygen, and carbon as water, marsh gas, and carbon monoxide and dioxide, and change to a mass of partly decayed vegetable fibre or even to a black muck.

A damp climate and a land surface from which the rainfall runs off slowly, favor the formation of extensive swamps, though in a climate as damp as that of Ireland peat bogs climb hillsides, the mosses (*Sphagnum*), the chief plant growth in such swamps, dragging up water by capillary action. On the plains of Alaska and Siberia, where the ground is permanently frozen, mosses cover the ground with a thick mat, and such swampy plains are called tundras. In a lake country can be found areas which a little investigation shows were at no very remote date covered by shallow bodies of water, but are now swamps, the original lakes having been filled by the dead mosses, rushes, and other aquatic plants. Along the seashore in a region of average rainfall, where the coast is of low relief and the rivers sluggish, sand-bars form by wave action off shore, and behind these bars are salt lagoons and marshes, changing, farther from the ocean, to brackish, and finally fresh-water swamps.

Fresh or brackish water and a fairly warm though not torrid climate are indicated by the fossils of plants and animals found in or near coal seams. From these facts and from the vast extent of some coal fields it is believed that coal beds represent old coastal swamps, possibly of the type of the Dismal Swamp in Virginia. Now if we suppose such a swamp-covered coast to

sink slowly, the encroaching ocean would cover the accumulated peat and muck with sand and silt until finally the swamp might be buried thousands of feet by sediments from the receding land surface. Instead of steadily sinking, however, the probabilities are that during the great coal-forming epochs the land alternately sank and rose through thousands upon thousands of years, and thus one swamp was buried over another, resulting in those alternating beds of coal, shale, and sandstone characteristic of all coal fields.

The progressive diminution of hydrogen and oxygen compared with carbon is shown by the following table from Percy's 'Metallurgy,' in which carbon is taken at the constant amount of 100:

	Carbon	Hydrogen	Oxygen
Wood	100	12.18	83.07
Peat	100	9.85	55.67
Lignite	100	8.37	42.42
Welsh bituminous	100	4.75	5.28
Pennsylvania anthracite	100	2.84	1.74

The loss of water and of combined carbon, hydrogen, oxygen, and nitrogen, in the change from peat to coal, caused a great loss of bulk. The pressure of overlying strata, or of those earth movements that warp and fold the rock formations, reduced the bulk still more. Thus it can happen that a coal seam one foot thick may represent what was 50 feet of peat in the ancient swamp, and it is fair to assume that an average seam of true coal is not one fifth the thickness of the original peat beds.

Some geologists have believed that when the old swamps now represented by coal seams were accumulating thick beds of peat, the climate was torrid, while the earth's atmosphere contained a higher percentage of carbon dioxide than now. It may be said, however, that a torrid climate is not necessary for the existence of great swamps; and as to a higher percentage of carbon dioxide in the air, were the present land surface of the globe covered with a layer of coal one foot thick, the carbon contained therein, if restored to the atmosphere, would mean an increase in the amount of carbon dioxide of but about .5. This about represents the difference between air in the city and in the country, and the effect of such an increase in stimulating plant-growth is at best doubtful.

As to the age of the coal formations it may be said that true peat deposits are all of later age than the Tertiary, and in North America only peat and incoherent lignite occur in later formations than the middle Tertiary (Miocene) though the early Tertiary (Eocene) formations contain great areas of lignite. In Europe there are lignitic deposits in the Triassic and in the Carboniferous. The great coal-forming age in North America and in Europe was the Carboniferous, though true coals occur in the Permian and in the Triassic, and in North America there are very important coal fields of Cretaceous age. Isolated pockets of coal, but no workable coal fields, occur in pre-Carboniferous formations. See CARBONIFEROUS SYSTEM.

An idea of the relative compositions of peat, lignite, and true coals may be had from the following table:

	H_2O	C	H	O	N	S	Ash
Condensed peat..	20	47.2	4.9	22.9			5.0
Lignite, Alaska..	16.52	55.79	3.26	19.0	.61	.63	4.18
Bituminous coal, Connellsville, Pa.	0.89	82.48	4.50	5.61	1.45	.94	34.1
Anthracite coal, Lykens, Pa....	0.73	82.89	4.53	.40	.64	.68	10.13

Varieties of Coal.—Various elaborate schemes of classifying coal have been advocated, but have not gained popular acceptance. In fact in the coal trade in this country the word coal is often applied to a true lignite. However, since the chief heat-producing element in coal is carbon, a classification in wide use is based on the value of the coal as fuel; that is on the percentage of carbon present and the condition of the carbon.

Part of the carbon is fixed, that is, cannot be driven off by heating in a retort; part is combined with the hydrogen and nitrogen as volatile hydrocarbon compounds which can be driven off. The percentage of fixed carbon is highest in anthracites, but even the semi-graphitic anthracite of Rhode Island contains a considerable percentage of hydro-carbons. The proportion of the volatile hydrocarbons to the fixed carbon in a coal is called its fuel ratio. On this basis the distinctions usually made are lignite, bituminous, semi-bituminous, semi-anthracite, and anthracite. Cannel coal, in which the percentage of volatile hydrocarbons is very high, is believed to be of different origin from other coals. It may represent accumulations of seeds, spores, resins, or gums, and possibly of fish remains, in pools in the ancient swamps. Generally speaking, in anthracite the volatile matter is below 6 per cent, in semi-anthracite below 10 per cent, in semi-bituminous between 12 and 18 per cent, and in bituminous above 18 per cent. In cannel coal the volatile matter may be as high as 50 or even 65 per cent.

Lignite, or brown coal, is brown to black in color, though the powder is always brown. It often shows plainly its vegetable origin, containing stems that look like undecomposed wood. The lustre may be resinous or dull; the specific gravity is .5 to 1.5, some kinds floating on water. Lignites burn easily with a smoky flame, generally contain a high percentage of water, crumble easily, and slack to mud on long exposure.

Bituminous or soft coal is black; the powder is black; the lustre may be resinous or dull; the specific gravity is 1.25 to 1.4. It contains less water than lignite and bears transportation better. Bituminous coals are subdivided according to their properties or uses, into coking, free-burning, smokeless, gas coals, etc. Coking coals partly fuse or cake in burning. If low in ash and very low in sulphur they are highly valued for forging and for making coke and gas. The famous coals of the Cumberland region in Mary-

land are classified as semi-bituminous. In coking coals the less volatile hydrocarbons present, the higher the yield of coke, but in gas coals the more hydrocarbons the better. A good gas coal will give 10,000 cubic feet of gas per ton. Smokeless coals burn with little smoke and are used for domestic purposes and for steam production.

Cannel coal (from *cannyl*, "a candle"), is black or brownish, has a dull lustre, does not soil the fingers, and shows few or no traces of vegetable structure. It grades into bituminous shale. It contains from 40 to 60 per cent of volatile matter, lights readily, burns with a steady flame, and is used as a fuel for open grates, but chiefly for enriching gas made from other coal. It is mined in the United States at Cannelburg, Ind., and in the Jellico district, Ky.

Anthracite, called also hard coal, is black with a black powder and does not soil the fingers. The specific gravity is 1.3 to 1.75. It kindles slowly, but, owing to the high percentage of fixed carbon, burns without smoke and gives an intense heat. It was formerly much used in this country for smelting iron and is still used as a steam fuel, but its chief use is for household purposes.

Generally speaking, the less water, ash, and sulphur in a coal the better. The water must be evaporated before the coal burns, ash represents inert matter, and sulphur is objectionable for several reasons. A first-class coal should not contain over 6 or 7 per cent of ash and a good gas coal should have less than .7 per cent sulphur.

The following table gives the composition of some representative American lignites and coals:

	Water	Volatile Hydrocarbons	Fixed Carbon	Fuel ratio	Ash	Sulphur

Coal Fields of the World.— North America, Europe, and Asia contain the great coal fields of the world. In southern Africa, in Australia, and in New Zealand are deposits of importance. Only small and disconnected areas are known in South America and the only mines worked on a large scale are in Chile. As to Asia, the coal fields of China are vast and of great promise but are still practically undeveloped. Coal is abundant in India and Burma and the output is increasing fast, particularly from the mines in Bengal. The rather small coal field of Japan is being opened rapidly. The chief coal-producing States of Australia are New South Wales and Queensland. The South African mines are in Cape Colony, Natal, and the Transvaal.

Great Britain long led the world in coal-production, but was passed by the United States in 1899. The important coal fields of Great Britain lie in southern Scotland, stretching with interruptions, from the coast of Ayr to the mouth of the Firth of Forth; in the north of England, in Durham and Northumberland counties; in central England, where the several fields worked include parts of 10 counties, the most important being Yorkshire and Lancashire; in the west of England, near Bristol, and in the Forest of Dean; and the very important South Wales field in the counties of Monmouth (England), and Glamorgan and Carmarthen (Wales), this field producing the best coal mined in Great Britain.

On the continent of Europe, France, Belgium, Russia, Austria-Hungary, and Spain have coal fields of more or less importance. The French coal fields may be grouped in three divisions, those of the north, of the centre, and of the south. The northern field, in the departments du Nord and Pas de Calais, extends into Belgium. The fields of central France are generally small and irregular, the most important being in the department of the Loire. In the south of France the coal fields of Alais and of the Aveyron are of some importance. The coal field of Belgium is a narrow belt extending across the country, except for a short interruption, from the Pas de Calais in France to the Aix-la-Chapelle coal field in Prussia.

Of the German states, Prussia has the largest and best coal fields. These include the Aix-la-Chapelle and the Eschweiler; the very important coal fields of the Ruhr, or of Westphalia; and, extending into Bavaria, the Saarbrücken field, perhaps the most remarkable in Europe for the number of seams and total thickness of coal. In the extreme southeast of Prussia are the important and comparatively undeveloped coal fields of Silesia at the head waters of the river Oder. Of the other German states, Saxony is a considerable producer of coal, the most important mines being near Zwickau.

In Austria-Hungary, coal fields extend from Lower Silesia into Bohemia, and from Upper Silesia into Moravia, with mines near Schlan, Radnitz, and Pilsen. There are also great deposits of lignite, extensively developed near Einbogen and Bilin, and valuable mines of lignitic-bituminous coal near Fünfkirchen in southern Hungary and about Syria and Carinthia in the Austrian Alps.

The most important coal field of Russia is the Donetz basin, between the Don and the Dnieper rivers. It covers a large area and is being developed steadily. Spain has several coal fields, one of some importance in the Asturias, and two others but little developed. Lack of railroads has prevented their exploitation.

North America, as noted before, surpasses all the continents in the extent and variety of its fuel supplies. The United States leads the world in coal production, and there is little prospect of any country surpassing it before that far distant day when the great coal fields of China are well opened. Canada has coal fields of importance near Pictou and on Cape Breton Island in Nova Scotia, known as the Acadian coal field; also a vast and but partly developed field of lignite and true coal in Alberta and eastern British Columbia, and another field on Vancouver Island. Alaska has no true coal, but workable beds of lignite occur on the coast and in the Yukon valley at Rampart and Circle City.

The Mexican coal fields are of much local importance, but are not likely to produce any coal for export. The principal field is in the State of Coahuila, extending from Eagle Pass to Sabinas. Coal seams have been worked in Sonora, Hidalgo, and Michoacan.

The following table showing the production of coal and lignite of the chief coal-producing countries of the world is compiled from figures published in the 'Engineering and Mining Journal':

Country	Production	Country	Production
United States..	293,298,550	Belgium	25,090,490
Great Britain...	245,321,708	Russia	17,929,320
Germany	166,117,978	Japan	8,265,000
Austria-Hungary	43,363,700	India	7,840,000
France	32,590,691	Canada	7,630,255

The above figures are for the years 1902 or 1901, and are short tons (2,000 pounds).

The United States, Great Britain, and Germany together produce over 80 per cent of all the coal mined in the world.

The coal fields of the United States, not including Alaska, are of various ages from the Carboniferous to the Eocene, the two great horizons being the Pennsylvanian of the Carboniferous, and the Laramie of the Cretaceous. The total area covered by possibly productive seams of lignite, bituminous coal, and anthracite is fully 250,000 square miles.

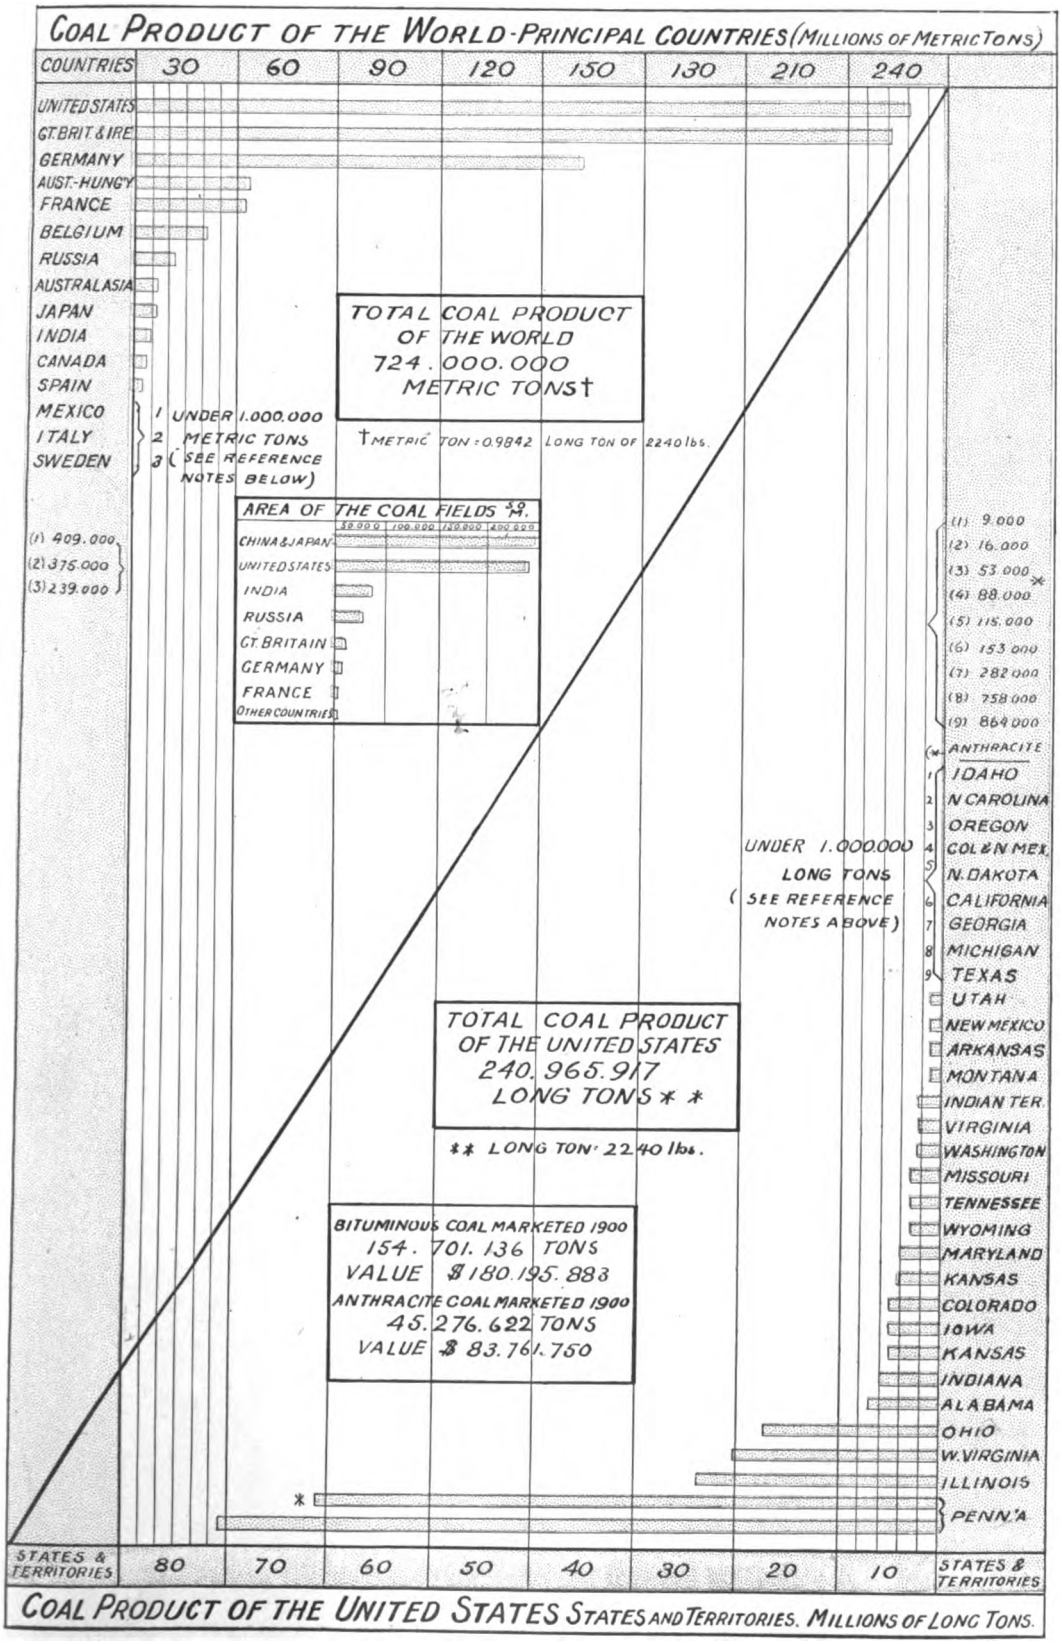
For convenience the coal fields may be grouped in these divisions: the Appalachian, covering 70,800 square miles; the eastern interior, 58,000 square miles; the northern interior, 11,300 square miles; the western interior, 94,000 square miles; the Rocky Mountain, 43,600 square miles; and the Pacific coast, 1,050 square miles.

The Appalachian field extends from near the New York and Pennsylvania state line southwesterly through the western half of Pennsylvania and eastern Ohio, the western end of Maryland, the extreme southwest of Virginia, nearly the whole State of West Virginia, eastern Kentucky, and Tennessee, into north-central Alabama. This field is of Upper Carboniferous Age, and with it are included the very important anthracite fields of eastern Pennsylvania, and a small area of graphitic anthracite in Rhode Island and southern Massachusetts. There are also coal beds of Tertiary Age (Newark) in the Richmond basin, near Richmond, Va., and on the Dan and Deep rivers in North Carolina. The Richmond field, though the first to be worked in the United States, having been opened in 1750, is now almost abandoned. The Chetham mines in Durham County, N. C., are of some importance.

The anthracite fields of Pennsylvania are divided for convenience into the northern, or Wyoming, lying in or near the valleys of the Lackawanna and Susquehanna rivers from Carbondale to Shickshinny; the Lehigh, comprising several basins about Hazleton and part of the Panther Creek valley; and the Schuylkill. The last really includes several fields extending from near Mahanoy on the north to Pottsville on the south, and from Tamaqua on the east to Lykens on the west. The total area of the various anthracite basins is about 480 square miles. The coal was mined first about 1765, and at the rate at which production is increasing the estimated life of the field is about 50 years. However, as mines go deeper, and mining costs increase, the resulting higher prices for coal will probably restrict consumption, and with a declining output it is possible that the anthracite mines may not be wholly exhausted in 200 years.

Owing to the competition of lower-priced bituminous coal in the form of coke, the use of anthracite for smelting iron has declined greatly of late years, and its consumption for industrial purposes is not increasing. For steam-production only the small sizes, pea, wheat, buckwheat, and rice, are much used, and these chiefly on railroads running through the fields or in cities having strict smoke ordinances. Anthracite, being clean, smokeless, having great heating power, and burning slowly, is chiefly used for household purposes and is sent to market broken into lumps of several sizes, known as broken or grate, egg, stove, and chestnut, these being called prepared sizes, in distinction from the small or steam sizes before mentioned. The market supplied by the Pennsylvania mines is along the Atlantic seaboard from Nova Scotia to Georgia, also a narrow strip of country extending from Montreal westward through southern Ontario and the States of the Union bordering on the Great Lakes. The chief markets are in New England and in New York, New Jersey, Pennsylvania, and Illinois. Out of a total shipment of 47,665,203 long tons in 1899 it is estimated that 7,144,131 tons went to the New England States, Massachusetts taking half the amount; 12,503,896 tons to New York; 4,693,500 tons to New Jersey; 13,803,253 tons to Pennsylvania; and 2,188,294 tons to Illinois. The total exports of 1,707,796 tons went almost wholly to Canada.

The bituminous coals of the Appalachian field include gas, coking, and steam coals of the highest grade. The largest and best seams or those most easily opened have been exploited so far, and the resources of the Appalachian field are still enormous. The State of West Virginia alone is estimated to contain more workable coal than the whole of Great Britain. The best-known of the various areas now opened are the Clearfield, in Pennsylvania, producing coking, gas,



and steam coals, shipped largely to seaboard points; the Broad Top, in Pennsylvania, producing coal of rather better grade, shipped to the same markets; the Cumberland, in Maryland, producing a famous steam and smithy coal, shipped to the seaboard and to interior cities from Canada to the Rocky Mountains; the Pittsburg, in Pennsylvania, whence come gas and steam coals largely used locally, but also shipped to points on the Great Lakes and on the Ohio River and lower Mississippi; the Connellsville, in Pennsylvania, yielding coal used chiefly for making a standard grade of coke; the Hocking Valley, in Ohio, whence are shipped steam coals to near-by cities and to distant ports on the Great Lakes; the Kanawha, in West Virginia, shipping gas and steam coal to various points on the Great Lakes or on the Ohio River and lower Mississippi; and the New River, Flat Top, and Pocahontas fields in West Virginia, producing steam, gas, and coking coals of varying excellence, the best grades having no superior, which are shipped mostly to seaboard points, though an increasing tonnage is made into coke to supply blast furnaces at Pittsburg, Chicago, and various Ohio cities. In eastern Kentucky is the Jellico field, whence gas and steam coal is shipped to a wide territory, including seaboard cities, and in eastern Tennessee are several basins yielding gas, steam, and coking coals, used locally and shipped to compete with the Jellico coal. The important district in Alabama is about Birmingham: the coal is shipped to Atlantic and Gulf ports for steam- and gas-making, and a large proportion of the output is made into coke for use in local furnaces and foundries.

The eastern interior field covers western Indiana, nearly the whole State of Illinois, and part of Kentucky. The coal is of Carboniferous (Pennsylvanian) Age, but in general lies in thinner veins and is of poorer quality than that of the Appalachian field. Most of the output is used as a steam fuel by railroads and in the many manufacturing cities that lie in or near the field. Certain grades are much used as a household fuel. The field contains no first-class coking coal.

The northern interior field covers a large area in the southern peninsula of Michigan and has been opened chiefly by the mines near Bay City and Saginaw. The seams are comparatively thin, and the coal is generally of poorer quality than that of Indiana and Illinois. The output is used locally. The beds are of Upper Carboniferous Age.

The west central field extends from western Iowa across western Missouri, northwestern Arkansas, and eastern Nebraska and Kansas, through Indian Territory into Texas. The coal beds vary widely. In parts of the field the coal is barely more than lignite, while in northwestern Arkansas it approaches semi-anthracite. The markets supplied cover a great area. Fully half of the output is used by railroads, and of the other half at least 40 per cent is used for household purposes. The measures are Carboniferous.

The Rocky Mountain field includes the numerous disconnected areas lying in narrow belts along either flank of the range from the Canadian frontier southward for 1,000 miles; Montana, Utah, Wyoming, Colorado and New Mexico having mines. Along the flanks of the mountains and in the parks or plateaus in the main range the coal is largely bituminous; but eastward from the range the coal measures, which are of upper Cretaceous (Laramie) Age, are lignitic, and vast beds of lignite underlie the plains of Montana, Wyoming, and North and South Dakota. The mines now opened supply the great transcontinental railroads, the chief users. In places the coals make good coke, used by local smelting plants. The resources of the field are vast and but little developed.

The Pacific coast coal field is of Tertiary Age and most of the output is lignite. It includes some unimportant basins in California, several fields in Oregon, of which the Coos Bay has been most developed, and the Roslyn and Puget Sound fields in Washington, the former producing a good bituminous coking coal. The California and Oregon fields are of little more than local importance, but the Washington mines supply railroads and steamships and are an important factor in the coal trade of San Francisco.

The rank of the principal coal-producing States of the Union is shown by the following table compiled from figures published in the 'Engineering and Mining Journal.' The figures are for 1902, except that for Pennsylvania the 1901 figures are taken, owing to the anthracite output in 1902 being curtailed by a long strike of the miners. The figures given include coal and lignite:

States	Short Tons	States	Short Tons
Pennsylvania	149,777,567	Kansas	5,379,500
Illinois	31,000,000	Wyoming	4,900,000
West Virginia	26,162,173	Tennessee	4,800,000
Ohio	24,700,000	Maryland	4,565,311
Alabama	10,327,713	Missouri	4,250,000
Indiana	8,357,417	Virginia	3,100,000
Colorado	7,522,923	Indian Territory	3,000,000
Kentucky	6,421,266	Washington	2,690,789
Iowa	5,800,000	Arkansas	2,200,000

It will be seen that Illinois already produces about as much coal as France, and West Virginia produces more than Belgium. The production of Pennsylvania in a few years bids fair to equal that of Germany.

Coalition, The, in political history. (1) ENGLISH. In 1783, after the American War, there were three parties in Parliament, neither able to stand alone. The weakest (C. J. Fox «conscience» Whig) joined the second (Lord North, Tory), ousted the strongest (Lord Shelburne, opportunist Whig), and the coalition tried to pass an India bill with self-perpetuating offices. Fox had long denounced both North and George III. without stint personally as well as politically, and was a chief agent in debauching the Prince

of Wales (afterward George IV.); and the king was furious alike at his accession to power and North's ingratitude. As the two statesmen had professed utterly irreconcilable basic principles, the people were equally disgusted with what seemed a grossly corrupt bargain for the sake of office — though a different view is now taken. The king killed the India bill by threatening the Lords, dismissed the Coalition ministry, and made the younger Pitt premier; at the next election the Tories received an overwhelming majority, remained in power many years, and the name "Coalition" was long the most unsavory of bywords. (2) AMERICAN. In 1824, there being no electoral majority for President, the smallest (Henry Clay) party joining in electing the head of the second (J. Q. Adams); the largest (Andrew Jackson) considered this defeating the popular will, and when Adams later made Clay secretary of state, declared it to be in pursuance of a corrupt bargain, and gave it the name of the ill-savored Fox-North Coalition. The nickname was used for many years with damaging effect, though perfectly irrelevant, as the Clay and Adams parties were in close sympathy politically, and their heads not hostile personally. The Clay men much preferred a trained and gentlemanly statesman like Adams to one whom they regarded as an ignorant and violent demagogue, and Clay's position and ability entitled him to the place, which other great party leaders (Blaine, for example) have held later.

Coal Measures. See COAL; CARBONIFEROUS SYSTEM.

Coal Mining. Coal mining differs from metalliferous mining chiefly in the better ventilation required, the extent and regularity of mine workings, and the necessity of getting out the mine product with as little dust as possible. The principal gases found in coal mines are carbon dioxide, CO_2, heavier than air, suffocating, but not inflammable, called choke-damp by miners; carbon monoxide, CO, about as heavy as air, poisonous and inflammable, the dreaded white-damp of the miners; carburetted hydrogen, CH_4, light, not poisonous, but inflammable, the chief constituent of fire-damp; also, but less important, sulphuretted hydrogen, poisonous and inflammable, but easily detected by its odor. Of these gases, marsh gas, given off in large quantities in some mines, is the chief agent in coal-mine explosions. A mine is said to be fiery when the coal-seams give off much fire-damp. Many of the deeper coal-mines of Great Britain, France, and Germany are very fiery. The most fiery mines in the United States are in the anthracite region of Pennsylvania, the South Wilkes-Barre shaft at Wilkes-Barre being one of the most fiery mines in the world. A mixture of marsh-gas and air in certain proportions explodes violently on contact with flame. Coal-dust in the air makes a much smaller proportion of marsh-gas an explosive mixture.

To enable men to work in places where sufficient air to carry away the gas does not circulate, or to enable them to work in very fiery mines, safety-lamps are used. In a safety-lamp the flame is enclosed by wire gauze and cannot ignite gas in the air outside the gauze, unless the gauze is heated to the combustion point of the gas. The safety-lamp was invented by Sir Humphry Davy in 1815 and has been improved in various ways. Many patterns are in use; one of the latest types used in Pennsylvania and Germany is known as the Wolf lamp. The Hepplewhite-Gray lamp is much used in England. A safety-lamp indicates the presence of fire-damp by the lengthening of the flame.

Carbon dioxide and carbon monoxide given off by the coal in place are produced in the mined-out areas known as "gob." These gases are the chief constituents of after-damp, the gases resulting from an explosion of dust or fire-damp. They, rather than the shock, cause the terrible loss of life in mine explosions, since men may be killed by carbon monoxide without knowing they are in danger.

Good ventilation is thus a prime necessity in coal mining. It is sometimes secured by a furnace over a shaft, the fire producing a sufficiently strong up-current. But in all fiery mines, and generally in all large mines, large revolving fans, sometimes 35 feet in diameter, are used to circulate the air. The fans may exhaust or force in air (up-draft or down-draft); various types of mine fans are used, but the majority of those in service in Great Britain and at the larger mines in this country are modifications of the Guibal type.

As most coal-seams worked are a few feet thick, but of considerable extent, and as in this country at least, most coal-beds lie flat or dip at low angles, a coal-mine can be opened in a more regular way than a metalliferous mine. Two systems of mining are used — the pillar and room ("board and pillar"), and the long wall. The first, generally used in the United States, consists in taking out various portions of the coal as the work proceeds, from the mine-opening, and the remainder in working back toward the opening. The long wall system, used in certain bituminous districts in the United States, and extensively used in England, consists in taking out all the coal in a long face as the work advances from the mine-opening, the roadways and air-passages being protected by packs or walls. It is best suited for thin coal-seams with weak roofs, while the pillar-and-room system is best suited for thick seams with rock roofs. The two systems grade into each other.

Coal is broken from the face of the seam by the miner under-cutting it with his pick and then putting in a blast strong enough to bring down the coal. Black powder is generally used in this country. Abroad explosives making less flame are required by law in many districts, and in some of the very fiery German mines wedges operated by hydraulic power are used. To blast coal from the solid rock like an ore, though occasionally done in Illinois and elsewhere in this country is wasteful and dangerous. Fine coal is less valuable than lump, and dust greatly increases the danger of an explosion.

To under-cut the coal, machines are sometimes used. Those in general use in this country are of two types: the Harrison, or puncher type, with a reciprocating piston impelled by compressed air, carrying a cutting bit; and the chain machine, having an electrically driven chain carrying cutting teeth. The latter type, though not favored for fiery mines, is probably more used in newly opened mines, than the former. No machines are used in the Pennsylvania anthracite mines. Of the total bituminous coal (225,826,849 tons) mined in the United

States in 1901, 57,843,335 tons were under-cut by machines.

The coal, when broken down, is roughly sorted by the miner or his helper and loaded into mine cars which are hauled to the main haulage roads by mules. Here the cars from the various gangways are usually made up into trains (or "trips") and hauled to the shaft bottom or the entrance of the mine by a wire rope (tail-rope haulage), by a compressed air locomotive, or by an electric locomotive. Sometimes the cars are attached singly to an endless wire rope like cars on an ordinary surface cable road (endless-rope haulage). Mines of the shaft type are to be found in largest numbers in the hard-coal districts. The hard-coal mines are likewise the deepest. Occasionally an extreme depth of 1,500 feet is attained. Two other styles of mines are found in both anthracite and bituminous fields,—"drifts" and "slopes." The drift mine is dug straight into the mountain from one side. The passageway or heading may have an upward trend. The slope mine slants downward to the extent of perhaps 35 or 40 degrees, the main heading often measuring a mile or more in length.

Occasionally coal is found in quantities near the surface of the ground. This is true to-day in parts of Missouri. At both Hazelton and Summit Hill, in Pennsylvania, coal has been extracted by an uncovering operation known as "stripping," which is regarded as apart from mining proper. An interesting process also is "pocket mining," but this is practised comparatively little to-day. An outcrop of coal at various points on the side of the mountain suggests the possibility of a rich mineral vein. Digging is begun directly into the bed of coal projecting at the surface. This form of mining is seldom highly profitable, for when the digging has progressed at considerable expense to a point where the mine should be expected to pay, all operations are suddenly cut short by the encountering of solid rock, which, owing to some upheaval of the past, has "faulted" the vein of coal from its natural course. These pockets at intervals in the mountains where pocket mining is done present an interesting sight. About Shickshinny, Pa., they are numerous.

In shaft mines, and especially those of anthracite, mules are used very extensively. Where mechanical power is employed to haul trains in the main haulage-ways, these beasts bring the cars only from the side headings or the rooms. The mules do not see daylight for months at a time. In bituminous drift mines evolution has included the introduction of miniature trolley trains of 40 or 50 cars, each train being in charge of a motorman and brakeman. In anthracite drifts steam locomotives of a small and peculiar type, know as "hogs," haul the trains. In a slope mine cable trains transport the coal. One end of the cable is attached to the train, and the other winds upon a drum at the power-house. When the cable turns a corner it passes around what is known as a "bull wheel." Twenty-five one-ton cars may comprise a cable train of soft coal. Anthracite cars often hold four and a half tons. In soft-coal mines the man in charge of the cable train is called a "rope rider." In bringing his cars out of the mine he sits upon the ring which connects the cable with the train. In the anthracite slopes a man stands upon the side of a car ready to "sprag" the wheels when a stop is made. Spragging consists in throwing short but stout lengths of wood into the openings between the four spokes of the car wheel. The height of the bituminous vein is often not more than four or five feet, thus making the quarters of the miners rather cramped. In the mining of anthracite only two thirds loosened from the vein is of value. The miner must use good judgment in loading only the paying coal. To handle and transport chunks in which slate predominates is unprofitable. Even the better coal has more or less slate in it, while in bituminous coal the slate is principally at the top and bottom of the vein and not mixed with the product as mined.

Off from the main or side headings of a hard-coal mine "breasts" or "chambers" are opened. In bituminous fields these are known as "rooms." A tunnel or neck 40 to 60 feet long may connect the room proper with the main passageway. Beyond the neck the chamber may broaden out to a width of 30 or more feet, continuing indefinitely. The coal between the rooms forms what is known as a "rib" or "pillar." As the rooms begin to broaden to their maximum widths, timber props are placed between the floors and ceilings to support the loose rock and earth. Apart from supporting the great mass of solid rock, they are of little service.

When all the coal that it is practical to mine in the chambers has been extracted, the work of drawing the ribs between the rooms is begun, eventually allowing the rock above to cave in. In addition to securing the coal in the ribs, this process is necessary, that the weight of the mountain bearing upon the entrance to the mine may be lightened. As mining progresses, the weight is thrown upon the main heading, until, were it not for the drawing of the ribs, this main passageway would close.

When drawing a rib, the soft-coal miner keeps but one car beside him. He cannot tell how much of the rib he will be able to remove before the rock above his head will fall. The first warning of approaching danger is a drumming noise from the layer of stone overhead. Sometimes this noise may be heard hours before the final crash; in anthracite mines it may be perhaps weeks before. Again, it may come with marked suddenness.

The coal, when brought to the surface, is screened, and at many bituminous mines is then shipped as lump and slack. Sometimes it is broken and washed, and in the anthracite region of Pennsylvania, where coal is shipped in seven or more sizes, the coal, as it comes from the mine, is passed through the breaker.

A modern coal breaker built on the side of a hill at Mocanaqua, Pa., will serve to illustrate the construction and operations connected with this important branch of coal-production. This breaker is 300 feet in length and 180 feet in height. It is capable of turning out 1,000 tons of clean coal per day. Some breakers have a much larger capacity. The Mocanaqua breaker was originally built at a cost of $50,000, but with recent improvements and the installation of the latest machinery its total cost reaches $100,000. It is heated by steam.

The anthracite is brought to the head of the breaker over a little railway leading from the

mine in the side of the mountain. The coal, when dumped from the cars, passes over a screen 30 feet in length, through which the fine coal sifts. The big chunks next pass to the breaker proper, where rolls with sharp teeth crush it. It next runs into a screen which is cylindrical in shape, and not unlike a locomotive boiler in appearance. As the coal is handled in this device, it falls through perforations of different sizes, each size dropping into a separate chute. On benches at intervals on these chutes, sit the breaker boys, presided over by a foreman. As the coal passes slowly down the chute at their feet, these lads pick the slate from it and throw the refuse into a parallel chute. The inexperienced boys are always at the upper end of the chutes. They succeed in picking a part of the slate from the coal, and then it passes to the next workmen in line, who continue the operation until, by the time the product has reached the boys at the bottom of the chutes, it is pretty well cleaned. The coal is also washed to free it from dust. From the chutes the various-sized coal finds it ways into bins, from which it is discharged into cars.

Mechanical contrivances for sorting have recently been installed at great cost in modern breakers. These inventions are spiral in shape, and provide for ridding the coal of much of its slate by centrifugal force. But even with these machines the final operation must be performed by boys or men.

A large amount of the soft coal of Ohio and Pennsylvania is brought to the lower harbors of the Great Lakes, bound for the Northwest and Canada. The cars which carry this coal have a capacity of 100,000 pounds, whereas, in the early days of the coal industry in this country, coal cars scarcely carried 1,800 pounds. On reaching the lake ports, coal for Canada may be taken 60 miles across Lake Erie in car ferries. But the bulk of the coal that comes to the lake ports is unloaded directly into the holds of lake vessels by means of most wonderful and massive machines, which pick up a 50-ton car and dump its contents as quickly as a pail of coal could be emptied into the magazine of a stove. Some of these machines can be operated by three men, and yet have a capacity of 500 tons per hour. A large and modern coal vessel will carry a coal cargo of 6,000 tons. The cargo record is 7,800 tons. More than 2,500,000 tons of coal have gone to the head of the Great Lakes in a single season.

Historically considered, coal mining perhaps dates back to about the end of the 12th century. Coal, as an inflammable substance, appears to have been known to the ancients, and to the Britons before the Romans visited their island, it being found frequently in ravines and beds of rivers of a color and texture so decidedly different from the strata which in general accompany it; but as at that period, and for centuries afterward, the country was covered with immense forests, which supplied abundance of fuel for every purpose of life, there was no necessity for using coal as fuel. The working of coal, therefore, only became an object of attention as population and civilization advanced, when agriculture began to be studied, the woods cleared away, and the arts of civil life cultivated; accordingly we find that the working of coal in Great Britain, as an article of commerce, is comparatively of modern date. The first charter giving liberty to the town of Newcastle-upon-Tyne to dig coal was granted by Henry III. in 1239; it was then denominated "sea-coal," on account of its being shipped for places at a distance. In the year 1281 the Newcastle coal-trade had become so extensive and important that laws were enacted for its regulation. In Scotland coals began to be wrought much about the same time; and a charter was granted in the year 1291 in favor of the abbot and convent of Dunfermline, in the county of Fife, giving the right of digging coals in the lands of Pittencrieff, adjoining the convent. Coal began to be used for iron-smelting about the beginning of the 17th century. The working of coal gradually increased, though on a very limited scale, until the beginning of the 18th century, when the steam-engine was brought forward by Newcomen in the year 1705, and was applied to collieries in the vicinity of Newcastle about the year 1715. This machine produced a new era in the mining concerns of Great Britain, and, as it were in an instant, put every coal-field within the grasp of its owner. Collieries were opened in every quarter; and the coal-trade rapidly increased to an astonishing extent. This extension of the trade was greatly aided by James Watt, who so very much improved the construction and power of the steam-engine as to render it one of the most complete and most useful pieces of mechanism.

Coal Oil. See PETROLEUM.

Coal-tar, or **Gas-tar,** the black, opaque liquid obtained by condensation from the products of the distillation of coal. As it comes from the condensers it contains more or less water, which rises to the surface when the liquor is allowed to stand for a time, bringing with it the ammonia and ammoniacal salts that are present. The tar as thus freed from water is used in the crude form for a variety of purposes, notably as fuel, for the preservation of building-materials, and the manufacture of sheathing-paper. It is exceedingly complex in chemical constitution, something like 100 different substances having been recognized in it up to the present time, many of which are of great industrial importance. In the utilization of coal-tar for the manufacture of these, it is first roughly separated into parts by fractional distillation,— an operation that is rendered possible by the fact that the various constitutents have widely different boiling-points. The distillation is carried out in wrought-iron retorts, and the details of the operation vary somewhat among the different manufacturers. The scheme here given probably represents average practice.

The temperature of the retorts containing the tar being gradually raised, the first products to be expelled are certain gaseous or very volatile substances, such as sulphuretted hydrogen and carbon disulphide, which must be carefully

treated to avoid danger from fire, since their vapors form explosive mixtures with air. As the temperature gradually rises, other bodies are driven off, and the total product that is obtained at temperatures below 350° F. is kept separate, and designated «light oil.» This is treated with soda lye, sulphuric acid, and water, and is then redistilled, fractionally, in special apparatus and in a much more careful manner. By accurate regulation of the temperature, benzene, toluene, and the xylenes are successively obtained, followed by other products that are of less commercial importance.

That portion of the original tar which comes off at temperatures between 350° and 445° F. is known as «carbolic oil,» or as «heavy oil» (because it sinks in water), and serves as a source of two exceedingly important substances known as naphthalene and carbolic acid. The former separates out from the heavy oil upon cooling. It is then pressed, treated successively with caustic soda and with sulphuric acid, and redistilled. When purified, it is used in the manufacture of dyes. The liquor from which the naphthalene has crystallized out is shaken with caustic soda solution to extract the carbolic acid and cressol. Upon standing, the aqueous solution containing those substances rises to the top and is removed. Sulphuric acid is then added to it, when the carbolic acid and cressol separate in an oily form. Carbolic acid is greatly used as a disinfectant, and as a raw material for the manufacture of numerous other important substances.

That part of the original tar which distils between 445° and 520° F. is known as «creosote oil,» and is used for the preservation of timber. This portion consists mainly of carbolic acid, cressol, anthracene, and naphthalene. That part of the tar which passes over at temperatures above 520° F. is known as «anthracene oil,» or «green grease,» and is used for the manufacture of anthracene (q.v.), and hence alizarin (q.v.) and the alizarin colors. The final product that is left in the retorts after the extraction of the anthracene oil is called «pitch,» and is used in the manufacture of artificial asphalt.

It need hardly be said that when a manufacturer is concerned with only a limited number of the coal-tar derivatives, he modifies the process of distillation in accordance with his immediate needs, so as to obtain the greatest yield that is economically possible of the particular substances in which he is interested. Hence the temperature-limits that are given above, for the various portions of the distillate, are subject to certain modifications according to the special end in view. See COAL-TAR COLORS.

Coal-tar Colors, the coloring matters that are artificially prepared from substances occurring in coal tar. They are exceedingly numerous, and are mostly of complex chemical constitution, belonging to the group known as aromatic compounds (q.v.). The coal-tar colors are exceedingly important in the arts, and are used in enormous quantities in dyeing and calico-printing. In popular language they are often called aniline colors. This designation is incorrect, however, for although they include the colors of the aniline class they also include derivatives of phenol, anthracene, and other bodies. Some prejudice exists against the coal-tar colors in the public mind, because they are believed to be less permanent than the natural animal and vegetable colors, for which they are substituted. This criticism was quite justifiable some years ago, but a considerable number of coal-tar colors are now known which are fully as «fast» as the natural ones, and in some cases the coal-tar color has a decided advantage in this respect. England may be regarded as the original home of the coal-tar color industry, but in recent years it has passed largely to Germany and France, the change being due in large measure to the attention that is paid in the educational institutions of the latter countries to the subject of synthetic chemistry. Following are a few of the more notable events in the history of the development of the coal-tar color industry, as given by Benedikt: Naphthalene was first discovered in tar in 1820 by Garden; anthracene in 1832 by Dumas; and phenol in 1834 by Mitscherlich. Faraday discovered benzene in 1825, but its presence in coal-tar was not recognized until 1845, by A. W. Hofmann. In 1826 Unverdorben discovered aniline among the products obtained in the dry distillation of indigo, and in 1834 Runge proved its existence in coal-tar, and observed that it gives brilliant colors when brought in contact with chlorid of lime. In 1834 Mitscherlich discovered nitrobenzene, and in 1842 Zinin showed that aniline can be manufactured by the reduction of nitrobenzene. The last-mentioned discovery was of exceeding importance, for although aniline occurs in coal-tar it is in such small quantities that it could not be profitably extracted on a commercial scale. In 1854 Bechamp greatly improved the process of manufacturing aniline from nitrobenzene, and in 1856 Perkin prepared mauveïne (the first aniline dye) on a large scale. In 1858 A. W. Hofmann published a paper in which he showed that magenta (aniline red) can be prepared by the action of carbon tetra-chlorid upon aniline, and in 1859 Verguin first manufactured magenta in quantity. During the next few years various other colors were discovered and placed on the market, and aniline black was discovered by Lightfoot in 1863. Pelletier and Walter discovered toluene in 1837, and in 1848 Mansfield showed that this substance occurs in coal-tar. The coal-tar color industry was greatly stimulated when Graebe and Liebermann effected the synthesis of alizarin in 1868, thereby opening up a new and important field of chemical activity. Previous to this date alizarin was obtained from madder-root, but it is now almost exclusively manufactured from anthracene. Baeyer produced the first eosin dye in 1874. The synthesis of indigo was the result of a long series of investigations, the final step in which was taken by Baeyer in 1878; and in 1880 a German company placed a substance known as nitrophenyl-propiolic acid on the market, for depositing artificial indigo upon fibres by Baeyer's method. Other methods for the artificial manufacture of indigo have since been discovered, but the natural dye is still largely used in spite of all efforts to displace it.

The marks that are used in commerce for designating the shade of a color consist usually of certain letters affixed to the name of the color to be described. Thus R is used for red, O for orange, J or G for yellow (Fr. *jaune;* Ger. *Gelb*), B for blue, and V for violet. Thus «Scarlet RR» or «Scarlet 2R» signifies a scarlet whose tint inclines toward red, and the doubled

R signifies that an intermediate color is recognized, whose tint lies between that here specified and the pure scarlet. Aniline blue occurs in a reddish shade which is designated as "Aniline blue R"; while the finest quality of aniline blue is designated as "Aniline blue 6B."

Much attention has been paid to the connection between the color of a substance and its chemical constitution, but no absolute rule can be given for predicting the color of a compound whose formula is known. In the case of the aromatic series, however (which is of special interest to the student of coal-tar colors), the following may be said: All of the aromatic hydrocarbons are colorless (or white), and the same is true of such of their mono-substitution compounds as are obtained by replacing one atom of hydrogen OH, NO_2, or NH_2. If two hydrogen atoms are replaced, the resulting compound is also colorless if the radicals introduced are alike. If they are unlike, and one of them is NO_2, then the resulting compound is colored. For example, benzene, C_6H_6, is colorless, and so also are its derivatives, aniline ($C_6H_5.NH_2$) and nitrobenzene ($C_6H_5.NO_2$), which are obtained by replacing one atom of hydrogen by NH_2 and NO_2, respectively. But if a second atom of hydrogen in the benzene nucleus of aniline be replaced by NO_2, we have the compound $NO_2.C_6H_4.NH_2$, which is known as nitroaniline and is yellow. The presence of certain atomic groups in the molecule of a substance appears to have a strong influence, also, upon the color of the compound. This is particularly noticeable in the quinones, which contain the group .O.O., and in the azo compounds, which contain the group .N:H. . The difference between a colored substance and a coloring matter, or dye, must be borne in mind, however. A dye is a substance which unites directly with the animal or vegetable fibres of the fabric to which it is applied, or with a mordant with which those fibres are impregnated. According to Witt, a true dye must contain two species of molecular groups, one of which is called the chromophor ("color-bearer"), while the other serves to make the compound acid or basic, so that it can form salts. The groups NO_2, .N:N., and .O.O. are examples of chromophors, Compounds that contain chromophors, but are neither acid nor basic, are called chromogenes ("color-generators"). They are not dyes, but may be transformed into dyes by the introduction of a salt-forming group such as OH or NH_2. Azobenzene, $C_6H_5.N:N.C_6H_5$, is a colored substance, but it is not a dye. It is a chromogene, however, because it contains the chromophor-group .N:N.; and if one of its hydrogen atoms is replaced by the group OH, the compound $C_6H_5.N:N.C_6H_4.OH$, known as oxyazobenzene, is obtained, which is a true dye. Again if one of the atoms of hydrogen in azobenzene is replaced by NH_2, the compound $C_6H_5.N:N.C_6H_4.NH_2$ is obtained; this is also a true dye, and is known to chemists as amidoazobenzene. (Consult: Hjelt, 'Principles of General Organic Chemistry,' from which these examples are taken.) Coloring matters that are basic in nature are always used, in dyeing, in the form of salts; that is, it is the compounds of these substances with acids that are used, and not the free bases themselves. "Substantive" coloring matters are those that are directly absorbed from solution by the fibre to be dyed. "Adjective" coloring matters are those that are not directly absorbed in this manner, but which require the fibre to be first "mordanted," or charged with certain metallic salts, or "animalized" with albumen, or treated in some other manner, before the dyeing can be done.

Classification.— It is impossible to give an entirely satisfactory classification of the coal-tar colors. The following scheme is due to Benedikt, and appears to be as good as any. (See Benedikt, 'The Chemistry of the Coal-Tar Colors,' for a full account of these colors and of their chemical relations.)

1.—Aniline Dyes.
- (a) *Rosaniline Group.*
- (b) *Indulines and Safranines.*
- (c) *Oxazines.*
- (d) *Aniline Black.*
- (e) *Thionines* (coloring matters containing sulphur).

2.—Phenol Dyes.
- (a) *Nitro Bodies.*
- (b) *Nitrous Derivatives* (coloring matters formed by the action of nitrous acid on phenols).
- (c) *Rosolic Acid.*
- (d) *Phthaleins and Indophenols.*

3.—Azo Dyes.
- (a) *Amidoazo Dyes.*
- (b) *Amidoazo Sulphonic Acids.*
- (c) *Oxyazo Dyes.*

4.—Artificial Indigo.

5.—Anthracene Dyes.

Aniline Dyes.— *Rosaniline Group.*— The coloring matters belonging in this group may be regarded, for the most part, as derived from two fundamental "mother substances," known respectively as triphenylmethane and tolyldiphenylmethane. Triphenylmethane, $C_{19}H_{16}$, is (in theory) obtained from methane, CH_4, by replacing three of the hydrogen atoms by three phenyl radicals. It therefore has the constitutional formula

$$C\begin{cases} C_6H_5 \\ C_6H_5 \\ C_6H_5 \\ H \end{cases}$$

The carbon atom which serves to unite the three phenyl radicals to the single hydrogen atom is known as the methane carbon. Tolyldiphenylmethane is derived from triphenylmethane by replacing an atom of hydrogen, in one of the phenyl radicals, by methyl, CH_3. Numerous basic substances are obtainable from these by replacing one hydrogen atom in two or three of the phenyl groups by NH_2, and by subsequently replacing the hydrogen of the NH_2 by methyl, phenyl, etc. The bases so obtained are colorless, from which circumstance they are known as the "leuco-bases." By oxidation they are converted into the color bases, which are also colorless for the most part. Prominent among the color bases are the two substances known as rosaniline and pararosaniline. Rosaniline (q.v.) is most conveniently obtained by oxidizing a mixture of aniline and liquid orthotoluidine. (See Toluidine.) Pararosaniline is is formed in the same way from aniline and solid paratoluidine. Pararosaniline may be prepared, however, from triphenylmethane, and rosaniline from tolyldiphenylmethane. The dyes that are classed under the rosaniline group are the salts of the color bases referred to above. Thus magenta (or fuchsin) is a mixture of the hydrochlorids of rosaniline and pararosaniline, and methyl violet is the hydrochlorid of pentamethylated pararosaniline. Auramine is the

hydrochlorid of the more complicated base imidotetramethyldiamidodiphenylmethane.

Indulines and Safranines.— The indulines and safranines are distinct from each other in all respects, save that they are derived from the same mother substances. The induline bases are formed when aniline acts upon an amidoazo compound, such as amidoazobenzene (or aniline yellow), with liberation of ammonia. The best-known base of this sort is violaniline. When the same mother substances are caused to interact so that oxidation occurs and hydrogen is liberated (instead of ammonia), safranine is formed. Blackley blue is one of the best known induline colors, and magdala red is one of the best known of the safranine series.

Oxazines.—This group contains coloring matters that may be regarded as derived from phenoxazine,

$$C_6H_4 <^{NH}_{O}> C_6H_4$$

It includes muscarin, gallocyanin (or solid violet), nile blue, resorcin blue, and prune.

Aniline Black.— This substance is formed by the cautious oxidation of aniline hydrochlorid. If the oxidation is not sufficient, violet or green colors are obtained; while if it is excessive quinone is formed. Aniline black may also be produced by the electrolysis of a concentrated solution of an aniline salt.

Thionines.— Thionine coloring matters are obtained when the hydrochlorids of certain of the aromatic diamines are dissolved in a solution of sulphuretted hydrogen gas, and subsequently oxidized by ferric chlorid. Methylene blue is the only color of this group that is in extensive use. It is prepared from dimethylaniline, $C_6H_5N(CH_3)_2$, by treatment with hydrochloric acid and sodium nitrite, and subsequent sulphurization with sulphuretted hydrogen, and oxidation with ferric chlorid.

Phenol Dyes.— *Nitro Bodies.*— This group contains substances that are derived from phenol, and are mostly yellow in color. Picric acid, which is one of the best-known examples, is formed by treating carbolic acid (phenol) with nitric acid according to the following equation:

$$C_6H_5.OH + 3HNO_3 = C_6H_2(NO_2)_3.OH + 3H_2O.$$
Phenol. Picric acid.

Phenyl brown, Victoria yellow, and naphthol yellow are further examples of dyes of this class. Aurantia, which has the formula $N(C_6H_2(NO_2)_3)_3.NH_4$, may be placed in this group. The acid of which it is the ammonia salt is obtained by the action of nitric acid upon methyldiphenylamine, $N(C_6H_5)_2CH_3$.

Nitrous Derivatives.— This group consists of those dyes that are obtained by the action of nitrous acid upon such bodies as resorcin, naphthol, thymol, and carbolic acid. Fluorescent resorcin blue is the only example of the group that is in extensive use in the arts. If resorcin is dissolved in sulphuric acid and treated with nitrous acid (obtained by adding nitrite of sodium to strong sulphuric acid), a red substance known as diazoresorufin is obtained, having the formula $C_{18}H_{10}N_2O_5$. When this body is treated with bromine, a hexabrominated substitution product is obtained, whose ammonium salt is the commercial resorcin blue.

Rosolic Acid.— The rosolic acids may be regarded as rosanilines in which the amido groups have been replaced by hydroxyl, OH. They may be prepared from the rosanilines or from triphenylmethane. They are classed as phenol coloring matters, however, because they (or at least their more common representatives, the corallins) are more conveniently prepared from phenol. Yellow corallin is obtained by the action of strong sulphuric acid upon phenol, followed by the prolonged action of oxalic acid. It consists chiefly of pararosolic acid (aurin) and of derivatives of rosolic acid. If yellow corallin is heated with ammonia to about 270° F., red corallin, $C_{19}H_{13}O_2NH_2$, is formed.

Phthaleïns and Indophenols.— The indophenols are formed by the simultaneous oxidation of a phenol and a paradiamine. Commercial indophenol is a blue powder or paste prepared from nitrosodimethylaniline and alpha-naphthol, and is used for obtaining indigo blue shades upon cotton and wool. The phthaleïns are manufactured from phenols and phthalic acid, or phthalic anhydrid; but they may also be regarded (like rosaniline and rosolic acid) as derivatives of triphenylmethane. When a phenol is heated with phthalic anhydrid at moderate temperatures, water is eliminated, and two molecules of the phenol combine with one of the anhydrid, the compound so obtained being known as the phthaleïn of the corresponding phenol. The phthaleïns of resorcin and of pyrogallol are by far the most important ones in the arts. The anhydrid of resorcin phthaleïn (known as "fluoresceïn") is obtained by heating resorcin with the correct molecular proportion of phthaleïn anhydrid to about 390° F., until the mass becomes solid and no more steam is given off. The product so obtained is cooled and pulverized, and sold in this form for the manufacture of the eosins, for which it serves as practically the sole commercial source. Pure fluoresceïn is a yellowish-red crystalline substance, with feebly acid properties. Fluoresceïn is seldom used as a dye, but its sodium salt (uranin) is employed to some extent in printing upon woolens. The empiric formula for pure fluoresceïn is $C_{20}H_{12}O_5$; and its nitro and halogen substitution products are known as eosins. Thus bromine forms, with fluoresceïn, the substitution product $C_{20}H_8Br_4O_5$, which is known to the chemist as tetrabromfluoresceïn, and to the dyer by various names such as "Eosin yellowish," "Eosin J," and "Soluble eosin." A somewhat similar compound, in which chlorine is the substituted halogen, is known as "Aureosin J."

Azo Dyes.— These coloring-matters all contain the binary molecular group .N:N., and may be prepared by the action of phenols or aromatic amines upon diazo compounds, which contain the group in question. See *Azobenzene*, under Benzene.

Amidoazo Dyes.— This group contains only three representatives that are of commercial importance,— aniline yellow, chrysoidine, and Bismarck brown. They are all derived from azobenzene. Thus aniline yellow is the hydrochlorid of amidoazobenzene, chrysoidine is the hydrochlorid of diamidoazobenzene, and Bismarck brown is the hydrochlorid of triamidoazobenzene.

Amidoazo Sulphonic Acids.— Helianthin will serve as an illustration of this group of coloring matters. It is prepared by the action of dimethylaniline upon diazobenzene sulphonic

acid, and occurs in commerce in the form of the sodium salt,

$$C_6H_4 \begin{matrix} N:N.C_6H_4.N(CH_3)_2 \\ SO_3Na \end{matrix}$$

On silk and wool it yields a fiery orange color. Acid yellow, which consists chiefly of the sodium salt of the disulphonic acid of amidoazobenzene, also belongs in this group, and while it is not used alone to any great extent, it is employed in various combinations, and large quantities of it are also manufactured for use in the preparation of the other diazo coloring matters.

Oxyazo Dyes.— These may be regarded as derived from oxyazobenzene, $C_6H_5.N:N.C_6H_4.OH$, which was first prepared in 1866 by Peter Griess. They are far too numerous and varied to be considered in any general encyclopædia, and they are not treated in any considerable detail even by Benedikt, who says:

> The immense number of coloring matters belonging to this group is easily accounted for if we consider that every primary amine belonging to the aromatic series, after having been converted into a diazo compound, will combine with almost any phenol or derivative of a phenol (in which the hydrogen atom standing opposite the hydroxyl group is not substituted) to form an azo dye.

The first patent for a dye of this group was taken out by Griess in 1878, and since that date many others have been taken each year.

Artificial Indigo.— Numerous methods for the artificial preparation of indigo are known, but all are too expensive in execution to displace the natural product to any great extent. For calico printing, extensive use is made of an artificial product known as "propiolic acid," which can be converted into indigo, upon the fibre, by the use of suitable reducing agents. The blue that it gives is not entirely pure, but the printing process is far simpler than when the natural indigo is used, and for this practical reason propiolic acid is preferred. In its manufacture cinnamic acid is first prepared by heating benzal chlorid, $C_6H_5CHCl_2$, with sodium acetate. The cinnamic acid so obtained is treated with fuming nitric acid, and the ortho-nitro-cinnamic acid that is formed is isolated. This is brominated with free bromine, and afterward boiled with potash and alcohol. Ortho-nitrophenyl-propiolate of potassium is formed, from which ortho-nitrophenyl-propiolic acid (which is the substance commercially known as propiolic acid), $C_6H_5(NO_2)O_2$, is liberated upon the addition of hydrochloric acid. This is transformed into indigo blue, $C_{16}H_{10}N_2O_2$, upon boiling with reducing agents, according to the equation, $2C_6H_5(NO_2)O_2 + 2H_2 = C_{16}H_{10}N_2O_2 + 2CO_2 + 2H_2O$.

Anthracene Dyes.— The coloring matters derived from anthracene (q.v.) contain hydroxyl (OH), and are slightly acid in nature, forming colored "lakes" with metallic oxides and with the alkaline earths. They require mordants, but they are faster than most of the other coal-tar colors, and are also faster than most of the natural dyes. Alizarin, purpurin, anthrapurpurin, and flavopurpurin are among the better-known coloring matters obtained from anthracene. (See Alizarin and Purpurin.) Alizarin is used in dyeing for red, black, blue, orange, and violet, and has replaced the madder-root dyes almost absolutely.

Many of the more important substances connected with the manufacture and use of the coal-tar colors will be found under separate headings. The principles that underlie the application of the coal-tar colors in the dyer's art are outlined in the article on Dyeing (q.v.). In addition to Benedikt's excellent work, consult: Hurst, 'Dictionary of the Coal-Tar Colors'; Nietzki, 'Chemistry of the Organic Dye-Stuffs'; and Schultz and Julius, 'Systematic Survey of the Organic Coloring Matters.'

A. D. Risteen, Ph.D.

Coaling Stations, depots established by maritime governments at various important points throughout the world, where the ships of the navy may obtain supplies of coal. The utility of such stations, when properly fortified, as points of refuge, defense, and repair for warships in the event of war can hardly be over-estimated. The more important of British stations are Aden, at Trincomalee (Ceylon), Singapore, Hong Kong, Sierra Leone, St. Helena, Mauritius, Jamaica, and Simon's Town (Cape Colony). During 1898–1900 the United States established coaling stations for its navy at San Juan, Porto Rico; Pearl Harbor, Hawaii, Pago Pago, Samoa; Cavite, near Manila; at the chief port of Guam, Ladrone Islands; and at convenient points in Cuba; and coal "piles" at La Paz, Mexico, and at several points in Alaska. Some of the British coaling stations supply both naval and mercantile vessels.

Coamings, in naval architecture, a framework surrounding the opening of a hatchway, designed to stiffen the parts weakened by the opening, and, by being raised above the deck, to keep water from entering the hold. A rabbet or groove in its inside upper edge receives the hatches.

Coan, kō'ăn, **Titus,** American missionary: b. Killingworth, Conn., 1 Feb. 1801; d. Hilo, Hawaii, 1 Dec. 1882. After spending several months (1833–4) on a dangerous exploring expedition in Patagonia, he went to the Sandwich Islands (1835), occupying the Hilo station 47 years, and in that time converting 14,000 natives. He wrote: 'Adventures in Patagonia' (1880); 'Life in Hawaii' (1881).

Coan, Titus Munson, American physician and critic, son of Titus Coan (q.v.): b. Hilo, Hawaii, 27 Sept. 1836. He now resides in New York, where he founded in 1880 the New York Bureau of Literary Revision. He has written: 'An Ounce of Prevention'; 'Topics of the Time' (edited).

Coanza. See Kwanza.

Coast and Geodetic Survey, United States. To all nations whose territory touches the sea or other water navigable to any extent, or who have any interests in the commerce of the sea, a full and complete knowledge of the coast — its nature and form, the character of the sea bottom near it, the location of reefs, shoals, and other dangers to navigation, the direction and strength of currents, and the character and amount of magnetic disturbance — is of the greatest moment.

To supply this knowledge the governments of all maritime nations have in modern times executed surveys of their coasts by the most exact methods.

Some idea of the importance to this country of like operations and their extent may be

formed when it is remembered that the coast line of the United States and Alaska, measured along its general trend, exceeds 10,000 miles in length. To represent the actual shore line as surveyed, which includes all the islands, bays, sounds, and rivers in the littoral or tidal belt, these figures would have to be multiplied many times. To this must be added the shore line of Porto Rico, the Hawaiian Islands, and the Philippine Islands. The length of the general shore line of only 14 of the principal islands of the latter group exceeds 11,000 miles.

On the recommendation of President Thomas Jefferson, Congress in 1807 authorized the establishment, as a bureau under the secretary of the treasury, of a national coast survey. For the purpose of furnishing geographic positions and other data to State surveys, the scope of the bureau was in 1878 enlarged, and its designation became the United States Coast and Geodetic Survey.

The plan upon which it is organized is the outgrowth of trial and experience during the first 50 years of its existence, and from its inception almost every year has seen some new feature added or some old one discarded.

Under the direction of a superintendent there are two great divisions of its work. They are the field and the office.

The field work includes all of the practical operations of the survey on land and sea.

Except in time of war, in accordance with the plan of reorganization of 1843, the work upon the land was divided between civilian assistants and officers of the army, the hydrographic parties being in charge of naval officers. Since 1861 no officers of the army have been connected with the survey, and the conduct of the hydrographic work was about equally divided between the civilian assistants and naval officers until 1898, when the naval officers were relieved, and since which time none have been assigned to the survey.

The civilian assistants consist of a body of trained experts permanently attached to the survey, and numbering between 50 and 60.

The service owns a fleet of 11 steamers and 6 schooners, besides steam and motor launches.

The office is that part of the establishment which receives the records, original sheets, etc., representing the results of field work. They are registered and deposited in the archives until in turn they are taken up for examination, computation, and adjustment, prepared for publication, and finally published. Original charts are reduced or enlarged, engraved, electrotyped, and printed.

For the convenience of administration the operations of the main office at Washington are carried on by eight divisions, each having some specified portion of the general work to perform. In these divisions are employed the required force of clerks, draftsmen, computers, engravers, instrument makers, printers, etc., numbering in all about 145.

There are sub-offices at San Francisco, Seattle, Honolulu, and Manila.

Many of the field operations of the survey being geodetic in their nature, a system of primary triangulation, together with the determination of geographic positions by means of astronomic methods, must furnish the foundation upon which the whole rests. On the Atlantic coast a chain of triangles, beginning at the eastern boundary of Maine, stretches to the Gulf, constituting an oblique arc, which, besides serving as a basis for the coast triangulation, adds much to our knowledge of the figure of the earth.

An extensive system of triangles extends across the continent along the 39th parallel of latitude, connecting the surveys of the two coasts and furnishing a basis for the surveys of the 13 States through which it passes. It is also one of the longest arcs now available for the determination of the figure of the earth. Another triangulation system is being executed along the 98th meridian. Its extension southward through Mexico has already begun, and there is a prospect of its extension northward through the British possessions.

In connection with these principal systems, the triangulation has been considerably expanded in the New England States, New York, and several western States, including California, where some exceptionally large figures were introduced. The longest line so far observed is that from Mount Helena to Mount Shasta, over 190 miles in length.

A tertiary triangulation for topographic and hydrographic purposes has been completed along the entire Atlantic and Gulf coasts, and over more than half of the Pacific coast, except Alaska. Much progress has been made in the latter territory by methods which possess a sufficient degree of accuracy for immediate use and are capable of rapid execution.

In the determination of astronomic positions the exact methods originally developed in the survey have been adhered to and perfected. The methods of using the zenith telescope for latitude and the telegraph for longitude have been constantly improved.

The topographical operations have been mostly restricted to a narrow margin, not often over three to five miles wide, along the coast and surrounding harbors, bays, and rivers up to the head of tide water. In some cases it has been somewhat more extensive, notably in the survey of the District of Columbia, where the scale was 1-4800 and the contour interval only five feet.

The hydrographic operations have extended as far out from the coast as was necessary for the interests of navigation, and have included, all harbors, channels, bays, etc., as far as the work has gone.

Deep-sea soundings have been made extensively, especially in and about the Gulf Stream.

Much attention has been given to tides, and continuous series of tidal records have been obtained at several important points.

The results of the operations of the survey in connection with the study of terrestrial magnetism can be found on its charts and in its other numerous publications on the subject. In addition to the determination of the magnetic elements at many widely distributed points and their frequent redetermination for secular variation, special observations are also made at certain base stations, with the aid of self-registering instruments, for the purpose of obtaining the record of the numerous variations of the earth's magnetism continually taking place.

The study of the force of gravity as a part of the great geodetic problem has received attention for 30 years, and the survey has of late years developed methods and instruments which will lead to a great extension of the work at a less cost

than by older processes, but without lowering the standard of accuracy.

A network of precise levels covering in a general way the eastern half of the United States, connecting the Atlantic Ocean, the Gulf of Mexico, and the Great Lakes, has been executed, and in the future will be extended to the Pacific Ocean.

Throughout its history the survey has constantly been called upon to determine boundary lines, both State and national, which have been in dispute.

At the present time, with its assistance, three State boundaries are in the process of settlement.

The Office of Standard Weights and Measures, charged with the maintenance of the standards of length, weight, and capacity, which was under the direction of the superintendent of the Coast and Geodetic Survey until 30 June 1901, is now an independent organization under the title of the «National Bureau of Standards.»

The principal publications of the survey consist of about 500 different charts; tide tables for all the principal and many minor ports; a monthly edition of 4,700 copies of a circular known as 'Notice to Mariners,' containing notes of all changes along the coast; 'Coast Pilots,' containing minute sailing directions for all navigable waters along our coast; and the 'Report of the Coast and Geodetic Survey', which contains, besides the reports of the superintendent and his assistants on the conduct of the work, a series of special reports upon various technical and scientific operations of the service. For details of the work of the bureau see CHARTS; COAST PILOTS; GEODESY; GRAVITY; HYDROGRAPHY; LEVELING; TRIANGULATION; TOPOGRAPHY; TIDES; etc.

O. H. TITTMAN,
Superintendent.

Coast Defense, systematic protection of a country against hostile attack along its coastlines. In providing such defense a nation will consider not only the safety of its territory, but also the security of its commercial interests. In any system of coast defense a good navy is the most important feature; and so essential is it considered, that all other means are regarded as adjuncts or auxiliaries of the navy. (Along a well-defended coast, in suitable places, are stations or points of support where is stored the requisite material for building, equipping, repairing, and supplying naval vessels, and where provision is made for furnishing men when additional force is needed. Forts are built in places where the coast artillery may co-operate with the navy in obstructing the advance of an enemy intending to capture a city or to invade the country; where their guns may command the entrance to a harbor or other approach by water; wherever they may cripple the enemy's attack on the defensive fleet, leaving it free to attack the enemy in turn; where forts may assist each other, and co-operate in repelling an invasion or preventing a blockade or a bombardment; where minor channels of approach may be closed or guarded, thus enabling the navy to give entire attention to the main channel, etc. Torpedo-boats, harbor-mines, the searchlight, which illuminates the harbor and permits detection of the enemy's manœuvres, are all valuable aids for the forts. The unfortified coast, as well as the land approaches to cities, must be defended in time of war by whatever means are at command.

The guns for coast defense change with the places and purposes for which they are to be used. To pierce the side armor of battleships, the flat trajectory, high-power guns are used; for projectiles intended to fall on the decks of an enemy's ships, the high-angle guns (mortars or howitzers) are employed. The number and size of guns vary with the estimated number and calibres of those which may be brought to bear by an enemy. From the depth and length of the channel may be determined how many and what classes of ships the enemy can operate in it, their armament, etc., and from these data the number and calibres of guns needed may be calculated.

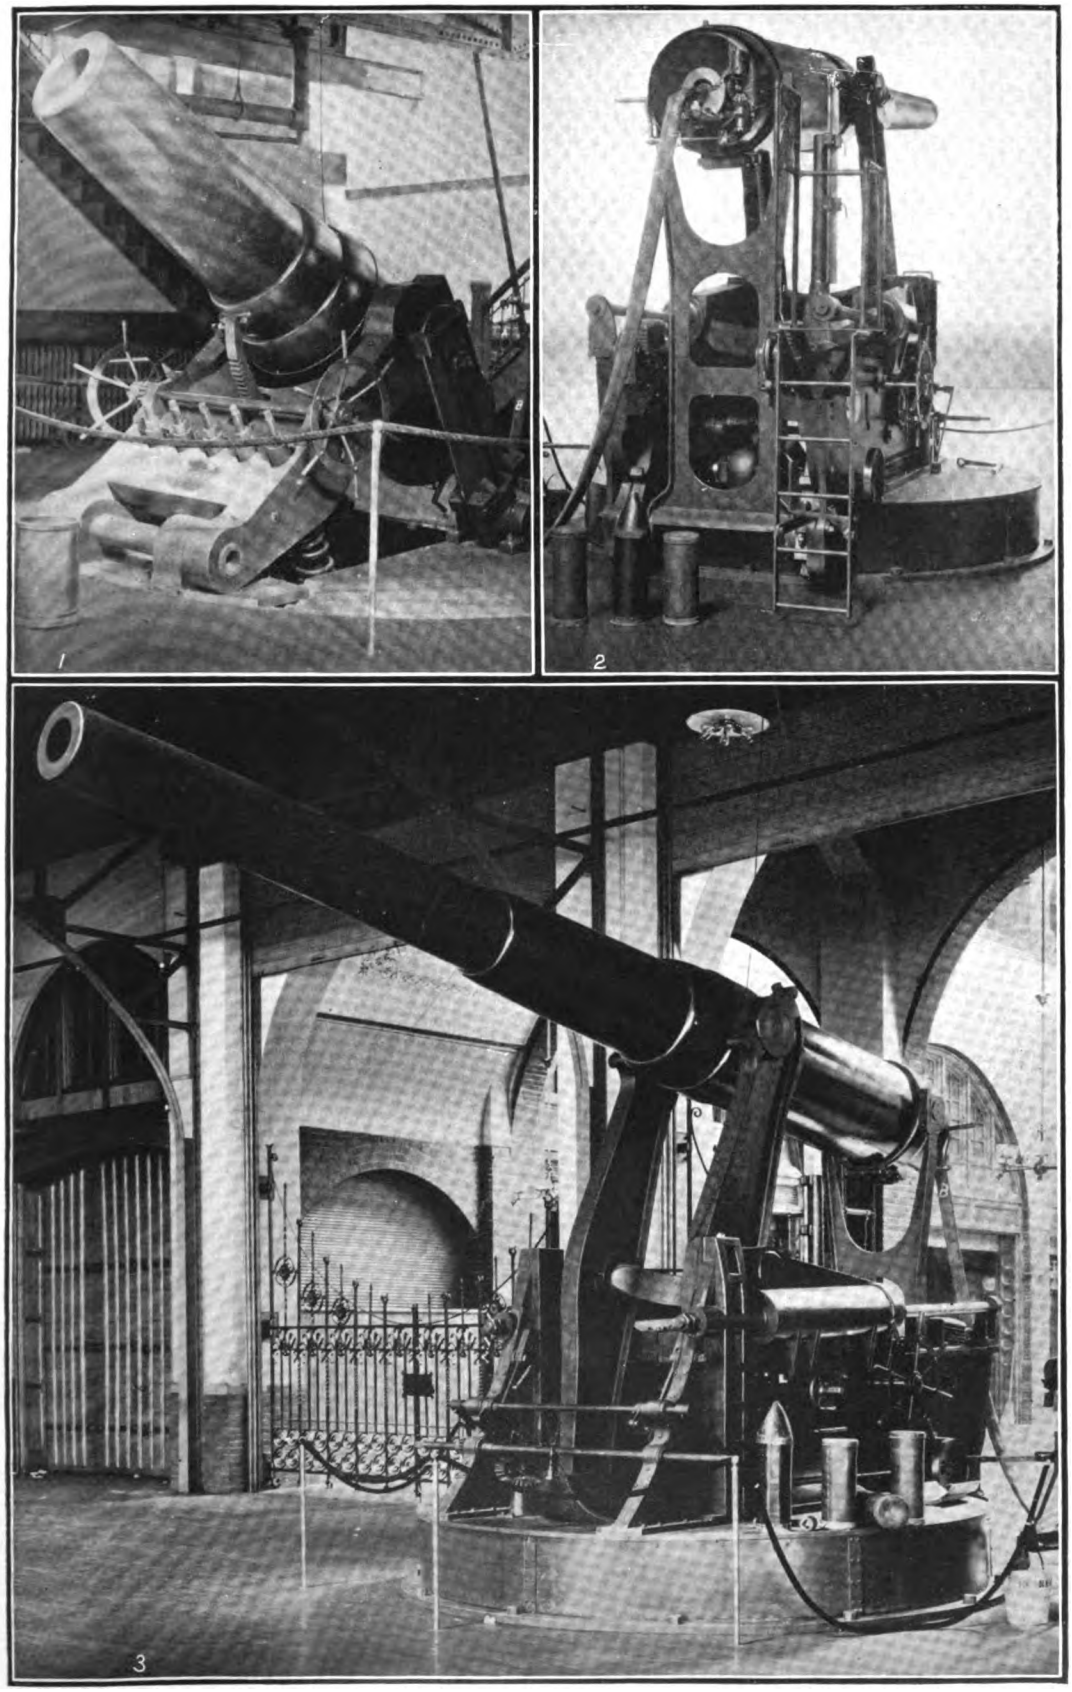
The difficulty of obtaining naval supplies after war has been declared makes it necessary to store them during times of peace. Besides quantities of supplies at points of support for the navy, important harbors are generally equipped with torpedo storehouses, cable-tanks, mining casements, etc., for use in emergencies.

The tactics of coast defense have changed greatly since the beginning of the last decade of the 19th century. Besides defense against attack upon fortified places preparation is also necessary for resisting assaults upon unfortified coasts. The length of the United States coast-line makes its secure fortification a matter of great difficulty and expense.

Methods of reconnaisance are important for defense as well as for attack. The defense seeks to veil all batteries, and even in times of peace a journey along a fortified coast might not discover many forts or other means of defense. The enemy, in preparation for attack, or in action, seeks to discover the nature and strength of the defenses; and the defense in turn uses all possible methods of ascertaining the number and classes of the enemy's ships, the probable line of attack, and whatever else may be discoverable in regard to his strength and purposes. Pictures of every important warship in the world are studied by certain officers of every navy, and so close are some of these studies that a war vessel may be recognized by such an officer in any position in which he sees it. For the important work of reconnaisance observation stations are fully equipped for the coast artillery, photographs, drawings, descriptions of warships, telescopes, etc., for use in procuring information of the enemy, being fully provided.

In times of peace a country may, to its peril, neglect its coast defense, as was shown by the condition of the defenses of the United States at the beginning of the war with Spain. European nations have for years divided their tide-water regions into naval zones, and have assigned to each zone reserves, torpedo divisions, lighthouse establishments, coast-guard services, and signal stations.

In France the naval authority is made paramount, and all naval affairs are in charge of the minister of marine, assisted by a chief of staff. Not only the mobile defenses, but the coast fortresses, submarine mines, and the fort batteries are under control of the minister or his aid. In June, 1903, the general board of the United States navy made public the details of a plan for its reorganization with a general staff



[1] A 12-Inch Mortar. [2] Rear View of 8-Inch Gun Showing Compressed-Air Attachment and Dummy Shell.
[3] Working Model of 8-Inch Gun.

SHELL PRACTICE WITH MODERN COAST-DEFENSE GUNS IN A CITY ARMORY.

in several grand divisions, under a chief of staff, with the secretary of the navy, as now, at the head of the department.

In recent times the navies of all leading countries have been enlarged, forts multiplied and strengthened, and more attention given to training young men in the tactics and strategy of defense, involving immense increase of national expenditure. In this general advance of naval preparation our own country is now maintaining a steady and quickened pace, and questions of coast defense must here be solved with equal energy and intelligence. The work of providing a proper armament for the exposed harbors of the United States has been progressing as rapidly as the congressional appropriations would permit. Since the outbreak of the war with Spain, Congress has been more liberal with its provisions for pushing this work. According to the annual report of the United States board of ordnance and fortification for 1895, at the rate of progress then being made it would require 50 years of work to place the great stretch of seacoast in proper condition for defense. The board recommended an appropriation of $2,000,000 for engineer work in the construction of implements, fortifications, etc., and one of $5,000,000 for the construction of guns, mortars, gun-carriages, seacoast armament, and ammunition. Concerning future advancement, the board recommended that it be along the following lines: the development of smokeless powders; the development of a high explosive that can be safely discharged in a shell at a high velocity with certainty of detonation; the selection of armorplate for sea forts; the development of rapid-fire field and seacoast guns, and of an efficient system of fire control for harbor defenses. Recent reports show that satisfactory progress has been made in all these lines except that the use of armor-plates in forts has been abandoned for the more satisfactory earth and concrete emplacements. The bill making appropriations for the construction of fortifications and coast defenses in the year ending 30 June 1900, carried a total of $4,744,798. The department submitted estimates for works to cost $12,151,898. In the 11 years from 1889 to 1899 inclusive Congress appropriated for these purposes $48,761,747. The bill for the year 1898–9 carried $9,377,494, and the further sum of $8,674,898 was provided in deficiency acts. In addition $12,865,841 was allotted for the same object out of the $50,000,000 appropriation for the national defense, making a total of $30,988,233 made available for fortifications and the armament thereof at that critical period.

The total appropriations made for fortifications and other works of defense since 1888 amounted in 1900 to $77,000,000. In April, 1900, the secretary of war issued a general order to the army announcing the names of 56 new batteries that had been recently constructed and the sites for works yet to be constructed along the seacoast.

The reorganization of the control of the coast defenses of the United States has embraced more thorough and systematic information regarding this branch of service. In one of its recent orders the navy department gives the following instructions: "As a part of the scheme of naval defense each district will provide means of obtaining and forwarding information to and from the coast, and of communicating with vessels of our own navy, and this system, as a whole, shall be designated as the naval patrol."

The sea and lake coasts of the United States have been divided into 13 naval districts. Torpedo boats are to be part of the defense of each district, and torpedo-boat bases will be established in them. Each district is to be in charge of an officer known as commandant. The districts follow:

1. Eastport, Me., to include Chatham, Mass.; torpedo-boat base, Rockland; commandant of the Portsmouth navy yard in charge.

2. Chatham to include New London, Conn.; torpedo-boat base, Narragansett Bay; officer specially detailed from Narragansett Bay headquarters in charge.

3. New London to include Barnegat, N. J.; officer detailed from headquarters in New York in charge.

4. Barnegat to include Assateague, Va.; torpedo-boat base, Delaware River; commandant of League Island navy yard in charge.

5. Assateague to include New River Inlet, N. C.; torpedo-boat base, Norfolk; commandant of the Norfolk navy yard in charge.

6. New River Inlet to include Jupiter Inlet, Fla.; torpedo-boat base, Charleston; commandant of Charleston navy yard in charge.

7. Jupiter Inlet, to include Tampa, Fla.; torpedo-boat bases, Tampa and Pensacola; commandant of Key West naval station in charge.

8. Tampa, to include Rio Grande; torpedo-boat base, lower Mississippi and West Gulf coast; commandant of Pensacola navy yard in charge.

9. Lake Michigan. 10. Lakes Erie and Ontario. 11. Lakes Huron and Superior. All these in charge of the commandant of the Lake training station near Sheboygan, Wis.

12. Southern boundary of United States on Pacific coast to lat 42° N.; torpedo-boat base, Mare Island; commandant of Yerba Buena training station in charge.

13. Pacific coast from lat. 42° N. to northern boundary; torpedo-boat base, Puget Sound; commandant of Puget Sound navy yard in charge.

Information collected in these districts is to be sent to the office of naval intelligence. In time of peace the aide to the commandant, or some other line officer, is to be second in command in each district; in time of war lighthouse inspectors are to be second in command. See BLOCKADE; BOMBARDMENT; FORTIFICATION.

Coast Guard, a British force formerly under the customs department, and intended only to prevent smuggling, but now organized also for purposes of defense and governed by the admiralty. The men, who are generally old men-of-war's men of good character, have high pay and are furnished with free cottages. The force numbers, with officers and men, about 4,000.

Coast Pilots are compiled to assist mariners in the navigation of their vessels, and, when from any cause they are without charts, to enable them to safely carry their vessels from port to port along the coast. The governments of all large maritime nations publish works for these purposes.

As early as 1796 a volume known as 'The American Coast Pilot', by Capt. Lawrence Furlong, was published in Newburyport, Mass., by Edmund M. Blunt, and the first edition met

with so ready a sale that a second edition of the same work was published in 1798. Since the latter date numerous compilers have published coast pilots of the coast of the United States and its harbors. These works were compiled from charts, from reports by shipmasters published in the newspapers, and from surveys and the personal knowledge of the compilers, some of whom were experienced shipmasters.

The vessels of the Coast and Geodetic Survey, while engaged in surveying the coast and harbors of the United States, collected much information of importance to mariners which could not be shown on the charts or completely given in 'Notices to Mariners.' 'Coast Pilots' are published and distributed by the Coast and Geodetic Survey at the cost of the printing and binding. Similar information can not be collected by private enterprise except at great cost and with imperfect means, and at the present time all the private publications containing such information relating to the coast of the United States are compilations from government publications and based generally on the work of the Coast and Geodetic Survey.

The compilation of the 'Coast Pilots' necessitates work in the office and in the field. The office work consists of the collection of the latest data from the reports and surveys of hydrographic and topographic parties, from the reports and surveys of the United States engineers engaged in the improvement of harbors and waterways, and from correspondence with local authorities and engineers. This information, in manuscript, is then put in the form of a volume which experience has shown to be convenient for the use of the mariner.

For the field work a vessel of the survey, with the compilers of the 'Coast Pilot' on board, visits every part of the coast which is treated in the volume; the information collected in the office is verified and, if necessary, corrected on the spot; the sailing lines and directions are tested by running over them; such artificial aids and natural landmarks as are of use to the mariner are noted, and hydrographic examinations of reported dangers and changes are made; pilots, shipmasters, and local authorities are interviewed and the latest information is incorporated, together with such notes as can only be obtained by observation and experience in the locality.

On returning to the office from the field work this manuscript, correct to date, is prepared for the printer, and when printed the volumes are issued with a supplement or insertion sheet containing the changes which have occurred since the date of the preparation of the volume and while the matter was going through the press.

The 'Coast Pilots' published by the coast and geodetic survey contain:

1. A tabular description of lighthouses, light vessels, and fog signals; lists of life-saving stations, storm-warning display stations, and seacoast telegraph stations, and information regarding tides, tidal currents, variation of the compass, etc.

2. Nautical descriptions of the coast and harbors and general information concerning the several bodies of water and harbors, including notes relative to pilots, depth of water, draft of vessels entering the harbor, supplies; facilities for making repairs, usual or best anchorage, and other matters of practical value. In each case the information of this nature precedes the sailing directions and is printed in smaller type.

3. Sailing directions, with subordinate paragraphs treating of prominent objects, dangers, aids to navigation, etc. The arrangement conforms to the order in which these matters would be considered in practice, and be available when wanted promptly. For this purpose, and to afford a ready means of reference from one part to another, the sailing directions, where long, are divided into numbered or lettered paragraphs, printed in large type, each followed by its own subordinate remarks in smaller type.

4. Appendices, containing rules of the road at sea and in inland waters; laws and regulations relative to pilotage, harbor control, national and local quarantine, and Marine Hospital service; and information regarding storm-warning displays.

5. Views of important points. These are only inserted in volumes which treat of localities which have not yet been surveyed or where the lighthouses and other aids to navigation are not sufficiently numerous to readily locate and navigate a vessel.

6. Sections of charts covering the coast treated in the volume to aid in finding the geographic positions of different localities. Index maps showing the limits of the charts covering the localities treated in the volume.

The 'Coast Pilot' publications of the United States Coast and Geodetic Survey include:

Seven volumes of the 'United States Coast Pilot, Atlantic Coast', in eight parts as follows:

Parts I-II. From St. Croix River to Cape Ann.

Part III. From Cape Ann to Point Judith.

Part IV. From Point Judith to New York.

Part V. From New York to Chesapeake Bay Entrance.

Part VI. Chesapeake Bay and Tributaries.

Part VII. From Chesapeake Bay Entrance to Key West.

Part VIII. Gulf of Mexico, from Key West to the Rio Grande.

One volume of the 'Pacific Coast Pilot'; California, Oregon, and Washington.

One volume of the 'Pacific Coast Pilot; Alaska, Part I, Dixon Entrance to Yakutat Bay, with Inland Passage from Strait of Fuca to Dixon Entrance'.

In addition to the above 'Coast Pilots', bulletins containing the latest information obtainable from all sources about the little known waters of northwest Alaska and Bering Sea are published for the use of mariners navigating those waters.

It is manifest that publications of this character must be subject to numerous corrections in the details after the lapse of a few years. To maintain the volume in a useful form corrections are issued in 'Notices to Mariners,' insertion sheets, and supplements; and each volume is revised and passed to a new edition when the corrections have assumed proportions that impair its usefulness, or more recent surveys show changes or furnish additions that render the old volume untrustworthy.

Coastal Plain. Where the foothills of a range of mountains descend to a lowland that slopes gently to the sea, this lowland is called

a coastal plain. It represents what was once the sea floor, being composed of material eroded from the mountains and deposited in the sea. With further elevation the original surface of the plain may be removed by streams cutting their valleys and by the weathering of the valley slopes. The coastal plain of the Atlantic Seaboard extends from New York to Georgia. In the Carolinas and Georgia it is divisible into belts parallel to the shore. The outer is a smooth plain, often swampy, perhaps 50 miles wide with a gently rolling surface. Further inland, where the streams have cut valleys, the surface is more hilly, and 100 miles inland is a belt of hilly country some 600 or 700 feet high covered with pine forests where the original surface of the plain has been nearly destroyed. Back of this come the higher hills, formerly mountains, of the old land, forming what is known as the Piedmont belt. Other instances of coastal plains are the east coast of Mexico, north and south of Vera Cruz, and the east coast of India, skirting the Bay of Bengal.

Coast Range. The Pacific shore of the United States rises abruptly from the ocean along nearly its whole length, with practically no coastal plain of any size from southern California to the Strait of San Juan de Fuca. The hills and low mountains which border the ocean are given the general name of the Coast Range. They do not form, however, a continuous ridge, but are rather parts of more or less disconnected uplifts, lower and possibly younger than the Sierra Nevada and Cascade ranges. North of the Strait of San Juan de Fuca the mountains of Vancouver Island and the Island range of British Columbia mark the continuation of these uplifts, although in British Columbia the name of Coast Range is given to the mountains which border the continental shore and are spurs of the Cascades.

In California the coast range comprises two parallel ridges, 400 miles long, 30 to 60 miles apart, and parallel to the coast from Point Concepcion in lat. 35° to Cape Mendocino, the ridge on the coast being the coast range proper, and the inner the Monte Diablo range, the two separate the Sacramento and San Joaquin valleys from the Pacific. In the south the coast ranges and the Sierra Nevada coalesce and the topography is complicated by east and west ranges; thus opposite the Santa Barbara channel is the Santa Inez range, having a height of about 4,000 feet, and farther south is another east-and-west range, the Santa Monica. Still further south the uplift is much broken and irregular without strongly marked ridges but with portions rising into central dominating points like the San Bernardino and San Jacinto mountains, about 11,000 feet high.

North of lat. 35°, toward San Francisco Bay, there are no very high peaks. The highest peaks near the bay are Monte Diablo, 3,856 feet, an isolated peak that is a conspicuous landmark for miles; Mount Helena, 4,343 feet; and Mount Hamilton, 4,400 feet, the latter famous as the site of the great Lick observatory. North of San Francisco Bay the heights of the summits gradually increase, and 150 miles north is Mount Bailey, 6,357 feet. Farther north the coast range becomes gradually a series of disconnected mountain groups, and near the Oregon line east-and-west ridges develop which unite with the Cascades, the most important of these being the Calapooia Mountains in Oregon.

Along the Oregon coast the uplift is low, being generally less than 3,000 feet. In Washington also the uplift is not great except in the Olympic Mountains between Puget Sound and the Pacific Ocean, which culminate in the fine peak of Mount Olympus, 8,150 feet.

Extending along such a length of coast, the coast ranges have a wide variety of climate and differ much in vegetation and attractiveness. In California, north of lat. 38° to San Francisco Bay, much of the outer range is covered with brush and has some timber. South the mountains are covered with a thorny undergrowth known as chapparal. Near the coast, from Santa Barbara to San Francisco, there is a fair rainfall in the interior. The climate is very dry, and the mountains are generally bare. North of San Francisco Bay the rainfall increases, and the mountain valleys are fertile and picturesque. In Oregon the rainfall is heavy, and in Washington very heavy; the mountains being covered with thick forests of fir, pine, and spruce.

Geologically the mountains of the coast uplifts, besides being newer than the Sierra Nevada and Cascades, are also less broken through by granite than the Sierra Nevada, and less covered by lava than the Cascades. The upheaval began in late Tertiary time, and perhaps continued into the Quatenary, Pliocene rocks being upturned at a high angle near San Francisco Bay. South of San Francisco Bay the rocks are mostly of the Miocene series, though there are large areas of Cretaceous in the east side of the Monte Diablo belt. North of San Francisco Bay and in Oregon the proportion of Cretaceous increases, and the Tertiary is much less. On Vancouver Island an uplift took place in Jurassic time.

Generally speaking, the rocks of the coast range in California are much metamorphosed, and large masses of serpentine and similar rocks are not uncommon. In places these serpentines sometimes contain workable deposits of chrome iron ore, though, owing to the limited demand, the production is small. The chief mineral wealth of the coast range is in quicksilver and petroleum, though some gold has been washed from placers in southern California. The quicksilver occurs at a number of places in the range where the altered rocks are silicified, and the total production, though the ore is generally of low grade, has been large.

South of San Francisco Bay, in the Miocene, in places is a great thickness of bituminous shale, there being several thousand feet of it near Santa Barbara and Los Angeles. This shale has been used extensively as a material for paving streets. Within the past eight years a valuable oil-field has been developed near Los Angeles. But little coal has been found in the range in California, and that is of poor quality. In Oregon is the Coos Bay field.

In Oregon and Washington the coast range contains very few mineral deposits of importance. On Vancouver Island, however, promising copper deposits are being developed on the west coast, and on the east coast are large and important coal mines.

The coast range naturally has no river systems, nor, except in California, is it a barrier to rivers of the interior. It is crossed by the

Columbia, Coquille, Rogue, Klamath, and other rivers.

For mineral resources of the range see COAL; PETROLEUM. See also BRITISH COLUMBIA; CALIFORNIA; OREGON; WASHINGTON.

Coasting Trade, trade carried on by sea between the ports of the same country. In some countries the coasting trade is retained as a home monopoly, and this used to be the case in the United Kingdom, but by recent laws the coasting-trade of Great Britain has been opened to foreign vessels, subject to the same rules, dues, and regulations as British sailing ships and steamers; but power was given to impose by an order in council retaliatory prohibitions and restrictions on the ships of such countries as should impose restrictions and prohibitions on British ships. The dues and regulations to which vessels engaged in the coasting trade are subject are different from those which relate to vessels engaged in the oversea trade, and masters are required to keep books showing that their cargoes are strictly such as are allowable by the rules of the coasting trade. In the United States the coasting trade is restricted to vessels belonging to the country. The commerce of the Great Lakes is included in the coasting trade. The great length of the sea and lake coasts, the number of good harbors, and the fact that much of the coast region of the United States has been settled makes the coasting trade of this country the most extensive in the world. Many hundreds of sailing craft and steamers are used in this trade, carrying the products and people of one part of the country to other parts. This trade is increasing rapidly, the licensed tonnage of fisheries and trade in 1900 was 4,338,145 tons, an increase of nearly 1,250,000 tons in the preceding 50 years. The annual amount of tonnage passing through St. Mary's Falls Canal is much larger than that of the annual tonnage of the Suez Canal, and the amount passing through St. Clair River is about four times that recorded at St. Mary's Falls Canal.

Coat of Arms, heraldic insignia, originally embroidered on the tabard, a short coat worn by knights over the armor. They originated in the age of chivalry, when they were assumed as emblematic of the adventures, and hopes of the knight and were useful for distinguishing individuals whom it was difficult to recognize when in full armor. The favorite emblem of the knight later became the adopted badge of the family, the figures or characters employed in the coat of arms began to receive names, and so the language and science of heraldry came into existence. Modern nations have adopted coats of arms, in monarchical countries, sometimes an adaptation of the heraldic insignia of a dynasty. The coats of arms of the United States and of the individual States are arbitrarily adopted emblems without true heraldic significance. The emblem of a State sometimes represents its leading industry; some cities have also adopted similar coats of arms. See HERALDRY.

Coat of Mail, a piece of armor in the form of a shirt, consisting of a close net-work of iron or steel rings, or of a strong linen or leather jacket covered with small laminæ or plates, usually of tempered iron, overlapping each other like the scales of a fish. See ARMS AND ARMOR.

Coatbridge, kōt'brĭj, Scotland, a municipal burgh in Lanarkshire, nine and a half miles east of Glasgow. It owes its rise to the working of the coal and iron-stone found in the surrounding district, and has grown rapidly from a village to a thriving town. The chief manufacturing interests are the numerous iron works in the town and neighborhood, about half of the blast-furnaces of Scotland being situated in this locality. There are also important engineering establishments and other industries. Pop. (1901) 36,981.

Coates, Florence Earle, American poet: b. Philadelphia, Pa., 1 July 1850. In 1879 she was married to Edward Hornor Coates. She has made many contributions to various magazines and published her collected 'Poems' in 1899.

Coates'ville, Pa., a borough of Chester County, situated on the Pennsylvania and the Wilmington & No. R.R.'s. It has a number of important industrial interests, including large boiler works, iron and steel works, foundries, and woolen and paper mills. Pop. (1900) 5,721.

Coati, an American animal somewhat related to the raccoons, of which two species are known, constituting the genus *Nasua*. One inhabits Mexico and roves as far north as southern Arizona; the other lives in Brazil. The Mexican coati, or "coati-mundi" (*N. nasica*) is about the size of a house-cat, has a long cartilaginous snout which may be reflexed or stiffened at will, according to its owner's needs. Its fur is long, thick, and a warm brown in color; and its tail is ringed like that of a raccoon. The Brazilian coati (*N. rufa*) is somewhat smaller than the Mexican, and its fur is not so fine. Both species feed on fruits, eggs, insects, and sometimes on small birds. They are readily tamed, and make as good pets as the domestic cat.

Coaticook, kō-ăt'i-kuk, Canada, a town of Stanstead County, Quebec, situated on the Coaticook River, and the Grand Trunk R.R. It has a number of factories and is a manufacturing centre. Pop. 3,000.

Coatzacoalcos, kō-ät-sa-kō-äl'kōs, a river of the isthmus of Tehuantepec in Mexico, rises in the Sierre Madre, and empties into the Gulf of Mexico, 130 miles southeast of Vera Cruz. It is navigable for large vessels for 30 miles, and is interesting as part of a route which has been surveyed for an inter-oceanic canal, a city of the same name, with a population of about 3,000, is situated at the mouth of the river.

Cobalt, a metal which occurs combined with arsenic, nickel, and other metals; also as a sulphide and as an arsenate. After the ore has been calcined, oxide of cobalt remains, but impure from the presence of other metallic oxides. When this oxide has been purified and reduced to the metallic state the cobalt is obtained of a white color inclining to gray, and, if tarnished, to red, with a moderate lustre. Its fracture is compact; it is hard, brittle, and of a specific gravity of 8.5 to 8.9. Like nickel, it is strongly magnetic. It undergoes little change in the air, but absorbs oxygen when heated in open vessels. It is attacked, though slowly, by sulphuric or hydrochloric acid, and is readily oxidized by means of nitric acid. Two basic oxides of cobalt are known, and some inter-

mediate oxides. The protoxide is of an ash-gray color, and is the basis of the salts of cobalt, most of which are of a pink hue. When heated to redness in an open vessel it absorbs oxygen and is converted into a higher oxide. It may be prepared by decomposing the carbonate of cobalt by heat in a vessel from which atmospheric air is excluded. It is easily known by its giving a blue tint to borax when melted with it. It is employed in the arts, in the form of smalt, for communicating a similar color to glass, earthenware, and procelain. *Smalt*, or powder blue, is made by melting three parts of fine white sand, or of calcined flints, with two of purified pearl-ash and one of cobalt ore previously calcined, and ladling it out of the pots into a vessel of cold water; after which the dark-blue glass, or zaffer, is ground, washed, and distributed into different shades of color, which shades are occasioned by the different qualities of the ore and the coarser or finer grinding of the powder. Smalt, besides being used to stain glass and pottery, is often substituted, in painting, for ultramarine blue, and is likewise employed to give to paper and linen a bluish tinge. The chloride of cobalt is well known as a *sympathetic ink*. When diluted with water so as to form a pale pink solution, and then employed as ink, the letters, which are invisible in the cold, become blue if gently heated. It is prepared by dissolving precipitated oxide of cobalt in hydrochloric acid with the aid of heat, and diluting with water. The nitrate of cobalt is readily got by dissolving cobalt or its oxide in nitric acid and crystallizing the solution. It is a deliquescent red salt, which dissolves in water with a pink color. The peroxide of cobalt is black, and is formed by adding a solution of bleaching-powder to a cobaltous salt, or by passing a current of chlorine gas through water holding cobaltous hydrate in suspension. It does not unite with acids; and when digested in hydrochloric acid the cobaltous chloride is generated with the disengagement of chlorine. When heated it is converted into one of the intermediate oxides.

Ores of Cobalt.— "Bright white cobalt ore" is the popular name for the mineral cobaltite (q.v.), a sulph-arsenide of cobalt. "Gray cobalt ore," also sometimes called "tin-white cobalt," is the mineral smaltite (q.v.). It is the chief ore of cobalt and is essentially cobalt diarsenide, though it always contains nickel and iron. "Red cobalt," also known as "cobalt-bloom," is the mineral erythrite (q.v.), a hydrous cobalt arsenate. "Earthy cobalt," or "black cobalt," is the mineral asbolite, a variety of wad containing up to 32 per cent. oxide of cobalt. "Cobalt pyrites" is the mineral linnæite, a sulphide of cobalt, often containing much nickel. The principal supply of cobalt is derived from the smaltite of Germany and the cobaltite of Norway and Sweden.

Cobaltite, "bright-white cobalt," an important ore of cobalt, is its sulph-arsenide, CoAsS, and contains 35.5 per cent. of cobalt. It occurs granular massive, but also in isometric-pyritohedral crystals. These usually have a brilliant metallic lustre and a white color slightly tinged with copper-red. Their hardness is 5.5 and specific gravity 6 to 6.3. The most important localities are in Norway and Sweden.

Cobalt'-blue, or **Thenard's Blue,** a compound of alumina and oxide of cobalt, forming a beautiful pigment often used in the arts. Sometimes it contains also the phosphate or arsenate of cobalt, according to the mode of manufacture employed. It is non-poisonous, and unacted on by acids and alkalies.

Coban, kō-bän', or **Vera Paz,** Guatemala, a city 90 miles northeast of the city of Guatemala. It is the capital of the department of Vera Paz, on the left bank, and near the source of the Dulce or Dolce. It was formerly a mission station of the Dominicans, whose memory is still revered. The Dominican monastery is now deserted. The valley is exceedingly fertile, and covered with plantations of sugar-cane, bananas, and pimento trees, and various kinds of fruit-trees. Pop. about 30,000.

Cobb, Henry Ives, American architect: b. Brookline, Mass., 19 Aug. 1859. He studied at the Massachusetts Institute of Technology, and graduated at Harvard 1880. In 1881 he established himself in Chicago, and has built up a large and lucrative general practice in that city and other parts of the country. In 1893 he was one of the national board of architects of the World's Columbian Exposition, and at present is retained as a special architect for the United States government. Among the prominent public buildings erected from his designs are, the Newberry Library, Chicago, opera house, University of Chicago, and Church of the Atonement, in Chicago; the Pennsylvania State Capitol, American University at Washington, D. C., and government buildings at Chicago, League Island, Annapolis, etc.

Cobb, Howell, American statesman: b. Cherry Hill, Ga., 7 Sept. 1815; d. New York City, 9 Oct. 1868. He was graduated at Franklin College in 1834, became a lawyer in 1836, and in 1843 was elected to Congress as a Democrat. He served eight years and was speaker of the House one term. Elected governor of Georgia in 1851, he returned to Congress in 1855, and was made secretary of the treasury by President Buchanan in 1857, resigning in 1860 to urge secession. He held a Confederate military commission in the Civil War, but saw little service.

Cobb, Sylvanus, American novelist: b. Waterville, Maine, 1823; d. Hyde Park, Mass., 2 July 1887. He was editor and publisher of a periodical called the 'Rechabite', and besides contributing to other publications, was a most prolific story-writer. His most popular novels are: 'The King's Talisman' (1851); 'The Patriot Cruiser' (1859); and 'Ben Hamed' (1864); 'The Gunmaker of Moscow'.

Cobb, Thomas Reed Root, American lawyer and soldier: b. Cherry Hill, Jefferson County, Georgia, 10 April 1823; d. Fredericksburg, Va., 13 Dec. 1862. He graduated at the head of his class at the University of Georgia, 1841, was admitted to the bar, and was reporter of the Georgia supreme court 1849–57. As a lawyer he enjoyed a wide reputation and large practice. In the Confederate Congress he was chairman of the Committee on Military Affairs, but later became a general in the army and was killed at the battle of Fredericksburg. He wrote: 'Digest of the Statute Laws of Georgia' (1851); 'Inquiry Into the Law of Negro Slavery in the United States' (1858); 'Historical Sketch of Slavery from the Earliest Periods' (1859).

Cob'ban, James Maclaren, Scottish novelist: b. Aberdeen, Scotland, 24 April 1849. He is the author of 'The Cure of Souls' (1879); 'Tinted Vapors' (1885); 'Master of His Fate' (1890); 'A Reverend Gentleman' (1891); 'Sir Ralph's Secret' reprinted in America as 'The Horned Cat' (1892); 'The Red Sultan' (1893); 'The Burden of Isabel' (1893); 'The White Kaid of the Atlas: a Boy's Story' (1895); 'The King of Andaman' (1895); 'Wilt Thou Have This Woman?' (1896); 'Her Royal Highness' Love Affair' (1897); 'The Angel of the Covenant' (1898); 'Pursued by the Law' (1899); 'An African Treasure' (1899); 'Cease Fire!' (1900); 'I'd Crowns Resign' (1900); 'The Golden Tooth' (1901); 'The Green Turbans' (1901); 'Life and Deeds of Earl Roberts' (1901); 'The Last Alive' (1902); 'Julius Courtney'; 'Royal Exchange'.

Cobbe, kŏb, **Frances Power,** Irish rationalistic writer: b. Dublin 4 Dec. 1822. She has taken a deep interest in many humanitarian movements, especially in the anti-vivisection crusade, and for 18 years acted as honorary secretary of the Victoria Street Society for the Protection of Animals from Vivisection. Some of her works are descriptions of her travels in Italy, Greece, Egypt, and Palestine, the others treating mainly of theological, religious, and humanitarian questions. The most important are: 'Essay on Intuitive Morals' (1855); 'Religious Duty' (1857); 'Pursuits of Women' (1863); 'Broken Lights: an Inquiry into the Present Condition and Future Prospects of Religious Faith' (1864); 'Hours of Work and Play' (1867); 'Dawning Lights' (1868); 'Darwinism in Morals' (1872); 'The Hopes of the Human Race Hereafter and Here' (1874); 'Duties of Women' (1880); 'The Peak in Darien' (1882); 'The Scientific Spirit of the Age' (1888); and 'The Modern Rack' (1889). She has also written an enormous number of pamphlets and edited an edition of the works of Theodore Parker.

Cobbett, kŏb'ĕt, **William,** English writer and politician; was the son of a farmer and publican: b. Farnham, Surrey, 9 March 1762; d. near Guildford 18 June 1835. In 1783 he set out to try his fortune in London, and arrived there with only a half a crown in his pocket. He succeeded in obtaining a situation as copying-clerk to an attorney of Gray's Inn, where he remained for nine months. Determined to find some other sphere of employment he quitted London for Chatham, enlisted in the 54th Regiment, and after continuing there for a year proceeded with it to New Brunswick. During his stay at Chatham he set himself assiduously to study and the improvement of his mind. He remained four years in America, during which time his regular habits and ability and attention in the discharge of his military duties effected his promotion to the rank of sergeant-major. In 1791 he returned to England with the regiment, and shortly after arriving there obtained his discharge. After a short stay in England, and a stay of six months in France in 1792, he embarked at Havre for America. He landed in New York in October, 1792, and continued in America for eight years, where he occupied himself with literary labors, chiefly of a political kind, commencing his career by an attack on Dr. Priestley, then recently landed in America, in a pamphlet entitled 'Observations on the Emigration of a Martyr to the Cause of Liberty', and signed "Peter Porcupine". Under this famous *nom-de-plume* a succession of papers appeared, all of a strongly anti-Republican tendency, which were afterward republished in England. Before leaving America he published a life of 'Thomas Paine'. In June, 1800, he sailed for England, and on his arrival started the 'Porcupine', which zealously supported the measures of Pitt, but met with little success. In a subsequent paper, the 'Weekly Register', he was more fortunate; and it continued to appear regularly every week up to the period of his death. Not long after its commencement symptoms of a gradual change began to appear in Cobbett's political opinions, and from high conservative he passed over to extreme radical principles. In 1803 a prosecution for libel on the lord-lieutenant and other officers of state in Ireland was instituted against him, and resulted in his being sentenced the following year to a fine of $2,500; while a second action, brought almost immediately afterward, subjected him to a second fine of the same amount. In 1810, owing to some remarks of his in the 'Register' of 10 July 1809, on the flogging of some militiamen, he was again prosecuted for libel, and sentenced to imprisonment for two years and a fine of $5,000. This last was paid by a subscription among his friends. Nowise daunted, he continued his attacks on government as soon as he was liberated, and commenced his celebrated 'Twopenny Trash', which reached a sale of 100,000, and from its supposed influence on the working-classes brought about the passing of the noted Six Acts. Partly to escape their operation, he retreated to the United States, and remained here for two years, residing principally in Long Island. He returned to England in 1819, and in 1820 endeavored, unsuccessfully, to be returned member for the city of Coventry. About the same period he commenced in the 'Register' a series of papers entitled 'Rural Rides', afterward reprinted, which present most charming pictures of English country scenery, and are among the best of his productions. In 1824–27 he published a 'History of the Protestant Reformation in England and Ireland', in which he vilified Queen Elizabeth and the leading reformers, but added in no way to his literary reputation. The work was eagerly adopted by the Roman Catholics, who caused translations to be made of it into various European languages. In 1831 he was again prosecuted for libel, on the ground of an article in the 'Register' alleged to be published with the view of exciting the agricultural laborers to acts of violence. He conducted his own defense in a speech of six hours, and the jury not being able to come to a verdict the trial ended in their discharge. On the passing of the reform bill in 1832 Cobbett was returned member to Parliament for Oldham; but his success in this capacity was indifferent. Nevertheless, at the general election in December, 1834, he was again returned to Parliament for Oldham. In addition to the writings already referred to Cobbett is the author of an English and a French Grammar; 'Advice to Young Men and Women', containing many useful hints; 'Cottage Economy'; 'Village Sermons'; 'A Year's Residence in America'; and other works. Cobbett wrote in a pure and vigorous English style, and his

writings contain a great amount of information and sound practical advice. See E. Smith, 'Life of Cobbett' (1878).

Cob'den, Richard, English economist, the great "apostle of free trade": b. Dunford, Sussex, 3 June 1804; d. London 2 April 1865. After receiving a very meagre education at the grammar-school of Midhurst, he was taken as an apprentice into a Manchester warehouse in London belonging to his uncle, where he rapidly made up for the defects of his education by his own diligence, and soon acquired a thorough acquaintance with the business. In 1830, being left to his own resources, he obtained some advances of money, and, with some relatives, started a cotton manufactory in Manchester, which in a few years succeeded in producing fabrics equal in point of quality to the best manufactured in London. By several journeys that he now made to France, Belgium, Switzerland, and the United States, chiefly in the interest of the firm, he not only increased his business connections, but matured and enlarged his views. His first political writing was a pamphlet on England, Ireland, and America, which was followed by another on Russia. In both of these he gave clear utterance to the political views to which he continued through his life rigidly to adhere, rejecting the course of policy based upon the theory of the balance of power, advocating non-intervention in the disputes of other nations, and maintaining it to be the only proper object of the foreign policy of England to increase and strengthen her connections with foreign countries in the way of trade and peaceful intercourse. These views, although disregarded or considered as visionary in Parliament were warmly received in industrial and commercial circles, and secured Cobden a considerable number of followers, especially in Manchester. After returning from extensive travels in the East and in Germany, he entered actively on a course of agitation with the view of carrying into effect his political views. Soon after the Anti-Corn Law League was formed in 1838, it was joined by Cobden, who expended all his energies on behalf of the cause to support which the league had been founded; and it was chiefly the extraordinary activity and perseverance of Cobden, joined to the zeal of his supporter Bright, that brought about the final victory of free-trade principles. In 1841 Cobden was returned to Parliament by Stockport. In his very first speech in Parliament he took occasion to point out the unjust way in which the corn-laws operated, and, undeterred by the failure of his first attempts, returned again and again to this subject. After five years of unwearied contest he at last succeeded in convincing Sir Robert Peel himself, at that time prime minister, of the pernicious action of the corn-laws, and in inducing him to bring in a bill for their repeal. The bill passed both houses of Parliament before the end of June 1846, and Sir Robert Peel was the first to congratulate Cobden on his victory in a speech delivered in the House of Commons. During this long struggle Cobden had been obliged to neglect his business, which before agitation commenced had been a highly prosperous one. As a compensation for the loss he had thus sustained a national subscription was made, and a sum of about $350,000 presented to him. After again visiting several countries on the Continent, where he was generally received with enthusiasm, he returned to his parliamentary duties in 1847, having been returned without opposition as one of the members for the West Riding of Yorkshire. He now appeared chiefly as the advocate of parliamentary reform, economy, and retrenchment in the management of the finances of the country, and a policy of non-intervention; in all of which he found a firm and ready ally in Bright. His advocacy of a peace policy did not in every case add to his popularity. His opposition to the policy of Lord Aberdeen in 1853, which ultimately led to the Russian war, met with no success; and although in 1857 he carried a vote of censure on Lord Palmerston's Chinese policy, his action in this case was displeasing to the country generally. In 1860 he negotiated a treaty of commerce with France, and in reward for his services on this occasion was offered a baronetcy, a seat in the privy-council, and several other offices and dignities, all of which he persistently refused. A collection of his political writings appeared in 1867, and a collection of his speeches 'Speeches on Questions of Public Policy' (1870). Consult Garnier, 'R. Cobden, les Liguers et la Ligue' (1846); McGilchrist, 'Life of Richard Cobden' (1865); Morley, 'Life of Richard Cobden' (1881–3).

Cobden Club, The, an organization named after Richard Cobden, formed about a year after his death, through the influence of John Bright and others, for encouraging the diffusion of free trade and the other economical and political principles with which Cobden's name is associated. The Cobden Club has distributed a vast number of books and pamphlets.

Cobego, kō-bā'gō. See Colugo.

Co'bern, Camden M., American Methodist clergyman: b. Uniontown, Pa., 19 April 1855. He was educated at Allegheny College, and the Theological School of Boston University and entered the ministry in 1876. He has published 'Ancient Egypt in the Light of Modern Discovery' (1892); 'Ezekiel and Daniel: a Critical Commentary' (1901).

Cob'ham, Lord. See Oldcastle, Sir John.

Cobija, kō-bē'hä, or **Puerto La Mar,** Chile, a seaport in the territory of Antofagasta (formerly belonging to Bolivia), on the shore of the Pacific. It stands in a desert region, and is entirely dependent on the mines in the neighborhood. The roadstead is tolerably safe, but the landing-place is far from good. All the water used for drinking must be obtained by distillation, and the means of subsistence come from a considerable distance. The population is about 4,000, including those who are going to and from the mines.

Co'ble, or **Cobble,** a flat-floored boat with a square stern, furnished with a lug-sail and also propelled with oars. It has a sharp high bow, is admirably constructed for encountering a heavy swell, and is used in fishing, especially on the east coast of Great Britain. The rudder extends for some distance below the stern. There is also a small rowing-boat with the same name used by salmon-fishers and others.

Coblentz, kō'blĕnts, Germany, a fortified city, anciently called *Confluentes,* from its situation at the confluence of the Rhine and Moselle. It is the capital of Rhenish Prussia, and is finely situated on the left bank of the Rhine,

in the angle between that river and the Moselle, and connected by a pontoon bridge over the Rhine with the fortress of Ehrenbreitstein. This with its other fortifications renders it one of the strongest places in Germany, and capable of accommodating 100,000 men. The new part of the town is well built, with broad streets and fine squares. The palace of the Elector of Treves is now a Prussian royal residence. Its industries embrace cigars, machinery, champagne wines, and pianos. Its trade in Rhine and Moselle wines is extensive. Pop. 46,000.

Cobourg, kō'bėrg, Canada, a town and port of entry, the county-seat of Northumberland County, Ontario, on Lake Ontario, and the Grand T. R.R., 69 miles northeast of Toronto. It is the seat of a Wesleyan university, and has several woolen mills, a car factory, foundries, newspapers, banks, and schools. Pop. (1901) 4,239.

Cobra di Capello, that is, "serpent with a hood"; the Portuguese name of an East Indian serpent, the *Naja tripudians,* and sometimes applied to an African serpent of the same genus, the *Naja haje,* or asp, both reptiles of the most venomous nature. The former inhabits India and southeastern Asia, Java, etc. The species of the viper kind are all remarkable for the manner in which they spread out or distend the sides of the neck and head when disturbed or irritated. In the cobra di capello the conformation necessary to this action is found in the most perfect condition, as some of the ribs are loosely articulated and moved by appropriate muscles on the sides of the neck, which, when expanded, give the anterior part of the body the appearance of an overhanging arch or hood, on the middle of which, posterior to the eyes, is a greenish-yellow mark, resembling the rim of a pair of spectacles. From this mark we have the name "spectacled snake." When disturbed by the approach of an individual or otherwise, the cobra raises the anterior part of its body, so as to appear to stand erect, expands its hood, and is prepared to inflict a deadly wound. The poison fangs are attached to the anterior end of the maxillary bone, and are permanently erect, not movable, as in the rattlesnakes. So exceedingly poisonous is its bite that in numerous instances which are well authenticated death has followed within a few minutes; under ordinary circumstances a few hours is the longest term that intervenes from the infliction of the bite till the death of the sufferer, where prompt measures for his relief have not been resorted to. So numerous are these snakes in India, and so bold in frequenting human habitations, that the census returns attribute not less than 10,000 deaths annually to their bites.

To minister to the curiosity of the multitude, the jugglers of India select these venomous reptiles for their exhibitions, and having extracted their fangs keep them in cages or baskets to exhibit as dancing snakes. When the cage is opened, the juggler begins playing upon a pipe or other instrument; whereupon the cobra assumes the erect attitude, distends its hood, and remains balancing itself in this position until the music is suspended. It is most probable that this snake in common with lizards and other animals, is peculiarly affected by musical sounds. With the exception of the spectacle mark on the back of the neck and its distensible hood, the cobra is not especially distinguished as regards coloration or form. Consult Gunther, 'Reptiles of British India'; Boulenger, 'Snakes of the British Museum'; Gadow, 'Amphibia and Reptiles.' See HAMADRYAD.

Coburg, kō'boorg, a noted family of Germany, dating from the 5th century, distinguished for intermarriages with royal houses, especially during the 19th century. A sister of Duke Ernest I. became Duchess of Kent and mother of Queen Victoria; the Duke's brother Leopold became king of the Belgians, and married in succession daughters of George IV. of England and of Louis Philippe; one of his nephews, Ferdinand, married the queen of Portugal, and was regent of that kingdom, 1853; another, August, married a daughter of Louis Philippe; one of his sons, Duke Ernest II., declined the crown of Greece, 1863, and another, Prince Albert, was the husband of his cousin, Queen Victoria of England.

Coburg, or **Koburg,** Germany, capital of the duchy of Saxe-Coburg-Gotha, situated on the left bank of the Itz, 106 miles east by north of Frankfort-on-the-Main. Among the principal buildings is the Ehrenburg Palace, one of the town residences of the Duke of Saxe-Coburg-Gotha, formerly a monastery of the Recollets, but converted into a ducal residence in 1549. It contains some interesting pictures, tapestry, etc. Some of the old doors exhibit beautiful specimens of marquetry or inlaid work. There are one or two other palaces, and various monuments, including a statue of Prince Albert, consort of Queen Victoria. The chief church is the Moritzkirche, a spacious building in the late Gothic style, with a tower 334 feet high. The government house is a handsome structure in the Italian style. The educational institutions comprise a gymnasium (founded in 1605), real school, normal school, etc. On an eminence overhanging the town is the ancient castle or fortress, now a museum, from which extensive views are obtained. In the museum are relics and writings of Luther, who resided here for three months in 1530, and here wrote some of his works. This castle was occupied by the Swedes in 1632, and was unsuccessfully besieged by Wallenstein during the Thirty Years' war. Coburg has manufactories of porcelain and ceramic wares, carriages, furniture, etc., and has also malt-works, breweries, and other establishments. Pop. (1900) 20,460.

Coburg, a thin fabric of worsted and cotton, or worsted and silk, twilled on one side, for ladies' dresses, intended as a substitute for merino.

Coburn, Foster Dwight, agricultural writer: b. Jefferson County, Wis., 7 May 1846. After serving in Wisconsin regiments during the Civil War he went to Kansas in 1867. He became secretary of the Kansas Board of Agriculture in 1894 and still holds that position. He is the author of 'Swine Husbandry'; and 'Alfalfa'; and also of the following books on agricultural topics prepared for and issued by the Kansas State Board of Agriculture: 'Feeding Wheat to Farm Animals'; 'Alfalfa-Growing'; 'Alfalfa, Irrigation, Well Water Supply and Subsoiling'; 'Corn and the Sorghums'; 'The Helpful Hen'; 'Cow-Culture'; 'The Beef Steer (and His Sister)'; 'The Plow, Cow and Steer'; 'Pork Production'; 'The Modern

Sheep'; 'The Horse Useful'; 'Forage and Fodders'; 'Dairying in Kansas'; 'Short-Horn Cattle'; 'Hereford Cattle'; 'Polled Cattle'; 'Kansas Wheat-Growing'; 'Railroads and Agriculture.'

Coca (*Erythroxylon coca*), a shrubby plant belonging to the natural order *Erythroxylaceæ*, found wild in the mountainous regions of Peru and Bolivia, and cultivated in districts 2,000 to 5,000 feet above sea-level. The leaves are gathered and dried in the sun, and chewed with a little powdered chalk. When taken in some quantity they produce an intoxication like that of opium. As the indulgence is repeated the appetite for it increases, while that for wholesome nourishment diminishes; the miserable victim loses all power of resisting his craving, and becomes reduced to a condition of physical and mental prostration. When used in moderation coca lessens the appetite for food and enables those who have partaken of it to sustain greater fatigue than they otherwise could. It has been found the best preventive of asthmatic symptoms caused by the rapid ascent of lofty mountains. An infusion of the leaves is also used with the same effect.

Cocaine, kō'kạ-īn, or -ēn, a vegetable alkaloid, with the chemical formula $C_{17}H_{21}NO_4$, obtained from the leaves of the coca shrub (*Erythroxylon coca*) of South America. The leaves are digested with ether, and the solution is evaporated to dryness and extracted with boiling water. Magnesia is then added, and the solution again evaporated, after which the cocaine is removed by solution in amyl alcohol. Cocaine crystallizes in small, monoclinic prisms, which melt at 208° F., and are but slightly soluble in water, though they dissolve freely in hot alcohol and hot ether. Salts of cocaine are precipitated from solution by numerous reagents, among which are ammonia, caustic potash, sodium carbonate, picric acid, tannic acid, gold trichloride, and platinum tetrachloride. The substance popularly known as cocaine is the hydrochloride of the true alkaloid, this being the form in which the base is usually administered in medicine. The leaves of the coca plant are chewed by the natives of Peru and Bolivia for the relief of hunger and fatigue, and of the disagreeable sensations connected with breathing the rarefied air at great elevations.

Cocco, Cocoa-root, Eddoes, Taro, various plants of the genera *Caladium* and *Colocasia* of the natural order *Araceæ*. They are widely cultivated for food in the tropical and subtropical islands of the Pacific, the West Indies, and adjoining continental regions, and to a less extent in other warm countries. The edible part most desired is the starchy acrid tuber which is eaten like potatoes or made into *poi*, a substance obtained by roasting the tubers, pounding them with water to a paste and allowing the mass to ferment before being eaten either in that form or again prepared for the table. In this form the roots are a staple food of the Hawaiians. During the process of roasting or boiling the tubers lose their acridity, which quality is, in some varieties almost wanting. The young leaves of some species are used as pot-herbs. The principal species is *Colocasia antiquorum* var. *esculentum*, a perennial herb with heart-shaped peltate green leaves often three feet long and nearly as wide; and an inconspicuous spadix. It is very popular as a bedding plant in the United States, since it gives a subtropical effect, especially when grouped with cannas and crotons. Popularly it is known as elephant's ear. It is easily grown, being started in the greenhouse, transplanted to the open ground after danger of frost, freely supplied with water, and at the approach of frost in the autumn, stored in a cool, dry cellar.

Cocceius, Heinrich von, hīn rĭH fŏn kŏk-tsā'yoos, German jurist: b. Bremen 1644; d. 1719. He studied at Leyden, and Oxford; was in 1672 professor of law at Heidelberg, and in 1688 at Utrecht; in 1690 regular professor of laws at Frankfort-on-the-Oder. He went to The Hague in 1702, without giving up his office, on occasion of the disputes as to the hereditary succession of the house of Orange; and received for his services, in 1713, the rank of baron of the empire. As a lawyer he was the oracle of many courts, and his system of German public law ('Juris Publici Prudentia') was almost a universal academical text-book of this science.

Cocceius, Johannes, yō hän'nĕs (originally Koch or Koken), Dutch theologian: b. Bremen 9 Aug. 1603; d. Leyden 5 Nov. 1669. He was appointed professor of biblical philology at the Academy of Bremen in 1629, was professor at the University of Franeker, 1636–50, and of dogmatics at Leyden for the rest of his life. He published 'Summa Doctrinoe de Foedere et Testaments Dei' (1648); 'Hebrew and Chaldaic Lexicon' (1669); as well as commentaries covering nearly all of the Old Testament.

Cocceius, Samuel Freiherr von, German jurist: b. Heidelberg 1679; d. 1755. He was a son of Heinrich von Cocceius (q.v.). He was, in 1702, professor at Frankfort-on-the-Oder, and rose through many degrees to the dignity of grand chancellor of all the Prussian dominions, and was also a distinguished jurist.

Coc'colith, the name given in 1858, by Huxley, to one of certain minute oval or globular calcareous bodies found in countless numbers in the ooze of the Atlantic, either detached or adherent to small pieces of protoplasm. They have since been dredged up from other places, and found in chalk, and, according to Guembel, in limestone of all ages. Carter thinks they belong to *Melobesia*, a genus of algæ.

Coccosteus, kŏk-kŏs'tē-ŭs, a genus of fossil placoganoid fishes, pertaining chiefly to the Devonian and Old Red Sandstone systems, but met with also in Silurian strata. The head was protected by a great shield covered with tubercles. Besides this bony cuirass there was also a ventral shield, but the rest of the body was naked. The mouth was furnished with small teeth.

Coc'culus In'dicus, or fish-berry, as it is commonly known in the United States, is the seed of a herbaceous climbing vine (*Anamirta paniculata*), a species of *Menispermaceæ*. The dried berries are imported from the East Indies. The drupe resembles a round berry, the size of a pea or larger, wrinkled externally, and with a brittle husk. The kernel is intensely bitter. It contains about one fiftieth of its weight of a powerful bitter narcotic poison called picrotoxin, also bases called menispemine, a crystalline base, paramenispermine, and several organic acids. Picrotoxin is used as an adulterant in enriching

and imparting a bitter taste to malt beverages, and is thrown into rivers in which fish abound to stupefy them, so that they may be readily caught. It has been used in the form of an ointment in certain skin diseases, and in decoctions for killing vermin in the hair of children and animals, although death is sometimes caused through this latter use. The symptoms of poisoning are twitching and incoördination of the muscles, increased reflex excitability, convulsions, coma, and death from asphyxia.

Coccus, in zoology, a genus of insects of the order *Hemiptera,* family *Coccidæ.* Generic character: antennæ filiform, of 10 articulations in the male, nine in the female, shorter than the body; rostrum pectorale, conspicuous only in the females; males with two large incumbent wings; females apterous, subtomentose, fixed, and becoming gall-shaped or shield-shaped after impregnation. These little insects are remarkable for many peculiarities in their habits and conformation. The males are elongated in their form, have long, large wings, and are destitute of any obvious means of suction; the females, on the contrary, are of a rounded or oval form, have no wings, but possess a beak or sucker formed of the extremely modified appendages of the mouth, by which they fix themselves to the plants on which they live, and through which they draw their nourishment, At a certain period of their life the females attach themselves to the plant or tree which they inhabit, and remain thereon immovable during the rest of their existence. In this situation they are impregnated by the male; after which their body increases considerably, in many species losing its original form and assuming that of a gall (whence Réaumur's name, *Gallinsecta,* for the family), and, after depositing the eggs, drying up and forming a habitation for the young. This change of form is not, however, constant to all the species, which has given rise to a division of the genus into two sections: those which assume a gall shape, in which the rings of the abdomen are totally obliterated, are called "kermes" by some authors; and those which retain the distinct sections of the abdomen, notwithstanding the great enlargement of the body, are called "true cocci," or "cochineal" (q.v.). They are impregnated in the spring, after having passed the winter fixed to plants, particularly in the bifurcations and under the small branches. Toward the commencement of summer they have acquired their greatest size, and resemble a little convex mass without the least appearance of head, feet, or other organs. Many species are covered with a sort of cottony down. Each female produces thousands of eggs, which are expelled by a small aperture at the extremity of the body. As soon as they are produced they pass immediately under the parent insect, which becomes their covering and guard; by degrees her body dries up, and the two membranes flatten and form a sort of shell, under which the eggs, and subsequently the young ones, are found. Soon after the death of the mother the young insects leave their hiding-place and seek their nourishment on the leaves, the juices of which they suck through the inflected rostrum placed beneath their breast.

But it is with a view to their importance as an article of commerce, arising from their use in the arts, that the insects of this genus are particularly interesting. When it is considered that the most brilliant dyes and the most beautiful pigments, as well as the basis of the most useful kinds of cement, are their product, it will be acknowledged that to none of the insect tribe, except, perhaps, to the bee and the gall-insect, are we more indebted than to these singular and apparently insignificant little beings. Kermes, the scarlet grain of Poland, cochineal, lac-lake, lac-dye, and all the modifications of gum-lac, are either the perfect insects dried, or the secretions which they form. The first-mentioned substance is the *Coccus ilicis.* It is found in great abundance upon a species of evergreen oak (*Quercus coccifera*), which grows in many parts of Europe, and has been the basis of a crimson dye from the earliest ages of the arts. It was known to the Phœnicans before the time of Moses; the Greeks used it under the name of *kokkos,* and the Arabians under that of *kermes.* From the Greek and Arabian terms, and from the Latin name *vermiculatum,* given to it when it was known to be the product of a worm, have been derived the Latin *coccineus,* the French *cramoisi* and *vermeil,* and the English "crimson" and "vermilion." The early Jews, the Greeks, the Romans, and until lately the tapestry-makers of Europe, have used it as the most brilliant red dye known. The scarlet grain of Poland (*Coccus polonicus*) is found on the roots of the *Scleranthus perennis,* which grows in large quantities in the northeast of Europe and in some parts of England. This, as well as several other species, which afford a similar red dye, have, however, fallen into disuse since the introduction of cochineal. The introduction of aniline dyes has greatly injured the cochineal industry.

Lac is a secretion from a species of *Coccus* inhabiting India, where it is found in astonishing abundance on the *Ficus religiosa.* In its native state, not yet separated from the twig on which it has been deposited, it is called "stick-lac"; when separated, powdered, and the coloring matter washed from it, it is denominated "seed-lac"; "lump-lac" when melted into cakes; and "shell-lac" when purified and formed into thin laminæ. Lac-lake is the coloring matter of stick-lac precipitated from an alkaline lixivium by means of alum.

Coccus is also the name of a family of bacteria characterized by their spherical form and consisting of a number of genera, all named for certain growth characters. Thus cocci that grow in chains are termed *Streptococci* in which group the virulent bacteria that cause blood-poisoning, septicæmia, and the organism of erysipelas are found; Cocci that grow in pairs are termed *diplococci.* The *diplococcus* of pneumonia, and the *diplococcus* of gonorrhœa are in this group. Others grow in bunches,—*Staphylococci.* The common organism of pus is *Staphylococcus pyogenes aureus,* by bacteriologists usually called *S.p.a.* Other spherical forms are known as *Micrococci,* one of which group, the *Micrococcus urea,* is found in the urine as causative agent in excessive urinary fermentation. Some forms of this family group grow in packets. These are termed *Sarcinæ.* They are very abundant in the air, and are frequently associated with chronic gastric fermentations. A large number of different forms of this family are known, the greater majority of which are

not pathogenic but very useful in agriculture and the arts, particularly in agricultural processes. As many as a hundred different species have been found in the air, and Chester has described 36 species of *Streptococcus*, 91 species of *Micrococcus* (*Staphylococcus* here included), 14 species of *Sarcinæ*, 3 species of *Planococci*, or movable cocci, and 3 species of *Planosarcinæ*. See BACTERIA.

Consult: Chester, 'Manual of Determinative Bacteriology.'

Coccygodynia, kŏk"sĭ-gō-dĭn'ĭ-a, a painful affection usually situated at the end of the spinal column, in and about the region of the coccyx. It is probably many affections rather than one, as neuralgias, arthralgias, and sympathetic pains may be felt in this region. It is an affection more common in women than in men, being more prevalent in those women who have had children. Pain is felt, usually of a decided sharp character, and definitely localized and in the region, on rising after sitting down, walking up and down stairs, and on defecation. The diagnosis may be extremely difficult and the treatment purely medical or surgical.

Coccygomorphæ, an order or suborder of birds, proposed by Huxley, and nearly equivalent to the *Cuculiformes* of some authors. All have the palate desmognathous or provided with a more or less well developed band of bone binding the two maxillary bones together across the palate; but, owing to the great diversity of characters exhibited by the families, a brief definition is impossible. The following families are included by Stejneger, and indicate the limits of the group: *Cuculidæ*, cuckoos (q.v.); *Coraciidæ*, rollers, of Madagascar; *Alcedinidæ*, kingfishers (q.v.); *Upupidæ*, hoopies (q.v.), of the Old World; *Musophagidæ*, plantain eaters (q.v.) of Africa; *Todidæ*, todies (q.v.), of Mexico and the West Indies; *Momotidæ*, sawbills (q.v.); *Bucerotidæ*, hornbills (q.v.), of the Old World; *Rhamphastidæ*, toucans (q.v.), of tropical and sub-tropical America; *Caprimulgidæ* (q.v.), goatsuckers, cosmopolitan; *Bucconidæ*, barbets and puffbirds (qq.v.); and *Indicatoridæ*, guide-birds (q.v.), of Africa.

Coccyx, kŏk'sĭks. See OSTEOLOGY.

Cochabamba, kō-chä-bäm'bạ, Bolivia, a central department of the republic, bounded on the north by the department of Beni, on the east by Santa Cruz, on the south by Chuquisaca and Potosi, and on the west by Oruro and La Paz. Its area is about 22,000 square miles. The following list shows its provinces and the varieties of climate: Tarata, Mizque, Punata, and Ayopaya are tropical; Chaparé, Tapacari, Totora, Arque, and Furacares are semi-tropical; the capital district is temperate. The goldmines at Choquecamata in Ayopaya have been worked for a long time, and were famous during the period of Spanish supremacy. Silver and marble are found at Palca; gold and silver at Sayari; silver in Mizque, Colcha de Arque, and Quioma. Cochabamba has been called "the granary of Bolivia." It is the great wheat and maize growing section of the country, and is also noted for its fine horses bred from imported Peruvian and Chilean stock. All classes of agricultural products can be grown on the extensive and rich plains of Sacaba, province of Chaparé, where useful medicinal plants are also found, and alfalfa grows luxuriantly. In the province of Ayopaya there are great tracts of pasture land, and wool, barley, etc., are produced. In Tapacari all the European fruits and cereals thrive, and herds of llamas, cattle, and horses abound. All cereals thrive in Mizque, a province which also contains extensive vineyards, and produces the excellent and nutritive Cochabamba corn. The agricultural products are manufactured on a limited scale. According to the census taken by the national committee and approved by President Pando, 5 Dec. 1902, the department has 328,163 inhabitants.

Cochabamba, Bolivia, the capital of the department of the same name. It is one of the principal centres of trade in the republic, and its elevation (8,400 feet above the level of the sea) gives it a cool and healthful climate. The city has manufactures of leather goods, woolen cloths, and other products. Pop. over 40,000.

Cochin, Charles Nicolas, French engraver: b. Paris 1688; d. 1754. He practised painting till his 23d year, and this was of considerable advantage to him in the art of engraving, to which he afterward devoted himself. In 1731 he became a member of the Academy of Painting.

Cochin, Charles Nicolas, French engraver: b. Paris 22 Feb. 1715; d. Versailles 29 April 1790. He was a son of the preceding, and his productions are superior to those of his father. The collection of his works contains more than 1,500 pieces, among which there are 112 likenesses, in the form of medals, of the most renowned French scholars and artists of his time, who were almost all his friends. Besides his essays in the memoirs of the Academy, he published 'Voyage d' Italie' (1758), and several other works. His frontispieces and vignettes are remarkable for neatness and taste. His views of 16 French seaports are of great value. His composition in general is rich, delicate, and pleasing. He was a member of the Academy, and occupied several places of importance.

Cochin, kō'chĭn, India, a seaport of Hindustan, in the Malabar district of the Madras presidency, situated on a small island. It is a picturesque place with many quaint old Dutch buildings. Its harbor, though sometimes inaccessible during the southwestern monsoon, is the best on this coast. Cochin was one of the first places in India visited by Europeans. In 1502 Vasco da Gama established a factory and soon after Albuquerque built a fort; he also died here in 1524. In 1663 the Dutch took the place, in 1795 the British. Pop. about 18,000.

Coch'in, a variety of the domestic fowl, imported from Cochin-China. It is a large, ungainly bird, valuable chiefly owing to its fecundity, eggs being laid even during the winter.

Cochin-China, a country forming part of the peninsula of southeastern Asia, and generally regarded as comprising the whole of Anam and Lower or French Cochin-China. Three of the six provinces into which the latter was divided were acquired at one period, and the remaining three at another period. A persecution of the French Roman Catholic missionaries in Anam furnished the French with an occasion of regaining a footing in the East. An expedition against Cochin-China was decided on in 1857, and Saïgon was occupied. The Austro-

Italian war deferred further operations till 1861, when the conquest of Metho gave the French possession of the most fertile district of Lower Cochin-China. The war continued till 5 June 1862, when a peace was concluded at Saïgon with the king of Anam, which was ratified at Hué 15 April 1863. By this treaty the king agreed to cede to the French the three provinces of Bienhoa, Saïgon, and Metho, along with the island of Poulo Condore, to permit the Roman Catholic religion in his kingdom, to open three of the ports in Tonquin to French ships, and to pay an indemnity of 24,000,000 francs (about $4,800,000). Although the inhabitants were found to be on the whole sufficiently tractable, yet a few revolts took place, whereupon Admiral De la Grandière, on the pretext that all these disturbances had their origin in the provinces of Lower Cochin-China which had remained to Anam, namely, Vinhlong, Chaudoc, and Hatien, took possession of these provinces, and declared them French territory, 25 June 1867. The territory thus acquired by France in this peninsula covers 21,710 square miles, and in 1894 had a population of 2,226,935. It is now organized in departments, prefectures, sub-prefectures, and cantons. In 1882–3 France asserted a claim to the protection of Tonquin, and indeed the entire Anam territory, and after some fighting this claim was conceded by the king. Tonquin was accordingly taken possession of by France in 1884, and is now under French administration, native resistance having now entirely ceased. Anam (q.v.) forms a protectorate.

The northern and eastern parts of French Cochin-China are hilly, but the rest of the territory consists almost entirely of well-watered low alluvial land. The lowlands, where the waters stagnate, are covered with a rank vegetation from three to ten feet high; contiguous to the flowing streams are extensive rice-grounds. Where the soil is somewhat raised above the water-level it is very fertile, and in some places ranges of low hills follow the line of the rivers. In the more elevated districts are grown tobacco, sugar-cane, maize, indigo, and betel. Among the other products are tea, gums, cocoanut oil, silk, spices, and various farinaceous and aromatic articles. The Anamites raise also great numbers of buffaloes, cattle, hogs, and birds; the first being employed in agriculture, and, as well as oxen, for draft purposes; but since the French conquest oxen are reserved more strictly for food. Industrial arts are as yet limited among the natives. They are skilful in all kinds of basket-work, in which they use the reeds and other similar materials which abound in the low lands; silk and cotton are also wrought. But they excel in the use of wood, of which their temples, pagodas, and tombs are built, and ornamented with elaborate carving. They live in villages — numbering nearly 1,000 — adjacent to the rivers, which, in the unsuitableness of the country for land traffic, form almost the only means of communication. Their houses are either tiled or thatched with straw, the roofs being supported with wooden pillars; the better class are in two sections, the inner apartments and the outer veranda, which serves for use in the daytime; they are often well furnished, and not devoid of comfort. The only roads at present are those connecting Saïgon, the capital, with the principal towns. Telegraphic communication between many of the principal places has been opened, and is being extended. The principal export is rice, of which there is annually exported about 7,000,000 hundredweight, mainly to China; cotton and silk are also exported.

Cochin-China, Upper, or **Dong-trong,** a narrow strip of land, consisting of four provinces, on the east coast of Anam, to which empire it belongs, extending from Tonquin on the north to Champa on the south. The most important river is that on which the chief town P'hu-thua-thien or Hué stands. In the most fruitful parts of this region aloes wood (of the Aquilaria ovata), corn, sugar-cane, and cinnamon flourish. From October to January the weather is often very stormy, and typhoons rage frequently. The climate is healthy and pleasant. Camphor is produced in the district in the utmost perfection.

Cochineal, an insect (*Coccus cacti*), used as a dye. It is a native of Mexico, but has been introduced into Europe and Algiers. Even the live insects were imported, and plantations of cactus were cultivated for their nourishment. The French and Spanish kermes, which at one time was in high repute, disappeared and was soon entirely forgotten. It is a small insect with the body wrinkled transversely; its abdomen of a deep mulberry color, and bristly in the posterior part; the legs are short and black, the antennæ subulate and about one third the length of the body. The male has two erect wings, the female none. The principal district in which they are reared is in the province of Oaxaca, those of the district of Mestique being considered the best insects. There are plantations of the nopal (*Opuntia coccinellifera*), upon which they feed, the insects being tended with care equal to that ordinarily bestowed upon silkworms. Before the rainy season sets in, branches of the nopal covered with insects are cut off and brought under shelter to protect them from the weather. At the close of the wet season, about the middle of October, the plantations are stocked from these supplies by suspending little nests made of some soft woody fibre, each containing 8 or 10 females, upon the spines of the nopal. The insects, warmed by the sun, soon emerge and lay their eggs, each female producing more than 1,000 young. These spread rapidly over the plants, and as the young females become impregnated they attach themselves to the leaves and swell to great size, presenting the appearance more of vegetable excrescences than of animated creatures. In this condition they are gathered for the cochineal. The males, which are few in number, not more than one to 100 or 200 females, are of no value for this purpose. The females are picked off with a blunt knife, the first crop about the middle of December, and subsequently several more of as many successive generations, the last being in May. A laborer can pick off only about enough to make two ounces of cochineal in a day. Those taken off full of young lose about two thirds of their weight in the process of drying, to which they are subjected as soon as they are killed, which is done either by dipping them in a basket into boiling water, or placing them in a hot oven, or on plates of hot iron. By the first method, usually considered the best, the insects turn to a brownish red color, losing a portion of the white powder with which they

were previously loaded between the wrinkles of the body. In the oven they retain this, and their color is then gray. Those killed on hot iron turn black. Such is the origin of the different varieties known in our market as "silver grains and black grains," and the "foxy" of the London market, the last being those killed by boiling water, though others ascribe it to the former being the female before laying her eggs, and the latter after she has parted from them. The quality of the cochineal is the same in both cases. When dried, the cochineal presents the form of grains, convex on one side and concave on the other, about one eighth of an inch in diameter, with the transverse wrinkles still visible. It is stated that it takes about 70,000 insects to weigh a pound.

Cochineal-fig, a name given to *Opuntia coccinellifera* and two other species of cacti, natives of Mexico and the West Indies, the plants on which the cochineal insect lives. See CACTUS; COCHINEAL.

Cochituate (kō-chĭt'ū-āt) **Lake,** Mass., a narrow body of water, about four miles long, in Middlesex County, 17 miles west of Boston. From this lake for many years Boston has derived its principal water-supply.

Cochlea, kŏk-lē'a, an important part of the internal ear, so called from its shape, which resembles that of a snail-shell. See EAR.

Cochlearia, kŏk-le-ā'rĭ-a, a genus of annual maritime herbs of the mustard family (*Cruciferæ*). It numbers upward of 25 species, all natives of the colder parts of the north temperate zone, and not familiar generally. About four species are found on the Arctic and northern Pacific coasts of North America. Two very distinct species quite well known are the horse-radish (*C. armoracia*), escaped from cultivation, and now found wild in the moist ground along streams, and scurvy-grass (*C. officinalis*), considered of great value as an antiscorbutic. If eaten fresh, it is a stimulant and diuretic, but is feeble if allowed to dry before being taken.

Cochran, John, American soldier and lawyer: b. Palatine, Montgomery County, N. Y., 27 Aug. 1813; d. New York 7 Feb. 1898. He was graduated at Hamilton College 1831, practised law in Oswego from 1834 to 1845, when he removed to New York, where his talents as lawyer and orator at once brought him into prominence. He was surveyor of the port of New York 1853–7, and a Democratic member of Congress 1857–61, serving as chairman of the Committee on Commerce. During the Civil War he commanded the 1st United States Chasseurs in the Peninsula campaign; was commissioned a brigadier-general 17 July 1862, and commanded a brigade in Gen. Couch's division of the Army of the Potomac; was with the reserve at the battle of Antietam and took an active part in the pursuit of the enemy. He was attorney-general of New York State 1863–5. He was active in securing Greeley's nomination for President in 1872; was president of the New York Common Council 1872, and acting mayor when Mayor Hall retired during the Tweed ring disclosures; again a member of the council in 1883, and a police justice 1889.

Cochrane, Thomas, 10th Earl of Dundonald, British naval officer: b. Annsfield, Scotland, 14 Dec. 1775; d. Kensington, England, 31 Oct. 1860. He entered Parliament in 1806. In 1814 he was accused of conspiring to circulate a false report of Napoleon's death for speculative ends, and though he protested his innocence he was imprisoned for a year, fined, and was expelled from the navy and the House of Commons. In 1818 he accepted an invitation to organize the navy of Chile and performed many brave exploits during the contest with Spain. He left the service of the Chileans and was commander of the Brazilian navy from 1823 to 1825, when he resigned, because accused of insubordination. In 1827 and 1828 he commanded the Greek army. In 1832 he was cleared of the charges brought against him in 1814, and restored to the Order of the Bath and to the English navy. He was appointed vice-admiral in 1841; admiral in 1851, and rear-admiral of the United Kingdom in 1854.

Cock, the male of the domestic fowl. At what time this valuable species of pheasant was brought under the immediate control of man it is now impossible to determine; but, as the forests of many parts of India still abound with several varieties of the cock in the wild or natural condition, it is reasonable to conclude that the race was first domesticated in Eastern countries, and gradually extended thence to the rest of the world. It is stated that the cock was first introduced into Europe from Persia; and Aristophanes speaks of it as "the Persian bird." Nevertheless it has been so long established throughout western regions as to render it impossible to trace its progress from its native wilds.

The cock has his head surmounted by a notched, crimson, fleshy substance called "comb": two pendulous fleshy bodies of the same color, termed "wattles," hang under his throat. The hen has also a similar, but not so large nor so vividly colored excrescence on her head. The cock is provided with a sharp horn or spur on the outside of his tarsus, with which he inflicts severe wounds; the hen, instead of a spur, has a mere knot or tubercle. There is, in both sexes, below the ear, an oblong spot, the anterior edge of which is reddish, and the remainder white. The feathers arise in pairs from each sheath, touching by their points within the skin, but diverging in their course outward. On the neck they are long, narrow, and floating; on the rump they are of the same form, but drooping laterally over the extremity of the wings, which are quite short, and terminate at the origin of the tail, the plumes of which are vertical. In the centre of the cock's tail are two long feathers, which fall backward in a graceful arch and add great beauty to the whole aspect of the fowl. The plumage is infinitely varied in both colors and markings, being in some breeds of the greatest richness and elegance, and in others of the simplest and plainest hue. Except in the pure white breeds, the plumage of the cock is always more splendid than that of the hen. The cock, when in good health and full plumage is apparently conscious of his personal beauty and courage. The cock is strongly attached to what may be called his harem, and is often seen strutting at the head of 10 or 15 hens. His sexual powers are matured when he is about six months old, and his full vigor lasts for about three years, varying

in earliness of maturity and duration with his size and the climate. See also HEN.

Cock-fighting, an ancient sport of unknown origin, but practised among both the Greeks and the Romans. An annual cock-fight was instituted at Athens, and Æschines reproaches Timarchus, and Plato the Athenians in general, with their fondness for the cock-pit. The breeds of Rhodes and of Tanagra in Bœotia were in great esteem in Greece. The Romans seem to have used quails and partridges also for this purpose. This sport has long been a favorite with both Americans and English, although repeatedly denounced and prohibited by the laws. The size proper for game-cocks may be said to be not less than four pounds eight ounces, nor above four pounds ten ounces. The strain from which the cock is chosen ought to be distinguished for victory. For the combat they are armed with steel or silver spurs, or "gaffles." The place appropriated to fighting is called a "pit," and consists generally of a mound of earth covered with sod, and surrounded by seats in circular tiers. The battle is conducted by two "setters-to," who place the cocks beak to beak. When they are once "pitted" (this verb owes its origin to the sport of cock-fighting), neither of the setters-to can touch his cock so long as they continue to fight, unless their weapons get entangled. In the Philippine Islands cock-fighting is pushed almost to the verge of a craze. Nearly every village has its pit, and every peasant his cock. The peasant, too, is said to rescue his fighting-cock rather than his wife or child in the event of fire, and wherever he goes he takes it with him. The sport is there practised in a very cruel form, and many are ruined by excessive betting. Throughout all Spanish-America cock-fighting is more or less in favor. It was formerly a regular sport in the public schools of England, and schoolmasters received dues in connection with it. Cock-fighting is still prevalent in China, Persia, and Malacca.

Cock-Lane Ghost, a famous hoax by which many people of London were deceived in 1762, arising from certain knockings heard in the house of a Mr. Parsons, in Cock Lane. Dr. Johnson was among those who believed in the supernatural character of the manifestations; but it was found out that the knockings were produced by a girl employed by Parsons.

Cock of the Plains. See CAPERCAILZIE.

Cock of the Rock (*Rupicŏla crocea*), a South American bird of a rich orange color, with a beautiful crest, belonging to the family *Cotingidæ*. The name, or its French equivalent, is also applied to several related species.

Cock of the Woods. See CAPERCAILZIE.

Cockade (Fr. *cocarde*), a plume of cock's feathers, with which the Croats in the service of the French in the 17th century adorned their caps. A bow of colored ribbons was adopted for the cockade in France, which soon became a national emblem and party signal. During the French Revolution the tricolored cockade — red, white, and blue — became the national distinction. National cockades are now to be found over all Europe. In Germany cockades of black, red, and gold, after being forbidden in 1832, were again allowed in 1848, and even introduced into the army. Since 1850, however, they have again ceased to be publicly worn. In Italy the former emblem of the party of progress, the green, red, and white cockade, was recognized by the government of Piedmont in 1848, and since the formation of the kingdom of Italy it has formed the national cockade.

Cockaigne, kŏk-ān', **Land of,** an imaginary land of idleness and plenty, in which the houses were roofed with cake, the rivers ran wine, and roasted fowl offered themselves to be eaten. The term was applied in derision to both London and Paris. The corresponding term in English is "lubberland," and in German "*Schlaraffenland.*" 'The Land of Cockaigne' was the title of a satirical poem written not later than 1300.

Cockatoo, an English rendering of a Malayan name for certain species of birds of the parrot family (*Psittacidæ*). They are comprised in *Cacatua,* and five other genera forming a sub-family, which, besides having some peculiarities of internal anatomy, is distinguished from true parrots by the greater height of the bill, and its being curved from the base, and by the lengthened, broad, and rounded tail. The head is also large, and in the true cockatoos is surmounted by a crest of long and pointed pink or yellow feathers, with their tips directed forward, which can be erected and expanded like a fan, or depressed, at the pleasure of the bird. The true cockatoos are also all of generally whitish plumage, but often finely tinged with red, orange, and other colors, or mixed with these colors in more brilliant displays. The cockatoos are confined to the Australian region and the neighboring Malayan islands, with the exception of a single Philippine species. The sulphur-crested cockatoos (*Cacatua sulphurea* and *galerita*) are well-known cage-birds which may be taught a few words, but their vocal efforts are chiefly limited to the harsh cry "cockatoo."

Cock'atrice, a fabulous serpent or serpent-like monster anciently believed to be hatched from a cock's-egg. It is often simply another name for the basilisk (q.v.).

Cockburn, kō'bėrn, SIR **Alexander James Edmund,** English jurist: b. 24 Dec. 1802; d. 20 Nov. 1880. He studied at Cambridge; was called to the bar in 1829, and soon became distinguished as a pleader before parliamentary committees. In 1847 he became member of Parliament for Southampton in the Liberal interest; became solicitor-general and was knighted in 1850. He was made chief justice of the common pleas in 1856; and lord chief justice in 1859. Among the many famous trials over which he presided were the Wainwright case and Tichborne case. He represented Great Britain at the Geneva arbitration tribunal for the adjustment of the "Alabama Claims," 1871–2.

Cockburn, Alicia or **Alison Rutherford,** Scottish lyrist: b. Fairnilee, Selkirkshire, 8 Oct. 1713; d. Edinburgh 22 Nov. 1794. In 1731 she married Patrick Cockburn, advocate, and in 1753 was left a widow. She died having for 60 years and more been a queen of Edinburgh society. In person she was not unlike Queen Elizabeth. Of her lyrics the best known is the exquisite version of 'The Flowers of the Forest' ("I've seen the smiling of Fortune beguiling"), commemorating a wave of calamity that swept over Ettrick Forest, and first printed in 1765. Mrs.

1. The Slender-billed Cockatoo (Licmetis nasicus). 2. The Black or Crow Cockatoo (Calyptorhynchus galeatus).

Cockburn in 1777 discerned in Walter Scott "the most extraordinary genius of a boy"; in 1786 she made Burns' acquaintance.

Cockburn, Sir George, English naval officer: b. London 22 April 1772; d. Leamington 19 Aug. 1853. He entered the navy in early youth, and about 1812 obtained the rank of rear-admiral. He took part in the capture of Washington City in 1814 and conveyed Napoleon to Saint Helena in 1815. He was a lord of the admiralty from 1818 to 1828, and sat in Parliament for many years.

Cockburn, George Ralph Richardson, Canadian educator: b. Edinburgh, Scotland, 15 Feb. 1834. He graduated at Edinburgh University, 1857, and studied in France and Germany. He went to Canada in 1858, became rector of the Upper Canada Grammar School; was commissioned to inspect the higher educational institutions of the province, and study the subject in all its phases. The investigation lasted two years, and he presented its results in two able reports. In 1861 he was made principal of Upper Canada College, and a member of Toronto University senate. Under his administration of 20 years the college attained a high reputation for the excellence of its teaching and discipline.

Cockburn, Henry Thomas, Lord, Scottish judge: b. Edinburgh, Scotland, 26 Oct. 1779; d. Bonaly, near Edinburgh, 26 April 1854. It was chiefly in connection with political cases that he rose to eminence in his profession, one leading transaction being his gratuitous defense of several persons tried for treason in the year 1818. He became solicitor-general for Scotland in 1830, and in 1834 one of the lords of session. 'Memorials of His Time' (1856) is an invaluable record of the social history of Scotland, narrated in the raciest and most genial manner. Not less interesting is his life of his friend Lord Jeffrey (1852).

Cockburn, Sir John Alexander, Australian statesman: b. Crosbie, near Duns, Scotland, 23 Aug. 1850. He was educated at Kings' College, London, and settled in South Australia in 1875. He sat in the House of Assembly as member for Burra in 1884, and for Mount Barker in 1887. He was minister of education 1885–7; premier and chief secretary 1889–90; chief secretary 1892; minister of education and agriculture 1893–8. He represented South Australia at the International Commercial Congress in Philadelphia in 1899, and at the Colonial Congress in Paris in 1900, as well as at other important conferences. He was knighted in 1900.

Cockchafer. See Chafer.

Cock'er, Edward, English engraver and teacher of writing and arithmetic: b. 1631; d. 1675. He is said to have published 23 books of exercises in penmanship, one of which is preserved in the British Museum. The great work with which his name is so intimately associated that the phrase, "according to Cocker," has become proverbial, was first published in 1678 under the title of 'Cocker's Arithmetic, Being a Plain and Familiar Method, Suitable to the Meanest Capacity, for the full Understanding of that Incomparable Art, as It is now Taught by the Ablest Schoolmasters in City and Country, Composed by Edward Cocker, late Practitioner in the Arts of Writing, Arithmetic, and Engraving.' The book reached a 37th edition by 1720, and upon it most of the succeeding treatises on arithmetic were based. Two other works bear Cocker's name—a treatise on 'Decimal Arithmetic' and an 'English Dictionary,' but it has been surmised that they are not of his authorship, but of that of his publisher, Hawkins.

Cocker, a variety of spaniel (q.v.).

Cockerell, kŏk'ĕr ĕl, **Charles Robert,** English architect: b. London 28 April 1788; d. London 17 Sept. 1863. He wrote monographs on the mausoleum of Halicarnassus and other archæological subjects. Advancing to the front rank of his profession, he became an associate of the Royal Academy in 1829, a member in 1836, and professor of architecture in 1839, delivering lectures which were highly esteemed and largely attended. He was happier in following classic models than in the Gothic style. He built the Bank of England and many other public and private buildings. He wrote on the 'Iconography of Wells Cathedral'; 'Sculptures of Lincoln and Exeter Cathedrals'; 'Tribute to the Memory of Sir Christopher Wren'; etc.

Cock'ermouth, England, a town in the county of Cumberland. It is situated at the confluence of the Cocker with the Derwent, 24 miles southwest of Carlisle, and 260 miles northwest of London. The old castle, supposed to have been built soon after the Conquest, stands on a bold eminence. Mary Queen of Scots was imprisoned in it in 1568, and in 1648 it was dismantled by the parliamentary forces. Cockermouth is the birthplace of the poet Wordsworth, in memory of whom a fine stained-glass window has been inserted in the church of All Saints. Pop. (1901) 5,355.

Cockle (*Cardium*), a genus of bivalve shellfish forming the type of the family *Cardiidæ*. The general characteristics are—shells nearly equilateral and equivalvular; hinge with two teeth, one on each side near the beak, and two larger remote lateral teeth, one on each side; prominent ribs running from the hinge to the edge of the valve. The animal has a powerful foot, with which it burrows in the sand. For this purpose it first distends it with water, to give firmness to it. This foot may also be used to enable the animal to move from place to place, for by first bending it and then suddenly straightening it the animal may project itself to a considerable distance. The common cockle (*Cardium edule*) is common all round the coasts of the British islands wherever it finds suitable sand-beds to live in, and is also found in the Baltic, and elsewhere. It is much used as an article of food. A prickly species, the *Cardium aculeatum*, found on the coast of Devon, is also eaten. Among American species, which, however, are not eaten, are *C. islandicum*, found to the north of Cape Cod, and *C. pinnulatum*, found about Long Island Sound. On the coast of Labrador *Serripes groenlandicus* reaches a large size, being nearly four inches long, and two inches thick. This genus is represented by fossils from the Devonian Period onward, but it attains its maximum in recent seas.

Cockle, kŏk'l. See Corn-cockle.

Cockle, Order of the, that of St. Michael, the knights of which wore the scallop as their badge. This order was instituted by Louis XI.

of France, who began to reign 1461 A.D. The dress is thus described from a MS. inventory of the robes at Windsor Castle in the reign of Henry VIII.: "A mantell of cloth of silver, lyned withe white satten, with scallope shelles. Item, a hoode of crymsin velvet, embraudeard with scallope shelles, lyned with crymsin satten."

Cock'lebur, a coarse annual plant, a species of *Xanthium,* belonging to the rag-weed family (*Ambrosiaceæ*). There are five or more species widely distributed throughout the temperate regions. Three of these species occur very commonly in waste grounds in nearly every part of the United States, excepting the interior region east of the Mississippi River, where the plant is rare. A distinct native of this country is the American cocklebur (*X. canadense*), while two other species (*X. strumarium* and *X. spinosum*), had their advent from Europe or Asia. Wool-growers are seriously troubled by the hook-spined burs of this plant, which catch in the sheep's wool, depreciating its value. In South Africa the injury to the wool industry is so great that strict laws are enforced to keep the plant from multiplying.

Cock'ney, a nickname for a native of London, especially for a person both born and bred there, the term being often used with a certain sense of disparagement, and as implying ignorance of other than city affairs, or as suggesting effeminacy. As to the origin of the word there has been much dispute, and many explanations, some of them sufficiently absurd, have been propounded. In the 14th and 15th centuries it was used to mean a petted or cockered child; and, according to the most recent etymology, its original meaning was "cock's egg," a small or misshapen egg.

Cockpit, in old-time men-of-war, a place situated under the lower gun-deck, where the ship's surgeons tended the wounded. The term is also applied to the open space in a yacht or canoe in which the crew or passengers sit.

Cockran, kŏk'ran, **William Bourke,** American lawyer: b. County Sligo, Ireland, 28 Feb. 1854. He came to America in 1871, and taught school for several years, while studying privately for the bar. He soon attained prominence as a lawyer, and entered actively into New York politics, his eloquence causing him to be much in demand as a Democratic public speaker. He was a member of Congress 1891–5, made noteworthy speeches at the Democratic national conventions of 1884 and 1892, at the latter of which he opposed Cleveland's nomination; and in 1896 refused to follow his party on the silver question, campaigning for McKinley, and advocating the gold-standard in effective addresses.

Cock'rell, Francis Marion, American senator: b. Johnson County, Mo., 1 Oct. 1834. He graduated at Chapel Hill College, Mo., 1853, studied law, and practised that profession until his election to Congress. During the Civil War he was a brigadier-general in the Confederate army, was severely wounded during Hood's invasion of Tennessee, and commanded a division in the operations around Mobile, Ala. He was chosen United States senator to succeed Carl Schurz, took his seat 4 March 1875, and has been re-elected four times, his present term expiring 3 March 1905.

Cockroach, any of the species of *Blatta* or allied genera, belonging to the family *Blattidæ,* order *Orthoptera.* The body of the cockroach is much flattened, being adapted to life under the bark of trees, under stones, in cracks, etc. The four wings are much alike in size and net-veined; the antennæ are long and slender, and to the end of the body are appended many-jointed antenniform limbs which contain olfactory organs like those in the joints of the antennæ. Cockroaches are hatched in nearly the same form as the parent, differing mainly in not having wings. The eggs are deposited in a bean-like case (*oötheca*), which is divided into two compartments, each containing about 30 eggs; these egg-sacs are carried about for some time by the female, projecting from the end of her hind-body. One small native species (*Platymodes pensylvanicus*) lives under stones, but the species so abounding in our homes have been introduced from the Old World. The peculiar odor given out by cockroaches is expelled from glands in the hind-body, and either present in both sexes, or only in the males. In the croton bug, or common small cockroach of our cities, these glands are very large, giving out a fœtid odor, and occur only in the males.

While nearly a thousand species of blattids are known to be now living and 200 fossil species are described, mostly from Palæozoic strata, chiefly the carboniferous states, several forms are household pests. They swarm in our kitchens, spreading through those parts of the house warmed by hot water or steam pipes, and are troublesome from eating clothing, cereals, devouring the paste in bindings of books; they also abound in ships, where they devour ship biscuit, etc., impregnating the pantry with their disagreeable odor. On the other hand, the cockroach is an enemy of the bed bug, doing great service in reducing their numbers. The development of the cockroach is slow and the number of eggs deposited not great. *Phyllodromia germanica,* the German roach or croton bug, reaches maturity in from four and a half to six months.

Of the many species known the most annoying is the German roach, whose native country is, however, not known, though supposed to have had an eastern origin. The Oriental cockroach (*Periplaneta orientalis*) is derived from tropical Asia, and is supposed to have been introduced into Europe two or three centuries since. The female is nearly wingless, it is a large dark brown species, living in colonies. The best remedies are insect powder, and phosphorus paste; a certain proprietary substance, called German snow-flake powder, is very efficacious. Consult the text books on entomology; also Howard and Marlatt, 'The Principal Household Insects of the United States.' (Bulletin No. 4 U. S. Department of Agriculture, Division of Entomology. Washington, 1896.)

Cock's-foot Grass. See ORCHARD GRASS.

Cocks'comb, a name sometimes given the genus *Celosia cristata* of the amaranth family *Amaranthaceæ.* It is an annual plant, native in the tropical regions of America, Asia, and the East Indies. The naturalized plant from tropical America is found during the months of August, September, and October as a weed or herb in waste places, also in cultivated ground, throughout the United States. The cultivated plant grows with an upright stem bearing a

brilliantly colored and wavy crest, formed by the minute flowers on the surface of the pointed bracts.

Cockswain, colloq. kŏk's'n, the officer who manages and steers a boat, and has the command of the boat's crew.

Cock'ton, Henry, English humorous novelist: b. London 1807; d. 26 June 1853. His stories were very popular in their day, the most noted among them being 'Valentine Vox, the Ventriloquist' (1840).

Cocles, kō'klēz, Horatius. See HORATIUS COCLES.

Cocoa. See CACAO.

Cocoa Butter. See CACAO, BUTTER OF.

Cocoanut, or **Coconut,** a palm tree (*Cocos nucifera*) native of islands in the Indian Ocean, but widely distributed in warm countries throughout the world. Geology shows that it had a wider distribution than at present, since specimens have been discovered in Central and South America. The tree grows naturally upon sandy soil bordering the sea or not far inland except where planted by man. It is remarkable as one of the first tree species to gain a foothold upon newly formed tropical islands. Its stem, which often attains a height of 100 feet is crowned by a rosette of long pinnatisect leaves from 10 to 20 feet long, gracefully curving upward at their bases and downward at their tips. From among the bases of the leaf-stems appear large pointed spathes from which proceed yellow or white flowers followed by large hard-shelled nuts. Several of the spathes in various stages of development are usually found upon the trees, which often commence to bear when less than 10 years old and continue productive for more than half a century, yielding about 100 nuts as an annual crop.

Since the tree does not produce well when remote from the coast, it is planted along the shores upon sandy or shelly land where little else of value will grow. The seeds are the sole means of propagation. They are planted in rows in the nursery and when the seedlings are large enough they are transplanted about 20 feet apart, where they are to remain, given clean cultivation for three or four years, and then allowed to shift for themselves, occasional mulches of seaweed, etc., but no manure, being given. The only part of the United States in which the cocoanut palm bears fruit with reasonable certainty is the extreme south of Florida, but even there it has not become commercially important. It may be taken as an index of the dividing line between the tropical and sub-tropical regions, since it thrives best in regions where frost never comes.

This palm is one of the most important economic trees of the world. Its fruit is a staple food either ripe or unripe, raw, or prepared in various ways, in many tropical countries. It is also exported to temperate climates, where the nuts are used in confectionery and for cake and dessert-making. The oil, of which there is about 70 per cent in the nuts, from which it is obtained by expression or heating in water, is largely used for making soap and candles and for food. (See COCOANUT OIL.) The central part of the stems of young plants is used for food, as is also the terminal bud or "cabbage." A drink and a kind of sugar are made from the sap of the young spathes. The dried leaves are used for thatching, baskets, mats, etc., and the petioles for oars. The wood in the lower portions of the trunks of old trees is commercially important under the name of "porcupine wood," which is used in cabinet-making, etc. The fibrous centres of old stems are used for cordage-making, as is also the fibrous husk of the nuts (see COIR). This latter is widely used for making cocoanut-matting, which is put down in corridors where there is a great deal of tramping. It is exceedingly durable. The cocoanut shell is used for drinking cups, bottles, etc., and for ornament when carved and polished. The fibre of the husks is used by florists as a moisture-retaining medium in which to plunge potted plants and in which to propagate various seedlings and cuttings.

Cocoanut Crab. See ROBBER CRAB.

Cocoanut Oil, a solid vegetable fat, largely used in candle-making and in the manufacture of soaps and pomatum. This fat is expressed from the albumen of the cocoanut kernel, and is as white as lard, and somewhat firmer. From Manila and Ceylon large quantities of the oil are exported.

Cocoa-plum, the fruit of *Chrysobalanus icaco,* belonging to the family *Rosaceæ,* which is eaten in the West Indies. It is about the size of a plum, with a sweet and pleasant though somewhat austere pulp. The root, bark, and leaves of the plant are employed as remedies in diarrhœa and other troubles. It has simple, alternate leaves and cymose flowers.

Cocoa (kō'ko) **Root.** See COCCO.

Coco de Mer, or **Sea** or **Maldive Double Cocoanut,** the fruit of the *Lodoicea seychellarum* palm. Its double kernel has long had an extraordinary value over a large area in the East. As a sovereign antidote to poison, and long known only from specimens thrown up on the Maldive coasts, it was supposed to grow on a submarine tree, and had other fables attached to it. The tree on which it grows is peculiar to some of the Seychelles Islands, reaches a height of 100 feet, and has very large fernlike leaves.

Cocoon, kŏ-koon', the web or ball spun by caterpillars before passing into the chrysalis state. The valuable product thus obtained from the silk-worm is well known.

Coco River. See CAJE RIVER.

Cocos, a genus of palms. There are about 30 species, natives, with one exception (*C. nucifera*), of South America, but cultivated for their fruits or for ornament in many warm countries. They vary considerably in height, but are all characterized by absence of spines, ridged trunks, pinnatisect leaves in a terminal crown or rosette, spadices erect at first, but later drooping, spathes two, flowers white or yellow, fruit of various forms. Some species are cultivated under glass on account of their graceful foliage. The most important species of the genus is unquestionably *C. nucifera,* the coco palm or cocoanut tree (see COCOANUT). Of the other species the following are perhaps best known in the United States. *C. flexuosa,* a medium-sized Brazilian species often planted in southern Florida and southern California as a street tree and to some extent cultivated in northern greenhouses. *Ceriospatha,* a stouter, somewhat taller

species from southern Brazil, by some considered the hardiest of the genus and often planted along avenues in the regions mentioned and in the West Indies. It is little cultivated under glass because of its rather coarse leaves. *C. datil,* an Argentine species, found to be hardy in southern California as a street tree. Its fruits which are edible, resembling those of the date palm. *C. plumosa* is the most generally cultivated street tree of the genus; it is of quick growth, soon reaching a height of 30 feet, and, with age, 50 feet. It is indigenous to central Brazil. *C. medalliana,* a dwarf species from central Brazil, is unquestionably the most popular greenhouse palm, not only of the genus, but of all genera. Its foliage is small, delicate, and graceful, and on this account it is frequently used as a table decoration. It is probably the most easily cultivated of the palms used in house decoration, and since it is of slow growth it retains its beauty for a considerable time, never becoming coarse or unattractive.

Cocos-keeling (kō'kōs-kē'lĭng) **Islands,** British India, a group in the Straits Archipelago, being a little horseshoe-shaped cluster of isles lying south of Java at about the distance of a three days' sail by steamer. The group is little known, but is said to be among the most picturesque in the British empire. The inhabitants, numbering about 600, are divided between the Cocos natives and coolie laborers from Java. The islands have a romantic history. A Scotch sailor named Ross landed here in 1825 and established himself as ruler; in 1851 he hoisted the British flag; but in 1857 the islands were formally annexed to Great Britain; and authority over them still remains in the hands of the Scotch sailor's descendants. An enlightened civil government is maintained; schools have been established; and industries connected with cocoanut and other products are carried on.

Co'cum-butter, or **Cocum-oil,** a pale, greenish-yellow solid oil obtained from the weeds of Garcinia purpurea, a tree of the same genus with mangosteen, used in India to adulterate ghee or fluid butter.

Cocy'tus (from Gr. *kōkucin,* to lament), a river of ancient Epirus which falls into the Acheron. Also, among the ancient Greeks, one of the rivers of the lower world. Pausanias advances the following conjecture respecting this river: "At Cichyrus is Lake Acheron, with the rivers Acheron and Cocytus, whose waters are very ungrateful to the taste. Homer, I imagine, had seen these rivers, and in his bold description of hell gave to the streams in it the names of those in Thesprotia."

Cod, the typical representative (*Gadus callarias* or *Gadus morrhua*) of a family (*Gadidæ,* q.v.) of marine fishes of pre-eminent economic importance. Although most widely and generally known as the codfish, or simply cod, perhaps not less than 50 other names are applied to it more or less colloquially, many of them derived from the same root as cod. The cod is moderately elongated, heavy in front, with a large head, and tapering gradually into a slender tail terminated by a slightly notched fin. There are three dorsal fins, none of which is elevated, and two anals, and the ventral fins are normal in structure and placed far forward on the throat. The mouth and eyes are large, and the chin bears a long barbel. Very small scales cover the entire body and most of the head. Although varying much in shade, the color is usually reddish-brown with small rounded spots of darker brown and a conspicuous pale lateral line. Unlike the haddock, all of the bones of the shoulder girdle are thin and lamellar; much variation in size has been observed, certain localities and schools always yielding large fish, others small or mixed ones. An average length is from three to four feet; and the weight from 7 to 40 pounds, but very much larger ones, several exceeding 100 pounds, and one of 160 pounds, have been recorded.

The cod is a fish of cold waters, apparently preferring a temperature of from 35° to 45°. Whether there is more than a single species is doubtful, though it is well known to fishermen and ichthyologists that the Alaskan cod have much larger swimming-bladders than those of the Atlantic. Waiving this question, the cod may be said to have a circumpolar distribution, ranging south in the Atlantic as far as the Bay of Biscay on the European side, and to Cape Hatteras on the American shore. In the Pacific it is abundant in the waters of Alaska and Bering Sea, and occurs on banks off the mouth of the Columbia River, though there are no cod fisheries at the latter point. Northward they are found to at least 80°, and probably beyond. Sometimes it will even enter fresh water, ascending rivers, as was formerly frequently recorded in the Delaware, perhaps in pursuit of food. That any north-and-south migration takes place is doubtful, but seasonal migrations between deep and shallow waters, and irregular ones in search of food, are well known both on our coasts and on those of Europe. Thus Prof. Sars has described the so-called "mountains of fish" which annually approach the coast of Norway. North of Cape Cod the fish approach the shores during the summer and retire, upon the approach of cold weather, to the deeper waters of the off-shore banks, where they are followed by the Gloucester fishermen. On the shores of New Jersey and Virginia no cod are found except during the winter, the shallow waters becoming so warmed in summer that they are driven seaward to the cold Labrador current. Rocky and stony banks, where a rich fauna has congregated at moderate depths to about 120 fathoms, are the favorite resorts of the cod, but considerable numbers are taken down to 250 fathoms on the edges of the outer banks, and the trawl has brought up cod from a depth of 300 fathoms.

Little need be said concerning the food of the cod. It devours everything of an animal nature that it comes across, and a mere list of the species which have been taken from its stomach would fill a volume and be little short of a catalogue of marine animals. Great clams are swallowed in their shells, and, after being digested, the hard parts are regurgitated in such numbers that the bottom over large areas is said to be paved with them. Spawning takes place at moderate depths, but the buoyant eggs rise to the surface, where they float until hatched. On the European coasts the spawning season is in March and April, but with us during the winter. The fecundity of the codfish is truly astounding, not less than 9,100,000 eggs having been estimated to be produced in a single year by a 75-pound fish, while 2,000,000 to 4,000,000 is the average yield of those of ordi-

nary size. The eggs are small, about one seventeenth of an inch in diameter, and, although buoyant, have no oil globule, as do many other pelagic eggs. They hatch in from 12 days to 3 weeks, and the young fry, which feed on small crustaceans, grow rapidly, becoming about two inches long in four months and about one foot at the end of a year, though the variation in size is very great. That there has been a great decrease in the numbers of cod frequenting the inshore banks is well known, and many suggestions have been made to account therefor. The late Prof. Baird connected it with the decrease in the number and size of the schools of herrings, a favorite food of the cod, itself due to the building of dams and other obstructions which have prevented their entrance into the rivers for spawning purposes. In an attempt to overcome this condition the United States Fish Commission has been engaged for several years in collecting and hatching enormous numbers of cod eggs at its Gloucester and Woods Hole stations, with every promise of a considerable degree of ultimate success. During the winter of 1901–2, the last season for which statistics are available, no less than 338,000,000 cod eggs were thus handled.

Next to the herring, the cod is the world's most important economic fish, and in the United States the most important. During 1901 the aggregate value of the fresh and salt cod landed at Gloucester and Boston, the two largest shipping points, was nearly $3,000,000, and the total annual value of the cod-fisheries of both sides of the North Atlantic cannot be less than $25,000,000.

Some idea of the magnitude of the cod-fishing industry may be gathered from the fact that out of a total population in Newfoundland of 220,000, more than half that number gains its livelihood from it. The Newfoundland cod fisheries are the oldest in America, and a description of the methods pursued there may well represent those of other and younger stations.

The island was discovered, or, granting an earlier discovery by the Northmen, rediscovered, by John Cabot, 24 June 1497. Soon after this event Portuguese, French, Basque, and Spanish fishermen established fisheries on its shores. When, in 1583, Sir Humphrey Gilbert took possession of the island in the name of Queen Elizabeth, small English colonies were established along the east coast, and several French ones on the southern shore. In 1713 the Treaty of Utrecht declared Newfoundland and its dependencies to belong wholly to Great Britain, but reserved to the French a right to fish and cure on parts of the coast, now known as the "French shore," extending from Cape St. John on the east to Cape Ray on the southwest. This reserved right has given rise to many complications, but more with respect to the lobster fishery than the cod industry. Of such prominence is the cod in the social economy of the island that the local courts have determined that the word "fish," if unqualified, must be deemed to mean codfish, which, in the northern and southern coast settlements, is so often used as an equivalent of money as to be called "Newfoundland currency." It is measured by the quintal of 112 pounds, and in this form pays for food, clothing, and medicines, as well as fees for physician, the clergyman, and the lawyer. The fish "flakes" (see below) are so numerous in all the towns, that it would be impossible to guard their contents; so stringent laws have been passed to prevent theft, and the convicted thief is frequently sentenced to several years' imprisonment, though he may take but a single fish.

While Newfoundland craft are to be seen in numbers upon the Grand Banks, during the last few years the crews have confined their operations largely to the waters in the vicinity of the island. Although the cod are somewhat smaller, they are fully as numerous and of excellent quality, while, in a good season fish weighing 10 or 12 pounds are frequently caught. The vessels range in size from the schooner, 125 feet long and over 100 tons burden, to the sailboat manned by two men, who cast their lines or set their nets under the lee of the rocky shores perhaps not more than 500 feet from land, for schools of fish are to be found in proximity to the coast as well as 100 miles away from it, depending largely upon the course of the Labrador current, which furnishes their principal food supply. The larger vessels are schooner-rigged, and usually carry two jibs, a mainsail, foresail, and main topsail, with sometimes a small jigger extending over the stern, and staysail rigged between the two masts. In addition, they carry a triangular riding-sail to assist in steadying them when at anchor. The larger ones are manned by from 15 to 30 men, provided with lines for deck-fishing as well as with set-lines and trap-nets. Each carries its complement of boats, and, on arriving at a fishing-ground, a part of the crew throw their lines over from the deck, while others bait and put out the set-lines and the trap-nets from the smaller boats, visiting them at regular intervals to gather in the fish, which are taken to the schooner to be hastily cleaned, salted, and packed in the hold until the "fare" is completed. The captain usually keeps his boat anchored as long as the school which has been "struck" remains. The fish may stay on one feeding-ground four or five days, or perhaps disappear in four or five hours after the vessel has cast anchor. Then the set lines and nets are taken up, the vessel weighs anchor, and search for another school begins.

In offshore fishing the trap-net is also used in addition to set-lines, and the larger boats occasionally use hand-lines as well, if the fish bite freely. A very large catch is made, however, with the set-lines and nets, and the boatmen go out every morning to take out the fish and bait the hooks, perhaps paying another visit in the evening. Upon the return of the men to the home settlement with their boatload of fish, the women and children join them in cleaning the fare, salting it, and spreading it on "flakes" to dry. At times the fishing is so good that the men make three and four trips daily to the nets and lines, carrying home a good load on each trip. Then the women and children prepare the fish in order to save time.

The time required to cure the codfish varies from 4 to 10 days according to the weather. With a succession of sunny days, the fare will be thoroughly cured in less than a week, but the fish must be protected against rainy weather, in spite of the salt with which they are rubbed after being cleaned.

The "flakes" are composed of platforms of boughs, elevated from 6 to 10 feet above the ground upon scaffolding; and the fish are laid

upon the boughs so closely together, that at a distance the "flakes" look as if they were covered with pieces of white canvas. Each fish is turned over at least once every 24 hours, in order to cure both sides thoroughly; and when the process is completed the fish is as stiff as a piece of board. No other ingredient except salt is required for the ordinary curing, although some of the cod prepared at the larger settlements are ground into fine particles after being dried, and mixed with a jam made of small berries. This is placed in jars and sold as a preventive of scurvy. The fares secured by the larger vessels remain in their holds until the cargo is completed. On arrival at St. Johns, or the home port, the cargoes are sold, in a partly cured condition, to the merchants, who finish the preserving process. In buying the fish from the large vessels, as well as from the fishermen in the settlements about the coast, the cod are valued according to their weight, and generally sorted in three different sizes, the largest bringing a proportionately greater price. The merchant, as he is known in Newfoundland, is the large dealer who exports the fish to the tropics and Europe. He buys from both the fishermen and the "planters." The latter are a sort of middlemen, and usually have "stations" located at different points along the coast. These stations include general stores containing everything required by the fishermen. The people in the vicinity can go to the station and exchange their harvest for what they need at home and the outfit required for fishing, and, if anything is left to their credit, can obtain its equivalent in money. Many of them, however, are usually in debt to the planter, and, in a good year, the surplus remaining after obtaining their necessities goes in payment of the debt of a previous season. The planters also buy schooner loads, and many of them own steamers and sailing vessels which make regular trips around the island, carrying the fish purchased by the planter to the general market at St. Johns or one of the other large towns.

While the number of cod caught varies considerably according to the season, the average catch is from 1,250,000 to 1,500,000 quintals, the value, of course, depending on the price. Within the last two or three years the revenue from this source has aggregated about $5,000,000, not counting $300,000 for codfish oil, and a small sum for the oil derived from the livers of the codfish for use in medicine. The number of crews engaged in codfishing can only be estimated, owing to the variety of craft and the wide field of their operations. Authorities on the subject, however, estimate that fully 60,000 men are engaged in the fishery each year, and that a fleet of fully 1,000 two-masted vessels, hailing from the island alone, ply upon the nearby waters and on the Banks. Practically all of these vessels are home-made, the wood for both hulls and spars being secured from forests in the interior, while the sails and rigging are imported chiefly from England. For a full account of the natural history of the codfish, consult Goode, 'American Fishes'; and for statistics of the fisheries and other information, the 'Annual Reports' of the U. S. Commissioner of Fish and Fisheries.

Cod-liver Oil, an oil extracted from the livers of different kinds of cod — the *Gadus morrhua* being specified in the pharmacopœia — and allied species. It has a fishy taste and odor, is insoluble in water, but dissolves in ether, and is colorless or pale yellow. The tint, however, depends on the mode of preparation, some kinds being pale brown, and others dark brown. The finest and palest oil is produced from fresh and carefully cleaned liver, the oil being extracted either in the cold or by a gentle heat. The darker kinds are obtained at a higher temperature, and often from the livers in a putrefying state. Only the pale oils are used in medicine, the dark oils are too rank and acrid, and they are only used in dressing leather. The oil is prepared in Great Britain, in Newfoundland, and in Norway, and it has also been prepared in Iceland.

Cod-liver oil has a specific gravity of 0.93. It is a somewhat complex substance, but the main ingredients appear to be olein and margarin. Acetic, butyric, and other acids are also present, and to these the oil may owe some of its odor. It contains, besides biliary matters, a peculiar body called gaduin, and inorganic substances, including minute quantities of iodine, bromine, sulphur, and phosphorus. It is questioned, however, whether iodine and bromine are constant constituents.

In medicine cod-liver oil is very highly prized, because it is a readily assimilable fat, splitting readily in the intestines and easily digested. Perhaps next to milk fat or egg fat it is one of the most easily taken up of the fatty bodies. It is therefore particularly valuable in the treatment of the chronic wasting diseases, proving especially serviceable in consumption. It is also of service in weak, puny children, and can be taken to advantage by adults with chronic nervous disorders. In fact cod-liver oil is very valuable in most affections of the nervous system. As it is the fat in cod-liver oil that is valuable the various forms of proprietary preparations on the market that claim to contain the active principles without the oil should be looked upon with suspicion. The oil is usually very unpalatable; hence the many emulsions that are put up. These, if they contain the pure oil in reasonable quantities, are excellent. There are many commercial cheats in cod-liver oil, and reliable preparations only should be used.

Codazzi, Agostino, ä-gōs-tē'no kō-dät'sē, Italian engineer: b. near Ferrara 1792; d. Colombia June 1859. He made several campaigns under Napoleon, and afterward distinguished himself as an engineer in South America. He entered the Colombian service with the rank of lieutenant-colonel of artillery, and was employed in making charts and in preparing plans of defense. In 1831 he was appointed by Paez to prepare partial charts of the new republic of Venezuela. This work occupied nearly nine years, and was twice interrupted by military defensive expeditions, in which Codazzi took part. He was rewarded with the rank of colonel. He devoted the years 1838–9 to exploring the wilderness of Guiana, and penetrated nearly to the sources of the Orinoco. The important additions to geography which were obtained from this expedition induced the congress of Venezuela to furnish him means to make public the result of his labors. For this purpose he went to Paris, where his work appeared in 1841, entitled 'Resumen de la Geografia de Venezuèla,' accompanied by an

extensive chart of Venezuela. Codazzi afterward established a German colony in Venezuela. In 1848 he was employed by the government of Colombia in a topographical survey of that country.

Cod'dington, William, New England colonist: b. Boston, Lincolnshire, England; d. Rhode Island 1 Nov. 1678. He was one of the founders of the colony of Rhode Island. He arrived in Massachusetts in 1630, remained in Boston for several years, but not being able to agree with the authorities of the colony, he removed in 1638 to Aquidneck, or Rhode Island, where he founded a colony to be governed "by the laws of the Lord Jesus Christ." It was soon found necessary to abandon this vague scheme, and in 1640 he himself was chosen governor, and in 1647 aided in the formation of a regular body of laws. He was unable to secure the reception of Rhode Island into the colonial confederacy. In 1674 and 1675 he was again elected governor.

Code, a term now generally confined to jurisprudence, and used to designate a systematic compilation of law authorized by governmental authority to take the place of prior existing law. It is in this sense applied to the codes of Theodosius, Justinian, and Napoleon. The word is used more generally in the United States as applied to a concise, comprehensive, systematic formation and re-enactment of the law, deducted from both its principal sources, the pre-existing statutes, and the adjudications of courts as distinguished from compilation of statute law only. Codes such as here described have been adopted and are in use in many of the States. They are, in the most part, modeled upon the Code of Civil Procedure of New York. The purpose of a code is to simplify methods of legal procedure and to model and bring together in a codified form the confused mass of laws, contradictions, repetitions, and disorder which have grown up during a long period of time. Such a codification of law has always been deemed a most difficult task, and though many times agitated in England, it has never been earnestly undertaken, and is not likely to be for some time. The same causes which made such a codification necessary in the time of the Emperor Justinian exist to-day in many countries and in most of the States of the United States. While the *Corpus Juris Civilis,* or body of civil laws, drawn up by Justinian's commission of 10 learned civilians, was the most important and complete of ancient codes up to that time, there had been other compilations under the empire. These compilations had been made by private lawyers, and formed the basis of the *Codex Gregorianus et Hermogenianus,* which in turn were the models for the imperial codes of Theodosius and Justinian.

The *Codex Theodosianus* was the work of a commission of 16, to whom, in 435 A.D., the Emperor Theodosius entrusted the task of collecting the edicts and constitutions. It was published in 438 A.D., was a work of great importance, and formed the masterpiece on which every later code was based. It was the initiative of a digest of the whole Roman law. In 528 the Emperor Justinian ordered a new collection to be made, and for this purpose appointed 10 commissioners with full power to make such changes as they might deem necessary in the language of the constitution. They were authorized in their compilation to use the codes, Gregorian, Hermogenian, and Theodosian, and the constitutions, with the understanding that the new code was to supersede the sources from which it had been compiled. The Code Justinian was completed within 14 months, and was subsequently revised to take in new decisions and constitutions of the emperor. The original code was lost. The revised one, which has been preserved, was published in 534, and is divided into 12 books and each book into titles.

Code Napoléon.— The civil code of France in force at the present day takes its name from the great Napoleon. It was undertaken under the consulship of Napoleon by the most eminent jurists of France, and was published in 1804. It is the most celebrated of modern codes. The *Code Napoléon* (under which name four other codes of commercial law, criminal law, penal law, and the law of procedure, drawn up at the same time, are often included) was a code in the fullest and strictest meaning of the word, in that it was not merely a collection of the law, but was a complete and thorough statement of the law. The need of a codification of the laws of France had been urged by eminent jurists and statesmen for some time before Napoleon took the matter up and carried it through. Previous to the adoption of the *Code Napoléon* there had been some partial codes in France; such as the *Code Henri,* made by Brisson in the reign of Henry III.; the *Code Murvillac* or *Michau* under Louis XIII. (1629), relating to judicial procedure, and the *Code Louis XV.,* by Chaussepierre, containing the ordinances from 1722 to 1740. There were several of these ordinances enacted in the reign of Louis XVI. No decided move was made to bring about a codification of the confused condition of the laws of France for the purpose of shaping them into a homogeneous jurisprudence until the Revolution had cleared the way. By the consular decree, 12 Aug. 1800, a commission was constituted to compare the order which had been followed in the preparation of the projects for a civil code "hitherto published, to determine the plan which the commissioners should think best to adopt, and to discuss the chief principles of civil legislation."

Napoleon, on becoming consul, appointed a commission headed by M. Tronchet, and including Portalis, Bigot de Préameneu, and Maleville, to review all previous efforts at codification and to suggest a new plan. In 1801 the commissioners reported a draft for a civil code, which was submitted to the court of cassation and other courts of appeal, and with the reports of the judges, was finally brought before the council of state, in which Napoleon (then first consul) presided in person and took part in the discussion as to the terms and scope of the code. The whole revision after much debate was finally adopted under the title of *Les Cinque Codes,* consisting of the civil code, distinguished by the name *Code Napoléon,* the code of criminal procedure, penal code, the code of civil procedure, and the code of commerce. The entire work was first published under the title *Code civil des Français,* but Napoleon subsequently had it published as the *Code Napoléon,* as he considered the code one of the crowning glories of his reign. The *Code*

Napoléon consists of 2,281 articles. It has been said of this code that it is the product of Roman and customary law, together with the ordinances of the kings and the laws of the Revolution. Although political upheavals have caused some changes and modifications, the code remains virtually the same as when it left the hands of its framers. The extent of its influence upon the laws of other countries has been very great, as it formed the basis of the codes of the two Sicilies (1819), the Netherlands in 1837, the Swiss cantons from 1819 to 1855, Bolivia in 1843, and the civil code of the State of Louisiana.

Code Frederic.— This is a revision of the Prussian laws, published by Frederick the Great 1749–51, and revised after 1780, but not in force until 1794, was intended, according to its preface, to obviate the difficulties of the Roman codes, the disputes of the commentators, and the contradictions between Roman and German law. It has been subjected to many changes.

Codes in the United States.— The first important experiment with a code in the United States was made in Louisiana, which State, originally a French colony, afterward ceded to Spain, again returned to France, and subsequently acquired by the United States from France, has had many changes of law. After the United States acquired Louisiana there arose a strong demand for a code, owing to the great confusion of laws. In 1806–8 a code was adopted, but only to supersede the ancient laws when they conflicted with it. A complete civil code was adopted for the State in 1824, which had for its basis the *Code Napoléon,* although some provisions of the common law were injected into it.

The most important code ever undertaken in the United States is the one which was prepared for the State of New York many years ago under the guidance and supervision of David Dudley Field. This code, although published, and having formed the foundation for many of the codes adopted by the various States, was never accepted by the legislature of New York. As early as 1839 David Dudley Field advocated and urged the adoption of a code by that State. The revised constitution of New York (1846) ordered the appointment of two commissions: one to reduce into a system the whole law of the State, the other to revise and simplify the rules of pleading. Both commissions were appointed by the legislature in 1847. The commissioners to revise and simplify pleadings and practice made a report on 27 Feb. 1848, which contained an incomplete code of civil procedure and practice in the courts of record. This report was immediately adopted by the legislature, but the complete codes of civil and criminal procedure were never adopted. On 6 April 1857, the legislature created a new commission to prepare codes. The commissioners named were David Dudley Field, William Curtis Noyes, and Alexander W. Bradford. After some eight years they reported a code — or rather three codes — which was never adopted, although reported favorably by the committees of several legislatures.

The code of civil procedure of the David Dudley Field commission formed the foundation, and was largely adopted in the codes of Ohio, Indiana, Missouri, Wisconsin, Iowa, Minnesota, Kansas, Nebraska, Nevada, California, Oregon, North Carolina, South Carolina, Washington, Montana, Alabama, the Dakotas, Wyoming, Utah, and Arizona, and it is the basis of the present codes of civil and criminal procedure in the State of New York, which are codes of practice and pleading, as distinguished from a code of substantive law. The principal feature of the code of civil procedure as adopted by these States was the fusion of law and equity and the simplifying of the written pleadings.

LEWIS P. CLOVER.

Code of Khammurabi. See KHAMMURABI.

Code Napoléon, a code of laws in France, framed by a committee appointed by Napoleon Bonaparte when first consul. This committee, consisting of Portalis, Bigot-Préameneu, Malleville, Tronchet, and the minister of justice, was directed by a decree dated 24th Thermidor, VIII. (13 July 1800),—

— to compare the order which had been followed in the preparation of the projects for a civil code hitherto published, to determine the plan which the committee shall think best to adopt, and to discuss the chief principles of civil legislation.

In the following year, 1801, these commissioners reported a draft of a civil code, which was in the first instance submitted to the court of cassation (q.v.) and the various courts of appeal. With the reports of the judges of these courts the draft was submitted to the council of state, over which the first consul presided, and in which every part was thoroughly discussed. In the work entitled 'Conférence du Code Civil, avec la Discussion Particulière du Conseil d'État et du Tribunat, etc.' (8 vols. Paris 1805), a detailed and very carefully prepared report of these discussions is contained. Each article, after having been discussed in this body, was presented to the tribunate, where it underwent another discussion, and was returned to the council of state as adopted, rejected, or amended.

Of the five codes prepared in this way, namely, the 'Code Civil,' published in 1804; the 'Code de Procédure Civile,' published in 1806; the 'Code de Commerce,' published in 1807; the 'Code d'Instruction Criminelle,' published in 1808; and the 'Code Pénal,' published in 1810; the first was called by way of eminence, by a law of 3 Sept. 1807, 'Code Napoléon.' At the restoration its name was changed back to 'Code Civil,' and during the time of the second empire it was again called 'Code Napoléon.' It is divided into 2,281 paragraphs, which are numbered, and consist of a few lines each. The work is divided into three books (livres); each book into a certain number of titles; each title is comprised in one or more chapters. A preliminary title, 'On the Publication, Effects, and Application of the Law in General,' precedes the whole. The first book is entitled 'Of Persons,' and in 11 titles treats, (1) of the enjoyment and privation of civil rights; (2) of civil acts, such as the registry of births, marriages, and deaths; (3) of domicile; (4) of absentees; (5) of marriages; (6) of divorce; (7) of the relations of father and son; (8) of adoption and official guardianship; (9) of the paternal power; (10) of minority, guardianship, and emancipation; (11) of majority, of guardian-

ship of persons of age (interdiction), and judicial counsel. The second book is entitled 'Of Property and the Different Modifications of Ownership,' and in four titles treats, (1) of the distinction of property into real and personal (*immeubles et meubles*); (2) of ownership; (3) of usufruct, of use and habitation; (4) of servitudes (easements, *des servitudes ou services fonciers*). The third book is entitled 'Of the Different Modes of Acquiring Property,' and in 20 titles treats, (1) of successions; (2) of donations *inter vivos* and testaments; (3) of contracts, or conventional obligations in general; (4) of engagements formed without a convention; (5) of the contract of marriage, and the rights of the parties respectively; (6) of sale; (7) of exchange; (8) of the contract of letting to hire; (9) of partnership; (10) of loan; (11) of deposit and sequestration; (12) of contracts connected with chance (*aléatoires*, such as wagers and life-rents); (13) of powers of attorney; (14) of becoming security; (15) of transactions; (16) of bodily duress in civil cases; (17) of furnishing security; (18) of mortgages; (19) of taking and setting off by execution; (20) of prescriptions.

The work already quoted, 'Conférénce du Code Civil,' is indispensable to a complete understanding of the code, because it gives the history of each law. It first presents each article in the code as finally adopted. Next follow the different forms and drafts of each article discussed in the council of state, with the report of the discussions. To this succeed the observations made in the section of legislation of the tribunate. We learn from this work how active a part Napoleon took in the formation of the code, as his remarks are given as well as those of the others, and he was present during almost the whole of the debates. Under the first empire the adoption of the 'Code Napoléon' was made obligatory on all the countries subject to the French. After the battle of Leipsic, in 1813, which freed Germany from the power of France, it ceased to be obligatory in the German states, but it continued to influence considerably their legislation. At present this code is recognized in the kingdom of Belgium (with some modifications), in the grand-duchy of Baden, in the kingdom of Italy, and elsewhere in Europe. In the United States it was a model for the code of Louisiana.

Code'ine, Codein, Codeina, or **Codeia** (Gr. κώδεια, "poppy-head"), a vegetable alkaloid closely allied to morphine and constituting about 0.5 per cent of the weight of opium. Codeine has the formula $C_{17}H_{18}(CH_3)NO_3 + H_2O$, and is known to the chemist as methylmorphine, since it is derived from morphine by substituting methyl (CH_3) for one atom of the hydrogen that morphine contains. Codeine may be prepared by adding calcium chloride to an aqueous extract of opium and evaporating to the point of crystallization. The hydrochlorides of morphine and codeine which are obtained in this manner are dissolved in water, and the morphine is precipitated by the addition of ammonia. Codeine hydrochloride remains in solution, and may be obtained by evaporation and crystallization, and further purified by recrystallization from ether. Codeine acts as a strong base, and its solution reddens litmus paper, neutralizes acids, and precipitates solutions of lead, iron, and copper. From aqueous solution it is deposited in the form of trimetric crystals, as indicated by the formula given above. Crystals free from water may be obtained by deposition from a solution in carbon disulphide. When treated with strong sulphuric acid and a small quantity of ferric chloride ($FeCl_3$), codeine compounds give an intense blue color. This reaction is of great value in testing for the presence of the alkaloid. Codeine is used in medicine as a narcotic and hypnotic. Its properties are very similar to those of morphine, but by reason of the methyl groups introduced it has more action on the spinal cord than morphine has. It thus does not cause sleep or relieve pain as readily as morphine, and causes more reflex excitability. It may even cause convulsions in children. It is valuable where a milder sedative than morphine is desired, as there is less euphoria produced and less likelihood of forming a habit. Its use is not free from danger, however, and very small doses have been known to prove fatal.

Codemo, Luigia, loo-e'jē-ä kō dā mō, Italian novelist: b. Treviso 5 Sept. 1828. In 1851 she became the wife of the Chevalier Karl von Gerstenbrand. Her first work, 'Memoirs of a Peasant' (1856), evinced a true insight into lowly life; and in the numerous sketches and tales that followed it, she showed a profound sympathy with the common people. Her writings have passed through several editions. Among her works are: 'Miseries and Splendors of the Poor'; 'The New Rich'; 'A Lady of Heart.'

Co'dex, with the ancients, the trunk of a tree stripped of the bark. Before the invention of paper, wooden tablets covered with wax, which were written on with the style, and put together in the shape of a book, were called codex. The word was afterward retained, in times when paper was used for writing, to denote a large book. Thus important works, particularly old manuscripts of poets, historians, etc., which had been preserved, were called *codices manuscripti*. In like manner a collection of laws was called codex, with the addition of the name of the sovereign under whom, or of the person by whom it had been compiled, as *Codex Gregorianus, Codex Theodosianus, Codex Carolinus.*

Codex rescriptus (Latin, a re-written codex) is the name given to ancient manuscripts, which, in the Middle Ages, were used, after the original writing had been in a great measure effaced, for the copying of other works, generally ecclesiastical treatises. Thus the Institutions of Gaius, discovered by Niebuhr at Verona in 1816, and published by Göschen in 1821, is a *codex rescriptus.* Some skill is required to read the ancient letters under the others. The Greek name for *codex rescriptus* is *palimpsest,* now more frequently used. The biblical writings themselves have been sometimes effaced to make way for homilies and legends. One of the oldest manuscripts of the New Testament, designated by the letter C, is a *codex rescriptus,* on which the works of Ephraem Syrus have been written. See PALIMPSEST.

Codex Argenteus, a translation of parts of the Bible in the Gothic language, attributed to Ulfilas, bishop of the Dacian Goths in the 4th century. It is written on vellum, the leaves of which are stained with a violet color; and on

this ground, the letters, all uncials or capitals, are painted in silver, except the initials, which are gold. The book, however, gets its name from its elaborately wrought silver cover, and not from its lettering. It throws much light on the kindred languages of Germany. The 'Codex' contains only fragments of the gospels and of the epistles of Paul, some psalms, and several passages from Esdras and Nehemiah. It was discovered by some Swedish soldiers in the monastery of Werden in Westphalia, in 1648; then deposited in Prague; afterward presented to Queen Christina, who placed it in the library of Upsala; next carried off by Vossius; and finally restored to the University of Upsala, which regards it as its most precious possession.

Codex Sinaiticus, sī-nā-īt'ī-kŭs, a very ancient and valuable manuscript of the Greek Septuagint version of the Old Testament (including the Apocrypha), the whole of the New Testament, the Epistle of Barnabas, and a part of the Shepherd of Hermas, discovered in the monastery of St. Catherine, on Mount Sinai, by the German scholar Tischendorf, 4 Feb. 1859, while traveling in the East by the desire of the Czar Alexander II. When the discovery was made Tischendorf endeavored to persuade the monks to make a present of the manuscript to the czar, and although he was not immediately successful, he was allowed to take it to St. Petersburg on loan. Ultimately, in 1869, the manuscript was formally presented to the czar as Tischendorf had desired. In 1860 an account of the manuscript was published by the discoverer at Leipsic. It is written on parchment in four columns, in early uncial characters, and bears every mark of possessing great antiquity, perhaps being even older than the Vatican MS., which, before the discovery of the Sinaitic MS., was recognized as the oldest known manuscript of the Old and New Testaments. It is assigned by Tischendorf himself to the 4th century. The Old Testament in this manuscript is defective, but the New Testament is complete, not a word being wanting, which is the more remarkable, inasmuch as it is the only manuscript of the New Testament which is complete. From this circumstance, as well as from its great age, it acquires a value in relation to the text of the New Testament, which can scarcely be overestimated. Two gaps in the Old Testament part of the manuscript are curiously supplied by another manuscript which Tischendorf had discovered in the same monastery in 1844, and which he had brought to Germany and named *Codex Friderico-Augustanus,* in honor of the king of Saxony. From this coincidence, as well as the general resemblance of the two manuscripts, it is inferred that the last-named manuscript is really a part of the Codex Sinaiticus, which is generally believed to be the case. A splendid fac-simile of the manuscript was published by Tischendorf under the auspices of the czar at St. Petersburg, in 4 volumes folio, toward the end of 1862. This was followed in 1863–4 by two smaller editions of the New Testament part of it.

Codex Vatica'nus, an ancient Greek MS. of the Old and New Testaments, so called from being contained in the Vatican library at Rome, where it was placed early in the 16th century. It is written on thin vellum, in small uncial characters. In the greater part of the manuscript there are three columns to a page, and this fact is regarded as one among other indications that it is later than the Sinaitic manuscript, which has four columns to a page. The manuscript is assigned to the 4th century, and until the discovery of the Sinaitic it was regarded as the best manuscript of the Old and New Testaments. The greater part of Genesis in the Old Testament, and the whole of the pastoral epistles and the Revelation in the New Testament are wanting. The first collation of this MS. was by Bartolocci, in 1669. An edition of it by Cardinal Mai was published in 1857, after having been 19 years in print without being published; but it did not satisfy the expectations of scholars. A fac-simile of it was published in 1868.

Cod'icil, an addition to, qualification of, or change in a will. It must be in the same form as a will, and be executed with the same formalities. All the laws applying to wills are the same for a codicil. A codicil properly executed is a republication of the will, and makes the will speak from the date of the codicil. The will and codicil are read together as one instrument. There may be more than one codicil to a will; and where there are several, if the last one is properly executed, referring to a former paper in such a manner as to identify it, that paper, although not properly executed, may be read into the will. See WILL.

Codification. See CODE.

Codil'la, the coarsest part of hemp, which is sorted out by itself. This term is also applied to the coarsest part of flax.

Codlaeum. See CROTON.

Codlin-moth, a moth the caterpillar of which attacks the fruit of the apple (q.v.).

Cod'man, John, American sea-captain and miscellaneous writer: b. Dorchester, Mass., 1814; d. Boston, 6 April 1900. He was the author of: 'Sailors' Life and Sailors' Yarns' (1847); 'The Mormon Country' (1876); 'Round Trip by Way of Panama, etc.' (1879); 'Winter Sketches from the Saddle' (1888); etc., besides many newspaper and magazine articles on current topics.

Codogno, kō-dōn'yō, Italy, a town in a fertile district between the Po and Adda, 17 miles southeast of Lodi. It has a large trade in Parmesan cheese and wheat, and carries on a number of manufactures. The French defeated the Austrians here in 1796. Pop. 10,000.

Cod'rington, SIR Edward, English admiral: b. 27 April 1770; d. London 28 April 1851. He entered the navy as midshipman in 1783, became lieutenant in 1793, and the following year received the appointment of captain. He obtained a gold medal for his services at the battle of Trafalgar, took part in the Walcheren expedition, and was afterward actively employed both in the Peninsular and second American wars. In 1821 he became vice-admiral. His name is principally famous in connection with the battle of Navarino, where he commanded the united squadrons that overthrew the Turkish fleet in 1827. In 1837 he became full admiral.

Co'drus, the 17th and last king of Athens. Tradition tells that during his reign Attica was attacked by the Dorians, or, according to some, by the inhabitants of the Peloponnesus, or the

Thracians. The assailants, inquiring of an oracle what would be the result of their incursion, received for answer that they would be successful if they avoided killing the Athenian king. Codrus, becoming acquainted with this answer, resolved to sacrifice himself for his country. He disguised himself in a peasant's dress, entered the enemy's camp, provoked a quarrel with the soldiers, and was slain. The Athenians, upon hearing of this, sent a herald to demand the body of their king. The courage of the assailants was so damped that they retired without striking a blow. In honor of their patriotic monarch the Athenians abolished the royal dignity, substituting that of a responsible archon, esteeming no one worthy to be the successor of Codrus. They also used his name as a common term to express a man of distinguished excellence.

Co'dy, William Frederick, American scout, hunter, and showman, best known as "BUFFALO BILL": b. Scott County, Iowa, 26 Feb. 1846. His parents moved to the country about Fort Leavenworth, Kansas, where the father was killed in the "Border War" with the Indians when the boy was but an infant. When still very young he was employed by the express companies as a rider to carry packages and valuables on horseback across the country, a most dangerous occupation. Soon he became known as a fearless and perfect rider, a keen scout, a reliable plainsman and hunter. When but little over 21 he attracted the notice of United States army officers, who were constantly in need of the services of expert scouts who could be depended upon and who knew the habits and languages of the red man. In 1868–9 he was made chief of scouts by Gen. Sheridan, then campaigning against the hostiles. Colonel John Schuyler Crosby, then adjutant under Sheridan, says of Cody: "He carried despatches 100 miles for Gen. Sheridan through terrific fire of hostile bands of Indians and returned with replies safely." This and his many personal encounters with the Indians, in some of which he saved the day for the troops, made him a noted man. He is the last of the six great scouts of America — Boone, Crockett, Carson, Bridger, "Wild Bill," "Buffalo Bill." He gained this name from his dexterity as a hunter, his record being 4,862 buffalo in one season — 69 in one day. He continued actively engaged in frontier work for many years, killing the Cheyenne chief, "Yellow Hand" in a celebrated personal encounter during the Sioux war of 1876. Early in the eighties he began the carrying out of a cherished idea — to gather about him some of the remaining elements which went to make up a frontier life and exhibit this unique existence in the eastern States and in Europe. He presently accomplished this end, forming the exhibition called the "Wild West," now known the world over. In this he has gathered scores of Indians, some of whom were once his mortal foes; hundreds of "cow-boys"; the old "Deadwood coach," used so many years to carry mail and passengers, and much other really valuable material. With this gigantic show he has toured America and Europe for nearly 20 years, amassing a fortune which he has invested in lands in Nebraska and Wyoming. In the latter State is a town named after him, on his land. In 1901 he became president of "The Cody Military College and International Academy of Rough Riders," a school to be established on his property in Wyoming where young men may learn to ride and become masters of themselves and their horses — a post-graduate school in manhood, as he terms it. He is a unique character, the connecting link between the rough life of our brave fathers in the Far West and these days of automobiles and wireless telegraphy.

PUTNAM DREW.

Coe, Edward Benton, American clergyman: b. Milford, Conn., 11 June 1842. He was graduated at Yale 1862, studied at Union Theological Seminary 1862–3, and in France and Germany 1864–7. From 1864 to 1879 he was Street professor of modern languages at Yale, and on 2 Oct. 1879 was ordained by the Classis of New York as one of the ministers of the Collegiate Reformed Dutch Church. He was pastor of the Fifth Avenue and West 48th Street Church till January 1899, since when he has been senior minister without charge of a specific congregation. He has published a number of sermons, and a volume entitled 'Life Indeed' (1899).

Coe, George Albert, American educator: b. Monroe County, N. Y., 26 March 1862. He graduated at the University of Rochester 1884, and in theology at Boston University 1887 obtaining the traveling fellowship of the latter college and studying at the University of Berlin 1890–1. He was acting professor of philosophy in Northwestern University 1891–3, when he was elected to the John Evans chair of philosophy there. Besides articles in philosophical and theological journals, he has written 'The Spiritual Life: Studies in the Science of Religion' (1900).

Coe College, an educational institution for both sexes, located at Cedar Rapids, Iowa. It was organized in 1881, under the auspices of the Presbyterian Church, and reported at the end of 1902 that it had 25 professors and instructors, 305 students, and 3,500 volumes in the library.

Cœcilian, or **Cæcilian,** sē-sĭl'yăn, limbless amphibians, constituting a family, *Cæciliidæ* or *Cæciliidæ,* and an order *Apoda* or *Gymnophionia.* They are remarkable for the entire absence of limbs, even the internal limb girdles having disappeared, and the bony roof to the temporal region of the skull. In the latter feature they simulate the extinct *Stegocephali,* to which some zoologists believe them to be rather closely related, though the temporal roof is formed by different bones. The form is worm-like, and, notwithstanding that the number of vertebræ may exceed 200, the tail is very short. A series of annular scales, somewhat embedded in the skin, protect the body externally, and as a further adaptation to their burrowing habits the eyes are rendered nearly or quite useless by being buried beneath the skin, the deficiency in sight being compensated by the presence of a pair of nearly unique retractile sensory tentacles.

Some species are viviparous, others oviparous. In the case of the latter the female coils about the eggs and protects them until hatched. The young of many are noteworthy in the possession of external gills, while the respiration of the adults is pulmonary. Their food consists principally of earthworms and subterranean insect larvæ.

Dr. Boulenger recognizes 17 genera and 4[illegible] species, but probably many remain undiscovered. None have been found except in a zone encircling the earth, chiefly within the limits of the tropics; South and Central American species are numerous; but none are certainly known from North America. Consult: Boulenger, 'Proceedings of the Zoological Society of London' (1895); Sarasin, 'Forschungen auf Ceylon' (Vol. II.).

Co'educa'tion, a term meaning joint education, has come to be specifically applied to the education of both sexes in the same class or institution. In the western States and Territories of the United States it is almost the only system of education, and it is rapidly becoming the prevailing system in the South, where the influence of the State universities is predominant. On the other hand, in the New England and middle States the great majority of the youth of both sexes are still receiving a separate college education. Coeducation was introduced into colleges in the West as a logical consequence of the so-called American system of free elementary and secondary schools. During the great school revival of 1830–45 and the ensuing years until the outbreak of the Civil War in 1861, free elementary and secondary schools were established throughout New England and the middle States and such western States as existed in those days. It was a fortunate circumstance for girls that the country was at that time sparsely settled; in most neighborhoods it was so difficult to establish and secure pupils for even one grammar school and one high school that girls were admitted from the first to both. In the reorganization of lower and higher education that took place between 1865 and 1870 this same system, bringing with it the complete coeducation of the sexes, was introduced throughout the South both for whites and negroes, and was extended to every part of the West. In no part of the country, except in a few large eastern cities, was any distinction made in elementary or secondary education between boys and girls. The second fortunate and in like manner almost accidental factor in the education of American women was the occurrence of the Civil War at the formative period of the public schools, with the result of placing the elementary and secondary education of both boys and girls overwhelmingly in the hands of women teachers. This result proved not to be temporary, but permanent, and from 1865 until the present time, elementary and secondary education of both boys and girls has been increasingly in the hands of women. When most of the State universities of the West were founded they were in reality scarcely more than secondary schools supplemented, in most cases, by large preparatory departments. Girls were already being educated with boys in all the high schools of the West, and not to admit them to the State universities would have been to break with tradition. Women were also firmly established as teachers in the secondary schools, and it was patent to all thoughtful men that they must be given opportunities for higher education, if only for the sake of the secondary education of the boys of the country. The development of women's education in the East has followed a different course because there were in the East no State universities, and the private colleges for men had been founded before women were suffered to become either pupils or teachers in schools. The admission of women to the existing eastern colleges was, therefore, as much an innovation as it would have been in Europe. The coeducation of men and women in colleges, and at the same time the college education of women, began in Ohio, the earliest settled of the western States. In 1833 Oberlin Collegiate Institute (not chartered as a college until 1850) was opened, admitting from the first both men and women. It was the first institution for collegiate instruction in the United States where large numbers of men and women were educated together, and the uniformly favorable testimony of its faculty had great influence on the side of coeducation. In 1853 Antioch College, also in Ohio, was opened, and admitted from the beginning men and women on equal terms. From this time on it became a custom, as State universities were opened in the far West, to admit women. Utah, opened in 1850; Iowa, opened in 1856; Washington, opened in 1862; Kansas, opened in 1866; Minnesota, opened in 1868; and Nebraska, opened in 1871, were coeducational from the outset. Indiana, opened as early as 1820, admitted women in 1868. The University of Michigan was, at this time, the most important western university, and the only western university well known in the East before the War. When, in 1870, it opened its doors to women, they were for the first time in America admitted to instruction of true college grade. The step was taken in response to public sentiment, as shown by two requests of the State legislature, against the will of the faculty as a whole. The example of the University of Michigan was quickly followed by all the other State universities of the West. In the same year women were allowed to enter the State universities of Illinois and California; in 1873 the only remaining State university closed to women, that of Ohio, admitted them. Wisconsin which, since 1860, had given some instruction to women, became in 1874 unreservedly coeducational. All the State universities of the West, organized since 1871, have admitted women from the first. In the 20 States which, for convenience, are classified as western, there are now 20 State universities open to women, and, in four Territories — Arizona, Oklahoma, Indian, and New Mexico — the one university of each Territory is open to women. Of the 11 State universities of the southern States the two most western admitted women first, as was to be expected. Missouri became coeducational as early as 1870, and the University of Texas was opened in 1883 as a coeducational institution. Mississippi admitted women in 1882; Kentucky in 1889; Alabama in 1893; South Carolina in 1894; North Carolina in 1897, but only to women prepared to enter the junior and senior years; West Virginia in 1897. The State universities of Virginia, Georgia, and Louisiana are still closed to women. The one State university existing outside the West and South, that of Maine, admitted women in 1872.

The greater part of the college education of the United States, however, is carried on in private, not in State universities. In 1897 over 70 per cent of all the college students in the United States were studying in private colleges, so that for women's higher education their admission to private colleges is really a matter of much

greater importance. The part taken by Cornell University in New York State in opening private colleges to women was as significant as the part taken by Michigan in opening State universities. Cornell is in a restricted sense a State university, inasmuch as part of its endowment, like that of the State universities, is derived from State and national funds. Nevertheless, there is little reason to suppose that Cornell would have admitted women had it not been for the generosity of Henry W. Sage, who offered to build and endow a large hall of residence for women at Cornell University. After carefully investigating coeducation in all the institutions where it then existed, and especially in Michigan, the trustees of the university admitted women in 1872. The example set by Cornell was followed very slowly by the other private colleges of the New England and Middle States. In Massachusetts Boston University opened its department of arts in 1873, and admitted women to it from the first; but no college for men followed the example of Boston until 1883, when the Massachusetts Institute of Technology admitted women. This school, like Cornell, is supported in part from State and national funds. In 1892 Tufts College was opened to women. In the West and South the case is different, and the list of private colleges that one after another have become coeducational is too long to be inserted here. Among new coeducational foundations the most important are, on the Pacific coast, the Leland Stanford Junior University, opened in 1891; and in the middle West, Chicago University, opened in 1892. (For Chicago's recent attitude, see UNIVERSITY OF CHICAGO.)

Of the 480 colleges for men enumerated by the commissioner of education, 336, or 70 per cent (or, excluding Catholic colleges, 80 per cent) admit women. In the western States there are, excluding Roman Catholic colleges and seminaries, out of 195 colleges 182 coeducational, and only 13 colleges for men alone. In the southern States and southern middle States, excluding Roman Catholic colleges and seminaries, out of 161, there are 125 coeducational and but 36 colleges for men only. Among these 36, however, are some of the most important educational institutions in that section — Johns Hopkins University, the University of Georgia, the Louisiana State University, Tulane University, and the University of Virginia. In New England and the northern middle States, out of 64 colleges, excluding Roman Catholic colleges and seminaries, only 29, or less than half, are coeducational. The colleges for men only include (with the exception of Cornell) all the largest undergraduate colleges in this section — Harvard, Yale, Columbia, Princeton, Pennsylvania.

Five important universities, closed to women in their undergraduate departments, have each affiliated to them a women's college through which women obtain some share in the undergraduate instruction given, the most important being Harvard, Columbia, and Western Reserve University. Of these five, four (all but Harvard) admit women without restriction to their graduate instruction, and in addition Yale, the University of Pennsylvania, and New York University make no distinction between men and women in graduate instruction. The Johns Hopkins University maintains a coeducational medical school. Princeton is the only one of the large university foundations that excludes women from any share whatsoever in its advantages.

All the arguments against the coeducation of the sexes in colleges have been met and answered by experience. It was feared at first that coeducation would lower the standard of scholarship on account of the supposed inferior quality of women's minds. The unanimous experience in coeducational colleges goes to show that the average standing of women is slightly higher than the average standing of men. Many reasons for the greater success of women are given, but the fact, however it be explained, remains and is as gratifying as astonishing to those interested in women's education. The question of health has also been finally disposed of; thousands of women have been working side by side with men in coeducational institutions for the past 25 years and undergoing exactly the same tests without a larger percentage of withdrawals on account of illness than men. The question of conduct has also been disposed of. None of the difficulties have arisen that were feared from the association of men and women of marriageable age. Looking at coeducation as a whole, it is most surprising that it has worked so well. Not only is the number of coeducational colleges increasing, but the number of women relatively to the number of men is increasing also. Between 1890 and 1898 men in coeducational colleges increased 70.0 per cent, but women in coeducational colleges increased 105.4 per cent. There is every reason to suppose that this increase of women will continue. Already girls form 56.5 per cent of the pupils in all secondary schools; and 13 per cent of the girls enrolled and only 10 per cent of the boys enrolled graduate from the public high schools. It is sometimes said that men students, as a rule, dislike the presence of women, but statistics show that the number of men increases more rapidly in coeducational colleges than in colleges for men only. It is women who have shown a preference for separate education; women have increased more rapidly in separate colleges for women than in coeducational colleges. It will be observed, however, that the separate colleges for women, like the separate colleges for men, are in the East; it is in the East only that any preference for separate education is shown by either sex. This preference is natural, since college life as it is organized in a woman's college seems to conservative parents less exposed, more in accordance with inherited traditions; and girls, who in their own homes lead guarded lives, are to be found in women's colleges rather than in coeducational colleges. Then, too, for the present, much of the culture and many of the priceless associations of college life are to be obtained, whether for men or women, only by residence in college halls, and no coeducational, or even affiliated, colleges have as yet organized for their students such a complete college life as the independent woman's college. In professional schools, including the graduate school of the faculty of philosophy, coeducation is even at present almost the only method. There are in the United States only four graduate schools for men closed to women, and only one independent graduate school maintained for women offering three years' consecutive work leading to the degree of Ph.D.

M. CAREY THOMAS.
President of Bryn Mawr College.

Coefficient of Induction. See ELECTRICITY; INDUCTION.

Coehorn, koo'hōrn, **Menno,** BARON VAN, Dutch engineer: b. near Leeuwarden, Friesland, 1641; d. The Hague 17 March 1704. In his 16th year he entered the service as captain, and soon rose to the rank of a colonel. During the siege of Graves he made use for the first time of the small mortars, called in honor of their inventor *coehorns,* used for throwing grenades. In the war of 1689, against France, he again distinguished himself. His defense of Fort William, in 1692, which he himself had planned, against the attacks of Vauban, attracted much attention. Both commanders displayed all their talents. In 1702 he published at Leeuwarden his new theory of fortification. In 1703 he directed several sieges. He fortified almost all the strong places in Holland. Bergen-op-Zoom he considered his masterwork. His system, and that of Vauban, are entirely different. Vauban operated by manœuvres, and by the skilful direction of his ordnance and his men saved both, and wearied and divided the forces of the enemy; Coehorn crushed by an overpowering mass of artillery and men, and sacrificed both for a rapid and powerful effect.

Cœle-Syria, sē'lē-sĭr'ĭ-a ("Hollow Syria"), the ancient name of the large valley lying between the Lebanon and Anti-Lebanon mountain ranges in Syria. The valley is about 100 miles in length. Near its centre are the ruins of Baalbek, or Heliopolis, and near the ruins rise the rivers Orontes and Litany, which water and fertilize the plain. The name also at one time included all the country (except Judea and Phœnicia) extending from Seleucis to the confines of Egypt and Arabia.

Cœlebs (sē'lĕbz) **in Search of a Wife,** a moral tale by Hannah More, published 1808. This is the best-known work of fiction by that prolific moralist. It was written after she had passed her 60th year, and was intended as an antidote to what she considered the deleterious influence of the romantic tales of that day. In 'Cœlebs' she sought to convey precepts of religion, morals, and manners, in the form of a novel. The book had an instant and great popularity. The first edition was sold in a fortnight, and 11 within a year. Its republication in the United States was also highly successful.

Cœlenterata, sē-lĕn-tẹ-rā'ta. The zoophytes or radiate animals of older writers included, among others, the *Actinia* or sea-anemone, the coral, the fresh-water *Hydra,* the sea-firs (*Sertularia*), and the *Medusidæ* or jelly-fishes. These forms were united under the common designation *Cœlenterata* by Frey and Leuckart, and recent observations tend to include the sponges likewise in the same class. Omitting the sponges, however, as their relations are still uncertain, the *Cœlenterata* may be defined as animals whose body wall, consisting of two layers, ectoderm and endoderm, encloses a cavity which has only one external aperture, and which discharges the function at once of digestive and circulatory organ. The outer surface may secrete a horny sheath, as in the sea-firs, or may develop in its substance the hard calcareous skeleton of the corals. The *Hydra,* if divided transversely at any point, shows only a single circular boundary; but the *Actinia,* if similarly treated, is seen to consist of an external and an internal circle, between which radial partitions pass. This is due to the fact that the oral margins are prolonged inward for a short distance as a funnel, which terminates by a truncated open end: the matters received into the funnel and then digested circulate in the compartments outside the funnel, while the effete portions are rejected by the mouth. The *Hydra* and *Actinia,* which are the simplest representatives of the two principal divisions of the class, are at first sight alike in their perfect radial arrangement; but in the *Actinia* bilateral symmetry may be recognized, in so far as the presence of a tubercle within the tentacular circlet indicates the point through which a section would divide equally the cylindrical animal. The structure of the coral will be given under that heading. The Venus' girdle (*Cestum veneris*), the spherical *Cydippe,* and the *Beroë,* are the commonest members of the *Ctenophora,* whose locomotive organs consist of cilia arranged on definite bands which divide the surface. The *Hydrozoa* comprise a very varied assemblage of fixed or free-swimming forms, of single animals or clusters aggregated into a compound mass by a process of gemmation, the various members of the group giving off buds which remain in organic connection with the parent mass. This, the simplest mode of multiplication, is obviously asexual, and the development of ova may take place at some part of the compound mass. But the most interesting phenomena are presented by those forms which illustrate what is known as alternate generations, when from the egg is produced an organism which is unlike that which gave it birth, but whose progeny exactly repeats the form whence the egg was derived. Thus from the egg may be produced a fixed compound structure like the sea-fir, from which a free-swimming zoöid is given off; and in this an egg is produced whence the fixed form is again developed. These free-swimming zoöids are the familiar umbrella-like disks of our jelly-fishes, and these are either gymnophthalmatous, or naked-eyed, the eye-spots on the margin of the disk being exposed; or else these spots are covered by a fold of the body-wall, as in the covered-eyed or steganophthalmatous *Medusæ.* These free-swimming forms move by the contraction of their umbrella; but the air-sacs developed in the Portuguese man-of-war and the like assist or supersede the muscular action of the disks. The majority of these *Medusæ* are known to be merely the sexual phases in the alternate generations, and the difficulty of their determination may be guessed from the fact, that the one "generation" may consist of zoöids seven feet in circumference, while that from which they proceeded is only half an inch in height. The researches of Allman have shown a beautiful series of gradations connecting the apparently quite dissimilar members of the group. Thus the umbrella-like zoöids may remain in connection with the parent mass of which they are buds, and the free-swimming zoöids are shown to be merely detached reproductive organs.

Cœliac Artery, an artery issuing from the aorta just below the diaphragm. It is called also the cœliac axis.

Cœlostat, sē'lō-stăt, an astronomical instrument in which an image of the sky is shown reflected in a plane mirror. Such an instrument has recently (1903) been completed for the Smithsonian Institution at Washington. It will be used primarily for the study of solar phenomena.

Cœnogenesis. See RECAPITULATION THEORY.

Coercion Acts. See IRELAND.

Coethen, kē'tĕn, Germany, a town in the duchy of Anhalt, in a fertile and attractive district on the Ziethe, about 80 miles southwest of Berlin. It was, till 1853, the capital of the former duchy of Anhalt-Cœthen. It consists of the old and the new town and several suburbs; has a fine Protestant cathedral church in the Gothic style, with old glass-paintings and a fine organ; the former ducal residence with library, picture-gallery and museum; a gymnasium, normal and several other schools. There are manufactures of machinery and metal goods, and various other industries. Beet-sugar is a staple article of commerce. The town dates back to the 10th century. Pop. 23,000.

Cœur, Jacques, zhăk kėr, French merchant and royal treasurer: b. Bourges toward the end of the 14th century; d. Chios, in the island of Scio, 25 Nov. 1456. His vast commercial enterprise attracted the attention of Charles VII., who in 1435 appointed him master of the French mint, and afterward treasurer. His excellent management of affairs caused the king to ennoble him, and to intrust him with high functions in the French provinces, and diplomatic missions in Italy. Cœur contributed 200,000 crowns to help the king in rescuing Normandy from the English. After the successful end of the war, his influence became so great as to give offense to envious persons, who after the death of the king's mistress, Agnes Sorel, charged him with having poisoned her, and caused him to be arrested (1451), and his vast property to be confiscated. Although the charge was proved to be groundless, he was detained in prison until 1455, when he effected his escape. Repairing to Rome, he was kindly received by Pope Nicholas V., and was enabled to gather the broken remains of his fortune. He had vainly claimed the clemency of Charles VII. in favor of his family, and it was under Louis XI. only that his memory was exculpated from all charges, while a part of his property was afterward restored to his descendants.

Cœur d'Alêne, kėr dă-lăn (Fr. "awl-heart"). 1. A name given by the French *voyageurs,* traditionally from the stinginess of a chief, to a tribe of Indians of the Salishan stock, though with a dialect widely different from the other members. Their own name is Skitswish, which Lewis and Clarke rendered Skitzoomish. When found by Lewis and Clarke they occupied a considerable tract in northern Idaho and Washington, near the lake named after them. There were perhaps 2,000 of them, rather squalid and unadventurous, though cruel; they lived on roots, fish, and small game, and did not visit the buffalo grounds. Father de Smet visited them in 1841, and the next year a Catholic mission was established among them, and they became Christians. They had regular dwellings and a mill; but they were hostile to the encroaching whites, and in 1858 their chief, Vincent, with a band of his warriors, joined in a war on them, which was only put down by Gen. Wright after two sharp battles, at Four Lakes and Spokane Plains. In 1867 part of them were placed on a reservation in Idaho, and in 1872 the rest were removed to the Colville Reservation, between the Okanogan and Columbia rivers.

2. A lake in northern Idaho, situated among mountains of the same name. The rivers Cœur d'Alêne and St. Joseph flow into the lake at its southern end, and the Spokane River is its outlet at the north. The region is a mining district, and has been the scene of serious labor troubles, especially in 1892 and 1899.

Cœur d'Alêne, a novel by Mary Hallock Foote, published 1894. It is a story of the Colorado mining camps, full of realistic details. Its situations turn upon the labor strife between union and non-union miners in 1892, which forms the sombre background of a bright lovers' comedy.

Cœur de Lion, kėr dė lē-ôn, a title given to several historical personages, as Richard I. of England; so called from the prodigies of personal valor performed by him in the Holy Land; Louis VIII. of France, frequently called *Le Lion;* and Bolaslas I. of Poland, also called "The Intrepid."

Coffee, the seed of an evergreen shrub, which is cultivated in tropical countries, supposed to be native to Abyssinia, although it was early found in Arabia. The plant belongs to the genus *Coffea,* order *Rubiaceæ.* In the wild state it grows to a height of from 6 to 30 feet, but in cultivation it is pruned and kept between 6 and 10 feet. The leaves are green, glossy on the upper side, and somewhat resemble those of the laurel, but less dry and thick. The flowers are white, fragrant, and grow in clusters from the axils of the branches. The fruit, often called berries, grows in clusters of from 3 to 12, each with a short stem or sessile. The fruit when ripe resembles in appearance a dark-red cherry, or a medium-sized cranberry. Each berry contains two seeds embedded in a yellowish, sweetish pulp which, when ripe, is delicious.

The trees are raised from seed grown in nurseries, and when of a size to endure variations of temperature, usually in about six months' time, they are transplanted to the coffee orchard. They begin to bear when three years old, and yield fruit for about 20 years. Considerable space is left between the trees, and corn, bananas, and plantain are grown among them, especially when young. The first year's crop is small, but when in full bearing a tree will yield from one to five pounds, according to location and variety. The regions best adapted to the growth of coffee are between the parallels of 15 north and 15 south latitude, and from 1,000 to 4,000 feet above sea-level. It is cultivated from lat. 25° N. to 30° S., in places where the temperature does not fall below 55° F. Moist and somewhat shady slopes are found most desirable. Little streams of water are conducted to the roots of the trees, which are kept very wet until the fruit is nearly ripe, then the water is turned off to keep the fruit from becoming too succulent. The fruit varies in size and color

according to the altitude in which it grows; that from highlands is small and green; that grown on lowland and near the coast is larger and of a yellowish tinge. The wild trees of Liberia, which grow in the lowlands, produce the largest fruit known, but it is of inferior quality. The coffee from the Far East can be distinguished by its large bean of a yellow color, while that of Central and South America is smaller and of greenish color. The fruit is harvested with great care, cloths being placed under the trees before shaking them. The fruit is then exposed to the sun to dry, after which it is pulped, washed, dried again, hulled, cleaned, and sorted before it is ready for the market. In some places, especially Brazil, the bean is pulped by machinery as soon as it is taken from the tree, and thus the time necessary to get the coffee ready for market is shortened.

Some of the coffee-producing countries of the world to-day are: Brazil, the Philippines, Hawaii, Cuba, Porto Rico, Jamaica, Central America, and parts of Africa, Arabia, Java, and Ceylon. Brazil has a larger coffee-bearing area than any other country; it produces more than two thirds of all the coffee consumed in the world. One year, when the crop was unusually good, Brazil produced 660,000 tons, and that same year the world's consumption was 600,000 tons. Coffee planting in Brazil has been the most successful farming in the world. Sao Paulo, a city of 250,000, owes its existence to the trade in the coffee raised in the great orchards in the vicinity. In some of the orchards there are about 5,000,000 trees. Large quantities of the Brazilian coffee are shipped annually to Aden (Arabia) and reshipped to other parts of the world as mocha. The producing of coffee in Yemen, or Wady Negram, or anywhere near Mocha is a thing of the past; but one kind of coffee-berry raised in Brazil and in some other countries much resembles in form and flavor the old market mocha. Coffee planting is no longer pursued to any extent in Ceylon. The red lands in the province of Sao Paulo, in Brazil, seem to be particularly favorable to the growth of the tree, and this section seems immune to the leaf disease which has destroyed the industry in Ceylon and in some parts of the West Indies. Giving the soil a rest or changing crops may result in again placing Ceylon among the places producing an excellent quality of coffee. The names given to coffee are usually those of the cities from which shipments are made.

The difference in taste of coffee as found in our markets is principally due to two causes: (1) the roasting to either a reddish-brown or a dark brown; (2) the picking of coffee when some berries are green, others red, and still others a dark purple, the last being the ripe fruit. Thus we have three grades from each tree; add the difference in roasting, as mentioned, and we have six grades; then take the perfect berry, which is flattened on one side, and the spherical berry, the so-called mocha, and that gives 12 grades of coffee.

In Porto Rico and Cuba coffee of a good quality is raised, but as yet in small quantities. In the Hawaiian Islands coffee of excellent quality is produced, and the orchards are increasing in size and number. Hawaiian coffee brings the highest price of any on the Pacific coast. In the Philippines there are splendid orchards, especially in the southern islands of the archipelago, known as the Sulu or Jolo group. On the island of Jolo are fine coffee-trees that bear much earlier after planting than those of Brazil. There are large tracts of land in the Philippines which are as favorable for coffee growing as any in Brazil, but the area that may be devoted to coffee farming is not so great.

The United States leads the world in the consumption of coffee. The yearly consumption in Great Britain declined steadily during the last half of the 19th century. This is attributed to the adulterations which at one time were extensively practised. Probably few articles of food are subjected to so much adulteration as coffee. Substances of an entirely foreign nature are often palmed off as genuine coffee, or are offered as substitutes. Dandelion, parsnip, carrot, and beet roots, beans, lupins, rice, and various cereals, roasted and ground, have all been employed, and within recent years the manufacture of artificial coffee has been undertaken on a considerable scale, the material being mixed to a stiff paste and run through a machine for which patents have been granted, and from which it emerges in the shape of "coffee-beans," which, after drying and roasting, are well calculated to deceive the eye, though not the nostrils or palate. These adulterations can be readily detected, for genuine roasted coffee may be soaked in cold water indefinitely without the bean losing its smooth surface or hard, tough consistency, nor will it impart its color to the water; whereas chicory and other imitations become soft and spongy and render the water muddy. As far back as the eighties it was estimated that something like 18,000,000 pounds of various vegetable substances were annually sold as coffee.

In Medicine.— Many of the leading medical men of the day hold that the action of coffee on the body is due to two or three factors. If coffee is mixed with milk or cream, it gives a certain amount of nutritive matter; but its action is usually that due to the volatile oils, and to the caffeine contained. The volatile oil, like others in this class, stimulates peristalsis, and assists to overcome constipation — in this respect coffee and tea being quite opposites — and it also aids in the expelling of flatus; but taken too often and in too large quantities the oil contributes to the causation of a certain amount of gastric indigestion. The more delicate the aroma of coffee the less the oil, and the better from this standpoint. The action of caffeine is much more complex.

So far as coffee-drinking is concerned, the action of caffeine is that of a cardiac stimulant, a nerve-muscle excitant, a diuretic, and a cerebral excitant. Thus it may cause a sense of undue fullness in the blood vessels. It almost invariably causes a slight muscular tremor, which is not noted in those who do not use their hands for fine work, as artists, for example. It causes an increased flow of urine, and tends to prevent sleep. Time, custom, usage, dose, and the individual's reaction all modify these general laws; but these reactions occur, although none of them may be of sufficient grade to make the observer cognizant of the action. Thus many people are not kept awake by coffee. They have probably habituated themselves and require larger doses.

Hot coffee is one of the best heart tonics known, and it is sometimes used in large quan-

tities by rectum in cases of shock, opium poisoning, pneumonia, etc. Coffee is also valuable in many types of headache and in many cases of nausea. Its excessive use leads to great muscular irritability, gastritis, restlessness, and sleeplessness. It is held by many medical men that the effects of coffee as a beverage are wholly bad. They say that the caffeine in the coffee, or in other vegetable substances — tea, coffee, kola, guarana, and maté, or Paraguay tea — is a stimulant to the brain, nerves, heart, and kidneys. In small doses it helps to resist fatigue, increases mental power and promotes excretion of urine. Large doses or continued use, however, tend to make a person nervous, to induce irritability of the heart with considerable depression, and to upset the stomach. The mildest results of an overdose are a tendency to wakefulness, but there are recorded a number of deaths from heart-failure due to its employment in large doses. It is used largely as a heart-stimulant and diuretic, but its action is characterized by great variability. Individual susceptibility to it varies so greatly that what would be a poisonous dose for one person would scarcely affect another. The usual dose is half a grain to three grains.

History. — The early history of coffee is obscure; as an article of diet, its introduction is recent; to the Greeks and Romans it was wholly unknown. It was first introduced into Persia from Abyssinia, and next in the 15th century by a Mohammedan priest at Aden. From Aden it was carried to Mecca, where first the pilgrims or Hadjis, and then the rest of the people, began to use it. From Arabia it was taken to Cairo, Egypt, where in 1511 it was prohibited because it was believed to be an intoxicant and came within the class of things forbidden as food by the Koran. The Sultan Causon removed the prohibition, and coffee passed along the coast by way of Syria and around to Constantinople. Again it was opposed as one of the articles not to be used as food according to the Koran. Thus its use was permitted and allowed for many years. The Turks are now immoderate coffee-drinkers.

Prior to the 18th century all the coffee used in Europe was brought from Arabia Felix via the Levant. In 1652 Edward, a merchant, in trade with Turkey, introduced coffee into England; in 1697 Van Horn introduced it into Batavia, and from there it was taken to France and the West India Islands. In 1754 Father Villaso, a Franciscan monk, took a plant to Rio Janeiro and cultivated it in the garden of the monastery of St. Anthony. This one plant was the means of introducing coffee into Brazil.

Bibliography.— Cook, 'Shade in Coffee Culture' (United States Botany Division, Bulletin 25); Hangwitz, 'The World's Coffee Trade in 1898' (United States Consular Reports, Vol. LX. 258); Hewitt, 'Coffee, Its History, Cultivation, and Uses'; Lock, 'Coffee, Its Culture and Commerce in all Countries'; Caswell, 'Coffee Culture in Our New Islands,' in the 'Overland Monthly,' new series Vol. XXXII. 459; and United States Bureau of American Republics, 'Special Report on Coffee Culture in Central and South America.'

Coffee-bug, an insect (*Lecanium coffeæ*), of the *Coccus* family (*Coccidæ*), very destructive in coffee plantations.

Coffee House, a house of entertainment where persons are supplied with coffee and other refreshments. Such houses were formerly the chief resorts of every class for purposes of conversation and information, and the meeting-places of politicians, literary men, etc. Constantinople is believed to have been the first European capital in which coffee-houses were instituted, the year of their establishment there being 1554 A.D. In 1650 the first one in England was opened in Oxford. They were suppressed by Charles II. in 1675, but were soon allowed to be reopened.

Coffee-nut: Coffee-tree. See Kentucky Coffee-tree.

Coffer-dam, a water-tight enclosure round a space where it is intended to found the pier of a bridge, quay, etc., so constructed that the water may be pumped out of it and the masonry executed "in the dry." It is formed of one or more rows of piles (usually two), between which clay is rammed. The piles, generally driven close together, are sometimes grooved and tongued; but if the water be not very deep the piles are placed some distance apart, and boards let into the grooves. Of course great care must be taken that no water can enter at the joints or at the junction with the natural soil, and that the structure is sufficiently strong to resist the great pressure of water from without. If the bottom is of rock, and piles cannot be driven, coffer-dams may be formed of two parallel stone walls, the intervening space filled up with clay. Iron caissons are also used instead.

Coffer Fish, or **Trunk Fish,** a peculiar genus (*Ostracion*) of bony fishes in the small order *Plectognathi,* and in the suborder *Sclerodermi,* which also includes the file-fishes. The body is enclosed in a firm box formed of hexagonal bony scales fitted into one another like a mosaic. The snout, the bases of the fins, and the end of the tail are the only soft-skinned parts. Over a score of species are known from tropical and sub-tropical seas. The best-known form is *O. quadricornis* from the tropical Atlantic.

Cof'feyville, Kan., a city of Montgomery County, situated on the Verdigris River, and on the Missouri P., Atchison, T. & S. F., and other railroads. There are gas wells in the vicinity, and the city has a large trade with Indian Territory, and a number of manufacturing interests. Pop. (1900) 4,953.

Coffin, Charles Carleton, American novelist and lecturer: b. Boscawen, N. H., 26 July 1823; d. Brookline 2 March 1896. He began life as a civil engineer, and afterward gave his attention to telegraphy. In 1851 he began to write for the Boston papers; and during the Civil War and the Austro-Prussian war of 1866 was war correspondent for the Boston *Journal,* writing over the signature of "CARLETON." His books include: 'Days and Nights on the Battle-Field' (1864); 'Four Years of Fighting' (1866); 'Our New Way Round the World' (1869); 'Story of Liberty' (1878); 'Boys of '76' (1879); 'Old Times in the Colonies' (1880); 'Life of Garfield' (1883); 'The Drum-Beat of the Nation' (1887); 'Marching to Victory' (1888); 'Freedom Triumphant' (1891).

Coffin, SIR Isaac, English admiral: b. Boston, Mass., 16 May 1759; d. England 23 July 1839. He entered the English navy as midshipman in 1773, served on various ships on the

American station, in 1778 was appointed lieutenant, and in 1781 commander. On 16 March 1781 he acted as signal-lieutenant to Admiral Arbuthnot in the action off Cape Henry, and in 1782 was present as a volunteer under Admiral Hood in the engagement between Rodney and De Grasse. In 1798, when Minorca fell into the hands of the English, he was appointed superintendent of the arsenal at Port Mahon. In 1804 he was advanced to the rank of rear admiral of the blue; next year was made a baronet; in 1808 vice-admiral, and in 1814 admiral. In 1826 he founded a school in Nantucket, Mass., still called by his name.

Coffin, James Henry, American scientist: b. Williamsburg, Mass., 6 Sept. 1806; d. Easton, Pa., 6 Feb. 1873. He was graduated at Amherst, 1828. He taught at Greenfield, Mass., Ogdensburg, N. Y., 1829–40; at Williams College 1840–3; Norwalk (Conn.) Academy 1843–6, when he was elected professor of mathematics and astronomy in Lafayette College, Easton, Pa., where he remained till his death. His reputation is due to his achievements in meteorology, a subject he began to investigate as early as 1838. In 1853 he published his theory of atmospheric circulation, including the principle quoted in Europe since 1860 as 'Buys-Ballot's Law.' He wrote: 'Solar and Lunar Eclipses' (1845); 'Winds of the Northern Hemisphere' (1853); 'Psychrometrical Tables' (1856); 'The Orbit and Phenomena of a Meteoric Fire-Ball, 20 July 1860' (1869); 'Elements of Conic Sections' (1874); 'The Winds of the Globe; or, the Laws of Atmospheric Circulation over the Surface of the Earth' (1875), completed by his son, S. J. Coffin. See Clyde, 'Life of J. H. Coffin' (1882).

Coffin, John Huntington Crane, American mathematician: b. Wiscasset, Maine, 14 Sept. 1815; d. Washington, D. C., 8 Jan. 1890. He was graduated at Bowdoin 1834, and in January 1836 entered the United States navy as professor of mathematics, serving in the West India squadron, and at the Norfolk navy yard. He had charge of the mural circle in the Naval Observatory at Washington from 1843 to 1853, when he was transferred to the Annapolis Naval Academy, taking charge of the department of mathematics, and later astronomy and navigation. From 1865 to 1877 he had charge of the 'American Ephemeris and Nautical Almanac.' In 1877 he was placed on the retired list. Bowdoin conferred the degree of LL.D. upon him in 1884, and in 1863 he became one of the corporate members of the National Academy of Sciences, named by Act of Congress. He published 'Observations with the Mural Circle, with Formulas, Tables, and Discussions, 1845–9', published in the observatory volumes for those years; 'The Compass' (1863); 'Navigation and Nautical Astronomy' (1868); 'Observations of the Total Eclipse of the Sun, August 1869' (1884).

Coffin, Joshua, American antiquary: b. Newbury, Mass., 12 Oct. 1792; d. there 24 June 1864. He was graduated at Dartmouth College in 1817, and was a teacher for many years. Whittier was one of his pupils, and addressed to him the poem 'To My Old School-Master.' Coffin was an ardent abolitionist, being a founder and first recording secretary of the New England Anti-Slavery Society 1832. He compiled: 'Sketch of the History of Newbury, Newburyport, and West Newbury, 1635–1845' (1845); 'List of Some of the Descendants of Mr. E. Woodman (of) Newbury, Mass., 1635' (1855); 'The Toppans of Toppan's Lane: Their Descendants and Relations' (1862).

Coffin, Levi, American philanthropist: b. near New Garden, N. C., 28 Oct. 1798; d. Avondale, Ohio, 16 Sept. 1877. He was a farmer's son, and early evinced interest in the negro's welfare. Proving successful in business, he actively aided slaves to gain freedom, largely through the "underground railroad." Thousands of escaping slaves were aided on their way to Canada by him. He helped found the Freedman's Bureau in 1863, and after the Civil War was active in schemes to advance the welfare of the colored people. He was known popularly as "President of the Underground Railroad."

Coffin, Robert Barry, American journalist and miscellaneous writer: b. Hudson, N. Y., 21 July 1826; d. Fordham, N. Y., 10 June 1886. He was on the staff of the 'Home Journal' of New York (1858), and was also art critic of the *Evening Post*. His humorous sketches, which appeared in many periodicals over the pen-name "Barry Gray," have been extensively read. Among his publications are: 'My Married Life at Hillside' (1865); 'Cakes and Ale at Woodbine' (1868); and 'The Home of Cooper' (1872).

Coffin, Robert Stevenson, American printer and poet: b. Brunswick, Maine, 1797; d. Rowley, Mass., 7 May 1827. He served his apprenticeship as a printer in Newburyport; was a sailor during the War of 1812, and at one time a prisoner on board a British frigate, and subsequently worked on newspapers in Boston, New York, and Philadelphia, publishing occasional verses in the poet's corner. He came to be known, perhaps from his own pretentiousness, as "The Boston Bard," and his poems were collected in a volume entitled the 'Oriental Harp, Poems of the Boston Bard.'

Coffin, William Anderson, American painter: b. Allegheny, Pa., 31 Jan. 1855. He was graduated at Yale 1874, studied art in the United States 1874–7, and then in Paris under Leon Bonnat 1877–82. He opened a studio in New York 1882, and has become well known as a painter of landscapes and figure pieces. In 1886 he won the Hallgarten prize of $200; was awarded a medal at the Paris Exposition 1889; received the Webb prize of the Society of American Artists 1891; and was gold medallist of the Philadelphia Art Club 1898. He was art critic of the New York *Evening Post* 1886–91, and of the New York *Sun* 1896–1900. In 1901 he was director of fine arts at the Pan-American Exposition in Buffalo, N. Y. Among his best-known pictures are: 'The Rain,' in the Metropolitan Museum; 'Une académie de peinture moderne'; 'An Examination' (time of Louis XIII.); 'The Close of Day' (1881); 'The Hayfield' (1886).

Cof'fin, a box or case designed to hold a corpse for interment or cremation. Coffins were used by the ancients mostly to receive the bodies of persons of some distinction. Among the Romans it was latterly the almost universal custom to consume the bodies with fire, and deposit the ashes in urns. Even at the present time coffins are not used in the East, either by

Mohammedans or Christians. In Egypt coffins seem to have been used in ancient times universally. They were of stone, earthenware, glass, wood, or a kind of pasteboard made by gluing cloth together. (See SARCOPHAGUS.) Coffins among Christians were probably introduced with the custom of burying. (See BURYING-PLACES.) It has been often proposed that they should be made with a hole opposite the place of the mouth of the body, so as to allow breathing in case of revival. Of course it would be necessary, at the same time, to let the coffin stand for some days in a convenient place, as is the custom in some parts of Germany. It has recently been proposed to employ coffins of wicker-work, while some strenuously advocate the burning of all dead bodies. See CREMATION.

Cofre de Perote, kō'frā dā pā-rō'tā, Mexico, a mountain about one mile from the town of Perote, and 70 miles northwest of Vera Cruz. It is 13,414 feet high. The English name is the Four Parts, or the Square Mountain. It is formed of basaltic porphyry.

Cog-wheel, a wheel with cogs or teeth. The pitch of such a wheel is the distance, measured along the pitch-line (explained below), between the centres of two successive teeth. The pitch-surface is an imaginary smooth surface between the tops and bottoms of the teeth, which is such that the velocity-ratio which would be produced by rolling contact with the pitch-surface of another toothed wheel would be the same as that actually produced by the action of the cogs. The pitch-circle (or pitch-line) of circular wheels is a section of the pitch-surface made by a plane perpendicular to the surface and to the axis of the wheel. The distance from the centre of the wheel to the pitch-line is the primitive radius, that from the centre to the crest of the cog being the true radius. The face of a cog is its outer surface, and the space between two adjacent teeth is the inter-dental space. Various kinds of toothed wheels are in use, such as the spur-wheel, the crown-wheel, and the bevel-wheel.

Coggeshall, England, a town in the county of Essex, 42 miles northeast of London, on the left bank of the Blackwater. The place was once famous for the manufacture of a kind of baize, celebrated under the name of "Coggeshall whites." The hamlet of Little Coggeshall is on the opposite side of the Blackwater, which is crossed here by an ancient bridge of three arches, said to have been built by King Stephen, who founded here also an abbey for Cistercians.

Coghetti, Francesco, frän-chĕs'kō kōgĕt'tē, Italian painter: b. Bergamo 4 Oct. 1804; d. Rome 21 April 1875. He was a profound student of Raphael and is best known by his masterly frescoes in the basilican church at Savona. He adorned several Roman palaces with frescoes, and was knighted for his 'Condemnation of Saint Stephen.'

Coghlan, kŏg'lan, **Charles Francis,** American actor: b. Paris, France, 1841; d. Galveston, Texas, 27 Nov. 1899. He was educated for the bar in London, but went on the stage, making his American début in 1880 as Captain Absolute in 'The Rivals.' He took leading parts for many years, being a refined and capable impersonator of old school gentlemen. He wrote: 'Jocelyn'; 'Lady Barter'; and other plays.

Coghlan, Joseph Bullock, American naval officer: b. Frankfort, Ky., 8 Dec. 1844. Graduated in 1863 from the United States Military Academy, he at once saw service as ensign in the Civil War, in 1868 rose to be lieutenant-commander, and later served successively on board the Richmond, Saugus, Monongahela, and Indiana. In 1882 he was promoted commander, and in 1896 captain. As commander of the Raleigh of the Asiatic station from 1897, he took part in the battle of Manila Bay, 1 May 1898. On 2–3 May he commanded expeditions for the reduction of all Spanish batteries at the mouth of the bay, and on 7 July an expedition for the capture of Isla Grande, Subig Bay, Luzon. He was commissioned rear-admiral in 1902 and appointed to command the Caribbean squadron of the North Atlantic fleet.

Coghlan, Rose, American actress: b. Peterborough, Eng., 1853. She rose from humble roles in England to be leading lady, making her American début in 1872. From 1880 to 1889 she was Wallack's leading lady and since 1893 has "starred" in various American and English companies.

Cognac, kōn-yäk, France, in the department of Charente, on the Charente River, 22 miles west of Angoulême. It is situated on a hill crowned by an old castle. It is famous for the brandy which bears its name and which is exported to all parts of the world, chiefly to England, the north of Europe, and America. Some English houses, established here in 1780, began the manufacture of this brandy and developed its enormous trade.

Cogniet, Leon, lā-ôn kōn-yā, French historical and portrait painter: b. Paris 29 Aug. 1894; d. there 20 Nov. 1880. He studied under Guerin, obtained the Grand Prix de Rome in 1817, and became a member of the Institute in 1849. Many famous artists of a later day were pupils in his studio. The Church of the Madeline in Paris contains a 'Magdalen' by Cogniet.

Cogno'vit, in law, a written confession given by the defendant that the action of the plaintiff is just, or that he has no available defense.

Cogs'well, Joseph Green, American librarian and bibliographer: b. Ipswich, Mass., 27 Sept. 1786; d. Cambridge, Mass., 26 Nov. 1871. He graduated at Harvard in 1806, and practised law for a few years in Belfast, Maine. He was a tutor at Harvard 1813–15, and after four years of study in Europe he was made professor of geology and mineralogy, and librarian at Harvard. In 1823, in connection with George Bancroft, he founded the famous Round Hill school at Northampton, Mass., the plan and methods of instruction being based on an examination of the best English and German systems of education. The school was discontinued in 1836. After a period of editorship of the New York 'Review,' Cogswell, with John Jacob Astor, Fitz-Greene Halleck, and Washington Irving, formulated the plan of the Astor Library. Cogswell was appointed its chief (1848), a place for which his remarkable attainments as a bibliographer eminently qualified him,—he went abroad to purchase books, and laid the foundation of the present collection with rare discrimination and economy. He presented to it his own fine collection of bibliographical works, and prepared a catalogue of its contents. Advancing years

caused his retirement in 1861. He was a frequent contributor to the leading reviews, such as the 'North American Review,' 'Blackwoods,' and the 'Monthly Anthology.'

Cogswell, Mason Fitch, American physician: b. Canterbury, Conn., 28 Sept. 1761; d. Hartford, Conn., 10 Dec. 1830. He was adopted by Samuel Huntington, president of the Continental Congress and governor of Connecticut, and graduated valedictorian at Yale 1780. He studied medicine with his brother James, at the soldiers' hospital in New York during the Revolution, and eventually became one of the best-known surgeons in the country. He was the first in the United States to remove a cataract from the eye, and to tie the carotid artery (1803). Mainly through his influence the first asylum for deaf-mutes was founded in this country at Hartford, and his daughter Alice was its first pupil. He was also a founder of the Retreat for the Insane in the same city.

Cohen, Alfred J. See DALE, ALLEN.

Co'hen, Jacob da Silva Solis, American physician: b. New York 28 Feb. 1838. He graduated M.D. at the University of Pennsylvania 1860, and in 1861 became assistant surgeon of the 26th Pennsylvania regiment, serving with the expedition to Port Royal and with the South Atlantic blockading squadron till January 1864. In 1866 he settled in practice in Philadelphia, and has made a specialty of diseases of the throat and chest. He has written many important articles and books on these topics, chief of which are: 'Diseases of the Throat and Nasal Passages' (2d ed. 1879); 'The Throat and the Voice' (1880); 'Treatise on Inhalation'; 'Croup in its Relations to Tracheotomy.' and since 1880, 30 other special studies, which have been published in the New York 'Medical Journal,' Philadelphia 'Medical News,' etc.

Cohen, Katherine M., American artist: b. Philadelphia 18 March 1859. Receiving her early training at private schools and Ogontz, Pa., she displayed a taste for art which was developed by study at School of Design, Pennsylvania Academy of Fine Arts, Students' Art League under Saint Gaudens, and six years in Paris schools. She has been engaged in sculpture since 1880 and her chief works have been portraits and bas-reliefs, decorative works and paintings of figure and landscape. Among her principal successes have been: Portrait of Gen. Beaver for Smith Memorial, Fairmount Park; 'The Israelite'; 'Priscilla'; 'Rabbi-ben-Ezra'; 'Romola'; 'Lorna Doone.'

Cohen, Mendes, American civil engineer: b. Baltimore 4 May 1831. Educated in private schools he soon displayed a bent toward engineering, and engaged in practical study at the locomotive works of Ross Winans, Baltimore, 1847–51. His active service became continuous, first at the engineer corps of the B. & O. R.R. 1851–5; then as assistant superintendent Hudson R.R. 1855–61; and, 1861–3, as president and superintendent O. & Miss R.R. (of Illinois). For some years he was engaged in the special service of Phila. & Reading, and became comptroller and assistant to the president of the Lehigh Coal and Navigation Company. In 1894 he was appointed by President Cleveland as member of the board to examine and report a route for the Chesapeake & Delaware Ship Canal. In Baltimore he has long been honored with important civic trusts.

Cohen, Solomon, American lawyer: b. Georgetown, S. C., 15 Aug. 1802; d. Savannah, Ga., 14 Aug. 1875. At an early age he became a lawyer and he soon was classed with leading lawyers of his day and State, who directed the political thought and education of the people. In 1838 he settled in Savannah, where he maintained a leading position at the bar, attaining so deserved a popularity that he was sent to the Legislature, and assumed a prominent part in municipal affairs. He was one of the founders of the system of public education in the State. He was appointed postmaster of Savannah by President Pierce, and was continued by President Buchanan, holding the same position under the Confederate government. In 1866 he was elected member of Congress from the first district of Georgia, but was not allowed to serve.

Cohen, Solomon Solis, American physician: b. Philadelphia, 1 Sept. 1857. After a course of study at the Central High School in his native city, he graduated from Jefferson Medical College in 1883, and made so thorough a record for scholarship that since 1888 he has been lecturer in clinical medicine at Jefferson Medical College, and since 1890 professor of clinical medicine and therapeutics at Philadelphia Polyclinic and College of Graduates in Medicine. He was elected president of the Philadelphia County Medical Society, 1898–9. His published writings include: 'Therapeutics of Tuberculosis'; 'Essentials of Diagnosis,' and he has edited 'System of Physiologic Therapeutics.'

Coherer, an electrical instrument, part of the receiver in Marconi's system of wireless telegraphy, consisting of a small glass tube about one and a half inches long, into which two silver plugs are tightly fitted. A small gap separates these plugs, and in this gap a mixture of nickel and silver filings is placed. Under ordinary conditions the resistance of this gap is too high to allow of any current passing from the local cell or battery; but under the influence of electric waves these filings instantly cohere, and the tube becomes a comparatively good conductor. Connected with this tube is a cell and a relay. By the cohesion of the filings the current from the cell is allowed to pass through the tube and actuate the relay. When once this is achieved, it becomes a very simple matter to make a bell ring or work a Morse siphon.

The filings, however, having cohered under the influence of an electric wave, remain in this condition unless shaken up. An automatic tapper, or discoherer, somewhat similar to an electric-bell tapper, minus the bell, is so adjusted as to tap the tube and shake the filings up, thus decohering them and bringing them to their normal condition, when they are again in a state to receive another impulse.

The oscillations set up by the transmitter at a distant station act on the vertical conductor or resonator which is connected with the sensitive tube at the receiving station, cohere the filings in the tube, and allow the local cell to actuate the relay. This, in its turn, causes the larger battery to pass a current through the tapper, or interrupter, and also

through the electro-magnets of the recording instrument. See WIRELESS TELEGRAPHY.

Cohe'sion, the force by which the various particles of the same material are kept in contact, forming one continuous mass. Its action is seen in a solid mass of matter, the parts of which cohere with a certain force which resists any mechanical action that would tend to separate them. In different bodies it is exerted with different degrees of strength, and it is measured by the force necessary to pull them asunder. According to Sikingen, the relative cohesive strengths of the metals are as follows:

Gold	150,955
Silver	190,771
Platinum	262,361
Copper	304,696
Soft iron	362,927
Hard iron	559,880

Cohesion in liquids is very much weaker, the parts being disjoined with much more facility; and in substances existing in the gaseous form it is entirely overcome, the particles repelling instead of attracting each other.

Cohesion in bodies is weakened or overcome by two general causes — by the repulsion communicated by heat, or by the attraction which may be exerted by the particles of one body on those of another.

Heat communicated to a solid body always diminishes the force with which the attraction of aggregation or cohesion is exerted; if the heat be increased to a sufficient extent the cohesion is so far weakened that the body passes into the liquid form; and if carried still farther, the attractive force is entirely overcome, repulsion is established between the particles, and the body passes into the gaseous state.

The same effects are produced by the exertion of that attraction which unites the particles of one body with those of another. If a liquid be poured on a solid, it often happens that their mutual attraction is sufficiently powerful to overcome the cohesion of the solid; its particles are consequently disunited, to combine with those of the liquid, and it entirely disappears. This forms the chemical process of solution (q.v.). A similar effect is sometimes produced by the chemical action of a gaseous body.

When these powers, whether of heat or of chemical attraction, are withdrawn, cohesion resumes its force, but with results which are different, according to the circumstances under which this happens. When the attraction of aggregation is suddenly and forcibly exerted, the particles are united, in general, indiscriminately, and according to no regular law. If a body which has been melted is suddenly cooled to a sufficient extent, it becomes solid, and forms a mass of no regular structure or figure; or if its cohesion has been suspended by the chemical attraction exerted by another body toward it, and if this attraction suddenly cease to operate, the force of cohesion is resumed, and the solid substance appears in the form of a powder. This latter case forms the chemical operation denominated precipitation (q.v.). But if the force of cohesion is exerted more slowly the particles are united, not indiscriminately, but usually with regularity, so as to form masses of regular structure and figure, bounded by plane surfaces and determinate angles. This forms the operation of crystallization; and such masses are denominated crystals (q.v.).

Cohe'sion Figures. When small drops of various liquids lighter than water, and slightly soluble in it, are allowed to fall on the surface of perfectly pure water, the drops form curious figures on account of the differences between the capillary tensions of the air surfaces of the liquids. (See CAPILLARITY.) These are called cohesion figures. They were investigated by the late Mr. Tomlinson, the results of whose researches are published in various papers in the 'Philosophical Magazine' since October 1861. Creosote, for example, forms a disk which sails about on the surface with a rapidly quivering motion. Ether, again, forms a circular figure composed of a central boss, surrounded first by a flat depressed ring, and then by a raised ring, the edge of which is waved. Mr. Tomlinson has observed many other liquids. The figures last for a short time, gradually disappearing as the drop becomes dissolved in the water. The slightest impurity in either liquid changes the figure by altering the superficial capillary tension of the liquid. Hence Mr. Tomlinson proposed to observe the figure as a test of the purity of certain essential oils. In applying the test it is necessary to have the water perfectly pure and clean, and Mr. Tomlinson has given special methods of cleansing the glass vessel into which distilled water is put. Mr. Tomlinson has also examined cohesion figures of fluids dropped on other liquids besides water, as cocoanut oil, castor oil, melted paraffin, etc.

Cohn, kōn, **Adolphe,** American educator: b. Paris, France, 29 May 1851. He was graduated from the University of Paris in 1868 and served as a volunteer in the French army during the Franco-German war from July 1870 to February 1871. In 1875 he came to New York and taught languages for some years, when his ability secured him a tutorship in French at Columbia University in 1882, in which he served as instructor for two years. He was instructor at Harvard 1884–5, and assistant professor in French 1885–91. In 1891 he became professor of Romance languages and literature at Columbia, which position he still holds. He is a singularly successful teacher, and many of his pupils hold posts of prominence. In addition to numerous contributions to literary periodicals, he has published: 'Voltaire's Prose' (with Woodward) (1897); 'Le Sage's Gil Blas' (with Sanderson) (1899).

Cohoba'tion, an operation in which a fluid is converted into vapor by heat, and is then condensed, but instead of being collected in a separate receiver, as in distillation, it is made to flow back into the heated vessel. It is employed to produce a change in the fluid by continued heating, but more frequently to subject some substance to the action of a fluid without either loss of the latter or the necessity of adding fresh quantities of it.

Cohoes, kō-hōz', N. Y., city of Albany County, at the confluence of the Mohawk and Hudson rivers, and near the junction of the Erie and the Champlain canals, and on the New York Central and the Delaware & Hudson R.R.'s, nine miles north of Albany. The Mohawk River has a fall of over 70 feet at this point, and supplies great power, making Cohoes a very important manufacturing community.

The Mohawk River is crossed by a dam above the falls, and the water is supplied to the mills and factories by means of canals. The principal manufactures are cotton, woolen and worsted knit goods, foundry and machine shop products, boots and shoes, tobacco, paper boxes, and bread and bakery products. The city is connected with Albany, Troy, and other neighboring cities by electric street railways. The most noteworthy buildings are the public library, St. Bernard's Academy, the Egbert public high school, and several of the numerous churches. Cohoes was first settled by the Dutch about 1630, and for some time was a part of Rensselaer Manor. It was chartered as a city in 1870. Pop. (1900) 23,910.

Co'hort, a division of the Roman army, the tenth part of a legion, containing three maniples or six centuries. The number of men varied with that of the legion, the 10 cohorts always containing an equal number. When the legion numbered 4,000 men, the cohort consisted of 60 triarii, 120 principes, 120 hastati, and 100 velites, in all 400 men. The centurion of the first century of the first maniple of the first cohort was the guardian of the eagle or colors of the legion, and hence the first cohort was always regarded as superior in dignity to the others.

Cohosh, kō-hŏsh' (*Cimicifuga racemosa*), also called black snakeroot, is a plant belonging to the crowfoot family (*Ranunculaceæ*). Besides this species there are about four others also called cohosh, herb-christopher, and rattlesnake herb, which are widely distributed from Nova Scotia and Anticosta, south to Georgia, westward to Missouri, and northward to British Columbia. It is an erect perennial herb growing in woods. The plant has powerful medicinal properties and is a valued remedy in rheumatism, epilepsy, etc. The blue cohosh (*Caulophyllum thalictroides*) is a powerful antispasmodic and emmenagogue. It is also a diaphoretic and diuretic, and has been used successfully in this country as an anthelmintic.

Coif (French, *coiffe*), the badge of serjeants-at-law, who are called serjeants of the coif, from the lawn coif which they wore under their caps when created serjeants. The cap worn by women of religious orders, usually white, and worn under the veil. The name is sometimes given to the small cap worn by monks who have the tonsure.

Coimbatore, kō-ĭm-bạ-tōr', or **Coimbetoor,** British India, a district in Madras presidency, with an area of 7,842 square miles. The country has on the west the range of lofty mountains called the Western Ghauts; a continuation of which also bounds it on the north. On the east it is bounded by Salem and Trichinopoly, and south by Madura and Travancore, west by Malabar and Cochin. It is fertile, producing sugar, cotton, rice, and tobacco; and well watered by several rivers. The climate is very malarious in some parts. The principal towns are Coimbatore, Erroad, and Carroor. In 1799, on the death of Tippo, and the division of his territories, Coimbatore was ceded to the East India Company.

Coimbatore, British India, city and capital of the district of Coimbatore, situated at the foot of the Western Ghauts, on the river Noyel, 90 miles south of Seringapatam, 252 southwest of Madras. It has wide streets, is well built and well drained, has an agreeable climate, and is more suitable for the residence of Europeans than most Indian towns. It suffered much in the wars between the British and Mysore sovereigns. Pop. (1901) 52,968.

Coimbra, kō-ēm'brä, Portugal, capital of the province of Beira, on a hill above the Mondego River, here crossed by a stone bridge, 135 miles northeast of Lisbon. Its streets are steep and narrow, its manufactures confined chiefly to earthenware and combs, and its interest consists mainly in its historical associations. The place derives its name from the Roman Conimbria, traces of which lie to the south; it was held by the Goths, and from them passed to the Moors, from whom it was finally conquered in 1064, by Fernando the Great, aided by the gallant Cid. Coimbra was the capital of Portugal for about two centuries and a half from its erection into a kingdom in 1139, and many of the early kings are buried in and around the old town. Of the public buildings, the most noteworthy are the older of the two cathedrals, the Church of San Salvador, and the ruined Convent of Santa Clara; across the river is the Quinta das Lagrimas, "House of Tears," where Inez de Castro was murdered. The University of Coimbra, the only one in Portugal, was originally established at Lisbon in 1288, but was transferred here permanently in 1537. It has five faculties and some 900 students; attached to it are a museum, an observatory, a botanical garden, and a library of over 80,000 volumes.

Coin, Spain, city in the province of Malaga, 21 miles north of the city of Malaga. It consists of well-built houses, spacious and clean streets, three squares,—in the centre of the largest square is a handsome fountain. The chief manufactures are linen and woolen fabrics, esparto mats, soap, paper, hempen shoes, wine and oil. The exports are cattle, grain, and fruits. In the neighboring hills are marble quarries, and jasper of all colors. Pop. 10,000.

Coin. The coin of a nation is said to be the life-blood of its trade. The "Mint" is the place of its origin. Coinage is therefore a monopoly, possessed and exercised by all firmly established governments. The mint of the United States was authorized by Act of Congress 1792, and its general operations began in 1793. At that time the appliances of coinage were few and crude, the striking of coin being by the old screw hand press, and the annual output confined to narrow limits. It was not until 1836, when the mint was removed from Seventh Street, Philadelphia, to more commodious quarters at Chestnut and Juniper streets, that improved appliances were introduced. At that time the steam operated coining-press invented by M. Thonnelier, a Frenchman, was introduced, and greatly facilitated the process of minting. Twenty years later this press was remodeled and much improved, continuing in use for 14 years, when it was superseded by the perfected machines now in use. The introduction of the steam coining-press inaugurated the improvements which have made the mint of the United States one of the finest equipped mints in the world. From 1836 to the present time the progress of the mint has been largely experimental. New and improved machinery

THE MANUFACTURE OF COINS AS CARRIED ON AT THE UNITED STATES MINT, PHILA., PA.

has been added from time to time and improved scientific processes have been adopted. The humid assay process for determining the fineness of gold and silver was introduced in the year 1836. The platinum apparatus for the assay of gold was introduced in 1867. This was an English invention, and a great improvement upon the method formerly in use. Automatic machines for the separation of coin blanks into "standard," "heavy," "light," and condemned "light" pieces were introduced in 1877. Improved rolls for converting ingots into coin strips, as well as gas annealing furnaces, may be said to have completed the equipment of the mint.

The organization of the mint, under the original and subsequent Acts of Congress, and until 1873, provided for a director, located at the parent mint at Philadelphia, an assayer, melter and refiner, coiner, and engraver of dies, with a necessary subordinate clerical force, the assayer, melter and refiner, coiner, and engraver, being designated as "operative officers." The director was subject to the orders of the Secretary of the Treasury. After the creation of branch mints and assay offices the heads of such institutions reported to the director at Philadelphia. By the Act of 1873 the mint was reorganized, with a bureau at Washington, where the director was located. The resident chief officer at the mint was by that Act designated as superintendent, ranking with the chief officers of the mints at San Francisco and at New Orleans, and the chief of the assay office at New York. The chief officers of the branch mints and minor assay offices were designated as "assayers-in-charge," reporting to the director at Washington. The mint service is now under this reorganized form. The superintendents and the operative officers are appointed by the President and hold their official positions at his pleasure.

The processes of the mint can best be considered under the head of routine. The mint purchases at its counter all gold presented in value not less than $100, providing the deposit is not too base for economical conversion into coin or fine bars. All deposits are made with the weigh clerk at the weigh room, who carefully weighs the same on the delicate balances, which are adjusted to show variations of one hundredth of a troy ounce. The weight is carefully recorded in the books of the weigh clerk and registrar of deposits, together with the description of the bullion and the name of the depositor, both officers being present and carefully noting the same. The deposit is then locked in a copper box and sent to the deposit melting room, where it is melted and cast in the form of a bar. From this bar the assayer cuts clips, weighing from 18 to 20 one hundredths of an ounce, two clips being taken, one from the upper side at one end, the other from the under side at the other end. These clips are assayed separately to determine the homogeneity of the metal. This assay determines the proportions of fine metal in the bar, and upon this assay the money value is determined and the depositor is paid. The loss of weight by melting is carefully noted and recorded. A slight allowance is made after melting to the melter and refiner and the weight so established becomes the true weight. As soon as the fineness of a day's deposits is reported by the assayer, they are delivered to the melter and refiner, and by that officer sent to the refinery, where the silver is separated from the gold and the base metals eliminated wholly, only the precious metals being accounted for.

The next step in the conversion of bullion into coin is the assembling of the refined metal into "melts" of about 3,000 ounces to which sufficient copper is added to render the melted mass 900 parts fine, which is the standard fineness of United States gold and silver coin. When melted the metal is cast into ingots of the size proper for the production of the coin required. This alloy is rigidly tested by assay, and if found standard within the legal tolerance it is so declared, and the ingots are delivered to the coiner for conversion into coin. They are first taken to the rolls, "broken down," annealed, and delivered at the finishing rolls, where they are converted into coin strips of the requisite thickness for coin blanks. The strips are then taken to the cutting machines, where they are converted into coin blanks which go to the selecting tables for the elimination of imperfect pieces and fragments. The accepted blanks are then sent to the adjusting room, where, if gold, each piece is weighed, the heavy pieces being reduced by filing and brought within the limit of legal tolerance. If the blanks be silver they are passed through automatic selecting machines which separates them into standards, heavies, lights, within tolerance, and condemned lights. The blanks are next passed into a machine and "upset," or "milled," which process so raises the edge of the piece as to protect the work on the stamped coin from abrasion. The blanks are then annealed, treated to a dilute sulphuric acid bath, and cleansed and brightened, and when thoroughly dried are ready for the coining presses. These presses work automatically, the only hand action being to fill the feeding tubes. The pieces are automatically seized by conveyers and centered between the obverse and reverse dies within a collar a little exceeding the piece in diameter. The impact of the dies, brought together by the operation of a toggle joint, forces the metal to flow to the full diameter of the collar, which is grooved inside, and puts a fine reeding upon the edge of the coin. The finished coin is then automatically passed on, and is followed by others, the delivery for large coins being at the rate of 80 or 90 per minute. Dimes are struck at the rate of 100 and 120 per minute.

The standard, heavy, and light coins are then separately counted by gauge, and made into drafts of $5,000 each, if gold, and drafts of $1,000 each, if silver. As the standard weight of gold drafts of $5,000 is 268.75 troy ounces, the standard, heavy, and light coins are mingled in due proportion to make that standard weight, no greater variation than 1/100 of an ounce being allowed. The standard weight of $1,000 in silver dollars is 859.375 ounces, and of subsidiary silver 803.75 ounces, with a tolerance of 2/100 of an ounce. The perfected drafts are then weighed in the presence of the superintendent, enclosed in canvas bags, and delivered to that officer. The mint balances are adjusted to the troy pound (5,760 grains) which is the mint unit of weight. This weight is a duplicate of the troy pound established by a royal commission in England in 1758, reaffirmed in 1838. It is kept in a special safe at the Phila-

delphia mint. In order to secure an exact conformity in weight and fineness of United States coin, a fixed number of coins is taken from every delivery, sealed in the presence of the superintendent and the assayer, and deposited in a receptacle called "the pyx," each of those officers having a key, both keys being required to open the pyx. These reserved pieces await the assembling of the Assay Commission, annually appointed by the President to meet on the second Wednesday in February, when the pyx is opened and exhaustive tests of the weight and fineness of the contents are made.

Location and Equipment.— The mint of the United States is located on Spring Garden Street between Sixteenth and Seventeenth streets, Philadelphia. The construction is of light granite and of the Roman Ionic order. It has an interior ground floor space of 58,000 square feet. Its equipment consists of eight boilers of 1,200 horse power capacity, for heating, ventilating, and electric lighting. To avoid the transfer of power by shafting the machinery is chiefly operated by independent motors. The building is lighted by 4,000 incandescent and 16 arc lights. There are 51 telephones connecting the departments and various offices. A gas plant capable of delivering upward of 20,000 cubic feet per hour furnishes fuel for the melting, annealing, and assaying furnaces. The ventilating is by fans operated by attached motors. The spacious melting department is equipped with 13 gas and 3 coal heated furnaces, with power topping machines. The coining department has 23 coining-presses with an average capacity of 110 pieces of finished coin, each, per minute; 10 milling, or upsetting machines, each capable of an out-turn of an average of 500 milled blanks per minute; a full equipment of trains of break-down and finishing rolls; 8 strip annealing gas furnaces, and 1 furnace for annealing blanks; 8 automatic presses for cutting blanks from coin strips; 6 automatic weighing machines for the separation of blanks into standard, heavy, light, and condemned pieces, together with appliances for cleaning, whitening, and drying blanks after annealing. The assaying department is equipped with every known appliance for determining the fineness of gold and silver, both by the platinum and the humid processes. The refinery operates largely the acid process of separating, but it has a plant for refining by electrolysis, and the process has proved a success, considerably increasing the capacity of the refinery.

The engraving department provides all of the coin dies used in the mints of the United States. It has every facility for die-sinking, hubbing, and annealing the steel from which dies are produced, as well as a geometric lathe for transferring designs. The department for the manufacture of medals of a national character is in charge of the engraver, who provides the dies. The medal department is equipped with three hydraulic presses of the respective capacity for exerting a pressure of 1,100, 400, and 300 tons. These powerful presses are operated by electric motors. The machine shop has every appliance for the construction, or the assembling and finishing, of all machinery used in the mint. There are 20 steel-lined vaults for the storage of coin and bullion and for the use of the operative officers. One of these vaults has a floor-space of 5,200 square feet, with a storage capacity of 112,000,000 silver dollars. Another has a floor-space of 4,160 square feet. Six others have each a floor-space of 2,562 square feet. The basement vaults are built wholly independent of the enclosing walls, with a free passageway around them. The doors are massive, and provided with the finest locks procurable, to which time-locks are attached. More than 3,250,000 pounds of steel enter into the construction of these vaults. The vestibule is highly ornate, the corridor extending through the cross section from east to west is finished in richly variegated marble, and the main staircase is of white marble. The floors are of messanine, the symbolic panels in the vestibule of glass mosaic. The ceilings are finished in white and gold.

The cabinet, or museum, is in a spacious room at the head of the main staircase in the rotunda. It contains a fine collection of the coins of all nations, ancient and modern, a full line of medals of a national character, and many rare medals of foreign countries. There is also a fine collection of curios, many of them collected in distant lands. The working capacity of the mint considerably exceeds the national demand for its product. Congress has therefore authorized coinage for other nations at a fair remuneration. Pursuant to this authorization the mint has coined much gold and silver, as well as copper and nickel coin, for several of the South American and most of the Central American states. Prior to the annexation, the mint at San Francisco coined money for the Sandwich Islands. Admission to the mint is free to the public on every working day between the hours of 9 A.M. and 2 P.M. The building is patrolled day and night by an armed guard.

JOHN H. LANDIS,
Supt. United States Mint, Philadelphia.

Coinage, the process of converting an authorized alloy of the money metals into the circulable coin of the country. The metal is alloyed and cast into ingots of sizes suitable to the production of the denomination of the coins required. Thus, for the double eagles, our largest gold coin, the ingot is cast 12⅝ inches in length, 1½ inches in width, and half an inch in thickness. Such an ingot weighs about 80 ounces troy, of the approximate value of $1,488. The ingots for the eagles are cast 11 15-16 inches in length, 1 2-16 inches in width and half an inch in thickness. The weight of such an ingot is about 62 ounces troy. The half eagle requires an ingot 12 inches in length, ⅞ inch in width and 7-16 inch in thickness. The ingots are taken to the break-down rolls in drafts of about 50 ingots, where they are passed through the rolls several times, according as they prove more or less malleable. If passed through the rolls six times the dimensions of a double eagle ingot will be increased to 26¼ inches in length, 1 9-16 inches in width, and 7-32 inch in thickness. The broken-down ingots are then sent to the annealing furnace, heated by gas fuel to about 1,500 degrees F. and being laid singly upon a carrier traveling the whole length of the furnace, remain until the strips become a uniform cherry-red. They are then removed and plunged into a bath of cold water to remain until cool enough to handle. The strips are then wiped dry and passed on to the finishing rolls.

The next step will depend upon the condition of the metal. Should it retain indications of the hardness and springiness resulting to the breakdown process, it is subjected to a second breakdown by being passed three or four times through the rolls. The malleability of the metal being sufficient, the strips are taken to the finishing rolls or "rolls of precision." After being passed through these rolls four times the strips develop the required thickness and uniformity for the production of blanks. At this stage the double eagle strip attains a length of 47⅜ inches, a width of 1⅝ inches and is reduced to a thickness of 7-64 of an inch. For ease in handling the strips are now cut in half by multiple shears and delivered at the cutting presses, where test planchets are cut from several strips and weighed, to determine if the strip, when converted into planchets (coin blanks), approximates to standard weight. The cutting presses are automatic. The strip is seized by a grip and drawn under a steel punch working in a matrix cutting the planchets at the rate of 80 each minute. The planchets are next cleansed and sent to the selecting table where the imperfect pieces are separated from the perfect and the latter are sent to the adjusting room. The adjusting consists in the careful weighing of each blank separately to ascertain if it corresponds to the standard weight and legal tolerance, the latter being for double eagles and eagles ½ grain per piece, and ¼ grain each for half eagles and quarter eagles. Pieces found in excess of legal weight and tolerance are reduced by filing the edges until they conform to the limit. Such pieces are placed by themselves and marked "heavies." Pieces a little less than the standard weight, but within the limit of legal tolerance, are placed in another receptacle and marked "lights." Those found of exact legal weight are placed in another receptacle and marked "standard."

The planchets so adjusted are then taken to the milling machines by the operation of which a protecting edge is raised on each piece. This edge is to preserve the face of the coin from abrasion. When milled the planchets are conveyed to the cleaning room where they are annealed until of a cherry-red and then treated to a bath of dilute sulphuric acid, by which process they are thoroughly cleansed and brightened. The annealing of the planchets after the milling process having prepared them for the stamping, when cleansed and brightened they are washed in boiling water, dried by riddling in sawdust, when they are ready for the coining press. It will be understood that the three descriptions of blanks, namely: "Heavies," "lights," and "standards" — have been kept separate throughout the processes, and are never mingled until the coiner makes up the drafts of finished coin for bagging. The planchets therefore go to the presses by those divisions.

The coining press used in all first-class mints is a wonderful exhibition of mechanical skill. Its frame is of cast-iron of several tons weight, with a central arch in which are placed the working parts. The frame combines stability and rigidity. The mechanism of the working parts is automatic. The setting of the dies is a work of precision and can be properly done only by a person, who, being a skilled mechanic, has reinforced his native ability by long experience. In order to set his dies properly he must take into account the condition of the metal to be stamped, whether it be soft and ductile or hard and brittle. Upon these qualities of the metal depends the distance apart of the dies at the moment of their impact upon the planchets. The blanks are fed into a vertical tube of equal diameter, and when the press is in motion automatic fingers seize the bottom planchet by its periphery and carry it forward to a collar, a little larger than the piece to be stamped. The piece drops into the collar, and a toggle joint causes the dies to approach each other and exert a pressure of about 160 tons upon the soft planchet. The planchet, being ductile, is by this pressure made to fill the entire space within the collar, which is grooved, and imparts the reeding to the edge of the coin. The finished coin is automatically released and falls into a pan below, to be followed by other coins at the rate of 90 or 120 per minute. The first number relates to large gold coins and silver dollars, the latter to small gold and small silver coins. It should perhaps be stated here that while the essential processes in coining are the same in all modern mints the routine is not uniform. In the mint of the United States the coin after stamping is returned to the adjusting room and each piece weighed separately. The necessity for this arises out of the possibly defective rolling of the strip from which the blank is derived. The density of the metal varies somewhat, and there may be also defective sonority developed in the process of stamping. In order to secure sonorous coin it is sometimes the practice to ring every piece (this relates to gold coin and silver dollars), and if any fail to give the proper tone they are rejected and sent to the melting pot. The pieces which stand the test are then returned to the coiner for conversion into uniform drafts for delivery to the superintendent, or other officer authorized to receive and hold coined money of the government.

As a matter of law and regulation the coiner is required to make up gold coin into drafts of $5,000 of the uniform weight of 268.75 troy ounces. As the weight of the pieces separately weighed are not uniform, though all within the limit of legal tolerance, the coin is separated by the adjusters into "heavies," "lights," and "standard." Gold coins may vary from ¼ of a grain in the half and quarter eagles to ½ a grain in double eagles and eagles. The coiner takes "heavies," "lights," and "standards" in such proportions as will make drafts of 268.75 ounces and mingles them in the delivery pans. The drafts are then weighed, after counting the pieces in detail, and being found of the required weight, are set aside for final delivery. The drafts must not vary to exceed 1-100th of an ounce above or below the standard weight of $5,000, stated in the foregoing. Before delivery to the superintendent the latter takes a good number of pieces at random from the proposed delivery and carefully weighs them. If found within the legal limit of tolerance the delivery is accepted; but if the weight of any piece proves it outside that limit the delivery is rejected, to be weighed, readjusted, and recounted. It is proper to say that such a necessity seldom arises.

The practice now is to adjust all silver coins, excepting dimes. Dollars are made in drafts of $1,000 of the weight of 859.375 ounces. These

drafts are constituted of "heavies," "lights," and "standard," and the only variation from that standard weight is 2-100 of an ounce. Subsidiary silver coin is delivered in drafts of $1,000, of a weight of 803.75 ounces, with an allowance of 2-100 of an ounce for half and quarter dollars, which are adjusted, and 1-100 of an ounce for dimes, which are not adjusted. It will be seen that all of the processes involved in coining money are works of precision, from the breaking down of the ingot to the issue of the perfect coin. All must be rigidly calculated, nothing can be left to chance. The presence of any of the base metals, as well as of the rare and valuable ones, may destroy the ingot for coinage. Arsenic lead and antimony cause most of the unworkability of the money metals, but this disability is lessening through the processes of advanced science.

Great advances have been made in the processes involved in coining as conducted in modern times. The substitution of the coining press operated by power for the hand screw press of olden times practically revolutionized the business. The introduction of automatic weighing machines for separating the blanks into "heavies," "lights," "standard," and "condemned," has simplified the process of adjusting. In fact the silver coins, with the exception of dimes, are now separated by the automatic weighing machines. The very great improvement in rolls for producing the coin strips from the ingot has made this new and rapid mode of selection possible. The draw-bench, made necessary to cure the defects of the rolls, has practically disappeared. Constant trying has produced rolls of such precision that the thickness of a coin strip can be regulated to the thousandths if required.

The automatic selecting machine in use at the mint of the United States at Philadelphia was invented and constructed by Seyesse, an Austrian, at Vienna. The blanks are fed into the machine through a vertical tube the size of the diameter of the blank. The feed is automatic and the pieces are conveyed into minute balances finely adjusted to grains, and by a complex and ingenious arrangement of parts are, according to weight, whether light, heavy, standard, or condemned lights; shunted into the conduits strictly according to their varying weights, and through these conduits, or ways, are delivered, each to its proper receptacle at the discharge end of the machine. The standard and the accepted light pieces are then ready for milling. The heavy pieces are adjusted by weighing on a delicate balance, and if found to exceed the legal tolerance are reduced by filing the edge of the piece. By this method the necessity for hand adjusting is minimized, and the rapid production of coin greatly facilitated. Other automatic selecting machines are employed in the mints of foreign countries, but have not been found so satisfactory as the Austrian machine, in this country.

One of the most difficult of the processes of coining has been the annealing process, because it is vital to the successful reduction of the ingot to the coin strip. Formerly the process was conducted in a furnace heated by wood fires. Much depended upon the fuel. Perfectly seasoned hard wood, preferably oak, was required for good work. In annealing gold strips in a wood furnace the strips were enclosed in copper canisters, sealed to air tightness, and remained in the furnace about three fourths of an hour. Silver strips were sometimes subjected to the heat for an hour or more. In all annealing of strips in the wood-fire furnaces the strips were superposed unavoidably, and it was not always easy to determine when the draft reached a uniform cherry-redness. Delays, and refractory metal, were common with the old method of annealing. Besides, the method was the reverse of economical, owing to oxidation of the metal.

In substituting the gas annealing furnace for the wood-fire furnace the work of rolling the metal soon became a work of precision. A considerable saving of time was also effected. The gas annealing furnace for strips has a heating chamber 10 feet in length, 17½ inches in width, and 10 inches in depth. A score of hollow rolls, named "conveyers," mounted on hollow shafts of cast-iron, are so ribbed as to divide the face into several parts conformed to the width of the strips. These ribs separate the strips and prevent superposition. The gas burners enter the heating chamber at the bottom and are in sections, in order to secure independent control. Through these burners a mixture of gas and air is injected along the whole length of the chamber. The strips to be annealed are placed on the rolls at the entrance of the furnace, the rolls are rotated by worm wheels, and pass entirely through the chamber, to enter a hood at the discharge end of the furnace. In this hood the strips, now of a cherry-red, are met by a flame surcharged with gas to prevent oxidation. A spray of water is applied to the strips outside the hood to cool them before they reach the air. This prevents the oxidation of the copper with which the metal is alloyed. The process thus described occupies about six minutes, instead of the hour, or even more, by the wood-fire furnaces. The time required in annealing silver is about 20 or 25 minutes as to the larger denominations. Dimes, however, not being adjusted, and the coin strip being produced from the dollar ingot, require a more prolonged annealing. The improvement in annealing has made it possible to produce from the ingot strips as high as 83 to 96 per cent of standard blanks, and blanks within the limit of tolerance, suitable for coining. This high percentage of good blanks is undoubtedly due to improved annealing and rolling. It is a higher percentage than has ever been secured when the defects in annealing and rolling were in part remedied by the draw-bench. As that machine is still employed in mints not strictly up to date, it may not be amiss to say, that in principle the draw-bench is a wire-drawing machine. As under the old mode of developing the ingot into the coin strip the ductility of the strip was not uniform, some parts being more refractory than others, and hence not reduced to a uniform thickness by the rolls, it was found necessary to pass the strips through a rigid die. The strips were then pointed so as to be firmly gripped by the nippers of the draw-bench which, retreating, drew the strip through the rigid die and gave it a uniform thickness, now imparted by rolls of precision without wasteful annealing. This improvement not only works a reduction of waste, but saves a delay between the finishing rolls and the cutting presses.

The preparation of the strips, the cutting of the blanks and the striking of medals is, at the mint of the United States, part of the coiner's duty. Medals may be of gold, silver, copper, or alloys of copper. The strips are rolled to the required thickness, which is usually with reference to the diameter of the proposed medal. The strips are then conveyed to the cutting press of great power and converted into blanks, which are annealed and placed between the dies of a hydraulic press capable of delivering a blow of from 300 to 1,100 tons. Nearly all medals of a national character require from three to six blows, owing to the high relief of the design and the sluggish flow of a large quantity of metal. Medals three inches in diameter require a press of higher power, and must be annealed after each blow until the finishing blow is delivered. The process of medal striking is therefore necessarily slow. Small medals of low relief may be struck by an ordinary coining press. Gold and silver medals of a national character are, respectively, of metal practically fine.

The processes of coining are of such precision that seldom a single piece in a million pieces will be found beyond the legal tolerance of 1½ grains for silver and from ¼ to ½ grain for gold.

JOHN H. LANDIS,
Supt. United States Mint, Philadelphia.

Coir, kir, the outer coating of the cocoanut, often weighing from one to two pounds; when stripped off longitudinally it furnishes fibres from which are manufactured matting, bagging, sails, ropes, and cables. The general preparation is simple; after being soaked for some months in water the fibrous coats become soft; they are then beaten to remove the other substances with which they are mixed, which fall away like sawdust. The fibres thus cleaned are ready for being spun into long yarns, woven into sailcloth, or twisted into cables. Cordage made of this material rots in fresh water and snaps in frost, but from the fact of its being strengthened by salt water, and its extreme buoyancy as compared with hemp cables, floating as it does in water, and also its great strength and elasticity, it is preferable in many respects to ropes of hemp. It has been proposed to employ it in the construction of deep-sea telegraphs, as being much cheaper and lighter than gutta-percha.

Coire, kwär, or **Chur,** Switzerland, capital of the canton of the Grisons, on the rivers Plessur and Rhine. It is irregularly built, and possesses many houses in the ancient style of architecture. The most remarkable buildings are the old Romanesque cathedral, partly dating from the 8th century, and the old Episcopal palace. Adjoining this is a lofty tower believed to be of Roman origin. Among modern buildings are a Protestant church, government buildings, and a hospital. Not far from Coire the Rhine begins to be navigable for small vessels. Until 1498 Coire was a free imperial city, but at that time came under the government of the bishop, who was under the Archbishop of Mentz. After having been repeatedly in the hands of the Austrians, French, and Swiss, in 1802 it was definitely united to the Swiss republic. Pop. 9,500.

Coit, James Milnor, American educator: b. Harrisburg, Pa., 31 Jan. 1845. He graduated at Hobart College 1865, and was manager of the Cleveland Tube Works 1873–5. In 1876 he became master in natural sciences at St. Paul's School, Concord, N. H., and is now (1903) acting head master there. He is a member of the leading scientific societies of the country, and has published: 'Manual of Chemical Arithmetic' (1886); 'Treatise on the X-Rays and Their Relation to the Medical and Surgical Sciences' (1897); 'Liquid Air' (1899).

Coit, Stanton, American lecturer on ethics: b. Columbus, Ohio, 11 Aug. 1857. He was educated at Amherst and Columbia colleges, and Berlin University, and has for many years lived and lectured in London, England, where he is chairman of the West London Ethical Society. He has published in German and Dutch, 'The Ethical Movement in Religion'; in English, German, and Dutch, 'Neighborhood Guilds.'

Cojutepeque, Central America, a town in the republic of Salvador, and on the direct route between the town of San Salvador and San Vincente. There is a lake of same name at some miles distance, the fish of which are often cast ashore dead in considerable quantities. Pop. 5,000.

Coke, kōk, SIR **Edward,** English jurist: b. Mileham, Norfolk, 1 Feb. 1552; d. Stoke Pogis 3 Sept. 1634. He was educated at Trinity College, Cambridge. From the university he went to London, and entered the Inner Temple. He pleaded his first cause in 1578, and was appointed reader of Lyon's Inn, where his lectures were much frequented. His reputation and practice rapidly increased, and he was placed in a situation of great respectability and affluence by a marriage with a co-heiress of the Paston family. He was chosen recorder of the cities of Norwich and of Coventry; was engaged in all the great causes at Westminster Hall, and in the 35th year of Elizabeth chosen knight of the shire for his county, and speaker of the House of Commons. In 1592 he became solicitor-general, and soon after was appointed attorney-general. He acted the usual part of a crown lawyer in all state prosecutions; and one of the most important that fell under his management, as attorney-general, was that of Essex, which he conducted with great asperity. Soon after the accession of James I. he was knighted. The celebrated trial of Sir Walter Raleigh followed, in which Coke displayed a degree of arrogance to the court, and of rancor and insult toward the prisoner, which was universally condemned at the time, and has been deemed by all posterity one of the greatest stains upon his character. On the discovery of the gunpowder plot he obtained great credit by the clearness and sagacity with which he stated the evidence; and in 1613 he succeeded to the important office of chief justice of the Court of King's Bench, but was in much less favor with James than his rival Lord Bacon. He was, in fact, too wary and staunch a lawyer to commit himself on the subject of prerogative; and as his temper was rough, and his attachment to law truly professional, he could scarcely forbear involving himself with a court so notorious for arbitrary principles as was the English during the reign of James. The honorable zeal which he displayed in the execrable affair of Sir Thomas Overbury, and in the prosecution of

the king's wretched minions, Somerset and his countess, for that atrocious murder, made him enemies; and advantage was taken of a dispute, in which he erroneously engaged with the Court of Chancery, to remove him, in 1616, both from the council and his post of chief justice. His real offense, however, was a refusal to favor the new favorite Villiers in some pecuniary matter. Coke was reinstated in the council in 1617, and actively engaged in prosecutions for corruption in office, and other crimes of a nature to recruit an exhausted treasury by the infliction of exorbitant fines. On the accession of Charles I. he was nominated sheriff of Buckinghamshire, in order to prevent his being chosen member for the county, which, however, he represented in the Parliament which met in 1628. The remainder of his career was highly popular; he greatly distinguished himself by his speeches for redress of grievances; vindicated the right of the Commons to proceed against any individual, however exalted; openly named Buckingham as the cause of the misfortunes of the kingdom; and, finally, sealed his services to the popular part of the constitution, by proposing and framing the famous "Petition of Rights," the most explicit declaration of English liberty which had as yet appeared. This was the last of his public acts. Two days before his death the king caused his house to be searched for seditious papers, and all his manuscripts were carried off. Sir Edward Coke was a great lawyer, but a great lawyer only. In mere legal learning he has perhaps never been excelled, but he was essentially defective in the merits of systematic arrangement and regard to general principles, without which law is a mere collection of arbitrary rules, undeserving the name of science. It must be admitted, however, that his writings, and especially his commentary on Littleton's 'Treatise on Tenures,' form a vast repository of legal erudition. In short, he was a man of immense professional research, and great sagacity and perseverance in a chosen pursuit; and, as usual, more philosophical and general powers were sacrificed to its exclusiveness. His principal works are: 'Reports,' from 1600 to 1615; 'A Book of Entries' (1614); 'Institutes of the Laws of England,' in four parts; the first of which contains the commentary on Littleton's 'Tenures'; the second, a commentary on Magna Charta and other statutes; the third, the criminal laws or pleas of the crown; and the fourth, an account of the jurisdiction of all the courts in the kingdom; 'A Treatise of Bail and Mainprise' (1636); 'Reading on the Statute of Fines, 27 Edward I.' (4to); 'Complete Copyholder' (1640).

Coke, Thomas, 1st bishop of the Methodist Episcopal Church in the United States: b. Brecon, South Wales, 9 Sept. 1747; d. at sea 2 May 1814. He was educated at Oxford, and entering the ministry of the Established Church, obtained a curacy at South Petherton. His preaching, however, was thought too evangelical, and he was finally excluded from the pulpit. Sympathizing strongly with the Methodists, he sought an interview with Wesley, which resulted in his joining that society, and being appointed to London, where his zeal and talents as a preacher soon brought him into favorable notice. He rendered valuable assistance to Wesley in procuring what was called the deed of declaration, which provided for the settlement of the Methodist chapels in the connection, and restricted the conference to 100 of the preachers and their successors for ever. So rapidly did he rise in public estimation, and so fully had he gained the confidence of Wesley, that he was appointed president of the Irish conference in 1782. Wesley set apart Coke by ordination as bishop of the Methodist Church in America, and gave him authority to ordain Francis Asbury to the same office as joint superintendent. In 1784 he arrived in New York, and sought an interview with Asbury, to whom he communicated the objects of his mission. A conference being called 25 December, Coke was duly recognized, and under its authority he proceeded on the 27th to ordain Asbury a bishop, and as such they were duly accredited as the joint superintendents of the Church in America. In company with Asbury he traveled, visiting the different conferences, until June 1785, when he returned to England, and visited Wales, Scotland, and Ireland. Subsequently he returned to America, and attended the conferences, traveling extensively throughout the entire connection. The first mission which he established was in the West Indies, in 1786, whence, after visiting the several islands, he went to South Carolina and engaged again in the regular work of the episcopacy. After traveling through the States, he embarked from Philadelphia for England in 1787. He revisited the West Indian and other American missions again and again, crossing the Atlantic 18 times in all. He was a prolific author and published: 'Commentary on the Holy Scriptures' (1803–7); 'Life of Wesley' (1792); 'History of the West Indies' (1808); etc.

Coke, the coherent cellular mass left after the expulsion of the volatile products of coal by heating in an oven. It is an aggregation of the particles of the fixed carbon in the coal.

Manufacture of Coke.— In general principles, coke-making differs little from charcoal-making, except that the carbon molecules are broken up more completely, requiring a higher heat. In coking, the organic compounds are destroyed, and the decomposition products form new compounds, stable at the higher temperatures. Gas begins to come off when the coal charged in the oven reaches a temperature of 100° C., and is given off till a dull red heat is attained. Tarry products are given off up to 600° C. The highest temperature reached is about 1,400° C., falling to 800° C. when the charge is drawn. The time required for coking is from 18 to 72 hours, varying with the coal and type of oven. The products, besides coke, are (1) illuminating gas, vapor, and diluents; (2) ammonia liquor; (3) tar, containing hydrocarbons of the fatty, or paraffine, and of the aromatic or benzene series, neutral compounds, acids, and bases; and (4) asphaltum.

Coal is made into coke in ovens of various types. The oven most used for making foundry and blast-furnace coke in the United States and England is the beehive oven, a development of the dirt-covered pile of wood used in charcoal-burning. The beehive oven has been used in Connellsville, Pa., the coke-producing centre of this country, for nearly 70 years. It is a dome-shaped chamber of bricks, 11 to 12 feet in diameter and 5½ to 6 feet high. The ovens

are arranged in rows and charged at the top from cars or larries, and drawn through doors at the bottom. The average charge is about 100 bushels of coal, and the average yield about 120 to 125 bushels of coke. By weight the average yield of coke is from 63 to 66 per cent. The time required in the beehive oven is 48 hours, though coke has been made in less time. The beehive ovens erected in the last few years are of larger size than the dimensions given.

The Belgian oven is a horizontal chamber 21 feet long, 8 feet wide, and 2½ feet deep. The average charge is 9 gross tons, yielding 6.3 tons of coke or 67 per cent.

The Coppée oven, a development of the Belgian oven, much used abroad, is 30 feet long, 6½ feet high, arched at the top, 21 inches wide in front, and 26 inches in the rear. It is charged from the top by four openings. The charge is from three to five tons, and the time required is about 24 hours. In the beehive oven the heat of the walls from the previous charge starts combustion, and air is admitted through flues which are closed when burning has gone far enough. The escaping gases and other products burn and are lost. In the Coppée oven vertical flues in the side walls communicate with the interior. The volatile products of distillation burning in these flues give heat for combustion. No by-products are saved, but the oven will coke lean and non-coking coals, and less fixed carbon of the coal is burnt than in the beehive.

The Otto-Hoffman oven is a development of the Coppée, with a Siemens regenerator, by which the air supplied to the furnace is heated to 1,000° C., while the products of combustion, after passing through the regenerator, are cooled, and the tar, ammonia liquor, etc., are recovered. In the Semet-Solvay by-product oven the coking chamber is 30 feet long, 16 to 17 inches wide, and 5 feet 6 inches high. The flues in which the products of distillation burn are horizontal and thin. The usual time of coking is 18 to 22 hours.

The advantages of the Coppée over the beehive oven are quicker work, higher yield of coke, and the ability to coke lean coals. In the Semet-Solvay and Otto-Hoffman ovens the by-products recovered are of value, so much so that the beehive oven is abandoned on the Continent. American and English ironmasters have clung to the beehive because of having rich or "fatty" coals, and because of the silvery lustre of the coke produced, though by-product oven coke is of just as good quality. In 1891 there were 12 Otto-Hoffman and 8 Semet-Solvay plants in the United States, and their output of coke was an insignificant percentage of the total. In 1900 fully 42 per cent of the coke made in England was from beehive ovens.

Objects of Coking.— Coke, though used as a domestic fuel and for locomotives, is used chiefly in metallurgical work. In the blast-furnace it reduces ores by combining with the oxygen in them; in the cupola furnace it is used simply to produce a high heat; hence there is a difference between blast-furnace and foundry coke, the latter being the purer. The objects of coking are: (1) to get a fuel rich in carbon by expelling volatile constituents; (2) to get a fuel giving no gas or smoke which would interfere with metallurgical operations; (3) to get an infusible fuel, since a fuel which softens and swells on heating prevents the charge in a blast-furnace from sinking evenly; (4) to reduce the sulphur present in coal, in organic compounds, or combined with iron. Coke has almost replaced charcoal and anthracite coal in blast-furnace work. In 1872 the blast-furnaces of this country used 500,000 tons of wood charcoal, 947,000 tons of coke, and 1,407,000 tons of anthracite; in 1892, 537,000 tons of charcoal, 7,154,000 tons of coke, and 1,798,000 tons of anthracite and coke. In 1902 the coke consumption reached 12,750,000 tons, while the charcoal and anthracite consumption was probably less than in 1872.

Coking and Non-Coking Coals.— A coking, or caking coal, is one which softens and becomes pasty or fuses on heating, while bubbles of gas escape; but there are all gradations between coking and non-coking coals, and why one cokes and another does not is undetermined. It may be due to differences in the carbon molecules. Coking seems to bear some relation to the percentages of combined hydrogen and oxygen, and of free hydrogen in the coal, and to the specific gravity. A coking coal may give from 50 to 87 per cent of coke, much depending on the method of coking. Coking coals rich in carbon and poor in gas give the most coke. Hydrogen lowers the yield by forming volatile compounds with carbon, the one having the lowest carbon percentage being methane, CH_4. A large percentage of oxygen causes losses by making a rapid formation of gas and smoke on heating, while water and ash in the coal render necessary more heat, thus burning up some of the carbon. Silica, clay, and iron in the coal hinder coking, but lime, by increasing the fusibility, facilitates it. Coke can be made from non-coking coals by mixing them with coals which cake, or by coking in special ovens.

Composition of Coke.— The composition of some representative American cokes is shown in the following table:

Name	Carbon	Ash	Sulphur	Moisture	Volatile Matter
Connellsville, Pa.....	87.481	11.323	.691	.492	.013
Irwin, Pa.....	88.240	9.414	.962	.....	1.384
Blossburg, Pa.....	84.760	13.345	.998	.175	.722
St. Bernard, Ky.....	86.930	12.10	1.96	.....	.....
New River, W. Va...	92.180	6.680	.618	.110	.....
Tracy City, Tenn.....	83.364	15.440	.142	.....	.....
Warrior, Ala.....	88.224	11.315	.563	.362	.990
Crested Butte, Colo.....	92.030	6.620	.....	1.35	

Good coke has a metallic ring, is of a silvery lustre or has a light gray color with a dark gray or black powder, though coke made in by-product ovens is dark and of excellent quality. The color is influenced by several things. For cupola work a coke should be below 1.25 in sulphur. Good coke should be hard enough to bear the burden in a blast-furnace without crushing.

Coke Production.— The United States in 1901 produced 21,795,883 short tons of coke, not including any of the coke made in gas manufacture; Great Britain, in 1900, produced 28,500,000 tons. The rank of the chief coke-producing States in 1901 was:

States	Tons	States	Tons
Pennsylvania	14,355,917	Virginia	907,130
West Virginia	2,283,700	Colorado	671,303
Alabama	2,148,911	Wyoming	564,191

Of the Pennsylvania production, 10,235,943 tons or nearly 46 per cent of the total United

States production, came from the Connellsville district.

SAMUEL SANFORD,
Assoc. Editor, Engineering and Mining Journal.

Col, neck, in geography, a depression or pass in a mountain-range. In those parts of the Alps where the French language prevails, the passes are usually named Cols — as the Col de Balme, the Col du Géant, etc.

Cola, or Kola, a genus of plants belonging to the natural order *Sterculiaceæ*, found in the west of Africa. The *Cola acuminata* produces seeds which are largely used in Africa on account of their digestive, refreshing, and invigorating properties, and have also been introduced into America and elsewhere on the same grounds. They have been found to contain caffeine, the active principle of coffee, and also the same active principle as cocoa.

Co'la-nut, the seed of a tree (*Cola acuminata*) from 20 to 30 feet in height, belonging to the natural order (*Sterculiaceæ*), whose habitat is a region of west Africa stretching 500 miles from the coast into the interior, between Sierra Leone and Lower Guinea. The tree has become naturalized in the West Indies and Brazil. It bears a profusion of purplish flowers. The flower yields a large brownish-yellow fruit, which enfolds in the same follicle the red and white seeds that are somewhat inaptly called cola-nuts. In its tenth year the tree reaches its greatest fecundity, and then yields 120 pounds of seeds. They are gathered in October and November from a June flowering, and again in May and June from a December flowering. In the tropics the natives use the cola-nut as a stimulant and for medicinal purposes, and only recently has the nut passed from the narrow use of the aborigines into an extensive service of civilized man. An analysis of it shows that it contains nearly all the constituents of coffee, tea, and cocoa, and other constituents not possessed by them. But although the chemists can get at the elements of cola, a full explanation of its hidden potency has eluded them.

Colban, kōl'bän, **Adolphine Marie Schmidt,** Norwegian novelist: b. Christiania, Norway, 18 Dec. 1814; d. 1884. Left a widow without resources at 36, she went to Paris, where a lady of quality sent to the printer some of the widow's letters to her, entitling the collection 'Letters of a Barbarian.' Parisian society was captivated, and the author decided to exercise her newly discovered talent by writing stories in her own language. Between 1869 and 1881 she published seven volumes of tales, charming for their fine spiritual insight and their warm human sympathy; they were nearly all translated into German. Among them 'Jeg Lever' (1877) is perhaps the most noteworthy. Others are 'Tre Noveller' (1873); 'Tre nye Noveller' (1875); 'Cleopatra' (1880).

Colberg, or **Kolberg,** Prussia, seaport and watering-place in the province of Pomerania, on the Persante, near its mouth, 170 miles northeast of Berlin. It stands on a hill, surrounded with three suburbs. The principal church dates from 1316. In 1102 Duke Boleslaus of Poland vainly besieged Colberg, which endured long sieges in the Thirty Years' war, in the Seven Years' war, and again in 1807, when it was most gallantly defended against the French. Colberg has manufactures of woolens, agricultural machines, and spirits; and salmon and lamprey fisheries. Pop. 18,622.

Colbert, Jean Baptiste, zhŏn bäp-tēst kōl'-bār, French statesman and financier: b. Rheims 29 Aug. 1619; d. Paris 6 Sept. 1683. He entered in 1648 the service of Cardinal Mazarin, who availed himself of his assistance in the financial administration of the kingdom. Mazarin rewarded him in 1654 with the office of secretary to the queen, and recommended him to the king at his death in 1660. Louis XIV. made Colbert intendant of the finances. His task was to remedy the evils which the feeble and stormy reign of Louis XIII., the splendid but arbitrary measures of Richelieu, the troubles of the Fronde, and the confused state of the finances under Mazarin, had occasioned. He found fraud, disorder, and corruption prevailing everywhere. The domains were alienated. Burdens, privileges, and exemptions were multiplied without measure; the state was the prey of the farmers-general, and at the same time maintained only by their aid. The revenues were anticipated for two years, and the treasury empty. He began with establishing a council of finances and a chamber of justice. For the purpose of alleviating the public burdens he endeavored to lower the interest of the public debt; and in order to mitigate the odium of this measure consented to a considerable diminution of the taxes, and the remission of all arrears up to 1656. He abolished many useless offices, retracted burdensome privileges, diminished salaries, and by a better distribution and collection of the taxes was able to reduce them almost one half. Notwithstanding the expenses of nearly 10 years' war, and the prodigality of a luxurious king, Colbert succeeded in 22 years in adding to the revenues more than 28,000,000 livres, and making an equal diminution in the public burdens; and at his death in 1683 the revenue actually received amounted to 116,000,000. To his talents, activity, and enlarged views the development and rapid progress of industry and commerce in France were largely due. He constructed the Canal of Languedoc; formed the plan of that of Burgundy; granted premiums on goods exported and imported; regulated tolls; established insurance offices; made uniform laws for the regulation of commerce. Naval schools were established, and order was introduced into all branches of the marine. By the advice of Colbert Louis XIV. caused the civil and criminal legislation to be improved, and the arts and sciences encouraged. Under the protection and in the house of the minister (1663) the Academy of Inscriptions was founded. Three years afterward he founded the Academy of Sciences, and in 1671 the Academy of Architecture. The Academy of Painting received a new organization. He enlarged the Royal Library and the Garden of Plants, and built an observatory, in which he employed Huyghens and Cassini. He began the measurement of the meridian in France, and sent men of science to Cayenne.

After having conferred the greatest benefits on his country he died, out of favor with the king, and dreading the exhaustion of the treasury by the new war Louis was resolved upon making against Holland. See Gourdautt, 'Colbert, Ministre de Louis XIV.'

Colbrand, or **Colbronde,** the Danish giant slain by Sir Guy of Warwick. By the death of this giant the land was delivered from Danish tribute.

> I am not Sampson, nor Sir Guy, nor Colbrand, to mow 'em down before me.
> Shakespeare, 'Henry VIII.,' v: 4.

Colburn, kōl'bėrn, **Warren,** American mathematician: b. Dedham, Mass., 1 March 1793; d. Lowell, Mass., 13 Sept. 1833. He at first worked at a machinist's trade, but developed a taste for mathematics, and graduated at Harvard 1820. He became superintendent of the Merrimac Manufacturing Company at Lowell, devised important improvements in machinery, and for many years was a popular lecturer on the sciences. He is best known for his 'First Lessons in Intellectual Arithmetic' (Bost. 1821) which he had planned while a student at Harvard. This work had an enormous circulation both in America and Europe, being translated into the chief European languages, and even into several Oriental tongues. He also published a 'Sequel' to the arithmetic (rev. ed. 1833), and an 'Algebra' (1827).

Colburn, Zerah, American mathematician: b. Cabot, Vt., 1 Sept. 1804; d. Norwich, Vt., 2 March 1840. Before his sixth year he began to manifest wonderful powers of arithmetical computation. His father resolved to exhibit them in public; and the boy astounded by the rapidity and accuracy of his processes the learned mathematicians of Dartmouth and Harvard. In 1812 he was taken to London, and after traveling over England, Scotland, and Ireland, went to Paris, where he stayed 18 months. Returning to London in 1816, he was placed by the Earl of Bristol in Westminster School, where he studied for three years. He lost his father in 1824, and returned to America, where he was employed again in teaching. In 1825 he became connected with the Methodist Church, and after nine years' service as an itinerant preacher settled in Norwich, Vermont. He was professor of languages in the university of that town till his death. When a boy of six or seven years he could answer questions in multiplication of four or five places of figures, proportion, involution, evolution, compound fractions, and the obtaining of factors even of large numbers, with accuracy and a rapidity to which the most experienced mathematician could not attain, but his remarkable gifts were less apparent after he grew to manhood.

Colby, Frank Moore, American writer: b. Washington, D. C., 10 Feb. 1865. He graduated at Columbia University 1888, and took graduate studies in political science there. He taught history at Amherst College 1890–1; was lecturer in history at Columbia 1891–5; professor of economics in New York University 1895–1900, when he became an editorial writer on the *Commercial Advertiser.* He has done a large amount of editorial work on Johnson's 'Cyclopædia'; the 'International Cyclopædia,' and 'International Year Book,' editing the latter since its foundation in 1898, and was the managing editor of the 'New International Cyclopædia' (1902–3).

Colby College, a coeducational institution in Waterville, Me.; founded in 1818, under the auspices of the Baptist Church. After the first year's work, the courses are nearly all elective. The average number of students, each year, is 200. In the library are 37,900 bound volumes and about 21,000 pamphlets. The college is endowed about $500,000, and the property is valued at $254,000.

Colchester, kōl'chĕs-tėr, England, a borough and river port of Essex, on the Colne, 50 miles northeast of London. It is partially encircled by a wall built during the Roman period, and among relics of the past it contains a castle whose enormously thick walls date from the time of William Rufus, a picturesque, ivy-grown ruin of Saint Botolph's priory, while in the Church of the Holy Trinity is a Saxon doorway. The most important modern structure is the spacious and handsome Town Hall, completed in 1902. Colchester was known to the early Britons and the Romans as Camulodunum, and to the Saxons as Colneceaster. It has a large oyster-fishing trade, and exports of corn and malt. In 1648 Colchester stood a memorable siege of 11 weeks against the Parliamentary forces, who eventually starved out the royalist garrison and hung the leaders. See Cutts, 'Colchester' in 'Historic Town Series' (1889).

Col'chicine, a vegetable alkaloid obtained from plants of the genus *Colchicum* (principally from the roots and seeds) by successive extraction with hot alcohol, water, and chloroform, and subsequent repeated crystallization from all three of these solvents. It is a yellowish-white powder, with the probable formula $C_{22}H_{25}NO_6$. It acts as a weak base, but most of its compounds are decomposed by water. Preparations of colchicine are used in medicine for the treatment of gout. It is very actively poisonous, half a grain having proved fatal.

Colchicum, kŏl'chĭ-kŭm, a genus of herbs of the natural order *Liliaceæ.* About 30 species, natives of the Mediterranean region, have been described. They are nearly all autumn-blooming perennial plants which produce their leaves in spring from corms. The perianth, which resembles but is much larger than that of the crocus, is long and tubular, and varies in color from white to purple (in one species yellow). The leaves, which are broad and long in proportion to the size of the plants, die in early summer, and the flowers appear when nature is preparing for the winter. For this reason the autumn-blooming species are very popular in gardens. They are of easiest culture, the bulbs being planted in late summer and protected in severe climates with a winter mulch of litter or straw, which is removed in the spring. Beds once planted will need no further attention for several years, when they should be dug up, the corms divided and set in fresh soil in a sunny situation. The plants of some species are very acrid and are reputed poisonous, and when cattle have access to them are said to produce injuries of various kinds. Ordinary clean cultivation will soon rid any land of the plants. The corms and the seeds have been used in medicine for gout and rheumatism. *C. autumnale,* the best-known species, is popularly known as mea-

dow saffron and autumn crocus, names also given to other species.

In medicine the corm and seeds of *Colchicum autumnale* are used, in which the active principle is found in from .3 to .5 per cent. Colchicum has in medicine but one use; that is, in attacks of acute gout. These it cuts short, relieving the pain and shortening the attack better than any other drug. The reasons why are at present unknown, and the remedy is one of the few now remaining in modern medicine that are still used on empirical grounds only. Poisoning by this drug is not uncommon. The symptoms are those of an acrid gastro-enteric poison, with great pain, nausea, vomiting, and diarrhœa. There is marked depression of the pulse and of the respiration, and death is due to shock and collapse. Washing of the stomach is the first indication for treatment, notwithstanding the self-conservative vomiting. Castor oil, heat, alcohol, and mucilaginous drinks are indicated.

Colchis, kŏl'kĭs, or **Colchos,** the ancient name of a region at the eastern extremity of the Black Sea, resting on the Caucasus, and corresponding partly to Mingrelia. It is famous in Greek mythology as being the destination of the Argonauts. The people were celebrated for frugality and industry, and from their dark complexion, crispy hair, language, and customs, Herodotus is of opinion that they were of Egyptian origin. The country abounded, according to Strabo, in all kinds of fruits and material for ship-building. Linen was an important branch of manufacture, and wool of fine quality and in great quantity was produced. It was fruitful in poisonous herbs. In the 15th century it was subdivided into several principalities, and is now comprised in the Russian government of Trans-Caucasus.

Col'cothar, red oxide of iron, ferric oxide, Fe_2O_3. The reddish-brown powder that remains in the retorts when ferrous sulphate is distilled in the manufacture of Nordhausen sulphuric acid. It is used for polishing glass, and also as a pigment, under the name of «Indian red.» When in the finest state of subdivision it is known as «rouge,» and is much used for fine polishing by jewelers and others. Colcothar was the *caput mortuum vitrioli* of the alchemists.

Cold. 1. In physics and physiology, a relative want of heat. Since there are no determinate boundaries between cold and heat, it is a mere arbitrary distinction to call the degrees of the thermometer below the freezing-point degrees of cold. When the atmosphere, or any substance which comes in contact with the body, is at a lower temperature than the skin, it absorbs heat from the body, and is called cold. The physiological action of cold on the animal organism requires a brief notice. All animals (the warm-blooded animals to the greatest extent) have a certain power of maintaining the heat of the body in defiance of external cold. This power is mainly due to a process analogous to combustion, in which carbon and hydrogen taken into the system in food are made to unite with oxygen derived from the air by respiration. If the combustible materials are not duly furnished, or if the supply of oxygen be deficient (as in various diseased conditions), there must be a depression of temperature. Now, if the temperature of a bird or mammal (except in the case of hibernating animals) be lowered about 30° below its normal standard (which in birds ranges from 100 to 112°, and in mammals from 96° to 102°), the death of the animal is the result. The symptoms indicating that an animal or a man is suffering from a depression of the temperature of the body are: (1) retardation of the circulation of the blood, causing lividity of the skin, which is followed by pallor, in consequence of the blood being almost entirely driven from the surface through the contracting of the vessels; (2) a peculiar torpor of the muscular and nervous systems at the same time, manifesting itself in an indisposition to make any effort or exertion, and in intense sleepiness. The respiratory movements become slower and the loss of heat goes on, therefore, with increasing rapidity, till the fatal limit is reached and death supervenes. In hibernating animals (the marmot, dormouse, bat, etc.) the power of generating heat within their own bodies is very slight, their temperature following that of the external air, so that it may be brought down nearly to the freezing-point. Great or prolonged atmospheric cold is a most powerful depressing agent, and is a fruitful cause of disease and even of death. Whenever the temperature of the atmosphere is suddenly reduced, and particularly when it is reduced below the freezing-point, a considerable addition takes place to the mortality of the region. The effects of cold are, in ordinary circumstances, most apparent among the aged and the very young, and among those suffering from chronic disease.

2. In medicine, cold, as well as heat, is frequently employed for its therapeutic value. Cold is one of the most valuable means of obtaining lowered temperature. Cold sponging, ice-packs, alcohol evaporation, are useful in most fevers, are indispensable in sunstroke, and very refreshing in minor indispositions. Cold applied to an inflamed area diminishes the blood-tension by contracting the blood-vessels, and thus tends to limit inflammation. Cold applied to the skin, as by a wet pack, or as a shower, is a tonic, increasing metabolism, augmenting the appetite and giving mental and physical vigor. Cold applied as iced drinks, or cracked ice itself, is one of the best agents in nausea and gastric distress. Cold by means of ether or ethyl chloride spray is an excellent local anæsthetic for the treatment of local boils, felons, ulcers, etc., and is also used frequently in the extraction of teeth.

Catching cold is a term of wide popular use, and signifies an affection which is little treated of in medical literature, although an affection widespread and unpleasant. Catching cold is a process of disturbed equilibrium of the blood vessels. It is usually due to excessive evaporation from the skin caused by drafts of air, to which is added contraction of the blood vessels of the periphery of the body, with consequent engorgement and congestion in some internal organ. Keeping quiet, taking hot foot-baths, or hot drinks, sweating, etc., are measures that tend to bring the blood to the contracted areas, and away from the congested areas, with consequent good results. If, however, the disturbance becomes marked, if the exposure has been excessive, the congestion in an area becomes so serious that its local functions are diminished or aborted, and the congested blood vessels may be over-distended and paralysis result. Then an inflammatory reaction may ensue; the reduced

vitality of the part encourages the multiplication of ever-ready bacteria, and an acute diseased process may result. It may be a simple acute inflammation of the kidney; or if the pneumococcus is present in the lung, a pneumonia; or it may be a bronchitis. Taking cold is therefore a distinct process that predisposes to more severe affections. In most cases the secondary reaction of taking cold manifests itself in the mucous membranes of the air-passages, and running from the nose, some degree of cough, general malaise, languor, and muscular and joint pains are the results. Secondary infection, frequently through the superimposed influenza bacillus (if the condition be not primarily induced by that organism), results in the "grippe," following which bronchitis and pneumonia are very frequent.

No cold in the head, no general cold, should be neglected. Rest in bed, cathartics, hot drinks, and medical advice are desirable.

Cold Cream, a cooling ointment made by melting four ounces of white wax in one pound of almond oil by means of a gentle heat. Then mix gradually with a pint of rose-water in a warm mortar. Another recipe is: Take two parts of spermaceti, two parts of white wax, and three parts of almond oil; melt together, and then add rose-water as before. This ointment cools the skin, rendering it soft and pliable, and is successfully applied for the cure of chapped hands.

Cold Harbor, Battle of. By a series of bloody assaults and flank movements, beginning at the Wilderness 5 May 1864, Gen. Grant had, at the end of the month, forced Gen. Lee back to within a few miles of Richmond, and confronted him on the line of the Totopotomoy. On 31 May his army was along the road from near Hanover Court-House to Cold Harbor; the Sixth corps about six miles southeast of the court-house; to its left, in the order named, the Second, Ninth, and Fifth corps, these near Bethesda Church. The Eighteenth corps was at White House, on the Pamunkey, where it had just arrived from the Army of the James. Gen. J. H. Wilson's cavalry division was on the right of Grant's line, and Sheridan, with the two cavalry divisions of Torbert and Gregg, on the left. On the 31st Sheridan, after a severe fight, occupied Cold Harbor, but was so hard pressed by the Confederate cavalry division of Fitzhugh Lee and Clingman's brigade of infantry, and his position so exposed, that he fell back at night; but receiving an order from Gen. Meade that the place must be held at all hazards, he returned, and during the night entrenched. Lee's position was so strongly entrenched and so difficult of access that Grant determined again to extend by his left on Lee's right, and in view of this extension Cold Harbor was an important point, as there the roads concentrated from Bethesda Church, Old Church, White House, New Bridge, and all the bridges across the Chickahominy above and below New Bridge. Grant extended in that direction by transferring from his right. At 11.45 on the night of 31 May, Gen. H. G. Wright's Sixth corps was ordered from its position on the right to march along the rear of the army to Cold Harbor, 15 miles distant, and to be there by daylight on 1 June to support Sheridan, who, it was believed, would be heavily attacked at daybreak; but it was nine o'clock before he arrived, and Sheridan meanwhile had repulsed two determined attacks of Kershaw's division. At 3 P.M. 31 May the Eighteenth corps, Gen. W. F. Smith, was ordered by Gen. Grant to march from White House and form on the right of the Sixth. By a mistake in the order given it, it was late in the afternoon of 1 June when it reached its position. Opposing the two corps were the Confederate divisions of Gens. Hoke, Kershaw, Pickett, and Field, their main entrenched line about 1,400 yards distant; the interval between mostly open ground. About 300 to 400 yards in advance of the main line was a line of rifle-pits. It was necessary to take this position before Gen. Lee could concentrate on that flank and thus cover this road to Richmond. Between 5 and 6 P.M. Wright and Smith assaulted, and under heavy artillery and musketry fire Smith carried the advanced Confederate works and held them, taking many prisoners. Wright carried the advanced line and, breaking the left of Hoke and right of Kershaw, took parts of the main line, some of which he held, the Confederates falling back to a new line. The loss in the two assaulting corps was about 2,200. On the night of the 1st Sheridan had been ordered to attack on Wright's left, but received the order too late to execute it. On the morning of the 2d he advanced Gregg's division to Sumner's Bridge, on the Chickahominy, attacked a force of infantry, cavalry, and artillery, posted near the bridge, carried their advanced position, and held it until Hancock's corps arrived. Hancock's Second corps moved after dark of the 1st from the extreme right, under Meade's order to march with all speed, join Wright by daybreak of the 2d, and take position on his left, extending the line if possible to the Chickahominy. By an error of Hancock's engineer a wrong road was taken, and it was after seven o'clock when his head of column arrived; then under heavy skirmishing he formed line across the road from Cold Harbor to Dispatch Station. It had been the intention to attack the Confederate line early in the morning. Smith declared that the idea "was simply preposterous." Hancock's men were in an exhausted condition, and the attack was suspended until 5 P.M., and then deferred until 4:30 A.M. 3 June. At this time Grant's line was held on the right by Gen. J. H. Wilson's cavalry from the Pamunkey to Bethesda Church; Warren's Fifth corps, which had not moved, stretched from Bethesda Church about three miles to Beulah Church. Burnside's Ninth corps had been ordered to withdraw from the extreme right and form in Warren's rear to support his right. The Eighteenth corps was on the left of the Fifth, a wide interval between them; the Sixth and Second corps were on the left of the Eighteenth. Lee had observed that Grant was transferring the right of his army, by successive movements, to the left, and not proposing that Grant should take the initiative in attack, took it himself. On the morning of 2 June he ordered Early with three divisions to attack Grant's right flank and drive it down in front of the Confederate line. Early found Burnside in the act of withdrawing from near Sydnor's Mill, to take position in Warren's rear, attacked and captured the skirmish line, which had been left in the works, and fell upon his rear division, by which, with the assistance of the other divisions, Early was checked, but not before he had got in the

rear of a part of Warren's skirmish line, from which he took many prisoners. Warren repulsed Rode's division, which had attacked his front, and at night both sides entrenched. The Union losses 1 and 2 June were over 5,000 killed and wounded. Meanwhile Lee closed in to the right and formed his lines in front of Grant's left, his right on the Chickahominy, near Alexander's Bridge, his left extending a little west of north in the direction of the Totopotomoy. A. P. Hill's corps was on the right; Longstreet's, commanded by R. H. Anderson, in the centre; and Early's on the left, cavalry covering both flanks of the infantry. The line included the ground on which was fought the battle of Gaines' Mill, June 1862, and covered all the main roads to Richmond, being about six miles from the main exterior fortifications of the city and but half that distance from its most advanced works. Grant's whole line, except the cavalry on the left, was ordered to assault Lee's lines at 4.30 A.M. 3 June. Wilson, re-enforced by 2,000 cavalry and 3,000 infantry, was ordered from Hanover Court-House to Hawes' Shop to attack Early's left and rear. The main work was to be done by the Second, Sixth, and Eighteenth corps, supported by the Fifth and Ninth. No reconnaissance had been made in front, where the Confederate works were so constructed as to give a cross-fire upon assaulting columns. At the signal the assault was made at 4.30 A.M. On the left Barlow's and Gibbons' divisions of the Second corps leaped their works and, under a severe fire of artillery and musketry, drove in the enemy's advanced line and in many places gained the main line, but the latter was soon retaken and in 20 minutes from the time the signal was given the Second corps was repulsed with a loss of 3,000 men, including many of its most promising officers, who were killed on the works. The men did not retreat far, but lay down within a few yards of the Confederate works, and with bayonets, tin cups, and plates, began to entrench, skirmishing all the while. It fared no better with the Sixth corps. Its three divisions went forward, carried some advanced rifle-pits, assaulted the main line, and were met by a severe musketry fire and an enfilading artillery fire. They were repulsed with a loss of 800 killed and wounded, but gained positions at some points only 30 or 40 yards from the enemy's works, and held and entrenched them. On the right of the Sixth corps, the Eighteenth was obliged to form one division to the right to protect its flank, Martindale's and Brooks' divisions assaulted and were quickly driven back by a cross-fire of artillery and musketry, and it desisted from further effort after a loss of about 1,000 men. In less than an hour the three corps had lost nearly 5,000 in killed and wounded. Warren, on the right, reported that he could not advance unless the troops on his left advanced at the same time. Wright said that if he advanced without a corresponding advance of Smith on his right he would be taken in flank and reverse, and he was waiting for Smith and Hancock to move; and Smith said he could not move unless Wright covered his left flank. Gen. Meade ordered another assault, each corps to go forward without regard to those on the right or left, but it was not made, Hancock would not take the responsibility. Smith had all he could do in holding his own; Wright, also Hancock, merely transmitted the order to brigade and regimental commanders without enforcing it; and the men opened fire from their sheltered positions, without an effort to advance. Meade gave a third order for an advance of the entire line. Smith positively refused to obey, as it meant but a wanton waste of life to attempt it. Wright and Hancock merely transmitted the order, and again the men complied with it only by renewing fire from their positions. Grant got the opinion of his corps commanders that further assault was inadvisable, and at 1.30 P.M. orders were given to entrench "with a view to moving against the enemy's works by regular approaches." Farther to the right Burnside with the Ninth corps and Warren with the Fifth, who were to support the main assault, attacked Early in the morning, occupied some of the positions taken from them on the 2d, entrenched close up to Early's main line, and were about to assault, when they received orders to suspend attack. They had fought sharply during the morning, the Fifth corps losing about 500 killed and wounded, the Ninth corps about 800. Wilson's cavalry had a sharp engagement at Hawes' Shop, driving the enemy with some loss, and attacking the left and rear of Heth's division; but failing to connect with Burnside, they withdrew to Hawes' Shop. The loss of the Army of the Potomac for the entire day of 3 June was about 7,000 killed and wounded. All night of the 3d both armies were entrenching; no pickets could be thrown out, so close were the lines, between which lay many wounded. Some of the wounded were brought in, but it was not until the 7th that a truce was agreed upon, by which all could be removed, when exposure and starvation had transferred the greater part of them to the death-roll. Reguiar approaches were made by the Union lines, accompanied by constant and heavy skirmishing; an assault gave no promise of success; and on the night of the 12th Grant withdrew to cross James River. Grant had 103,000 "present for duty" at Cold Harbor. His loss (1–12 June) was 1,845 killed; 9,077 wounded; 1,816 missing; an aggregate of 12,738. Lee had not to exceed 65,000 men. His loss cannot be accurately given, but probably did not exceed 2,600 killed and wounded. Gen. Grant, in his 'Personal Memoirs,' says: "I have always regretted that the last assault on Cold Harbor was ever made. No advantage whatever was gained to compensate for the heavy loss we sustained." Consult: 'Official Records,' Vol. XXXVI.; U. S. Grant, 'Personal Memoirs,' Vol. II.; F. A. Walker, 'History of the Second Army Corps'; A. A. Humphreys, 'The Virginia Campaign of 1864–5'; I. R. Pennypacker, 'Life of General Meade'; The Century Company's 'Battles and Leaders of the Civil War.'

E. A. CARMAN.

Cold Spring Harbor, N. Y., a village of Suffolk County, on Cold Spring Harbor, and on the Long Island R.R. It was formerly a whaling port. It is now a summer resort, and has a fish hatchery and a school of biology.

Cold Storage, a method now generally employed for preserving perishable articles of food by the use of machines which reduce the temperature of the air. The same method is used extensively for preserving articles other than food which are destructible by high temperature. Refrigeration is often called ice-making, but in a cold-storage building the area

kept at a certain temperature by the frozen liquid is small compared with that kept at a proper temperature by ammonia and other substitutes for ice. Perhaps no product ever came into common use more rapidly than air treated according to the cold-storage method, unless electricity or steam be excepted. It is now indispensable in connection with some of the largest business enterprises, which, without it, would soon cease to exist. One of the most important uses of cold storage is in the transportation of beef, fruit and vegetables, etc., from place to place and from one country to another, especially from the United States and South America to Europe.

The extensive systems employed in breweries, provision depots, dairies, and distilleries have familiarized the public with the use of cold air; and no modern hotel or apartment house on a large scale is constructed without a plant for producing it by some process. It is as much a portion of the mechanical equipment as the elevator motor, or the lighting and heating apparatus. It is also being introduced for cooling purposes in theatre and other auditoriums; it maintains a pleasant temperature during the heated term in the hospital ward, and several companies have been formed to distribute it in cities through mains, as water and gas are supplied to the consumer. In some of the largest packing-houses of Kansas City and Chicago, not a pound of ice is used in a year for preservative purposes, although every department where the products of the beef, sheep, and hog are stored any length of time, is required to be at a temperature near or below the freezing point. Plants are now being made in this country to generate cold air for butter and butterine factories, ice-cream factories, chemical works, sugar refineries, molasses factories, paraffine works, oil refineries, stearine factories, chocolate factories, morgues, office buildings, skating rinks, steel-tempering plants, blast-furnaces, laundries, glue works, dry-plate works, dynamite-works, paint factories, soap factories, fur storage, India-rubber works and plants for seasoning lumber — a list including some of the country's most important industries.

While an extensive variety of machinery is being manufactured for refrigeration under a score of patents, the aim of all the inventors is the same — to perfect the most economical process to remove the heat from a certain temperature level to a higher level, discharging it at this point. With one ton of coal, a cold-air equivalent of from 8 to 14 tons of ice has been produced, the quantity varying according to the process employed. In the United States the refrigerating machines use anhydrous ammonia as the agent for generating low temperatures, mostly in conjunction with brine made from chloride of calcium and water. The ammonia is circulated through a series of pipes in which it evaporates. Then, in its gaseous form, it is pumped by the machine into the condensers and liquefied. The brine-cooler consists of a double pipe-coil. A small quantity of ammonia is injected through a needle valve, which allows a very fine stream to pass into the space between two pipes, running in a coil approximately 300 feet long surrounding a pipe containing the brine. From this coil the ammonia gas is drawn to the machine. The gas is forced thence into other coils, called the ammonia condensers, which have water circulating over them. It is now in a heated condition from the compression. The water running over these coils cools off the gas, and at the same time condenses it into liquid anhydrous ammonia. In this form the ammonia is conducted to a receiving tank, and from there it again passes through the needle-valve into the brine-cooler, going through the same circuit again and again. The brine-cooler represents the apparatus where the brine and ammonia systems are in conjunction, the brine being pumped through the cooler, and from there through coils of pipe in the room in which it is desired to reduce the temperatures. This is sometimes to 20° F. below zero for freezing fish, sometimes to 32° F. for preserving meat, and often to 50° F. for preserving fruits and other perishables. The temperature is easily adjusted to the required degree by controlling the brine-flow in the piping. By lessening or increasing the flow in a single pipe, a wide range of temperature can be produced. Thus the same room can be used either for freezing the articles it contains, or merely for chilling them.

The capacity of a refrigerating machine is based upon the weight of ammonia in the gaseous form which it can discharge in 24 hours, each pound of gas representing a certain quantity of heat-absorbing power. The unit of capacity is the refrigeration which would be accomplished by the use of one ton of ice. Such a quantity will lower the temperature of 28,400 pounds of water 10 degrees. Therefore, if a "one-ton" machine is employed, it will cool 197⅓ pounds of water to the extent of one degree a minute. Tests made of the York type machines of this capacity show that one will keep the "curing" department of a packing-house containing 12,000 cubic feet of space, at a temperature of 40° F. or 1,500 cubic feet at zero. In other words, it is sufficient to keep 10 beeves or 25 hogs chilled at the former temperature. As a single plant used in the large packing-houses and breweries may represent 500 tons capacity, it will be seen that the cold storage compartments are maintained on a very elaborate scale, a single one containing thousands of carcasses. The horse-power required for one of these large machines aggregates 625. The air-compressors are built in various designs, and are known as single and double acting.

In large cold-storage warehouses the floors are not over eight or nine feet high. The pipe is attached to the walls, and in wide rooms to the sides of posts running through the middle of the room, so that an equal temperature can be maintained in all portions. In others, like fish-freezing rooms, the pipes are even used as shelves to hold the tins filled with fish, which are frozen into bricks and piled away in another compartment. Poultry and game are also kept in a frozen state, and the meat remains almost as hard as stone while in the cold room. Butter also is kept at a temperature near zero, which is said to preserve the flavor contained in its volatile oil, so that it is equal to fresh butter. Eggs are preserved sometimes from two to six months, but require particular care. The air in the room should be neither too moist nor too dry, and the chamber should be neither without ventilation nor supplied with too much, as then the eggs would lose in weight on account of their liability to evaporate through the shell.

Eggs, butter, and milk are also liable to be tainted by any smell arising from the woodwork, or articles stored in the neighborhood, and the rooms have to be constructed and arranged with this point in view.

The above, it may be said, have been problems for the cold-storage experts to solve by practical experiments; but food products can be preserved in properly constructed houses with as little difficulty as any other articles. In the preservation of meat, from the time that the beef, sheep, or hog is killed, it is kept in cold storage or "chill" rooms, until the time that it is taken from the refrigerator to be prepared for the table. The "chill" rooms are used to take the animal heat out of the meat, and reduce its temperature from about 98° F. to cold-storage temperature, that is, from 32° F. to 40° F. For this purpose the meat is hung on rails in rooms which have chambers in the upper part over the rails for ammonia or brine piping, which reduces the temperature to a point near freezing before the meat is put in. After the meat is put in, the animal heat it still contains raises the temperature in the room, but this is again gradually lowered, in the course of 24 to 48 hours, to the proper degree for refrigeration. This length of time is required in order to chill the meat thoroughly. Should it become chilled on the outside and remain warm in the centre, the centre part of the meat would be spoiled. From the "chill" room the meat is run into the cold-storage rooms and hung on rails, where it is kept until such time as it is to be shipped. The choicest pieces are kept at least four weeks in cold storage, as the quality is thus improved, and, if the rooms are kept clean, these pieces will taste better than meat which has been recently slaughtered. For this reason, not only slaughter-houses, but depots of packers and other buildings where meat is kept in cold storage, even to small butcher establishments, are preferably cooled by refrigerating machinery, owing to its dryness and cleanliness.

In some of the large hotels refrigerators cooled by machinery are even placed close to the ovens or ranges where the viands are prepared for consumption, the refrigeration being maintained at the proper standard despite the outside temperature. High temperature is also the rule in candy factories, but manufacturers of chocolate candy have been using refrigerating machines for some time. They are forced to do this, as the compound is apt to become soft in hot weather, which, of course, would spoil the appearance of the goods for the market. The arrangement of the refrigerating piping for chocolate factories has been made in various ways. In some instances a large refrigerator is cooled in the centre of the workroom with the piping inside of it, this refrigerator being of such length that endless belting carrying tins with chocolate enters it on one side and brings them out chilled on the other. In other workrooms a series of pipe coils are simply placed along the ceiling, and the cold air coming down chills the confectionery as it is made by the employees in the same room. The chocolate is then stored in refrigerators, apart from the workroom, and there properly packed at a low temperature. After being packed it can be sent out, and ordinarily will keep for an indefinite length of time.

One of the most interesting applications of cold storage, however, and one which has become very extensive, is for preserving furs and woolens, which are kept at a temperature of not over 20° F. to keep the moths from destroying them. These rooms have a very interesting appearance, as among the trunks, boxes, and drawers of clothing there appear figures of bears, tigers, and other stuffed animals in threatening attitudes, put away through the hot season by their owners and taken out in the fall. Sometimes furs are left in storage continuously for several years, yet at the end of the time they are invariably found in perfect condition. Many of the trust companies in the larger cities have such cold storage compartments. In these fur and clothing rooms, where valuable carpets and rugs are also stored, the air is generally cooled outside of the room and circulated through it by means of fans.

The cold storage building erected by the United States government at Manila is probably unexcelled in scientific construction. It has a storage capacity for 1,200 tons of beef, 200 tons of mutton, 50 tons of butter, 100 tons of potatoes, and 100 tons of bacon; or, in other words, sufficient food to feed an army of 10,000 men for three months. In addition to the ordinary freezing apparatus it has an ice plant with a daily output of 40 tons. The elevator, with its 2,400 pound lifting capacity, as well as most of the other appliances in the building, are operated by electricity. Connecting with the elevator is an overhead tracking system extending four miles, and the mechanism is so complete that a ship landing at a near-by pier has only to open her hatches and her cargo is transported to the storage almost automatically. The power in the building is furnished by three 200-horsepower engines.

Cold Wave, a term commonly used in the United States to denote a fall of at least 20° in temperature in 24 hours, bringing the temperature below the freezing point. It is due to steady winds from the northwest, which bring with them the chill conditions of the great west Canadian plains. This chill seems due to anti-cyclonic conditions which bring down to the surface the cold air of the upper atmosphere, and cause it to flow out over the southern and eastern United States.

Colden, kōl'dĕn, **Cadwallader,** American scientist and colonial official: b. Dunse, Scotland, 17 Feb. 1688; d. Long Island, N. Y., 28 Sept. 1776. He was graduated from the University of Edinburgh in 1705, and emigrated to the American colonies in 1708. He devoted himself to botany and astronomy and also to public affairs, becoming surveyor-general of New York and president of the council. He sided with the crown in the contest over the stamp act. Among his correspondents were Franklin and Linnæus, and he wrote 'Cause of Gravitation' and 'History of the Five Indian Nations.'

Colden, Cadwallader David, American lawyer: b. near Flushing, L. I., 4 April 1769; d. Jersey City, N. J., 7 Feb. 1834. He studied law in England and the United States; began practice in New York in 1791, where he soon attained high rank in his profession. He was a member of the legislature and mayor of New

York (1818), a member of Congress (1821), and of the State senate (1824–7). He was an earnest advocate of the system of internal improvements that was an important political issue early in the 19th century. He wrote: 'Life of Robert Fulton' (1817); 'Memoir of the Celebration of the Completion of the New York Canals' (1825); 'Vindication of the Steamboat Right Granted by New York State' (1819).

Cold'stream, Scotland, a town in Berwickshire, on the northern bank of the Tweed, which is here crossed by a bridge (erected by Smeaton in 1766) that unites the two kingdoms, and forms a well-frequented thoroughfare. The ford of Coldstream was a favorite point with the invading armies of England and Scotland when they passed alternately into each other's country. Pop. 1,535.

Coldstream Guards, a regiment in the Foot Guards or Household Brigade, the oldest in the British army except the First Foot, now called the Royal Scots. Raised in 1660 by Gen. Monk at Coldstream, it was at first called "Monk's Regiment," but when Parliament consented to give a brigade of guards to Charles II., this corps, under the name of Coldstream Guards, was included in it.

Coldwater, Mich., a city and county-seat of Branch County. It is in the southern tier of counties, 153 miles west of Chicago and 126 miles east of Detroit, on the Coldwater River and the Lake Shore & Mich. Southern Railway. Coldwater was first settled in 1830 by Hugh Campbell, became a borough in 1837 and a city in 1862. It is governed by a mayor and a common council of eight members, four members of which are elected yearly for a term of two years. The city has three banks, churches of all denominations, is in the centre of a rich farming community, has cement, shoe, wagon, milling and other industries, and owns and controls its waterworks and electric-light plant. Pop. (1903) 7,000.

Cole, Asahel N., American agriculturist and editor: b. 1821; d. Wellsville, N. Y., 14 July 1889. He was educated in the public schools of western New York State, and when 21 entered politics. He figured prominently as a Republican in the party's early days, and in 1852 he founded the 'Genesee Valley Free Press,' the pioneer Republican paper. He was no less noted as an agriculturist, being widely known as the father of subsurface irrigation.

Cole, Grenville Arthur James, English geologist: b. London 21 Oct. 1859. He was educated at the City of London School and the Royal School of Mines, and has been professor of geology at the Royal College of Science for Ireland since 1890. He has published: 'Aids in Practical Geology' (1891, 4th ed. 1902); 'The Gypsy Road' (1894); 'Open Air Studies' (1895); 'As We Ride' (with Blanche Cole) (1902).

Cole, Joseph Foxcroft, American landscape painter: b. Jay, Maine, 9 Nov. 1837; d. Boston, Mass., 2 May 1892. He studied in Paris under Lambinet and Jacque, and exhibited at the Centennial Exhibition in Philadelphia, 'Twilight,' 'Melrose Highlands,' and 'Coast Scene in Normany,' for which he was awarded a gold medal. His work was somewhat impressionistic in character.

Cole, King, a legendary British king, described as a "merry old soul," fond of his pipe, and fond of his "bowl," and fond of his "fiddlers three." Colchester is said to have been his residence.

Cole, Samuel Winkley, American musician: b. Meriden, N. H., 24 Dec. 1848. He began his professional career at Portsmouth, N. H., 1877, was organist of the Clarendon Street Baptist Church, Boston, Mass., 1882–94, and teacher of sight singing in the New England Conservatory of Music since 1883. Since 1884 he has been supervisor of music in Brookline, Mass., and in Dedham, Mass., since 1886. In 1890 he produced Haydn's 'Creation' with the Dedham high school, and in 1891 Handel's 'Messiah,' being probably the first successful attempt in the United States to produce a complete oratorio with high school pupils. He has written: 'Child's First Studies in Music'; 'Course in General Sight-Reading'; 'New England Conservatory Course in Sight Singing.'

Cole, Thomas, American landscape painter: b. Bolton-le-Moors, Lancashire, England, 1 Feb. 1801; d. Catskill, N. Y., 11 Feb. 1848. His father, a woolen manufacturer, came to the United States when Thomas was 18 years old, and settled in Steubenville, Ohio. The son worked in his father's shop for two years, but the coming of a portrait painter to the village made him wish to be an artist. After a few lessons he set to work to paint pictures, and traveled for a while painting portraits and landscapes, but often had to paint chairs and japanned ware for a living. At last he went to New York, and by hard work succeeded in making himself one of the foremost landscape painters in this country. Among the best of his pictures are five called 'The Course of Empire,' and four called 'The Voyage of Life.' The last, showing childhood, youth, manhood, and old age, are very popular, and are well known through engravings. He was one of the founders of the National Academy, New York.

Cole, Timothy, American engraver: b. London, Eng., 1852. He emigrated to America in 1857; was burned out by the Chicago fire in 1871, and returned to New York penniless. In 1875 he entered the employ of the 'Century Magazine' (then 'Scribner's Monthly'), and in 1883 was sent to Europe to engrave pictures by the old masters. The first Italian series was finished in 1892, the Dutch and Flemish series in 1896, the English series, 1900, and he has of late been at work on a Spanish series. He stands easily at the head of living wood-engravers. His notes and short papers to accompany his engravings in the 'Century' have been published separately. He received a first class medal at the Paris Exposition, 1900.

Cole, Vicat, English landscape artist: b. Portsmouth, Eng., 1833; d. London 6 April 1893. He was a pupil of his father, George Cole (1810–83), a landscape painter also, and painted many studies from nature in Surrey, 'The Heart of Surrey' being one of his most noted works.

Cole, William Morse, American teacher: b. Boston, Mass., 10 Feb. 1866. He graduated at Harvard in 1890, and was instructor in political economy there 1890–3, and since 1900. From 1894 to 1898 he was a university extension lecturer, and secretary of the Massachusetts Commission on the Unemployed. He is the author of 'An Old Man's Romance' (1895), under the pseudonym of "Christopher Craigie."

Colebrook, Henry Thomas, English Sanskrit scholar: b. London 15 June 1765; d. there 10 March 1837. In 1782 his father's influence procured him a writership in the Bengal service. His duties as revenue officer at Tirhut led him to make a minute study of the state of husbandry in Bengal; his legal functions led him to study Indian law and learn Sanskrit; and he began in 1794 publishing essays on Indian religion, poetry, and science in the 'Asiatic Researches' of the Asiatic Society of Calcutta. His removal in 1795 to the magistracy of Mirzapur gave him the opportunity of cultivating the acquaintance of the learned men of the neighboring Sanskrit college at Benares, and with this advantage he brought out his 'Digest of Hindu Law on Contracts and Successions.' A mission to Nagpur (1799–1801) interrupted his work, and on his return he was appointed a judge of the new court of appeals at Calcutta, and at the same time honorary professor of Hindu Law and Sanskrit at the college of Fort William. Yet he contrived during this busy period to publish the first (and only) volume of his 'Sanskrit Grammar' (1805), based upon Pánini and the native commentators, to write his famous articles on the Vedas and on the sect of Jains, besides many other valuable essays for 'Asiatic Researches,' and also to supplement his 'Digest' by 'Two Treatises on the Hindu Law of Inheritance' (1810).

Coleman, Arthur Philemon, Canadian educator: b. Lachute, Quebec, 4 April 1852. He was educated at Victoria University and at the University of Breslau, and after some years of scientific work he became professor of geology and natural history in Victoria University, and in 1891 professor of assaying and metallurgy in the School of Practical Science, Toronto.

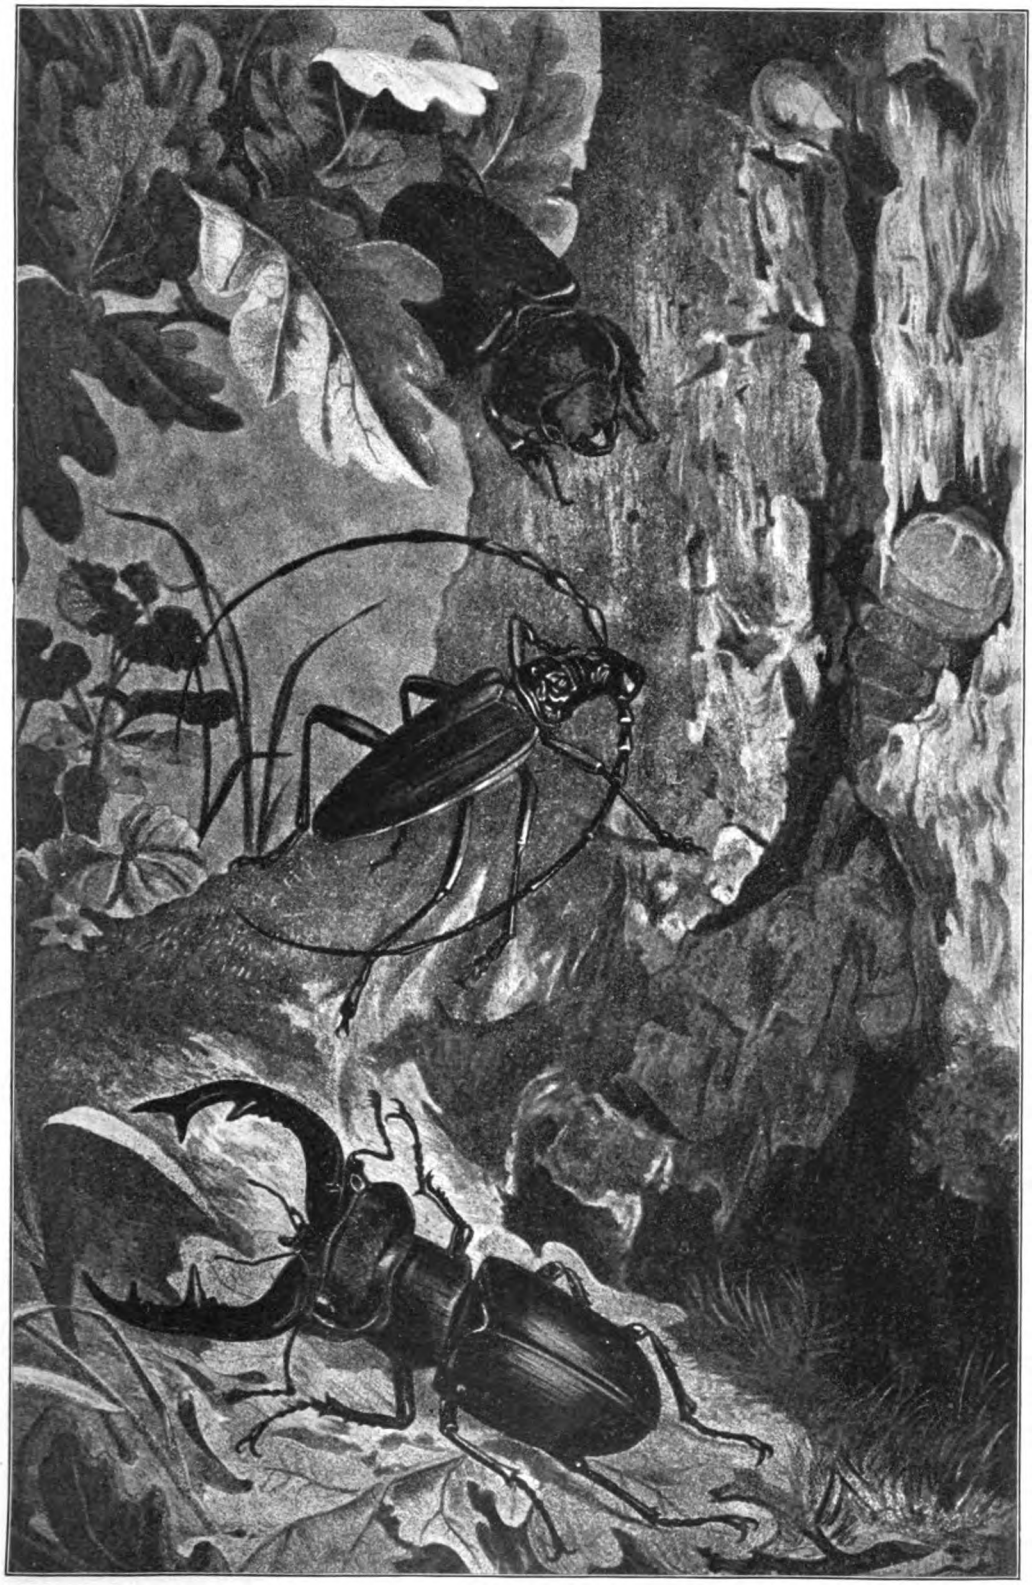
Coleman, John, American clergyman: b. Baltimore, Md., 11 Feb. 1803; d. St. Louis, Mo., 16 Sept. 1869. Until 1834 he was a Methodist. He entered the Protestant Episcopal ministry in 1836, and for 20 years was rector of Trinity Church, Philadelphia. He edited the religious paper Banner of the Cross (Philadelphia); and also edited Faber's 'Difficulties of Romanism' (1840); and Wilmer's 'Episcopal Manual' (1841).

Coleman, Leighton, American Protestant Episcopal bishop: b. Philadelphia 3 May 1837. He was graduated at the General Theological Seminary in 1861, was ordained to the Episcopal ministry in 1862, and after holding important rectorships, was consecrated bishop of Delaware in 1888. He has written 'The Church in America.'

Coleman, Lyman, American clergyman and scholar: b. Middlefield, Mass., 14 June 1796; d. Easton, Pa., 16 March 1882. He graduated at Yale 1817; taught in Hartford, Conn., 1817–20; was tutor in Yale 1820–5, studying theology at the same time. He was pastor of the Congregational Church in Belchertown, Mass., for seven years, when he again took up teaching. He studied in Germany 1842–3, where he formed a close friendship with Neander, and returning, taught German at Princeton and Amherst 1845–6. In 1856 he traveled extensively through the Orient. He was professor of Latin and Greek in Lafayette College from 1861 to 1868, when he was transferred to the chair of Latin, which he held until his death. His writings, which were highly praised and regarded in their day, are: 'Antiquities of the Christian Church' (1841), translated from the German; 'The Apostolical and Primitive Church' (1844); 'Historical Geography of the Bible' (1850); 'Ancient Christianity' (1852); 'Historical Text-Book and Atlas of Biblical Geography' (rev. ed. 1859); 'Prelacy and Ritualism' (1869); and 'Genealogy of the Lyman Family in Great Britain and America' (1872).

Coleman, William Tell, American pioneer: b. Cynthiana, Ky., 29 Feb. 1824; d. San Francisco, Cal., 22 Nov. 1893. In 1849 he made the overland trip to California, and opened several stores for the sale of mining supplies. When in 1851 the famous Vigilance Committee of San Francisco was formed to rid the city of its formidable criminal element, Coleman became one of the most active members. In 1856 the committee was revived in consequence of the murder of James King, an editor of William, Cal. Coleman took charge of the trials, resisted official pressure against interfering with "the people," directed the execution of Casey and the other murderers, and carefully avoided any clash with the United States authorities. From 1857 to 1864 he directed his business from New York, aided in suppressing the draft riot, and contributed liberally to patriotic benefactions. In 1877–8, at the request of the citizens of San Francisco, he organized the Committee of Safety, to fight Dennis Kearney and his sandlots mob, and in this was highly successful. In 1888 his firm failed with liabilities of $2,000,000, but in 1892 he personally paid off his entire indebtedness, more than he was legally bound to pay, with interest.

Colen'so, John William, English clergyman, bishop of Natal: b. Saint Austell, Cornwall, 24 Jan. 1814; d. Bishopstowe, Natal, 20 June 1883. He was educated at St. John's College, Cambridge; was assistant-master at Harrow 1838–42; resided at St. John's College 1842–6, when he was preferred to the rectory of Forncett, St. Mary, Norfolk, and on 20 November 1853 was appointed the first bishop of Natal. His numerous writings extend over a wide field. His treatises on arithmetic and algebra have become text-books in schools and universities. In 1853 he published a collection of 'Village Sermons'; in 1855 'Ten Weeks in Natal' and an edition of the 'Communion Service with Selections from the Writings of the Rev. F. D. Maurice'; in 1861 a 'Translation of the Epistle to the Romans Commented on from a Missionary Point of View.' In the following year public attention was widely attracted by the first part of his work on 'The Pentateuch and Book of Joshua Critically Examined,' in which the historical accuracy and



COLEOPTERA.

Mosaic authorship of those books were called in question. This work was condemned as heretical by slight majorities in both Houses of Convocation of the province of Canterbury in 1864, and Colenso was declared to be deposed from his see by his metropolitan, the bishop of Cape Town. The deposition was, however, declared null and void on appeal to the privy council in March 1865. Notwithstanding this decision the prelates forming the council of the Colonial Bishoprics Fund refused to pay him his income, and he appealed to the court of chancery. The master of the rolls delivered judgment on 6 Oct. 1866, ordering the payment in future of his income, with all arrears and interest, but declaring that if his accusers had refused payment on the ground of heretical teaching he should have felt it his duty to try that issue, an offer which they declined to accept. One of the results of this ecclesiastical quarrel was that the Anglican community of the Cape was divided into two hostile parties; Colenso still remained the only bishop of the Church of England in Natal, but the Rev. W. K. Macrorie was consecrated bishop of Maritzburg for the Church of the province of South Africa 25 June 1869. About the end of 1874 Colenso visited England, and during this visit he pleaded before the secretary for the colonies and other members of the government the cause of Langalibalele, a Zulu chief who had been dispossessed of his territory and imprisoned at Cape Town. From that time forward the humane bishop was foremost in advocating the cause of the aboriginals against the oppression of the Boers and the encroaching policy of the Cape officials supported by Sir Bartle Frere. The captive Cetewayo (see ZULULAND) appealed to Colenso to place his case before the English people, and it was mainly owing to the bishop's efforts that the Zulu king was allowed to go to England to plead his own case with the ministry. In the meantime Colenso continued his literary labors. 'The New Bible Commentary by the Bishops and Other Clergy of the Anglican Church Critically Examined' was published in 1871, the seventh and last part of his work on the Pentateuch in 1879, and 'Lectures on the Pentateuch and Moabite Stone' in 1873. Consult Cox, 'Life of Bishop Colenso' (1888).

Coleop'tera (Gr. *koleos,* a sheath and *pteron,* a wing), an order of insects the species of which are commonly known by the name of beetles. The insects which constitute the order *Coleoptera* may be characterized as having four wings, of which the two superior are not suited to flight, but form a covering and protection to the two inferior, and are of a hard and horny or parchment-like nature, and when closed their inner margins, which are straight, touch, and form a longitudinal suture. The inferior wings, when not in use, are folded transversely under the superior, and are membranous. The appendages of the mouth are well adapted for cutting, and the metamorphosis is complete.

Coler, Bird Sim, American politician: b. Illinois 1868. He removed to New York, and with his father, established the stock-broking firm of W. N. Coler & Company. He became active in Democratic municipal and State politics was elected comptroller in the first administration of Greater New York under the new city charter (1900–1), and was Democratic candidate for governor of the State in 1902. He has written 'Municipal Government, as Illustrated by the Charter, Finances, and Public Charities of New York' (1900).

Coleraine, kōl-rān', Ireland, a town in the county of Londonderry, situated on both sides of the river Bann, about four miles from its mouth, and 47 miles northwest of Belfast. It consists of a central square called the Diamond, and several diverging streets, and has long been celebrated for its fine linens. Its trade, chiefly in agricultural produce, and provisions, is considerable; and it has a valuable salmon fishery. There is regular steam connection with Glasgow. Pop. 6,800.

Coleridge, kōl'rĭj, **Christabel Rose,** English novelist: b. Chelsea, England, 1843. She is a daughter of Derwent Coleridge (q.v.), and for many years assisted Miss Charlotte Mary Yonge (q.v.) in editing 'The Monthly Packet.' She has published: 'Lady Betty' (1869); 'Hanbury Mills' (1872); 'Hugh Crichton's Romance' (1873); 'The Face of Carlyon and Other Stories' (1875); 'The Constant Prince' (1878); 'Kingsworth' (1881); 'An English Squire' (1881); 'The Girls of Flaxby' (1882); 'A Near Relation' (1886); 'A Plunge Into Troubled Waters' (1888); 'Reuben Everett' (1888); 'Amethyst' (1891); 'Waynflete' (1893); 'The Tender Mercies of the Good' (1895); 'The Main Chance' (1897); 'The Thought Rope' (1898); 'Tricks and Trials' (1899); 'The Winds of Cathrigg' (1901); 'Fifty Pounds'; 'The Green Girls of Greythorpe'; 'Life and Letters of Charlotte Mary Yonge' (1903).

Coleridge, Derwent, English clergyman and author: b. Keswick, England, 14 Sept. 1800; d. Torquay, Devonshire, 2 April 1883. He was a son of Samuel Taylor Coleridge (q.v.). He took orders in the Established Church, and engaging in teaching was master of the grammar school in Helston, Cornwall, 1825–40; and principal of Saint Mark's College, Chelsea, 1841–64. He was rector of Hanwell, Middlesex, 1864–80. He published 'The Scriptural Character of the English Church' (1839).

Coleridge, Ernest Hartley, English literary editor: b. 8 Dec. 1846. He is a son of Derwent Coleridge (q.v.) and was educated at Balliol College, Oxford. He engaged in tutoring 1872–93, and besides editing the 'Letters of Samuel Taylor Coleridge' (1895); 'Animæ Poetæ,' selections from unpublished notebooks of S. T. Coleridge (1895), and the 'Poetical Works of Lord Byron' (1898–1902), has published a volume of 'Poems' (1898).

Coleridge, Hartley, English poet: b. Clevedon, near Bristol, 19 Sept. 1796; d. Rydal, Westmoreland, 6 Jan. 1849. He was the eldest son of S. T. Coleridge (q.v.), and upon the elder Coleridge taking up his residence in the Lake district, Hartley and his brother Derwent were placed as day scholars under the charge of a clergyman at Ambleside. In 1815 he became a student at Merton College, Oxford, and having inherited his father's conversational talents, was soon in great request at the wine parties and other festivities of the undergraduates. An unfortunate propensity was thus formed for drinking, which proved even more ruinous than his father's craving for opium. He obtained a fellowship at Oriel College, but

forfeited it for intemperance before the close of his probationary year. He then left Oxford and resided for two years in London, contributing occasionally to the 'London Magazine,' in which his first sonnets appeared. His friends induced him against his will to settle at Ambleside for the reception of pupils, but this scheme, as might have been expected, failed. He continued, however, to reside in the Lake country, and during this period enjoyed the friendship and good offices of Wordsworth, who had taken a paternal interest in him from a child. He likewise employed himself extensively in study and literary composition, contributing to 'Blackwood's Magazine,' and producing a volume of 'Poems,' and 'Worthies of Yorkshire and Lancashire.' Many of his sonnets will rank with the finest in the English language, while the charming vivacity of his biographies leave only room for regret that he had not accomplished more as a prose writer. In 1839 he wrote a life of Massinger for an edition of his works published by Moxon. He was buried in Grasmere churchyard, adjoining the spot where Wordsworth was laid a few months afterward. A memoir, with a collection of poems written by him in his later years, was published after his death by his brother Derwent.

Coleridge, Henry Nelson, English writer: b. Ottery Saint Mary, 19 Sept. 1796; d. 26 Jan. 1843. He was a nephew of S. T. Coleridge (q.v.) and was educated at Eton and King's College, Cambridge. Having accompanied, in 1825, his uncle, the Bishop of Barbadoes, on a voyage to that island, on his return he published an account of his sojourn, under the title of 'Six Months in the West Indies.' He was called to the bar in 1826, and shortly afterward married his cousin Sara, only daughter of Samuel Taylor, and sister to Hartley Coleridge. In 1830 he published an 'Introduction to the Study of the Greek Classic Poets,' and after his uncle's death set himself to the task of committing to writing the reminiscences of Coleridge's conversation, which were published under the title of 'Specimens of the Table-talk of the late Samuel Taylor Coleridge.' He also edited the posthumous writings of his uncle, including three volumes of 'Literary Remains,' published in 1836 and 1838, and 'Confessions of an Inquiring Spirit,' in 1840.

Coleridge, Herbert, English philologist: b. Hampstead, Eng., 7 Oct. 1830; d. London 23 April 1861. He was a son of Henry Nelson Coleridge (q.v.), and was one of the original planners of the dictionary outlined by the Philological Society and which in subsequent years has expanded into the 'New English Dictionary on Historical Principles' in process of preparation from 1884.

Coleridge, John Duke Coleridge, Lord, Lord Chief Justice of England: b. London 3 Dec. 1820; d. 14 June 1894. He was the eldest son of Sir John Taylor Coleridge (q.v.), judge, a nephew of Samuel Taylor Coleridge. He was educated at Eton and Balliol College, Oxford, and was called to the bar at the Middle Temple in 1846. In 1855 he was appointed to the recordership of Portsmouth, six years later he became a queen's counsel, and soon afterward was chosen a bencher of the Middle Temple. From 1865 till 1873 he represented Exeter in the House of Commons as a Liberal, and in 1868 he became solicitor-general under Mr. Gladstone, being knighted at the same time. Three years later he became attorney-general, and in 1873 he was appointed chief justice of the court of common pleas. In the same year he was raised to the peerage as Baron Coleridge of Ottery St. Mary, and in 1880 succeeded Sir Alexander Cockburn as lord chief justice of England. Lord Coleridge distinguished himself very highly when acting as chief counsel for the Tichborne family in the famous trial of 1871–2. He was the first lord chief justice who was granted the office with his present title, instead of the older one of lord chief justice of the court of queen's bench. He visited the United States in 1883 and received much attention, especially from the members of his profession.

Coleridge, Sir John Taylor, English jurist: b. Tiverton, Eng., 1790; d. Ottery Saint Mary 11 Feb. 1876. He was educated at Oxford, where he and Keble became close friends, and was called to the bar of the Middle Temple in 1819. In 1835 he was appointed justice of the king's bench, and was sworn of the privy council in 1858. As a literary critic he took high rank, and besides editing an edition of 'Blackstone's Commentaries' (1825); published a 'Life of John Keble' (1869).

Coleridge, Miss M. E., English novelist: She has published: 'The Seven Sleepers of Ephesus' (1893); 'The King With Two Faces' (1897); 'Non Sequitur' (1900); 'The Fiery Dawn' (1901).

Coleridge, Samuel Taylor, English poet: b. Ottery Saint Mary, Devonshire, 21 Oct. 1772; d. Highgate 25 July 1834. One of his schoolfellows was Charles Lamb, with whom a lasting friendship was formed. While a mere boy Coleridge was remarkable for his wonderful conversational powers. He took little interest in the ordinary sports of childhood, and was noted for a dreamy abstracted manner, though he made considerable progress in classical studies, and acquired great celebrity for the admirable art with which he recited the ancient Greek poets. In 1791 he obtained a presentation to Jesus College, Cambridge. Here he remained for two years, but the only special distinction achieved by him was gaining the prize for a Greek ode. A rationalist at this period in religious, and a Republican in political matters, his ultra views on these subjects attracted the animadversions of his superiors at college. Owing, it is said, to a disappointment in love, he one day suddenly quitted Cambridge, proceeded to London, and after wandering about the streets for some time and giving his last penny to a beggar, enlisted in the 15th Dragoons under the name of Comberbach. In this new sphere his progress was far from brilliant, as he was a very awkward horseman and slow in acquiring a knowledge of military exercises. He is said to have written his comrades' letters, in return for which they would look after his horse and accoutrements. A correction of a Greek quotation which he ventured one day to address to his officer, revealed his real position, and a communication was in consequence established with his friends by which his discharge was effected. He now took up his residence at Bristol with Robert Southey, who had just been obliged to quit Oxford for his Unitarian opinions, and Lovell,

a young Quaker. The three conceived the project of emigrating to America, and establishing a pantisocracy as they termed it, or community in which all should be equal, on the banks of the Susquehanna. This scheme, however, never became anything more than a theory. In 1795 the three friends married three sisters, the Misses Fricker of Bristol. Coleridge about this time started a periodical, the 'Watchman,' which advocated extreme opinions in religion and politics, but did not live beyond the ninth number. In 1796 he took a cottage at Nether Stowey, in Somersetshire, where he was soon joined by Wordsworth and his sister, who came to reside in his neighborhood. The two young poets used to ramble together over Quantock Hills, and arranged together the collection of poems, entitled 'Lyrical Ballads,' which appeared in 1798, and contained Coleridge's 'Ancient Mariner.' He had previously, in 1796, published a collection of juvenile poems in cooperation with Charles Lamb. While residing at Nether Stowey he used to officiate in a Unitarian chapel at Taunton. An acquaintance had been formed by him some time previously with the Wedgewoods, and these friends now bestowed on him an annuity, and furnished him with the means of making a tour to Germany with Wordsworth in 1798–9. He attended the University of Göttingen, and made himself acquainted with the German language and literature. Having returned to England, he obtained literary employment in London, and his translation of Schiller's 'Wallenstein' was published. In 1800 he took up his residence at Keswick, where Southey joined him in a year or two, while Wordsworth lived at Grasmere in the same neighborhood. From this circumstance of the three poets inhabiting the same district, the epithet of the "Lake School" was affixed to them by the Edinburgh and other reviewers. Some time previously Coleridge had contracted the pernicious habit of opium-eating, which seriously impaired his mental and physical powers. About 1804 his health had considerably declined, and with the view of re-establishing it he proceeded to Malta, where he acted for a time as secretary to the governor. In 1808 he delivered a course of lectures on poetry and the fine arts, at the Royal Institution. A periodical, entitled the 'Friend,' was started by him at Penrith in 1809, but only reached the 27th number. His religious and political views had now undergone a great change from those professed by him in younger days, his rationalistic notions being abandoned for orthodox tenets, and his ultra-radicalism for conservative principles. In 1810 he quitted permanently the Lake district, and resided with various friends in London or elsewhere till 1816, when he located himself for the remainder of his life in the house of his friend Mr. Gillman, a surgeon at Highgate. Every attention and kindness was here shown him, and for a time he manifested a good deal of literary activity, publishing his 'Biographia Literaria'; his 'Essay on Church and State,' and his 'Aids to Reflection.' A conversazione used to be held weekly by him in Mr. Gillman's house, when for hours consecutively he would pour forth those unintermitting torrents of wondrous eloquence which enchained all listeners. Some idea may be formed of the variety and extent of his conversational powers from the two volumes of his 'Table-talk,' published after his death. In 1825 he was chosen one of the 10 royal associates on the incorporation of the Royal Society of Literature, and as such received an annuity of 100 guineas out of the king's private purse till the death of George IV.

In person Coleridge is described by Wordsworth as "a noticeable man, with large gray eyes." With an ardent and affectionate nature, his amiable qualities endeared him to the hearts of a large circle of friends, while at the same time his vacillating and irresolute character rendered him in a manner through life the creature of circumstances, and reduced many of his greatest efforts to the condition of magnificent fragments. His poetry eminently exhibits the peculiar characteristics of his mind, dreamy and transcendental, with at times glimpses of the mysterious and unseen, which break upon us like voices from another world. Such are his 'Ancient Mariner,' 'Christabel,' and 'Kubla Khan.' In sublimity of thought and expression even Milton has nothing superior to his 'Hymn at Sunrise in the Vale of Chamouni,' while his 'Genevieve' is an impersonation of tenderness and purity of sentiment. Some passages of his rendering of Schiller's 'Wallenstein' excel, in all the elements of poetic merit, those in the original. His metaphysical prose writings are little else than adaptations from the German Philosophers, whole pages being frequently merely translated from Schelling. As a critic of literature and the fine arts, Coleridge may be said to have schooled the minds of his younger contemporaries. His 'Literary Remains,' as well as specimens of his 'Table-talk,' were edited by his nephew, Henry N. Coleridge. Consult lives by Gillman (1838); Traill (1884); Caine (1887); Dykes Campbell (1894); Brandl, 'Samuel Taylor Coleridge und die Englische Romantik' (1886); Shairp 'Studies in Poetry and Philosophy' (1868).

Coleridge, Sara, English poet: b. Keswick 22 Dec. 1802; d. London 3 May 1852. She was the daughter of S. T. Coleridge (q.v.), and was married to Henry Nelson Coleridge in 1829. She inherited much of her father's genius and is known in the world of letters by her romance of 'Phantasmion,' and her editions of 'Aids to Reflection,' and other works to which she appended valuable disquisitions. She aided her husband materially in editing her father's works, and continued the accomplishment of this labor after his death. She is also the author of 'Pretty Lessons for Little Children,' which passed through several editions. Her 'Memoirs and Letters' appeared in 1873.

Coleridge, Stephen, English author and artist: b. 31 May 1854. He is a son of John Duke Coleridge (q.v.). He was educated at Bradfield College, and Trinity College, Cambridge, and was private secretary to his father 1884–90. He has exhibited pictures at Birmingham, Leeds, and elsewhere, is honorary secretary of the National Anti-vivisection Society, and has published 'Demetrius' (1887); 'The Sanctity of Confession' (1890).

Coleridge-Taylor, Samuel, an Anglo-African composer: b. London 15 Aug. 1875. His father was a native of Sierra Leone and his mother an English woman. He has composed many successful songs and waltzes, and an operetta entitled 'The Dream Lovers.'

Coles, kōlz, **Abraham,** American prose-writer and poet: b. Scotch Plains, N. J., 26 Dec. 1813; d. Monterey, Cal., 3 May 1891. In 1835 he graduated from Jefferson Medical College, Philadelphia. He published 13 original translations of the celebrated hymn 'Dies Iræ' (1859); 'Old Gems in New Settings' (1866); 'The Microcosm'; and 'The Light of the World' (1884).

Coles, Cowper Phipps, English naval architect: b. Hampshire 1819; d. 7 Sept. 1870. He early entered the navy, and became lieutenant in 1846, and captain in 1856. In 1855 he constructed a gun-raft which was favorably reported on; from 1856 he was engaged in experiments, and ultimately produced a form of turret-ship, the general idea of which had probably occurred to him independently, although its development owed much to the invention of John Ericsson (q.v.). A vessel was built from his designs, with little more than six feet of freeboard; it was commissioned as the Captain in 1870, and in September of that year turned bottom upward in a gale, and sank off Cape Finisterre, almost all on board, including Coles, being drowned.

Coleseed, a name commonly given to a variety of cabbage (*Brassica napus*) and its seed, the latter often being made into oil-cake for feeding cattle. See RAPE.

Colet, kŏl'ĕt, **John,** English divine, founder of St. Paul's School, London: b. London 1466; d. there 16 Sept. 1519. His father, Sir Henry Colet, was twice lord mayor of London. About 1493 he set out to make a continental tour, and became acquainted with several of the most eminent men of the time, and more especially with Erasmus. While on the continent, he studied Greek, canon, and civil law, and the writings of the fathers. In 1496 he returned to England, and in the following year he was ordained, took up his residence in Oxford, and lectured in Latin on St. Paul's Epistle to the Romans. He was an ardent advocate of the new learning and an admirable Biblical scholar. Erasmus was one of his audience at a later series of lectures on the First Epistle to the Corinthians, and from this time (1498) the two became warm personal friends. In 1505 Colet was appointed dean of St. Paul's. With Sir Thomas More and others he urgently advocated the reform of certain ecclesiastical abuses, but it is an utter mistake to suppose that he held anything in common with the spirit of the Protestant Reformation. St. Paul's School was founded and endowed in 1512, the earliest school in England in which Greek was a regular part of the curriculum. His writings are not numerous, but gave good evidence of his learning and piety. In 1867–76, J. H. Lupton produced an edition of those of Colet's works not published during the 16th and 17th centuries. The most recent biography is that by Lupton (1887).

Colet, Louise Révoil, loo-ēz rā-vwāl kō-lā, French poet and novelist: b. Aix, France, 15 Sept. 1810; d. Paris 8 March 1876. Four times between 1839 and 1855, poems of hers were crowned by the French Academy. She was a graceful lyrist, and often struck the chord of deep passion with effect. Of her verses, poured forth with marvelous facility, 'The Woman's Poem' is perhaps her best after the four offered to the Academy. Among her numerous novels, 'Bruised Hearts' (1843) may be mentioned. She also wrote several narratives of travel.

Colewort, kōl'wĕrt, a common name for several cultivated varieties of cabbage (q.v.).

Col'fax, Schuyler, American statesman: b. New York 23 March 1823; d. Mankato, Minn., 13 Jan. 1885. He removed in 1836 to Indiana, where in 1845 he acquired a newspaper at South Bend, which he made the most influential Whig journal in the district. He was a delegate to the Whig conventions of 1848 and 1852; was elected to Congress in 1854 by the newly formed Republican party, and re-elected until 1869, being thrice chosen speaker; and in 1868 he was elected vice-president of the United States, in Grant's first term. Implicated, unjustly, as he and his friends claimed, in the Credit Mobilier charges of 1873, he spent the remainder of his life in political retirement, making public appearances only on the lecture platform. He was the founder of the Daughters of Rebekah branch of American Odd Fellowship.

Colfax, Wash., city, county-seat of Whitman County. It is situated on the Palouse River, the line of the Oregon Railroad and Navigation Company, and 80 miles south of Spokane. It is a trade centre for the products of the fertile, surrounding country; grains, lumber, and live stock are the chief exports. Manufactures are increasing. The waterworks are owned by the city. Pop. 2,300.

Col'gate, James Boorman, American philanthropist: b. New York 4 March 1818; d. Yonkers, N. Y., 7 Feb. 1904. He was for some years a member of the dry goods firm of Colgate & Abbe in New York, and in 1852 formed a partnership with J. B. Trevor as dealers in stocks and securities. To Colgate University (q.v.) he gave several buildings and an endowment of $1,000,000, called the Dodge Memorial Fund, and also gave to other institutions.

Colgate, Samuel, American manufacturer: b. New York 22 March 1822; d. Orange, N. J., 23 April 1897. He was a son of William Colgate, founder of the soap and perfumery house of Colgate & Company. Samuel Colgate succeeded his father as head of the firm, and continued his father's generous benefactions to religious, educational, and charitable enterprises. With his brother, he erected Colgate Academy building in Hamilton, N. Y., at a cost of $60,000, and in recognition of their munificent gifts to Madison University, in the same place, the name of that institution was changed to Colgate University. He was a contributor to every charity in Orange, N. J., and at his death bequeathed to Colgate University his valuable collection of Baptist reports and literature, numbering 40,000 titles, in several languages.

Colgate University, an educational institution at Hamilton, N. Y., founded in 1819 as a school for the education of Baptist ministers. The collegiate and preparatory departments were later added. The name was originally Madison University, and was changed in 1890 in honor of the principal benefactors, the Colgate family. At that time James B. Colgate established an endowment fund of $1,000,000 in memory of Ebenezer Dodge, who was president for over 20 years. The theological seminary, which was at first a separate corporation,

was incorporated with the university, the professors being members of the university faculty; the preparatory department (Colgate Academy) is also a part of the university, and its principal a member of the faculty. The college has three distinct courses, leading to the degrees of A.B., Ph.B., and B.S., and provision is made for graduate work for the corresponding masters' degrees. The theological course (three years) leads to the degree of B.D. The library numbers nearly 35,000 bound volumes; besides this there is in the library building the Baptist Historical Collection, of about 60,000 volumes and pamphlets, the bequest of Mr. Samuel Colgate. At the end of 1902, the university reported 35 professors and instructors, 365 students (178 in the college); value of property over $2,100,000; president, George E. Merrill, D.D.

Colic, in pathology, a painful affection of the intestines, especially of the large bowel or colon, whence the name. The pain is due to spasmodic and irregular contractions of the colon, and is felt chiefly in the region of the navel. It is of a severe twisting character, and comes on in paroxysms, occasionally so severe that the patient rolls and twists about, usually doubled up and grasping his abdomen, and not seldom groaning or crying. Constipation of the bowels usually accompanies colic, and the pain may give rise to vomiting. Often, however, severe colicky pains are the forerunner of looseness of the bowels, caused by some food which has disagreed. The pain may be caused by wind, the discharge of which affords great relief. There is no fever with the attack, but the pulse is usually lowered, and the face pale and anxious-looking. In this respect colic differs from inflammatory attacks of the bowels. Pressure on the abdomen generally gives relief in cases of colic, but in cases of inflammation the patient cannot endure pressure. Whether the attack be one of colic or not may readily be learned from the attitude of the sufferer and the fact of his exerting or avoiding pressure. Treatment consists in applying hot cloths or bags of hot salt across the abdomen. Doses of medicine, such as castor-oil, should also be administered, and a large injection of water at a gentle warmth will probably bring relief. In the case of an adult patient 30 drops of laudanum may be given along with the castor-oil, or shortly after it. Magnesia and dill-water are also used as remedies for colic in young children. What is called biliary or renal colic is caused by the passage of gall-stones toward the bowels. It occurs oftener in women than in men.

Coligny, kō-lēn-yē, **Gaspard de,** French soldier: b. Châtillon-sur-Loing 16 Feb. 1517; d. Paris 24 Aug. 1572. After a brilliant military career he was made in 1552 admiral of France. He was distinguished for valor in battle, for strict discipline, and for his conquests over the Spaniards, in particular for his defense of St. Quentin. When St. Quentin was taken by storm, the admiral was made prisoner. After the death of Henry II., the intrigues of Catharine de Medici induced him to place himself at the head of the Calvinists against the Guises. He formed so powerful a party that the Catholic religion in France seemed to be in danger. Condé was more ambitious, enterprising, active; Coligny more considerate, prudent, and more fit to be the leader of a party; equally unfortunate in war with Condé, but skilled in remedying even what appeared irretrievable losses, and more to be feared after a defeat than his enemies after a victory. The first battle between the Huguenots and Catholics (1562, at Dreux) was lost by the admiral, but he saved his army. When the Duke of Guise was murdered at the siege of Orleans, he was accused of being the author of the murder. The civil war re-commenced with increased fury in 1567. Coligny and Condé encountered the Constable Montmorency at St. Denis. This indecisive action was followed by the battle of Jarnac in 1569, which was fatal to the Calvinists. Condé fell, and the whole burden of command devolved on Coligny. An advantageous peace seemingly put a stop to this contest in 1570. Coligny appeared at court, and was, with his adherents, loaded with favors. Charles IX. gave him 100,000 francs as an indemnification for his injuries, together with a seat in the council. From all sides he was warned not to trust to these caresses. As the admiral was leaving the Louvre 22 Aug. 1572 his right hand and left arm were wounded by a shot from a window. One Maurenal had fired at him from a building belonging to the monastery of St. Germain l'Auxerrois, according to the plan of Catharine de Medici, probably with the knowledge of the Duke of Guise. Charles testified the deepest sorrow, caused search to be made for the assassin, and said to Coligny, "My father, you have the wounds, but I the pain." This he said at the moment when the massacre of the Protestants was already prepared. The slaughter began on the night of St. Bartholomew's, 24 Aug. 1572. The Duke of Guise hastened with a numerous suite to the house of the admiral. One Behme, or Besme, at their head, entered with his drawn sword into the chamber of the old man, pierced him with several stabs and threw the body out of the window into the courtyard.

Coliidae. See MOUSEBIRD.

Colima, kō-lē'mä, Mexico, a state in the southwest of the United States of Mexico. It includes the four desert islands, Socorro, Rosa Partida, San Benedicto, and Clarion, which form the Revillagigedo group. The northern section of the state is occupied by the slopes of the Colima volcanoes. The Armeria River flows through the state, and the Coahuayana is on the boundary. There are two lakes, Cuyuthan and Alcuzague. The climate, except in the mountainous region, is hot and unhealthy. Rainfall is abundant, and malaria prevails. Salt, silver, gold, sulphur, and copper are found; about 170 species of trees, including fruit, and trees, the parts of which are useful for tanning, dyeing, clothing, food, and medicine. The chief products are coffee, cacao, tobacco, rice, cotton, indigo, sugarcane, cereal, and luguminous plants. The principal industries are agriculture, stock-raising, and working in the salt sections. Much of the trade is with the other states of Mexico, especially those along the coast, but it has a growing trade with Germany, Hawaii, and the United States cities on the Pacific. Exports are: rice, coffee, rubber, fruits, cabinet and dye woods, corn, hides and skins, and minerals. Imports are: woolen, linen, and silk

goods, foodstuffs, wines and liquors, glass-ware, firearms and ammunition. The Pacific Mail, Red Line, Izaquirre, and the Sinaloa and Durango Railway Company's steamers connect the port of Manzanillo with other ports, foreign and domestic.

Colima, Mexico, capital of the state of Colima. It is situated in a fertile valley, which is irrigated by the Colima River. The principal buildings are the city hall, cathedral, theatre, the station of the Mexican N. R.R., and a new market. It has an electric-lighting system, a street-car line, etc. (See COLIMA, THE STATE OF.) Pop. 18,977.

Colin Clout, kŏl'ĭn klowt, a satire by John Skelton. It was a vigorous pre-Reformation protest against the clergy's lack of learning and piety.

Colise'um, more properly **Colosseum,** a gigantic ruin in Rome, the greatest amphitheatre which Roman magnificence ever erected. It was commenced by Vespasian (reigned 69–79 A.D.), and practically finished by Titus about the year 80 A.D., who dedicated it with shows in which 5,000 animals were killed. It was built to furnish a place for amusements for the Roman people; such as gladiatorial combats, fights with wild beasts, and less harmless athletic sports. In the early days of Christianity it was the scene of the martyrdom of a number of the Christians. It is said to have held 100,000 spectators, of whom about 87,000 were seated. For the greater part it consists of travertine, is elliptical in shape, 1,680 feet in circumference, and 157 feet high, and has three rows of columns, one above the other: the lowest is of the Doric, the second the Ionic, and the highest the Corinthian order. The diameter of the arena from side to side was 182 feet, from end to end 285 feet. Down to the 6th century this monument of ancient grandeur remained almost uninjured, when Theodoric, king of the Goths, caused material to be taken from it for the construction of various buildings; afterward Pope Paul II. took all the stones from it, which were used for the construction of the palace of St. Mark, and in later times some other palaces were erected from its fragments.

Colitis, kō-lī'tĭs, a general term indicating a disorder of the large intestine or colon. Disease or disorders of the colon may be due to a large variety of causes. A simple diarrhœa may persist, becoming chronic, or an enterocolitis (q.v.), or the initial process may have been dysenteric in character and, persisting, may have become a chronic colitis (see DYSENTERY).

Col'lamer, Jacob, American senator: b. Troy, N. Y., 8 Jan. 1791; d. Woodstock, Vt., 9 Nov. 1865. He graduated at the University of Vermont 1810, studied law at Saint Albans, and was admitted to the bar 1813. He became associate justice of the Vermont supreme court 1833–42; representative in Congress 1843–7; was appointed postmaster-general in 1849, but resigned upon the death of President Taylor; was again elected judge of the Vermont supreme court and held that office until 1854, when he was elected United States senator and remained such until his death.

Collar-bone. See CLAVICLE.

Collars and Cuffs, Manufacture of. According to the United States Census of 1900, the manufacture of collars and cuffs is the most extremely localized industry in the country; of the total product, amounting annually to $9,077,700.00, $8,073,271.00, or 89½ per cent., is made at Troy, N. Y., and within the State of New York, 99.4 per cent. The relatively great extent of this localization is manifest when comparison is made with the two next greater localized industries,— oyster canning and preserving in Baltimore; and the manufacture of gloves, in the adjoining cities of Gloversville and Johnstown, N. Y., which are respectively 64.4 and 54.2 per cent. of the totals of the industries named. This localization is accounted for, first,— by the fact that this industry had its origin and development in Troy; second,— by the skill required in certain portions of the manufacture of collars and cuffs on the part of the operators; and third,— by the technical knowledge necessary on the part of the manufacturers. The importance of the industry to the city of Troy is manifest by the fact that the Census of 1900 reports, that of the 21,564 wage earners in the city, 14,822, or 68.7 per cent., are employed in the collar and cuff industry.

The collar trade, the detachable collar, is distinctively a Troy invention, and had its conception about 75 years ago, in the mind of the wife of a blacksmith, who is stated to have made for sale the first detachable collar, cutting it with scissors from a paper pattern. Prior to that time, shirts were made with collars attached. Arthur James Weise, in preparing his history, 'Troy's One Hundred Years,' devoted much time to the investigation of the early history of collar-making, and the credit is due him of rescuing from oblivion the facts regarding the inception of this industry. In 1829, Ebenezer Brown, a retired Methodist clergyman, at that time the proprietor of a small dry goods store, began making collars in quantities, and their manufacture soon became an important part of his business. The collars were known as «String Collars,» were worn with the old fashioned stock tie, and tied around the neck, with a string attached to each end of the collar, the band lapping at the back, and high points extending above the chin, on either side. About 1834, Orlando Montague and Austin Granger, doing business under the firm name of Montague & Granger, began the manufacture of collars, as a separate industry. In 1835, Independence Starks also engaged in the manufacture of collars, and a few years afterward added a laundry to his business, for the laundering of collars of other manufacturers, as well as his own. This was probably the first «Troy Laundry,» a name which has since attained a national reputation. In 1845, the manufacture of detachable cuffs was commenced. In the winter of 1851–52, Nathaniel Wheeler, of the then firm of Wheeler & Wilson, visited Troy to introduce his firm's recently invented sewing machine. Regarding that visit he wrote, «I particularly brought the attention of the manufacturers of collars and cuffs to the machine; most of them shook their heads, doubting the practicability of stitching collars by machinery. Among my visitors was Jefferson Gardner, who, seeming to be less skeptical, patiently examined

the machine and concluded to give one a trial.» In the Spring of 1852, several sewing machines were sent to his factory and their introduction led to the rapid increase of the industry. In 1855, O. W. Edson, of the firm of Bennett & Edson, was the first Troy manufacturer to apply steam power to the operation of sewing machines. In 1875, button-hole sewing machines were introduced, and without this invention the manufacture of collars and cuffs could not have reached its present proportions, for Troy requires annually the making of upwards of 500,000,000 button-holes, and it would not have been possible to obtain sufficient hand button-hole makers to make this vast quantity.

The manufacture of collars and cuffs is attended with great detail. The designing of patterns is a work of an expert, nearly every ply of a collar being cut from a different pattern, with "cut outs" to compensate for the extra thicknesses occasioned by the overlapping of the seams. The work is so classified that a single collar will go through upwards of 25 operations, performed by as many different operators, all especially trained to their particular division of the work. It is difficult to get accurate statistics regarding the collar and cuff industry, as it is of such comparatively recent origin that it did not have a separate classification in the United States Census, until 1900. The data below is taken from the United States Census report of that year, and, while not altogether satisfactory, gives perhaps the only statistical information that has any semblance of accuracy. The figures refer only to the collar and cuff industry, and do not include the shirt industry, which, with many of the larger Troy concerns, is carried on conjointly with the manufacture of collars and cuffs. The following data is for the year ending June 1900:

Total value of collars and cuffs made in the United States	$9,077,700
Total value of collars and cuffs made at Troy, N. Y.	$8,073,271
Total number wage earners in this industry in the United States	17,115
Total number wage earners in this industry at Troy, N. Y	14,822
Total wages paid in this industry in the United States	$5,658,969
Total wages paid in this industry at Troy, N. Y.	$4,956,427
Total number of dozens of collars and cuffs made in the United States	10,086,045
Total number of dozens of collars and cuffs made at Troy, N. Y	8,881,400

E. O. HOUSE,
First Vice-Prest., United Shirt & Collar Co.

Colla'tion. 1. In the canon law of the Anglican Church, the act of a bishop in appointing a clergyman to a benefice (whether rectory, vicarage, canonry, or prebend) when the living is in his own gift through lapse or otherwise. In such a case the combination of the act of presentation and admission or institution constitutes collation. In the Roman Catholic Church the word has much the same meaning when applied to the conferring of a benefice, except that some benefices are conferred by the bishop or some delegated ecclesiastic; others, and in a few cases only by special grant of the Pope, a king or an abbess. In several countries of Europe the right of conferring the higher ecclesiastical dignities is regulated by a concordat between the Holy See and the respective governments.

2. Collation, the name given to the restricted meal, sometimes permitted on fast days, usually food to the amount of about eight ounces or one fourth of an ordinary meal.

Col'lect (*Collecta*) in ecclesiastical language means a collection, as of alms, taken up during the church service; this is of apostolic origin, and St. Paul mentions the collections for the saints taken up on the first day of the week. Used in still another meaning it signified what collect still does in English, a brief prayer pronounced by the priest in celebrating Mass after the Gloria.

Collect or **Collect Pond,** a small lake in old New York. See NEW YORK.

Collec'tivism, a plan of social organization in which the means of production and distribution in a community would belong to the people collectively. The term is also applied to the theory that society should be so organized. In the collectivist commonwealth the people cooperatively organized would have full control of production and distribution. Collectivism does not involve the abolition of all private property, but only of private property in the means of production. Collectivism is considered by Socialists as the natural successor to the present social system, and is the form of organization which they seek to establish; hence the term collectivism is often used as synonymous with Socialism (q.v.).

Collector of the Port. See CUSTOMS.

Colleen Bawn, kŏl'ēn bân, **The,** a noted play by Dion Boucicault. It was based on Gerald Griffin's novel 'The Collegians' (1828) and was first played 10 Sept. 1860. The novel was republished in 1861 as 'Colleen Bawn or the Collegian's Wife.'

College (Latin, *collegium*), in its primary sense, a body of colleagues, a corporation or society of persons invested with certain powers and rights, performing certain duties, or engaged in some common employment. In Great Britain and America some societies of physicians are called colleges. So, also, there are colleges of surgeons, a college of heralds, etc. Colleges of these kinds are usually incorporated or established by the supreme power of the state. The most familiar application of the term college in English is to a society of persons engaged in the pursuits of literature or science, including both professors and students. At first the students of the universities had no common bond of union, except that of study and discipline, and were lodged where they could find it convenient. Then hostels or boarding-houses were provided (principally by the religious orders, for the benefit of those of their own fraternity), in which the scholars lived under a certain superintendence. Charitable persons subsequently endowed these hostels that poor scholars might have free lodgings. The colleges of Oxford and Cambridge are academical institutions of this kind, each endowed with revenues of its own, and having fellows, students, and tutors, who live together under a head, in particular buildings. Each college is regulated by laws framed by its founder, with such modifications as have been deemed necessary to introduce from time to time. According to these laws, the head (variously styled master, principal, warden, rector, etc.), is either chosen by the fellows from their own number, or appointed

by the crown or other authority. The fellows are graduates who receive special emoluments for a term of years, and are generally elected to the position on account of special scholarship; while the scholars, admitted as undergraduates, are either chosen from particular localities, schools, etc., or elected according to merit after free competition. There are also a number of ordinary students, all as a rule occupying chambers belonging to the college. The undergraduates receive their instruction chiefly from tutors, who are generally resident fellows. The colleges are subordinate to the university, and it is the university that confers degrees, and institutes and carries out the necessary examinations. Generally speaking, the term college implies an institution inferior to a university, so far at least as the right of conferring degrees is concerned; but in Scotland, Germany, and elsewhere there are no colleges such as those of Oxford and Cambridge, and the college or colleges in Scotland are simply edifices in which the teaching is carried on. Some modern colleges are called university colleges, either because equipped similarly to a university, or because connected with a university, and able to train students for degrees to be obtained from that university. Institutions for teaching theology are often called colleges, and some schools that train pupils for the universities, or give a good secondary education, are also so called.

In France there are university colleges or *facultés* in all large towns, besides *lycées*, corresponding to what are called, in Germany, *gymnasia*. Other institutions of a similar kind, that is, schools for secondary education, are called *colléges communaux*. These are public establishments aided by the communes, and subject to the direction of the public authorities. Besides these, there is the *Collége de France*, which deserves the name of a university. It was instituted in 1529 by Francis I., and here numerous professors, among whom there are always some of the most distinguished men, lecture publicly and gratuitously.

College, The American. *Its Place and Importance.*— The American college has no exact counterpart in the educational system of any other country, although its elements are derived from European systems, and in particular from Great Britain. And while it is true that the primary form of organization in our earliest colleges, such as Harvard, Yale, and Princeton, was inherited from the English University of Cambridge, still it was subjected to modification at the very beginning, to adapt the college to its community, and afterward it was progressively modified to assure close sympathy with the character of the growing American nation. The result is an institution with derived elements of composition, and in less degree of form, which has developed for itself an organization notably different from the old-world schools.

So the college, from the nature of its development, holds the central place in the historic growth of American higher education. It remains to-day the one repository and shelter of liberal education as distinguished from technical or commercial training, the only available foundation for the erection of universities containing faculties devoted to the maintenance of pure learning, and the only institution which can furnish the preparation which is always desired, even though it is not yet generally exacted, by professional schools. Singularly enough, the relation of directive influence sustained to-day by our colleges to the university problem is not unlike the relation held in the Middle Ages by the inferior faculty of arts at the University of Paris to the affairs of the university as a whole. In both cases the college, or faculty of arts, appears as the preliminary instructor in the essentials of liberal education; this earlier education is recognized as the proper requisite for later study in the professional faculties; and in both cases the inferior faculty contains the germ of the higher university faculty of pure learning, the faculty of arts, sciences, and philosophy. The reason for this similarity is that the American college in this respect perpetuates and develops a fundamental tradition of liberal learning, which found its way from Paris through Oxford to Cambridge, and then from Cambridge to our shores. The parallel of our college history with the old-world history holds good in other important respects. Still, in order to understand the precise nature and unique influence of the college in American education, it is not necessary to trace the story of its development, for in its various forms of present organization it reveals the normal type which has been evolved, survivals of past stages of development, instances of variation and even of degeneration from the type, and interesting present experiments which foreshadow the future.

The Old-fashioned College.—The three commonly accepted divisions of education into primary, secondary and higher stages, while fully recognized in America, are not followed rigorously in organization. Primary education is more clearly separable from secondary than secondary from the higher or university stage. The chief cause for this partial blending of the secondary and higher stages is the college. However illogical and indefensible such a mixture may appear the historical outworking of this partial blending has been compelled by the exigencies of our history and has been fruitful in good results.

The American college, then, as contrasted with European schools, is a composite thing— partly secondary and partly higher in its organization. It consists regularly of a four-year course of study leading to the bachelor's degree. Up to the close of the Civil War (1861–5) it was mainly an institution of secondary education, with some anticipations of university studies toward the end of the course, which, however, were usually taught as rounding out the course of disciplinary education, rather than as subjects of free investigation. The average age of graduation was about 20. The maximum course of preparation in secondary schools was four years. In the better schools they studied Latin and Greek grammar, four books of Cæsar, six books of Virgil's Æneid, six orations of Cicero, three books of Xenophon's Anabasis and two of Homer's Iliad, together with arithmetic, plane geometry (not always complete) and algebra to, or at most through, quadratic equations. This the stronger colleges required for entrance; but many weaker ones were compelled to teach some of these preparatory studies in the first two years of the college course. With few

and unimportant exceptions the four-year course consisted of prescribed studies, including English literature and rhetoric, Latin, Greek, mathematics, natural philosophy, chemistry, the elements of deductive logic, moral philosophy, and political economy, and often a little psychology and metaphysics. Perhaps some ancient or general history was added. French and German were sometimes scantily taught. At graduation the student received the degree of bachelor of arts, and then entered some professional school, or went into business or into teaching in the primary or secondary schools.

The College of To-day.— At the present time things are very different. The old four-year course, consisting entirely of a single set of prescribed studies leading to the one degree of bachelor of arts, has grown and branched in many ways. The better preparation now given in thousands of schools has enabled colleges to ask for somewhat higher entrance requirements and to exact them. The age of entrance has increased. In some quarters the increasing age of the students is shortening the course to three years, in order that young men may not be kept back too long from entering upon their professional studies. A generation ago a young man graduated at 20 or earlier without difficulty, and after two or three years in studying law or medicine he began to earn his living at 22 or 23. But to-day a college student is 22 years old at graduation, and if he studies law or medicine he must wait until he is 25 to begin earning his living. Accordingly boys are now passing in considerable numbers directly from secondary schools, which do not really complete their secondary education, to the professional schools. The problem is an economic one, and it is affecting college courses of study. One solution, to shorten the course to three years, has been advanced by President Eliot of Harvard, and three years is the length of the course in the undergraduate college established in connection with the Johns Hopkins University. Another proposal is to keep the four-year course and allow professional studies in the last year, thus enabling the student to save one year in the professional school. This experiment is being tried at Columbia. A third proposal is to keep the college course free from professional studies, but to give opportunities in the last year or the last two years to pursue liberal courses clearly underlying professional training, thus saving a year of professional study. This is the trend of recent experiments in Yale and Princeton. The one common consideration in favor of all these proposals is that a year is saved. Against the three-year course, it is argued that there is no need to abolish the four-year course in order to save a year. Against the admission of professional studies it is argued that work done in a professional school ought not to count toward two degrees representing two radically different things. Against the proposal to allow the liberal studies which most closely underlie the professions, it is argued that this is a half-way measure, after all.

Alterations in the Course.— The four-year course, however, no longer leads solely to the degree of bachelor of arts, and this old degree has been modified. With the founding of schools of science, aiming to give a modern form of liberal education based mainly on the physical and natural sciences, the degree of bachelor of science came into use. Then intermediate courses were constituted, resting on Latin, the modern languages, history, philosophy, mathematics, and science, and thus the degree of bachelor of letters or bachelor of philosophy came into use. Sometimes the various courses in engineering were made four-year undergraduate courses with their degrees virtually rated as bachelor's degrees. Still other degrees of lesser importance came into vogue here and there to mark the completion of a four-year college course. The dispersing pressure of the newer studies and the practical demands of American life proved too strong to be held in form or to be kept out by the barriers of the old course of purely liberal studies with its single and definite degree, and new degrees were added to represent the attempted organization of newer tendencies. Compared with the old course such courses lack definiteness of structure. They aimed to realize new and imperfectly understood conceptions of education, and were composed of studies whose inner content was changing rapidly, or else were "half-and-half" forms of education, difficult to arrange in a system that promised stability, as in the case of studies leading to the bachelor of letters or bachelor of philosophy. A graver source of trouble was the admission of various engineering and other technical studies as parallel undergraduate courses. This tended to confuse in the minds of students the radical distinction between liberal and utilitarian ideals in education, and by the attractiveness of the "bread-and-butter" courses, to diminish the strength of the liberal studies. When in addition it is remembered that the newer courses, whether liberal, semi-liberal, or technical, exacted less from preparatory schools in actual quantity of school work necessary for entrance into college, it will be seen that the level of preparation for college was really lowered.

The present drift of opinion and action in colleges which offer more than one bachelor's degree is more reassuring than it was some 20 years ago. There is a noticeable and growing tendency to draw a sharp line between liberal and technical education and to retain undergraduate college education in liberal studies as the best foundation for technical studies, thus elevating the latter to a professional dignity comparable with law, medicine, and divinity. The more this conception prevails, the more will college courses in engineering be converted into graduate, or at least partially graduate courses. Independent schools of technology may continue to offer their courses to young students of college age, but where such schools have been associated as parts of colleges or universities the tendency to a clearer separation of technical from liberal studies seems likely to prevail.

Another hopeful tendency gradually gathering strength is to give the various bachelor's degrees more definite significance by making them stand for distinct types of liberal or semi-liberal education. First comes the academic course, attempting a general liberal education, consisting of classical and modern literatures, mathematics, and science, with historical, political and philosophical studies, and leading to the bachelor of arts degree. The second aims to represent a strictly modern culture predomi-

nantly scientific in character, and culminating in the degree of bachelor of science. In this course technical aspects of the sciences taught tended to create a demand for strictly technological instruction. So schools of science do little save produce experts in the various mechanical and chemical arts and industries. Conscious of this difficulty, many schools of science have been giving larger place in the curriculum to some of the more available humanistic studies, especially French, German, and English. Economics, modern history, and even the elements of philosophy have found place. Some improvement has also been effected by increasing the entrance requirements in quantity of school work. But the course still suffers from an inner antagonism between technical and liberal impulses, and until it settles into a strictly technical form, or else comes to represent a strictly modern liberal culture, its stability cannot be regarded as assured. In the independent scientific schools, unassociated with colleges, it seems probable the course will keep or assume a highly technical form. But wherever it exists side by side with other bachelor's courses as a proposed representative of some form of liberal education, it will almost inevitably tend toward the ideal of a modern culture mainly scientific. But the process promises to be slow and difficult. For there is not only a financial risk, but a serious theoretical difficulty in realizing this form of liberal education. The antagonism between the technical and liberal impulses in the course seems very difficult to eliminate completely. For the utilitarian instinct of the time militates against devotion to the intellectual value of modern studies and tends more and more toward technical standards.

The third type of liberal college education is the intermediate course labeled with the degree of bachelor of letters or bachelor of philosophy. It differs from the other courses mainly in its treatment of the classical languages. To placate the practical spirit it drops Greek, but retains Latin both as an aid to general culture and as a help in learning the modern languages. Although indeterminate and intermediate, it serves a valuable end by providing many students, who do not care for the classical languages in their entirety, with a sufficiently liberal form of education to be of great service. Judged from the standpoint of the historical bachelor of arts course, it is a less general but still valuable culture. Judged from the standpoint of the bachelor of science course, it appears to escape the unhappy conflict between the technical and liberal impulses.

But some colleges, following the example of Harvard, have dealt with the bachelor degree very differently. The meaning of the degree has been radically altered, so as to represent the free selections made by the students themselves out of the range of liberal studies. In these colleges it no longer stands for the completion of a definite curriculum composed of a few clearly related central studies constituting a positive type. What it does stand for is not easy to define, because of the variation of practice in different colleges and the wide diversity of selection on the part of the student. In the undergraduate college connected with the Johns Hopkins University at Baltimore choice is regulated by prescribing moderately elastic groups of cognate studies, the student being required to say which group he will choose. In Harvard College the student is allowed to choose what he prefers, subject to such limitations as the priority of elementary to advanced courses in any subject, and the coincidence in time of various courses. A Columbia student in his senior year may pursue his first year's course in law or medicine, and at the same time receive double credit for this work, both toward the degree of bachelor of arts and toward the professional degree of doctor of medicine or bachelor of laws.

Other Phases of Change.— To what extent the undergraduate collegian has become a university student is the real question around which a controversy of vital importance is raging.

The profound change indicated by external symptoms has been in progress since the Civil War, and is still working along toward its consummation. The difficult thing in analyzing this change is not merely to understand the change from a uniform to a multiform mode of life and organization, but to understand what is changing the old-fashioned American college. But even the old-fashioned colleges, while aiming to follow out a single course of study ending in a single degree of single meaning, did not succeed in exhibiting such close individual resemblance to each other as is to be found among the lycées of France, the public schools of England or the gymnasia of Germany. Many colleges really served as preparatory schools for larger and stronger colleges, and many so-called universities did not attain and in fact do not yet attain to the real, though less pretentious dignity of the better colleges. For the sake of simplicity then we discard from our consideration all except the better colleges which, when taken together, exhibit the dominant tendency.

How, then, have these better colleges changed? Speaking generally, they have changed in a way which reflects the diversified progress of the country, and yet they have had an important influence in leading and organizing the national progress. Then, too, the change is not merely a change of form, but of spirit. In the older days scarcely any college had as many as 400 or 500 students, and the range of studies was limited. The faculty of the college exercised a strong paternal anxiety and oversight on behalf of the morals and religion, as well as over the studies of the students. The authority of the president was almost patriarchal in character. Not highly developed insight into the problems of education, but plain common sense in governing students was the condition of a successful presidency. The range of studies has increased. With the strengthening of preparatory courses, the school preparation of students has improved, and at the same time their average age at entrance has risen. The number of professors has multiplied. The old-fashioned college professor, the man of moderate general scholarship and of austere yet kindly interest in the personal welfare of those he taught, still remains; but at his side has appeared the newer type of American college professor, the man of high special learning in some one subject or branch, who considers it his primary duty to investigate, his next duty to teach, and his least duty to exercise a personal care for the individual students. Perhaps the old type will be replaced

by the new. Such a result, however, would not be an unmixed gain, and our finest college professors to-day endeavor to combine high special attainments as scholars with deep interest in the personal well-being of their students. The authority of the faculty is still sufficient, but is exercised differently. Student self-government is the order of the day, and the more this prevails the less is exercise of faculty authority found to be necessary. The presidents of our larger colleges, and even of many of the smaller, are becoming more and more administrative officers and less and less teachers. It is no doubt something of a loss that the students should not have the intimate personal acquaintance with the president enjoyed by students a generation ago, but mere numbers frequently make this impossible. Out-door sports have also entered to modify and improve the spirit of our academic life. They have developed their own evils, but at the same time have done wonders for the physical health of the students, the diminution of student disorders and the fostering of an intense *esprit de corps*. In the reaction from the asceticism of early college life there is little doubt athletics have gone too far. But the abuses of college athletics can be corrected, and are to some extent self-correcting.

Nearly all our colleges are avowedly or impliedly Christian. A respectable minority of them are Roman Catholic. The large majority are under Protestant influences, which are seldom denominational. The student is expected to attend certain religious exercises, such as morning prayers; but often all such attendance is voluntary. The religious life of the undergraduates finds its expression in various societies, which endeavor to promote the Christian fellowship and life of their members. While moral and religious convictions are freer and sometimes laxer than of old the Christian life in our colleges is real and pervasive.

As a rule the student is so absorbed by the scholastic, athletic, and miscellaneous activities of his college that he sees little outside social life. This is particularly true in colleges which enjoy truly academic seclusion amid rural surroundings, for here more than anywhere else is to be seen the natural unperturbed outworking of the undergraduate spirit.

Development of Elective Courses.—The non-scholastic aspects of our present college life are important in that they give tone to the whole picture, but they do not account for the great transformation which has been wrought, for that transformation is distinctly scholastic. It is caused by the increase of students, their better preparation and their greater age. The studies which made up the curriculum leading to the old bachelor of arts degree are now being completed before the end, sometimes by the middle of the college course. There is to-day no reason why a young man of 20 should not know as much as his father knew at 20. But at 20 his father had graduated with the bachelor of arts degree, whereas at 20 the son is only half way through his college course. As this fact forced itself upon the older and stronger colleges, experiments were made in granting a limited amount of elective freedom to students in the latter part of their course; first in the senior year and then in the junior year, until in some instances the whole four-year course is now elective. In some colleges a student may obtain the bachelor of arts degree without studying any science, or he may omit his classics, or he may know nothing of philosophy. To-day the problem of the relation of prescribed to elective studies is a question of constant interest and perpetual readjustment. The solutions offered are many.

The first proposal, which has now scarcely an advocate, is plainly an impossible one. It is to insist on the old-fashioned four-year prescribed course. But the old-fashioned course cannot be restored, because it no longer suits our age. Young men will not go to college and remain there until the age of 22 years without some opportunity to exercise freedom of choice in their studies.

The second proposal is to constitute the undergraduate course entirely, or almost entirely, of elective studies. It is argued that when a young man is 18 or 19 years of age, he is old enough to choose his liberal studies, and that his own choice will be better for him individually than any prescription the wisest college faculty may make. The advocates of this view admit its dangers. They see the perils of incoherency and discontinuity in the choice of studies. They see that many students are influenced, not by the intrinsic value of the studies, but by their liking for this or that instructor, or the companionship of certain students, or for the easiness of certain crowded courses. Yet they argue that the college student must be free at some time, that his sense of responsibility will be developed the sooner he is compelled to choose for himself, and that he will have the stimulating and sobering consciousness that what he does is his own act and not the prescription of others for him. Those who oppose this view argue that the academic freedom here proposed belongs to university rather than to college students; that the American freshman is not a university student in the sense in which that term has been commonly understood in the educated world, because of his much shorter preparatory training, and his mental immaturity as compared with the English and Continental student. If, therefore, he is to be as well educated as they are, some of his time in college, the first two years at least, should be spent in perfecting his properly secondary education before entering upon that elective freedom which has a place, and a large place, in our present undergraduate courses.

A third proposal is a conservative modification of the one just mentioned. It is to prescribe groups of cognate studies with the object of concentrating attention on related subjects in that field which the student may prefer. The advantage claimed for this mode is that it allows the student to choose the field of study he likes, and then safeguards him against incoherency by requiring him to pursue a group of well-related courses in that field. The advocates of wider freedom object to this as fettering spontaneity of choice, as not recognizing the fact that there are many students for whom it is advantageous to choose a study here and there at will, as a piece of side work outside the chosen field of their activity. The objection to this plan of restricted groups and also to the plan of practically unrestricted freedom, is that it offers temptations to pre-

mature specialization at the expense of liberal education.

Still another proposal remains to be considered. Its followers urge that the best type of liberal education is to be found in the historic academic course, which has been the centre and strength of American college life. They concede that other bachelor's courses may give a valuable education to many, provided these courses are consistently organized according to their own ideals. They hold that it is possible to ascertain with sufficient exactness just what studies ought to be prescribed as integral parts of these courses, and that the preliminary training given in these prescribed studies develops maturity in the young student and enables him to choose intelligently his later elective studies. At the present time, in their view, it is not wise to introduce elective studies until about the middle of the college course. These studies should be organized and related in a system, and connected with the underlying system of prescribed studies. The principle of freedom should be introduced gradually, not suddenly. A form of this view which finds a good deal of support is that elective studies should be introduced first of all in the form of extensions of subjects already studied by the student, in order that he may make his first experiment of choice in an area where he is most familiar. According to this view the second stage of elective studies should be the introduction of large general courses in leading subjects, accompanied by special courses for students of exceptional ability in special directions, and finally leading to as high a degree of specialization as the resources of the college will allow.

Modes of Instruction.— Instruction is still mainly conducted by recitation and lecture, the recitation finding its chief place in the earlier and the lecture in the later part of the course. For purposes of recitation the classes are divided into sections of 25 or 30 students, and the exercise is usually based on a definitely allotted portion of some standard text-book. Much has been done to improve the character of this exercise. The correction of mistakes, the attempt to lead the student to discover the cause of his mistakes, and the endeavor to teach the entire class through the performance of each individual, is the aim of the more skilful instructors. The professors most skilled in the art of conducting recitations, rather than those who depend wholly on lectures, leave the most abiding impression. While instruction by recitation continues with effectiveness in the latter part of the course, especially with smaller groups of students, yet instruction by lecture is the rule. The lecturer may have to face a class which enrolls as many students as the whole college contained a generation ago. He delivers his lecture, while those before him take notes, or as they listen, read a printed syllabus prepared for the use of the class, and add such jottings as may seem desirable. In many lecture courses the recitation is employed as an effective auxiliary.

But other forms of instruction find place. In all except elementary courses in science the laboratory plays a most important part, and even in lectures in introductory courses in physics, chemistry, or biology full experimental illustration is the rule. The library serves as a sort of laboratory for the humanistic studies. Students are encouraged to learn the use of the college library as auxiliary to the regular exercises of the curriculum. Certain books are appointed as collateral reading, and the written examination at the end of the term often takes account of this outside reading. That prolonged reading, which gives such wide and assuring acquaintance with the important literature of any subject, is as yet unattempted in a really adequate degree.

The academic year is divided into two (sometimes three) terms. At the end of each term the student is required to pass a fairly rigorous set of written examinations. Oral examinations have largely disappeared. Very rarely a high record of attainment in recitations during the term entitles a student to exemption from examination. In awarding honors the old academic college confined itself almost entirely to general honors. Honors for general eminence still remain in most colleges. The rank list of the class at graduation either arranges the students in ordinal position (in which case the first honor-man still appears) or else divides the class into a series of groups arranged in order of general scholarly merit. In such cases the old first honor-man is one of the select few who constitute the highest group in the class. But special honors in particular studies, while not unknown in the past, are really a development of our time. Undoubtedly they have tended to increase the interest of abler students in their favorite studies. A student trying for special honors is, of course, specializing in some sense, though he is not ordinarily pursuing original research. He is rather enlarging and deepening his acquaintance with some one important subject, such as history or mathematics.

Student Life.— At 18 the typical student of the older eastern college has completed a four-year course in some secondary school. He finds near at hand a local entrance examination conducted by a representative of his intended college. The days and exact hours of examination and the examination papers are the same as for the examination held at the college. His answers are sent on to be marked and estimated. In a week or two he receives notice of his admission to the freshman class.

Having passed his entrance examinations, he is now entitled to secure rooms in one of the dormitories, or else to find quarters outside the college campus in town. In the following autumn his name is enrolled in the matriculation book and his student career begins. His newness and strangeness naturally pick him out for a good deal of notice on the part of the older students, especially those of the sophomore class. But these annoyances soon cease unless he be vain or «very fresh.» The daily round of college exercises demands his attention, and in the class room he begins to pass through a process of attrition more beneficent in its spirit. Under the steady measuring gaze of the instructor, and the unuttered but very real judgment of his classmates who sit about him, he begins to measure himself and to be measured by college standards. He is learning something not down in the books! and what he is thus discovering is well pictured in the words of Prof. Hibben: «There is a fair field to all and no favor. Wealth does not make for a man nor the lack of it against him. The students live their lives

upon one social level. There is a deep-seated intolerance of all snobbishness and pretension. The dictum of the 'varsity field, 'No grandstand playing!' obtains in all quarters of the undergraduate life. It signifies no cant in religion; no pedantry in scholarship; no affectation in manners; no pretense in friendship. This is the first and enduring lesson which the freshman must learn. He learns and he forgets many other lessons, but this must be held in lively remembrance until it has become a second nature." His college comradeship continues and constitutes his social world. Day after day, term after term, they are thrown together in all the relationships of student life. Truly the American collegian is brimful of the "gregarious instinct."

In addition to this ever-present gregarious comradeship which environs and inspires him, our entering freshman finds the deeper intimacies of close individual friendship. As a matter of course he has some one most intimate friend, generally his room-mate or "chum." Side by side they mingle with their fellows. They stand together and, it may be, they fall together, and then rise together. And thus the class is paired off, and yet not to the lessening of the deep class fellowship. Here indeed is a form of communism, temporary and local, but most intense. They freely use things in common, not excepting the property of the college. They are welcome to enter each others' rooms at pleasure and use their friends' tobacco and stationery, or to borrow such articles of furniture and bric-a-brac as will brighten their own rooms for some special occasion. Money, however, stands on a different basis from other valuables. It is freely loaned for an indefinite time, but is strictly repaid. A student who lends his fellow money at interest cannot live in a college community.

Our student, unless he is an unusual recluse, takes some part in athletics. If he is not able to win a place on the football team or baseball nine or crew, which represents his *alma mater* in intercollegiate contests, he is very likely to be found playing ball in some organization improvised for the day, or trying his hand at tennis or golf. The bicycle is a necessity of his life, and on it he rides to recitations and lectures, to his meals and to the athletic field.

He has still other interests outside the curriculum. He may be a member of the voluntary religious society of the students. Perhaps he gets a place on the glee club or dramatic club. He may become one of the editors of the daily college paper or of the monthly literary magazine. Perhaps he is manager or assistant business manager for one or another undergraduate organization. Then there are the whist clubs and time-consuming chess clubs. There are also circles for outside reading and discussion springing up around the course of study, as well as the societies which train in speaking and debating. Perhaps he may win the distinction of representing his college in an intercollegiate debate, and success in intercollegiate debating is highly coveted. The contestants are greatly honored, for debating and athletics form the principal bond of union between the different colleges and give to their participants intercollegiate distinction.

Until the student passes out of freshman year, he is not always free to choose what kind of clothes he will wear. In some colleges freshmen are not allowed to wear the colors, except on rare occasions. But as soon as he becomes a sophomore he is free to do as he likes. Then he and his classmates suddenly appear wearing various hats, picturesque and often grotesque in appearance, and revel particularly in golfing suits. Toward the close of the course their daily dress becomes more conventional, though the universal interest in athletics continues to affect the student mode to the end. He has other amusements besides athletics, and these again are found in the student circle. His briarwood pipe goes with him almost everywhere. In the evening, when the work of the scholastic day is done, he sits with his comrades at an unconventional "smoker," or else they may gather round the table of some restaurant with pipe and "stein"; for the American student who drinks at all prefers beer to either wine or whiskey. At such evening sessions the different phases of student politics are discussed again and again. College songs are sung, the air being carried in that sonorous baritone which is the dominant sound in all our student music. Tales and jests fill out the hour. At the end the college cheer is given as the men start strolling homeward, singing as they go. Arrived on the campus they disperse, and their good-night calls echo from the doors and windows of the different dormitories. And so the day ends where it began; within that closed circle where every student lives in "shouting distance" of the others.

Our former freshman is getting on bravely toward the end of his course. The closing months of senior year pass swiftly. His class procession is preparing to march out into the world, and there take its place as a higher order of freshmen in the long file of the classes of alumni advancing with their thinning ranks toward middle manhood and beyond,—and when commencement is over his undergraduate life is ended.

What has he acquired in the four years? At least some insight into the terms and commonplaces of liberal learning and some discipline in the central categories of knowledge, some moral training acquired in the punctual performance of perhaps unwelcome daily duty and some reverence for things intellectual and spiritual. He is not only a very different man from what he was when he entered, but very different from what he could have become had he not entered. He is wiser socially. He is becoming cosmopolitan. Awkwardness, personal eccentricity, conceit, diffidence, and all that is callow or forward or perverse have been taken from him, so far as the ceaseless attrition of his fellow-students and professors has touched him. He has been unconsciously developed into the genuine collegian. He is still frank and unconventional. But he has become more tolerant, better balanced, more cultivated, and more open-minded, and thus better able to direct himself and others. It is little wonder his student affiliations last. As he goes out to take his place among the thousands of his fellow alumni it is natural that his and their filial devotion to their academic mother should last through life. No matter what university he may subsequently attend, here or abroad, his college allegiance

remains unshaken. It is this which explains the active interest shown by our alumni. In the best sense they advertise their college to the public, and it is to their exertions the recent rapid advancement of many of our colleges is largely due.

Organization and Administration. — The form of government is simple. A college corporation, legally considered, consists of a body of men who have obtained the charter and who hold and administer the property. Where a particular State has established a college or even a university, which regularly includes a college, the members of the corporation are commonly styled regents, and are appointed by the State to hold office for a limited term of years. But most colleges have been established as private corporations. In this case the title is vested in a board of trustees, sometimes composed of members who hold office for life, or else composed of these associated with others who are elected for a term of years. Boards of trustees holding office for life usually constitute a close corporation, electing their own successors as vacancies occur. The two chief functions of such governing bodies, whether known as regents or trustees or by any other name, are to safeguard the intent of the charter and to manage the property. They give stability to our college system. To carry out the main purpose for which the charter was obtained they create a faculty of professors and instructors and entrust the general headship to a president. The president and professors usually hold office for life. In some places provision is made for the retirement of professors on pensions as they grow old. Instructors and sometimes assistant professors are appointed for a limited time, such appointments being subject to renewal or promotion. In the larger colleges the president is assisted in his administrative work by one or more deans. By immemorial tradition the president and faculty are charged with the conduct of the entire instruction and discipline. They have the power to admit and dismiss students. The conferring of degrees belongs to the corporation, but this power is almost invariably exercised according to recommendations made by the faculty. Honorary degrees, however, are sometimes given by the trustees or regents on their own initiative.

In State colleges the income is derived from taxation; in others from endowments, often supplemented by annual subscriptions for special purposes. But the private colleges are cut off from dependence on the State, and have to rely on private gifts. This stream of private liberality flows almost unceasingly. The fact that many colleges are integral parts of real or so-called universities makes it difficult to say how much the specifically collegiate endowments and incomes amount to. But a few significant facts may be mentioned. No college president, unless he is at the same time the president of a university, receives as high a salary as $10,000 annually. He is more likely to receive $4,000, $5,000, or $6,000. While $2,000 is considered a good professor's salary in small colleges, $3,000 is a usual salary in the larger colleges, while few professors receive more than $4,000.

The expenses of individual students vary greatly. In some places there is no charge for tuition; in others they must pay as much as $100 or $150. In little country colleges the total cost for a year often falls within $300; in the larger old eastern colleges, drawing patronage from all parts of the land, the student who must pay all his bills and receives no aid in the form of a scholarship can hardly get along with less than $600 or $700, exclusive of his expenses in the summer vacation. The average expenses in some of the oldest colleges, according to tables prepared by successive senior classes, is higher than this, running up to $800 or $900, or even more. But these institutions afford the student of limited means multiplied opportunities for self-help. Moreover many colleges possess scholarships which are open to able students who need temporary pecuniary help. The young American of narrow means, if he be of fair ability and industry, can almost always manage to find his way through college.

The College is American.— The college lies very close to the people. Distinctions of caste may manifest themselves occasionally, and yet the college is stoutly and we believe permanently democratic. Its relation to the better side of our national life has been profoundly intimate from the beginning. The graduates of Harvard and Yale in New England, of Princeton and Columbia in the Middle States, and of the College of William and Mary in Virginia contributed powerfully to the formation of our republic. Edmund Burke attributed the "intractable spirit" of the Americans to "their education," and by this he meant the college education. "The colleges," wrote President Stiles, of Yale shortly after the Revolution, "have been of signal advantage in the present day. When Great Britain withdrew all her wisdom from America this revolution found above 2,000 in New England only, who had been educated in the colonies, intermingling with the people and communicating knowledge among them." John Adams of Harvard delighted to find in President Witherspoon of Princeton "as high a son of liberty as any in America." Hampden-Sidney College in Virginia, founded about the time of the Revolution, incorporated in its charter the following clause: "In order to preserve in the minds of the students that sacred love and attachment which they should ever bear to the principles of the ever-glorious Revolution, the greatest care and caution shall be used in selecting such professors and masters, to the end that no person shall be so elected unless the uniform tenor of his conduct manifest to the world his sincere affection for the liberty and independence of the United States of America." And from that day to this the collegiate spirit and the national spirit have been at one. Rightly, indeed, did our appreciative French visitor, Baron Pierre de Coubertin, perceive that the place to find "the true Americans" is in our college halls; "*les vrais Americains, la base de la nation, l'espoir de l'avenir.*" Scarcely one in a hundred of our white male youth of college age has gone to college. But this scanty contingent has furnished one half of all the presidents of the United States, most of the justices of the supreme court, not far from one half of the Cabinet and of the national Senate, and almost a third of the House of Representatives. No other single class of equal numbers has been so potent in our national life.

Statistics.— College students are found in greatest numbers in the belt beginning in New

England, passing southwestward through the Middle States, and thence extending broadly across the middle west. These northeastern and north-central portions contain 70 per cent of the college students and 63 per cent of the population of the whole country; 114 colleges, exclusive of colleges for women, enrolling 31,941 students and generally possessing the largest endowments, are under no ecclesiastical control; 59 colleges, enrolling 5,954, are Roman Catholic; 284 are under the control of various Protestant denominations and enroll 29,104. It thus appears that the division of student enrollment between non-sectarian and sectarian colleges is not very uneven, but the non-sectarian colleges show an average enrollment of nearly 300 and the church colleges of about 100.

A little more than half our collegiate undergraduates, who seek any degree, are studying for the degree of bachelor of arts, which still generally means, with some important exceptions, that they have had a classical education. The figures for the bachelor of letters and the bachelor of philosophy may be properly associated in one total as representing the intermediate type, which enrolls a little more than one third of the number studying for the bachelor of arts. The figures for the bachelor of science do not materially differ from the total for the bachelor of philosophy and bachelor of letters.

ANDREW FLEMING WEST,
Professor of Latin in Princeton University.

College Park, Md., a village in Prince George County, on the Baltimore & O. R.R., about nine miles northeast of Washington, D. C. It is a favorite suburb of Washington, and contains an experiment station and the Maryland Agricultural College. Pop. 325.

College View, Neb., a village in Lancaster County, about four miles southwest of Lincoln. The village is really a cluster of houses, stores, and workshops, built around or near Union College, a Seventh-Day Adventist institution established in 1891. Pupils from several places in Europe are in attendance at this school. Pop. 900.

College of the City of New York, The, originally entitled the Free Academy, was established in 1848, for boys, by the board of education of New York City. In 1854 the legislature of the State passed a law endowing the school with collegiate powers and privileges; and in 1866 the name was changed to that of "The College of the City of New York." The institute possesses all the powers and privileges of a college pursuant to the revised statutes of the State of New York relative to colleges, visitation of regents of the university, granting of degrees, etc. Prior to 1882 one condition for admission was attendance for at least one year at the public schools of the city. In the year 1882 the legislature repealed so much of the statute as related to this condition, and now the college is open to all young men of the city of proper age and preparation. Instruction, the use of text-books, and apparatus are free. The courses of study extend over seven years, three academic or preparatory and four collegiate years. The number of students in attendance in 1903, 2,200; number of graduates, 200; volumes in library, 36,876. Purchases of books are made with the income of the Seth M. Grosvenor fund of $30,000 and the Ephraim Holbrook fund of $5,000. In 1903 plans were perfected for the removal of the institution from 23d Street and Lexington Avenue to Washington Heights, in the upper part of the city. The new buildings already designed will eclipse in size and beauty any like institution in the United States, if not in the world.

Collége de France, kŏl-lăzh dė fräns, a celebrated institution founded by Francis I. in 1530, originally a *Collége de Trois Langues* or a college in which would be taught Greek, Hebrew, and Latin, is a very important educational institution, now giving instruction over a very wide field of literature, history, and science. It is independent of the University of France, is under the direct supervision of the minister of public instruction, and is supported by the government. As in the Sorbonne, the lectures are gratuitous, and for the most part are designed to attract auditors older than ordinary university students. The college comprises two faculties, one literary, one scientific; each has about 20 professors. Among the professors have been some of the most distinguished scholars and scientists in France, such as Laboulaye, Gaston de Paris, Saint-Hilaire, Ramus, Rollin, and many others.

College Fraternities. See GREEK LETTER SOCIETIES.

Colleges for Women, institutions of higher learning, designed to give women practically the same advantages of instruction and research as are afforded to men. They are of three types: independent or separate colleges; coördinate or affiliated colleges, connected more or less closely with an older college for men, and coeducational colleges.

1. Independent colleges for women of the same grade as those for men are peculiar to the United States. The earliest foundation was Mount Holyoke College, opened as a seminary in 1837; reorganized as a college in 1893. It has graduated more than 3,000 students. The first charter for a collegiate institution founded only for women in the United States, was granted Elmira College in 1855. The four colleges, Vassar, opened in 1861; Smith, in 1875; Wellesley, in 1875, and Bryn Mawr, in 1885, are ranked among the 58 leading colleges of the United States in point of endowment and wealth of equipment, number of teachers and students, and variety of courses of study offered. Wells College, founded as a seminary in 1868, chartered a college in 1870, and the Woman's College of Baltimore, opened in 1888, also have good endowments and high standards. The standing of all these institutions is higher than many of the so-called universities of the country, and the degrees conferred are the same as those given in the men's colleges.

2. The affiliated colleges for women are five: Radcliffe College, at Harvard University, opened in 1879; Barnard College, at Columbia University, in 1889; Woman's College, of Brown University, in 1892; College for Women, of Western Reserve University, in 1888; Sophie Newcomb Memorial College, at Tulane University, in 1886. In all these colleges the standards of entrance and graduation are the same as in the men's colleges with which they are affiliated, and usually the instructors are the same.

3. The prevailing system of education in the United States for both men and women, began in Oberlin College, in Ohio, founded in 1833, chartered as a college in 1850, built "for the education of both sexes and all colors." Antioch College, also in Ohio, followed in 1853, by admitting both men and women on equal terms. In 1900 every State university in the country, except those of Virginia, Georgia, and Louisiana, admitted women. Of the 480 colleges for men in the United States enumerated by the commissioner of education, 336, or 70 per cent, admit women, or, omitting Catholic colleges (which do not admit women), 80 per cent. In the list of the 58 leading colleges in the United States there are only 10 to which women are not admitted in some departments.

Many professional schools and colleges have been opened to women in theology, law, medicine, dentistry, pharmacy, schools of technology, and agriculture, and the number of women entering these professions is increasing rapidly.

In 1890–1900 the increase of women students in medicine was 64.2 per cent; in dentistry, 205.7 per cent; in pharmacy, 190 per cent; in technology and agriculture, 194.7 per cent.

There were, in 1900, in the United States, more than 20,000 women college graduates, and the number is growing so rapidly that it may be considered a national movement. In Europe the advance in this direction has been much slower. The first woman's college in Cambridge, England, was begun in 1869. Now Oxford and Cambridge give large opportunities to women, but do not confer upon them their degrees. With these exceptions, all the greater English and Scotch universities and colleges in Great Britain and in her colonies give their degrees to women. Outside of Germany, Austria, and Russia, all European university degrees are open to women. Yet Russia has the distinction of having first given women the opportunity of studying medicine on the same terms with men, and to most of the lecture rooms of German-speaking universities women are admitted by special favor, while every year sees more German universities giving their highest degrees to women.

Other colleges in the United States for women are: Trinity College, Washington, D. C., faculty, 25, nearly all of whom are Sisters of the order of Notre Dame; College de Notre Dame de Maryland, Baltimore, Md., faculty, school Sisters of Notre Dame and seculars; College of St. Agnes, Mount Washington, Md.; St. Elizabeth's College, Convent Station, N. J., faculty 25, 20 Sisters of Charity, and 5 seculars; St. Mary's College, Notre Dame, Ind.; and Notre Dame College, San Francisco, Cal.

ALICE FREEMAN PALMER,
Late President Wellesley College.

Colleges, Land Grant, colleges established and maintained in whole or in part by the Land Grant Act of 2 July 1862. Justin S. Morrill, a representative from Vermont, introduced in Congress the first bill asking that grants of government land be donated for the purpose of aiding in the education of the people, in scientific and technical subjects. This bill, introduced in the lower House 14 Dec. 1857, authorized the establishment of colleges of agriculture and mechanical arts in all States, and provided for the support of said colleges, 20,000 acres of land for each senator and representative. The bill passed both Houses but was vetoed by President Buchanan. In December 1861 Mr. Morrill introduced a new bill, bestowing 30,000 acres of land for each member of Congress for the establishment and maintenance of industrial colleges. Ben Wade, of Ohio, introduced the bill in the Senate. The House committee on public lands made an adverse report, but the bill passed both Houses and was approved by President Lincoln 2 July 1862. This act gave to the cause of industrial education 30,000 acres of land for each senator and representative in Congress to which the States were entitled by apportionment of the census of 1860, or in all, about 13,000,000 acres of land for educational purposes. The act was entitled "An act donating public lands to the several States and Territories who may provide colleges for the benefit of agriculture and mechanical arts." The object of the act is expressed as follows:

"The endowment, support and maintenance of at least one college where the leading objects shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and mechanic arts, in such manner as the legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life."

In 1889 Mr. Morrill and others began to form plans to secure another appropriation, and Mr. Morrill introduced another bill in Congress, providing that there shall be appropriated annually to each State out of the funds arising from the sale of public lands, the sum of $15,000 for the year ending 30 June 1890, and an annual increase by the additional sum of $1,000 to such appropriation for 10 years thereafter until the appropriation shall become $25,000, at which figure it shall remain fixed.

The bill passed both Houses and was approved by President Harrison 30 Aug. 1890. The act says that this appropriation shall be applied "only to instruction in agriculture, the mechanic arts, the English language, and the various branches of mathematical, physical, natural and economic science, with special reference to their applications to the industries of life, and to the facilities for such instruction." Provision was made at this time for separate institutions for white and colored students in such States as desired to make this arrangement.

The reports for the year ending 30 June 1901, received by the Commissioner of Education from the presidents of the land grant colleges, show that the States have received 10,320,843 acres of land, of which 1,030,572 acres remain unsold. The invested funds from the sale of the land amount to $10,806,780, yielding an income of 6.3 per cent. Unsold lands are held by 17 States.

The total number of students in the agricultural and mechanical departments was 29,950, of which number 23,872 were men and 6,978 women. (For information in detail about each land grant college, consult 'Report of Commissioner of Education,' Vol. II. 1901.)

Colleges for Teachers, or colleges in which are special departments for the study of the history of education, psychology as applied

to teaching, pedagogy, and all subjects bearing upon methods of instruction.

To the English schoolmaster, Richard Mulcaster, is given the credit of being one of the first, if not the first, to propose a college for the training of teachers. He classified his chief reasons for desiring the establishment of such a school under four heads: (1) Importance of the work, it will make or mar the State; (2) The great numbers who are to teach and be taught; (3) Need of the profession of teaching, professors must be trained; (4) That teachers may acquire wisdom in arranging and presenting subjects, in economizing time, and that they may attain staidness of demeanor.

Instruction in the science and art of teaching was included in the university scheme that was proposed for Columbia College in 1858, but then without avail. Again President Barnard urged the same plan, which he now worked out much more fully, upon the trustees of the same college in 1881 and 1882. The next step forward was the organization in New York, in 1888, of Teachers' College, which was chartered the following year. While this college was organized outside of the Columbia system, it was still under the control, in great part, of Columbia men, and was loosely affiliated with the college. The last step in the evolution came in 1898, when Teachers' College was made an integral part of the educational system of Columbia University. The president of Columbia is president also of the college, and the university professors of philosophy and education and of psychology are members of its faculty, while the college is represented in the university council by its dean and an elected representative. The college, however, continues its own separate organization, having its own independent board of trustees, which is charged with the sole financial responsibility of its management.

Teachers' College is the professional school of Columbia University for the study of education and the training of teachers, ranking with the schools of law, medicine, and applied science. The university accepts courses in education as part of the requirement for the degrees of A.B., A.M., and Ph.D.; while graduate students who prefer to devote their entire time to professional study may become candidates for the higher diploma of the college. The college diploma is conferred upon students who have successfully completed some one of the general courses, and a departmental diploma upon those who have fitted themselves for particular branches of school work. Undergraduate students of Columbia and Barnard colleges may, if they desire, obtain the diploma of Teachers' College at the same time that they receive the degree of bachelor of arts. The Horace Mann school, fully equipped with kindergarten, elementary, and secondary classes, is maintained by Teachers' College as a school of observation and practice.

These are the undergraduate courses: Secondary course leading to the degree of A.B. and the college diploma; general course leading to the college diploma in elementary teaching; general course leading to the college diploma in kindergarten teaching. Then there are several courses leading to the college diploma in art, domestic art, domestic science, and manual training. Candidates for the first of these courses must be either college graduates or candidates for the degree of A.B. in Columbia University. There is a combined course of study prescribed for the degree of A.B. in Columbia University and the diploma of Teachers' College; but particulars must here be omitted. Graduate work is also well developed. For the year 1898-9 the teaching staff counted more than 60 persons.

New York University School of Pedagogy, established in 1890, aims to furnish graduate work equal in range to other professional schools. The school is an organic part of the university, having its own dean and faculty. More definitely, its aim is declared to be to furnish thorough and complete professional training for teachers. The plan of the school places it upon the same basis as that of the best schools of law, medicine, and theology. The work is of distinctively university grade, and graduates of colleges and normal schools, and others of equal experience and maturity, may find in this school opportunity for the thorough study of higher pedagogy. In 1898-9, the instruction was distributed in four major and eight minor courses, namely, history of education; physiological and experimental psychology; analytical psychology; history of philosophy; physiological pedagogics; elements of pedagogy; comparative study of national school systems; æsthetics in relation to education; sociology in relation to education; institutes of pedagogy, ethics, school organization, management, and administration. Special facilities for research are offered to the seminaries. The degree of master of pedagogy is conferred upon candidates who have completed five of the foregoing courses, three of them majors; the degree of doctor of pedagogy, upon candidates who have completed the four major and five of the minor courses. The school does not attempt undergraduate work. There is no practice teaching, but opportunity is given for the critical observation of selected schools. The staff includes 10 persons.

Clark University, opened in 1889, has given much attention to education from the first, and the subject has now been made a sub-department in the department of psychology, in which a minor may be taken for the degree of doctor of philosophy. The work is intended to meet the needs of those intending to teach some other specialty than education, but who wish a general survey of the history, present state, methods, and recent advances in the field of university, professional, and technical education, and of those who desire to become professors of pedagogy, or heads of instruction in normal schools, superintendents, or to become professional experts in the work of education. The program for the year 1899 included (1) child study, educational psychology, and school hygiene; (2) principles of education, history of education and reforms, methods, devices, apparatus, etc.; (3) organization of schools in different countries, typical schools and special foundations, motor education, including manual training, physical education, etc., moral education, and ideals. Great stress is placed on original investigation. The president, Dr. G. Stanley Hall, has been from the first the leader of the child study movement in the United States. 'The Pedagogical Seminary,' edited

by him, is the organ of the educational department of the university. It is an international record of educational research and literature, institutions, and progress, and is devoted to the highest interests of education of all grades. One of its most valuable features is its digests of meritorious contributions to educational literature.

The department of pedagogy in the University of Chicago has as its primary aim to train competent specialists for the broad and scientific treatment of educational problems. The courses fall under three heads: Psychology and related work, educational theory, and the best methods of teaching the various branches. Stress is laid upon the relation of pedagogy to other subjects, and courses are offered in the proper departments in which the methodology of such subjects is employed. For the year 1898–9 such courses were offered in history, sociology, and anthropology, in the English, German, and Latin languages and literatures, in mathematics, and in geology. The courses in educational theory are preceded by the introductory courses in psychology, ethics, and logic, given in the department of philosophy.

The University of Chicago has also established a college for teachers on a somewhat novel plan. This institution, which was founded in October 1898, is an outgrowth of the class study department of the extension division of the university. It is a "downtown" college, and aims to provide instruction of high grade for busy people; or, more definitely, "for any and all persons qualified to do the work, who are so engaged by other imperative duties as to make continuous attendance at the other colleges of the university impracticable." The work of the new college is of the same grades as that of the other colleges of the university. Students may take much or little, according to their ability and wishes, but when the requirements have been met, the work is crowned with a degree. The school aims at scientific, cultural, and disciplinary results. It distinctly denies that it is in any sense a normal school. Moreover, while it is not exclusively a teachers' school, the college, nevertheless, emphasizes instruction suitable to the special needs of teachers sufficiently to justify its name. The distinctively pedagogical teaching, like all the teaching, looks to knowledge and scientific training rather than to practical applications. At the close of its first year of life the outlook is an encouraging one. See UNIVERSITY OF CHICAGO.

The University of Wisconsin school of education is an expansion of the former department of education. The four main lines of instruction are the history, the philosophy, the science, and the practice of education. The school aims to afford practical and healthful instruction to intending teachers, professors, principals, and superintendents, and to those students who desire to pursue studies and investigations in the science of education.

Collegeville, Minn., village in Stearns County, on the Great N. R.R., nine miles northwest of St. Cloud. St. John's Abbey and St. John's University, in charge of members of the order of St. Benedict, are the chief parts of the village. The university was opened in 1867. The number of students is greater than the number of inhabitants of the village.

Collegeville, Pa., a borough in Montgomery County. It is situated on the Perkimon River, the Philadelphia & R. R.R., and is 27 miles northwest of Philadelphia. Ursinus College, established in 1870, is an institution belonging to the German Reformed Church. The manufactures are iron machinery and boilermaking. Pop. 700.

Collegians, The, a novel by Gerald Griffin (1828). The incidents of the book are founded on fact, having occurred near Limerick, Ireland. Like most other novels of its period, it is diffuse and over-sentimental; but it is likely to live for its faithful delineation of Irish character at its best — and worst. See COLLEEN BAWN.

Collembola, kŏl-lĕm'bō-la, a group of wingless insects called springtails. Formerly associated with the *Thysanura* or bristletails, they are now regarded as constituting a distinct order. Compare BRISTLETAIL.

Colles, kŏlz, **Christopher,** American philosophic adventurer: b. Ireland about 1738; d. New York 1821. In 1765 he set out, a wanderer from his native land, and we find him in Philadelphia in 1772, delivering lectures upon pneumatics, illustrated "by a variety of curious and entertaining experiments in an air pump lately invented by him." He is reported to have been the first individual who undertook to build a steam engine in this country. In April 1774 he proposed to erect a reservoir for the purpose of conveying water through the several streets of the city of New York. His proposals were "read and referred." In 1775 he delivered lectures on gunnery, and was further employed in giving instruction to the artillery department of the American army in the principles of projectiles. He was selected from time to time by detachments of the artillery corps in different stations to give them lessons on the momentum and direction of the cannon ball, continuing in this employment until the arrival of Baron Steuben in 1777. Colles was the first person who suggested canals and improvements to connect Lake Ontario with the Hudson. According to the records of the assembly of New York, in November 1784 he presented a memorial on the subject, and in April following a favorable report was made thereon. As the War of the Revolution arrested the progress of his measures for supplying the city by his reservoir, which he designed to be erected, with other works, between Pearl and White streets, we find his name again recorded as an applicant for a contract to convey water through the city by means of pipes. Dr. Brown recommended to the common council the Bronx River for that purpose, and this, it is affirmed, is the first indication on record that a supply was to be looked for from without the city. Doubtless the original suggestion of the Bronx came from Colles. In 1808 Colles published an elaborate pamphlet on the interests of the United New York, and in 1789 published a book of roads through New York. The constitution of the United States being adopted, and the duties on spirits established by Congress, both the hydrostatics and the chemistry of Colles were called into requisition, and he was appointed to test the specific gravity of imported liquors. He was never idle. His devices to secure an "honest livelihood" were

almost countless. His various knowledge was admitted, his science was considered real, yet he seemed to be perpetually appropriating it to merely conjectural measures. The victim of penury, his integrity was never questioned. His long career proved useful to his adopted country in that early state of the arts when wooden axe handles were imported. Clinton included him among the earliest and prominent instigators of the canal policy, and Hosack has recorded his services. Humble as was his condition, Hamilton paid him marked deference, and often visited him. Jefferson corresponded with him. Jarvis painted his portrait. When the great celebration in November 1825 took place, on the completion of the canal, the effigy of Colles was borne among the emblems which characterized that vast procession.

Collet, kŏl'lĕt, **Jakobine** (yä'kō-bēn) Camilla, Norwegian novelist: b. Christiansand 23 Jan. 1813; d. Christiana 7 March 1895. Her works, in many of which she champions the political emancipation of women, have had very wide circulation. Among them are: 'In the Long Nights' (1863); 'A Bright Picture in a Dark Frame'; 'Against the Current' (1879); 'The Magistrate's Daughters' (1885).

Col'lie, the domestic sheep-tending dog developed in Scotland, and for a long time bred there exclusively, but now known in all parts of the world. It is one of the most beautiful, and perhaps the most intelligent of all dogs, and many anecdotes are told illustrative of its sagacity. Collies have for hundreds of years aided the Scotch shepherds in caring for their flocks, under all conditions and in all sorts of weather. To meet the inclemency of stormy days and cold nights, these dogs have acquired an outer coat of thick, rough hair, black or black-and-tan in color. It has an undercoat so close and soft that, even when it is parted, one can scarcely see the dog's skin. The chief points of these dogs are: long, sharp heads; bright, keen eyes, set rather close together; small ears, drooping at the tips; a full ruff of hair around the neck; strong, wiry frames; and rounded feet. Their intelligence is remarkable — almost human; and their affection so constant that they have been known to die of grief after the death of a master.

The collie measures from 22 to 24 inches at the shoulder, and weighs generally from 45 to 60 pounds. He is as alert as a fox, and as fleet as a deer. In fact, no dog, except the greyhound can excel him in speed and grace of movement, and it is safe to state that no dog is so faithful and trustworthy a companion to man, for the collie gives implicit obedience and unfaltering loyalty to his master, and will yield his life rather than desert his master's charge. This it is that makes him invaluable as a sheep-dog. Detailed information in regard to the collie may be found in most books relating to dogs (q.v.), and special books treating of him from the point of view of both the shepherd and the fancier are accessible. Consult Lee, 'Collie or Sheep-Dog'; and Wickham, 'Practical Training of the Shepherd Dog.'

Collier, kŏl'yĕr, **Ada Langworthy,** American writer of verse: b. Iowa 1843. Her principal work is 'Lilith, the Legend of the First Woman' (1885).

Collier, Arthur, English philosopher: b. Langford Steeple, Wiltshire, 12 Oct. 1680; d. there 1732. He was educated at Pembroke and Balliol colleges, Oxford, and in 1704 became rector of Langford, a living which had belonged successively to his great-grandfather, grandfather, and father, and which he retained till his death. In 1713 he published a work entitled 'Clavis Universalis,' in which he maintained both the non-existence and the impossibility of the existence of any objects external to the mind. Berkeley had three years before advanced incidentally his theory of the negation of an external world, but the two philosophers appear to have had no knowledge of each other, and it is certain that Collier meditated upon his opinion for 10 years before promulgating it. Though they developed simultaneously the first systematic scheme of absolute idealism, and though Collier was inferior to his contemporary rather in the graces of composition than in acuteness or method, yet the 'Clavis Universalis' attracted not the slightest attention in England. In Germany a copious and able abstract of its contents was given in 1717, in a supplemental volume of the 'Acta Eruditorum,' and it was quoted by Wolf, Bilfinger, and others. In 1756 a complete translation of it into German was made by Eschenbach. Thus rendered accessible in Germany, Collier has enjoyed among the thinkers of that country high repute for talent and originality, and the best comparative view of his doctrines and those of Berkeley is that given by Tennemann. Other publications of Collier were the 'Specimen of True Philosophy' (1713); and 'Logology' (1732). In religion he was an Arian, and also a high churchman on grounds which his associates could not understand.

Collier, H. Price, American writer: b. 25 May 1860. He is a son of R. L. Collier (q.v.) and was educated at Harvard. Entering the Unitarian ministry, he was for nine years in charge of churches in Hingham, Mass., and elsewhere, and during the Spanish-American war served as a naval officer. He has published 'Essays'; 'Mr. Picket Pin and His Friends'; 'America and the Americans from a French Point of View,' issued at first anonymously.

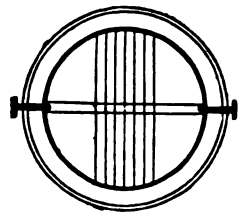
Collier, Jeremy, English bishop: b. Stow Qui, Cambridgeshire, 23 Sept. 1650; d. London 26 April 1726. He was educated at Caius College, Cambridge, entered the Anglican Church in 1677, and was rector of Ampton, Suffolk in 1679. The revolution of 1688 found in him a most zealous opponent, and he not only refused to take the oaths to the government of William and Mary, but came boldly forward in defense of his nonjuring principles, and subjected himself to repeated imprisonment, both for writings and other overt acts, which a more tyrannical government might easily have construed into treason. His political writings have almost been forgotten; but he wrote two other works, which have preserved his name, and prove him to have been a writer of distinguished ability. The one entitled 'Essays Upon Several Moral Subjects' (1697), is distinguished by learning and wit, and an easy flowing style; the other, entitled 'Short View of the Immorality and Profaneness of the English Stage' (1698), is unquestionably a masterpiece, and is still perhaps the best work written on

the subject. It enjoyed great popularity, notwithstanding the fierce opposition it encountered, especially from Congreve and Vanbrugh, and is said to have had the effect of greatly purifying both the sentiments and the language of the theatre. The only other work of Collier deserving of special notice is his 'Ecclesiastical History of Great Britain to the End of the Reign of Charles II.' (1708 and 1714). It cost him many years of labor, and displays much ability, but is strongly tinctured with his nonjuring views.

Collier, John Payne, Shakespearean critic: b. London 11 Jan. 1789; d. Maidenhead 17 Sept. 1883. He wrote many critical articles in periodicals, published in 1820 his 'Poetical Decameron,' and thenceforward continued his editions of poems and plays, notably those of the less-known Elizabethan writers. His 'History of English Dramatic Poetry' appeared in 1831. He took great interest in and edited many publications for the Camden, Percy, and Shakespeare societies, and completed in 1844 an eight-volume edition of Shakespeare. In 1852 he professed to have discovered, on the margins of a copy of the second folio Shakespeare, bought from a second-hand bookseller, manuscript notes and emendations written in a 17th century hand. When these notes and emendations were published they became the subject of eager discussion by the critics, the best of whom were not disposed to set a high value on them, and in 1859 an examination of the volume convinced the British Museum authorities that the marginal notes were forgeries. Collier published a weak and inconclusive reply, in which he maintained their genuineness, and thenceforward he maintained complete silence on the matter. He continued to produce editions of English writers, among them Spenser, and also critical and autobiographical works. Among his papers were found indisputable proofs of a long series of literary forgeries. As a consequence suspicion has rested on all his work, and has obscured the real services he indisputably did to English literature.

Collier, Robert Laird, American Unitarian clergyman and writer: b. Salisbury, Md., 7 Aug. 1837; d. near Salisbury, England, 27 July, 1890. Starting in life as an itinerant Methodist preacher, he held prominent Unitarian pulpits in Chicago and Boston, and became noted as a preacher and lecturer. In later life he was London correspondent of the New York *Herald*. Besides religious writings he published 'Henry Irving, a Sketch and a Criticism'; 'English Home Life' (1885).

Collima'tion, Line of. In a measuring telescope there is placed at the focus of the eyepiece a system of spider-threads. In a transit instrument there are seven vertical and two horizontal "wires," as shown in the diagram. In taking an observation the time at which the star passes behind each wire is noted. Taking the mean of these times, we obtain what is called the time for the "mean wire," an imaginary wire which would, if the adjustments were perfect, coincide with the middle vertical wire. The mean of these observations gives a better result than if only one central wire were used. The line of collimation is defined to be the straight line that joins the centre of the object-glass with the point of this imaginary vertical wire midway between the two horizontal wires. A definition similar to that here given applies in other cases, in the case of the mural circle, for example, and in the case of instruments for terrestrial surveying. The proper adjustment of the line of collimation of these instruments is the most important of all the adjustments. In the case of the transit instrument, for instance, in observing the passage of a star, what is noted is practically the instant, according to the observatory clock, when the line joining the eye and the star coincides with the line of collimation. The following is one of the conditions to be satisfied when the instrument is in perfect adjustment. The line of collimation must be perpendicular to the geometrical axis on which the telescope revolves, and will then describe a great circle. The framework that carries the spider-lines admits of several small movements for their adjustment. After the adjustment has been carefully made, however, there always remains a slight error, which is determined and allowed for in calculations under the name of the collimation error. Adjustments and corrections are similarly made in the other telescopes for measuring. See TRANSIT INSTRUMENT.



COLLIMATION.

Collination. See MERIDIAN CIRCLE; TRANSIT INSTRUMENT.

Collin, Heinrich Joseph von, hīn'rĭh yō'sĕf fŏn kŏl'lĭn, Austrian dramatist and lyrist: b. Vienna 1771; d. 1811. He wrote several tragedies, mostly on antique themes; of these 'Regulus,' the first of the series, is the best. His powerful 'Songs for the Militia' (1809) gave him a high rank among the balladists of the war of liberation. Of his historical ballads, 'Kaiser Max on the Walls of St. Martin's' is best known.

Collin, Louis Joseph Raphael, loo ē zhō zĕf rä-fā-ĕl kŏl lăn, French figure and portrait painter: b. Paris. He studied under Cabanel, obtained a second-class medal in the Paris Salon in 1873, and the medal of the Legion of Honor in 1884. His 'Idyl' is one of his most admired works.

Collin d'Harleville, Jean François, zhŏn fräṅ-swä kŏl lăṅ därl-vēl, French dramatist: b. 30 May 1755; d. 24 Feb. 1806. He worked a genuine vein of comedy, yet never slighted the moral side of conduct, and some of his plays still keep the stage. Notable among his works are 'The Old Bachelor,' his masterpiece (1793); and 'Castles in Spain' (1806).

Col'lingwood, Cuthbert, LORD, English admiral: b. Newcastle-upon-Tyne 26 Sept. 1750; d. at sea near Minorca 7 March 1810. He entered the royal navy in 1761, gradually rose in service, and became a close friend of Nelson. In 1799 he was made rear-admiral of the white. His most distinguished service was the part he bore in the great victory of Trafalgar, in which his gallant manner of bringing his ship (the 'Royal Sovereign') into action, and the skill and resolution with which he fought her, excited the personal admiration of Nelson himself, upon whose fall the command of the fleet devolved upon Collingwood as senior offi-

cer. He was promoted to be vice-admiral of the red, continued in his command of the fleet, and elevated to the peerage with the title of Baron Collingwood. He was distinguished for zeal, courage, humanity, circumspection, and strictness of discipline, though averse to flogging.

Collingwood, William Gershom, English writer and artist: b. 1854. He was educated at Liverpool College, and University College, Oxford. He first exhibited at the Royal Academy in 1880, while from 1881 to 1890 he was secretary to John Ruskin. He has published 'Limestone Alps of Savoy'; 'Art Teaching of Ruskin'; 'Life of Ruskin'; 'Thorstein of the Mere'; 'The Bondwoman'; 'Book of Coniston'; 'Saga-steads of Iceland'; 'Coniston Tales'; 'Early Sculptured Monuments of the Diocese of Carlisle.'

Col'lingswood, Australia, a suburb of Melbourne, lying at the northeast of that city. Pop. 33,000.

Col'lingwood, Canada, a port of Simcoe County, Ontario, situated on the south shore of Georgian Bay, and on the Breton & C., and the Medford branches of the Grand T. R.R., 75 miles northwest of Toronto. It has steamboat connections and a large trade. Among the manufactures are leather, lumber, and flour. Pop. 6,000.

Col'lins, Anthony, English theologian: b. Heston, Middlesex, 21 June 1676; d. London 13 Dec. 1729. He was educated at Eton and at Cambridge, and devoted himself to general literature. During the years 1703–4 a correspondence was carried on between him and Locke, who regarded him as having «as much of the love of truth for truth's sake as he had ever met with in anybody.» Among his numerous writings, all published anonymously, the one most commonly associated with his name is entitled a 'Discourse on Freethinking.' It attracted considerable notice at the time, and was answered, among others, by Bentley, under the assumed name of *Philelcutherus Lipsiensis.* Another work, entitled 'Philosophical Inquiry Concerning Liberty and Necessity,' was answered by Samuel Clarke. His benevolent and tolerant spirit gained the respect of many who widely differed from him on theological questions.

Collins, Edward K., American shipowner: b. Truro, Mass., 5 Aug. 1802; d. New York 22 Jan. 1878. He early entered the shipping business, and after serving as superintendent of a packet line, established in 1836 the Dramatic Packet Line, from New York to Liverpool. In 1849 the Collins line between the same ports was inaugurated. The Arctic and the Pacific of this line are memorable in the history of marine disasters. The government having withdrawn mail subsidies, the line ceased operations in 1858.

Collins, John, English poet and actor: b. Bath 1742; d. Birmingham 2 May 1808. He was a stay-maker, turned actor; and his poetic fame rests upon 'Scripscrapologia,' a collection of poems, among which 'To-morrow' is especially readable.

Collins, Joseph William, American ichthyologist: b. Isleboro, Maine, 8 Aug. 1839. His boyhood was spent on fishing schooners and he was entirely self-taught. He made the statistical inquiry into New England fisheries for the 10th United States census 1879–80, and for the United States Fish Commission, with which he remained connected until 1892. He was an official of the International Fisheries Expositions at Berlin 1880; London 1883; chief of the Fish and Fisheries department at the Chicago World's Fair 1893; and organized the section of Naval Architecture in the United States National Museum. He was a contributor to the 'Century Dictionary'; edited the 'Fishing Gazette' 1893–4; and has written many papers and reports on his specialty.

Collins, Mabel. See COOK, MABEL COLLINS.

Collins, Mortimer, English novelist and poet: b. Plymouth 29 June 1827; d. Knowl Hill, Berkshire, 28 July, 1876. He was for a time mathematical master in Queen Elizabeth's College, Guernsey, but resigned in 1856 in order to devote himself wholly to literature. His works include examples of many different styles, ranging from playful verses to political articles. The chief are the books of verse entitled 'Summer Songs' (1860); 'Idyls and Rhymes' (1865); and 'The Inn of Strange Meetings and Other Poems' (1871); and the novels, 'Sweet Anne Page' (1868), partly autobiographical; 'The Vivian Romance' (1870); 'The Marquis and Merchant' (1871); 'Two Plunges for a Pearl (1872); 'Miranda, a Midsummer Madness' (1873); 'Mr. Carington' (1873); 'Transmigration' (1874); 'Frances' (1874); 'Sweet and Twenty' (1875); 'From Midnight to Midnight' (1875); 'Fight With Fortune' (1876); 'The Village Comedy' (1876); and 'You Play Me False' (1878); in some of which his second wife, Frances Cotton, collaborated. His most successful book was the series of essays, 'The Secret of Long Life' (1871), published anonymously.

Collins, Patrick Andrew, American politician: b. Fermoy, Ireland, 12 March 1844. He came to the United States when four years old, went to the public schools until he was 16, became an upholsterer, saved money, and graduated at Harvard Law School in 1871. He served in the Massachusetts Legislature from 1869 to 1871, and was a delegate to the Democratic national conventions of 1876, 1880, 1884, 1888, and 1892. From 1882 to 1888 he sat in Congress and from 1893 to 1897 was consul-general at London. He has been prominent in the Fenian movement, the Land League, and other Irish organizations. He served as mayor of Boston 1902–3.

Collins, William, English poet: b. Chichester, England, 25 Dec. 1721; d. there 12 June 1759. He was educated at Winchester school and at Oxford, and while at college wrote his 'Oriental Eclogues', printed in 1742. Their success was moderate, and in 1744 the author went to London as a literary adventurer. In 1746 he gave his 'Odes, Descriptive and Allegorical', to the public; but the sale did not pay for the printing, and the poet burned all the unsold copies. Yet among these odes were many pieces which at present rank with the finest lyrics in the language. His best known poems are 'The Ode on the Passions,' those to Mercy and Evening, 'The Dirge in Cymbeline,' and the famous 'How Sleep the Brave.'

His odes are now almost universally regarded as among the best productions of the kind in English for vigor of conception, boldness and variety of personification, and genuine warmth of feeling. Originally too laxly strung, disappointment, distress, and irregularity disorganized his nervous system and he was confined for some time in a lunatic asylum.

Collins, William, English painter of landscapes and domestic scenes: b. London 18 Sept. 1787; d. there 17 Feb. 1847. His picture of the 'Young Fifer', exhibited in 1811, was purchased for 80 guineas, and in 1813 he at once raised himself to a position of eminence by his 'Sale of the Pet Lamb', so well known by engravings. In 1820 he was elected a Royal Academician. For his picture of the 'Fisherman's Departure,' painted in 1826, he received 350 guineas. Other noted works of his are 'Rustic Hospitality,' 'Sunday Morning,' and 'Happy as a King.' Two sacred pictures, 'Our Saviour with the Doctors in the Temple,' and 'The Two Disciples at Emmaus,' were exhibited in 1840 and 1841. A life of him was published by his son, Wilkie Collins (q.v.)

Collins, Sir William Job, English surgeon: b. London 9 May 1859. His medical training was obtained at Saint Bartholemew's Hospital, London, and he has since held various professional positions of importance. He has published 'Specificity and Evolution in Disease' (1884-90); 'Pathology of Cataract' (1897); 'Spinoza' (1889); 'Rationalism in Medicine' (1890). He was raised to knighthood in 1902.

Collins, William Wilkie, English novelist: b. London 8 Jan. 1824; d. there 23 Sept. 1889. He was a son of William Collins (q.v.). After a short time spent with a firm in the tea trade he adopted the profession of the law, and was a student at Lincoln's Inn when his father died. He wrote a biography of his father in 1848, and from that time made literature his profession. His first novel was printed in 1850, and was called 'Antonina; or, the Fall of Rome, a Romance of the Fifth Century.' 'Rambles Beyond Railways; or Notes in Cornwall Taken Afoot' (1851) was his next work, followed by 'Basil, a Story of Modern Life' (1852); 'Mr. Wray's Cash Box'; 'Hide and Seek' (1854). At about the same time he became a contributor to the magazine 'Household Words,' in which 'After Dark' and one of his most successful works, 'The Dead Secret,' were originally published. Several of his novels, including 'The Woman in White' and 'No Name,' were published originally in 'All the Year Round.' 'Armadale' and many of his subsequent stories were printed in American magazines before appearing in book form, and he is said to have received enormous prices for some of these. 'The Moonstone,' 'Man and Wife,' 'The New Magdalen,' 'The Law and the Lady' and 'Poor Miss Finch' (1872) are other works of his that have wide circulation. His unfinished novel, 'Blind Love,' was completed by Walter Besant. His principal books passed through many editions, both in England and the United States, and have also been translated into French, Italian, German, Dutch, Danish, and Russian. The works of very few modern writers have had greater circulation or acquired more general popularity than his. He also made occasional incursions into the field of dramatic writing, but in this direction he never achieved marked success. As a novelist Wilkie Collins may be said to have been deficient in the power to give a sense of reality to his creations; but in the skill to evolve and sustain a wide web of intricate plot he was altogether unrivalled.

Col'linson, Peter, English botanist: b. Hugall Hall, Westmoreland, 1693; d. 1768. A merchant in London, he yet found time for studies in natural history, which gained him the acquaintance and correspondence of the most eminent naturalists of the time. He was the means of first drawing Franklin's attention to electricity, and one of the objects of Linnæus in visiting England in 1736 was to make his personal acquaintance. He gave especial attention to botany, and to the naturalization of plants and trees in regions remote from their original habitats. He sent over to Maryland, Pennsylvania, and other Atlantic States, many foreign ornamental shrubs, which found in America a congenial soil and climate; and he introduced into England many American forest trees. He was one of the first to suggest the culture of the grape in Virginia. A genus of labiate plants is named *Collinsonia* from him.

Colli'sion, in navigation, the shock of two ships coming into violent contact, whereby one or both may suffer more or less injury. The American rules in regard to the prevention of such accidents are based upon the same principles as the British, with which they are substantially identical. The leading doctrines of the English law on this subject are thus stated by Lord Stowell: "In the first place, collision may happen without blame being imputable to either party, as where the loss is occasioned by a storm or any other *vis major,* in which case the misfortune must be borne by the party on whom it happens to light. Secondly, a misfortune of this kind may arise where both parties are to blame — where there has been a want of due diligence or skill on both sides; in such case the loss must be apportioned between them, as having been occasioned by the fault of both of them. Thirdly it may happen by the misconduct of the suffering party only, and then the rule is that the sufferer must bear his own burden. Lastly, it may have been the fault of the ship which ran the other down, and in that case the injured party would be entitled to an entire compensation from the other. In a court of common law the same rule holds in the first, third, and fourth cases; but in the second (where both parties are to blame) the rule is, that if the negligence of both substantially contributed to the mishap, neither has an action against the other; but if one of them, by exercising ordinary care, might have avoided the consequence of the other's negligence, the former is liable for any injury sustained by the latter." In pursuance of the Merchant Shipping Amendment Act (1862), orders were issued in 1863, 1879, 1884, and 1885, giving regulations for preventing collisions. These contain rules concerning lights and fog-signals, and sailing and steering rules. With respect to lights it is enacted that steamers shall, when under way, carry a white mast-head light, on the starboard side a green, and on the port a red light; when towing other vessels they must

carry two mast-head lights, placed vertically. Sailing vessels shall carry only the side lights; fishing and other open boats are not required to carry side lights, but may use a lantern with a red slide on the one side and a green slide on the other, and such lantern must be exhibited in sufficient time to prevent collision, and so that the green light shall not be seen on the port side nor the red light on the starboard side. Ships at anchor in a roadstead must exhibit a white light where it can best be seen, but not 20 feet above the hull, in a globular lantern eight inches in diameter, showing at a distance of a mile all round. The sailing and steering rules demand that if two sailing ships are approaching each other end on, or nearly so, the helms of both must be put to port, so that each may pass on the port side of the other; in crossing so as to involve risk of collision the sailing ship with the wind on the port side shall keep out of the way of the ship with the wind on the starboard, but if they have both the wind on the same side the ship which is to windward shall keep out of the way of the one that has it to leeward. If a steamship and a sailing ship are approaching so as to involve collision, the former must keep out of the way of the latter. The rules for two steamships passing or crossing are nearly the same as for sailing ships. If one vessel is overtaking another she must keep out of the way of the last-named vessel. When, according to the rules, one of the ships keeps out of the other's way, that other shall generally be understood to keep her course. See NAVIGATION LAWS; RULES OF THE ROAD.

Collo'dion (Gr. *κολλώδης*, "like glue"), a solution, in mixed alcohol and ether, of soluble pyroxylene (or "gun-cotton"). It is colorless, and very inflammable. The gun-cotton that is used in its manufacture is commonly prepared by the action of a mixture of nitric and sulphuric acids upon cotton-wool that has been boiled in a solution of sodium carbonate (to remove all greasy and resinous matters), and afterward thoroughly washed and dried. The following details are recommended for the subsequent operations: Three fluid ounces of strong nitric acid are diluted with two fluid ounces of water, and nine fluid ounces of strong sulphuric acid are added. When the mixture has cooled to about 140° F., 100 grains of the cotton-wool are added in tufts weighing about 10 grains each. At the end of 8 or 10 minutes the acid is poured off, and the cotton is subjected to gentle pressure to expel the greater part of the fluid that its fibres have retained. The cotton is next thoroughly washed with water (or weak solution of sodium carbonate) until the acid has been entirely eliminated, after which it is allowed to dry. The product is "soluble gun-cotton." It does not differ materially, in appearance, from the orignal cotton; but if the operations to which it has been subjected have been correctly carried out, it will be found that the cotton has become soluble in a mixture of equal parts of alcohol and ether. Commercial collodion contains about 60 grains of gun-cotton to each 10 ounces of the solvent. Before the advent of the dry-plate process, collodion was greatly used in photography for the preparation of sensitive plates; and at the present day it is used to some extent in this way, especially in certain branches of photo-engraving. In the preparation of these plates the collodion is first iodized or brominized by the addition of the iodides and bromides of cadmium and ammonium, and is then poured over a carefully cleansed glass plate. The volatile solvent evaporates rapidly, leaving a film of iodized gun-cotton upon the glass. Immediately before the exposure is made, the coated plate is immersed in a solution of nitrate of silver, with the result that a deposit of iodide and bromide of silver, sensitive to light, is formed in the gun-cotton layer. The plate is next exposed in the camera, and afterward developed in the usual way. Collodion is used in the place of adhesive plaster, in the case of trivial injuries, to afford protection from the air, and from pyogenic and other objectionable germs. When applied to the injured spot it quickly dries, leaving a tough, elastic coating which is impervious to moisture. It was first employed in surgery by Dr. J. Parker Maynard, of Boston, Mass., in 1847. It is also medicated in various ways, one of the best-known varieties of this sort being blistering collodion, which contains cantharides, and is applied to the skin for the purpose of producing a blister. Medicated collodion is also largely used in chiropody.

Col'loids (Gr. *κολλώδης*, "glue-like"), substances, such as albumin and silicic acid, which, when combined with water in certain proportions, exhibit a gelatinous consistency. The word does not imply that there is any chemical resemblance among the bodies to which it is applied, the distinction between colloids and non-colloids being wholly physical. The term "colloid" was proposed by Thomas Graham, in 1861, to designate substances that are practically incapable of diffusion through porous membranes. Substances such as salt, sugar, and the mineral acids, which diffuse readily through such membranes, were called by him "crystalloids." The distinction is a convenient one, and has been universally adopted by chemists and physicists. It is probable that colloidal substances do not combine with water to produce true solutions. Quincke, for example, says:

> I believe gelatinous substances, such as glue and other jellies, should be regarded as fluids in which there are numerous invisible thin partitions of firm or fluid lamellæ,— the structure of a colloidal substance being likened by him, in other words, to that of a sponge filled with water.

Similar views have also been held by other competent authorities. For a discussion of the phenomena exhibited by colloids and crystalloids in solution (or apparent solution) see DIFFUSION.

Colloph'anite (Gr. *κόλλα*, "glue" + *φαίνειν*, "to appear" = "glue-like"), a native amorphous phosphate of calcium, having the formula $Ca_3P_2O + H_2O$, and found principally on the island of Sombrero, the phosphoric acid that it contains being derived from the guano deposits there. Collophanite is white or nearly so, with a specific gravity of 2.7 and a hardness of from 2 to 2.5. The name is given on account of the glue-like appearance of the mineral.

Collop Monday, the Monday after Quinquagesima Sunday and preceding Shrove Tuesday. It was so named because on that day the faithful ceased eating flesh, meat, or collops.

Collot, d'Herbois, Jean Marie, zhŏn mä rē kō-lō dār-bwä, French revolutionary leader:

b. Paris 1750; d. Cayenne, South America, 8 Jan. 1796. He was an actor, who adopted the name of D'Herbois. On the breaking out of the French Revolution he zealously espoused the views of the ultra-party, and published his 'Almanach du Père Gérard,' which gave him much influence with the most violent revolutionists. After the events of 10 August he became a member of the Municipal Council of Paris, and a few days after the horrors of September was chosen deputy to the national assembly. He afterward became an active leader of the Mountain against the Girondists. He was sent by Robespierre along with Fouché to Lyons, in 1793, with almost unlimited powers, and was guilty of the most flagrant enormities. Declaring that he found the guillotine too tedious and formal, he introduced the method of executing wholesale by the sword and by discharges of musketry. On his return from Paris he became a determined opponent of Robespierre, and being chosen president of the convention (19 July 1794), contributed powerfully to his fall. A few weeks after his own downfall followed. On the motion of Merlin he was expelled from the assembly and banished to Cayenne.

Col'lotype Process, a method of reproducing engravings, photographs, etc., allied to photo-lithography (q.v.). It is worked universally, and is known by a variety of names: the Germans call it "Lichtdruck," the French "Phototypie," the Americans "Phototype," and the English have given it the titles of "Photo-print," "Heliotype," "Autotype," "Photophane," "Photo-mezzo-type," "Graphotone," etc.

The process is based on the well-known action of light on bichromatized gelatine. It differs from photo-lithography in that in collotype the exposed image in gelatine is employed for the actual printing surface, and not only can line subjects be printed from it, but copies of photographs, paintings, and drawings. It renders half-tones so accurately that when prints by collotype process are made on highly glazed paper with a suitable ink there is scarely any perceptible difference between them and ordinary silver prints; platinotype and bromide prints can also be closely imitated. The process is largely used for the production of view books, fac-simile copies of engravings, copies of paintings, portrait work, and for commercial illustrations. When a film of bichromate mixed with gelatine is exposed to light under a negative, then washed and dried, it will when treated like a lithographic stone absorb water where the gelatine film was protected from light by the dense portions of the negative, and will take ink and form a printing surface in the places where light has obtained access to the film through the negative. A collotype plate will not only take ink where absolutely clear glass occurs in the negative, but it will take ink in the half-tone in exact gradations corresponding to the amount of light passing through the negative. This property is most valuable, and, as a matter of fact, constitutes the process.

The preparation of collotype plates is not difficult. The printing plate is formed of a piece of plate glass of about half an inch in thickness, ground on the printing side to give a better hold to the gelatine. In order that the film may withstand the heavy pressure of the printing press, it is found necessary to coat the plates first with a substance containing albumen, water-glass, and water. This solution is spread over the cleaned glass in a thin coating and dried. The sensitizing solution for collotype printing is composed of Coignet's gelatine, 3 ounces; albumen, 1 ounce; water, 25 ounces; and bichromate of potash, ½ ounce. The exact proportions are not arbitrary, and different operators modify their solution as experience guides. The sensitizing solution is carefully filtered through flannel, and, while warm, is poured over the surface of the "substratumed" glass plate in a fairly thick film; the coated plate is then placed on accurately leveled supports in a drying-chamber or box, and heat is applied to the bottom of the box, which is made of sheet iron. Considerable heat is required to dry the plates, and the grain or texture of the plate is affected by the speed of the drying; about four hours is the usual time occupied. When the plate is dry and cool it is ready for exposure under the negative; the qualities necessary in a collotype negative are that it must be reversed, and be of full printing strength. A negative that would render a full rich print by any silver printing process is the proper standard for collotype. The margins of the negative are masked with thin opaque paper or tinfoil, so as to permit of the picture being printed with a clean edge on paper with proper margins. The time required for the exposure under ordinary conditions as regards light is from 20 minutes to half an hour, but this is a matter which can only be fixed by experience. The image on the plate cannot be examined during exposure, and an actinometer scale is used for gauging the amount of light. After exposure the plate is taken into a room lighted a dull or yellow light, and washed in running water for about half an hour in order that all the soluble unacted-upon bichromate may be removed from the film, after which the plate is allowed to dry spontaneously, when it is ready for printing.

The printing may be performed in an ordinary press used for letterpress printing, or in a lithographic press. For rapid printing, or for long runs, special steam-driven presses are constructed, with cylinder pressure, on which it is possible to print two or three hundred copies per hour.

When the plate is fixed in position in the press, it is first wetted all over with a sponge and water, or with a solution of common salt, glycerine, and water, which, after being allowed to act on the gelatine for 10 or 15 minutes, is sponged off, and the plate is rolled up with ink. If the printing is being done on a hand press, a coating of ink is applied first with a leather roller, which inks up the shadows and stronger parts of the picture. This inking is then followed by another with a gelatine roller, which inks up the half-tones and details of the subject. A sheet of ordinary printing paper is now placed over the inked surface, and pressure applied. The result is a permanent ink print on paper of the negative used. If the printing is done on a steam press, the operations are, of course, more mechanical, but the finished result is practically the same. Large plates can be successfully dealt with, and pictures on paper up to 40 by 30 inches can be printed.

The collotype process has had a long and successful career, and the beauty and delicacy of its results, when properly printed, are fully equal to that of any other photo-mechanical process, but of late years the advances made in half-tone blocks, and more especially in the machinery constructed for printing them, has to some extent covered the ground hitherto occupied by collotype illustrations alone; and though the half-tone block can never oust or replace collotype for many kinds of illustration, yet it is sufficiently a rival to restrict its expansion and scope from a commercial point of view.

Collusion, kŏl-lū'zhŏn (Lat. *collusio,* "a playing together"), a secret agreement between opposing litigants to obtain a particular judicial decision on a preconcerted statement of facts, whether true or false, to the injury of a third party. Collusion, when proved to exist, nullifies the judgment obtained through it.

Collyer, kŏl'yėr, Robert, American clergyman: b. Keighley, Yorkshire, Eng., 8 Dec. 1823. He came to the United States in 1849, being then a Wesleyan preacher and a blacksmith, but became a Unitarian, and preached some years in Chicago, where he founded Unity Church in 1860 and was its pastor 1860–79. He was made pastor of the Church of the Messiah, New York, in September 1879, and pastor emeritus in 1896. Included in his publications are: 'Nature and Life' (1864); 'The Life That Now Is' (1871); 'The Simple Truth' (1878); 'A History of the Town and Parish of Ilkley' (England, 1886, written with Horsefall Turner); 'Talks to Young Men' (1888); 'Things New and Old' (1893); 'A Man in Earnest.'

Collyridians, kŏl-ĭ-rĭd'ĭ-ąnz (Gr. *kollyridia,* "little cakes"), a sect toward the close of the fourth century, so denominated from the little cakes which they offered to the Virgin Mary. The sect consisted chiefly of Arabian women, who, out of an extravagant devotion to the Virgin, met on a certain day of the year to celebrate a solemn feast, and to render divine honors to her as to a goddess, eating the cakes which they offered in her name. It is said that the members of this sect were not native Arabs, but immigrants from Thrace and Scythia. While pagans they had been accustomed to offer similar cakes to Venus or Astarte.

Colman, kōl'mąn, Benjamin, American clergyman: b. Boston, Mass., 19 Oct. 1673; d. there 29 Aug. 1747. He graduated at Harvard in 1692, began preaching, sailed for England 1695, was captured by a French privateer, and after a short imprisonment, reached England. He received ordination in London, and returned to take charge of the Brattle Street Church, Boston, remaining with that society until his death. He was for many years one of the leading clergymen of New England, exerting a strong influence on civil affairs that frequently drew censure upon him. He procured considerable benefactions for Harvard and Yale, and was offered, but declined, the presidency of the former, in 1724. His collected sermons were printed at Boston 1707–22, and his 'Life' was written by his son-in-law, Rev. E. Turell (1749).

Colman, George ("The Elder"), English dramatist: b. Florence 28 April 1733; d. London 14 Aug. 1794. He wrote in 1760–1 the comedies of 'Polly Honeycombe' and the 'Jealous Wife.' 'The Clandestine Marriage' we owe to him and Garrick. This was left unfinished, and it has never been ascertained to which of the authors most credit is due for one of the best pieces in our theatrical repertory. 'The English Merchant,' the 'Oxonian in Town,' and other pieces, followed the foregoing. In 1777 he purchased the little theatre in the Haymarket, and continued in the personal superintendence of it till the year 1790.

Colman, George ("The Younger"), English dramatist, son of the preceding: b. London 21 Oct. 1762; d. there 26 Oct. 1836. He was entered as a student in the Temple, but soon left legal studies for dramatic and general literature. He assisted his father as director of the Haymarket Theatre, and succeeded him as its patentee. After selling his interest in the theatre he was appointed examiner of plays, the duties of which he performed with a severe purism, hardly to have been expected in a man who wrote with almost licentious freedom himself. Most of his dramas were well received, and some of them still keep the stage; as 'John Bull'; the 'Heir-at-law'; 'Poor Gentleman'; and 'Love Laughs at Locksmiths.'

Colman, Norman J., American office holder: b. Richfield Springs, N. Y., 16 May 1827. He settled in St. Louis, Mo., and adopted the legal profession. In 1874 he was elected lieutenant-governor, and was commissioner of agriculture in President Cleveland's first administration 1885–9. Shortly before his term of office ended, Congress enacted the law raising the Department of Agriculture to the rank of an executive department, with its chief a Cabinet officer, 11 Feb. 1889.

Colman, Samuel, American landscape painter: b. Portland, Maine, 4 March 1832. He studied in Europe 1860–2; was elected a member of the National Academy in 1862; and first president (1866–71) of the American Society of Painters in Water Colors. He has traveled extensively, and his pictures include scenes from Algeria, Germany, France, Italy, and Holland.

Colmar. See Kolmar.

Colne, kōln, England, a municipal borough in the county of Lancaster, and 31 miles southeast of the town of Lancaster. The most remarkable edifice is the Piece Hall, in the Elizabethan style. The chief manufactures are cotton goods. Colne was one of the earliest seats of the woolen and cotton manufacture in England, but woolens are no longer made there. Pop. (1901) 23,000.

Colocasia. See Cocco.

Colocollo, kō-lō-kŏl'lō, a wild cat (*Felis colocollo*) found in Guiana and Chile. It is somewhat larger than the domestic cat, is whitish-gray in color, with elongated black markings on the back and sides.

Colocynth, kŏl'ō-sĭnth, the fruit of *Citrullus Colocynthus,* deprived of its rind. The plant, one of the *Cucurbitaceæ,* or melon family, is widely distributed over waste lands in Arabia and adjacent countries, the Mediterranean islands, Cape of Good Hope, Java, southern Spain, and Europe. It is also extensively cultivated. It is collected when the fruit is nearly ripe and peeled while fresh. The fruit subse-

quently contracts somewhat, is whitish in lustre, and very porous and light. As found in the market colocynth occurs as light, yellowish white balls, from one to three inches in diameter, that are very porous and fragile. It contains a large number of whitish seeds in six compartments. On breaking, the fruit splits irregularly, although there may be a tendency to dehisce in threes. The active principles are a resin and a bitter glycoside, colocynthin ($C_{56}H_{43}O_{23}$ Walz). Colocynth is an active drastic purgative and is rarely administered alone because of its harsh action, but in small doses in combination with other drugs, it is widely used as a laxative and purge. The compound cathartic pill and the vegetable pill are the chief vehicles that contain colocynth. The compound extract, made of colocynth, aloes, scammony, soap, and cardamom, is widely employed in other preparations. Colocynthin is recommended as a rectal cathartic in doses of ⅛ to ½ grain. Colocynth itself can be given in doses up to five grains.

Cologne, kō-lōn' (German, *Köln*), Germany, a strongly fortified city of Prussia, in the Rhine province, on the left bank of the Rhine. It stands upon the river in the form of a crescent, and is connected with Deutz, on the opposite side and forming part of it, by a bridge of boats and an iron bridge. Till recently it was surrounded by fortifications dating from the Middle Ages, but these have been cleared away, their site built upon, and a wider circuit of works constructed. Until the middle of the 19th century a great part of the city bore the impress of the Middle Ages, the streets being dark, narrow, and filthy; but now the municipality has paid great attention to the appearance and sanitary condition of the town generally by opening up thoroughfares, widening and paving the streets, etc. Among the principal buildings are the townhouse, a remarkably fine Gothic building, partly of the 14th century; the Gürzenich (1441–52), a splendid Gothic building, used for public festivities, and also accommodating the exchange; the Tempelhaus, a fine Romanesque building of the 12th or 13th century, occupied as the Chamber of Commerce; the government buildings, courthouse, postoffice, Imperial Bank, and railway station. But the object of greatest interest in the town is the cathedral, begun in 1248, one of the finest and purest Gothic monuments in Europe. It is in the form of a cross; its entire length is 490 feet; its breadth, 231 feet; the roof rests on 100 columns, of which the four centre ones are 30 feet in circumference. The choir was long the only part finished; it is 161 feet high, and, with its pillars, arches, chapels, and its superb painted glass windows, presents one of the finest sights conceivable. In 1842 the completion of this magnificent edifice was begun, after designs by Zwirner; the works were vigorously prosecuted from that time onward, and were completed in 1880. The two western towers are each 511 feet high, and are among the highest edifices in the world. The other remarkable churches are those of St. Peter, in which is an altar-piece of the crucifixion of that saint, by Rubens, who presented it to this church, in which he was baptized; St. Mary, on the capitol, occupying the site of the capitol of the ancient Roman city, and dating from about the year 1,000, with some good stained glass windows; the Apostles' church, in the Neumarkt, built about the year 1200, a perfect specimen of the Romanesque style, having a singularly elegant and picturesque exterior; the church of St. Ursula, filled with the bones of the 11,000 British virgins, who, according to the legend, were destroyed here on their return to Britain, under the guidance of St. Ursula; the church of the Jesuits, or Maria Himmelsfahrt, dating from 1636, overloaded with gorgeous decorations of marble sculpture, etc.; and St. Gereon's, which, like the church of St. Ursula, is lined with bones, not, however, of virgins, but of the Theban legion of martyrs, slain, according to tradition, during the reign of Diocletian; this is one of the finest and oldest churches in the city. The city contains several gymnasia and other high-class institutions; a technical school; an observatory, and botanical garden; a normal school, a public library, a theatre, several hospitals, a school of design, a museum, etc. The manufactures are very extensive and varied, embracing sugar, chocolate, tobacco and cigars, glue, liqueurs, mineral waters, starch, vinegar, soap, candles, velvet, silk, woolen and cotton goods, India-rubber, and gutta-percha wares, machinery and metal goods, etc., and the celebrated eau de Cologne, of which there are a great many different manufacturers. Its commerce is considerable; it has a good port on the Rhine, and an extensive railway communication with the interior of Germany and with Belgium and Holland. It is the principal entrepôt of the corn, wine, and oil trade on the river, and has active commercial relations with the Netherlands, Germany, Belgium, and Switzerland.

Cologne is of ancient origin, and was originally called *Oppidum Ubiorum,* being the chief town of the Ubii, a German nation. The Romans made it a colony 51 A.D., and called it *Colonia Agrippina.* It was annexed to the German empire in 870, and became one of the most powerful and wealthy cities of the Hanseatic league, its population then amounting to 150,000. As early as the 11th century Cologne carried on an extensive trade with foreign countries, including England, in the produce of the country — wine, corn, flour, malt, beer, etc. The arts and sciences also flourished, and its university was one of the most famous in Germany. Intestine divisions, and other causes, finally effected its ruin, and in 1792 it ceased to be a free city. It was taken by the French in 1794, ceded to them by the Treaty of Luneville in 1801, and restored to Prussia in 1814. Duns Scotus died in Cologne in 1308, and was interred in the chapel of the Minorites; and Rubens was born here in 1577, in the same house in which Mary of Medicis died, in 1642. Pop. (1900) 372,229.

Cologne. See EAU DE COLOGNE.

Cologne Earth, a kind of ochre, of a deep-brown color, transparent, and durable in water-color painting. It is an earthy variety of lignite or partially fossilized wood.

Cologne Yellow, a pigment consisting of two parts yellow chromate of lead, one of sulphate of lead, and seven of sulphate of lime or gypsum. It is prepared by precipitating a mixture of nitrate of lead and nitrate of lime with sulphate of soda and chromate of potash. See CHROME YELLOW.

Colomb, kō-lōm′, Sir **John Charles Ready,** English military writer. He was educated at the Royal Naval College and entered the Royal Marine Artillery in 1854, retiring in 1869 with the rank of captain. He was member of Parliament for Bow and Bromley 1886–90, and was knighted in 1888. He has published 'Protection of Commerce in War' (1867); 'Imperial Strategy' (1868); 'The Distribution of Our War Forces' (1869); 'Colonial Defense and Colonial Opinions' (1873); 'The Defense of Great and Greater Britain' (1879); 'Naval Intelligence and Protection of Commerce' (1881); 'The Use and Application of Marine Forces' (1883); 'Imperial Federation: Naval and Military' (1886); 'British Defense' (1900); 'British Dangers'; 'Our Ships, Colonies, and Commerce in War' (1902).

Colomba, kō-lôṅ-bä, a romance by Prosper Mérimee, published 1830. It is the story of a Corsican vendetta, followed up to the end by the heroine, with a wild ferocity tempered with a strange piety. The story has an ethical significance of a rather unfortunate kind, for the author's belief in the dogma of fatalism underlies the whole of it,— that circumstances control the human will, and whether a man is a brigand or a philanthropist depends purely on chance, crime and virtue being mere accidents.

Colombia, The Republic of, a country of South America; bounded on the north and northwest by the Caribbean Sea and the Republic of Panama; on the east by Venezuela and Brazil; on the south by Brazil, Peru, and Ecuador; on the west by the Pacific Ocean. Its area cannot be stated precisely, estimates ranging between 424,000 and 482,000 square miles; official estimate, 472,202 square miles. The boundary lines between it and three of the neighboring countries are in dispute. The republic is divided into eight departments as follows: Two on the Caribbean coast, Bolivar, and Magdalena; one with coasts upon both oceans, Cauca; and five in the interior, Tolima, Antioquia, Boyacá, Cundinamarca, and Santander. The capital and largest city of the country is Bogotá (q.v.). Others of importance are: Vélez, Bucaramanga, San José de Cúcuta, Neiva, Medellin, Manizales, Pasto, Cali, Cartagena (q.v.) Barranquilla, and La Mesa.

Physical Features.— The Andes of Colombia are divided into three ranges — the Cordillera Oriental, Cordillera Central, and Cordillera Occidental — with intervening uplands of great extent, which are habitable and fertile, but as yet rather inaccessible. Of the three ranges mentioned, the western Cordillera is the least impressive, though it extends farther toward the north than the others. The central Cordillera has the greatest number of snow-clad summits. Some of the altitudes are: Sierra Nevada, estimated 23,779 feet; Alto del Viejo, 12,965 feet; Boca del Monte, 12,735 feet. The highest snow-peak of the central Cordillera is the volcano called Huila. The volcanos of Sotará (extinct), Pasto, Chiles, Puracé, and Azufral are well known, but the ordinary demonstrations of volcanic energy are earthquakes. See Cordilleras. There are four river systems in the republic: (1) The western system, comprising the streams which flow from the western Cordillera into the Pacific Ocean; (2) the river Cauca and its affluents; (3) the Magdalena River with its affluents; (4) the streams of the eastern slope of the eastern Cordillera, including the upper Orinoco and upper Amazon, and some of the tributaries of those great rivers. Important harbors on the Caribbean coast are: El Portete of Rio Hacha, Santa Marta, Sabanilla (the active port of Barranquilla), Cartagena, etc. On the Pacific coast line are the Bay of Malaga, with the harbors of Guapi and Izcuandé; the bays of Pasacaballos and Buenaventura; the harbors of Tumaco and Trinidad, and the gulfs of Montijo, David, and Dulce.

Climate.— The coast and some interior valleys are intensely hot and insalubrious. On the elevated plateaus the temperature is that of perpetual spring. The lowest average temperature in any inhabited part of the mountainous country is 20° F. The peaks of the Cordilleras are covered with snow always. In spite of the equatorial situation of Colombia, the Andes make temperature merely a question of altitude. At Bogotá the thermometer ranges from 55° to 70 F. Alternating periods of dry weather and rainy weather, each generally of three months' duration, are Colombia's «summer» and «winter.»

Resources, Flora and Fauna.— Gold is found in Antioquia; in the Chocó region, department of Cauca; in Santander and Tolima, etc. Silver mines are especially productive in Antioquia, Cauca, and Tolima. Aggregate annual output of these metals, about $4,100,000. Iron is found in Cundinamarca and Antioquia; copper in Boyacá and Magdalena; platinum, sulphur, salt, emeralds, lime, nitre, chalk, marble, petroleum, asphaltum, alum, magnesia, amethysts, lead, tin, manganese, mercury, and cinnabar in various parts of the country. Emeralds valued at $100,000 were produced annually at the Muzo and Coscuez mines up to 1899. The low and torrid regions (coasts and valleys) produce coffee, sugarcane, bananas, cacao, yucca, cotton, tobacco, indigo, vanilla, rice, and many kinds of tropical fruits. The temperate middle region of the Andes is suited to the cultivation of wheat, barley, etc., but these grains are not produced in very large quantities, owing to the lack of means of transportation. Vast tracts of forest remain to be explored. It is assumed that rare botanical treasures will be found in their recesses; and with good reason, since the known varieties of Colombian flora are of exceptional interest. Building, cabinet, and dyewoods are plentiful; the rubber-tree, the cinchona, wax-palms, cedar, balsam of tolu, lignum vitæ, and mahogany flourish especially. In the southeast are great plains suitable for grazing, but as yet unappropriated. The total number of cattle in the republic is only about 3,500,000, with an equal number of sheep, goats, and swine. There are some excellent horses and mules of Andalusian stock. Wild animals of the intertropical or higher regions are: the puma, bear (two species), jagua, alligator, sloth, armadillo, tapir, deer, cavy, opossum, guagua, and 17 distinct species of monkeys. Serpents (the boa constrictor, yaruma, etc.), are not found at a greater height than about 5,000 feet above the sea, though they are very numerous in the lowlands. Characteristic birds are: parrots (many varieties), paroquets, cockatoos, lorries, cranes, storks, the condor, and sol-y-luna.

Commerce, etc.— The average export trade of Colombia before the secession of Panamá, amounted to about $15,000,000 annually. Imports during the five years immediately preceding the outbreak of hostilities in 1899 averaged about 14,000,000 pesos (gold). Exports to the United States during the fiscal year ending 30 June 1901 were valued at $3,230,625, as against $4,307,814 in 1900. Imports from the United States were valued at $3,142,052 for 1901, as against $2,710,688 for the preceding 12 months. The United States took about 27 per cent in value of Colombia's total exports; Great Britain 25 per cent; France 17 per cent; Germany 16 per cent. The articles exported are: coffee, quinine, emeralds, cacao, sarsaparilla, tobacco, indigo, ivory nuts, dyes, balsams, resins, straw hats, orchids, cattle, hides and skins, rubber, gold, and silver. The principal imports are: cloths of wool, cotton, linen, and silk, shoes, ready-made clothing, furniture, paper, machines, haberdashery, watches, drugs, books, flour, liquors, pottery, and iron. Duties are levied on exports as well as on imports.

Manufactures.— Sugar, molasses, articles of iron, ordinary cotton and woolen cloths, sole-leather, saddles, shoes, furniture, hats, jewels, books, pottery, varnishes, mats, bags, cigars, cigarettes, liquors, carpets of maguey thread, hammocks, hempen sacks, and household utensils are manufactured on a very small scale, partially supplying home consumption.

Transportation and Communication.— At the beginning of the year 1901, according to official information, there were in the republic 605 kilometres (376 miles) of railways; and before the events of November, 1903, eleven lines of steamships plied between the ports of Colombia and those of Europe and the United States. England had five lines, France two, Germany two, Italy one, and Spain one. There was not a single line of American steamers running to Colombian ports at that time. Inland traffic on the Magdalena River employs 42 small steamers. In some recent years the post-office has carried only about 2,600,000 letters, postal cards, newspapers, and parcels. The telegraph system has suffered especially. The total length of its lines in 1898 was given as 8,600 miles; the principal cities being connected with each other, and with the systems of Venezuela and Ecuador, as well as (by cable) with the United States. All the telegraph lines are owned by the government.

Coins.— Silver is the standard; the peso (value in United States gold or silver, $0.361) is the unit. The gold coins are the condor ($9.647) and double condor; silver coins, the peso and divisions. Paper money was issued during the war in such quantities that it became practically valueless.

Weights and Measures.— The kilogram (kilo), equivalent to 2.2046 pounds avoirdupois; carga = 125 kilos; quintal = 50 kilos; arroba (dry) = 12½ kilos; libra = 1.102 pounds avoirdupois. In liquid measure the French litre is the standard. Measure of length, the vara = 80 centimeters.

Federal Government.— The president is chosen (by electoral colleges) for a term of six years. His cabinet, though nominally composed of six secretaries, in recent practice has been limited to four, namely, state and interior, war, finance, and foreign affairs. As in Chile, the secretaries are responsible to congress. A council of state (7 members) is also prescribed by the constitution for the assistance of the executive branch. When for any reason the president ceases to exercise the functions of his office, temporarily or finally, during his term, the vice-president takes his place; failing both, the vacancy is filled by a substitute elected by congress for a term of two years. In time of peace congress meets at Bogotá every two years on 20 July. It is composed of the senate (27 members; 3 from each department) and the house of representatives (one member for every 50,000 inhabitants; term, 4 years; elected directly by citizens — whereas the senators are chosen by departmental assemblies). Judicial authority is exercised by the supreme court (seven magistrates), the district courts, circuit judges, and municipal judges.

Revenue and Debt.— The revenue of the government is mainly derived from the customs, as may be exemplified, thus: Estimated government revenue for 1901–2 (in paper pesos), 28,983,640; estimated amount of customs duties in the same years, 21,450,640 paper pesos. Minor sources of revenue are the government monopolies — the salt mines near Bogotá, the slaughtering of cattle, and the sale of meat. Estimated expenditures for 1901–2 exceeded the estimated revenues for the same years by more than 11,000,000 paper pesos. In 1901 the government offered for sale or lease its emerald mines (Muzo and Coscuez). The exploitation of coal mines and other deposits of minerals in the republic was undertaken in the same year by Swiss capitalists and a mining company organized in the United States. The sale of monopolies supplies the departmental governments with a large portion of their revenues. The total external debt of the nation in 1901 amounted to more than $14,000,000, the arrears of interest being about $506,000. The internal debt, two months before the war began, had reached a total of 11,359,074 pesos.

Army and Navy.— In time of war the president's powers are so greatly enlarged by constitutional provision that they become those of a dictator. He has then, among other privileges, the right to claim the military service of every able-bodied male citizen, the age limits being disregarded in practice. In time of peace congress determines the strength of the army at each biennial session. The regular army in former years was usually maintained on a peace footing of 5,500, the reserve being estimated at 120,000 men. The government maintains only two or three small war vessels.

Population and Classes.— Uncivilized Indians to the number of 150,000 or more are found in the territories or districts outside of the departmental limits. Largely mixed with the whites of the lower classes are the numerous descendants of the aborigines in Cundinamarca, Cauca, and Boyacá. Negroes abound in Bolívar, and the Cauca valley, but are rare in the interior departments. The population of Antioquia (570,000) is chiefly white. Members of the ruling class, almost exclusively of European descent, preserve the language and literary traditions of Spain. The total population was about 4,000,000 when the war of 1899–1902 began.

Education.— Primary education is not compulsory, but public schools and colleges maintained at the expense of the departments were

attended in 1897 by 143,076 pupils. The federal government maintains a national university that has faculties of philosophy and letters, jurisprudence, medicine and natural sciences, and mathematics and engineering. Between 1,500 and 1,600 students are usually enrolled at this institution. Schools of secondary education, normal schools, an artisans' institute, an academy of music, and an institute of the fine arts are also supported by the nation. In addition to these there are many private schools, and several colleges relying wholly upon their own revenues. Before the civil war of 1899 an increase was noted in the provision for the free instruction of the people.

Local Government.— In each of the departments there is a legislative body, known as the departmental assembly, composed of deputies elected directly by the citizens in the ratio of one deputy for each 12,000 inhabitants. These assemblies regulate local affairs and expenditures, and choose members of the national senate. Governors of departments, being appointed by the president, and removed at his discretion, are regarded as local agents of the national administration, and at the same time chiefs of the departmental administrations. The municipal districts are controlled by alcaldes who are agents of the governors.

History.— The earliest voyages to the Colombian coast are mentioned in DISCOVERIES. In 1508 the Spanish crown granted to Ojeda the district between Cape Vela and the Gulf of Darien, and to Nicuesa the country from the Gulf of Darien to Cape Gracias á Dios. The two territories were united in 1514. Balboa's discovery of the "Southern Sea" was followed by the removal of colonists to the Pacific coast and the founding of the city of Panamá. (See BALBOA, DABAIBA, DARIEN, ELDORADO, and DAVILA.) Starting from Santa Marta 6 Aug. 1536, Gonzalo Jiménez de Quesada led 700 infantry and 80 horsemen into the mountains of New Granada (now Colombia), and took the Indian capital. Colonies were established in the table-lands and along the coasts. The city of Medina was founded in 1670 by Fray Alonzo Ronquillo of the order of Preaching Friars. In 1719 the natives destroyed the Spanish colonies on the Pacific slope. New Granada became a viceroyalty in 1740, having been administered previously as a simple presidency, except in 1718–19. In 1810 an insurrection against the government of Spain began. In 1819 New Granada and Venezuela were united, Ecuador joining the union two years later. The country thus formed was called the Republic of Colombia. (See BOLIVAR.) The efforts of Spain to retain these colonies ceased in 1824. Six years later the Colombian union was dissolved, Venezuela and Ecuador having withdrawn; and the republic of New Granada was established in 1831, its territory corresponding to that of the present republic of Colombia.

New Granada was at first divided into five departments, namely: Boyacá, Cauca, Cundinamarca, the Isthmus, and Magdalena. Lack of coherence caused a civil war in 1840; Panamá and Veragua unsuccessfully sought independence in 1841. From 1849 to 1857 the Liberal party controlled the government. In 1853 the right was granted to the departments to elect their governors by popular vote, and the powers of the provincial legislative bodies were increased. New political divisions were organized soon afterward — Panamá, etc. These claimed, and taught the older departments to claim, the privileges of semi-independent states. A civil war, beginning in 1859, resulted in a triumph for the liberal (States' Rights) party. Under the constitution of 1863 the name Colombia was reverted to, the official title being United States of Colombia. Nine sovereign states were formed, each authorized to maintain its own military forces without restriction, and to nullify the federal laws. Insurrections made steady progress impossible until a reasonable degree of federal control was asserted. In 1880, Rafael Nuñez became president. His influence secured to the national government the right to use its forces for the suppression of insurrections in the several states. A national (government) bank was incorporated; diplomatic relations were established with Spain; the question of the boundary between Colombia and Venezuela was submitted to arbitration. Nuñez held the same office, which he made important, again in 1884 and 1886. In 1891 he was elected for the fourth time, but allowed Vice-President Caro to assume his duties.

A new constitution, which is still in force, was adopted in 1886. By this the states were reduced to departments, with governors appointed by the president of the republic, and legislative assemblies elected by the people. The president's term of office was extended from two to six years. Colombia passed from the extreme of a loose federation to that of a centralized republic. Subsequent revolutions have shown the desire of the Liberals to return to the old irresponsibility. In 1892 subsidies were granted for the construction of several important railways, and new cable lines along the coast and telegraph lines in the interior were authorized. Two years later a law was passed providing for the free coinage of gold and the redemption of the paper currency. Very little progress was made, however; on the contrary the means of communication and transportation, as well as the medium of exchange, have gone from bad to worse in the last few years. The rebellion of 1895 was suppressed in 45 days, but a civil war which broke out 17 Oct. 1899, proved to be more ruinous than any preceding conflict. The Liberals attempted by force of arms to drive the Conservatives from power. An issue which, in a republic, should be settled at the polls, cost the lives of 50,000 soldiers, while among the wretched non-combatants the number of deaths from privation and disease was vastly greater. As usual, the department of Panamá was a centre of disturbance. American marines were landed to guard the stations and railway at Colón and Panamá, in accordance with the treaty of 1846 between the United States and New Granada, by the terms of which the United States guaranteed the neutrality of the isthmus and assumed the obligation to protect free transit between the ports mentioned.

Toward the end of 1902 the flame of civil war finally went out. The government was almost destitute of money; it could neither pay interest on the national debt nor meet current expenses. Congressional elections were held throughout the country. The most important matter to come before that Congress was the question of ratifying a convention concluded at Washington 22 Jan. 1903, between the secretary of state of the United States of America and the chargé d'affaires of Colombia, for the con-

struction of a ship canal to connect the Atlantic and Pacific oceans. The French Panama Company, formed in 1881, had suspended operations in 1889, and in 1894 a new company had been organized, securing a concession for 10 years, which term was subsequently extended by six years. (See ISTHMIAN CANALS, AMERICAN.) The board of this company had offered (4 Jan. 1902) to sell all its property and rights to the United States for $40,000,000 The Panamá route had been approved by the United States Isthmian Canal Commission. After a long discussion in the United States Senate, the convention was submitted to the Colombian Congress, the Constitution of 1886 providing that ratification by both Houses is requisite for the validity of such an agreement as that relating to the Panamá Canal.

The convention just referred to, commonly known as the Hay-Herrán treaty, was defeated at Bogotá, 24 members of the Senate voting on 12 Aug. 1903 to reject it. A counter-proposition prepared by a commission (29 Aug.) was debated for a while, but not adopted. The adjournment of the Colombian Congress on 31 Oct. was followed almost immediately by the outbreak of a carefully planned «Separatist» movement in Panamá. Independence was proclaimed 3 Nov., and the Colombian army and navy officers in the principal city of that department were imprisoned. A provisional government was organized. American warships were ordered to the Isthmus; marines landed at Colón; and the Colombian troops withdrew from that town. On 6 Nov. the government of the United States entered into relations with the government of the Republic of Panamá, and on 13 Nov. M. Philippe Bunau-Varilla was formally received by President Roosevelt as minister of the new country. At that time hostile demonstrations against the Colombian government occurred at Bogotá, and another revolution seemed imminent.

Arbitration.— While political factions have continued to resort to arms for the settlement of differences of opinion within the nation's boundaries, the better sentiment of an increasing class of educated people has begun to make itself felt in the disputes with neighboring republics touching the location of those boundaries. Arbitration has repeatedly been chosen in place of foreign wars. The award by the queen regent of Spain, 16 March 1891, defined the frontier on the Venezuelan side. An agreement was made 15 Dec. 1894 for submitting to arbitration the question as to the southern line between Colombia and Ecuador and Peru. President Loubet of France acted as arbitrator of the boundary dispute with Costa Rica, rendering a decision 11 Sept. 1900.

MARRION WILCOX.

Colombo, kō-lōm′bō, Ceylon, the capital, a seaport on the southwest coast, near the mouth of the Kelani River, and about 70 miles southwest of Kandy, the principal place on the island. It is a handsome town, and a portion of it, comprising most of the best houses, is within the walls of its very extensive fort, which occupies a projecting point of land, and embraces a circumference of nearly one and a fourth miles. The houses of the Europeans outside the town are very beautifully situated, especially those near the sea. There are several bazaars or market-places. The public buildings comprise the government offices, government house, hall of the supreme court, the valuable museum, etc. Some of the noted buildings are an old Dutch church, Presbyterian, Anglican, and Roman Catholic churches, hotels, orphan asylum, military hospital, and barracks, the town-hall, the railway station, the Colombo Royal College, St. Thomas' College, and Wesley college. The Moors have two handsome mosques with minarets; the Hindus also have their temples, rudely sculptured. Water is brought from a distance of 30 miles to the town, and there are extensive gas-works. The harbor was formerly capable of receiving small vessels only, and large ships had to cast anchor upward of a mile from the shore, exposed to the southwest monsoon; but a breakwater now gives complete shelter, and Colombo is the regular calling station for the large steamers bound for Bombay, Madras, Calcutta, the Straits, China, Australia, etc. It is the chief port of Ceylon, its exports and imports including the great bulk of the goods sent from and brought to the island. Pop. (1901) 154,556.

Colon, sometimes called **Aspinwall,** Panamá, a town of 5,000 inhabitants on the northern side of the Isthmus of Panamá, connected with the city of Panamá by a railway 49 miles in length. During the civil war in 1885 it was partly burned, but has been rebuilt. It stands upon an island which divides an inlet of the sea into the ports called Manzanillo and Naos, or Newbay. American marines and sailors were landed there during the revolutions which began in 1885, 1899, and 1903, in accordance with the treaty by which the United States guarantees to preserve from interruption free transit across the isthmus.

Colón, kō-lōn′, Cuba, a town and district of the province of Matanzas. Area of the district 114 square miles. Area cultivated, 245.03 caballerias. (This was 498.91 caballerias in 1895.) Races, occupation, etc., for the district: Native whites, 5,706; foreign whites, 824; negroes, 2,856; mixed, 2,432; Chinese, 377; persons 10 years of age or over who can neither read nor write, 5,467; engaged in agriculture or mining, 2,741; in trade and transportation, 600; manufacturing and mechanical industries, 576; professional service, 61; domestic and personal service, 984; without gainful occupation, 7,233; number of occupied dwellings, 2,199; number of families, 2,624; persons to a family, 4.7. The following statistics are from the United States War Department census of 1899: Population of the town, 7,175; of the district, 12,195 in 1899, as against 16,679 in 1887.

Colón, Venezuela, a federal territory embracing the Venezuelan islands in the Caribbean Sea, except those belonging to the state of Rivas. The islands forming the territory are: Blanquilla, Los Hermanos, Frailes, Sola, Testigos, Venados, Esmeraldas, Caracas, Picudas, Chimanas, Borracha, Arapos, Monos, Piritu, Farallón, Ocumare, Orchila, Los Roques, Aves, Los Monjes, and several smaller ones. The natural products are phosphate of lime, guano, lime, woods, and fish. Large quantities of the plant called orchila are exported for industrial purposes. There are salt deposits in Los Roques. Gran Roque is the capital. Nearly all of the islands are uninhabited. The territory is directly dependent upon the national government, and, like the territory of Amazonas, is governed by special laws.

Co'lon, that part of the intestine that extends from the ileo-cæcal valve to the rectum, practically the entire large intestine. Its position in the abdomen is at first vertical, on the the right side,—the ascending colon; then horizontal, the transverse colon, situated just beneath and behind the liver and stomach, going from right to left. It then descends, on the left side, to the sigmoid flexure in the left flank, and then bends abruptly inward and backward to end in the rectum, just in front of the spinal column. It is about four feet in length, and two inches in diameter, is made up of the same kinds of tissue as the intestine, but is rougher and more sacculated. In the large intestine the fecal matter loses its surplus water, and is molded slowly into form for final discharge through the rectum and anus. See ABDOMEN; INTESTINE.

Colon Bacillus, a very common bacterium (*Bacillus coli communis*), of the intestinal canal of many animals, including man, in which place it seems to serve some useful functions in the breaking down of food-stuffs, although, for lower animals at least, it is not indispensable for proper digestive processes. It is a short motile bacillus and closely resembles the typhoid organism, from which it is separated only by careful bacterial technic. While a normal inhabitant of the intestines of man, it may in abnormal situations be a cause of disease-processes. Its presence or absence in potable waters is of service in determining the presence of contamination of a water supply by animal fecal matter. See TYPHOID BACILLUS.

Colonel, kėr-nēl, the commander of a regiment, whether of horse, foot, or artillery. Any rank above a colonel constitutes the bearer of it a general officer. In the British service the rank of colonel is honorary, and is usually bestowed upon officers of superior rank and princes of the blood, who receive the emoluments of it in addition to those of their regular rank. The actual commander of the regiment is the lieutenant-colonel. In some of the Continental armies also the colonelcy is an honorary post held by persons of rank in the army or the state. In the United States army and the State militias the title of colonel is not honorary, but entails actual service as commander of his regiment.

Colonia Bolívar, kō-lōn'-yā bō-lē'vär, Venezuela, in the Sucre district of the old state of Miranda, about 30 miles from Caracas and five miles from Guatire. It is one of the two colonies which were established in 1874 with the design of encouraging immigration. The main products are coffee and starch. The principal town is Araira. The Araira River and several other streams irrigate the soil.

Colonia Catalana, kā-ta-lā'nā, Paraguay, situated in the department of Villa del Rosario. Cultivated area, 58 cuadras.

Colonia Cosme, kŏz'mā, Paraguay, in the department of Caazapá, a colony recently founded by Australians, who have already a school, several stores, a carpenter shop, a shoe factory, a saw-mill, a tannery, and 65 cuadras under cultivation.

Colonia Independencia, ēn"dā-pān-dān"-sē-a, Venezuela, in the Altagracie district of the old state of Miranda, about 70 miles from Caracas. Its area is 555 square kilometers; its altitude 5,400 feet above sea-level; Taguacita is its principal town, and its agricultural products are coffee, sugarcane, yucca, and cacao. There are extensive forests and two rivers. The colony was founded in 1874. See COLONIA BOLIVAR.

Colonia Nacional, nā-thē-ō-nāl', Paraguay, formerly called "President Gonzalez's Colony," situated in the department of Caazapá. It covers an area of 12 square leagues, crossed by the railway from Asunción to Villa Encarnación. The ground is hilly, well watered, and covered with fine timber. Maize (harvested as often as three times a year), sugarcane, tobacco, wheat, potatoes, coffee, vines, rice, and lucerne, all grow readily in the valleys or on the hillsides. The export trade in 1901 was valued at $245,971. Pop. 847. For other colonies, see PARAGUAY.

Colonia, Uruguay, a department on the Plata, below the Uruguay River. The uplands are barren, but in the fertile valleys and plains are numerous European colonies, engaged in agriculture and stock raising. The capital, Colonia del Sacramento, on the Plata, about 100 miles above Montevideo, has a good harbor, a dock for vessels of 1,000 tons, ruined fortifications, and some 1,500 inhabitants. Area of the department 2,192 square miles; pop. 50,300.

Colonial, or Compound Animals, organisms which cannot be fairly regarded as unities, but consist of numerous more or less similar individuals united in a common life. Among the usually single-celled simplest animals or *Protozoa,* loose colonies not unfrequently occur, and are of not a little importance as suggestions of the bridge between the single-celled and many-celled animals. Such colonies arise when the original cell instead of reproducing discontinuously, retains its daughter-cells in union with itself or with one another, much like the segments of the egg-cell of a higher animal. By sacrifice of individuality at the time of reproduction, a higher unity is formed. In the same way a simple cup-shaped sponge, by continuous budding, forms a colony of similar forms, which may possess more or less distinct individuality. The common fresh-water *Hydra,* to mount a step higher, buds off daughter *Hydræ,* which remain for a while connected with the parent organism, and make it temporarily colonial.

Many marine hydroids retain their polyps permanently as constituents of such a complex organism, and, as a differentiation of these into

nutritive and reproductive, and often into still other kinds, takes place, a higher order of more complex individuality arises; the polyp life is in part subordinated to the colony life. Among the most perfectly organized of such colonies are the floating *Siphonophora* (such as the Portuguese man-of-war), in which five or six perfectly differentiated and specialized kinds of zooids act together in mutual interdependence to support the whole. In most cases such zooids are incapable of performing any but the one function, or set of functions, to which they are adapted, and consequently cannot sustain independent life. This is one way of approaching the questions of individuality and of organization of the higher *Metazoa*. See COMPARATIVE ANATOMY.

For social communities or colonies composed of numerous free individuals all working together for mutual benefit, and how new colonies are founded, see ANT; BEE; WASP; WHITE-ANT, etc.

Colonial Dames of America, The National Society of, an ancestral and patriotic organization of American women, founded 19 May 1892; and composed of one Colonial Society from each of the 13 original States, one society from the District of Columbia, and one associate society from each of the non-colonial States. The objects of the National Society are: to preserve colonial history, traditions, manuscripts, records, relics, and buildings; to perpetuate the brave deeds, and glorious memory of the colonists, and to engender and encourage patriotism. To be eligible to membership, a woman must be descended from some worthy ancestor, who rendered valuable service to the colonies, and who became a resident of America previous to 1750. Memberships are obtained only upon invitation from those already enrolled, and must be procured through admittance into the Colonial Society, of the ancestral State, where the service of the ancestor was rendered. The work of the society has been patriotic. During the Cuban war nurses and supplies for the sick were supplied; at the close of the war a splendid monument, in Arlington cemetery, Washington, D. C., "to the memory of the soldiers and sailors, who gave up their lives in the late war with Spain," was erected by the society "in the name of the Women of the Nation." One of the most valuable and interesting collections of colonial relics and furnishings is under the control of the New York Society at the old Van Cortlandt manor house in Van Cortlandt Park. Churches and colonial houses of historical importance have been restored; historical sites marked with tablets; prizes awarded for essays on patriotic and historical subjects, to pupils of public schools and colleges. A complete list of the soldiers and sailors, who fell in the Cuban campaign, form the contents of a Record Book, compiled by the society. Great credit is due this organization for preserving many historical places which otherwise might have been destroyed. The society numbers (1903) 4,000 members.

Colonial Office, the English government office where business connected with the government of the colonies is carried on. A secretary of state for the colonies was first appointed in 1768. In 1782 the title was abolished again and the colonies were placed under the home secretary. In 1801 the jurisdiction was transferred to the secretary for war. In 1854 the original arrangement was reverted to, and there have been colonial secretaries ever since.

Colonial System. See COLONIES AND COLONIZATION.

Colonial Wars in America. A résumé of the colonial wars in America must of necessity omit many local disturbances which were of importance historically and which the student can find graphically described in many of the volumes included in the bibliography at the close of this article. Some of the most important are here chronologically presented.

1607. Jamestown, Va.—Although Capt. Gabrill Archer and a sailor were severely wounded by arrows tipped with deer's-horn and sharp stones, the night the English landed in Virginia, the first real conflict in American colonial history came two weeks after the Jamestown settlement, at the end of May, 1607, 200 Indians being repulsed by the settlers under Capt. Edward-Maria Wingfield. English casualties, one killed; 11 wounded. From this encounter to the battle of Lexington (q.v.), April 19, 1775, scarcely a generation in the several colonies reached manhood, without knowing the horrors of war.

1620. Plymouth, Mass.—The Pilgrims of New England had their first encounter with the dusky Nausite tribe, whose arrows were headed with hart's-horn, eagle's-claws, and brass, Dec. 8, 1620, and for over half a century the warfare continued with exacerbations of varying ferocity.

1622. Virginia.—Two years later their kinspeople at Jamestown escaped annihilation by the warning of a converted Indian. March 22, at midday, 347 men, women, and children were slain, by supposedly friendly savages, among the scattered hamlets along both banks of the river.

1633–7, Pequot War.—The Pequot Indians, in 1633, killed several English traders who came to their Connecticut River territory; 1634 found the Pequots at war with the Narragansett tribe, and hostile to the Dutch as well. Then the New England colonists prepared for the inevitable encounter. Sassacus reigned as Pequot chief. About this time John Oldham and two young lads were slain by the savages at Block Island. Governor Endicott promptly sent a force which destroyed the major part of this band. The Pequots then tried to enlist the cooperation of the Narragansetts, but this failed, owing to the influence exerted by Roger Williams over this tribe. The murder of 30 men and women followed. Connecticut, in May, 1637, placed John Mason in command of troops contributed from Massachusetts and Plymouth under Capt. John Underhill, allies being Mohegans, Uncas their sachem, and 400 Narragansetts and Nyantics. The desperate battle of Pequot Hill, Groton, Conn., was fought May 26, 1637. Mason says: "Most courageously these Pequeats behaved themselves"; but, "such a dreadful Terror did the Almighty let fall upon their Spirits that they would fly from us and run into the very Flames, where many of them perished." Nearly 800 Indians were slain in an hour; only two English were killed, and 20 wounded. Activities ceased in August, and the

next year a treaty was concluded between the colonies and the tribes.

1642–7. Ingle's Rebellion.— Indians began to molest Europeans in Maryland in 1642, and following these attacks came Ingle's Rebellion, July, 1643, aided by Clayborne, and which caused internal discord in the colony until peace was declared between contending parties in 1647.

1643–7. Kieft's War.— Kieft was appointed governor of New Netherlands in 1638. In the winter of 1643 he made war on the Mohawks, causing an outburst of hostilities among the Algonquin tribes. Massacres and conflagrations continued through the winter and following summer. John Underhill of Connecticut commanded the troops, and successfully routed the Long Island tribes. In March, 1644, Underhill, with 150 Dutch soldiers, landed at Greenwich, Conn., attacked an Indian village of 700, slew 180 in an hour, then set fire to the village, causing the death of 500 Indians by fire and sword. Kieft proclaimed a public thanksgiving for this victory. Nearly all Dutch farms and 1,600 Indians had been destroyed when Peter Stuyvesant succeeded Kieft in 1647, and peace was established.

1644. Virginia.— On Holy Thursday, 1644, Opechancanough and his warriors killed 500 white settlers in Virginia. Vigorous measures were taken by settlers, and the Indians were dispersed, their villages and the Powhatan confederacy (embracing nearly 50 petty tribes) destroyed, their chief captured and shot.

1648–56. New Sweden.— In April 1638 Peter Minuit, with his colony of Swedes, reached Delaware Bay. The colony was unusually prosperous, while Dutch interests there waned. Disputes arose as to titles of land; in 1648 the Dutch tried to erect a fort and houses on the Schuylkill, but were repulsed by the Swedes. Continued friction between the two races resulted, although Stuyvesant of New Netherlands and Printz of New Sweden agreed to be, and for three years were, allies. First one side would capture a fort, then the other; until, in 1656, after discussion by the States-General and Sweden (which came to naught), the city of Amsterdam bought the West India Company's interest on the South River (Delaware), and the colony of New Amstel was launched, while the authority of New Netherlands ceased.

1660. Bacon's Rebellion.— See BACON'S REBELLION.

1664–73. New Netherlands.— England seized New Netherlands Sept. 8, 1664, and war was formally declared in March, 1665. England suffered greatly at hands of Holland in 1666, but continued to hold her American conquests. August 8, 1673, a Dutch fleet of 23 vessels, with 1,600 men, arrived off Staten Island, and on the 9th anchored off the fort. The Dutch commander, Evertsen, at length opened fire, which the fort returned, but the fort surrendered and the Dutch flag was raised.

1666. French and Iroquois.— The French waged war with the Iroquois and other tribes for 60 years, coming down from Canada, invading and destroying their villages. As a result, peaceful white settlers suffered from Indian retaliation.

1675. King Philip's War.— John Sassamon or Sausaman, secretary and interpreter of the Wampanoags' chief (he had been a pupil of the apostle Eliot) heard of plot to exterminate the English, and reported it to the Plymouth authorities. King Philip, second son of Massasoit, who had been chief sachem of tribes between Charles River and Narragansett Bay, was summoned and examined by the authorities. Learning of the informer, he caused his death, Jan. 29, 1675. His slayers were, in turn, executed by the authorities. Then followed a series of Indian retaliations; eight or nine whites were killed at Swansy; in June, companies from Massachusetts and Plymouth drove Pokanokets from Mount Hope; Philip fled to Nipmucks, who killed Capt. Hutchinson and 16 others; Brookfield was burned; Deerfield and Northfield attacked; Capt. Beers and 20 men from Hadley slain; Capt. Lathrop and 80 men killed at Bloody Brook, near Deerfield, which was then burned; and Springfield and Hatfield were attacked. War continued through the summer, and in October, fearing an attack from the Narragansetts, Governor Winslow with 1,000 men marched against them. All troops were assembled December 18, and on the 19th began the memorable battle, which ended in the complete rout of the once powerful Narragansetts. On Feb. 10, 1676, occurred the Lancaster massacre by the Nipmucks; and this, taken with the series of calamities at Medfield, Worcester, Marlborough, Mendon, Groton, Weymouth, Sudbury, Chelmsford, Springfield, Wrentham, Hatfield, Hadley, North Hampton, Andover, and Bridgewater, makes an appalling list of horrors. War was actively waged by Canonchet, son of Miantonomo, until his capture by Capt. Dennison and the Connecticut troops, and subsequent death at hands of Mohegans. August 12 King Philip was killed at Bristol and the war was at an end.

1680. Port Royal, S. C.— The Spaniards from Florida attacked the Scotch settlement at Port Royal, S. C., in 1680, completely destroying it. A force of 400 men was raised to retaliate, but this plan was forbidden by the proprietors, inasmuch as the colonists were supposed to be not wholly blameless.

1687–9. French and Senecas: Montreal.— The French waged war with Senecas 1687, defeating them. Indians then destroyed Fort Frontenac. In 1689 the Iroquois attacked Montreal causing great devastation and loss of about 1,000 French.

1689–91. Leisler's Rebellion.— See LEISLER'S REBELLION.

1690. First Intercolonial War: King William's War: Quebec.— War between England and France was declared in 1689. The French in Canada planned an attack on Boston and New York. They came down from Canada with Indian allies; attacked Schenectady Feb. 8, 1690; Salmon Falls, March 27; horrible massacres ensued, and the colonies were aroused. March 19 the General Court of Massachusetts proposed a congress, at which measures for their protection should be arranged. The several colonial bodies were notified. Representatives from Massachusetts, Plymouth, Connecticut, and New York met at New York. On May 1 they signed an agreement to send 855 men for the support of Albany and, "by the help of Almighty God, subduing the French and Indian Enemies." Attempts to conquer Acadia and so move on Quebec, together with a plan to secure Montreal *via* Lake Champlain,

followed. Acadia and Port Royal were captured by New England men under Sir William Phipps; then the force pressed on to Quebec, but not securing the desired support of Major Fitz John Winthrop, their object was not accomplished.

1696. Frontenac's Expedition.— Frontenac's expedition against Iroquois, Oneida, and Onondaga tribes, occurred in 1696, when he was 74 years of age. The tribes were humbled by him, but not subdued.

1702–10. Second Intercolonial War: Queen Anne's War.— War was declared May 15, 1702. In August, 1703, the French and Indians attacked Wells, Saco, and Casco. Deerfield and Lancaster also suffered. In May, 1704, Col. Benjamin Church, with troops, sailed from Boston, against Acadian settlements. In 1705 French and Indians destroyed Petit Havre and St. John's, N. F. In 1709 Haverhill was attacked by French and Indians; Oct. 16, 1710, Port Royal captured by the English under Nicholson, and renamed Annapolis, in honor of the queen. Varying degrees of Indian hostility were experienced along the coast to the Kennebec River, until 1725, when peace prevailed.

1703–15. Southern Wars: Charlestown.— On Jan. 15, 1703, a battle was fought between Carolina troops under Col. Moore and the Spanish forces under Don Juan Mexia, and 800 of the latter were killed. In August, 1706, Charlestown was attacked by a Spanish fleet, with small loss to either side.

1711. Tuscarora War.— September 22, 1711, Tuscaroras and Corees slaughtered inhabitants along the Roanoke River and Pamplico Sound. During several days they killed the whites along Albemarle Sound. Col. John Barnwell, with South Carolina troops and Indian allies, guided an expedition which made several attempts to drive them away; finally captured 800 in a fort; fought a severe battle Jan. 28, 1712, and killed 400 warriors. The remaining hostile Tuscaroras migrated to Oneida Lake, joining the Iroquois confederacy.

1714–15. Yemassee War.— The Yemassee war was instigated, so it is claimed, by the Spaniards. A series of Indian outbreaks occurred in 1714–15, in one encounter 400 South Carolinians being killed. The Yemassees were driven out of Carolina into Florida, but disastrous warfare continued, hundreds suffering brutally at hands of savages.

1739–48. War with Spaniards in Florida: War of Jenkins' Ear: Carthagena.— The English South Sea Company, under the Treaty of Utrecht, was permitted to supply slaves to Spanish colonies. A smuggling-trade developed, which a Spanish fleet (*guarda costas*) tried to discourage. England and her colonies heard of terrible severities imposed by Spaniards on suspects captured. Runaway slaves from South Carolina made their way to Florida, were well received, protected, and given grants of land by the Spaniards, who declined to return slaves. In 1738 Oglethorpe, appointed military commander of Georgia and South Carolina, returned from England with a regiment. The same year, Capt. Jenkins, skipper of the ship Rebecca, was examined in the House of Commons. He described how, having unjustly accused him of smuggling, the Spaniards first hung him at the yardarm, then lowered him, and cut off his ear, telling him to take it to his king. Public clamor caused Walpole to declare war Oct. 23, 1739. An English fleet under Admiral Vernon visited the Isthmus of Darien, and captured Porto Bello. Oglethorpe, having perfected a treaty with the Creek Indians, called on them and South Carolina for aid. Although an expedition captured Fort Picolata (thus preserving navigation of St. John's River, and preventing Spaniards communicating with posts at St. Mark's and Pensacola), Oglethorpe found the 1,200 men under his command unable to make any impression on St. Augustine, and gave up the siege of that place after heavy loss to his Highland regiment, and desertion of Indians and some Carolina troops. In the spring of 1741 Admiral Vernon, co-operating with land forces under Gen. Wentworth, failed in an assault on Carthagena. A fleet under Commodore Anson secured several valuable Spanish prizes. The Peruvian town of Paita was destroyed. In 1742 a Spanish fleet of 56 vessels, carrying 7,000 or 8,000 men, fitted out at Havana, and appeared off the Georgia coast at the end of June. Its attempts to capture the island of Amelia and forts at Frederica were frustrated by Gen. Oglethorpe. July 7, 1743, the Spaniards lost heavily at the battle of Bloody Marsh; July 24 Oglethorpe proclaimed a general thanksgiving for the end of the invasion.

The following reproduction of the governor's speech to the General Assembly of his Majesty's colony of New York is of interest. It is for the first time reproduced from the only known copy, in possession of the New York Historical Society, and bears upon this period of martial activity, giving an idea of the style of appeal from king to colonists.

JOURNAL OF THE NOTES AND PROCEEDINGS OF THE GENERAL ASSEMBLY OF HIS MAJESTY'S COLONY OF NEW YORK, 30TH DAY OF JUNE 1740.

Gentlemen: His Majesty having been called upon, by repeated Provocations, to declare War against Spain, and being determined, by God's Assistance in so just a Cause to Vindicate the Honor of His Imperial Crown, to Revenge the Injuries done to His Subjects, to Assert their undoubted Rights of Navigation, and by all possible Means, to Attack, Annoy, and Distress a Nation that has treated His People with such Insolence and Barbarity, has given Orders for the Equipping and setting forth an Expedition against the Territories of the Catholic King in the West-Indies, which will consist of a large Squadron of Ships of War, and of a considerable Body of Land Forces, with a suitable Train of Artillery, Store-ships, and all Things requisite: and has likewise given Orders to raise the Body of Troops in His Majesty's Colonies on the Continent of North America, to join those to be sent from England, at a particular Rendezvous. I have, in Obedience to His Majesty's Commands, taken the best Measures in my power, to invite and encourage in His Majesty's faithful Subjects in this Province, chearfully to enlist in His Majesty's Service for this Expedition: But it is in your Power to do much more, by giving a Bounty to every Man who inlists in this Service. And I am perswaded it will be such as will shew the World, that you will not be behind the most Zealous of His Majesty's Subjects, in promoting this Glorious Enterprise. Now, although by the Success of this Expedition, the Commerce and Navigation of this Province, to and from the West-Indies, will not only be secured, but greatly increased by the large Possessions which, by the blessing of God on His Majesty's Arms, will fall into his Majesty's hands. And although by such acquisitions a Door will be opened for a larger Consumption of Provisions (the Staple of this Province) whereby the Farmer, as well as the Merchant, may be greatly enriched, Yet, it is but little that His Majesty expects from his Dutiful and Loyal Subjects of this Province, towards the Expense of this Expedition. And I am commanded by His Majesty, to Recommend it to you, in His Name, as I do most earnestly, That you provide Victuals, Transports, and all other Necessaries for the Troops

to be raised in this Province, except Cloathes, Tents, Arms, Ammunition and Pay till their arrival at the general Rendezvous in the West-Indies from which Time the Said Transports are to enter into His Majesty's Pay. In the doing whereof, I hope you will loose no Time, that the Expedition may not be retarded. His Majesty's Expectations are so just and reasonable, and the Prospect of Advantage to the Province so clear, that I perswade myself, you will chearfully and immediately provide for the Expence of what is recommended to you. These Things being Matter of the highest Importance, I will not now take off your Attention, by Recommending anything else to your Consideration, hoping you will give this Business the utmost Dispatch, wherein you will, in a very particular manner, Recommend yourselves and your Country to His Majesty, Whom God long Preserve.

GEORGE CLARK.

A bill covering the above passed the assembly July 10, 1740, and Cols. Morris and Philipse carried the same to the council for its concurrence. It was passed by the council July 11, and signed by the lieutenant-governor July 12.

1744–48. Third Intercolonial War: King George's War.— May 13, 1744, Governor Duquesnel of Cape Breton captured an English settlement at the island of Canso, near Nova Scotia; destroyed the fort, removing all prisoners to Louisburg; but was unsuccessful in an attempt against Annapolis, N. S., and Placentia, N. F. New England colonists declared war on Nova Scotia Indians, who attacked Annapolis and planned the capture of Louisburg. Men, money, and supplies were contributed by Pennsylvania, New Jersey, New York, Connecticut, Rhode Island, and New Hampshire, but the chief burden was imposed on Massachusetts. Command of the forces (some 4,000 men) was given to William Pepperell, who left Boston in April, 1745, Commodore Warren, commanding in the West Indies, furnishing ships of convoy. Five assaults were made on an island battery protecting the harbor before the French surrendered, June 17. For this success Pepperell was made a baronet. An expedition the following year proved unsuccessful, and Louisburg was returned to the French by the Treaty of Aix-la-Chapelle, Oct. 7, 1748.

1754. Great Meadows.— In December, 1753, George Washington carried a request from Gov. Dinwiddie of Virginia to the French commander of Forts Vernango (confluence of French Creek and Allegheny River, now Franklin, Pa.) and Le Bœuf (west fork of French Creek, now Waterford, Pa.) that he retire from territory claimed by the English; request was refused. Gov. Dinwiddie then ordered a fort constructed at the forks of the Ohio, and while work was in progress the French appeared and the English retired. A regiment organized under Col. Joshua Fry, with Washington second in command, pushed on with 150 men. May 28, 1754, when near Great Meadows, the French were met in a glen. In ensuing hostilities the French commander, Jumonville, was killed, and those under him captured. Washington retired to Great Meadows and threw up intrenchments, awaiting Col. Fry's force, which finally arrived. Col. Fry had died suddenly. Washington made a second advance, which proved ineffectual against a French force of 700, and he retired with the honors of war, July 3, 1754.

The same month Benjamin Franklin, Thomas Penn, and others assembled at Albany by request of the "Lords of Trade" (a standing committee of England's privy council), hoping to make an agreement with the chiefs of the Six Nations for protection in the event of further hostilities with France. Franklin's plan was unanimously approved at this congress, but the several assemblies failed to ratify it. Had his plan been adopted, it is said, the several colonies would have been united and strong enough to withstand attacks from enemies without England's assistance and the later pretense for unjust taxation. Thus the Revolutionary struggle might have been averted.

1755–63. Seven Years' War: French and Indian Wars: Braddock's Defeat.— The English government, in 1755, placed Gen. Braddock over a force intended to drive the French from the Ohio Valley. Washington was on his staff. Braddock planned the capture of Fort Du-Quesne, at the confluence of the Allegheny and Monongahela rivers. Untrained in methods of frontier warfare, having seen no enemy on his tedious march (April 2 to July 9), Braddock scoffed at the employment of scouts as he approached the immediate vicinity of the enemy, with the result that when his command was attacked it was completely defeated; half his 1,600 men killed or wounded, and he himself died from a wound received in the onslaught. His papers were captured by the French, who found therein all the English plans.

1755. Battle of Lake George.— At a council of war, called by Gen. Johnson at early morning Sept. 8, 1755, it was proposed to send 500 men to Fort Edward. The noted Indian King Hendrick, when consulted about this number, said: "If they are to fight they are too few; if to be killed, they are too many." The force was doubled. Johnson then proposed dividing it into three parties. Hendrick took several arrows, handed one of them to Johnson, requesting that he break it, which the general did; Hendrick then placed three arrows in the general's hand, saying: "Put them together and you can't break them: take them one by one and you will break them easily." This argument was conclusive. Col. Ephraim Williams led; Lieut.-Col. Whiting had second division; King Hendrick, with 250 Mohawks, was in advance of the Provincials. Rocky Brook was reached; here the enemy was in ambush; but for friendly warning from Senecas, troops would have perished. Col. Williams and King Hendrick lost their lives; Gen. Johnson was wounded; Lieut.-Col. Whiting conducted a successful retreat, followed by the French and Indian allies. Lieut.-Col. Cole, with 300 men, came from Lake George; a brilliant dash was made on the enemy, driving them and capturing Baron Dieskau. Col. Blanchard advanced from Fort Edward, where the firing had been heard, with 250 men; discovered 300 Indians resting at Rocky Brook; slew most of them. Among 500 lost by the French was Le Gardeur de St. Pierre, whom Washington had met the year before at Great Meadows.

1756–7. Forts Oswego, Ontario, George, and William Henry.— England declared war against France May 18, 1756. Gov. Shirley was commander-in-chief of colonial forces; Marquis de Montcalm general of French. Shirley slowly matured plans of attack on Crown Point and Fort Duquesne; meanwhile Montcalm destroyed three forts, Oswego, Ontario, and George. This activity of the enemy cost Shirley his position;

the Earl of Loudon taking his place, Gen. Abercrombie second in command. In 1757 Montcalm attacked Fort William Henry, at head of Lake George, garrisoned by 2,264 regulars, under Col. Munroe. The attack lasted from August 3 to August 9, when a capitulation was signed.

1758. Louisburg: Ticonderoga: Crown Point: DuQuesne.— Three expeditions were proposed for 1758: the first against Louisburg; the second against Ticonderoga and Crown Point; the third against Fort DuQuesne. May, 1758, found Admiral Boscawen at Halifax with a fleet of 157 vessels (23 ships of the line, 18 frigates and transports). There were 12,000 men under Jeffery Amherst to co-operate with him. The attack on Louisburg began June 9, and lasted until July 26, when the garrison capitulated, becoming prisoners of war. Vast quantities of ammunition and stores, 218 cannon, and 18 mortars fell into the hands of the English.

Gen. Abercrombie led a force of 15,000 men against Ticonderoga, embarking on Lake George July 5; advanced toward the fort; experienced many difficulties, including a skirmish in which Lord Howe was killed, and finally had to retreat. He lost about 2,000 men.

Lieut.-Col. John Bradstreet proposed an attack on Fort Frontenac (now Kingston, Canada); Abercrombie consented and gave him 3,000 men. This was successful toward the close of August; Bradstreet captured quantities of stores, ammunition, and cannon.

DuQuesne.— Early in July Gen. Forbes left Philadelphia en route to Fort DuQuesne, with Cherokee allies; Col. Bouquet was at Raystown; in September Col. Washington joined Forbes; late in November Fort DuQuesne was in possession of colonial forces, receiving the name of Pittsburg in honor of the elder William Pitt.

1759. Quebec.— Maj.-Gen. James Wolfe was appointed to proceed against Quebec. He had ten battalions of infantry, six companies of rangers, artillery, engineers, and the Louisburg Grenadier Corps. Under Admiral Saunders were 22 ships of the line, 5 frigates, and several transports; Wolfe had, as brigadier-generals, Monckton, Townshend, and Murray; Col. Guy Carlton commanding the grenadiers, and Lieut.-Col. William Howe (brother of Lord Howe) the light infantry. At Quebec were more troops than the English had, under Montcalm, who placed them along the north shore, below the city, from St. Charles River to the Falls of Montmorency. Wolfe placed batteries within cannon-shot of Quebec at the west point of the Isle of Orleans, and at Point Levi. The lower town was destroyed; conflagrations occurring in the upper town by red-hot balls and shells. July 9 Wolfe crossed from the Isle of Orleans to the north branch of the St. Lawrence, camping below the Montmorency; July 18 he made a successful reconnoitre. His attack on redoubts at the ford was unsuccessful, with a loss of 400 men and two vessels. While ill, and awaiting the arrival of Gen. Amherst, he called a council of war; and it was decided to draw Montcalm into the open field. Camp was broken and the troops moved to Point Levi.

De Bourgainville, with 1,500 French, guarded the north shore to prevent landing. The English admiral deceived the French by moving his vessels below the real landing-place (Wolfe's Cove, near Cape Diamond). Ascent was made to the Plains of Abraham; the memorable battle was fought, Wolfe and Montcalm both dying from wounds therein received; and the citadel surrendered September 17 to Gen. Townshend.

Fort Niagara.— Soldiers under Prideaux landed July 1, 1759, within six miles of Fort Niagara. A sally was made July 11. Prideaux was killed by a bursting shell July 19; Amherst appointed Gen. Gage to succeed him; until his arrival Gen. Johnson carried on a siege; the fort surrendered July 25.

Presqu' Isle: Venango: Le Bœuf: Ticonderoga.— Col. Bouquet captured with ease Presqu' Isle, Venango, and LeBœuf. Gen. Amherst had 11,000 men for an attack on Ticonderoga, which he took late in July (the French having withdrawn), only losing 75 men in a skirmish. He also took Crown Point. The English now fortified these places.

1759–60. Cherokee War.— While the above events were transpiring trouble arose with the Cherokees, who had accompanied Gen. Forbes against Fort DuQuesne the previous year. On the return of the Cherokees numerous instances of loss of life occurred between Indians, Virginians, and Carolinians. Gov. Littleton, with 1,500 men, marched against the Cherokees, demanding surrender of the murderers; he received 22 Indian hostages as security for peace, and retired from the field owing to disease and insubordination in his command. The Cherokees attempted to take Fort Prince George, at the head of the Savannah. Hostages were placed in irons through fear of an effort to release them; one of them wounded a soldier, and his friends promptly killed all the Indians. This enraged the Cherokees, and war-parties were sent out in every direction and laid siege to the fort; the South Carolina assembly offered £25 for each Indian scalp, and voted to raise 1,000 men. Gen. Amherst sent 1,000 Scotch Highlanders under Col. Montgomery, who raised the blockade at Fort Prince George, and met Indians in June 1760. Victory was claimed by both sides. Montgomery retired to Charlestown, prepared to return north, by order of Gen. Amherst. Lieut.-Gov. Bull now ordered 400 regulars for frontier protection. Upper Cherokees besieged Fort Loudon so successfully that the garrison lived on horse-flesh until it surrendered under promise of protection to the settlement; the promise was broken, many lives lost, and many taken prisoners. In June, 1761, the Highland regiment returned and defeated the Cherokees with great slaughter. They sued for peace, which eventually was concluded.

1760. Quebec.— The delay caused in rebuilding and strengthening Ticonderoga and Crown Point prevented Amherst from moving on Montreal. The French had time to rally under De Levis, who succeeded Montcalm, and planned retaking Quebec. The plan was put in operation April 17, 1760. De Levis, with 10,000 men went down the river to Quebec, where Murray was in control. De Levis camped three miles from the city. On April 28 an attack was made, in which Murray lost 1,000 men and a train of artillery. The French loss was estimated at 300. De Levis built trenches about the city, preparing for a long siege. May 15 Swanton arrived and destroyed all the French ships at Quebec. The siege was raised May 17,

and on Sept. 8, 1760, the English flag was raised in Montreal.

1762. Martinique: Havana.— Gen. Robert Monckton sailed from New York late in 1761 with two line-of-battle ships, 100 transports, and 12,000 regulars and colonials; in February, 1762, he captured Martinique; next, Fort Royal, St. Pierre, St. Vincent, Grenada, and St. Lucia surrendered; the French fleet was destroyed; on Aug. 12, 1762, Havana was captured by forces under the Duke of Albemarle, after a fierce struggle of 44 days, and great loss of life.

1763–4. Pontiac's War.— Pontiac, chief of the Mohawks, posed as friend of the English after their victories; in secret he was plotting against them with Algonquins, Wyandots, Senecas, and others. He planned simultaneous attacks on western posts in the spring of 1763. Major Gladwin, commanding at Detroit, was forewarned, and when Pontiac and his 60 chiefs appeared on May 6, they found the garrison under arms. The fort was unsuccessfully attacked for two months; then relief came from Fort Niagara. Capt. Ecuyer at Fort Pitt (Pittsburg, Pa.) was also prepared. At the first attack, June 22, the Indians were repulsed. The second attack, July 26, lasted four days, and the Indians were defeated. Gen. Amherst sent Col. Bouquet with 500 men to its relief; while en route, 25 miles east of the fort, he fought a stiff battle with Indians at Bushy Run, coming off victorious. In September, 1764, Col. Bouquet was again at Fort Pitt. Toward the close of November the Delawares and Shawnees returned 200 captive whites. This border war had caused much distress, and the following forts had been lost before Sir Wiliam Johnson and Bradstreet successfully treated with 2,000 representatives of the Ottawas, Ojibways, Iroquois, and Wyandots at Fort Niagara, and Pontiac's war was over:

May 16, 1763, Fort Sandusky.

May 25, Fort St. Joseph (at the mouth of St. Joseph River, Mich.).

May 31, Fort Onatanon (on the Wabash, Lafayette, Ind.).

June 2, Fort Michillimackinac (Mackinaw, Mich.).

June 17, Fort Presqu' Isle (Erie, Pa.).

June 18, Forts Le Bœuf (Erie County, Pa.), Venango (Venango County), and forts at Carlisle and Bedford, Pa.

1774. Lord Dunmore's War.— When Lord Dunmore was royal governor of Virginia in 1774, dissension as to boundary lines arose between Virginia and Pennsylvania, as well as to ways and means of dealing with Indians. Virginia wished to possess their lands; Pennsylvania desired their trade; as whites encroached more and more on lands, Indians became angered; outrages followed, perpetrated by Shawnees, Mingos, Cherokees, Wyandots, and Delawares. In the spring of 1774 a ruffian borderer, Greathouse, killed nine kinsmen of the Iroquois Logan. This caused continued hostilities until the battle of Great Kanawha, or battle of Point Pleasant, in October. The effect of this battle kept the northwest Indians submissive during the early years of the Revolution, and at the same time permitted settlement of the Kentucky region.

Colonial Wars, Society of. The Society of Colonial Wars in the State of New York was incorporated 18 Oct. 1892. It is essentially a patriotic organization, keenly alive to the necessity, in these modern days of whirl and rush, of perpetuating the names and valor of those participating in the warfare of American colonial history. Eligibility to membership consists in the applicant being 21 years of age, of good moral standing, and having a line of descent from an ancestor: (1) who served as a military or naval officer, or as a soldier, sailor, or marine, or as privateersman, under authority of the colonies which afterward formed the United States, or in the forces of Great Britain which participated with those of the said colonies in any wars in which the said colonies were engaged, or in which they enrolled men, from the settlement of Jamestown 13 May 1607, to the battle of Lexington 19 April 1775; or (2) who held office in any of the colonies between the dates above mentioned, either as (*a*) director-general, vice-director-general, or member of the council, in the colony of New Netherlands; (*b*) governor, lieutenant or deputy governor, lord proprietor, member of the king's or governor's council, in the colonies of New York, New Jersey, Virginia, Pennsylvania, and Delaware; (*c*) lord proprietor, governor, deputy governor, or a member of the council, in Maryland and the Carolinas; (*d*) governor, deputy governor, governor's assistant, or commissioner to the United Colonies of New England, or body of assistants in any of the New England colonies.

Membership is hereditary in the male line of the present members of the society and of those who may hereafter be elected, up to the limit that the society may hereafter determine upon, subject to the vote of the council upon the moral qualification of the person who may be the heir at any time to such membership. The membership in the New York Society is limited to 1,000, exclusive of descendants of members, members of State societies who may be transferred to this society, and members of the army and navy and marine corps on active service.

In 1903 there were 26 co-ordinate State societies united in the general society, with a membership approaching 6,000. In New York "business courts" are held in March and November; a "general court," for the annual election of officers, in December. At these courts papers are read dealing with the colonial period. An annual banquet is held in honor of the founding of New Amsterdam. A "general assembly" of the general society meets once in three years at such time and place as the preceding assembly designated. These general assemblies are composed of the members of the general council, together with five delegates chosen by each of the State councils.

The society has erected commemorative bronze tablets at Fort Oswego and Ticonderoga, and one of marble to Gen. Forbes. An oil portrait of Gen. Bouquet has been presented to the city of Philadelphia, and adorns Independence Hall. Many members of the society participated actively, either in the army or the navy, during the Spanish-American war, many thousands of dollars being contributed by the several State societies, from Maine to California, in equipping State regiments, caring for the sick and wounded, and for hospital supplies, flags, band instruments, etc. The year-books of the society contain valuable historical and genealogical data.

SYDNEY H. CARNEY, JR., M.D.,
Historian Soc. of Colonial Wars, New York.

Colonies and Colonization. In the older and stricter sense, a colony is a body of people who, having migrated and settled beyond the borders of their native country, retain a political connection with the parent state. Since, however, the colonists may be mingled in any proportion with the natives, it is impossible to maintain a firm distinction between colony and dependency. It has therefore become customary to apply the term "colony" to an outlying possession of a national state the administration of which is carried on under a system distinct from but subordinate to, the government of the national territory. According as the dominant feature is the exploitation of a dependent population, the settlement of immigrants from the mother country, or the investment of capital, colonies may be divided into possessions, settlement colonies, and investment colonies.

The Greek colony was formed in a natural way by the swarming off of surplus population, and was usually independent from the beginning. The bond between the mother state and the colony was sentimental, not political, and the former seldom expected any advantage from the founding of the colony save relief from the pressure of population. The Roman colonies formed part of an elaborate scheme for extending Roman dominion. They were instituted by the state, and were its chief instrument in confirming its conquests. In their origin they were little more than garrisons in conquered, fortified places, where land was allotted to the soldiers instead of pay and provisions.

When the discovery of America occurred, Europe was not overpeopled, and there was for a long time little spontaneous outflow of substantial elements to create new communities. The conquest of large and industrious populations, settled upon rich lands, tempted the cupidity of rulers, and gave rise to the conception of the colony as a possession, an estate to be mined or worked by the state or its favorites for purposes of revenue. Says Seeley: "A native population reduced to serfdom, in some parts driven to compulsory labor by caçiques turned into state officials, in other parts exterminated by overwork and then replaced by negroes; an imperious mother country drawing from the colony a steady revenue and ruling it through an artful mechanism of division, by which the settlers were held in check by the priesthood, and by a serf population treated paternally, that it might be available for that purpose; such was the typical colonial system."

The exploitation of subject populations by such means as tribute, serfdom, forced labor on public works and government plantations, or

the maintenance of crown or company monopolies, has come to be generally recognized as short-sighted, and no longer commends itself to enlightened nations. The old, harsh policy has, moreover, become more difficult with every step toward popular government in the dominant country, and every increase in the power of public opinion. The idea that the dependency is an estate, to be worked for the benefit of the owner, is, however, by no means dead. A disguised and slanting exploitation is still effected by tariff discriminations which insure the dominant country a monopoly of colonial trade, by the granting to favored citizens of lucrative concessions and contracts, by the imposition of a highly paid civil service from which the natives are excluded, and by the saddling of colonial taxes upon the natives while the proceeds are expended in the neighborhood and for the benefit of the European settlements.

Entirely different from the type just described is the settlement colony, which grows up in desirable temperate regions, vacant or sparsely peopled by savages. Although the love of adventure, the crusading spirit, and the desire to escape political, religious, or racial oppression are by no means to be overlooked, it is chiefly the economic motive that leads to the founding of settlement colonies. A stationary population enjoying rapid industrial expansion yields few colonists, but a clogged labor market, a narrowing circle of opportunities, and a darkening prospect stimulate large numbers to face the unknown in the hope of bettering their condition. Not only is a population stimulated to its utmost capacity, provided it remains in vitalizing touch with the mother country, but the mixture of races results frequently in a beneficial crossing of stocks, and the severe struggle in a new and untamed environment accelerates the improvement of the race by natural selection. The growth of numbers, changing constantly the relation between population and opportunities, carries a colony through well-defined stages. First comes the appropriation of natural wealth, hunting, trapping, and mining; then follows pastoralism; then agriculture, to which in time is added manufacturing. During the earlier stages, when the colony is complementary to the mother country, each finds in the other a convenient vent for its surplus products. The volume of exchanges is relatively large, and their trade reaches its maximum importance. But as population thickens and wealth accumulates, the colony, acquiring home manufactures and home markets, becomes an integral, self-sufficing community, and evinces a growing disposition to assert its independence of the mother country, formerly its complement, but now its competitor.

The granting of large entailed estates may lend a colony a semi-feudal character. But if the land system is popular, landed property will be diffused, the proceeds of labor will go to the producer, and the colony will contain few persons living on incomes derived exclusively from ownership. Moreover, being more favorable to production than to consumption, the colony will draw to itself adult males from the industrial population of the mother country, but will attract few members of the less active classes. Since the reward of industry is greater than in older societies, and the community is but little differentiated, economically or socially, manhood rather than property controls the body politic, the temper is individualistic and liberty-loving, and the conditions favor the germination and rootage of democratic ideas. Despite its social and political radicalism, the colonial society is conservative in its moral and religious ideals. Unless non-economic motives have presided over the beginnings of the colony, the pursuit of wealth is the chief interest of the settlers, and there is little room for speculative thought. The lack of cities, of intercourse, and of leisure is unfavorable to the cultivation of the sciences or the fine arts. During the early life of the colony the preoccupation with private affairs leaves little margin for public life. If the mother country is wise enough to establish security without interfering vexatiously with private interests, the administration of affairs of general concern is turned over to it without regret. A dependence upon the richer and riper culture of the parent state may indeed cause the political connection to continue long after the colony is ready for self-government. Lands thickly peopled by non-European races, and tropical regions where the climate is such that white men will not settle there with their families, do not develop into settlement colonies. Unfit to serve as an outlet for the surplus population of the temperate zone, they can be legitimately utilized by the more advanced races only as a field for the employment of commercial or industrial capital.

The commercial type of the investment colony is best seen in the early establishments of Portugal, Holland, and England, for trade with the East Indian and African peoples. When colonial enterprise is dominated by the commercial motive, penetration of the interior of a new region is not required. Trade is conducted from the decks of merchantmen, from hulks anchored at the mouth of streams, or from fortified stations situated on the seacoast or on the banks of navigable rivers. Settlements of traders and soldiers spring up, but there is little motive to extend political control over large inland regions. A chartered commercial company has at first no occasion to clash with the natives. Its armament is chiefly directed against envious rivals, eager to share in its lucrative trade. Later, when in its eagerness for an exorbitant profit, it attempts to dictate to the natives or limit their production of the staples of trade, it comes to blows with them, and squanders its resources in profitless wars. The earlier commercial colony was valued as a source of tropical products, such as sugar, coffee, and spices, which could be resold in Europe at a large advance. Since the advent of machine industry, however, the commercial colony is valued rather as a market for surplus manufactures. The recent revival of protective tariffs accentuates the struggle for outlets, and impels each of the industrial countries to extend, so far as possible, its control over Oriental and tropical populations, in order to develop in them a taste for its own goods and thus build up an important trade. The old maxim that "trade follows the flag" has taken on a new significance since protectionist nations have adopted the policy of extending their own tariff walls about their territorial acquisitions so as to exclude their commercial rivals.

The chief means of relieving the superabundance of capital that threatens to lower the rate

of profits in the advanced countries is the application of capital in the industrial development of the more backward regions. Tropical lands under native systems are almost invariably underexploited from the point of view of modern industry. The forest and mineral wealth is largely untouched, and even the area under intensive native cultivation, lacking as it does the best facilities for irrigation, tillage, and transportation, produces by no means the value it might yield. Owing to ignorance, to unstable conditions, or to the lack of accumulated wealth, industry is almost wholly deprived of the aid given by large applications of capital. Under these circumstances it is possible for the more civilized peoples, without in any way exploiting the native populations, without depriving them of their earnings or their patrimony, to apply capital and directive skill in such a manner as to reap a generous profit.

The example of Mexico and of certain countries of South America shows that backward regions may be developed by capital invested under the protection of local governments, and that no adequate reason exists for administering these countries from a distance. In other cases, however, a rapacious and unstable native rule paralyzes industry, and the utilization of natural resources is impossible until a responsible and equitable government has been instituted. It is necessary for some civilized power to suppress tribal and local warfare, to stamp out brigandage, and to establish an efficient police, a righteous administration of justice, and a rational system of taxation. When order and stability have thus been assured, the next step is the investment of development capital in the form of harbors, railways, highways, telegraphs, improved natural waterways, and irrigation works. As the means of communication are perfected, there follows naturally the employment of capital in the opening of mines, the cutting of forests, the clearing and planting of estates, and, possibly, the establishment of factories. The development of a tropical region by the aid of capital from abroad requires the presence of a small body of white men in the capacity of officials, traders, planters, and superintendents, representing in the midst of the less advanced population the superior power and intelligence of the civilized peoples.

The extension of modern forms of agricultural exploitation into climates where white men cannot endure heavy field-work creates special problems respecting the relations of capital and labor. Successful enterprise requires an abundant supply of suitable and reliable labor, and this can come only from the natives or from other colored races. In the old plantation colony the problem was solved by enslaving the local population, or by kidnapping negroes from Africa. Of late there is a tendency, in case the natives cannot be tempted or taxed to work, to draw upon the great reservoir of labor power in the East Indies and China. In the British colonies alone the numbers of coolies that have been imported under five-year contracts are approximately: In Guiana, 70,000; Trinidad, 70,000; Natal, 40,000; Jamaica, 13,000; Mauritius, 250,000. Owing partly to the racial inequality of employer and employee, and partly to the character of tropical agriculture, which cannot bear interruption, especially at harvest time, there is a strong tendency in all planting colonies to compel the specific performance of the labor contract. Under the indentured labor system in the British colonies strikes are unlawful, and refusal to work can be punished; on the other hand, the government closely supervises the terms of the labor contract, suppresses all obnoxious features, and provides machinery for compelling the fulfilment of its provisions by the employer.

If the welfare of the colony is the first desideratum, the degree of control exercised by the mother country over the internal affairs of a settlement colony will be moderate at the beginning, and will tend constantly to diminish. The prosperity of the English colonies in America was largely due to the salutary neglect of the mother country. They revolted when she sought by a stricter control to make them subserve her economic interests. The home government, even with the best of intentions, is likely through sheer ignorance to press upon the colony institutions ill-adapted to local conditions. On the other hand, during the early life of the colony the settlers, preoccupied with private affairs, have little leisure for the study of the problems of administration and government. Their political life is unduly dominated by selfish, special interests, and there is danger that the first comers may monopolize or waste the natural wealth which ought to be reserved for later arrivals. As impartial umpire and as custodian of the interests of the future, the home government may wisely exercise a supervision which will diminish as the colonial society grows in mass, stability, and variety of interests. In the final stage of political connection, the colony is granted autonomy in all save external affairs, or even becomes with the mother state a member in a federal empire. On the other hand, this gradual ripening off the parent stem is by no means the normal course of a tropical colony, where there are two unmingling elements in the population — a colored race and an incoming European race. In the West Indies, for example, self-government means the rule of the one race or the other. There is either the domination of a large native population by a permanently resident European caste, cut off from the moral and political conditions which have produced European standards, or else the subjection of the white element to the uneducated and politically inefficient majority race. Here, the home government presents itself as a power superior to local prejudices and able to override the antagonistic class or race interests which otherwise might wreck the prosperity of the colony. For these reasons the system of self-government now enjoyed by the colonies of Canada and Australasia is not likely soon to be extended to the remaining 500,000,000 human beings in existing colonies, dependencies, and protectorates.

The method of direct administration — known as "the crown colony system" — while excellent as a means of balancing conflicting interests and protecting the native majority against oppression by the white minority, errs in trusting too much to the power of ordinance, and showing too little deference to the deeply ingrained customs and characteristics of the native population. The direct government of an alien race by European officials is, moreover, very expensive; and if it is sought to utilize natives as magistrates and police, the best among the

native leaders will stand aloof, leaving often only the riffraff to become the instruments of administration. Provided there exists an advanced civilization and a highly organized native society, the legitimate ends of European control over a tropical region can best be attained by preserving and working upon the native government through the instrumentality of a protectorate. By this method the natives continue to follow their natural leaders, and retain their time-hallowed laws and customs. Resident agents of the suzerain country supervise the native authorities and, by the exercise of personal influence, prevent misrule, suppress obnoxious practices, and introduce gradually the standards of civilized administration. Commercial and industrial development proceeds apace, while the local population is better safeguarded against exploitation.

The present age has seen a marked increase of political dependency. The strong nations evince a growing disposition to police and place under orderly administration all regions where potential wealth exists, in order to make safe and profitable the improvement of such resources by means of the capital and skill of their citizens. The investment motive is likely to become in the future even more imperious than now, and the increasing speed of communication favors the permanence of the colonial relation where once it is established. There is, in fact, every prospect that in the more advanced nations a larger and larger share of attention will be given to colonial affairs and problems.

The table below prepared by the Bureau of Statistics of the United States Treasury Department shows the present area and population of the colonial possessions, protectorates, dependencies, and "spheres of influence" of each country given.

Countries Having Colonial or Noncontiguous Territory	Number of colonies, etc.	Area		Population	
		Mother country	Colonies, and other noncontiguous territory	Mother country	Colonies, and other noncontiguous territory
		Square miles	*Square miles*		
United Kingdom	54	120,979	*12,043,806	41,605,177	*351,254,076
France	29	204,092	4,317,826	38,595,000	62,270,560
Netherlands	8	12,648	782,863	5,103,924	33,408,014
Belgium	1	11,373	900,000	6,744,532	30,000,000
Chinese Empire	5	1,353,350	2,881,560	383,000,000	16,680,000

Professor Sociology University of Nebraska.

Coloniza'tion Society of America, The National, an association to colonize free negroes in Africa or elsewhere. The idea was evolved by friends of negro advancement and opponents of slavery; by Dr. Samuel Hopkins of Newport, R. I., in 1770, at once to Christianize and civilize Africa, and to assist emancipation here by providing a place to which free negroes could go; and by Jefferson during the Revolution, for the latter object. But about 1800 it was taken up by the slaveholding interest, for exactly the opposite purpose — to strengthen their system by deporting the free negroes, who made the slaves discontented and were considered otherwise objectionable. Virginia tried repeatedly to obtain a national grant for colonizing purposes, and failing this, in 1806 enacted that any slave thereafter freed should leave the State within a year or be again reduced to slavery; and in 1816 the petition to Congress was renewed, to force some national action. On the first of January the society above was organized. The president (Judge Bushrod Washington), all the managers, and all but a small minority of the vice-presidents, were slaveholders; its constitution professed no purpose to benefit the blacks, and its ablest northern advocate denied that it had any. Support was asked for it in the North on the ground of its civilizing Africa and leading to gradual emancipation; in the South, on the ground of its contributing to the continuance and strengthening of slavery, augmenting the value of slave property, and providing an overflow for the excess of slaves beyond profitable employment. This impossible "straddle" of purposes ruined its chance of accomplishing much; though a number of the best northern philanthropists, and their southern peers like Birney, clung to it for some years and hoped for good from it. A great many State branches were organized, and vigorous public appeals made for it. Charles Carroll, James Madison, Henry Clay, and Latrobe the architect were its presidents. In 1820 a colony of a few hundreds was sent to Sherbro Island, West Africa, with tools and arms, and in 1822 another was sent to

found Liberia, with sincere hopes. But the perpetual vilification of the free negroes by the managers, advocates, and organs of the society, their anxiety to do nothing to antagonize the slaveholders, and their advocacy of the severest "black laws" to force the freedmen into desiring deportation as a refuge, alienated the anti-slavery element, who felt that they were being used as cats'-paws of the slave interest. Even Daniel Webster in 1825 refused to join it on that ground, though in 1822 he favored it. By 1830 the Tappans, Gerrit Smith, Birney, Lundy, Garrison, and others had withdrawn from it, and the last-named was openly denouncing it. In 1833 he went to England to expose it before the anti-slavery people there, and they united in a public protest against it. A similar society was organized there, but accomplished nothing. The American society maintained its organization even after the War, though its problem was altered, as well as the southern attitude toward it. An effort a few years since to promote a large negro emigration to Kansas or Oklahoma was met with strong objection from southern employers of labor. Consult: Wilson, 'Rise and Fall of the Slave Power in America,' Vol. I., chap. 15; Alexander, 'History of Colonization on the West Coast of Africa.'

Colonna, kō-lŏn'nä, **Aegidius de,** Italian scholastic theologian: b. 1247; d. 1316. He was prior-general of the Augustine order, and an ardent realist and disciple of St. Thomas Aquinas, under whom he studied at Paris.

Colonna, Fabio, Italian botanist: b. Naples 1567; d. there about 1650. He published several botanical works and is classed as the founder of genera in botany.

Colonna, Fabrizio, fä-brēt'sē-ō, Italian general: d. Naples 1520. He was the cousin of Prospero Colonna (q.v.) and father of Vittoria, served in the army of Charles VII. of France in 1494; in that of Frederick, king of Naples, in 1497; and afterward in that of Ferdinand the Catholic, by whom he was made grand constable in 1507. Subsequently he served in the papal army under Julius II. In 1512 he was made prisoner at the battle of Ravenna by Alfonso d'Este, Duke of Ferrara, who treated him with distinction, and dismissed him without ransom. To show his gratutude he tried to reconcile Alfonso with the Pope, and gave him a safe conduct to come to Rome; but Julius kept him prisoner, and attacked his states. Colonna, indignant at this breach of faith, rescued Alfonso from the papal troops, and reconducted him to Ferrara.

Colonna, Marco Antonio, Italian commander: b. 1535; d. 1 Aug. 1584. He commanded the papal forces at the battle of Lepanto and was subsequently viceroy of Sicily.

Colonna, Ottone. See MARTIN V. POPE.

Colonna, Pompeo, pŏm-pā'ō, Italian ecclesiastic, nephew of Prospero Colonna (q.v.): d. 1532. He was a restless and intriguing Roman cardinal who quarreled in succession with the Popes Julius II., Leo X., and Clement VII., and had part in all the troubles of the court of Rome. When Clement VII. was the prisoner of the Constable de Bourbon, Pompeo exerted his influence for his liberation. He at length became viceroy of Naples.

Colonna, Prospero, Italian general: b. 1452; d. 1523. On the invasion of Italy by Charles VIII. he took part with that prince, owing to his enmity against the Orsini family. He shortly afterward, however, abandoned the French cause, and bore arms in the Spanish interest. Among his most noted victories were those gained at Vicenza over the Venetians 1513; and at Bicoque over the French 1522. He also took Milan from the French in 1521, and Genoa in 1522. In 1523 he defended Milan successfully against Admiral Bonnivet.

Colonna, Stefano, Italian noble: d. 1347. He deserted the policy of his house, and became a supporter of the Guelf party. He was chosen a senator with Orsini, the hereditary enemy of his family. He was a leader of the nobles in opposition to Rienzi, to whose government he temporarily submitted, but was killed in an attempt to take the city by a *coup-de-main.*

Colonna, Vittoria, Italian poet: b. Marino 1490; d. Rome 25 Feb. 1547. She was the daughter of Fabrizio Colonna (q.v.), and when four years old was betrothed to a boy of the same age, Fernando d'Avalos, son of the Marchese di Pescara. At 17 they were married. After her husband's death in the battle of Pavia (1525), Vittoria found her chief consolation in solitude, and the cultivation of her poetical genius. For seven years she resided at Naples and Ischia, then removed to the convent of Orvieto and afterward to that of Viterbo. In her later years she left the convent and resided in Rome. Her earlier poems were chiefly devoted to the memory of her husband. Among her later verse the 'Rime Spirituali' (1548), is remarkable for truth of sentiment and enlightened piety. She was the friend of Michaelangelo, who wrote several poems to her. Consult Campori, 'Vittoria Colonna' (1878); Reumont, 'Vittoria Colonna, Leben Dichten, Glauben in 16 Jahhundert' (1881); Mrs. Roscoe, 'Vittoria Colonna, Her Life and Poems' (1868).

Colonna, a village in the papal states, which gave its name to one of the most powerful and celebrated aristocratic Roman families. During the Middle Ages the family played an important part in the affairs of Europe, became allied to the greatest houses of Italy, Spain, and Germany, and furnished many celebrated warriors, Popes, and cardinals.

Colonna, Cape. See SUNIUM.

Colonna Palace (It. *palazzo Colonna*), a handsome and interesting structure at the foot of the Quirinal, belonging to the family from whom it is named, but occupied of late years by the French embassy. It was commenced by Pope Martin V. in the 15th century, and was the residence of Julius II. and of Cardinal Borromeo. It contains a picture gallery, open to the public every day except holidays, which in point of size and architecture ranks with the finest in Rome. The ceiling of the great hall, supported by handsome columns of *giallo antico,* is covered with frescoes illustrative of the history of the Colonnas, the central subject being the battle of Lepanto. The collection of paintings, formerly numbering 1,362 pieces, has been greatly reduced by division among branches of the family, but still embraces many magnificent works by Titian, Guido, Salvator Rosa, Guercino, Paul Veronese, Giulio Romano, Holbein, and lesser artists. Almost equally celebrated as the

picture gallery are the Colonna gardens, which extend behind the palace in terraces up the west slope of the Quirinal. They are planted with box, ilex, laurel, etc., and have long rows of straw houses in which the lemon is brought to rich perfection. There are some colossal ruins in the garden, supposed to belong to the temple of the sun erected by Aurelian, and to the baths of Constantine.

Colonnade, a range of columns. If the columns are four in number it is tetrastyle; if six in number, hexastyle; when there are eight, octastyle; when ten, decastyle, and so on according to the Greek numerals. When a colonnade is in front of a building it is called a portico; when surrounding a building, a peristyle; and when double or more, polystyle. The colonnade is, moreover, designated according to the nature of the intercolumniations introduced as follows: pycnostyle, when the space between the columns is one diameter and a half of the column; systyle, when it is of two diameters; eustyle, when of two diameters and a quarter; diastyle, when three; and araeostyle, when four or more. A colonnade differs from an arcade in this respect, that the columns of the former support straight architraves instead of arches.

Colonsay (kŏl'ŏn sā) and **Oronsay,** ō'rŏn-sā, two islands off the west coast of Argyle, Scotland, united at low water, and at high water only about 100 yards apart; united length about 12 miles; breadth varying from 1 to 3 miles. Colonsay is much the larger, and has a diversified surface with fine rock and other scenery and beautiful sandy beaches. On Oronsay are the imposing ruins of an extensive priory, and near it a fine sculptured cross. Cattle and sheep are reared, and fishing is carried on. Visitors land at Scalasaig pier, on the island of Colonsay. The islands are named after St. Columba and St. Oran. Pop. in 1891, 381.

Colonus, in civil law, a freeman of inferior rank, corresponding with the Saxon *ceorl* and the German rural slaves. It has been held probable that many of the ceorls were descended from the *coloni* taken into Saxony by the Romans. The names of the *coloni* and their families were all recorded in the archives of the colony or district, from which fact they were known as *adscriptitii* also.

Colonus, kō-lō'nŭs, an eminence near Athens, to which Œdipus retired during his banishment to Thebes, and from which Sophocles gave the title of "*Œdipus Coloneus*" to one of his finest tragedies. According to Pollux, there were two places at Athens known as Equestris and Agoræus Colonus.

Colony, a settlement formed in one country by the inhabitants of another. Colonies may either be formed in dependence on the mother country or in independence. In the latter case the name of colony is retained only in a historical sense. The motives which lead to the formation of colonies, and the manner of their formation, are various. The lust of territory; the requirements of commerce; the desire of increasing wealth, combined with the love of adventure; the necessity of relieving the pressure of redundant population; political dissensions; the convenience of removing to a distance persons likely to disturb the peace of the state, and especially the apparent ease with which a numerous criminal class may be got rid of by expatriations, are among the chief motives which have influenced colonization. Colonization is only a more formal development of the migratory tendency; and a colony may be considered as an organized and permanent migration. Among ancient nations the principal promoters of colonization in the more formal sense were the Phœnicians, the Greeks, and the Romans, and the greatest colonizers in modern times have been the English and the Spaniards, next to whom may be reckoned the Portuguese, the Dutch, and the French. The Phœnician colonies, extending along the shores and throughout the islands of the Mediterranean, were mainly commercial. The most famous of them was Carthage, itself a great colonizing state. From the distance of the mother states, and the slowness of communication, many of them must have been practically independent from a very early period; but this was not the case with the colonies of Carthage, which wielded powerful armies and maintained great fleets, both for commerce and for conquest. The Greek colonies were widely spread, being numerous in Asia Minor, the Balkan peninsula, and the islands and coasts of the Mediterranean, in South Italy, and Sicily. They were commonly independent, and frequently soon surpassed the mother states in power and importance. Constantinople, Naples, Palermo, and Marseilles were all originally Greek colonies. The Greek civilization was largely based upon and highly favorable to individual liberty, and the independence of spirit which it fostered made political dissension a frequent cause of colonization. A still more pressing one was the limited extent of the Greek territories, and the inviting character of those by which they were surrounded. Rome was a state which left nothing to the individual. Its colonies were chiefly military, and while the empire lasted were all in strict subordination. As the Roman power declined the remains of them amalgamated with the peoples among whom they were placed, and contributed largely to the homogeneous growth of modern civilization.

Before America and the way by sea to the East Indies were discovered, the states of Europe in the Middle Ages, with the exception of the Genoese and the Venetians, had no foreign colonies. The intercourse and wars of the Portuguese with the Moors, then more advanced in civilization than most of the European nations, served to incite their rivalry and stimulate them to maritime enterprise, and they became the pioneers of Europe in maritime discovery. One of the chief names in this connection is that of Henry the Navigator, son of John I. of Portugal. The Portuguese in 1419 discovered Madeira; in 1431–60 the Azores; in 1487 Bartolomeo Diaz doubled the Cape of Good Hope; and on 20 May 1498, Vasco de Gama landed near Calicut on the Malabar coast, after a voyage round the south of Africa. The Moors had previously been in possession of the inland trade of India, and it was not without a struggle that the Portuguese succeeded in establishing settlements on the coast of Malabar. The first Portuguese colonies were garrisons placed along the coasts of the continents and islands they visited for the security of their commerce, as Mozambique, Sofala, and Melinda on the east coast of Africa, Ormuz and Muscat, in the Persian Gulf; Goa, Diu, and Damaø, on the Malabar coast of India. Goa became the capital of their Indian do-

minions. Colonies were established in Ceylon in 1505; in the Moluccas in 1510; Java, Sumatra, Celebes, and Borneo were also colonized, though the settlements there did not attain so great importance. The direction taken by the Portuguese navigators made them miss the discovery of America; but Brazil was discovered by Cabral in May 1500, a few months after Pinçon, and was colonized by the Portuguese about 1530. The splendid colonial empire of which the foundations were thus laid was not destined to last. As in the case of Spain the energy of the Portuguese was trammelled by climatic and other conditions, and this, together with a despotic colonial policy, had weakened the power of Portugal before she fell in 1580 under the dominion of Spain. The colonial possessions of Portugal were afterward assailed by the Dutch as enemies of the Spaniards, and when she recovered her independence in 1640, many of them were irretrievably lost. Brazil declared its independence in 1822. The colonial possessions of Portugal are now mostly in Africa; the whole of her possessions in that continent embracing an area of more than 5,000,000 square miles.

Soon after the Portuguese the Spaniards commenced the work of colonization. On 12 Oct. 1492, Columbus discovered the island of San Salvador. Hayti, or San Domingo, named by Columbus Española, was discovered in the course of the same voyage, December 1492, and immediately colonized. Porto Rico and Jamaica were colonized in 1509, Cuba in 1511. On the mainland a Spanish settlement was effected in Colombia (New Granada) in 1510. Mexico was conquered 1519–21; Ecuador, Venezuela, New Granada, Peru, and Chile, were occupied and subdued between 1524 and 1541; and Spain was raised to the first rank among the colonizing powers of Europe. The Spaniards regarded their new possessions in various aspects. Some, animated by a zeal for religion, considered the conversion of the natives as the great end which Heaven had assigned to them. Others were inspired by the love of glory or the passion for gain, and scrupled at no means by which it was possible to gratify their wishes. Owing to the degraded character of many of the first colonists, who were often mere adventurers and released criminals, the first settlements suffered much from internal strife and confusion. After many dissensions the government of the colonies, in its fundamental traits, was settled in 1532, during the reign of Charles V. A council of the Indies in Europe, viceroys, at first two, afterward four, together with eight independent captains-general in America, were the heads of the administration. Cities were founded, at first along the coasts, for the sake of commerce and as military posts; afterward also in the interior, especially in the vicinity of the mines; as Vera Cruz, Cumana, Porto Bello, Carthagena, Valencia, Caracas; Acapulco, and Panamá, on the coast of the Pacific; Lima, Concepcion, and Buenos Ayres. The whole ecclesiastical discipline of the mother country was transferred to the colonies, except that in them the Church was much more independent of the king. The intercourse with Spain was confined at first to the single port of Seville, afterward to that of Cadiz, from which two squadrons started annually. So, although commerce was not expressly granted by law to a society, it remained nevertheless entirely in the hands of a few individuals. Spain took possession of the Philippine Islands in 1564, and a regular intercourse was maintained from 1572 by the South Sea galleons, between Acapulco and Manila; but owing to the great restrictions on commerce those islands, notwithstanding their advantageous situation, were an expense to the crown. Spain proved to be the foremost of the colonizing powers of Europe in respect to the formation of new states; the most unfortunate of all in regard to the retention of her possessions. The causes of the loss of her colonies differed from those which prevailed in the case of the Portuguese. European wars and the decline of her home power were the most important, but they did not so often lead to the colonies falling under other powers, as in the case of Portugal. They more frequently became the occasion of revolt, and the opportunity for declarations of independence on the part of the colonies themselves. Thus were formed the republics of Mexico, of Central America, of Venezuela, New Granada or Colombia, Ecuador, Peru, Bolivia, Chile, etc.; but as the weak government of the mother country served to promote this early defection, few of the states formed in this unfortunate school have yet attained the repose of settled government. An insurrection began in Cuba in 1895, and after Spain had in vain endeavored to suppress it the United States interferred. War followed, with the result that after a brief struggle not only Cuba, but also Porto Rico and the Philippine Islands were lost to Spain.

The Dutch, during the struggle for their independence, first became the formidable rivals of the Portuguese, then subject to the Spanish yoke. They had already for some time carried on the trade in East India merchandise between Lisbon and the rest of Europe, but their intercourse with Lisbon was prohibited by Philip II. in 1584. The prohibition was revived in 1594 with the utmost severity, and a number of Dutch vessels in the harbor were seized. Excluded from the European trade in the productions of India, they resolved to import directly from India the articles which were refused to them in Europe. Companies were formed, which were united into one by a charter granted 20 March 1602 to the Dutch East India Company, established in 1595. This charter, which was renewed afterward at different times, conferred not only the monopoly of the East India trade, but also sovereign powers over the conquests which the company should make, and the colonies which it should establish in India. An entirely new colonial policy was thus introduced, which instead of political or ecclesiastical aggrandizement, contemplated mercantile advantage as its main object. The Dutch colonies in the East Indies were thus commercial colonies; and the islands of the Malay Archipelago, being more easily defended than the continent of India, became the principal seat of the Dutch power. This was undoubtedly the chief cause of their colonies being so long in a flourishing condition, as they required only the dominion of the sea to maintain them. In 1619 the newly built Batavia was made the capital of the Dutch East Indies. About the middle of the 17th century the power of the Dutch reached its highest point. They effected the establishment of a colony at the Cape of Good Hope in 1650, which afforded an

excellent bulwark for their East India possessions, and took Ceylon from the Portuguese, after a long and sanguinary struggle in 1658. All the Dutch colonies in the East Indies were under the governor-general of Batavia. In 1621 the Dutch also established a West India Company, which at first made extensive conquests in Brazil, but soon lost them entirely (1623–60). Their settlements on some of the smaller West India Islands, as San Eustatia, Curaçoa, Saba, and San Martin (1632–49), were more permanent. On the continent Surinam, Paramaribo, Essequibo, and Berbice were in the hands of the Dutch in 1667. In North America the Netherlands held the valley of the Hudson, and pushed south at the expense of the Swedes, winning the present States of New Jersey and Delaware, only to lose them to England. The decline of the Dutch colonial power, partly caused by European wars and partly by the successful rivalry of the English, continued from the end of the 17th century till the French Revolution. On the recovery of its independence, the commerce and the colonial importance of Holland somewhat revived, and though many of her colonies were lost, the value of the remainder was enhanced by improved administration. The Dutch still possess numerous colonial possessions in the East Indies, including Java, Sumatra, parts of Borneo, the Moluccas, and part of New Guinea; several small islands in the West Indies, and Surinam.

No colonizing power has had a career of such uniform prosperity as Great Britain. The freedom of her institutions, and the practical enterprise and self-reliance of her people peculiarly fitted her for the work of colonization, and it has steadily advanced with her equally in peace and in war. Her insular situation freeing her from the ambition of direct territorial aggrandizement, and giving her the command of the seas, enabled her in every war to strip her opponents of colonial possessions which were not unfrequently retained as the price of peace. The only break in a career of prosperity which has resulted in the formation of an empire greater in extent of territory and of population than any other known to history was the revolt of her American colonies, which resulted in the formation of a state destined ultimately to rival Great Britain herself in political and commercial importance and in the freedom of its institutions. This state, too, by the successful result of the war of 1898 with Spain, itself entered on a policy of colonial expansion.

The English made their appearance as a colonial power nearly at the same time with the Dutch, but at first with far inferior success. After many fruitless attempts to find a northeast or northwest passage to the East Indies, English vessels found their way round the Cape of Good Hope to the East Indies in 1591. In 1600 Elizabeth granted a charter to the East India Company. Its commerce with India, however, was not at first important. It established only single factories on the continent, and at the beginning of the 18th century the possessions of the English in the East were limited almost exclusively to Madras, Calcutta, and Bencoolen. The ruin of the Mogul empire in India, which commenced in internal disturbances after the death of Aurengzebe (1707), and was completed by the incursions of Nadir Shah (1739), afforded the opportunity for the growth of British power, as the British and French were compelled to interfere in the contentions of the native princes and governors. The French, under Labourdonnaye and Dupleix, appeared at first likely to maintain the superiority; but the British succeeded in acquiring the ascendency in the Carnatic; and in the middle of the 18th century they greatly extended their dominions under Clive. By the destruction of Pondicherry they secured their superiority on the coast of Coromandel; and the victory of Clive at Plassey, 26 June 1756, laid the foundation of their exclusive sovereignty in India. By the Treaty of Allahabad, 12 Aug. 1765, Bengal was surrendered to the British by the titular Great Mogul; and the fall of the empire of Mysore, the dominions of Hyder Ali and Tippoo Saib, may be considered as completely establishing the British supremacy in India. The Mahrattas, with whom the British waged war at intervals from 1774 to 1818, and the Sikhs, subdued in 1849, were the last formidable enemies of the company. With the exception of a few dependent states the British territory now embraced nearly the whole of India, and this vast territory was still under the government of a chartered mercantile company, exercising many of the most important functions of an independent sovereignty. On the suppression of the Indian mutiny (1857–8) this state of things was deemed too hazardous to last, and the government of India was transferred to the crown by act of Parliament in 1858. Ceylon was first occupied in 1795–6.

The discoveries of the Cabots, following soon after the voyages of Columbus, gave the English crown a claim to North America, which in the reign of Elizabeth led to colonization on a large scale. In 1606 James I. divided the territory claimed by England into two parts — South Virginia, extending from Cape Fear to the Potomac; and North Virginia, from the mouth of the Hudson to Newfoundland. Two companies were formed for the colonization of America — the London Company, to which was granted South Virginia; and the Plymouth Company, to which was granted North Virginia, The region between the Potomac and the Hudson was neutral ground. The London Company in 1607 founded the commonwealth of Virginia by building Jamestown on the James River, so called in honor of the king. A House of Burgesses for the new colony met for the first time on 19 June 1619, and thus was constituted the beginning of representative government in the British colonies of America. In 1614 Capt. John Smith, having examined the coast from the Penobscot to Cape Cod, named the country here New England. The next permanent settlement on the North American coast was effected in this district by the body of Puritans, known as the Pilgrim Fathers, who sailed from England 6 Sept. 1620, in the Mayflower, and arrived 9 November in Massachusetts Bay. The government of this colony was that of a religious oligarchy. Another colony was established in New Hampshire in 1623, and in the same year Maine, which had previously been colonized by the French, received its first permanent English settlement. New Jersey was colonized in 1634. Connecticut was colonized in 1635 by emigrants from Massachusetts. Rhode Island was settled in 1636. Samuel Champlain, the French navi-

gator, was the first European who entered the region now forming the State of New York (1609). In the same year Henry Hudson, an Englishman in the service of the Dutch East India Company, discovered the river to which his name has been given, where Dutch settlements were effected and gradually spread. The English, who claimed this territory as included in Cabot's discoveries, finally seized the Dutch colony of New Amsterdam by force in 1664, giving it the name of New York in honor of James, Duke of York (James II.), to whom Charles II. had made a grant of the province. In 1681 the territory west of the Delaware was granted to William Penn, who colonized it with Quakers, and founded Pennsylvania in 1682. The first settlement in Maryland was made in 1631 by a party from Virginia. In 1633 a colony of Roman Catholics arrived here from Great Britain. The country south of Virginia was permanently settled in 1670 by a party of English colonists who landed at Port Royal and afterward removed to Charleston. The colony was called Carolina. Georgia, originally a part of Carolina, was granted by George II., after whom it was named, to a colony from England in 1732.

Colonies were early established in the West India Islands, including Barbados, half of St. Christopher's (1625), and soon after many smaller islands. Yet the West India possessions did not become important as plantations until the sugarcane was introduced into Barbados in 1641 and into Jamaica in 1660. This island had been taken from the Spaniards in 1655. The cultivation of coffee was introduced into the West India Islands in 1732. Newfoundland was taken possession of by the English in 1583, and colonized in 1621 and 1633. Canada was surrendered by France to Great Britain at the Peace of Paris in 1763 (see section on French colonies below). In 1764 began the dispute between Great Britain and its North American colonies, on the question whether the former had the right to impose taxes on the colonies when they were not represented in the British Parliament; and on 19 April 1775 commenced the war which terminated with the acknowledgment of the independence of the 13 provinces. Though the United States thus entered on their independent career, Canada still remains as a great and flourishing British dependency.

Australia was discovered in the beginning of the 17th century. The first Australasian settlements of Great Britain were penal colonies. New South Wales, discovered in 1770, was established as a penal colony in 1788; Tasmania (Van Diemen's Land), discovered by Tasman in 1742, followed in 1803. West Australia, for some time a penal settlement, was founded as a free colony in 1829; Victoria (Port Phillip) was colonized in 1835, and made an independent colony in 1851; South Australia was settled in 1836; Queensland became a separate colony in 1859; New Zealand, discovered by Tasman in 1742, began to be used in connection with the whale fishery about 1790, was settled in 1839, and made a colony in 1840. In 1851 gold was discovered to be plentiful in Victoria. This gave a great impetus to the prosperity of the Australian colonies, and the influx of population it caused has largely contributed to promote their general development. A federal union of the British colonies in Australia was proclaimed 1 Jan. 1901, with the title of the Commonwealth of Australia. The Fiji Islands became a colony in 1874, and other islands in the Pacific have been acquired since, as well as part of New Guinea and part of Borneo.

The acquisition of the South African colonies dates from the Napoleonic period, the Cape Colony and Mauritius being both secured to Great Britain in 1814. Natal was proclaimed a British colony in 1843. The Guinea Coast settlements date from the 17th century. Extensive spheres of influence have been recently acquired, being partly developed by chartered companies.

In Europe Great Britain has only two possessions of the nature of colonies, acquired for military reasons: Gibraltar in 1704; Malta and Gozo, 1800.

It is estimated that the existing British colonies and dependencies embrace fully one fifth of the land surface of the globe, and a rather larger proportion of its population. The whole of the British colonial possessions have been grouped in about 40 administrative divisions, and they are situated in every quarter of the globe. See GREAT BRITAIN.

According to their governmental relations with the crown the colonies are arranged under three heads: (1) Crown colonies, in which the crown has the entire control of legislation, while the administration is carried on by public officers under the control of the home government; (2) colonies possessing representative institutions, but not responsible government, in which the crown has no more than a veto on legislation, but the home government retains the control of public officers; (3) colonies possessing representative institutions and responsible government, in which the crown has only a veto on legislation, and the home government has no control over any officer except the governor. All colonies are, however, disabled from such acts of independent sovereignty as the initiative in war, alliances, and diplomacy generally.

France was somewhat late of entering fully upon a colonial career, being retarded by internal dissensions and religious wars. Between 1627 and 1636 Pierre Belain d'Esnambuc colonized St. Christopher's, Guadeloupe, and Martinique. Champlain was the pioneer of the French in the exploration of the North American continent, where they soon had considerable possessions, including Canada — in which they had settlements as early as 1604–5, and where Champlain founded Quebec in 1608 — and Louisiana, colonized in 1699. Commercial companies were then deemed essential in colonizing, and a West India Company and an East India Company were established by Colbert in 1664. He purchased on several West India Islands, as Martinique, Guadeloupe, St. Lucia, Grenada, and others, settlements already formed by private persons, and sent out colonists in 1664 to Cayenne. But the settlements in part of St. Domingo, by the buccaneers, became of more importance than those effected by the government. The West India Company survived only 10 years. The East India Company, after fruitless attempts to form a colony in Madagascar, founded Pondicherry on the Coromandel coast in 1670. This became the capital of extensive French possessions in the East Indies. The French also acquired the Isle de France (Mauritius) and Bourbon (Réunion), occupied in 1720.

At the beginning of the 18th century France had attained an important position as a colonial power. In North America her settlements extended from Canada to California, particularly along the Great Lakes and the Mississippi River, embracing many districts which have since become of the highest importance. Nova Scotia (Acadie) and Newfoundland (Terre Neuve), which had been disputed with Great Britain, were then in her possession. Her West India Islands were more flourishing than those of England, and she still had a prosperous career before her in India. The superiority of the fleet of England gave that power a great advantage in colonial contests, and many of the French colonies subsequently fell under the power of Great Britain. The struggle for the supremacy in India, though France was finally unsuccessful, was long and gallantly maintained, and more than once seemed to promise a different issue. The North American colonies were partly lost by conquest and partly suffered to fall into decay. Of the West India possessions several were taken by Great Britain, and finally ceded to her. Canada was finally ceded to England in 1763; Louisiana, after being surrendered to Spain, to prevent it from falling into the hands of the English, was sold by Napoleon to the United States in 1803. At the general pacification of 1815 France recovered some remains of her colonial possessions, and since then she has acquired extensive regions beyond sea, some of them highly valuable. She occupied in 1830 and begun in 1833 to colonize Algeria, a country whose irregular and lawless government had exposed her as well as other European states to frequent annoyance. Tunis, Senegambia, great tracts of the Sahara, Sudan, and Congo regions, the islands of Madagascar and Réunion, are all comprised in France's African possessions, while in Asia she possesses a large portion of the Indo-Chinese peninsula, and in America French Guiana. Some of the French colonies are represented in the National Assembly by members chosen for the purpose.

Denmark established an East India Company in 1618 with a view to enter on the colonial trade; and other companies were afterward formed. In the same year with the formation of the first company, the colony of Tranquebar was founded on the Coromandel coast. Its success was fluctuating, like that of the companies formed to manage it, and at last, in 1845, it was sold to the East India Company. St. Thomas in the West Indies was settled by the Danes in 1672; St. John and some of the smaller islands in the same group (the Virgin Islands) were also occupied by them. The island of Santa Cruz was purchased from France in 1733. The United States tried to buy these islands in 1902. Sweden established an East India Company in 1741. She acquired the island of St. Bartholomew from France in 1785, but restored it in 1878, and has now no colonies.

Germany has recently been making some attempts at establishing colonies in different parts of the world, and in this way acquired considerable tracts in southwest Africa, east Africa, between the Portuguese and British possessions, Camerun, Togo, New Guinea, etc. Italy has also shown the same ambition, and has established a colony on the African side of the Red Sea, between it and Abyssinia, and in Somaliland.

The colonial policy of paternalistic countries as Spain and Portugal naturally differed from that of commercial and industrial nations like England and Holland. In the former the expense and risk of colonizing was borne by the government, who retained direct control over the colonies and their productions; but in the latter the work, being too much for individual enterprise, was entrusted to companies, whose charters conferred on them not only exclusive privileges in regard to trading, but also extensive powers of conquest and administration. In respect to trade a very exclusive and jealous policy long prevailed, but since the adoption of a free-trade policy in Great Britain, the whole trade of her colonies has been thrown open without reserve, as far as the privileges of the mother country are concerned, to the competition of foreign nations. Other countries, while not following her commercial policy entirely, have relaxed more or less the stringency of the regulations affecting their colonial trade. Consult: Leroy-Beaulieu, 'De la colonisation chez les peuples modernes' (Paris, 3d ed. 1887).

Col'ophon, kŏl'ō-fŏn, an inscription at the "Finis" of a book, giving the printer's name and date and place of printing; in the early days of printing nearly all books had colophons. The printers followed the usage of their predecessors. the copyists, who almost invariably appended to the works they transcribed their own names, often with date and not unusually with some pious ejaculation. Not a few of the early printers adhered to the custom of the pious ejaculation, but usually the fraternity seized the opportunity of the colophon to magnify themselves and their art and in particular their own proficiency in the art. A collection of colophons of books printed in the first half century of typography would make a highly interesting and amusing chapter in the history of the Art Preservative of Arts. Usually they are ludicrous in the extravagant claims the printers make for the unapproachable excellence of their handwork; but some are modest and dignified, while a few are pathetic, showing the hard struggle made by masters of the noble craft for a bare subsistence. It was quite usual to compose the colophons of Latin classic works in heroic or in elegiac verses. Udalricus Gallus, for example — thus does Ulrich Hahn latinize his German name — in the colophon of his Virgil (Rome 1472) makes a pun with his Latin patronymic Gallus and the Latin name for a native of Gaul, which is also Gallus. In Latin, the noun gallus, as in German hahn, means cock. In the four elegiac couplets which constitute his colophon Ulrich apostrophizes the goose, which, by its cries, notified the Romans of the approach of the Gauls: "O Goose, keeper of Jove's Tarpeian abode, why flap your wings? The Gaul (Gallus) has fallen; the avenger is here, Udalricus Gallus; he has shown that there is no further call for your quills; in a day he prints more than is penned in a year." The two German printers, Conrad Schweynheym and Arnold Pannartz, who produced the *editio princeps* of the same poet in 1469, express in the colophon the hope that their artistic work may make amend for their harsh Teutonic names, unknown to the Muses:

> Aspera ridebis cognomina teutona; forsan
> Mitiget ars musis inscia verba virum;

which names, however, they contrive to squeeze into a Latin hexameter, thus:

Conradus Suueynheym Arnoldus Pannartzque magistri.

How graceful, modest and dignified is the tetrastich appended by the celebrated French printer, Nicolas Jenson, to his edition of Suetonius: I, Nicolas Jenson, a Frenchman, printed this book; who shall deny it to be a work of art? But while you peruse Suetonius do, I pray thee, love the artist's name —

Artificis nomen fac, oro, lector ames.

Posterity has confirmed that printer's estimate of his work, for his typography has ever since been regarded as a standard of elegance. Vindelin of Spire, the elder printed at Venice in 1470, in the colophon of his Virgil, an elegiac octastich celebrating himself and his typography and boldly challenging comparison with the Grecian masters of form:

Laudent ergo alii Polycletos Parrhasiosve
Et quosvis alios id genus artifices —

let others praise the Polycletuses or the Parrhasiuses, and the rest of that class of artists: Vindelin shall have the highest praise of all.

And Adam Rot, another German printer at Venice, in his Virgil (1471) in 12 hexameter verses, challenges Solomon and Hiram and the Sibyl, and Greece with all her sages, and Rome, mighty in arms and equal to the gods, to show forth such an art as he is master of. In a like spirit Bartolomaeus of Cremona in a hexastich colophon to Virgil (Venice 1472) augurs for his natal town undying fame, insured to her by this work of her alumnus, which is more enduring than the Athene of Pheidias —

Phidiacum hinc superat Bartholomæus ebur.

But Christopher Valdarf (? Waldorf) is content with styling himself in the colophon of his Virgil (Venice 1471) the glory of Ratisbon, his native town:

Ratisponensis gloria Christophore.

Colophon, an ancient Ionian (Greek) city of Asia Minor situated at a short distance from the coast and about eight miles north of Ephesus. Its inhabitants were removed by Lysimachus after the death of Alexander the Great. Colophon was one of the places that claimed to be the birthplace of Homer. It was the native city of Mimnermus and other poets. Its site was discovered in 1887 by the German explorers, Schuchhardt and Wolters. Proverbially Colophon came to mean "a finishing stroke" because of the many instances in which the city's cavalry carried the day. The word took this proverbial meaning in Latin and was used by early printers as the imprint at the close of a volume; commonly used before the introduction of the title page.

Colophonium. See ROSIN.

Col'ophony, a name formerly used for common rosin (q.v.), but now found only in books.

Coloquintida. See COLOCYNTH.

Color, the impression given to the eye by lights of various rates of vibration. The optic nerves are excited by vibrations of the light-bearing ether when the rapidity of the vibrations is not greater than or less than two limits, which perhaps vary slightly with different eyes, just as some ears cannot hear intensely shrill sounds or dull sounds that are perceived by others. Every vibration between these limits is recognized as light; its intensity or brightness is observed; but, besides this, the eye is differently affected by light of different times of vibration, in a way that it is not possible to describe. It is to this variation in the sensation that the name color is given. The word color is also applied to the properties of bodies that cause them to emit the light that thus affects our senses.

In considering the subject we must remark in the first place that ordinary white light, the light which comes from an incandescent solid or liquid, consists, as Newton showed by his celebrated experiment of passing it through a triangular glass prism, of a large number of colored lights, which, meeting the eye together, produce the sensation of white light. The colors of the spectrum are usually said to be seven — red, orange, yellow, green, blue, indigo, violet; although in reality there is an enormous if not an infinite number of distinct colors in it. These colors are frequently called the primary colors, and other tints and shades are producible by mixing them; but in a stricter sense the primary colors are three in number, namely, red, green, and violet (or blue). These three colors or kinds of light cannot be resolved into any others, while a yellow ray, for instance, can be resolved into a red and green, or can be produced by the mingling of red and green light, consequently yellow is not now regarded by scientific men as a primary color. Inasmuch, however, as a yellow and a blue pigment will always produce a green when mixed, red, yellow, and blue may still in a sense be regarded as primary. In the scientific sense of the word white and black are not considered colors, a white body reflecting and a black body absorbing all the rays of light without separating them, whereas the colors proper are due to separation of the rays of light by partial absorption and reflection or by refraction. That the colors of the spectrum may be recombined so as to make white light, the following experiment shows. Let a disk be painted as nearly as possible with the primary colors of the spectrum in sectors. If this painted circle be made to whirl rapidly round its centre all the colors will practically be seen simultaneously at each point, owing to the persistence of the impression on the retina of the eye, and the effect will be that the circle will appear white. If the proportions of the colored sectors be altered, or if any of them be cut or covered with white or black paper, various colors or shades of color are producible. If one complete sector be removed, and the wheel whirled round, the color produced is the complementary color to the removed sector. By complementary color is meant the color or colors which, with any color or colors mentioned, together make white; thus any of the primary colors is complementary to the other two, and a secondary color is complementary to the remaining primary.

The color resulting from the mixture of two or more lights is the color which is seen when they fall on the same part of the retina. There are various methods of mixing lights, such as, (1) by combining reflected and transmitted light; (2) by causing two or more spectra to overlap; and (3) by employing a rotating disk

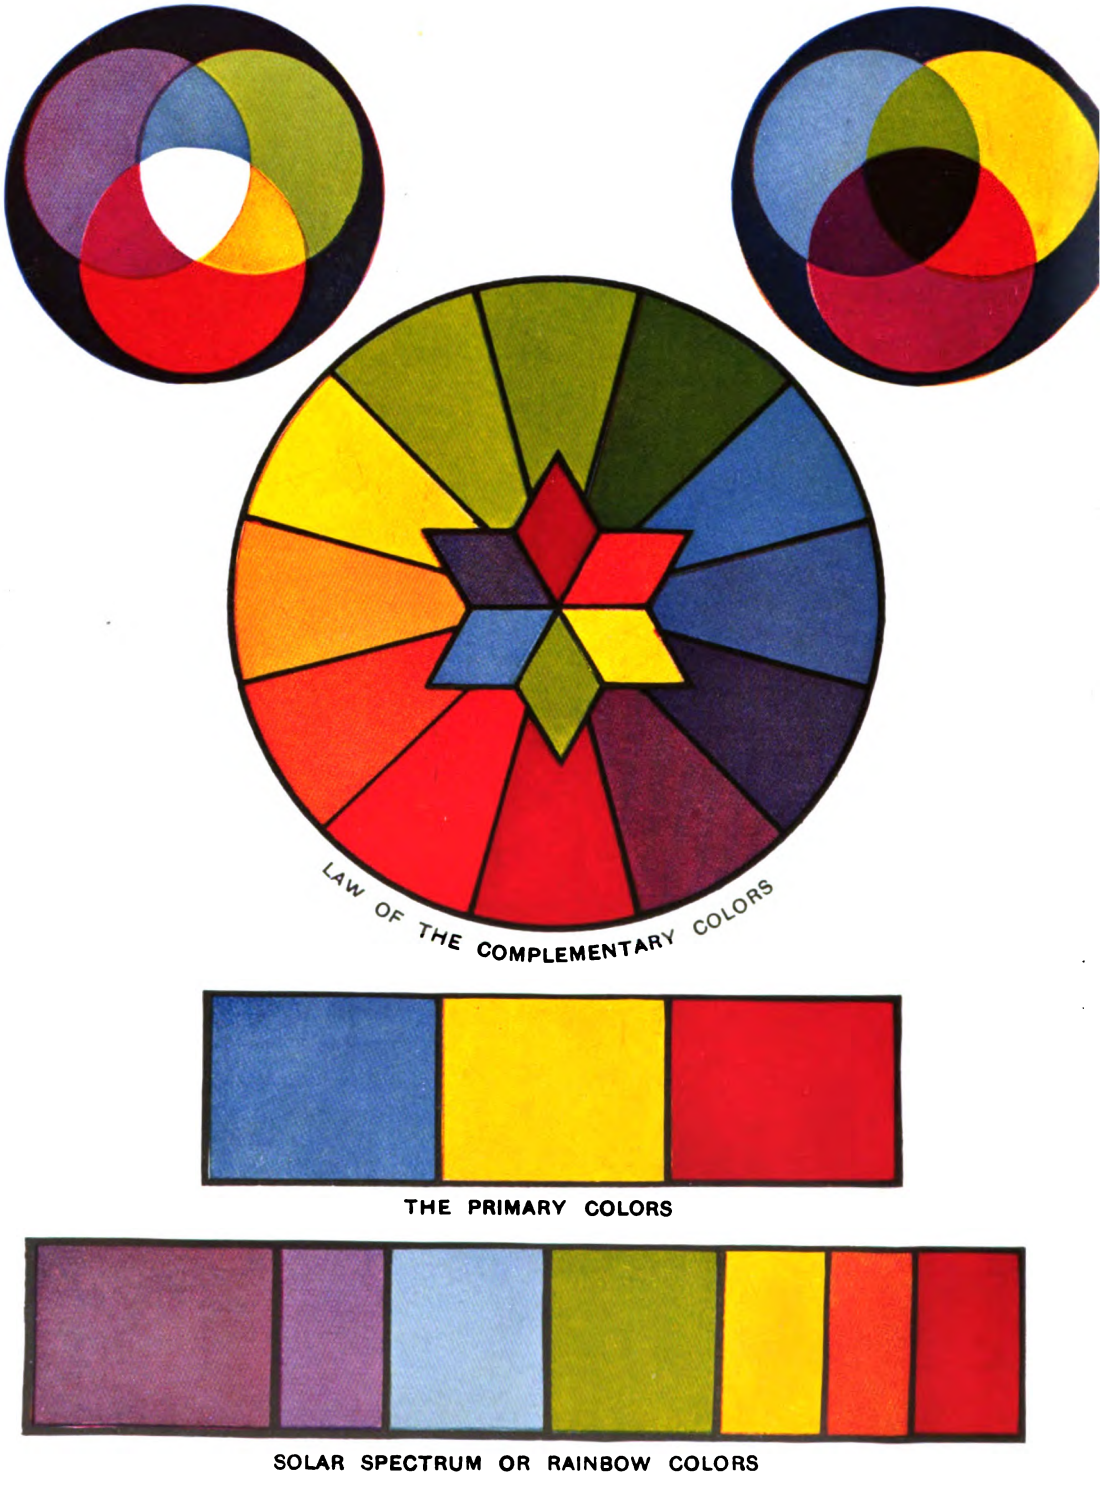

DIAGRAM ILLUSTRATING THE PRIMARY, SOLAR SPECTRUM OR RAINBOW COLORS AND LAW OF THE COMPLEMENTARY COLORS.

OR.

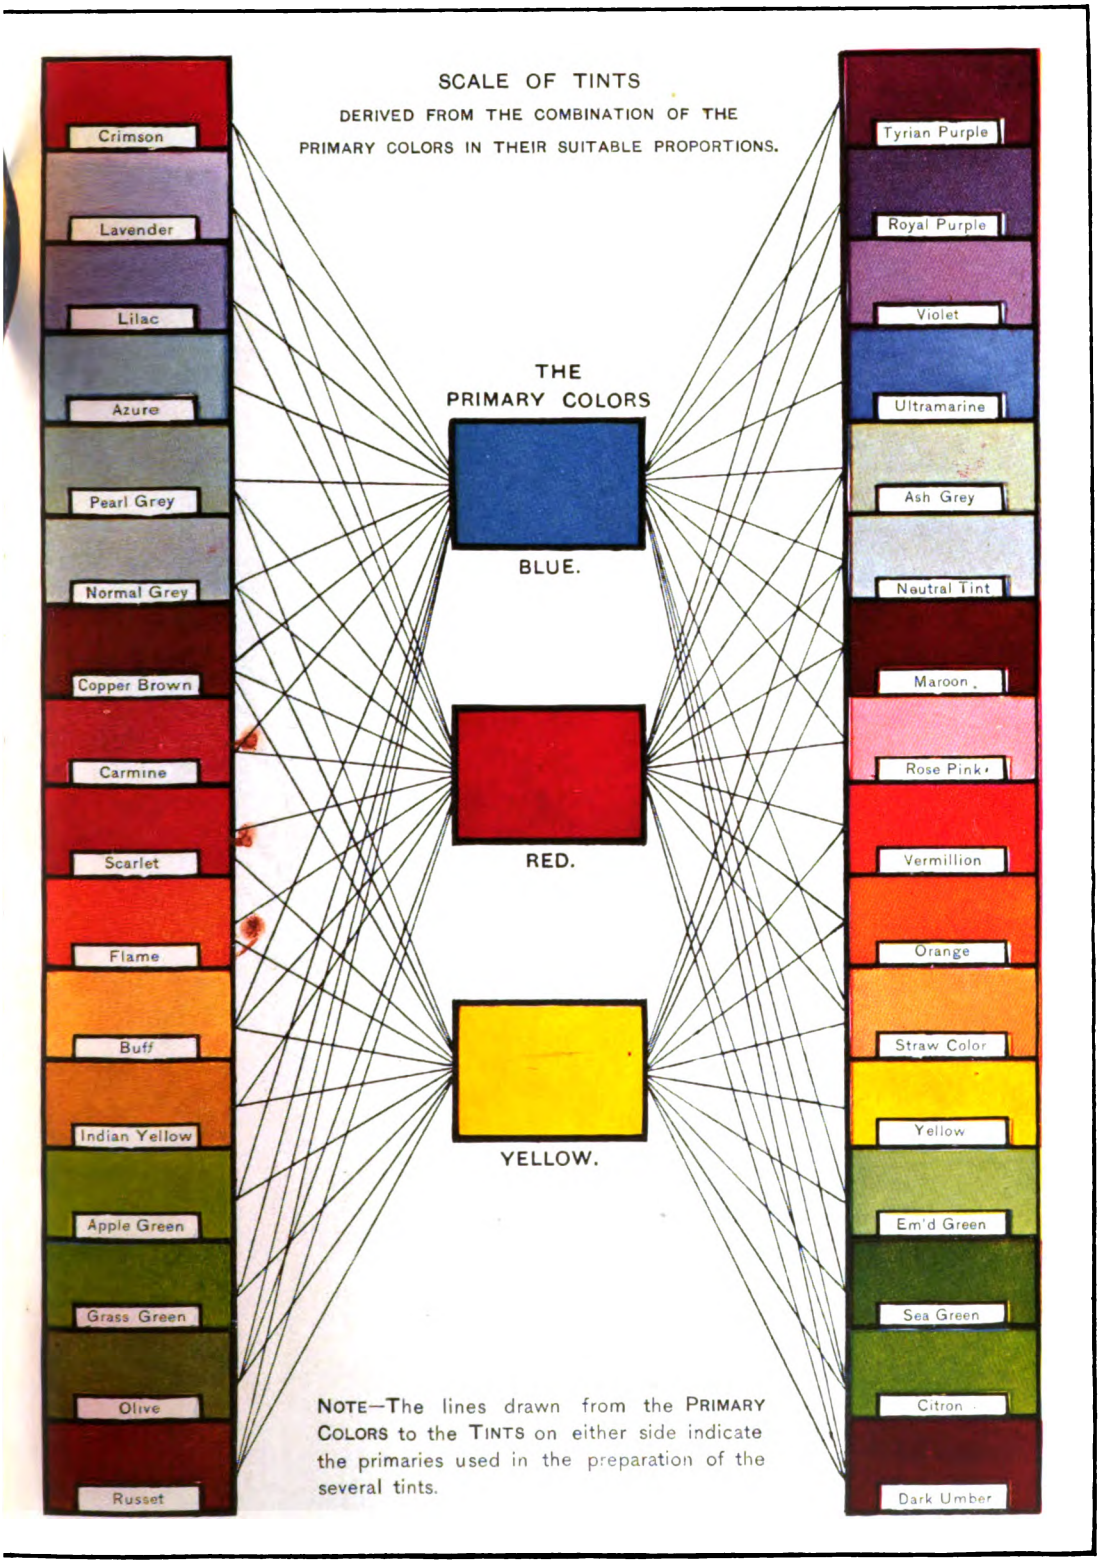

DIAGRAM ILLUSTRATING THE PRIMARY COLORS AND THEIR COMBINATIONS OR TINTS.

composed of differently colored sectors, as shown above. Colored disks of paper, each having a radial slit, are very convenient for this purpose, as any moderate number of such disks can be combined, and the sizes of the sectors exhibited can be varied at pleasure. The mixed color obtained by the rotating disk is to be regarded as a mean of the colors of the several sectors,—a mean in which each of these colors is assigned a weight proportional to the size of its sector. Thus if the 360 degrees which compose the entire disk consist of 100° of red paper, 100° of green, and 160° of blue, the intensity of the light received from the red when the disk is rotating will only be $\frac{1}{3}\frac{0}{6}$ of that which would be received from the red sector when seen at rest; and the total effect on the retina is represented by $\frac{1}{3}\frac{0}{6}$ of the intensity of the red, plus $\frac{1}{3}\frac{0}{6}$ of the intensity of the green, plus $\frac{1}{3}\frac{6}{6}$ of the intensity of the blue; so that the resultant color may be called the mean of 10 parts of red, 10 of green, and 16 of blue. All the results of mixing colors can be represented geometrically by means of a cone or pyramid within which all possible colors will have their definite places. The vertex will represent total blackness, or the complete absence of light; and colors situated on the same line passing through the vertex will differ only in intensity of light. Any cross-section of the cone will contain all colors, except so far as intensity is concerned, and the colors residing on its perimeter will be the colors of the spectrum ranged in order, with purple to fill up the interval between violet and red. It would seem that the true form of the cross-section is approximately triangular, with red, green, and violet at the three corners. When all the colors have been assigned their proper places in the cone, a straight line joining any two of them passes through colors which are means of these two; and if two lines are drawn from the vertex to any two colors, the parallelogram constructed on these two lines will have at its farther corner the color which is the sum of these two colors. A certain axial line of the cone will contain white or gray at all points of its length, and is called the line of white. It is convenient to distinguish three qualities of color, which may be called hue, depth, and brightness. Brightness or intensity of light is represented by distance from the vertex of the cone. Depth depends upon angular distance from the line of white, and is the same for all points on the same line through the vertex. Paleness or lightness is the opposite of depth, and is measured by angular nearness to the line of white. Hue or tint is that which is often *par excellence* termed color.

All authorities are now agreed in accepting the doctrine, first propounded by Dr. Thomas Young, that there are three elements of color sensation, or three distinct physiological actions, which by their various combinations produce our various sensations of color. Each is excitable by light of various wave-lengths lying within a wide range, but has a maximum of excitability for a particular wave-length, and is affected only to a slight degree by light of wave-length very different from this. The complete diagram of all color is theoretically a triangular pyramid, having for its three edges the colors which correspond to these wave-lengths; but it is probable that we cannot obtain one of the three elementary color sensations quite free from admixture of the other two, and the edges of the pyramid are thus practically rounded off. One of these sensations is excited in its greatest purity by the green, another by the extreme red, and a third by the extreme violet. These three actions are ascribed to three distinct sets of nerves, having their terminations in different parts of the thickness of the retina, a supposition which aids in accounting for the approximate achromatism of the eye, for the three sets of nerve terminations may thus be at the proper distances for receiving distinct images of red, green, and violet respectively, the focal length of a lens being shorter for violet than for red. As it is completely established that the difference between the colors of the spectrum is a difference of vibration-frequency, there is an obvious analogy between color and musical pitch. Attempts have been made to compare the successive colors of the spectrum with the notes of the gamut; but forcing is necessary, as in almost all details the relations between colors are strikingly different from the relations between sounds.

When white light falls on the various objects that surround us, it is not always reflected back to our eye as white light. The bodies are illuminated by it, but they have the power of so altering it that they appear to us colored. The reason of the natural colors of bodies is a difficult subject, and one that is scarcely yet understood. It is usual to say that the surfaces of bodies have the power of absorbing certain parts of the white light and reflecting the remainder back, and that what we see is the complementary color to that which is absorbed. This is generally the case with light passing through a transparent colored body. But there is good reason for thinking that this is not really the case always. Experiment, in fact, seems to show that the light which comes from colored bodies is frequently generated by the bodies themselves by a kind of luminous resonance, as it has been called; just as a harp with two or three strings will send out a sound by resonance when a loud noise of any kind is made near to it, but the sound emitted by the harp will be only that belonging to its two or three strings, and not a clash like that which set it in vibration. The subject is one of much difficulty, as we know nothing of the molecular construction of the surfaces of bodies.

Lastly, we have to speak of the colored lights produced by ignited gases. The lights themselves are often far less complicated than white light, though we have spoken of them last. Incandescent gases, instead of giving out white light, as incandescent solids and liquids do, give out light of colors depending on the nature of the gas or vapor. Seen by the eye the flame is colored, and examined by the spectroscope it is found to be in many cases a very simple light indeed. Thus sodium vapor gives a yellow light, and on looking at a flame containing nothing but sodium it is seen to consist of two particular yellow lights shown by two bright yellow lines in its spectrum. Thallium, another metal, gives a simple green light. Hydrogen gas also gives a pale-blue flame when burning, and shows some five or six bright lines. So also do other gases. These colored flames are taken advantage of by the pyrotechnist, who mixes the powder for his fireworks with various bodies which give colored flames. See LIGHT; SPECTRUM.

Color-blindness, a singular affection, producing an inability to distinguish one color from another, and in certain rare cases to discern color at all, the eye perceiving only light and shade, or black and white. Almost no attention appears to have been paid to this subject till the end of the 18th century, when the famous chemist, Dr. Dalton, brought it into notice by publishing in 1794 an account of his own case as marked by this peculiarity. More recently, Dr. George Wilson of Edinburgh also examined minutely into this phenomenon, and collected many striking instances. From the result of these investigations it would appear that color-blindness is much more common among men than among women, and that of the former one in 20 is unable to discern the nicer shades of color, and one in 50 to distinguish certain primary colors from one another. The colors most liable to be confounded are red and brown with green, purple and green with blue, red with black, light hues of all sorts with white, and dark shades with black. Many of the instances adduced by Dr. Wilson are exceedingly curious and amusing. An undertaker covered a coffin with bright scarlet instead of black; a chemical lecturer had always to ask the colors of his compounds; a physician never met with scarlet fever in the course of his practice; a gentleman meeting a lady in a green dress condoled with her on the bereavement which he imagined she had sustained; and a quaker purchased a bottle-green coat for himself and a scarlet merino gown for his wife. The cause of this remarkable affection in almost every case which has been carefully investigated has been found to be seated in the sensorium, not in the visual apparatus, and to consist in the absence of the elementary sensation corresponding to red. To persons thus affected, the solar spectrum appears to consist of two decidedly distinct colors, with white or gray at their place of junction. One of these two colors is doubtless nearly identical with the normal sensation of blue or violet. The other color extends a considerable distance into what to normal eyes is the red portion of the spectrum. The scarlet of the spectrum is thus visible to the color-blind, not as scarlet but as a deep dark color, perhaps a kind of dark green, orange and yellow as brighter shades of the same color, while bluish-green appears nearly white. The eyes of persons so constituted present in general nothing abnormal either internally or externally, while their power of vision is equal to, and in many cases even superior to, that of persons in whom no such peculiarity exists. The colors most easily distinguished by the color-blind are yellow and blue, the latter color, if pure and well-illuminated, being the one many of the color-blind see best, and which is rarely mistaken for other colors. The use of yellow spectacles has accordingly proved advantageous in some cases. It is a curious fact that the substitution of artificial light for daylight often enables persons affected in this manner to discern colors.

Color Photography. From the earliest days of photography, efforts have been made to reproduce by it alone the colors of nature. It was found as long ago as 1801 by Ritter, of Jena, that the various rays of the spectrum differed considerably in their action on silver chloride, and in 1810 Seebeck, also of Jena, obtained a reproduction of the spectrum, in some approach to natural colors, on paper coated with silver chloride. These images could not, however, be fixed.

Various other experimenters have from time to time endeavored to obtain the desired result by the use of different materials and methods, but without effecting a complete solution of the problem.

In 1891 Lippman laid the foundation of the process known by his name, it being based on the theory of Zenker and work of Wiener, with due acknowledgment to both. This is distinguished as an "interference" process, the effect being produced by decomposition of the light.

The apparatus employed for the production of the picture is very simple, differing but little from that used for ordinary photography. Any transparent sensitive film answers as the photographic surface. This film is exposed in a camera of the usual type, with the difference in arrangement that the plate is backed by a layer of mercury, which layer, of course, acts as a mirror. The arrangement is effected by using a slide so arranged that mercury can be allowed to flow into a space back of the plate after the plate has been placed in the slide. After exposure the mercury is allowed to flow out, and the plate is then developed in the usual way.

The materials on the finished plate are the same as those on an ordinary negative, but a difference exists in the structure of the deposit, by which it is enabled to decompose the light by which it is illuminated and reflect those portions of it which correspond to the natural colors of the object from which the picture was taken.

The reason for the formation of this structure as formulated by Lippman is that the light waves, as they rush through a plate as ordinarily arranged, impress the plate more or less strongly, and thus leave a design of different intensities of the image, but in this rapid passage they leave no record of their own forms. Each ray of light of a certain color has a certain structure; it is made up of waves which have a certain wave-length. If there be a mirror behind the plate, the light, says Lippman, is reflected back on itself; the light rushes in and rushes out again with the same velocity; the entering and issuing rays interfere, and the effect of the interference is that vibration takes place; but the effects of propagation are stopped, and instead of having propagated waves we get stationary waves; that is, the waves now rise and fall, each in its own place; they pause, therefore, in the interior of the film and impress their form upon it.

On looking through a film obtained by the Lippman method it appears like an ordinary negative; its color effect is obtained only when viewed by reflected light, different portions of the plate reflecting different colors according to the light-waves by which it had been impressed. In order that the interference colors may be seen so that they are true to nature, the plate must be viewed by vertical incidence, which is inconvenient. They may be projected by an arrangement devised for the purpose.

In 1861 Prof. Maxwell showed at a lecture at the Royal Institution that by taking photographs of a colored ribbon through three solutions colored to represent the primary colors, and then projecting these photographs so that their

images were superposed, a colored image of the ribbon was given, which was faulty, however, from lack of photographic materials more sensitive to the less refrangible rays. In 1873 Prof. Vogel announced that dyes would influence the distribution of color-sensitiveness in plates.

On these facts are based the process of Ives, brought out in 1892. In his process three negatives are obtained through color-filters; from these positive transparencies are made (in monotone), which are placed in a special viewing instrument called the "kromskop," each in combination with its properly adjusted color-screen; these being then combined, the images are seen in the original colors of nature.

The next development in this method was the introduction of the process worked out by Prof. Joly in 1894. This differs considerably from the Ives method in the manner of working, but in principle it is very similar. Only one negative, instead of three, is required, but this is taken through a transparent lined screen, ruled very finely and closely with parallel alternate lines of orange, yellowish-green, and blue. After development a positive transparency is made from the negative, which, when mounted accurately and in close contact with a viewing-screen similarly ruled with parallel lines of red, green, and violet, the image is seen in its original colors. These mounted positives are usually viewed as lantern-slides, but are somewhat marred by the obtrusiveness of the lines when seen too closely.

To go back to the underlying principle of the three-color process — the "filtering" out of certain rays in taking the different plates — we should explain that the primary colors from which white light is formed are now set down as a particular shade of red, a particular green, and a particular blue-violet. The primary pigmentary colors, it may be added, are red, yellow, and blue, as has always been taught. If we obtain three negatives from an object, each taken through a color-filter or screen adjusted for the red, the green, and the blue-violet respectively, these plates will present negative images of the object in the negative values of the colors named. When from each of these negatives we produce a positive in the complementary color, and combine these positives in accurate registration, we shall, if the operations have been correctly performed, obtain a reproduction of the original object in the exact colors of nature. The ordinary photographic plate, as is well known, is not sensitive to all the rays. If, however, the addition of certain colored substances, chiefly analine compounds, be made to the emulsion, these apparently combine with the haloid silver salt to form an organic compound of silver which is sensitive to the light reflected from various colors according to the particular dye employed; and in this way it is possible to obtain a plate which will be sensitive to the light reflected from all the colors of the spectrum, though for convenience in working, the extreme red is generally excluded, or otherwise the plate could be made and handled only in complete darkness.

The processes of Lumière and others are essentially the same as that of Ives, varying in the details of working.

In the working of the three-color process the negatives are taken through color-screens of red, green, and blue-violet, adjusted for use with the Cadett spectrum plate. By means of a repeating back used in connection with a frame containing the screens, these may all be taken upon one plate; that is when the size of the picture required is small, such as is suitable for a lantern-slide. The length of exposure varies with each of the screens, an ordinary ratio being, say, 55, 13, 4 for the red, green and blue-violet respectively; but on account of unavoidable variations in different batches of emulsion, largely due to the difficulty in obtaining gelatin of uniform quality, these ratio exposures are liable to differ, but can be readjusted without great difficulty by making a trial exposure upon some subject with well-marked high lights and half-tones, such as a crumpled piece of white blotting-paper, which should appear equal in all three negatives. The length of the exposure through the red screen may be gauged by a fraction tint actinometer, by timing to a certain tint; from the time thus obtained the remaining two exposures can then be calculated from the ratio numbers.

There is a special form of camera in which the exposure for the three negatives can be made simultaneously by means of mirrors.

The plate must be developed either in darkness or by a special "safe" light supplied for use with such a plate, and a developer of the rapid type used, yielding a soft negative of good gradation without stain. Correctness of exposure is essential, forcing development being almost certain to result in failure. Intensification and reduction can be effected only at great risk of interfering with the gradation of the image, and should never be resorted to unless it is impossible to make another exposure. The best intensifying re-agent is said to be mercuric iodide with sodium sulphite.

The next step is the production from the negatives of the three positives, and first we produce a blue — or rather greenish-blue — positive from the negative obtained through the red color-filter. This, in the Sanger-Shepherd process, is done by first making a lantern-slide positive in the ordinary way by contact, taking care to secure one of good quality and well representing all the detail and gradation in the negative clear and free from fog, for the density and detail of the finished slide will largely depend upon the blue positive. This, after fixing and washing, is treated with a solution of potassium ferri-cyanide, again well washed, then immersed in a solution of ferric salt, rinsed, and replaced in the fixing solution, and finally again washed to free from hyposulphite. The effect of this is to convert the deposit of silver into one of Prussian blue. When dry this plate should be varnished, preferably with a solution of celluloid.

The remaining two positives, the pink and the yellow, are produced by modifications of the carbon process. A celluloid film coated with an emulsion of silver bromide in soft and soluble gelatin is employed. This is sensitized by immersion in a solution of potassium or ammonium bichromate, and, when dry, printed in contact with the two other negatives, care being taken to place the celluloid side next the film side of the negative. The necessary exposure varies from 1 to 10 minutes, according to the light, and should be gauged by means of the fraction tint actinometer. The silver bromide takes no part in the formation of the image, its func-

tions being to afford some guide in the exposure and development by giving a faintly visible image, and to assist in the more rapid disintegration of the gelatin in the warm water used for the development. The water used should be of a temperature of from 90° to 100° F., as in the carbon process, and when all the soluble portions which have not been acted upon by light are removed, the silver bromide is dissolved out by a solution of hyposulphite, leaving the almost invisible photographic image in relief in clear gelatin. The positive thus obtained from the negative taken through the green filter is then immersed in a dye-bath of a pinkish-red color, and that from the negative taken from the blue-violet filter in one of a yellow color, and they are stained to the required depth, comparing the result by holding in approximate position occasionally with the blue positive, without touching each other. It is usually better to overstain these positives and then wash down in water to the required depth of color.

The blue positive may be obtained in similar manner upon a thin celluloid support, using a weak solution of methylene blue as the stain, and this method is preferred by some workers. The advantage, however, rests with the prussiate process, in that a positive is produced of maximum sharpness, being printed in actual contact, without the necessity for the interposition of the celluloid, this being more essential in the case of the blue print, which forms the foundation of the finished slide, for however slight the diffusion may be, it must necessarily be more apparent if it exists in each of the three monochromes.

In the method of working recommended by Messrs. Lumière the three stained positives are produced upon a mica support. The mica has the great advantage of rigidity, but the still greater disadvantage of frequently failing to retain the gelatin film, which will sometimes float off, even in the bichromate sensitizing solution.

The pink and yellow positives, having been dried, are placed in register with the blue, and any preponderance or inequality in coloring noted. This can be corrected by careful reduction, in cold water, of either the pink or yellow films. The greens are usually the best guide, as, if these are correct, the other colors will usually be bound to follow. If the blue be at fault, it will be found better to make another rather than attempt to alter it. When finally adjusted and dry, the two celluloid films are varnished with a special transparency varnish, in order to prevent the colors from running. The three positives may now be placed in accurate register and bound up with a cover glass as usual, but the transparency and unity of the complete positive will be much improved by mounting in Canada balsam. This is effected by first fixing the two celluloid positives on one edge of the blue plate, by trimming first the pink, so that when it is in register there is a margin of at least one eighth of an inch of the blue extending beyond it, then the yellow, so that the pink extends beyond it for the same distance. The three can then be fixed down by a piece of lantern binding strip, or better and more securely, by a thin strip of paper firmly fastened down with fish-glue, as the gum of the binder does not always adhere securely to the celluloid. The three positives and the cover glass are then made warm; the Canada balsam, thinned by heating in a beaker, poured in a sufficient quantity between each of the positives and also under the cover glass, and the excess pressed out; the whole being then placed between strong spring clips till set; after which the slide can be cleaned with alcohol and masked and bound up as usual. Should any separation or bubbles occur, these may generally be remedied by again warming the slide and replacing it in the clips for a few hours.

The three-color process has assumed much importance as a means of producing colored prints. To do this, the process is modified to produce three half-tone plates, the negatives being taken through filters of the complementary colors, and from these the prints are made by the use of suitable inks, the impressions being made accurately one over the other. Here the primary colors are represented by pigments of red, yellow, and blue (as before noted) and the colors overlapping and mingling produce, approximately at least, the various tints required.

It has been recently reported that Prof. A. B. Leckenby has devised a new method of color photography, the details of which have not yet been made known. The method is said to be the same as the old system of photography up to the making of the print. The difference lies in the emulsion of the sensitive paper. The slight differences in the shades on the negative plate are just enough to act in different ways on the paper during printing, and produce the several colors. One fault has been found with the pictures; they are not all the same shade. A red rose may show pink at one time, and with the next toning and fixing, a dark crimson. In either case the color will still be red, but the shades will be decidedly different. Even this objection, which is not in itself very serious, Dr. Leckenby thinks will be remedied, and he has worked out a method which will have the effect of bringing the various prints to a more even tone.

Color Printing, the art of producing pictures, designs, cards, etc., in various colors by means of lithography, printing from metal blocks, etc. The ordinary methods are: (1) The chromo-lithographic, in which a tracing of the original picture, or the like, is first made, and a copy transferred to as many stones as there are colors in the original, every color requiring a fresh stone. The drawing on each stone is made to fit in, or register, with the preceding one, and as the paper passes through the machine an additional color is added every time, and thus the picture is built up, color upon color (each being allowed to dry before the next is put on), until it is completed. Some chromos or oleographs may have as many as 25 or 30 printings or colors. (2) Block or surface color-printing is specially adapted for book illustrations, or work where nicety of detail or rapidity is required. As in chromo-lithography, various printings are necessary; but these are reduced in number by printing several tints of the same color at one operation. Each block, which is usually of zinc and prepared in the usual way, is capable of producing three or more gradations of the same color; the darkest shade from the normal surface, lighter shades being

got from parts which have been bitten or corroded in an almost imperceptible degree — the deeper corrosions giving the lightest shade. When the tints of one color are thus printed from one block and at one operation, a second block with gradations, in the same way, is used, registering as in chromo-lithography, and so on till the picture is finished.

Colorado, kŏl-ō-rä'do, the "Centennial State" (admission to the Union planned for 4 July 1876, consummated 1 August), is bounded north by Wyoming and western Nebraska, south by New Mexico and western Oklahoma, east by Kansas and Nebraska, west by Utah. Capital, Denver. Area, 103,925 square miles (280 of it water). Pop. (1900) 539,700.

Topography.— Eastern Colorado, about one third the total area, is the westernmost portion of the great treeless plains that continue the Kansas prairies. Near the abrupt rocky faces of the mountains they rise in low rounded foothills called "hog-backs," remnants of the junction of sedimentary with primary rocks. The remainder of the State belongs entirely to the Rocky Mountain system, the main range lying on the east and facing the plain, while the western portion falls in minor slopes toward the Pacific. Colorado contains the highest mountains in the United States excepting Mount McKinley in Alaska and Mount Whitney in California.

There are some 200 peaks more than 13,000 feet high, and 40 over 14,000. The highest is Blanca Peak, 14,464 feet, near the south border. The lowest ground of the plains is 3,047 feet above sea-level. The main mass of the Rockies crosses Colorado in two principal lines of elevation, joining and separating, and enclosing a series of elevated watered valleys called parks, which extend with slight breaks through its entire length in the State. On the south the Saguache or Sawatch range, or Great Divide, a continuation of the Sierra Madre of Mexico, enters west of the Rio Grande; and the Culebra east, continued by the Sangre de Cristo. North of the Arkansas the eastern line is carried on by the Front Range, the one first encountered by the early emigrants, and still the main line of transmontane travel, and this in turn by Medicine Bow Range extending to Wyoming. On the west, the Saguache meets the Park Range from the north. West of these main systems lies a welter of short broken ranges and plateaus, parallel, lateral, and oblique, but with a general trend northwest and southeast. Of these the principal are the Roan or Book, north of the Grand River in the extreme west, the Uncompahgre parallel to the Gunnison River on the south, the San Miguel still south, the San Juan to the east, and the Elk nearer the centre obliquely to the Saguache. The Elk is a very notable range about 30 miles long, geologically interesting from the extraordinary displacement of strata, and with a number of lofty and handsome summits. Castle Peak, the highest, 14,115 feet; Capitol, Maroon, White Horse, Snow Mass, etc., nearly or quite 14,000 feet, and Italian Mountain, named from its displaying the colors of Italy — red, white, and green. The best-known heights are Long's Peak (14,171) and Pike's Peak (14,147) in Front Range, noted landmarks of the old emigrant trail. This range also contains Mount Evans (14,330), Rosalie Peak (14,340), and others; and on its flanks lie Denver, Colorado Springs, Boulder, etc., while Cripple Creek is a little west of Colorado Springs. The Saguache is the loftiest as a whole — a granite mass over 13,000 feet high for many miles together, and 15 or 20 miles wide. It contains Mounts Harvard (14,375), Princeton (14,196), Yale (14,187), Elbert (14,351), and other immense peaks, and after a depression for some 18 miles, rises in the Mountain of the Holy Cross (14,175), where a deep ravine and a transverse ridge outline a gigantic cross in the snow. The Sangre de Cristo, besides the crowning summit Blanca (above), has Baldy (14,176); and the Culebra is noted for the Spanish Peaks, two striking isolated mountains, the highest 13,623 feet. The principal summits of the Park Range are Gray's Peak (14,341) and Torrey's Peak (14,336). The great passes are far higher than any mountain summits east of the Rockies; there are 15 over 10,000 feet above sea-level; and the loftiest, Argentine Pass, between Gray's Peak and Rosalie Peak, is 13,100 feet. Marshall, Cochetopa, Hamilton, and others are well known.

There are four great parks along the crest, besides multitudes of smaller ones in various parts. By far the largest is San Luis Park, extending into New Mexico; a tract about 7,000 feet above the level of the sea, between the Sangre de Cristo and Culebra ranges on the east, and the Saguache on the west, and more level even than the plains. It is about 140 miles long by 60 miles wide, 8,000 square miles in area, or about as large as Massachusetts. It is drained south by the Rio Grande through the southern centre; the north part is watered by a score of mountain streams which are lost in the huge swamp known as San Luis Lake, half a dozen miles long, and the largest lake in Colorado. Next north is South Park, between the Front and the Saguache, east of Leadville; 8,000 feet high (in places 10,000), and 1,200 square miles in area, or about the same as Rhode Island. Then comes Middle Park, still more elevated, and somewhat larger; and across a continental divide is North Park, largest of all but San Luis, between Medicine Bow and Park ranges. Of the lesser ones, the best known are Monument Park, and the "Garden of the Gods," near Colorado Springs; Estes famed for hunting and fishing, and Huerfano, also in the east; Leon, Cañon, Egeria, Powell, Raven, etc., in the west.

River Systems.— The main Rocky Mountains must obviously be the greatest of American watersheds and source of river systems, except Minnesota; and they contain more than one continental divide between the waters flowing to the Atlantic and those flowing to the Pacific. One of these is the southern boundary of North Park, the streams within it flowing north to the Platte-Missouri-Atlantic system, those south of it feeding the Grand-Colorado-Pacific; another is between Creede and Ouray, separating the headwaters of the Rio Grande from those of the Gunnison and Uncompahgre of the Colorado system. The eastern plains are divided chiefly between the two great systems of the Arkansas and the South Platte; the former occupies more than one half their area in the State, the southern portion, the latter the larger portion of the northern half; between them on the east is a section draining into the Republican River, an affluent of the Kansas. The South

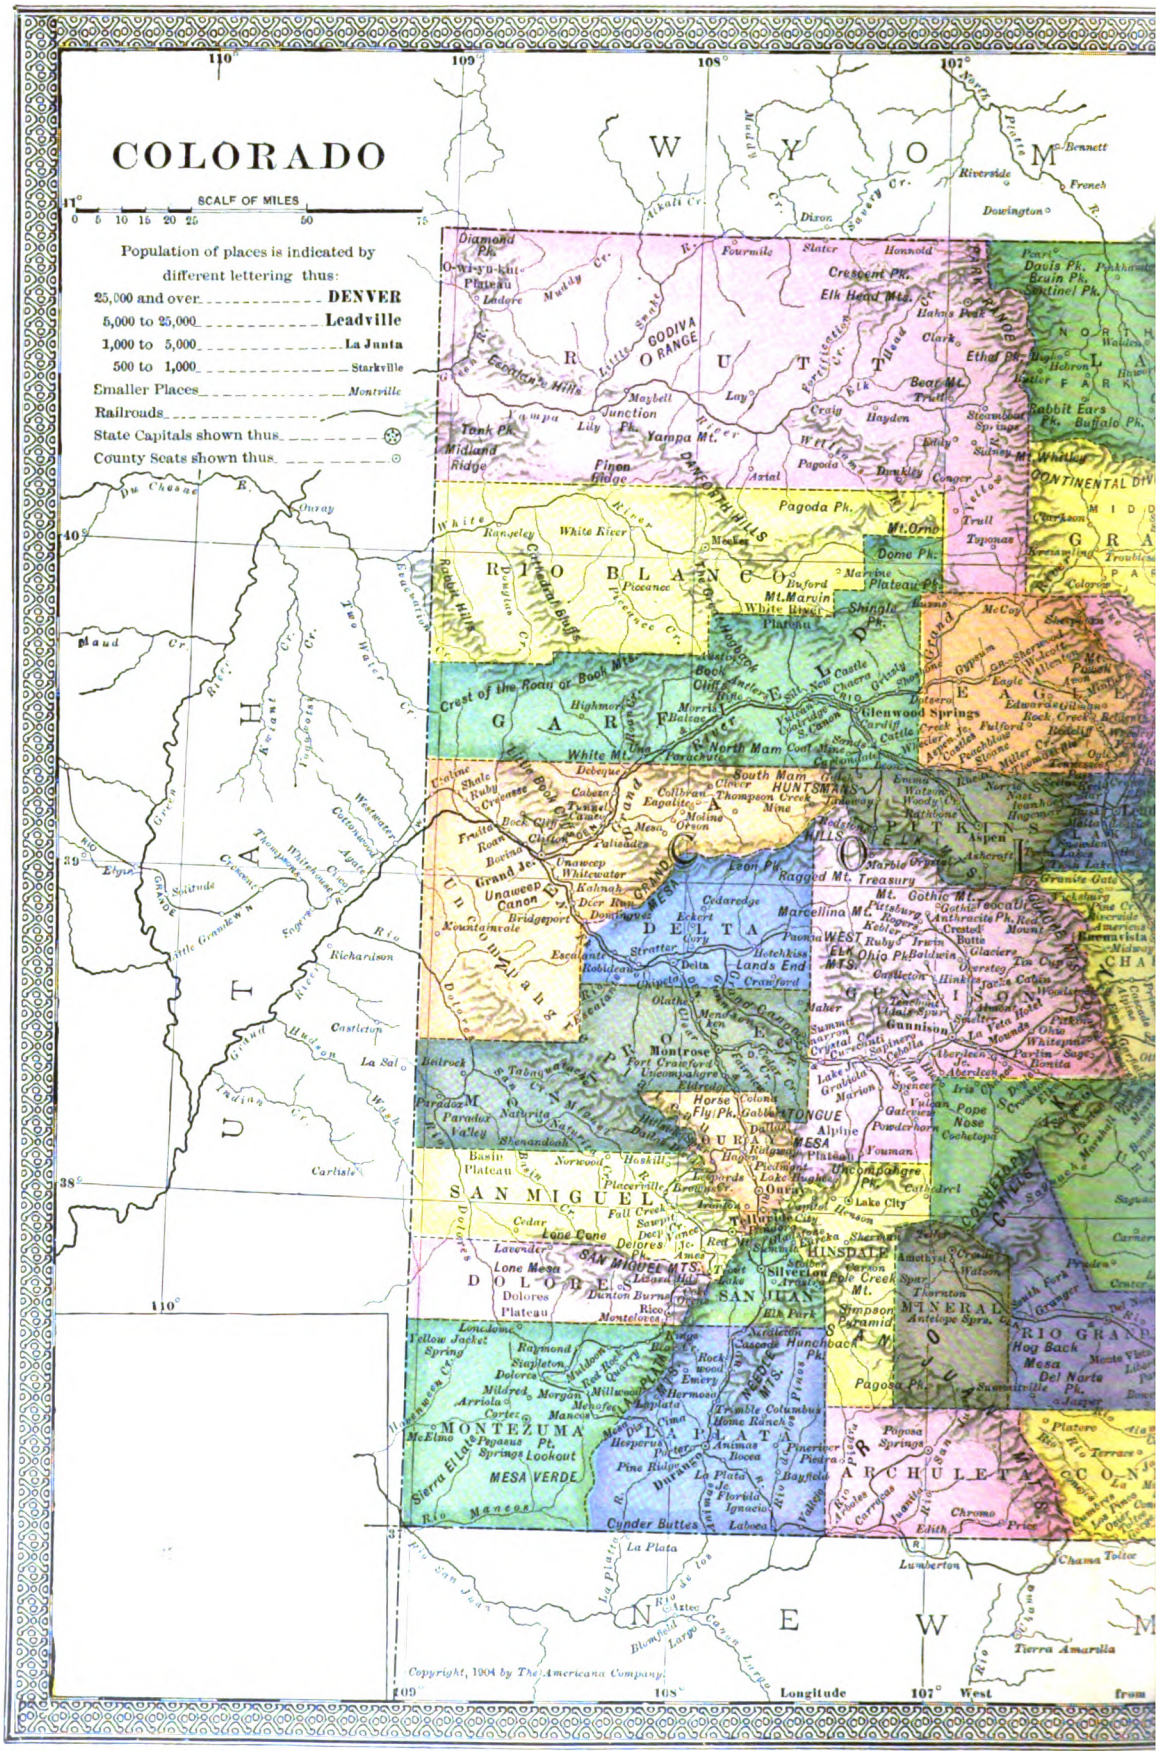
Platte rises in South Park; the Arkansas in the mountains west of it, Leadville lying on one of its head creeks. Except for these and the Rio Grande in San Luis Park, the mountain section is almost entirely drained by the Colorado River system: the Yampa (or Bear) and the White, in the northwest, flowing to the Green; the Grand through the centre, with its chief affluent the Gunnison from the south; and the Dolores in the southwest.

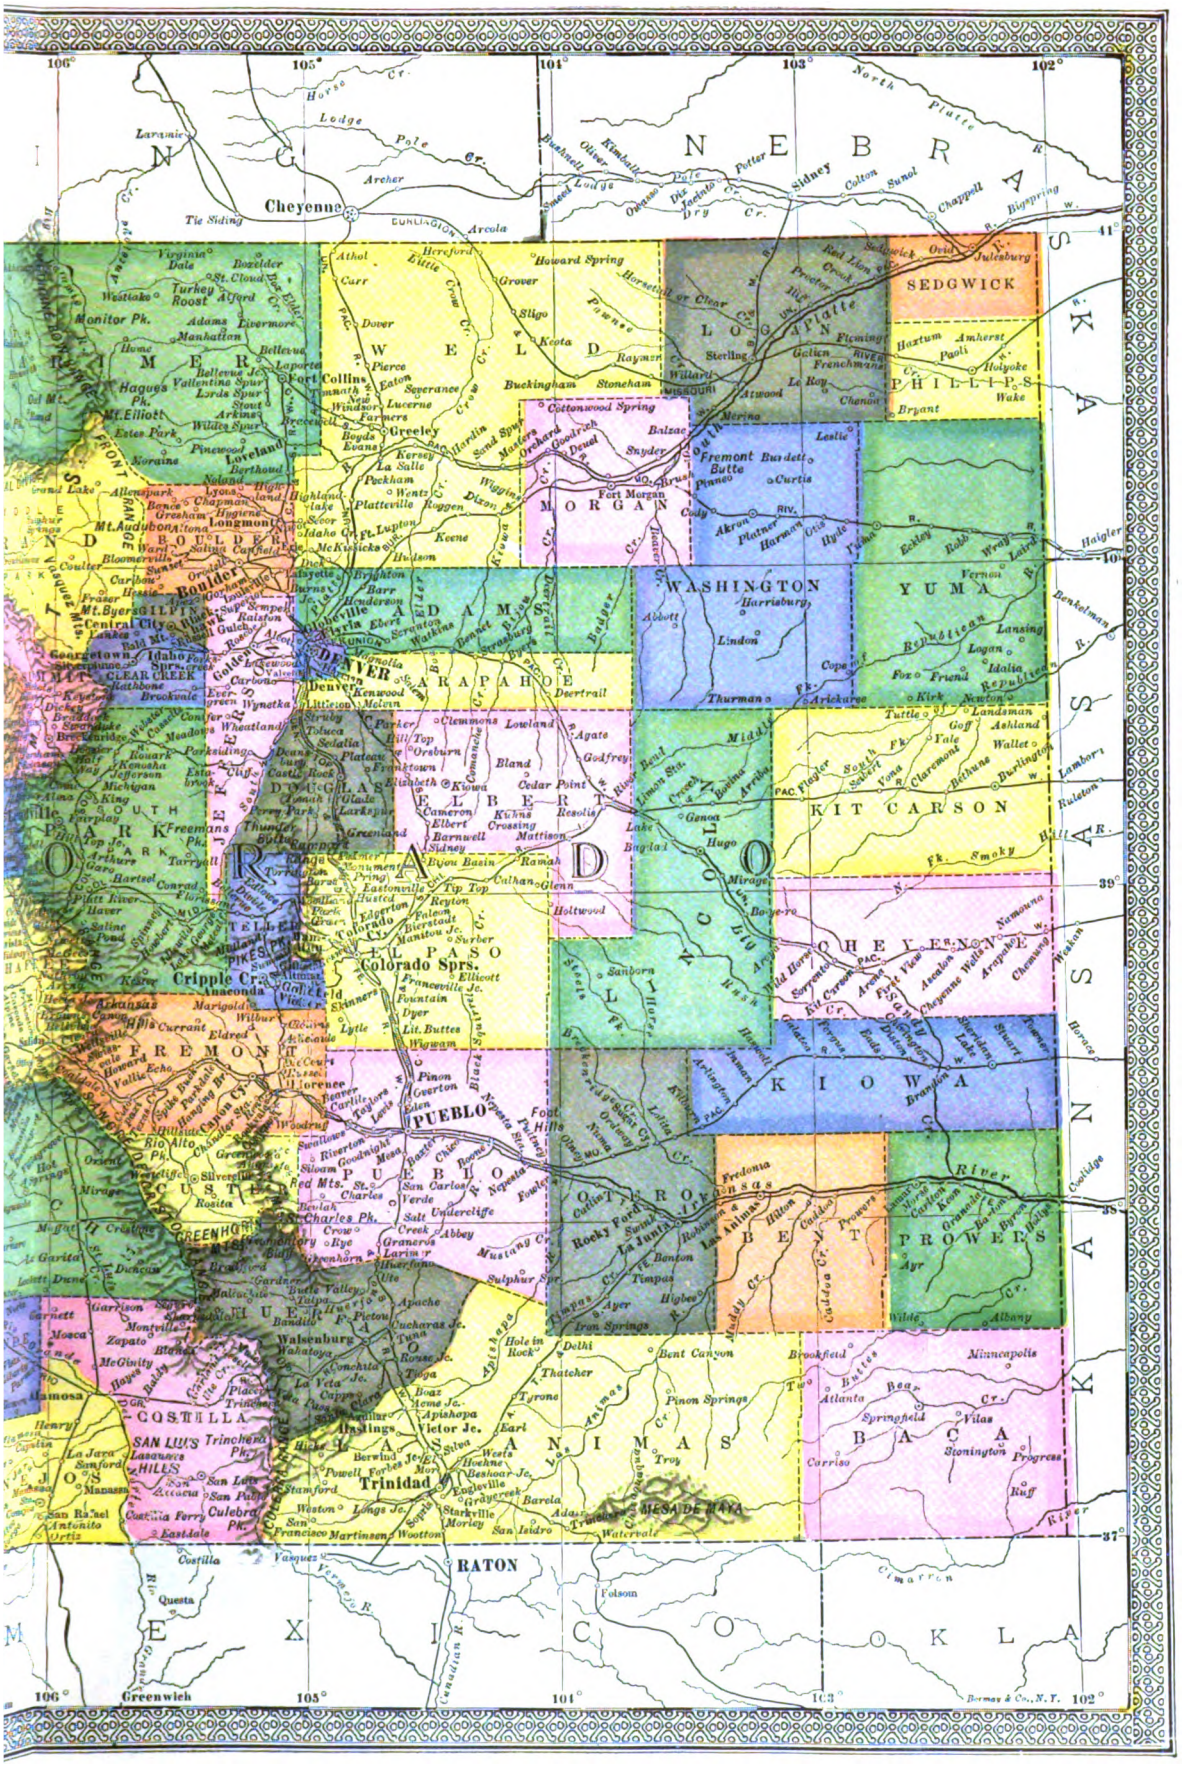
Of equal fame with the giant peaks and even greater beauty, are the stupendous mountain cañons through which its rivers cut their way. Western Colorado forms the eastern edge of what Major Powell has called the Plateau Province; and all the wonders and beauties of this remarkable region are found in this State. There are the terraced platforms, ending in rock faces dropping sheer upon other platforms hundreds of feet below, and ending in perpendicular gorges from 1,000 feet to a mile in depth, where the sand-laden currents with a steep fall, have cut their channels through countless strata of brilliantly variegated sedimentary stone; barren mesas, and cool grassy forested levels and slopes above the plane of perpetual drouth where the mountains bar off the vapors; rock headlands around curves or junctions of streams or gullies, fantastically carved in striking likeness to the work of human architects; and buttes or rock hills sometimes hundreds of feet in length, pillars and towers, cut from the stone valleys by the erosion of interlacing streams. The "Garden of the Gods" is so named from the enormous number of these tapering monuments of quartz and pebbles with a cap of sandstone, rising from the green meadows; with great table mesas sometimes 250 feet high, having sides almost perpendicular, and often a cap of purple basalt. The cañon of the Arkansas is also famous.

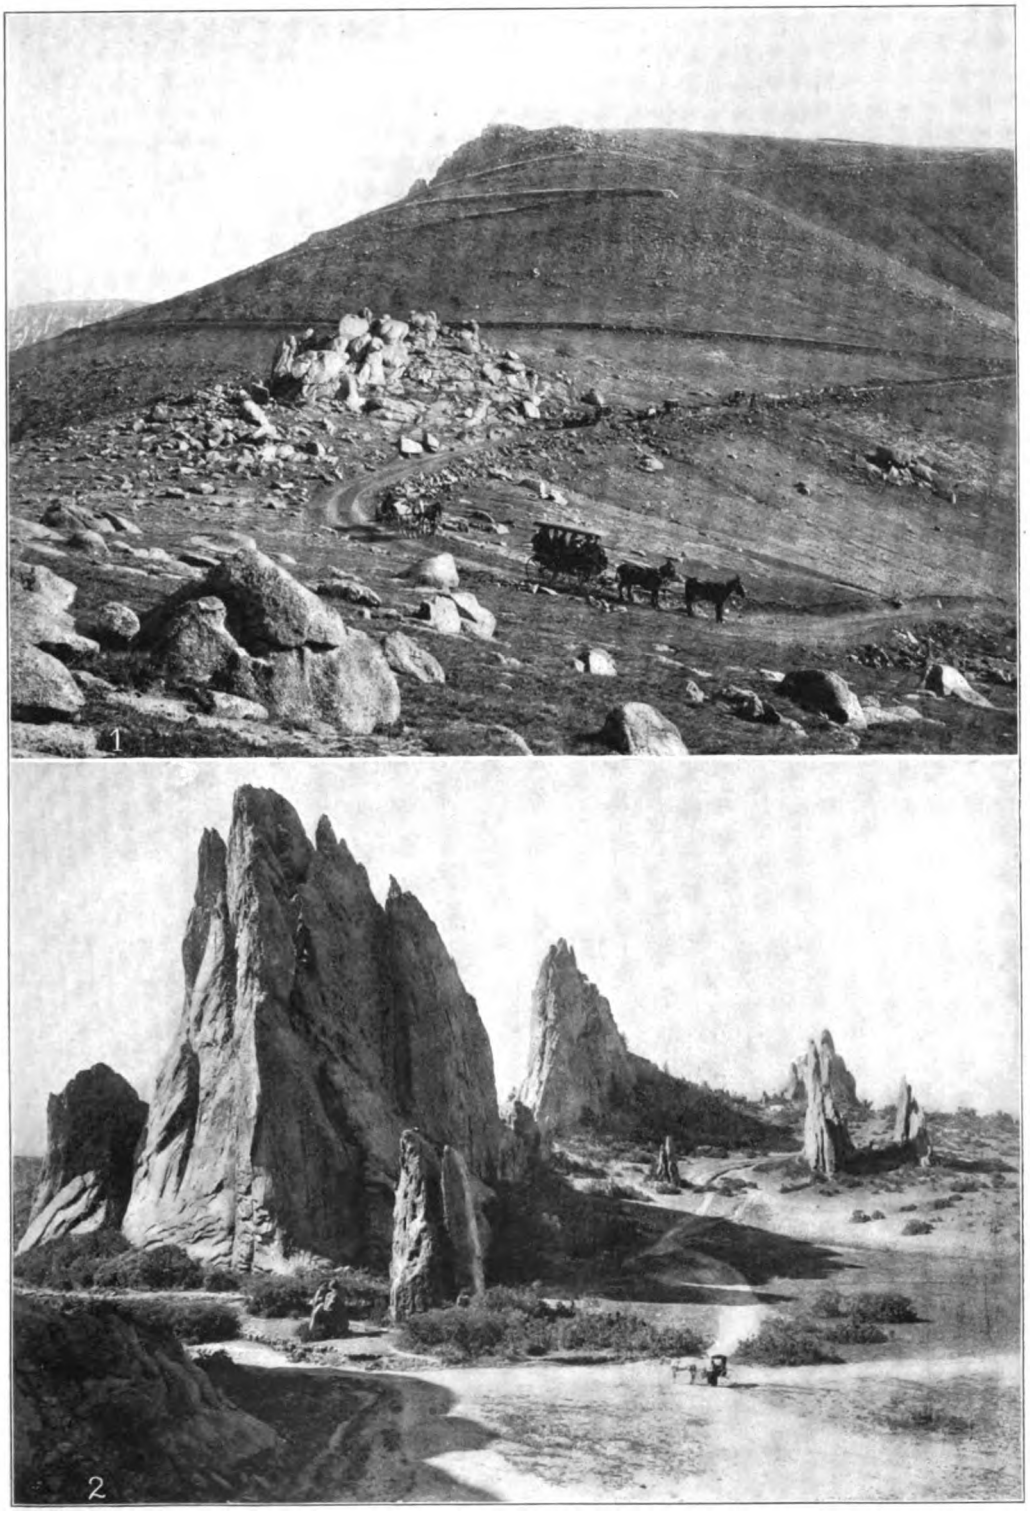
Climate and Rainfall.— The dry, cool, thin air of mountain Colorado makes its accessible eastern portions, especially the parks, widely famed as sanatoriums for patients with asthmatic or pulmonary disease. Colorado Springs, the Rocky Mountain Saratoga, is built up by eastern invalids. The summer days are sometimes hot, but the dry air and bare rocks cause so rapid a radiation that the nights are always cool and dewless. There is little severe winter cold, zero being rare; the frost season is short, and the snows are seldom deep and soon melt, except on the mountains. The January mean temperature for the leading places is about 28.5° F.; the July, 72° to 74° F. The average rainfall is 14.8 inches, fairly even throughout the State, though naturally much heavier on the higher levels, varying from nearly 30 inches at Pike's Peak to 12 at Las Animas in the Arkansas plains. Hence, agriculture can be carried on without irrigation in many mountain regions, though better with it.

Surface, Farming, Stock Raising, and Irrigation.— There are about 16,000 square miles of forested land in the State, the trees being mostly conifers, with cottonwoods along the eastern streams. Of the 40,000 square miles of plain and parks, about one third is arable, the rest being grazing-ground, to which, however, must be added many thousand miles of grassy mountain slope. The pasturage in many parts lasts through the winter; and the plains are covered with gorgeous wild flowers, also perennial. The soil of the plains is mostly sandy loam, with some clay. Along the water-courses the soil is rich, but the rainfall is not sufficient, and irrigation is needed; but is scarcely feasible there except along a few large streams, or near the mountains. But there is an estimated irrigable area of 4,800,000 acres, or 7,500 square miles, in the State; and in recent years an immense amount of energy has been turned to utilizing its possibilities. The land within reach of mountain streams had been so improved thereby that in 1900 Colorado was first in the United States in extent of land irrigated, and was surpassed only by California in number of irrigators and value of crops raised by irrigation. The average size of farms is much larger than in California. But of all the land under cultivation in 1900, 70.9 per cent or 1,611,271 acres, was irrigated, against little over half that in 1890. Of this amount over one third is in a solid block along the South Platte, at the northeast corner of the mountains in the State; the next greatest, nearly a fifth of the whole, in San Luis Park. There are lines along the South Platte and Arkansas; blocks on the Grand in Mesa County, on the Gunnison in Delta and Montrose, and again in Gunnison County; scattered sections on the White and Yampa, along the southern Arkansas tributaries, and indeed in every quarter of the State. There were 1,890 gravity irrigating systems in all, with 7,374 miles of main ditches; besides 277 artesian wells. Each mile of ditch had side ditches covering 390 acres; but only 218 were actually irrigated, from lack of water. The last census year was, however, one of abnormally small rainfall. The cost of construction per mile was $1,569; per acre, $7.21. The State is divided by law into six irrigating divisions: the South Platte — the richest farming section of Colorado — irrigating 711,192 acres; the Arkansas, Rio Grande, Grand, San Juan, and Green.

The most important single crop of Colorado is hay, now amounting to some $10,000,000 a year in value. Two thirds of this is alfalfa, whose great yield and nutritious qualities make irrigation worth while, and most of it is grown by means of irrigation. The next is wheat, 7,207,111 bushels in 1900. It had more than doubled in the decade, and it makes the highest priced flour on the market. Potatoes rank third; the soil is admirably adapted to them, and in 1900 4,465,748 bushels were raised, against 383,123 in 1880. The sugar-beet industry is becoming of the first importance. There are five large beet-sugar factories in the State, which in 1902–3 are estimated to have utilized a crop of over 270,000 tons, and produced nearly 30,000 tons of sugar. In it the State ranks third of the United States. The only other crops of first-rate importance were oats, 3,080,130 bushels; and corn, 1,275,680 bushels. Others, however, are rapidly becoming valuable specialties. Barley is increasingly raised for brewing. With irrigation fruit-culture is assuming large proportions; especially the growing of apples, which have arisen from nearly nothing in 1890 (77,798 trees and some 10,000 bushels) to 2,004,595 trees and 257,563 bushels in 1900. Over 80,000 bushels of peaches, pears, and plums were also grown. Most of the fruit-raising was in Delta, Mesa, and Montrose counties, on the Grand and Gunnison, in Boulder County, on the South Platte, and in Fremont County, on the upper Arkansas.







1. Pike's Peak, Showing Carriage Road.

2. Garden of the Gods.

A fragrant crop on the Arkansas is that of muskmelons, including the famed Rocky Ford cantaloupes.

Stock raising has increased with the production of feed, or *vice versa*. In 1900 the value of Colorado live stock was $49,359,781; the number of meat cattle more than doubled in the decade (640,913 to 1,333,202), as it had done in each decade since 1870; and sheep, swine, and horses increased 50 to 75 per cent. The quality improved even faster than the quantity. Colorado ranchmen have been among the foremost to import blooded bulls to breed up the native stock, and in 1900 the average price of bulls was $55.26, the highest in all the States save one (Wyoming), against $34.49 for the whole country, and $15.26 for the South Atlantic States. This breeding is displacing the Texas long-horn with blooded stock, and the average herd is smaller and better looked after. Dairying has increased by a third in the decade. There were 76 creameries and 27 cheese factories in the State in 1901, and a large condensed milk factory was built. Sheep and wool form the wealth of several counties.

Geology and Mining.— The main ranges of the Rocky Mountains are predominantly igneous granite and the like, with sedimentary rocks of great antiquity to the east and west (erosion is believed to have bared the former), and Cretaceous and Tertiary in the eastern plains and along the valleys in the west. The Cretaceous rocks hold great coal deposits; and the volcanic upthrows have left enormous deposits of the precious metals and others. Colorado is the foremost State in the Union except Pennsylvania in mineral resources, and by far the first in all except iron and coal. In 1900 40,111 of its inhabitants were employed in mining, 16,040 above ground, and 24,071 below. In 1901 it produced 1,342,712 ounces of gold, worth $27,693,500, almost a seven-fold increase within the decade; and 18,557,068 ounces of silver, worth $11,062,680 (coining value, $23,838,772); in all $38,756,180. More than half of this came from Cripple Creek in Teller County, and the remainder from 33 of the 57 counties of the State. The production of gold is relatively steady, and tends to increase; that of silver is subject to immense fluctuations, but is on the decline, many mines having closed down on account of the great fall in price. The greatest output was in 1892, the year before the repeal of the Sherman Act. Colorado's gold product in 1901 was 64 per cent greater than that of California, four times that of Alaska or South Dakota, and 35½ per cent of that in the entire United States; its gold and silver together over one third. The mines at Cripple Creek and Leadville are the best equipped in the country. About three fourths of the silver is from lead ore, and Colorado's lead product is about one fourth that of the whole country, much of it being independent of silver. It is not only marketed as a raw material, but is the most valuable flux for smelting gold and silver, and therefore large quantities are imported from other States. In 1900 it produced 82,137 tons. In 1895 Leadville produced three fourths of all in the State; in 1902, a little more than one third, Creede and the San Juan district having taken its place. Trade with Belgium within a few years has developed a great zinc industry, previously slighted: and the output of zinc and manganiferous iron is worth some $600,000 a year. Copper is much more important: not so much from direct mining, which is trivial, as from extraction from ores of the precious metals containing it. It amounts to some 4,000 tons a year, or in value, nearly $2,000,000. But of late, coal and iron are coming to the front. In 1900 Colorado ranked eighth in coal and fourth in coke in the country (5,300,000 tons of coal and over 500,000 of coke), and mined toward 500,000 tons of iron ore, mainly brown hematite. Except Minnesota, it far outranked every State west of the Mississippi in both. About half the coal was from Las Animas County in the southeast. These products are only the chief of a vast number of mineral stores — salt and sulphur (whence many valuable mineral springs), mercury and platinum, porcelain clay, marble and sandstone, petroleum and natural gas, etc.

Manufactures.— The chief industries of Colorado could be predicted from a glance at its raw materials — precious metals, copper and lead, coal and iron, wood, cattle, and grain. These mean smelting, iron and steel and railroad work, lumber manufacture, meat-packing, flouring-mills and breweries. The predominating industry is the smelting and refining of lead ores or with lead, which makes two fifths of the State's total of product in value — $40,732,271 out of $102,830,137; over a third the investment of capital — $22,569,715 out of $62,825,472; and nearly one sixth the wages paid — $2,390,383 out of $15,146,667. Copper-smelting embraced about one tenth as much capital and product, and paid one eighth as much in wages. Iron and steel were second, with $2,903,136 capital, $6,108,295 product, and $710,742 wages. The great advantage of Colorado in having its iron, coal, and flux close together have given it a practical monopoly of the market west of the Mississippi. The increase over 1899 was 25,000 tons of pig iron and 40,000 of steel rails. Foundry and machine-shop products are really a part of this: product, $3,986,915; wages, $1,125,432; and car-shop work is dependent on iron and lumber — $3,141,602 product, $1,676,500 wages. Flouring and grist-milling showed $4,528,062 product, $139,510 wages; wholesale slaughtering and meat-packing, $3,562,357 product and $139,510 wages; malt liquors, $2,042,863 product, $256,764 wages; lumber, timber, and planing-mill output, $2,693,575 product, $655,053 wages. Colorado industries pay about $1,000,000 a year internal revenue tax.

Railroads.— Colorado has about 5,000 miles of main track of steam roads; besides well-developed electric systems, not only in cities, but between mining camps. A number of great trunk lines cross the State and pierce to the heart of its mountain districts, giving the best transportation service of any State along the Rocky Mountains. The chief systems are the Union Pacific, the Missouri Pacific, the Atchison, Topeka & Santa Fé, the Denver & Rio Grande, the Rock Island, the Colorado & Southern, the Colorado Midland, and the Rio Grande Western railroads. Within the past few years two important branch lines have been built from Denver, connecting with the Burlington and the Northwestern systems.

Finances.— In 1902 the assessed valuation of the State was about $354,002,501 and the bonded debt $1,004,720 net. The tax rate was $4.50 per $1,000.

Banks.— On 1 Jan. 1903 there were 53 national banks in Colorado, with a capital stock of $5,607,000, deposits of about $66,000,000, and reserves of $15,000,000; 40 State banks, with about $2,000,000 capital, about $15,000,000 resources, and over $20,000,000 deposits; and a number of private banks.

Education.— Colorado stands high among States in the efficiency of its school system, the length of its school year (not exceeded by any west of the Atlantic seaboard), and the salaries paid to its teachers. It expends over $3,000,000 a year on its public schools; and erected 126 school buildings in the two years 1899 and 1900. Out of 158,142 children of school age in 1900, 120,846, or three fourths, were enrolled, and the actual attendance was 96,728; of whom 83,325 attended six months or more and 7,805 four to five months. It has nearly 2,000 public schools, with 3,500 teachers, and over 40 public high schools. There is a State normal school at Greeley, with about 600 pupils; and a private one at Denver. For higher education there are the University of Colorado (1877) at Boulder; Colorado College (1874) at Colorado Springs; the University of Denver (1864) M. E.; College of the Sacred Heart (1876) R. C.; and Baptist Female College, at Denver; the State School of Mines at Golden, accommodating 200 to 250 pupils, and constantly crowded; and the State Agricultural School at Fort Collins. These institutions are constantly adding new buildings and facilities, and increasing in students. There are medical colleges at Boulder and Denver. There are also several private secondary schools —at Boulder, Cañon City, Del Norte, Leadville, and Montclair.

Churches.— In 1900 there were about 650 church organizations in the State, and nearly 500 Sunday-schools. The strongest denominations are the Methodist, Presbyterian, and Roman Catholic; there are also considerable numbers of Congregationalists, Baptists, Episcopalians, Lutherans, and Disciples of Christ.

Charitable and Penal Institutions.— Each of these has a board of control, under the general supervision of the State Board of Charities and Correction. Besides the care of the poor by the counties and some city institutions, as elsewhere, there is a State insane retreat at Pueblo, and a soldiers' and sailors' home at Monte Vista. The State prison is at Cañon City. The convicts are employed at useful labors inside, and also at road-making and the digging of irrigation ditches outside. The indeterminate sentence is used. There is also a State reformatory and farm at Buena Vista; and an industrial school for juvenile offenders at Golden, where the inmates are not confined nor marked with penal badges, and the appeal is to their honor.

State Government.— The State constitution is of 1 Aug. 1876, adopted soon after the State's admission. Woman suffrage was adopted in 1893, and women are eligible to office. In 1901 over a score of them were elected to be county superintendents of public instruction, and several to other offices. The governor holds office for two years, and has a salary of $5,000. He has a veto by items, overriden by a two thirds vote. Of the other State officers, the treasurer and auditor are limited to a single successive term. The legislature has biennial sessions, and is limited to a membership of 100 in both branches; there are now 65 in the House (elected for two years), and 35 in the Senate (four years). The State had two representatives in Congress prior to the reapportionment under the census of 1900, which gave it three. There are three judges of the State supreme court, elected for nine years; the judges of the judicial districts are elected for six, and each county has a judge, elected for three. The terms of county commissioners are three years; there are three in all counties having under 10,000 population, and five in those with more than that number. The State militia consists of two infantry regiments of 550 each, an artillery squadron of 200, and a battery of 75.

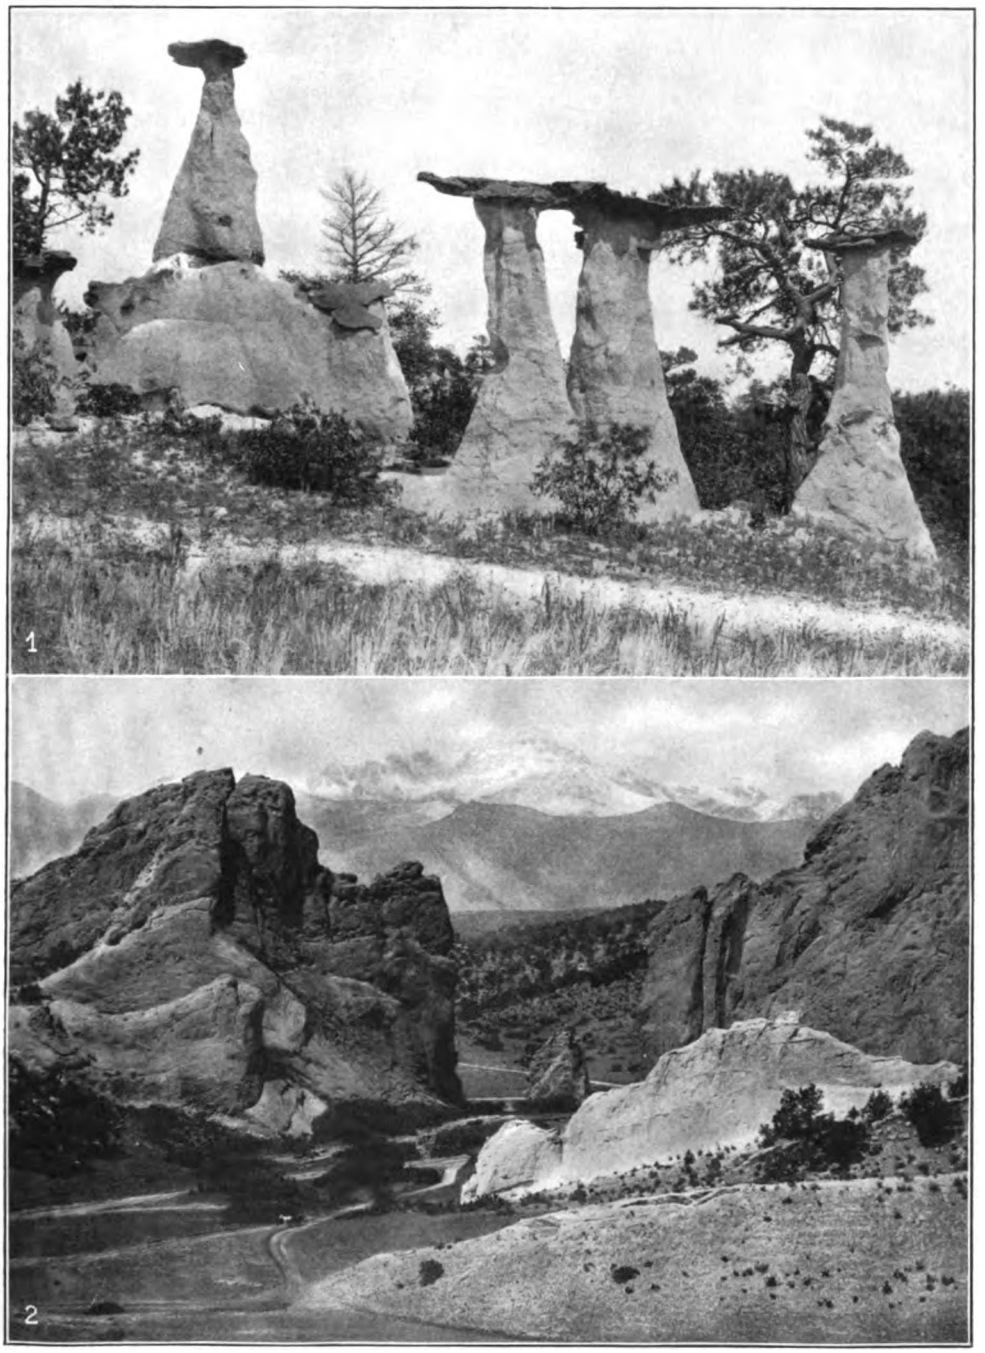
Politics.— Colorado, admitted as a Republican State, has alternated between the parties till within the last few years, when it has become Democratic, mainly on the currency issue. The Populists are also strong there, and the Republicans are predominantly Silver Republicans.

Population and Divisions.— The first (Territorial) census, that of 1860, showed 34,277 people; 1870, 39,864; 1880, 194,327; 1890, 412,198. The census of 1900 showed a population of 539,700. The foreign-born numbered 91,155. Of these, 26,481 were from England, Scotland, and Canada; 4,606 were from Germany; 10,765 from Sweden; 10,132 from Ireland; 6,818 from Italy; and 6,024 from Austria(probably in the main Hungarians and Slavs). Counting the north of Ireland English, probably a third of the foreign-born were English. The colored were 10,654. The enormous predominance of males usual in a mining district had dwindled with the settled industries, and the males were under 55 per cent.

There are 57 counties in the State, as follows, with their county-seats:

Adams, Brighton.	La Plata, Durango.
Archuleta, Pagosa Springs.	Larimer, Fort Collins.
Baca, Springfield.	Las Animas, Trinidad.
Bent, Las Animas.	Lincoln, Hugo.
Boulder, Boulder.	Logan, Sterling.
Chaffee, Buena Vista.	Mesa, Grand Junction.
Cheyenne, Cheyenne Wells.	Mineral, Creede.
Clear Creek, Georgetown.	Montezuma, Cortez.
Conejos, Conejos.	Montrose, Montrose.
Costilla, San Luis.	Morgan, Fort Morgan.
Custer, Silvercliff.	Otero, Lajunta.
Delta, Delta.	Ouray, Ouray.
Denver, Denver.	Park, Fairplay.
Dolores, Rico.	Phillips, Holyoke.
Douglas, Castlerock.	Pitkin, Aspen.
Eagle, Redcliff.	Prowers, Lamar.
Elbert, Kiowa.	Pueblo, Pueblo.
El Paso, Colorado Springs.	Rio Grande, Del Norte.
Fremont, Cañon City.	Rout, Hahn's Peak.
Garfield, Glenwood Springs.	Saguache, Saguache.
Gilpin, Central City.	San Juan, Silverton.
Grand, Sulphur Springs.	San Miguel, Telluride.
Gunnison, Gunnison.	Sedgwick, Julesburg.
Hinsdale, Lake City.	South Arapahoe, Littleton.
Huerfano, Walsenburg.	Summit, Breckenridge.
Jefferson, Golden.	Teller, Cripple Creek.
Kiowa, Sheridan Lake.	Washington, Akron.
Kit Carson, Burlington.	Weld, Greeley.
Lake, Leadville.	Yuma, Yuma.

There are 27 places in Colorado of over 2,000 people; 17 of over 3,000; and 8 of over 4,000. The metropolis is Denver, on the east flank of the Rocky Mountains, north of the centre, with 133,859 inhabitants in 1900, having nearly quadrupled in 20 years; the head of the Rocky Mountain trade, and chief United States market for ranching, prospecting, and mountaineering supples. Pueblo, with 28,157, and Colorado Springs with 21,085, are on the same front line of the mountains: the former a mining emporium; the latter the greatest sanatorium of the West. Leadville, 12,455, is the head of the



1. The Dutch Wedding, in Monument Park,
2. Pike's Peak, from the Garden of the Gods.

great mining district on the upper Arkansas west of South Park; Cripple Creek, 10,147, is the centre of its rich mining region, west of Colorado Springs; Boulder, 6,150, in the mountains northwest of Denver, is a sanatorium with medicinal springs, also a manufacturing town; Trinidad, 5,345, in the extreme south, is the southernmost of the frontal towns, below Pueblo; Victor, 4,986, is one of the Cripple Creek settlements.

History.— The State is named from the river (Sp. "red-colored"). In prehistoric times the pueblo builders dwelt in the southern part; but the early Spaniards found no survivors to establish missions among, and the country was not even explored to any extent till, in 1776, Francisco Escalante led an expedition into the Dolores and Gunnison region. It remained totally unoccupied, however, and a part of it passed under United States control by the Louisiana Purchase of 1803, the rest being claimed by Mexico. In 1806–7 Lieut. Zebulon M. Pike crossed the mountains, discovering Pike's Peak, and reached the Rio Grande; and in 1819 Stephen H. Long explored the northern part, Long's Peak being named after him. Frémont's explorations of 1842 and 1844 added considerably to the knowledge of the region, and lines of fur-trading posts were established on the South Platte and the Arkansas. After the Mexican war this formed a part of the territory taken from Mexico; but in 1854 Conejos, in the Rio Grande valley, was founded by colonists from New Mexico, and a Jesuit mission established there. But the real founding of the State as a civilized settlement dates from 1858. Prospectors from Kansas and Georgia were seeking for gold in this likely district; and its discovery by W. G. Russell of Georgia on the headwaters of the South Platte, near Idaho Springs, and by others farther north on the same river system, near Boulder, drew a torrent of immigration there in 1858–9, from Kansas, Nebraska, and Missouri. Denver, Boulder, and Auraria, Black Hawk, Central City, Golden City, Mount Vernon, and Nevada City, were all founded in those years; Breckenridge, Empire, and Gold Hill in 1860; Georgetown and Mill City in 1861. Arapahoe County, Kan., was organized 1859, extending to the snow-crests; that and parts of Nebraska, New Mexico, and Utah were organized into the Territory of Colorado 28 Feb. 1861, in accordance with the resolution of a convention at Denver in 1859. The first governor was William Gilpin, a Pennsylvania Quaker, who had been prominent in its development, and especially had originated the plan of making it include both sides of the Rocky Mountain chain. The War checked settlement somewhat; much more did the fierce Indian war of 1864–5 with the Cheyennes and Arapahoes of the plains, which made the roads unsafe and forced many of the settlements out of existence. Immigration was resumed when the savages were quelled, and nearly 40,000 persons were living in the Territory in 1870 — 25,000 males to 15,000 females. The Indian wars were chronic at intervals, but were past seriously affecting the Territory, and the Utes, who held much of the best mountain and park land, were forced to cede it by 1880. Repeated attempts had been made to organize a State government, without success; but the political conditions of 1874–6 made two senators more desirable, and the enabling act was passed 3 March 1875, the formal admission being intended for the centennial of the Declaration of Independence. The easy gold-working was, however, coming to an end, and the State was running down, when a new process of working silver and lead from the carbonates made hitherto useless ores suddenly more valuable than the gold had been. Leadville was founded in the heart of the region best suited for this, and shortly became the most famous mining camp of the West. For a few years past the great silver interests of the State have dictated its political sympathies, and the nominal party divisions have been subordinate to the one controlling issue.

Consult for early history and modern settlement, Bancroft, 'History of the Pacific States' (Vol. XX. 1890).

Colorado, Texas, city and county-seat of Mitchell County, situated on the Texas & Pacific Railroad, about 235 miles northwest of Austin. It is surrounded by a stock-raising and wool-growing region. Salt is extensively produced. Pop. about 2,000.

Colorado Agricultural College, a coeducational institution at Fort Collins, Col., providing instruction in agriculture, mechanical engineering, veterinary science, etc., a four years' course leading to the degree of B.S. It was opened in 1879, and received a grant of 90,000 acres of land under the act of Congress of 1862, providing for the endowment of "colleges for the benefit of agriculture and the mechanic arts." About half of this land is still owned by the college, and the institution receives its annual income mostly from State tax and government appropriations. In 1902 there were 27 instructors and 387 students.

Colorado Beetle, a coleopterous insect of the family *Chrysomelidæ,* belonging to the phytophagous group of tetramerous beetles (*Chrysomela,* or *Polygramma,* or *Doryphora decemlineata*). In size it is nearly half an inch in length, almost oval, convex, of a yellowish or ochre-yellow color, marked with black spots and blotches, and on the elytra with 10 black longitudinal stripes. The wings, which are folded under the elytra, are of a blood-red color. It is a native of the eastern slopes of the Rocky Mountains, where it fed on a wild solanaceous plant (*Solanum rostratum*) until the introduction and cultivation of the potato into the western States afforded it a more appropriate food. It has gradually spread at the rate of nearly 100 miles a year, until it is now found over all the central and northern parts of the United States east of the Rocky Mountains, and throughout Canada, where it has done incalculable mischief to the potato crops of these regions. The damage is chiefly wrought by the larvæ (of which they produce three broods annually), which are hatched on, and greedily devour, the stalk and leaves of the potato plant. See POTATO.

Colorado College, a coeducational nonsectarian institution in Colorado Springs, organized in 1874. It offers full collegiate courses and confers the degrees of A.B., B.S., and Ph.B. In 1902 the college reported 33 professors and instructors; 500 students; 25,000 volumes in the library; value of grounds and

buildings, $500,000; annual income, $41,000; president, William F. Slocum, LL.D.

Colorado Desert. See DESERT.

Colorado River, one of the chief streams of Texas. Rising in the high table-lands of Bexar, near the line of New Mexico, about lat. 32° 30′ N. and lon. 102° W., it flows southeast, receiving in its upper course the Conca, the San Saba, and the Lano on the south, and the Pecan from the north, and empties into Matagorda Bay. Austin, Bastrop, and Columbus are on its banks, and Matagorda near its mouth. For most of its course it flows through a fertile region, and has an average width of 250 feet. It is a clear stream; its name, meaning red, was originally applied to the Brazos, north and east, but the two were interchanged. The Colorado is some 900 miles long, and navigable to Austin or farther.

Colorado River, or **Colorado of the West,** a great river of the United States and Mexico, formed at about lat. 38° N. and lon. 110° W., by the junction of the Green and Grand rivers. The Green river rises in the Rocky Mountains in the west of Wyoming, receiving in its southwestern course the waters of the Bear, the White, the Uintah, and San Rafael. From Flaming Gorge, a point in the northwest of Colorado, where the Uintah Mountains rise, the Green River cleaves its way rapidly through cañons, the walls of which tower up to a height of nearly 1,500 feet. The Grand River rises in the Rocky Mountains, west of Denver, Col., receiving in its southwestern course the South Fork or Gunnison, the San Miguel, and Dolores. After the junction the Colorado flows southwest through Utah, joined on the east by the San Juan, on the west by the Dirty Devil and Escalante; southwest through the north of Arizona, till its waters are increased by the Colorado Chiquito, or Little Colorado of Arizona. Near the inflow of this tributary is the Marble Cañon, 3,600 feet deep and about one third the length of the greater cañon below.

From the mouth of the Little Colorado the river bends west and for more than 200 miles flows through the wonderful Grand Cañon. The successive divisions of the cañon are known as the Kaibab section, the Kanab section, the Uinkaret section, and the Sheavwitz section. The walls of this water-worn trench are often vertical, or nearly so, for a distance of thousands of feet at a time; sometimes they slope steeply, or constitute magnificent terraces. The cliffs or rock-walls attain a height of from 4,000 to 7,000 feet above the stream. (For heights of particular points, see CAÑON.) There are frequent whirlpools and waterfalls. Below the cañon the valley opens, and there is much fertile bottom-land on one or both sides of the river. Numerous tributaries pierce the high plateau on either side, the whole presenting a strangely intersected topography. Escaping from the Grand Cañon, the river flows southwest to the borders of Nevada, receiving from the west the Paria, Tapeat's River, the Kanat (of Arizona), and the Virgen (of Nevada).

Above Callville, Nev., the Colorado, as also its tributaries, again bores its way through deep cañons, the sides of which in some places present walls of solid rock nearly 7,000 feet high; the plateaus at the top of these rock masses, generally treeless, are again surmounted by terraces 1,000 feet or more high. These lower and higher terraces are both piled with massive ruins, once the walled towns and cities of the Toltecs, as is supposed, a race said to be represented by the present Moqui Indians in the northeast of Arizona. Below Callville the river is again shut in by the last of the cañons, the Black Cañon, 25 miles long, and from 1,000 to 1,500 feet high. Shortly after receiving the Virgen, the Colorado takes a southerly course, severing Arizona and Sonora on the east from Nevada, California, and lower California on the west, and receiving on the east Bill Williams' Fork and the Gila. After absorbing the Gila the river sweeps round in a westerly direction for 7 or 8 miles, and soon expands to a width of 1,200 feet. Thence it pursues a tortuous course of 180 miles, the last portion being through Mexican territory, to its mouth in the Gulf of California. There is a vast delta or flood plain formed by the waste from rock erosion. From the sources of the Green River the Colorado measures a total length of about 2,000 miles. It is navigable for steamers as far as Callville, 612 miles from its mouth, and can be made navigable, it is thought, to the foot of the Grand Cañon, 57 miles higher. The first attempt to navigate the upper part of the Colorado was made in 1891. In 1893 the stream was proved navigable for 130 miles between Green River and Cataract Cañon.

The investigation of the geologists dispelled the theory once held that the Grand Cañon was a fracture of the earth's crust. It is now clear that a long period of erosion through plateaus successively uplifted has produced this remarkable gorge. At the bottom of the cañon throughout a considerable part of its course the Archæan system is laid bare. The Algonkian beds with their high coloring give brilliancy to that portion of the cañon where they can be traced. The Cambrian beds are found above the Algonkian, but in places rest directly on the Archæan. The thickness of the Cambrian (here known as the Tonto formation) is in places 1,000 feet. The upper part of the cañon walls consists of carboniferous formations (Red Wall formation below, Aubrey limestone and sandstone above). It has been estimated that all of the Eocene, Cretaceous, Jurassic, and perhaps Triassic beds and the greater part of the Permian were worn away from the plateau region during the period of erosion. The Marble Cañon platform, like that of the Grand Cañon consists of carboniferous strata with a considerable number of Permian remnants scattered over it.

In less than 50 years after the landing of Columbus, Spaniards explored the Colorado. In 1540 the river was visited by a detachment of Coronaro's expedition and another of his exploring parties gave the first description of the Grand Cañon as seen by white men. About the same time Fernando Alarçon ascended the stream in boats for a long distance. Catholic missionaries subsequently traveled through these regions. For about 300 years, nothing more was learned concerning the Colorado. Much light was thrown on the subject by the investigations of Ives in 1858. In 1869 Powell explored the region and made the descent through the whole course of cañons to the mouth of the Rio Virgen, a distance of more than 1,000 miles.

Dutton made geological studies of the Grand Cañon in 1875. In 1889 the cañons were explored by a party of engineers sent out to make surveys.

Bibliography.—W. M. Davis, 'An Expedition to the Grand Cañon of the Colorado'; Dutton, 'Monograph II, U. S. Geol. Survey' (1882).

Colorado Springs, Col., a city and county-seat of El Paso County, on the Denver & R. G., the Denver T. & G., the Santa Fe R. I. & M. P., and the Colorado M. R.R.'s. It is situated on a plain at an elevation of 6,000 feet, near Pike's Peak and has a world-wide reputation as a health and pleasure resort. Colorado Springs is an attractive city and is the midway gate to the western section of the State. The celebrated mineral springs of Manitou attract many visitors.

Industries.— Colorado Springs was settled in 1870 and its wonderful growth since 1892 may be largely attributed to the development of the Cripple Creek gold mines, which are 30 miles distant on the opposite side of Pike's Peak. The gold output since the discovery of the district in 1891 has been $136,000,000. A great part of this wealth flows into Colorado Springs, whose population has more than doubled in the past ten years, and whose bank deposits have increased 600 per cent. in the same period, and now amount to about $10,000,000.

Buildings, Educational Institutions, Railways, Etc.— Colorado Springs boasts a handsome opera house and five clubs, one occupying an edifice worth $80,000; 17 fine school buildings, Colorado College (q. v.), the oldest institution of its kind in the State, with over 800 hundred students, a State institution for the education of the blind and mute, sanitoriums, church edifices, 2 hospitals, and 6 trunk lines, 28 miles of electric railway and a modern telephone system.

Government, Etc.— The city is governed by a mayor, who is chosen biennially, and a city council. Colorado Springs has a water supply costing over $1,000,000 and a sewerage system perfected at an expense of $10,000,000. Pop. (1904) 24,000.

HENRY RUSSELL WRAY,
Secretary Chamber of Commerce.

Colorado Stage. The rocks of the Colorado Stage, one of the lower divisions of the upper Cretaceous Series, are all of marine origin and cover a great area, having been laid down in an interior sea that stretched from northern New Mexico, where it opened into what was then the Gulf of Mexico, to the Arctic Ocean. This sea at about the latitude of Duluth, Minn., was over 1,000 miles wide. The Colorado is separated into two sub-stages, the lower, or Fort Benton, clays, shales, and limestones, with a maximum thickness of 1,000 feet, and the upper or Niobrara, shales, sandstones, chalk, and chalky marls, with a maximum thickness of 2,000 feet. Along the northern border of what was the Gulf of Mexico, in Alabama and Mississippi the Colorado is represented by the rotten limestone 500 to 1,200 feet thick, and along the western shore of the gulf, across Texas into Mexico, by the Eagle Ford shales, 500 feet thick, and by part of the great chalk belt 300 to 600 feet thick, that stretches from Arkansas into northern Mexico. The Colorado Stage is of interest because of its marking the time when more of North America was under water than since the Carboniferous Epoch, and because of the beds of chalk in South Dakota, Kansas, Arkansas, Texas, and Mexico. See CHALK; CRETACEOUS SERIES.

Colorado, University of, a coeducational institution at Boulder, Col., supported by the State. It was incorporated in 1861 by the Territorial legislature; when Colorado became a State in 1876, the Constitution provided that the university at Boulder should become the State University, thus giving it the advantage of the lands appropriated by the national Congress for such institutions. The University of Colorado commenced its work in September, 1877, with two departments, the collegiate and the preparatory. Since then the preparatory work has been gradually withdrawn from the university until the preparatory school has a separate organization; and the schools of medicine, law, and applied science have been added. The collegiate department offers courses leading to the degrees of A.B., Ph.B., and B.S. In 1903 there were over 500 students in the university proper, and nearly 400 in the preparatory school. The library numbers 26,000 volumes.

Coloration, Protective. The color of plants and animals is primarily due to the action of light, and is dependent on the pigment in the tissues of flowers, and in the skin, scales, hair, or feathers of animals. Plants are colored green by chlorophyll, so are caterpillars from eating plants; animals derive their colors from the waste matter of the blood. The "chromatic function" is that adaptation of color of the skin of the frog, chameleon, squid, fish, or crustacean, which rapidly changes so as to be assimilated to the tints of the objects on which they rest. In all animals the coloration is due to pigment-cells (see CHROMATOPHORES), which are more or less ramified, and which, under the stimulus of the prevailing color of the habitat, cause the animal to be assimilated in hue to the ground, or tree, or sea-bottom. In most animals the coloration is permanent, in a few it changes with the change of color of the immediate surroundings of the animal, as in the chameleon. In insects, fishes, and birds, where the variety of colors is almost endless, it is usually more or less protective, though, when the males are brightly colored this is the effect of sexual selection.

Pigment in Animals.— That this is primarily due to the action of light is proved by the fact that cave animals, or those living in darkness, are white or bleached out, so that the pigment cells become degenerate, the pigment losing its more or less dark color, while in insects the colors are either optical or natural; the pigments, when present, are formed in the cellular layer of the skin (*hypadermis*). The pigments are formed from the waste products of the blood which have not been carried away with the urinary excretions. These colors tend to fade after death, but when enclosed and preserved in air-tight sacs, such as the scales and hairs of butterflies, and the wing-covers of beetles, they remain bright for a longer time, though eventually fading when dried specimens are exposed to the light. It has been shown that red, yellow, brown, and black colors in the scales of certain butterflies are always due to pigments, while in a few cases greens, blues, violets, purples, and whites are due to

pigments in the scales themselves. Mayer finds that the pigments of the American silkworm moth (*telea polyphenmus*) are derived from the blood of the chrysalis. He has artificially produced several kinds of pigments from the blood, which are similar in color to various markings on the wings of the moth, and has found that chemical reagents have the same effects on their manufactured products as on similar pigments in the wings of the living moth.

Origin of Spots, Bands, or Stripes.—The markings of caterpillars, the stripes of the zebra, of many African antelopes, and of the tiger are supposed to be due to the direct effects of light and shade, to shadows cast in jungle-grass or in forests. The proofs of this are the experiments of Steinach, who glued strips of black paper to the skins of frogs which were kept in the dark; when they were exposed to the light, only the uncovered parts of their skins returned to a lighter hue, while the covered parts remained dark. The reflected green light in the case of frogs turning green when among leaves, appears to act directly upon the pigment cells. When the bottom of the vessel is covered with felt or with a wire net, the frogs become black, but recover their green color when a green branch is introduced into the vessel containing them. Those caterpillars living among pine needles are green, striped with white, yellow, and red, exactly harmonizing with the red and yellow or white portions of each needle; this seems due to the direct reflection of different shades of light on the moist skin of the caterpillar. In other caterpillars the longitudinal lines are broken up into spots, and if the process is carried on farther the spotting becomes transverse. Eyelike spots on certain caterpillars have been observed to be gradually formed at successive molts from what were originally continuous lines or stripes. It thus appears that the wonderful variety of colors and markings in animals is primarily due to the direct result of the environment, bringing about different results in animals of different groups and exposed to different environments. (For coloration due to changes of temperature see *Seasonal Dimorphism* under DIMORPHISM.)

General Protective Resemblance.— Cases in illustration are the white animals of the Arctic regions, where extreme cold and dryness have turned the hair of the polar bear, and the feathers of the snowy owl white. This applies to species, the individual ptarmigan, ermine, hare, fox, etc., turn white in winter, but of a russet hue in summer, due to the differing light reflected from the ground in summer and the snow in winter. The ptarmigan, grouse, prairie chicken, and the like, which build open nests, are protectively colored, while the conspicuously marked kingfisher, parrot, etc., build a nest which conceals the sitting bird.

The under side of the wings of certain butterflies, such as the species of *Polygonia, Suvanessa antiopa*, and the East Indian *Vallima* are assimilated in color, together with their often ragged outlines, to dead and tattered leaves; when the butterfly is resting on the ground or in bushes among the dead leaves, it is difficult to distinguish. On the other hand the upper side of the wings are conspicuously marked with reddish hues and conspicuous bars. Certain moths, when resting on the lichen-covered bark of trees, are wonderfully similar to the surroundings, and are thus protected from the attacks of birds or lizards. In the Arctic regions and in Labrador certain butterflies and moths are of the color of lichen-covered rocks, so much so that when at rest they are difficult to detect.

Special Protective Resemblances.—The most striking examples are the measuring-worms, or geometrid caterpillars, which, when holding themselves out straight and stiff, resemble twigs, not only in shape, but in color and markings; and still more wonderful are those species whose bodies are provided with tubercles which in shape resemble the leaf-bud and other excrescences in the back of the twigs. How to account for the origin of such protuberances is a puzzle. The stick-insect is another example; though not common with us, and supposed to be well protected from the bills of birds, yet in the East Indian archipelago they are said to be the principal food of one kind of bird. Another example is the famous leaf-insect (*phyllium*) of Java, in which the wings are very broad, thin, and marked with veins like the mid-rib and side-ribs of a leaf.

Alluring Resemblances.— Such are the tentacles of the angler-fish or goose-fish, which, buried in the mud, waves its tentacles so as to deceive small fish. An Asiatic lizard (*phrynocephalus mystaceus*) is colored like sand, but is furnished with a red fold of skin at each angle of the mouth, which, says Marshall, is produced into a flower-like shape resembling a little red flower which grows in the sand. An Indian mantis (*Hymenopus bicornis*) devours insects which are attracted by its flower-like shape and pink color, which are like an orchid, the shape being due to the flattening of the tarsal joints of the legs, which radiate from the body like the petals of a flower.

Recognition Marks.— By Naller and others the stripes of the African antelopes, the upturned white tail of the rabbit and hare, and the bars and other conspicuous markings of birds that fly in flocks, are regarded as recognition marks, but others consider that this is rather fanciful and that they are protective alone.

Warning Colors.— Certain animals, of which the skunk affords an example, are so marked as to be easily distinguished by their enemies, which knowing by experience their offensive nature, pass them by. Hence the conspicuous stripes of the different species of these animals in the New World. There are many cases of brightly colored caterpillars which are avoided by birds and lizards which greedily devour green ones. The conspicuous red, blue, and purple spots and stripes are advertisement of their inedibility. In Nicaragua Belt observed that while ducks and fowl fed on ordinary green frogs, a small species gorgeously colored with red and blue, was avoided. On offering one to ducks and fowl they all refused to eat it, except one young duck, which took the frog in its mouth, only to drop it, going about jerking its head as if the taste of the frog was unpleasant. Although these striking markings are supposed to be the result of natural selection, Eisig's theory that the abundant secretion of pigment is the cause of the distastefulness, seems better grounded. Indeed a large number of cases of protective mimicry seem due to the direct action of light and warmth in

bringing about the varied hues of the pigment — moreover the range of primary colors is not very great, and the hues are apparently due to the action of the environment, so that we need not, in most cases at least, invoke the somewhat fanciful hypothesis of Wallace, Poulton, and others to account for these resemblances. As Eisig claims, the abundant secretion of pigment has caused the insects to be inedible, rather than that the bad taste has caused the production of bright colors as an advertisement or warning siginal.

Color Preference.—It has been frequently noticed that house-flies will light on a dark dress in preference to a light one. They will settle down upon a dark red or brown dress in great numbers, and either avoid or rarely alight upon a pearl gray, lavender, or light or white dress or clothing of any kind. It is the same with the mosquito, which has the same color preference as the fly. In malarious countries this is a most important matter. The wearing of light yellow, drab, or white garments is an important means of protection against malaria. Houses in such regions should have light-colored walls to the rooms, especially in sleeping-apartments.

On the other hand, locusts are attracted by white or light-colored garments more than those of any other hue. White butterflies (*Pièris*) show a preference for white flowers; while in several cases yellow butterflies (*Colias, etc.*) prefer to visit yellow to white flowers.

Insects Attracted Rather by the Odors of Flowers than their Colors.— It has been argued by Lubbock and others that the colors of flowers attract insects, and that the gay lines and stripes leading down to the bottom of deep corollas are guides to the nectar. At present this view has been stoutly opposed by Plateau, after many observations, who thinks that the color of flowers has no connection with the visits of insects, but that they are attracted by the odor of the nectar. He finds that any flower is freely visited if it be nectariferous, no matter how colorless or inconspicuous it may be. Many gay flowers are wholly avoided by insects, but on placing nectar at the base of such flowers, insects were at once attracted. It appears from Plateau's observations that color is not a primary factor in attracting insects to flowers. Though bright blossoms are undoubtedly seen by insects from a distance, when they once reach the flowers it is a matter of indifference to them what their color is—blue, red, yellow, green, or white—if they differ from one another in no other respect. Consult: Wallace, 'Darwinism,' (New York 1889); Poulton, 'The Colors of Animals' (New York 1890); Beddard, 'Animal Coloration' (New York 1895); Newbigin, 'Color in Nature' (London 1898); also the writings of Lubbock, Plateau, Coste, Urech, Eimer, Hopkins, Weismann, Tenneck.

Colorimeter, kŭl″ō-rĭm′ę-tėr, an instrument for measuring the depth of color in a liquid by comparison with a standard liquid. In its usual form it consists of two long, narrow glass tubes placed side by side on a stand. The standard liquid and the one in question are poured in equal quantities, one into each tube; and water is then added to the darker till its tint becomes the same as the other. The amount of water used is a measure of the depth of color in the given liquid.

Coloring, one of the essential parts of painting — namely, that part which relates to colors. Besides a knowledge of the art of preparing and mixing colors, and the whole mechanical process from the beginning to the finishing of a picture, which in the various kinds of painting varies according to the materials of each, coloring comprehends the knowledge of the laws of light and colors, and all the rules deducible from the observation of their effects in nature, for the use of the artist. This subject has been treated by Leonardo da Vinci in his work on painting; Lomazzo and Gérard Lairesse in books on the same subject; Mengs in his 'Praktischer Unterricht'; Goethe in his 'Farbenlehre'; etc. The skill of the painter presupposes a natural ability founded on superior sensibility — namely, the ability to image forth, and in the imitation to express with characteristic truth the peculiar substances and color of any object under the influences of the light and air. To make this imitation successful, an accurate attention to the local tones and tints is requisite. By local tones we understand the natural color of an object as it appears on the spot where it stands, or from the spot where the spectator is supposed to be stationed. In works of art the natural color of an object appears always as a local tone, because every object must be regarded from only one point of view, conformably to which the natural color is modified according to the supposed distance. By tints we understand, in a more restricted sense, the gradations of the clear and obscure which lights and shadows produce on the colored surface. In no object of art do these modifications and shades exist in greater delicacy and diversity than in the naked human body, which is consequently the most difficult subject for a painter. Coloring, in as far as it is an imitation of the color and character of flesh (the naked body), is called carnation (q.v.). If, in addition to the accurate coincidence of the natural colors, local tones, and tints of a painting with its original, the artist hits the expression of the peculiar character of the substance of which the object consists, the coloring is called true. But to truth should be joined beauty, which is attained by the harmonious union of all the tones of the painting into one leading tone. The coloring must conform to and promote the object of the painting as a work of art, and by the harmony of the colors and lights, as well as by the truth of the local colors, and of the individual parts of the subject, constitute one beautiful whole. In the choice of lights and the distribution of colors the artist should aim not only at clearness of representation, but at the same time at the production of a pleasing harmony, which should aid the general impression of the piece. Consequently harmony and chiaroscuro are comprehended in the idea of correct, beautiful coloring. We often see pictures in which the colors are true to nature, but which have little merit and are deficient in a harmonious union of excellences.

Coloring Matters. This name ought to include every substance, organic or inorganic, which is the cause of color in another, but in practice it is restricted to the natural coloring

matters of vegetables and animals, and to the dyes that are used for coloring fabrics. The reason of this restriction probably is that these coloring matters are distinctly different from the tissues or fluids which contain them, whereas the color of a mineral is not in general due to an isolable body, but is peculiar to the mineral itself. It is impossible, for instance, to take away the blue color of a copper compound, or the green or yellow of one of chromium. In the mineral world the analogy to the coloring of plants is found rather in rocks; for example, in a sandstone colored with oxide of iron, where the coloring matter may be removed without the rock mass being destroyed.

The organic coloring matters derived from vegetables are both important from their uses in the arts and interesting from their character and decompositions. They may be divided into two classes, those which exist ready formed in the plant, and those which are obtained by the spontaneous or artificial decomposition of some principle in the plant. Of those belonging to the first class, chlorophyll, the green coloring matter of the leaves, and the different colors in the flowers, are the most obvious. Those, however, which are used in the arts are not at first sight apparent, being contained in the seed, bark, stem, or roots, from which they can be extracted by water, alcohol, ether, dilute alkalies, etc. The second class includes bodies which result by oxidation or other chemical change from some usually colorless matters, to which the name "chromogens", color-producers, has been given; the question having been raised whether all coloring matters, even in plants, have not been produced from prior chromogens. The coloring matters have been subjected to investigation by numerous chemists, but, notwithstanding, very little is known about their real constitution. It is certain that many of the crude colors of commerce are mixtures, and it is highly probable that, when better known, their constituent principles will turn out to be diverse in constitution. Coloring matters are generally odorless, with a rough taste, soluble, some in water, others in alcohol. Indigo and alizarine can be sublimed, but most are decomposed by a slight elevation of temperature. They all consist of carbon, hydrogen, and oxygen, to which in some cases nitrogen is added. Some exhibit a weak acid tendency, combining with the oxides of lead, copper, and especially tin, iron, and aluminum, and forming insoluble colored compounds called "lakes." Some have the power of attaching themselves permanently to different vegetable and animal fibres, as silk, wool, cotton, and linen; others are unable to give a color which will not redissolve in water: in such cases the fibre is mordanted, that is, treated with one of the metallic oxides just mentioned, and then, when immersed in the color, the lake is precipitated in the fibre. The coloring matters are liable to change by exposure to daylight; they are also affected by a number of chemical reagents — certain blues, for example, are turned green by alkalies, and red by acids; they are destroyed by nitric acid, bleached by chlorine, decolorized, but not always permanently destroyed, by sulphurous acid, sulphuretted hydrogen, etc.

Of the coloring matters the yellows are the most abundant, and different varieties are got from different plants: fustic, turmeric, quercitron, Persian berries, morindin, saffron, arnotto, purree, chrysophanic acid, and others; of the blues, indigo and litmus are the most familiar; and of the reds and purples, madder, logwood, Brazil-wood, safflower, and a few more. Most of these colors require complicated operations to separate them in the pure state.

The only green coloring matter known, of no importance as a dye, but indispensable to the life of the plant, is chlorophyll. It was formerly supposed that this is a single substance which could be obtained from an alcoholic extract of leaves by adding lime, then decomposing the lime-chlorophyll compound with an acid, and agitating with ether, from which the chlorophyll was got by evaporation. But by another process it was found that it could be separated into two bodies, one yellow, the other blue; and by the application of the spectroscope, Stokes showed that chlorophyll contains four coloring matters, two yellow and two green, differing in optical properties. By further study in the same direction Mr. Sorby thinks he has proved that besides the greens there are four or five distinct yellow coloring matters, to which he has given special names. It is quite obvious, if this be so, that our knowledge of the nature of chlorophyll is just beginning, for each coloring matter will become an object of chemical and physiological investigation, and not till then will it be possible to say how chlorophyll acts in a plant. Experiments have been recently tried to elucidate more precisely the fading of chlorophyll when exposed to light, a change which is accompanied by altered spectrum bands, but in their present state they are too incomplete for description here.

The chief animal coloring matters are those of the blood, the bile, the urine, the retina, of the muscle and of the skin. The blood's coloring matter is the well-known hemoglobin, while the pigments of the bile, bilimbim, and its oxidation product, biliverdin, are derived from the blood pigments. Biliprasin and fuscin, bilicyanin, bilipurpurin, and bilixanthin, are other bile pigments. They may be regarded as various products of oxidation and reduction of the initial bile pigments. Urochrome is the general name applied to the urinary pigments. Its exact composition is by no means definitely understood. In the retina there are a number of pigments or chromophenes. They are mostly lipochromes, or fatty pigments, and have been named rhodophane, chlorophane, and xanthophane, these being red, green, and yellow respectively. There is a further black pigment in the eye, fuscin, allied to the melanins of the skin and hair. The muscle pigments are identical with the blood pigments. The skin pigments belong to a group known as the melanins. It is questioned whether these are iron pigments or not.

The artificial coloring matters may be divided into two classes, those which exist ready formed in nature, as many of the common red and brown paints, or which are formed by the mechanical mixture of such naturally existing colors, and those which do not exist in nature, but are produced by chemical operations. The latter are of mineral or of organic origin, examples of the first class being afforded by

Scheele's, Guignet's and other greens, artificial ultramarine, smalt, and many others, and of the latter by Prussian blue, and especially by the aniline colors. The artificial colors will be more particularly described in the articles DYEING and PIGMENTS; COAL-TAR COLORS.

Colors, in the army, the flags carried by each regiment. Each British regiment carries two colors, the royal or first color, and the regimental or second color; neither of these is now carried into battle. Each United States regiment carries the national color and the regimental color, the latter bearing the regiment's number; both are carried into action. In the navy the term colors is applied only to the national flag.

Colors. See COAL-TAR COLORS.

Colors of Thin Plates. See INTERFERENCE.

Colossæ, kō-lŏs'ē, an ancient city in Phrygia, situated on the Lycus, a branch of the Mæander. Colossæ had disappeared by the Middle Ages, and it is uncertain whether it was superseded by the town of Chonæ in its neighborhood, or whether Chonæ was Colossæ with only a change of name. It was first mentioned by Herodotus, Xerxes passed through it on his march to Sardis, 481 B.C., and it was a place of considerable mercantile importance in the time of Strabo. One of Paul's epistles was addressed to the Colossians, from which it is known that Colossæ was the site of one of the early Christian churches.

Colossal Cavern, The. A large cave discovered in 1895, the entrance to which is about one and a half miles distant from the entrance to the Mammoth Cave, of Kentucky. It was not explored to any great extent until 1898, nor has it yet been thoroughly explored; and no scientific investigation was made of the interior until 1903. On account of its immense size and the varied character of its formations, which are preserved in all their pristine beauty, the Colossal Cavern is a most worthy rival of the Mammoth Cave. The Louisville & Nashville Railroad Company purchased the Cavern in 1896. As exploration was pushed in various directions, the company acquired the land under which its course was found to run, and large sums have been expended in widening narrow passageways, smoothing rough places, building stairways where desirable for comfort, and doing many other things to make exploration easy. There are four separate entrances to the Cavern, only one of which (an artificial entrance) is used by visitors, and over 14,000 linear feet in distance have been surveyed. Among the many attractions of the Cavern are, Colossal Dome, 135 feet high, which is the most symmetrical as well as one of the largest domes known; Vaughn's Dome, 78 feet in height, which is approached through a magnificent canyon, about 300 feet in length; the Twin Pits, 65 feet deep; the Lover's Gallery, 400 feet long; the Ruins of Carthage, 400 feet long and 100 feet wide; Pearly Pool; Pulpit Rock; Dining Room, etc. Taken as a whole, Colossal Cavern presents to lovers of subterranean beauty and grandeur, a field which is perhaps unequaled by any other known cavern. The Cavern is readily and comfortably accessible by wagon from the terminus of the Mammoth Cave R.R.

HORACE C. HOVEY.

Colosseum. See COLISIUM.

Colossians, kō-lŏsh'ĭ-anz, **Epistle to the,** accredited to Paul the Apostle, written to the faithful of Colossæ, a city of Phrygia, near Laodicea. The epistle does not show that Paul had been in Colossæ or that he had, by word of mouth, preached the doctrines of Jesus Christ to the people of that city. There are good reasons to believe that Epaphras, a disciple of the apostles, preached to the Colossians and converted them. From the epistle itself (i. 7, 8,) it would seem that the disciple Epaphras was one of Paul's assistants, that he gave to this apostle accounts of his work, and that such accounts had been pleasing to Paul.

Some critics and commentators writing on this epistle, claim that it was written by Paul when he was in prison, in Rome (iv. 10), and that he wrote epistles, at the same time, to the Ephesians and Philippians. Others hold that the epistle to the faithful in Colossæ was written while he was in prison in Cæsarea.

The epistle contains a summary of Christian doctrine and practices, an arraignment of the sins of the time and the temptations by which the new-born Christians were beset, and a series of practical exhortations to the people of Colossæ in particular, but which are applicable to Christians in general. The epistle itself seems to show clearly that it was addressed to a body of Christians in union with all the other Christian Churches and bodies of the day. The sins and crimes which are mentioned indicate the time and locality where lived the people to whom the epistle was addressed.

A distinctive mark of the Christians was their method of prayer. They saluted each other in the name of Jesus Christ and expressed honor and respect for him, and thus made a prayer of the very beginning of their conversations, discourses, or writings (i. 2). They praised and adored God (i. 16–20), they petitioned Him and returned thanks for all things (i. 9, 12), and they offered the Lord Jesus Christ as atonement for all their wrong doings (i. 14, 21, 22). Several of the early Christian missionaries are mentioned; as Epaphras, Onesimus, Aristarchus, Mark, Barnabas, Luke, Demas, and Tychicus. The epistle must have been written in 62 or 63 A.D. The union among the Christians is shown by the remarks about the faithful in Laodicea and Hierapolis.

The faithful of Colossæ are warned lest any man cheat them or deceive them (ii. 8); they are told that Jesus Christ died for all (iii. 11), and they are given a code of morals and told their duty as Christians in general and as husbands, wives, children, masters, and servants.

Bibliography.— Köpper, Lightfoot, Oltramare, 'Commentaire sur les épitres de S. Paul aux Collossiens, aux Ephésiens et aux Philippiens'; Moffat, Fouard, 'Life of St. Paul.'

Colossus, kō-lŏs'ŭs, in sculpture, a statue of enormous magnitude, from which our adjective colossal is derived. The people of the East from the most ancient times have been celebrated for colossal sculpture. The pagodas of China and of India and the excavated caverns of the East abound with colossi of every description. The Asiatics, the Egyptians, and in particular, the Greeks, have excelled in these works. The celebrated colossus of Rhodes was reckoned one of the seven wonders of the world. It was raised by the Rhodians in honor of Apollo. Strabo, Pliny, and other ancient authors who

lived at the time that the colossus of Rhodes is said to have been in existence, have given its height at 70 cubits, or about 105 feet. Other authors who flourished since its destruction report its height at 80 cubits. The statue stood at the entrance of the harbor of Rhodes, but there is no authority for the statement that it bestrode the harbor mouth, and the Rhodian vessels could pass under its legs. Of other colossal statues of ancient times the most celebrated are the Olympian Zeus and the Athena of the Parthenon, both the work of Phidias. The virgin goddess was represented in a noble attitude, 26 cubits or 39 feet in height, erect, clothed in a tunic reaching to the feet. In her hand she brandished a spear, and at her feet lay her buckler and a dragon of admirable execution, supposed to represent Erichthonius. The statue of Zeus was 60 feet high. The earliest colossus recorded to have been sculptured in Rome was the statue of Jupiter Capitolinus, which Spurius Carvilius placed in the capitol after his victory over the Samnites. There has been dug up among the ruins of ancient Rome a colossal statue of the city of Rome, a personification reckoned among the tutelary divinities of the empire.

Among modern works of this nature are the colossus of San Carlo Borromeo at Arona in the Milanese territory; the four colossal statues at Paris in front of the façade of the palace of the Chamber of Deputies, representing four of the greatest French legislators; and a statue of Germania, 34 feet high, on a pedestal over 81 feet high, erected near Rüdesheim in commemoration of the unification of the German empire. In the United States a figure of "Liberty Enlightening the World," 151 feet high on a pedestal 155 feet high, has been erected in New York, overlooking the harbor and serving as a beacon. It was the work of the French sculptor Bartholdi, and was constructed mainly through the efforts of a French-American Union formed in 1874. In 1880 it was presented by France to the United States, and six years later it was placed on its present site, Bedlow's Island.

Col'peo, a species of fox-dog (*Canis magellanicus*) found in Patagonia and Tierra del Fuego. It is somewhat larger than the other South American fox-dog, and its fur is redder. See Fox-dog.

Col'quitt, Alfred Holt, American legislator: b. Walton County, Ga., 20 April 1824; d. Washington, D. C., 26 March 1894. He was graduated at the College of New Jersey in 1844, and settled in his native State as a lawyer. He served in the Mexican war, and was elected to Congress in 1852 as a Democrat. Upon the outbreak of the Civil War he entered the Confederate army as a captain. He was elected governor of Georgia in 1876 and United States senator in 1882 and in 1888.

Colquitt, Walter T., American lawyer: b. Halifax County, Va., 27 Dec. 1799; d. Macon, Ga., 7 May 1855. He was educated at Princeton, was admitted to the bar in 1820; became a district judge in 1826, holding the first court ever held in Columbus, Ga. He was a successful lawyer, and in criminal practice was without a rival in his State. He was a member of the Georgia State senate 1834, 1837; a representative in Congress 1839–43; a United States senator 1843–9; and a member of the Nashville Convention 1850.

Colt, Samuel, American inventor: b. Hartford, Conn., 19 July 1814; d. there 10 Jan. 1862. He had a common school education and was employed in his father's textile mill; but went to sea as a sailor when 15. His attention being drawn to firearms while at sea, he began to perfect a revolver and patented it in 1835. Its great success led to the erection by him at Hartford of one of the most extensive weapon factories in the world.

Col'ton, Arthur Willis, American writer: b. Washington, Conn., 22 May 1868. He graduated at Yale 1890, held the Foote scholarship there 1890–3, and was instructor in English literature 1893–5. He has of late devoted himself almost entirely to writing, and his stories have appeared in the 'Atlantic Monthly' (1899), 'Scribner's Magazine' (1899), and the 'Century' (1900). In book form he has published 'Bennie Ben Cree'; 'The Debatable Land' (1901); 'The Delectable Mountains' (1901); 'Tioba, and Other Tales' (1903).

Colton, Gardner Quincy, American scientist: b. Georgia, Vt., 7 Feb. 1814; d. Rotterdam, Holland, 11 Aug. 1898. He received a common school education and learned chair making, removing to New York in 1835, and taking up the study of medicine and science in 1842. Lecturing on chemistry and physics a few years later, accident led him to a discovery of the anæsthetic properties of nitrous oxide, or "laughing gas," credit for which is also given to Dr. Horace Wells. He perfected an electric motor in 1847, went to California in 1849, and resumed his scientific lectures in 1860. He later built up a large dental practice.

Colton, Julia M., American writer: b. New York. She was educated at Packer Collegiate Institute, and has contributed to 'St. Nicholas' and other magazines. She has written: 'Annals of Switzerland' (1897); 'Life of Velasquez' (1900); 'Annals of Old Manhattan, 1609–1664' (1902).

Colton, Walter, American writer: b. Rutland, Vt., 9 May 1797; d. Philadelphia, Pa., 22 Jan. 1851. He became professor of moral philosophy and belles-lettres at Middletown Academy, Conn. (1825); in 1828–30 was editor of the 'American Spectator,' Washington. In 1845 he went to California, and in Monterey established the first newspaper of the State, called the Californian. He wrote several books of interest, including 'Visit to Athens and Constantinople' (1836), and 'Three Years in California' (1850); 'The Sea and Sailor' (1851).

Colts'foot (*Tussilago farfara*), a herb of the thistle family (*Compositæ*). The name is derived from the shape of the leaf. The bell-shaped blossom is bright yellow. The plant is naturalized from Europe, and is found in moist soil and waste places from Nova Scotia through northern New England and New York to Minnesota. The leaves have been used, either as an infusion or smoked, as a cure for asthma. Sweet coltsfoot is a common name in America for several species of the genus *Petasites* of the *Compositæ*.

Coluber, kŏl'ū-bẽr. See Colubridæ.

Colubridæ, kō-lū'brĭ-dē, a family of snakes, typified by the limited genus *Coluber* of Linnæus, and itself typical of the sub-order or super-family *Colubroidea* or *Colubrina*. As used

by Cope the family contains non-venomous snakes only, but under Boulenger's system it embraces both the *Opisthoglypha* and *Proteroglypha*, which include the majority of poisonous snakes, especially those of the Old World, all, indeed, except the vipers and pit-vipers (qq.v.). Even in the limited sense, a vast majority of snakes, not less than 1,000 species, fall within the family. All are of relatively small size, only a few giants attaining a length of 10 feet and all have continuous rows of small teeth in both jaws, and none enlarged to serve as poison fangs. The head scales are large non-imbricate plates, but the body scales usually overlap, tile-like. They are oviparous or ovoviviparous, and feed on insects, small mammals, birds, etc., though a few, as the king-snake, habitually devour poisonous serpents. Most of them are terrestrial, but some are aquatic and others arboreal. Nearly cosmopolitan in their distribution, but very sensitive to the influence of cold, they are absent from the polar regions, and in temperate climes hibernate during the winter. Many species are found in North America. (See BLACKSNAKE; CORNSNAKE; GARTERSNAKE; PINESNAKE; WATERSNAKE; etc.) Consult: Cope, 'Scaled Reptiles of North America'; Boulenger, 'Catalogue of Snakes of the British Museum,' where full references will be found.

Col'ugo, kō-loo'gō, **Cobego,** kō-bā'gō, or **Kaguan,** kä'gwän, an East Indian insectivore of the typical genus of the family *Galeopithecidæ*, as yet imperfectly known. It is a slender creature about 18 inches long, its body covered with peculiarly sleek fur, and provided with a parachute of membrane furred on both sides, and extending from the neck nearly to the tip of the tail, by which it is enabled to make long sailing leaps like a flying-squirrel, a feature which gives it its technical name, *Galeopithicus volitans*. Like the bat, which the colugo resembles in various actions, it is a creature of twilight, hanging suspended by its hind legs, from branches during the glare of day, and seldom venturing forth in the complete darkness of night. It feeds upon leaves, fruit, and insects. Consult: Moseley, 'Notes by a Naturalist on H. M. S. Challenger'; Wallace, 'Malay Archipelago.'

Columba, kō-lŭm'ba, **Saint,** apostle of the Northern Picts of Caledonia and founder of numerous monasteries in the Hebrides and the Scottish mainland: b. 7 Dec. 521 in the territory of the Kinel-Conal, modern Donegal. He was a scion of the illustrious race of Conal, and was thus of kin to the northern princes of Ireland and of the Gælic princes of Scotland. Whether his name, or surname, Columba, is Latin or a Latin modification of a Gælic name cannot be determined; it appears also in the form Colm (whence the name Malcolm, servant or devotee of Columba); and the saint is also known as Columkillé (Columba of the churches, or *cellae*, the c in Gælic being equal to k), because of the great number of churches and monasteries he founded both in Ireland and in Scotland and the isles. He became a monk in his youth in the monastery of Moville in Donegal, and at the age of 30 was a priest. Among the monastic establishments founded by him in Ireland are those of Daire-Calgaich (Calgach's oak grove), the site of the famous city of Derry or Londonderry; and Dair-mach (oak of the plain) where now is Darrow. This was the greatest of all his Irish monasteries. It is worthy of note that after his migration to Scotland, he and his immediate successors in Iona exercised jurisdiction over these Irish monasteries. About the year 563, being then under excommunication for the part he had taken in the bloody battle of Cooldrevny, he set sail for North Britain with a band of his monks to preach the Christian religion to the still pagan Picts of northern Caledonia. He was entertained hospitably by his kinsman, Conal, king of the Scots in Argyll (Airer-Gædhill, land of the Gæl) who gave him for his residence the island in the Hebrides later called I, or Iona and I-Columkillé. Having established in Iona a monastery and training-school of missionaries, he crossed over to the country of the northern Picts — the southern Picts had already been converted to Christianity — and to them preached the gospel with such effect that their king Brude and the whole people embraced the faith. Before Columba's death all northern Caledonia was Christian and monasteries were very numerous whether on the mainland or in the islands. Iona was the mother house, and thence Columba and his successors, abbots of Iona, governed not only the monastic houses but the churches also; and though there were bishops for the special functions of the episcopate — the ordering of priests, for example, the administering of confirmation, the consecrating of churches, and the like — those bishops were subject to the authority of the abbot of Iona, though he was never more than a presbyter in ecclesiastical order. What time was at his disposal amid the many cares of his station, Columba devoted to study and to transcription of the Scriptures. On 8 June 597 he was employed in this labor, transcribing the psalm Benedicamus Domino (the 33d in the Septuagint and the Vulgate, but the 34th in the authorized English version); after penning the words "Inquirentes autem Dominum non minuentur omni bono" — they who seek the Lord shall want no manner of thing that is good. "Here," he said, "I must stop; what follows let Baithen write," and laid down the pen. At the midnight hour he was in choir for the office of Matins, having come to the church unaided and knelt at the altar; through sleep he in a few moments passed to death.

Columba, or **Columbà Noachi,** nō-ā'kī (Lat. "Noah's dove"), a small constellation of stars south of Lepus and Canis Major, about the time of whose discovery there are different statements. It is generally believed that it was discovered by Royer in 1679 or 1680. This is easily disproved by the fact, seldom noted, that Bayer in his 'Uranometria,' published in 1603, on the 37th map, just below Canis Major, pictures the dove flying with the olive-branch in its mouth. Dr. Gould states that it was mentioned by Petrus Plancius, an eminent Dutch geographer and teacher of Petrus Theodori. The latter died in 1596. The constellation is known to-day by the simple name of Columba, and is situated between Puppis, Pictor, Cælum, Lepus, and Canis Major.

Columbæ, kō-lŭm'bē, an order of birds, also when somewhat extended, called *Pullastræ*, placed next to the *Gallinæ* near the summit of the series of schizognathous birds. It contains

the various kinds of doves and pigeons. The order is not clearly circumscribed, but all typical forms may be distinguished from the *Gallinæ*, with which they have most in common, by the tumid membrane or cere into which the nostrils open at the base of the beak, and by their feet. Their toes are four, namely, three before and one behind, the former not or very slightly united toward their base by a membrane; the hallux is well developed and on the same level as the other toes. The species are monogamous, and pair for life; lay generally but two eggs for a brood, but breed often, and feed their young with macerated food from their own crops. The young at birth are helpless and naked. Upward of 500 species of pigeons have been described from all parts of the world, including many strange forms. Three sub-orders, the *Didi, Pterocletes,* and *Peristeræ* are recognized. The first includes only the extinct dodo, family *Dididæ;* the second the *Pteroclidæ,* or sand-grouse, so called, of Asia and Africa; the third the families *Didunculidæ,* or tooth-billed pigeon, of the Samoan Islands; *Tieronidæ,* or fruit-eating tree-pigeons of the Australian and Malayan regions; *Calœnadidæ,* or bony-gizzard pigeon of the Indian Archipelago; *Gouridæ,* or crowned pigeons of New Guinea; and finally the *Columbidæ* or true pigeons and doves, cosmopolitan group, and the only family represented in North America. Consult: Salvadori, 'Catalogue of Pigeons of the British Museum.'

Columbanus, kŏl-ŭm-bā'nŭs, missionary and founder of a monastic order, that of the Columban monks, was born in Ireland about 545; died in his monastery of Bobbio, in the Apennines, Italy, 21 Nov. 615. The order founded by him, was for a while hardly inferior to the order of St. Benedict in number of monasteries or in the services it rendered to the Church. He was an alumnus of the great monastery of Benchor or Bangor, in Ulster, and thence in his 45th year he went to France as a missioner, accompanied by 12 young disciples. In France he founded the monasteries of Luxeuil and Fontenay, giving to the monks a rule identical with that of the Celtic monasteries of Ireland. He gave offense to the French bishops by the fashion of his tonsure and by his observance of Easter in accordance with the calculation of the eastern churches. And his apostolic outspokenness in rebuking the vices of the Burgundian court, the king (Thierry II.) and the queen mother (Brunchant) led to his expulsion from that country. He now decided to cross the Alps and labor as a missionary in Italy. On his route thither he tarried a while among the Swiss, preaching the gospel on the shore of Lake Constance. One of his 12 companions, named Gallus, falling sick, was left behind when the missionary party resumed their travel: this Gallus afterward laid the foundations in Switzerland of a monastic institute which later was called by his name, St. Gall (Sankt Gallen) and which was one of the notable centres of monasticism in Europe. Columbanus, in 612, founded the great monastery of Bobbio in the Apennines, giving to the monks of that house, which soon was recognized as the mother-house of a multitude of abbeys and monasteries, a rule of great austerity. The keynote of it is implicit, unquestioning obedience in all things to the abbot or superior. It prescribes perpetual silence save where speech is absolutely necessary. The use of animal food of all sorts is interdicted. The monks are allowed one meal daily, taken at eventide, and it consists of vegetables and bread. The monks of his monasteries, called Columbans, came under the Benedictine rule in the 8th century and the Columban order was merged in the Benedictine. Columbanus was a man of learning, acquainted not only with the Latin language current in his time, but with the classic Latin authors, as also with the Hebrew and Greek languages. He left a few writings, all in Latin; they have all been published more than once. They comprise his Monastic Rule (Regula Cœnobialis); a few poems of considerable merit; 16 brief sermons, and several letters of value for ecclesiastical history. A town in Lombardy, San Colombiano, perpetuates the memory of this Celtic missionary to Italy.

Colum'bia, the popular name of the United States; derived from Columbus, and applied to the greatest nation of the New World from a feeling of poetic justice to the memory of its great discoverer.

Columbia, British. See BRITISH COLUMBIA.

Columbia, District of. See DISTRICT OF COLUMBIA.

Columbia, Mo., a city and county-seat of Boone County, situated 10 miles north of the Missouri River, on the Wabash R.R. It was first settled in 1815 by Kentuckians and is governed by a mayor and a council of eight members, who are elected semi-annually. The city has four banks with a combined capital of $370,000. Columbia has many public and educational institutions, including Missouri University, Missouri State Farm and Experiment Station, Parker Memorial Hospital, Stephens Baptist College for Women, Christian College for Women, Columbia Normal Academy, Columbia Business College, University Military Academy, and High School. Pop. (1904) 6,000.

Columbia, Pa., borough, in Lancaster County; on the Susquehanna River, and on the Pennsylvania and the Philadelphia & Reading R.R.'s; about 26 miles southeast of Harrisburg. The place, originally called Wright's Ferry, was founded in 1726 by Quakers from Chester County. Columbia was one of the places proposed, in 1789, for the capital of the United States. The bridge, which connected Columbia with Wrightville, was burned in 1863, to prevent the Confederate forces from proceeding to Philadelphia. A fine bridge has taken the place of the old one. Columbia is an industrial and trade centre of considerable importance. The chief manufactures are foundry and machine-shop products, boilers and engines, flour, beer, wagons, shirts, silk, lace, and lumber. Pop. (1890) 10,199; (1900) 12,316.

Columbia, S. C., the State capital, and county-seat of Richland County, situated in the centre of the State, on the east bank of the Congaree River, at the head of navigation, two miles below the junction of the Broad and Saluda. It is on the Atlantic Coast Line, the Seaboard Air Line, the Southern, and the Columbia, N. & L. R.R.'s, 129 miles northwest

of Charleston, 82 miles northeast of Augusta, Ga., and 153 miles north of Savannah.

Columbia is one of the handsomest cities of its size in the country, and in a district noted for sanitariums. It is built on a sand-hill plateau which forms a bluff 100 feet high at the river, and sloping away on all sides, giving excellent drainage. The streets which are 100 feet wide are at right angles to each other, and there are four avenues 150 feet wide radiating from the capitol. All the chief streets are boulevards, with handsome shade-trees not only along the sides but in the centre. There is also a fine park. The business buildings are rapidly increasing in size and architectural beauty. The granite State-house, costing $4,000,000 and modeled on the capitol at Washington, is one of the most imposing in the South and one of the handsomest in the country. Spacious grounds surround the capitol, and among the city's attractions are the monuments, which include a "Palmetto Tree" in bronze. The executive mansion, the government building, the county court-house, the city hall, the State insane asylum and State penitentiary are also noteworthy. The city is rich for its size in important educational institutions: South Carolina College, founded 1801; the Presbyterian Theological Seminary, also very old; Columbia Female College (Methodist Episcopal Church South), founded 1859; Allen University (African Methodist Episcopal), 1881; the College for Women (Presbyterian) 1890; and Benedict College (colored). It has also a well-attended public-school system, and two high schools.

Municipal Conditions.— The principal streets are asphalt; the roads are chiefly of sand and clay and are excellent. The city owns its waterworks, and has gas, electric light and power, and an electric railway system. The government is by the revised charter of 1894, with a two-years' mayor, and a council which has nearly all the appointing power.

Business Interests.— The city affords one of the most remarkable instances of manufacturing development in the country. It is in the heart of a fertile cotton district, and near forests of pine, oak, walnut, and maple; but its site is the key to an important future. A rocky shelf projecting for four miles from the junction of the Broad and Saluda forms the bed of the Congaree, 500 feet wide, which plunges down it in rapids, affording immense power, which is made available by a canal 2⅞ miles long, 110 feet wide at bottom and 150 at top, with 31 feet fall, furnishing 14,000 horse-power, and operating dynamos which create electricity for manufacturing power, light, and street railways. But the greatest establishments are independent of this except as a resource, using steam dynamos, — for all Columbia's industries are run by electricity. In 1892, there was one cotton mill in the city employing 125 men. Now the great Whaley system of cotton mills includes four in Columbia, with 197,000 spindles, 4,840 looms, and $3,100,000 invested capital. The Olympia mill, with nine to ten acres of floor space, and over 100,000 spindles, is the largest in the world operating under one roof; the Granby and Richland are also large and well-equipped mills; and the three, owned by one company and employing almost 3,000 hands, are the nucleus of a large village of 500 acres owned by the company, with sewerage, fire department, electric street lighting, cottages wired and plumbed, churches, schools, etc. The Columbia Mills Company is also a great organization, capitalized at $1,500,000, and turning out over 20,000 bales of cotton duck a year. Besides this predominant industry, there are growing hosiery works, glass works which utilize the fine sand found nearby, four quarries of fine granite, large lumber works starting up, and small miscellaneous industries. The vast beds of kaolin in the vicinity now supply outside potteries, but local works are contemplated. The rock ledge before mentioned extends two miles below the city with only four feet of water over it, dropping off to ten feet or more at Granby. Deep water is now to be brought up to Columbia, not by dredging, but by a floating dam 15 feet high, costing $250,000, which will enable vessels of ten feet draft to come up to the city, instead of unloading and trucking up from Granby as heretofore. Two steel steamers run from Granby to Georgetown, which will start from Columbia when the dam is completed, and ultimately go to Charleston. This improvement makes Columbia the great distributing point for central and northern South Carolina.

History.— The town was settled about 1700, but remained farm land till 1786, when the people of the State demanded a capital more centrally located than Charleston, and Columbia village was laid out. The legislature first met there in 1790. In the Civil War it shared the general fortunes of the State, till Sherman's army entered it 17 Feb. 1865. The following night a fire broke out which lasted all the next day and laid over half the city in ashes, including a number of business blocks, private residences, schools, the railroad station, several churches, and a convent, and destroyed a great quantity of cotton. Its development since is part of the general industrial awakening of the South. Pop. (1860) 8,052; (1870), 9,298; (1880) 10,036; (1890) 15,353; (1900) 21,108, of which 11,244 were white. Several mill villages, chiefly that of the Whaley mills, with several thousand inhabitants, are outside the old city limits though close by, and 35,000 is a reasonable estimate of the population including these suburbs.

Columbia, Tenn., county-seat of Maury County, situated on the Duck River, and on the Louisville & N. and the Nashville, C. & St. L. R.R.'s. It is the trade centre of a fertile agricultural region, and has a stock yard, a grain elevator, and cotton and flouring mills. It is the seat of Jackson College and two seminaries for young women. It also has a United States arsenal. Pop. (1900) 6,052.

Columbia City, Ind., the county-seat of Whitley County, in the northeastern part of the State, situated on Blue Creek and on the Wabash and on the Pittsburg, Ft. W. & Ch. R.R.'s. It has lumber mills and a few other manufacturing interests. Pop. (1900) 2,975.

Columbia or **Oregon River,** after the Yukon the largest river on the western side of America; it rises in British Columbia, on the west slope of the Rocky Mountains, near Mounts Brown and Hooker, in about lat. 50° N.; has a very irregular course, generally southwest through Washington; forms the northern boundary of Oregon for about 350 miles; and enters

the Pacific by an estuary 35 miles long and from three to seven wide. Its estimated length is 1,400 miles. The area drained by this stream and its tributaries, of which the largest are Clarke's Fork and the Snake River (with very remarkable cañons), has been computed at 298,000 square miles. The river is broken by falls and rapids into separate portions, and formerly a bar across its mouth obstructed navigation. The construction of a jetty has provided a good harbor; and in Nov. 1896 the Government completed a canal and locks at the Cascades, at an expense of nearly $4,000,000, and navigation is (1904) open to The Dalles. The Government is about to begin work to overcome the obstructions at The Dalles. The Columbia and its branches have 2,132 miles of navigable waters. The extraordinarily abundant salmon-fisheries have been largely developed. There are a number of canneries near the mouth of the river; the annual export of canned salmon exceeds 500,000 cans. Captain Gray of Boston was the first modern navigator to enter the river in 1792; and it was explored in 1894 by Lewis and Clarke.

Columbia Salmon. See QUINNAT.

Columbia University, a seat of learning in New York. The design of establishing a college in New York was more than 50 years in contemplation before it was carried into effect. In 1746 provision was made by law for raising money by public lotteries. Five years later the proceeds of these lotteries amounted to about $1,700 and were given to trustees. The fact that two thirds of these trustees were in communion with the Church of England, and that some of them were vestrymen of Trinity Church excited opposition to the proposal as a scheme to strengthen the Established Church and delayed the procurement of a royal charter. Friends of the enterprise proceeded, however, with the arrangement for opening the college and elected for their first president the Rev. Dr. Samuel Johnson, of Stratford, Conn., who assumed the office 17 July 1754, in the school house belonging to Trinity Church. There was a class of eight students.

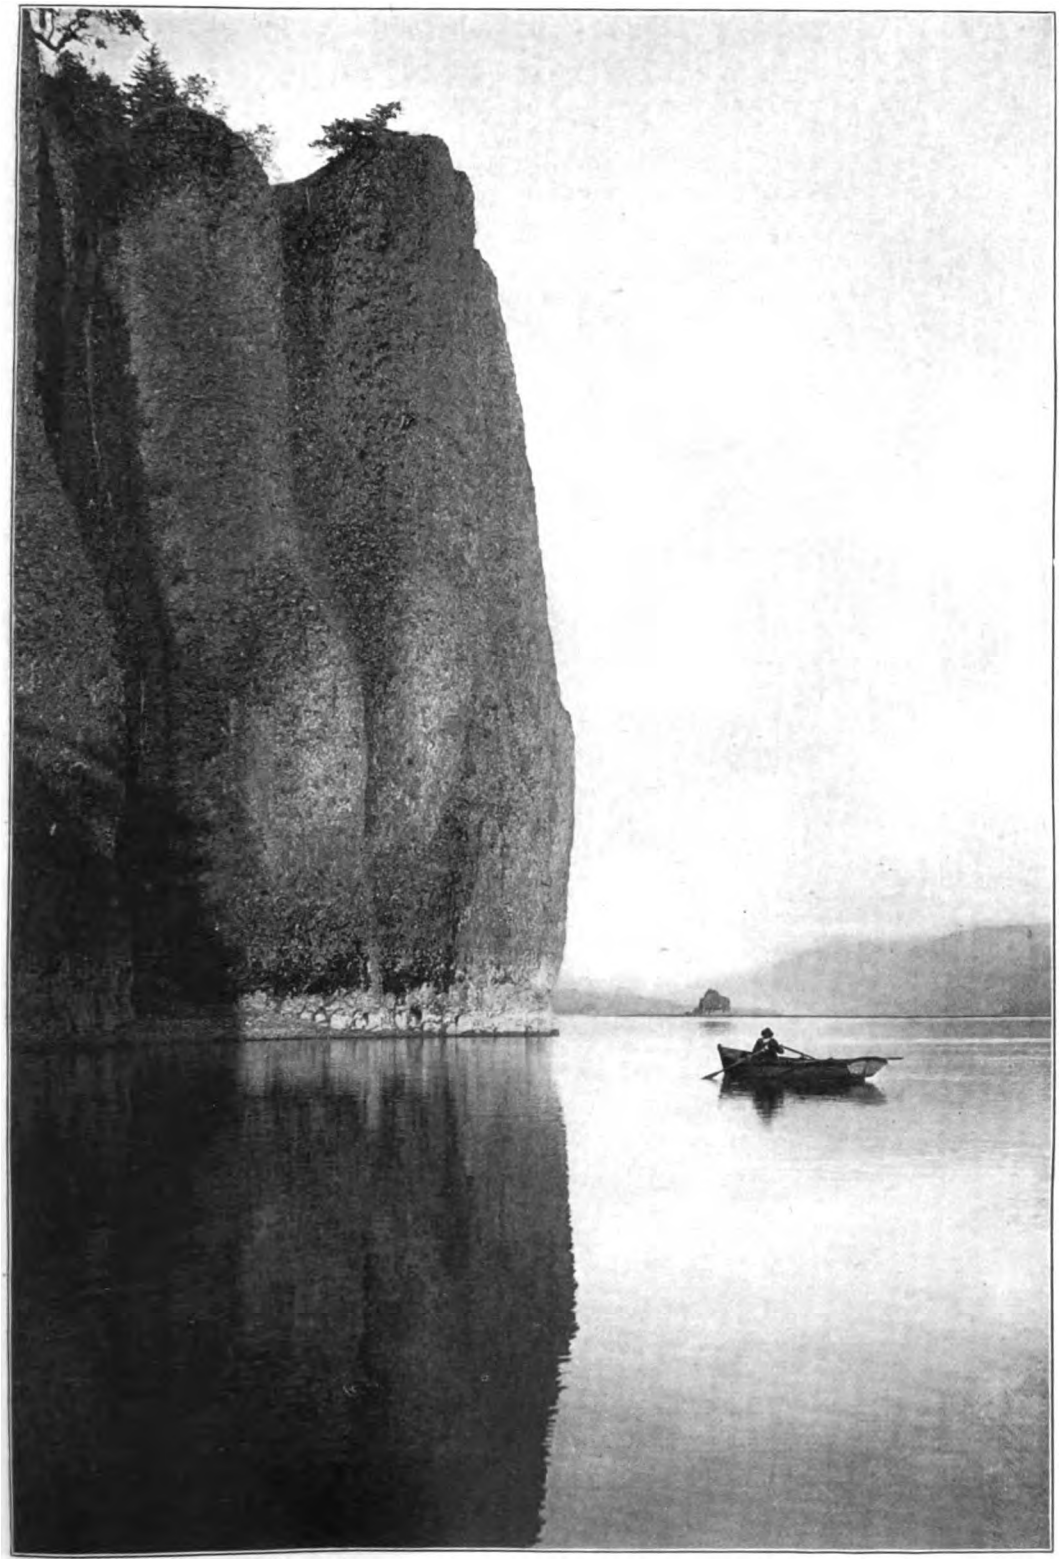
The cosmopolitan character of the governing body of the college is due to its charter. To meet the objections that had been made, it was so drawn as to include in its board of governors, besides other ex-officio representatives, not only the rector of Trinity Church, but the senior minister of the Reformed Protestant Dutch, Ancient Lutheran, French, and Presbyterian churches. It is probably due to this circumstance that Columbia almost alone of all the pre-Revolutionary colleges in the United States has never had a theological faculty connected with it. The trustees, at present, are members of the Episcopal Church, and also of the Reformed, Presbyterian, and Roman Catholic churches, showing that this cosmopolitan character has never been lost. A prominent Hebrew rabbi was at one time a member of its councils.

The charter of King's College, the original name of Columbia, was granted by George II., and finally passed the seals on 31 Oct. 1754, from which day the college dates its existence. It received from Trinity Church, according to a promise previously given, a portion of a grant of land known as "the King's Farm," upon the site of which its first building was erected. It was stipulated in the royal charter that its president should be a communicant of the Episcopal Church and that proper selections from the liturgy of that Church should be used in the religious services of the college. This caused much angry controversy, and after the Revolution it was stricken out of the charter, but remains as the condition of the deed of gift from Trinity Church. King's College played a conspicuous part in securing and confirming the independence of the United States. The Revolutionary War caused a suspension of the activities of the college, and in 1776 the college building was used as a military hospital. After eight years the college work was resumed by act of the legislature, 1 May 1784, under the name of Columbia College.

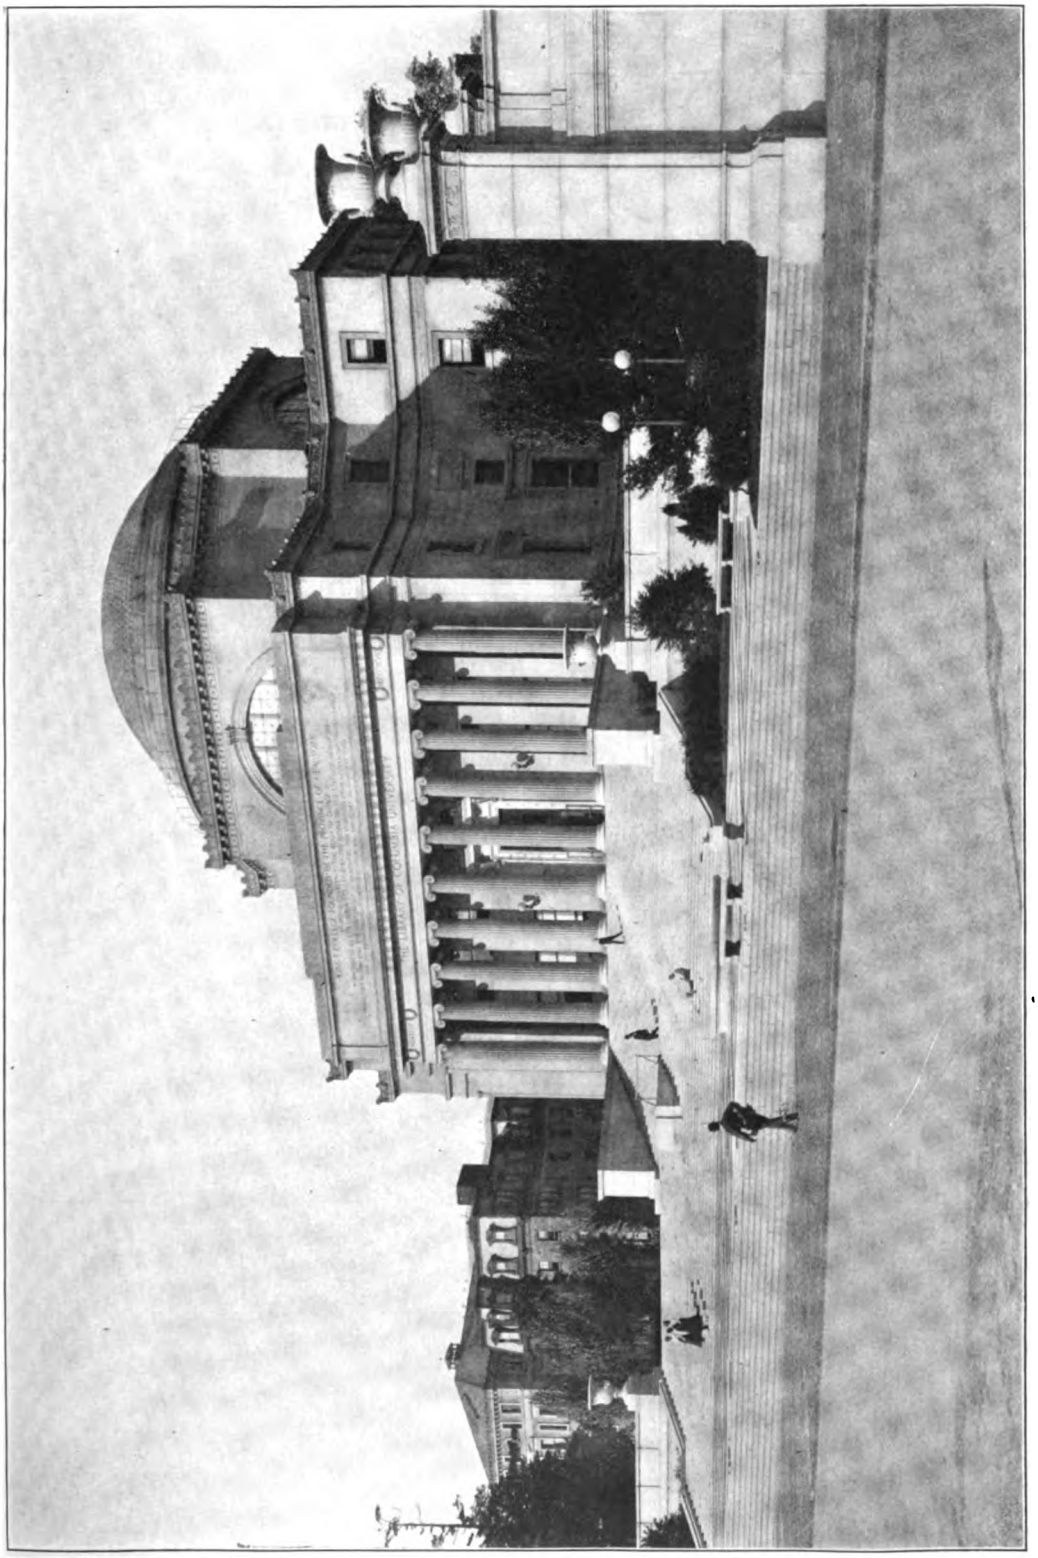
On 13 April 1787 the legislature revived the original charter with amendments, which abolished ex-officio membership of its governing body, canceled the requirement that the president should hold a certain form of religious belief or that a certain form of prayer should be used in the services of the college, and named a body of 29 trustees, which, when reduced to 24 members, was made a self-perpetuating body, under which government the college has remained. The medical faculty was organized in 1792 and a professorship of law was established in 1793.

The original site of the college was in what became later the block bounded by College Place, Barclay, Church, and Murray streets. In 1857 the college was moved to 49th and 50th streets and Madison Avenue, where it remained until 1897. In 1892, for $2,000,000, purchase was made of 17½ acres of land lying between 116th and 120th streets, Amsterdam Avenue, and the boulevard. Here in 1897 the college was reorganized on the basis of a university.

Columbia University, in a technical sense, consists of the faculty of law, the first professor of which (1792), James Kent, during the period of his second appointment in 1823 delivered the courses of lectures which developed into the first two volumes of his famous 'Commentaries'; the faculties of medicine; philosophy, political science; pure science; and applied science. The College of Physicians and Surgeons, the outcome of the medical faculty, established in King's College in 1767, became in June 1860, the Medical College of Columbia. In 1891 it surrendered its separate charter and became an integral part of Columbia College. A peculiarity of the Columbia organization is the system by which seniors in Columbia College, who have entered the college not later than the beginning of the junior year, are allowed to select part or all of the courses necessary for the bachelor's degree from among those designated by the university faculties, professional or non-professional, as open to them. The object of this arrangement is to shorten the time necessary to the attainment of the higher, particularly of the professional, degrees. The degree of master of laws is conferred for advanced work in law done under the faculties of law and political science together. The faculties of law, medicine, and applied science, conduct respectively the schools of law, medicine, and mines, chemistry, engineering, and architecture, to which



CAPE HORN.



LIBRARY BUILDING.

students are admitted as candidates for professional degrees on terms prescribed by the faculties concerned. The school of mines was due to the exertions of Thomas Egleston, who was made professor of mineralogy and metallurgy in 1864, and who opened the school of mines the same year in the basement of the old college building in 49th Street. There is also the school of chemistry, engineering, and architecture, set off from the school of mines in 1896. Out of the school of mines grew the school of pure science, established in 1892. Under President Barnard's influence, in April 1889, the trustees gave their official approval to the plan for founding Barnard College for women studying for Columbia degrees. It is financially a separate corporation, but educationally it is part of the system of the university. Teachers' College, a professional school for teachers, is also financially a separate corporation and educationally a part of the university. It was founded in 1888, chartered in 1889, and included in the university in 1898. (See COLLEGES FOR TEACHERS.) Some of these courses are accepted by Columbia University, and may be taken without extra charge, by students of the university in partial fulfillment of the requirements for the degrees of bachelor of arts, master of arts, and doctor of philosophy. In 1902–3 the university had a total of 5,134 students in all departments, and its library comprised 330,000 bound volumes. The new library building is a gift from ex-President Low, and cost over $1,000,000; in 1903 the university received a gift of $300,000 from Marcellus Hartley Dodge and Mrs. Helen Hartley Jenkins for the erection of a new dormitory. In the same year the trustees voted to purchase the South Field, a tract of land lying directly south of the university campus.

The presidents of the university have been: Samuel Johnson (1754–63); Myles Cooper (1763–75); the Rev. Benjamin Moore (1775–6); William S. Johnson (1787–1800); Charles H. Wharton (1801); the Rt. Rev. Benjamin M. Moore (1801–11); William Harris (1811–29); William A. Duer (1829–42); Nathaniel Moore (1842–9); Charles King (1849–64); Frederick A. P. Barnard (1864–89); Henry Drisler, acting (1888–90); Seth Low (1890–1901); and Nicholas Murray Butler (inaugurated 1902).

SETH LOW,
Ex-President Columbia University.

Columbiad, a poem by Joel Barlow (q.v.) published in 1807. It is an enlarged edition of his 'Vision of Columbus' (1787), and was very popular when first published.

Columbian Catholic Summer School. See SUMMER SCHOOLS.

Columbian Formation, a series of gravels, sands, and clays of Pleistocene age covering the coastal plain of the Atlantic slope from New Jersey southward, and typically developed in the District of Columbia. The formation in the north covers the plain up to elevations of 400 feet, and in the south up to 100 feet. It includes estuarine and delta deposits, and the fossils are recent marine species, indicating a submergence and re-elevation of the coast. The formation may correspond to the Champlain stage of the glaciated portion of the continent. See CHAMPLAIN STAGE; GLACIAL PERIOD.

Columbian World's Fair. See WORLD'S COLUMBIAN EXPOSITION.

Columbian University, a coeducational institution in Washington, D. C., organized in 1821 under the auspices of the Baptist Church. For several years it was Columbian College, but in 1873 it enlarged its courses of study and became a university. During the Civil War the buildings were used, for a time, as a hospital. Mr. W. W. Corcoran gave a generous gift to the school which has been used to endow the «Corcoran Scientific School.» Professors and instructors in the university (1903) 175; pupils, 1,400; volumes in the library, 15,000; grounds and buildings valued at $1,200,000.

Columbidæ, kō-lŭm'bĭ-dē, the family of true pigeons, the typical one of the order *Columbæ,* of which it embraces the bulk of the known species, more than 400 belonging to this family. Over half of them are found in the Malayan and Austro-Malayan Archipelago, and 75 in South and Central America, while all other parts of the world, except the polar regions, have their representative species in smaller numbers. Although our native species give but a faint idea of the richness of color and other peculiarities of adornment of the tropical pigeons, the structural features are remarkably constant and well exemplified in the domestic pigeon. The bill is moderate and compressed, having at its base a soft skin in which the nostrils are placed. The feet have three divided toes before and one behind, all of which are on the same level; the tarsi scutellate. The wings are rather long and exceptionally powerful; the plumage generally compact, and the feathers without aftershafts. One of the most variable features is the tail, which may be short and square or long and pointed, and its rectrices from 12 to 16. Although classed by Cuvier with the gallinaceous birds, the *Columbidæ* differ from them in structure and especially in habits, being monogamous and good flyers. Besides they are unlike the domestic fowl which is the type of the *Gallinæ,* in that the males assist in nest-building and incubation, and the young are not able to walk, and are nourished by the parent birds, which secrete in the double crop a milky fluid utilized to soften their food. Moreover the *Columbidæ* drink at a single draught. They eat seeds and berries, more rarely insects. See DOVE; PASSENGER PIGEON; PIGEON; etc.

Col'umbine, a popular name for *Aquilegia vulgaris* or other species of the genus *Aquilegia.* The common columbine has drooping purplish-blue flowers with five flat sepals; five petals, with long spurs, often curved; five follicles, the root-leaves twice or thrice ternate, the others singly ternate. The claim of the columbine to become the national flower of the United States has been pressed since 1896 by the Columbine Association with offices in Boston. This association urges that the flower is wild and commonly diffused, that it has decorative value, that its common name symbolizes the dove of peace and suggests Columbus, the discoverer; that its Latin name hints at the eagle of power, that the form of the short-spurred variety is strikingly like the Liberty Cap, and that its compound leaf exemplifies the Federal motto *E pluribus unum.*

Colum'bite, a mineral of variable composition, consisting of a compound niobate (columbate) and tantalate of iron and manganese. When niobium is present in large amount relatively to the tantalum, the mineral is called "columbite," and when the reverse is the case, it is called "tantalite"; the two minerals passing into each other, in nature, by insensible gradations. Typical columbite has a hardness of 6, and a specific gravity of from 5.4 to 5.8, the specific gravity increasing with the proportion of tantalum present. The crystals are short and prismatic, often tabular, and belong to the orthorhombic system. The mineral is black or brownish-black in color, and is often iridescent. In the United States columbite is known to occur in most of the States lying near the Appalachian Mountain system, and also in Colorado, South Dakota, and California. One crystalline mass of it, found in the Black Hills region, is said to have weighed about a ton. The existence of columbite in the United States was first made known through a specimen sent by Gov. Winthrop of Connecticut to Sir Hans Sloane, president of the Royal Society of Great Britain.

Colum'bium, a metallic element, better known as niobium (q.v.).

Columbo, the root of a climbing plant, *Jateorrhiza Columbo,* which grows in great profusion in the island of Mozambique. It is also called calumba. The root, sliced transversely into disks, is dried and is used in medicine in the form of an infusion as an appetizer and tonic. It contains a bitter alkaloid *berberine,* and another bitter principle *columbin.* It is free from tannic acid, so, unlike most bitters, it may be mixed with the preparations of iron. It was formerly employed for diarrhœa, dysentery, and gas in the bowels, being carried to India, whence it is exported.

Columbus, Bartholomew (Sp. Bartolomeo Colon; It. Bartolommeo Colombo, his real name), Italian navigator, brother of Christopher Columbus: b. Genoa about 1432; d. San Domingo May 1515. The events of his early years are not on record. In 1470 we find him established at Lisbon as a mariner and constructor of maps — one of those adventurous navigators whom the patronage of the Portuguese princes had drawn to their capital. About 1486 he visited the Cape of Good Hope, probably with Barthelemi Diaz. It is not know how long he was absent when his brother sent him to England to seek the aid of Henry VII., but it appears certain that Christopher was ignorant of his fate, further than that he was captured by pirates. He did, however, attain the ear of the English monarch, and presented him with a map of the world, but it does not appear that he succeeded in securing English aid. On his return through France, he learned that his brother had already discovered the new world, and had sailed on a second voyage. Hastening to the Spanish court, he was received as became the brother of the admiral. Queen Isabella sent him in command of three store ships to the new colony of Hispaniola, where Christopher received him with joy, and appointed him adelantado or lieutenant-governor of the Indies. In this position Bartolommeo showed great bravery and decision. He shared his brother's imprisonment, and with him was liberated on reaching Spain, where the Spanish monarchs confirmed his title, and gave him the lordship of the small island of Mona near St. Domingo, with 200 Indians as his personal body-guard. The fierce energy of his character, however, made them jealous of giving him too much latitude in public affairs. He died without issue.

Columbus, Christopher (Sp. Christobal Colon; It. Cristoforo Colombo, his real name), Italian navigator, the discoverer of America: b. Genoa probably 1446; d. Valladolid, Spain, 20 or 21 May 1506. His father, Domenico Colombo, a poor wool-comber, gave him a careful education. He soon evinced a strong passion for geographical knowledge, and an irresistible inclination for the sea. The details of his early life are confused and unsatisfactory. He appears to have gone to sea at an early age, and to have navigated all parts of the Mediterranean and some of the coasts beyond the Strait of Gibraltar. In 1470 we find him at Lisbon, where he married the daughter of Bartolommeo de Palestrello, a distinguished navigator, who had founded a colony in Porto Santo, an island recently discovered and belonging to the Madeira group, and had left many charts and nautical instruments. Columbus made use of these materials, and his opinion that the other side of the globe contained land, belonging to eastern Asia and connected with India, which was, as yet, little known, became more and more fixed. While the Portuguese were seeking to reach India by a southeast course round Africa, he was convinced that there must be a shorter way by the west. He applied in vain to Genoa for assistance, and equally fruitless were his endeavors to interest John II. of Portugal in the enterprise. He also sent letters on the subject to Henry VII. of England, with the same ill success. He then determined to apply to the Spanish court, Ferdinand and Isabella being at this time the sovereigns of Spain, and after an eight years' struggle with the obstacles thrown in his way by ignorance and malice, he received three small vessels. These were named the Pinta, the Niña, and the Santa Maria; and according to Jal each of them was fully decked and had four masts and a crew of 90 men. The dignity of high-admiral and viceroy of all the countries he might discover was conferred on him, the former to be hereditary in his family. A certain share of the profits was secured to him by a written contract with the sovereigns.

It was early in the morning of Friday, on 3 Aug. 1492, that Columbus set sail from the port of Palos. Eighteen years had elapsed since he had first conceived the idea of this enterprise. The most of that time had been passed in almost hopeless solicitation, amidst poverty, neglect, and ridicule; the prime of his life wasted in the struggle. Nor should it be forgotten that it was to Isabella alone that he was finally indebted for the means of executing his project, which had been coldly rejected by the prudent Ferdinand. Having provided himself at the Canary Islands with fresh water, he sailed southwest into an ocean never before navigated. But when 21 days had elapsed without the sight of any land, the courage of his men began to sink. It was certain, they said, that they should perish, and their visionary commander ought to be forced to return. Some of them even proposed to throw him overboard; and Columbus had to exert all the powers of his daring and

commanding spirit to prevent an open rebellion. A phenomenon, which surprised even him, filled his pilots with consternation: the needle deviated a whole degree. But the sea appeared suddenly covered with grass, and again showed symptoms of shoals and rocks. Numbers of birds were also seen. Columbus sailed in the direction from which they flew. For some days the voyage was continued with revived courage, until at last the dissatisfaction of the crews began to break out into open violence; but Columbus, after endeavoring in vain to pacify his men by promises, finally assumed a different tone, and told them it was useless to murmur; that he was determined to persevere. Fully convinced that he must be near the land, he promised a reward to whosoever should first discover it. On the night of 11 and 12 October Columbus himself descried a light which sometimes flickered in the distance and sometimes disappeared, and at two o'clock on the morning of the 12th a cannon shot from the Pinta announced that a sailor belonging to that vessel had discovered land.

It was the island of Guanahani, which Columbus believed to belong to eastern Asia and to be connected with India, a belief which he carried with him to his grave. Hence the mistaken names of Indians applied to the natives of America, and that of West Indies applied to the group of islands of which Guanahani forms one. On landing Columbus threw himself upon his knees and kissed the earth, returning thanks to God. The natives collected round him in silent astonishment, and his men, ashamed of their disobedience and distrust, threw themselves at his feet, begging his forgiveness. Columbus, drawing his sword, planted the royal standard, and in the name of his sovereigns took possession of the country, which, in memory of his preservation, he called Saint Salvador. He then received the homage of his followers, as admiral and viceroy, and representative of the sovereigns. Being informed by the natives that there was a rich gold country toward the south, Columbus directed his course toward that region, and reached Cuba on 28 October, and Española (Hispaniola, Hayti), on 6 December; but as one of his vessels was wrecked, and the other separated from him, he resolved to carry the news of his success to Spain. Having built a wooden fort from the wreck of his vessel, he left in it 39 volunteers, and set out on his return, 4 Jan. 1493. The day after he left the island he met the Pinta, which had been missing. Both vessels were afterward nearly wrecked in a tremendous storm. Columbus, more interested for his discovery than for himself wrote an account of his voyage on a piece of parchment, which he secured in a cask, and threw the whole overboard, in the hope that it might be carried ashore. He had hardly finished his work when the gale subsided. On 15 March he re-entered the port of Palos amid the acclamations of the people, the thunder of cannon, and the ringing of bells. He hastened immediately to Barcelona, where the court then was, and entered the city in a triumphal procession, with the productions of the newly discovered countries carried before him. A chair was placed for him next to the throne, and, seating himself, he gave an account of his discoveries. He was created a grandee, and all the marks of royal favor were lavished upon him.

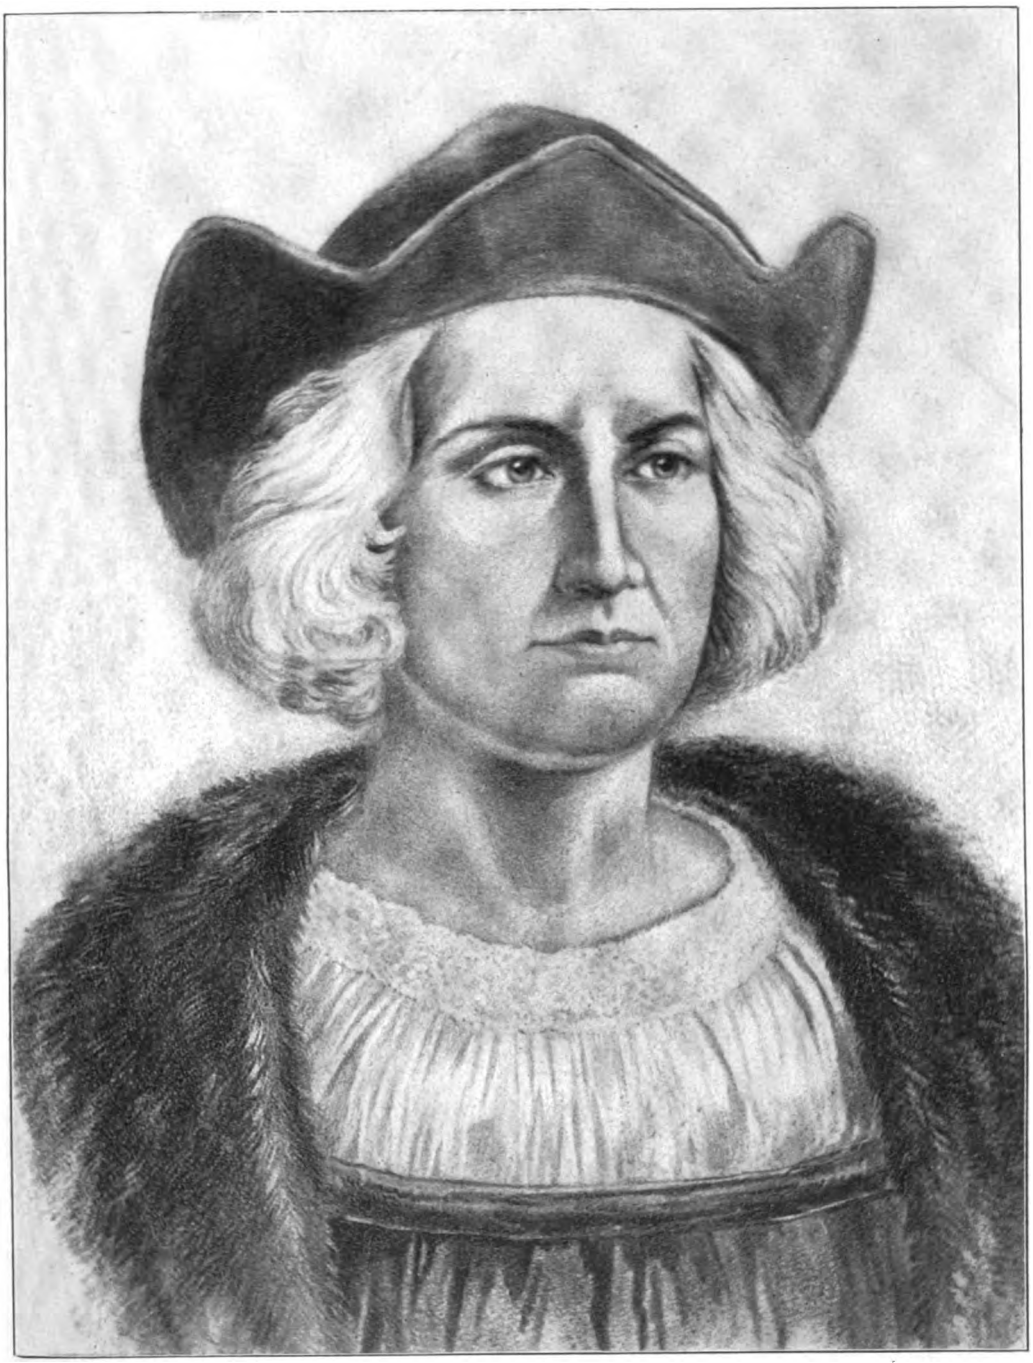
On 25 Sept. 1493, he set sail from Cadiz with 3 large ships of heavy burden and 14 caravels, carrying 1,500 men. On 3 November he discovered the island of Dominica, and afterward Mariegalante, Guadeloupe, and Porto Rico, and on the 22d arrived at Hispaniola. Finding the colony he had left destroyed, he built a fortified town, which he called, in honor of the queen, Isabella, and of which he appointed his brother Diego governor. He immediately left the island in order to make new discoveries, visited Jamaica, and returning after a voyage of five months, worn down with fatigue, found to his great joy that his brother Bartolommeo, who had escaped from his captivity, had arrived at Isabella with provisions and other supplies for the colony. Meanwhile a general dissatisfaction had broken out among his companions, who, instead of the expected treasures, had found hardships and labor. They set on foot many calumnies, and gave the most unfavorable description of the country and the viceroy. Columbus thought he could not better oppose these reports than by sending considerable treasures to his sovereigns, and for this purpose collected gold from the natives, which was not done without violence and some cruelty. Aguado, a personal enemy of Columbus, was sent as commissioner to investigate the complaints against the great discoverer, who, thinking it time to vindicate himself in the presence of his sovereigns, prepared to return to Spain. Having appointed his brother Bartolommeo adelantado or lieutenant-governor, he embarked for Spain in March 1496 with 225 Spaniards and 30 natives. In Spain calumny was silenced by his presence, and probably still more by his treasures. Yet his enemies were powerful enough to detain the supplies intended for the colony a whole year, and to retard the fitting out of a new expedition.

It was not till 30 May 1498, that he sailed with six vessels on his third voyage. To man these vessels criminals had unwisely been taken —a measure which Columbus himself had advised, and which had been taken up with great satisfaction by his enemies. Three of his vessels he sent direct to Hispaniola; with the three others he took a more southerly direction, for the purpose of discovering the mainland, which information derived from the natives induced him to suppose lay to the south of his former discoveries. He visited Trinidad and the continent of America, the coasts of Paria and Cumana, and returned to Hispaniola, convinced that he had reached a continent. His colony had been removed from Isabella, according to his orders, to the other side of the island, and a new fortress erected called St. Domingo. Columbus found the colony in a state of confusion. After having restored tranquillity by his prudent measures, in order to supply the deficiency of laborers he distributed the land and the inhabitants, subjecting the latter to the arbitrary will of their masters, and thus laying the foundation of that system of slavery which has lasted down to our time. His enemies, in the meantime, endeavored to convince his sovereigns that he had abused his power, and that his plan was to make himself independent, till at last even Isabella yielded to the wishes of Ferdinand, who had previously become convinced of the truth of the slanders. Francisco de Bobadilla was sent to Hispaniola with extensive powers to

call the viceroy to account. As soon as he reached the island he summoned Columbus to appear before him and put him in irons. His brothers were treated in the same manner. All three were sent to Spain, accompanied by a number of written charges, drawn up from the statements of the bitterest enemies of Columbus. Columbus endured this outrage with noble equanimity, and wrote, as soon as he had arrived in Cadiz, 25 Nov. 1500, to a lady of the court vindicating his conduct, and describing in eloquent and touching language the treatment he had received. The fetters with which he had been bound he kept to the day of his death, and his son Hernando states that he even ordered that they should be enclosed with him in his coffin. Orders were immediately sent directing him to be set at liberty, and inviting him to court, where his sovereigns received him with the same distinction as formerly. Isabella was moved to tears, and Columbus, overcome by his long-suppressed feelings, threw himself upon his knees, and for some time could not utter a word for the violence of his tears and sobbings. He then defended himself by a simple account of his conduct, and was re-instated to his dignities. Ferdinand even consented to dismiss Bobadilla, which was intended for the first step toward the promised restoration of the great discoverer in his dignities. But these dispositions in the monarchs were soon changed. There was much talk of great expeditions, and in the meantime Nicolas de Ovando y Lares was sent as governor to Hispaniola. Columbus still urged the fulfilment of the promises solemnly made to him; but after two years of delay he became convinced that there was no intention to do him justice.

But he had now learned to suffer, and he was principally desirous of completing his work. Supposing the continent which he had seen to be Asia, he did not doubt that he should find, through the Isthmus of Darien, a way to the East Indies, from which the first fleet of the Portuguese had just returned richly laden. In four slender vessels supplied by the court for this purpose Columbus sailed from Cadiz on his fourth and last voyage 9 May 1502, with his brother Bartolommeo and his son Hernando; arrived contrary to his original intention off St. Domingo 29 June, and was denied permission to enter the port for the purpose of refitting his vessels, and escaping an approaching storm. He succeeded, however, in anchoring his small squadron in a place of safety, and rode out the storm, while a fleet of 18 vessels, which had put to sea in spite of his warning, was almost entirely destroyed. He then continued his voyage to Darien, but without finding the expected passage. Two of his vessels were destroyed by a gale; the two others were wrecked off Jamaica, where he was scarcely able to save himself and his companions. Here the severest trials awaited the constancy of Columbus. Separated from the other part of the world, his destruction seemed to be certain. But he succeeded in procuring a few canoes from the natives, and prevailed on some of his boldest and best men to attempt a voyage to Hispaniola, in two canoes, in order to inform the governor of his situation. Several months elapsed without a glimpse of hope. Part of his companions, reduced to despair, rebelled, repeatedly threatened his life, separated from him, and settled on another part of the island. Here they alienated the minds of the natives by their cruel treatment, so much that they ceased to bring them supplies. The death of all seemed inevitable; but Columbus, whose courage rose with the danger, preserved his men in this crisis. He had ascertained that a total eclipse of the moon was about to take place, and threatened the natives with the vengeance of his God if they should persist in their enmity. As a proof of his assertion the moon, he said, would lose its light, in token of the chastisement which awaited them. When they beheld his threat verified they hastened to bring him provisions, and implore his intercession with the Deity. But hostilities now broke out between him and the rebels, in which several of the latter were killed, and their leader was taken prisoner. After remaining a year on the island, relief at last appeared. The two canoes had reached Hispaniola in safety, but the messengers could not prevail on the governor to undertake the deliverance of the admiral. They finally bought a vessel themselves, and it was on board this ship that Columbus left Jamaica 28 June 1504. He went to St. Domingo, but only to repair his vessel, and then hastened back to Spain. He arrived in Spain ill and exhausted. The death of the queen soon followed, and he urged in vain on Ferdinand the fulfilment of his contract. After two years of illness, humiliations, and despondency, Columbus died at Valladolid. His remains were transported, according to his will, to the city of St. Domingo, but on the cession of Hispaniola to the French, they were removed in January 1796 with great pomp, to the Cathedral of Havana in Cuba. A splendid monument was erected to him, in a convent at Seville, where his body lay before being transferred to St. Domingo. In 1898 his remains were again removed to Spain, Cuba being no longer a Spanish possession since the war with the United States.

In the vigor of manhood Columbus was of an engaging presence, tall, well formed, and muscular, and of an elevated and dignified demeanor. His visage was long, his nose aquiline, his eyes light gray, and apt to enkindle. His whole countenance had an air of authority. Care and trouble had turned his hair white at thirty years of age. He was moderate and simple in diet and apparel, eloquent in discourse, engaging and affable with strangers, and of great amiability and suavity in domestic life. His temper was naturally irritable, but he subdued it by the benevolence and generosity of his heart. Throughout his life he was noted for a strict attention to the offices of religion; nor did his piety consist in mere forms, but partook of that lofty and solemn enthusiasm with which his whole character was strongly tinctured. Of a great and inventive genius, a lofty and noble ambition, his conduct was characterized by the grandeur of his views and the magnanimity of his spirit. For further information respecting the life of Columbus various authorities are available to the inquirer. His son Ferdinand wrote a memoir, but the original is lost, though an early Italian version exists which has been translated into English and other languages. His own journal of his first voyage may also be read in English, both it and Major's 'Select Letters of Columbus' being published by the Hakluyt Society.



CHRISTOPHER COLUMBUS.

Bibliography.— Irving, 'History of the Life and Voyages of Columbus'; Winsor, 'Christopher Columbus' (1891); Fiske, 'The Discovery of America' (1891); Payne, 'History of the New World' (Vol. I. 1892); Markham, 'Christopher Columbus' (1892); Adams, 'Christopher Columbus' (1891); Harisse, 'Christoph Colomb' (1884); Cronau, 'Amerika: Seine Entdeckung' (1891–2); Thacher, 'Christopher Columbus' (1903); Prescott, 'Ferdinand and Isabella' (1838); Roselly de Lorques, 'Christophe Colombe' (1856).

Columbus, Diego, dē-ā'gō (It. Giacomo Colombojē), Italian voyager: b. Genoa about 1450; d. after 1509. He was a brother of Christopher Columbus, whom he accompanied on the second voyage to America, in 1493. He was sometimes left in command at the settlements of Isabella and Santo Domingo and returning to Spain in 1500, subsequently entered the priesthood.

Columbus, Diego (Sp. Colon, kō-lōn'): b. probably at Lisbon about 1476; d. Montalvan, near Toledo, Spain, 23 Feb. 1526. He was a son of Christopher Columbus (q.v.), and from 1492 till his father's death was a page at the Spanish court. He was confirmed admiral of the Indies and governor of Hispaniola in 1509, where he ruled with great pomp and splendor, but his opponents in the New World succeeded in curtailing his powers and he was recalled to Spain.

Columbus, Ferdinand (Sp. Ferdinando Colon, fĕr-dē-nän'dō kō-lōn'), Spanish voyager: b. Cordova, Spain, 15 Aug. 1488; d. Seville 12 July 1539. He was a son of Christopher Columbus, whom he accompanied on his father's fourth voyage 1502–4. His library of 20,000 books was bequeathed to the cathedral chapter of Seville and was known as the "Columbina." But 4,000 of these now remain and the history of the Indies by him is also lost as well as the original Spanish of his life of his father, largely drawn upon by Las Casas. This is the basis of the majority of the lives of Columbus.

Columbus, Luis, loo-ēs' (Sp. Colon), Spanish noble: b. Santo Domingo 1521 or 1522; d. Oran, Africa, 3 Feb. 1572. He was a son of Diego Columbus 2d (q.v.), and a grandson of Christopher Columbus. He was given the title of admiral of the Indies, but in 1530 was obliged to relinquish the title of viceroy, receiving in exchange the island of Jamaica, an estate 25 leagues square in Veragua, a pension of 10,000 ducats and the titles of Duke of Veragua and Marquis of Jamaica. He was captain-general of Hispaniola 1542–51. Arrested in 1559 for having three wives, he was imprisoned for three years and then banished to Africa. Felipa, his daughter married her cousin, Diego, who then became Duke of Veragua, but dying childless in 1518 the family of Columbus then became extinct in the male line. The present Duke of Veragua (b. 1837), traces his descent from Columbus through Diego, Cristoval, Diego's son, and Francesca, the daughter of Cristoval and sister of Diego Columbus, who died in 1578.

Columbus, Ga., a city and county-seat of Muscogee County, situated on the east bank of the Chattahoochee River, at the head of navigation, and on the Central of Ga., the Southern, the Seaboard A. L., and the Georgia F. & A. R.R.'s. It is also connected with Appalachicola, Fla., by three steamer lines. Columbus is in the centre of a fertile cotton and agricultural producing region, and near forests of conifers and hardwood, and deposits of coal and iron. It is also at the foot of the "Piedmont" region, where the rock ledges of the older geological formations give place to the coast plain; hence the Chattahoochee falls sharply for many miles over its rock bed to its new levels and deeper water, affording an immense head of power,— 115 feet fall, with 42,500 horse-power, at average low water, within a mile of Columbus, and 368 feet with 134,000 net horse-power within 36 miles. Three large companies (the Columbus Power Company, the Coweta Company, and the Chattahoochee Falls Company) are making this power available by a series of dams, transmitting electric power from dynamos. Two great dams nearly 1,000 feet long, developing 28,866 horse-power, are already built; and five others, one with a fall of 52 feet, and all developing over 70,000 horse-power, are announced within a year or so. The Coweta Company owns 12 miles of river front to the north. This power implies a great future extension of industries; but the cotton manufacture is already so extensive as to give the city the name of "the Lowell of the South." There are now six large mills here, operating 154,000 spindles and 4,400 looms, employing about 4,000 hands, paying nearly $1,000,000 a year in wages, and using toward 50,000 bales of cotton a year. The great Eagle and Phœnix mills were the pioneers of large manufacture; the Coweta Company has a mill of 35,000 spindles and a village (Bibb) of its own; the North Highlands mills represent an investment of $500,000, and are second in the South in equipment and arrangement. There are also two cotton compressors and ginning works, among the largest in the South; cotton-seed oil mills, etc. Next to this, and equally old, is the iron industry, with two great concerns; the Columbus Iron Works, dating from 1853, which with their department, the Southern Plow Company, cover six acres, and are to be the largest in the South; and the Goldens Foundry and Machine Company. These manufacture all kinds of agricultural implements, cotton screws and compressors, engines and boilers, etc. One of the largest syrup and sugar refining works in the South has lately been erected; there are also a large wagon factory, a barrel factory, three show-case works, grist mills, etc. The trade of the city is large; it is the distributing centre of all southwest Georgia and a considerable part of central Georgia and Alabama. There are five cotton warehouses, and the total receipts of cotton are about 165,000 bales a year.

The city has broad handsome streets, which in the original plan were intended to be boulevards with parks down the centre. Steps are being taken to carry out the design. The business streets are being paved, and 35 miles of macadam roads are completed. There is an electric street railway system, and the city is connected with its suburb, Girard, Ala., by a bridge, which is crossed by the Central R.R. of Ga. There are some fine buildings, and the number is rapidly on the increase. The $60,000 passenger station of the Central of Georgia is one; the Masonic Temple is one of the finest in

the South, and the Odd Fellows have planned an equal; the new Y. M. C. A. building, faced with the finest Georgia marble, is to be one of the most beautiful in the Southern States; and several of its 23 churches, embracing all denominations, are excellent specimens of architecture. The school system is justly famed: Columbus was the first city in the South to adopt graded schools and manual training. It has five large modern school buildings, and the system includes not only free kindergartens and a night school, but a primary industrial school for the children of the poorer wage-earners, with a unique provision for "little dinner carriers" (children carrying dinner to parents at work), regulating the hours to give them a longer nooning. The improvement of the condition of cotton-mill workers (all of the "poor white" class) has engaged the attention of the owners, who have not only provided excellent modern villages for them, but schools and other elevating influences. The Columbus Power Company proposes to build and partly maintain at Bibb a superior school for the operatives' children; and the Eagle and Phœnix Club for employees is a building with library, gymnasium, and all forms of amusement, built by the company, and then given over to the absolute control of the hands. There is also a public library in the city. The city government is by a mayor, elected for two years, and a council, elected on general ticket, the council appointing the other city officers.

History.— Columbus was laid out in 1828, on land taken partly from an Indian reservation. As early as 1845 it had a cotton mill and was a centre of the cotton trade; in 1846 it was nearly destroyed by fire. In 1853 the first iron foundry was built there. During the Civil War it was the reliance of the Southern armies for their clothing, shot and shell, and swords. In its streets and those of Girard was fought the last battle of the War east of the Mississippi, when on 16 April 1865 Wilson captured it. Pop. (1870) 7,401; (1880) 10,123; (1890) 17,303; (1900) 17,604 (10,337 whites); (1903) including suburbs, about 30,000.

Columbus, Ind., a city and county-seat of Bartholomew County, in the southern central part of the State, situated on a fork of the White River and on the Cleveland, C. Ch. & St. L. and the Pittsburg, C. Ch. & St. L. R.R.'s. It has large manufactories of cerealine, agricultural implements, and furniture, and starch- and flour-mills. Pop. (1900) 8,130.

Columbus, Kan., the county-seat of Cherokee County, in the southeastern part of the State, situated on the Kansas City, Ft. S. & M. and the St. Louis & S. F. R.R.'s. It is in an agricultural and mining district, coal and zinc being found in the neighborhood. Pop. (1900) 2,310.

Columbus, Miss., a city and county-seat of Lowndes County, situated on the Tombigbee River and on the Mobile & O. and the Southern R.R.'s., 150 miles southeast of Memphis and the same distance northeast of Jackson. It is the farming trade centre of the country, and has a large cotton-mill, machine shops and lumber-mills. It is the seat of the State Industrial Institute and College for girls and of Franklin Academy. Pop. (1900) 6,484.

Columbus, Neb., the county-seat of Platte County, in the eastern part of the State, situated on the Loup River, near the Platte, and on the Union Pacific and the Burlington & M. R.R.'s. It has various manufacturing interests and is the seat of a Roman Catholic academy. Pop. (1900) 3,522.

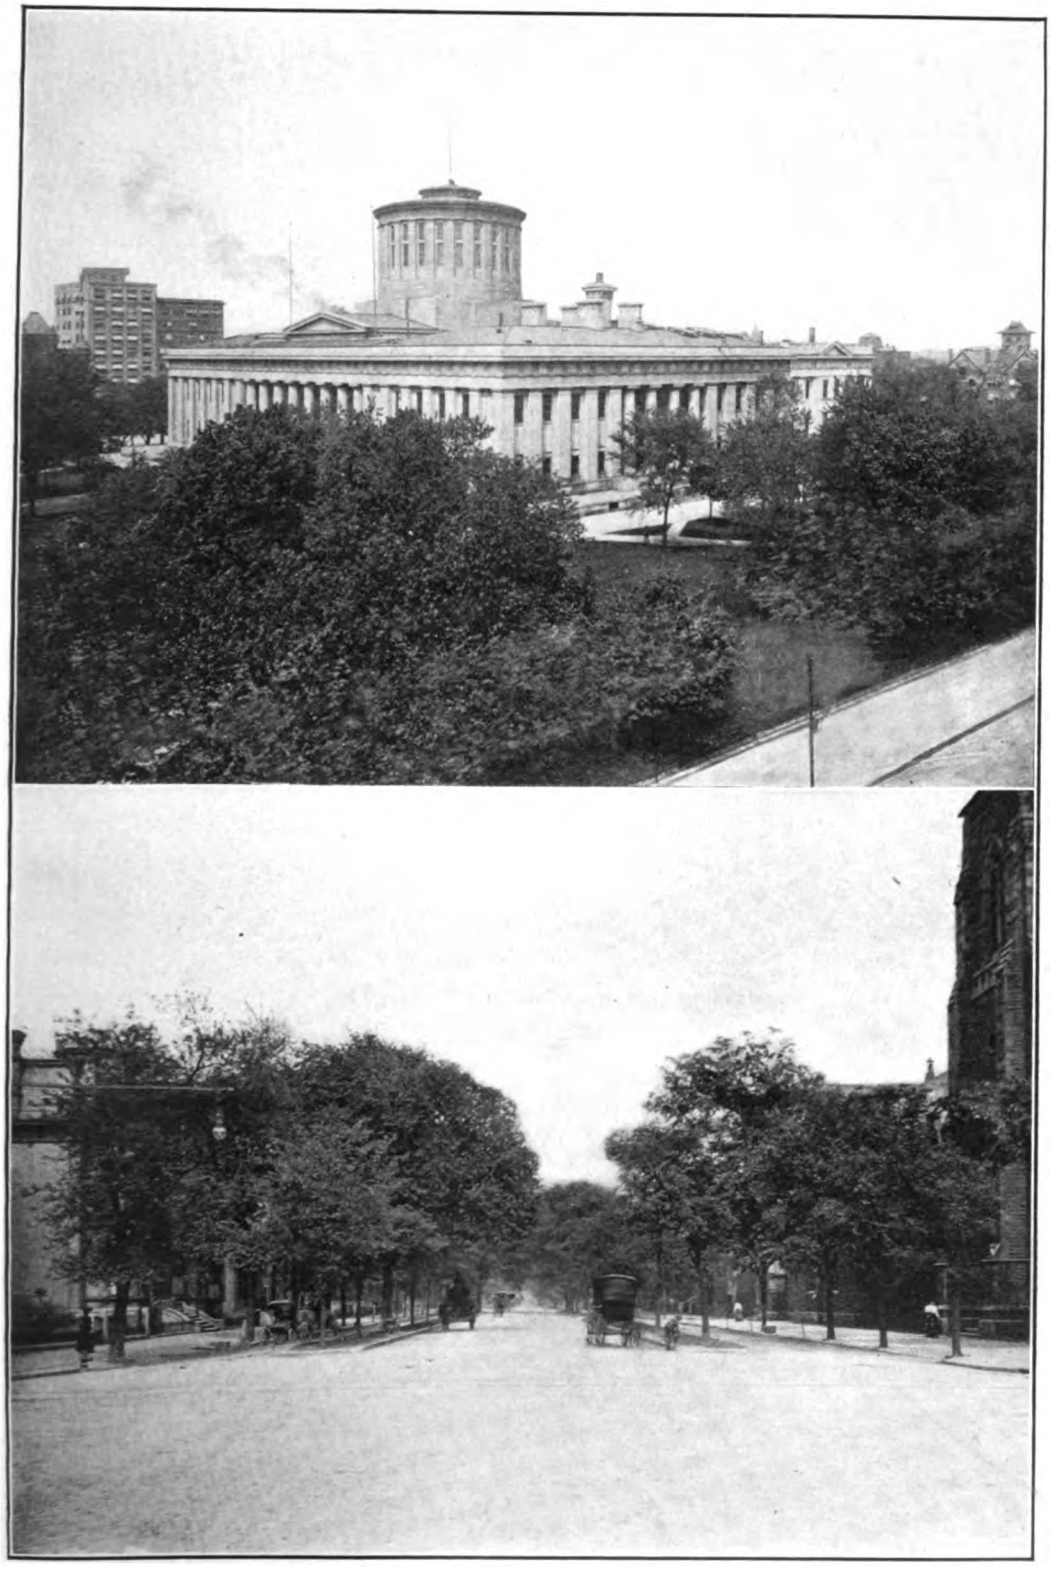
Columbus, Ohio, the capital of the State and the county-seat of Franklin County, is located at the centre of the State and at the junction of the Scioto and Olentangy rivers, in lat. 39° 57′ N., lon. 83° 3′ W., on a slightly elevated alluvial plain, and is nearly equidistant from Cincinnati, southwest; Cleveland, northeast; Toledo, northwest; and Marietta, southeast, the average distance from these points being 115 miles.

Columbus was made the capital by the legislature in 1810, and became the permanent capital in 1816, the original Territorial and State capital having been Chillicothe. The first State buildings were of brick, and cost $85,000. The present massive buildings and additions are of dressed native gray limestone, in the Doric style of architecture. They cover nearly three acres, and their total cost has been $2,500,000.

As early as 1812 Columbus was surveyed in rectangular squares; it was incorporated as a village in 1816, and chartered as a city in 1834. In general outline the city resembles a Maltese cross. It extends eight miles north and south, and seven miles east and west on its arms of expansion. Its longest streets, High and Broad, bisect the city north and south and east and west respectively. The uniform width of the former is 100 feet, and the breadth of the latter is 120 feet. Broad Street is planted with four rows of shade-trees for its entire length east of the capitol square, where it penetrates the fashionable residence district. High Street is the leading business thoroughfare. Capitol square, a miniature park of 10 acres, is situated at the intersection of these streets, two squares east of the Scioto River. The residence portions of the city contain many beautiful homes and fine mansions. There are numerous apartment buildings; the houses of the average people are substantial and comfortable; the tenement districts are but ordinary of their class. On the business streets are many handsome, commodious blocks; many steel, brick, and stone office buildings from 8 to 14 stories high, as well as commodious railway buildings and stations. The streets are wide, well paved and lighted, and are kept in good condition.

The police and fire departments are excellent; the water supply is pure and ample, and the sewerage system good. Natural gas is the principal fuel for domestic use. Bituminous coal, in unlimited quantities, is found a few miles south.

The 40 or more church buildings of Columbus include those of the following religious denominations: Methodist Episcopal, United Presbyterian, Roman Catholic, Lutheran, Baptist, Disciples, Friends, Christian Scientist, Evangelical Jewish, Independent German Protestant, German Evangelical Protestant, African Methodist Episcopal, Seventh Day Adventists, and United Brethren. These churches have a total active church membership of 75,000. The newspapers and periodicals include four English and two German dailies, 21 secular weeklies, and 33 trade, professional, religious, fraternal, and other publications. There are 38 large public school



State Capitol (upper). Looking North on East Broad Street (lower).

buildings, four being devoted to high school purposes. The schools have an average attendance of 18,500, the high schools having 2,300. Among institutions for higher education are the Ohio State University, Capital City University, and St. Mary's Academy. Professional schools include one dental and three medical colleges, and a law school; and there are also private and religious educational institutions. Here are 20 private hospitals; and Columbus is the location of a State hospital for the insane; State institutes for the education of deaf-mutes, blind, and imbecile youth; the Ohio Penitentiary; county, city, and memorial buildings; five opera houses; and a board of trade building. There are five public parks and a United States military post, Fort Columbus. This post, known also as Columbus Barracks, was originally an arsenal, and now has quarters for eight companies of infantry.

From Columbus 18 steam railroads radiate to all parts of the State, intersecting all through lines running east, west, northwest, northeast, and south; and eight interurban lines in operation, and as many more nearing completion, connect with a model street-railway system. Prominent business interests of the city are represented by 6 national and 20 private banks, trust companies, savings and building and loan associations, with a combined capital of $25,000,000. There are 289 great and small manufacturing establishments, representing an investment of $35,000,000, including steel plants, blast-furnaces, malleable iron works, and manufactories of various steel, iron, and wood products, beer and liquors, trucks, cars, cash registers, watches, furniture, agricultural implements, mine, mill, and farm supplies, shoes, cloth fabrics, gloves, hosiery, clothing, medicines, buggies, wagons and all kinds of vehicles, automobiles, novelties, specialties, and general merchandise, with an anual output approximating in value $105,000,000. The mercantile trade is extensive, including all lines, and embracing 23 wholesale and hundreds of retail establishments.

The people of Columbus possess the characteristic push and enterprise of Western cities, and much of the culture and artistic taste of those in the East. The population is drawn from all the counties in the State, especially the 45 which are centrally located. Two thirds of the population are native-born. The largest foreign elements are German, Irish, Welsh, English, and Italian, in this order, and include scattered groups and individuals from almost every civilized and semi-civilized country in the world. Since 1880, when it had 41,215 inhabitants, Columbus has grown rapidly. In 1900 it had a population of 125,560, and that number has increased, according to the estimate of 1903, to about 150,000.

WILLIAM ALEXANDER TAYLOR.

Columbus, Texas, the county-seat of Colorado County, situated on the Colorado River and on the Southern P. R.R. Its chief industry is its cotton trade. It is the seat of Colorado College. Pop. (1900) 1,824.

Columbus Barracks. See COLUMBUS, OHIO.

Columella, kŏl-ū-mĕl'la, **Lucius Junius Moderatus,** Roman practical writer on agriculture: b. Cadiz, Spain. He flourished about the middle of the 1st century, and wrote 12 books, still extant, one of which, on gardening ('De Re Rustica'), is in verse. He treats in this work of all the branches of agriculture. The earlier editions of this work contain also his treatise 'De Arboribus,' in one book. According to Pliny, Columella wrote a work on ancient sacrifices for obtaining the fruits of the earth, but this is lost. The *editio princeps,* printed in folio by Jenson at Venice, in 1472, and forming part of a collection of 'Rei Rusticæ Scriptores varii,' is very rare. The most complete edition is contained in the 'Scriptores Rei Rusticæ' of Schneider (1794–7).

Column (Latin, *columna*), in architecture, a round pillar. In the earliest times the column was merely a tree-trunk, or its imitation in stone, used to support the roof. The parts of a complete column are its base, on which it rests; its body, called the shaft; and its head, called the capital. Columns are used to support the entablature of an order, which has also its proper division. In the most ancient times columns of wood were most usual, as being most easily wrought. In countries like Egypt, where timber fit for construction is scarce and stone abundant, the latter became the principal material for columns, and those of Egypt are remarkable for the beauty of their workmanship and the durability of their materials. The Egyptian columns were numerous, close, short, and very large. They were generally without bases, and had a great variety of capitals, from a simple square block ornamented with hieroglyphics, or faces, to an elaborate composition of palm leaves, not unlike the Corinthian capital. The Greeks, for their columns, used marble of the finest kind, with which their country abounded; and other nations the stone or material of their country. The Greeks properly considered the column as an essential part of the architecture of their temples, and never used it as a mere decoration.

The manner of constructing the columns of all the orders rests on similar principles. They are all divided into three primary parts or divisions, the base, the shaft, and the capital, except the Doric order, which has no base. The lowest or thickest part of the shaft is used by architects as the universal scale or standard whence all the measures which regulate and determine heights and projections are taken; and this standard or scale must be understood before any architectural design can be commenced. The universal architectural scale is called a diameter, and is the diameter of the lowest or the largest part of the column; and, unlike the foot, inch, or yard, is as various as the size of columns. By the diameter, of course, is meant that of the circle which forms the bottom of the column. Half of this diameter, or the length of the radius which forms the circle, is called a module, and is used as well as the diameter as a primary standard of mensuration by some writers upon architecture. These measures of length are subdivided as follows, namely: the diameter into 60 parts, and the module into 30 parts, called a minute. The Doric column has no base. The Ionic column has one peculiar to itself called the Attic, which, with that of the Corinthian order, is described under the article ARCHITECTURE.

The shafts of the different orders differ in height and even in various examples of the same order. The capitals also are as various. Col-

umns are either plain or fluted, and the flutes and manner of dividing them are different in the Doric and Corinthian orders. The Ionic flutes much resemble the Corinthian, and in many instances are exactly similar. Columns of all the orders taper gradually toward the top, but in the middle there is sometimes a slight swelling called an entasis. Roman architecture being derived from the Greek, Roman columns were either exactly similar to Greek ones or modifications of the latter. The principal modifications of the column made by the Romans were that form of the Ionic capital in which there were four pairs of diagonal volutes instead of two pairs of parallel ones, and that peculiar to the Composite order, in which the capital of the Corinthian column was combined with that of the diagonal or modern Ionic.

Columns are also often used for commemorative purposes as well as for architectural supports; like the Trajan and Antonine columns in Rome, and that called the Monument in London, which was erected in commemoration of the great conflagration of 1666, and is one of the loftiest, the best constructed, and the most beautiful. It is a Doric fluted column, 202 feet high from the bottom of the pedestal, which is ornamented with bas-reliefs of Charles II. and his court giving protection to the fallen city, and various inscriptions, to the top of the vase of flames, by which it is surmounted.

Column, in military tactics, a deep, solid mass of troops, formed by placing several bodies of men one behind another (sections, platoons, companies, squadrons, and even several battalions). The column is either open or close. When a battalion is formed in open column, room enough is left between the companies for them to wheel into line. When the distance left between the companies is very small, the battalion is said to be formed in close column. When the distance is intermediate between that in close and that in open column, it is said to be formed either for marching or for attack. On the march and in manœuvring the arrangement of troops in column is general and convenient, and this order is usually kept up till the actual fighting is about to begin; but it is as a rule unsafe to expose troops in column to the firearms of the present day. This formation consequently is retained in combat only when time and space do not allow of any other being adopted, or for some other special reason.

By dividing a large force into columns it becomes possible to march in places where it would be impracticable to move with unbroken lines. They also increase the force and steadiness of troops, both in attack and defense. The drawing up of the infantry in line is usually advisable where there is no obstacle in the ground to prevent advancing in this order. The order in mass may be preferred where a charge is intended, in which physical force, given by the depth of the column, is necessary and also where a charge, particularly of cavalry, is apprehended. Though a cannon ball, and still more a shell, in the midst of the mass, causes a greater havoc, the probability of being hit is diminished on account of the small front exposed.

An objection to columns, founded on the difficulty of moving so dense a mass, and of changing it into a line, has been removed in modern times by the practice of making the columns consist of only one battalion, and by disposing these single battalions near each other in such a way as to support one another by their fire, instead of arranging them uselessly one directly behind another. By the usual way of forming the columns toward the centre, those have received such a mobility and facility of development that a line may be restored in two or three minutes. The charge in close columns, which has been especially common among the French, is of the greatest effect when it succeeds; but when it fails the whole body of assailants is exposed to annihilation or to rout, no orderly retreat being possible. The attack with columns at some distance from each other has this advantage, that the facility of manœuvering is much greater. This mode of attack has been frequently employed in assulting squares of infantry. Marching and fighting in lines, however, are the modes usually practised by cavalry. Column roads are such roads as may be passed with all kinds of arms; when the ordinary road is ruined, they are laid out across the fields and marked by poles with straw (*jalons*).

Column of July, a monument erected in Paris in 1840, on the site of the old Bastile in honor of the citizens killed in the revolution of 1830. It is a shaft of bronze on a marble base, capped with a gilded statue of the Genius of Liberty. It is 154 feet high and 13 feet in diameter.

Column of Saint Mark. See VENICE.

Column of Trajan, a monument erected in Rome in 114 A.D. in honor of the emperor. It is a Roman Doric column of white marble of 34 blocks, 23 composing the shaft, on which is carved representations of various scenes in Trajan's campaigns, containing 2,500 figures of men, each about two feet in height. The quadrilateral pedestal contained the emperor's ashes and bore an inscription. It is 127½ feet high, exclusive of the statue of St. Peter, which now stands on the apex of the column, having taken the place of the colossal figure of Trajan in 1587.

Column Vendome, vŏn-dōm, a monument erected in the Place de Vendome, Paris, by Napoleon I., to commemorate the victories of the Grand Army over the Russians and Austrians in 1805. It is similar in design and ornamentation to the Column of Trajan, but is built of masonry encased in bronze taken from 1,200 captured guns, and capped by the statue of Napoleon. It is 142 feet high and 13 feet in diameter. It was overthrown in 1871 during the Commune but was restored in 1875.

Colure, kō-lūr', one of the two imaginary great circles of the celestial sphere intersecting the poles of the world; one passing through the equinoctial points of Aries and Libra and the pole of the equator; and the other through the solstitial points of Cancer and Capricorn, and the poles both of the ecliptic and equator. For this reason the first is called the equinoctial, and the second the solstitial colure. The name, meaning "docked" or "dock-tailed," is now rarely used; it was originally applied because a portion of these circles is always concealed under the horizon.

Col'ville, SIR **Henry,** English general: b. 10 July 1852. He was educated at Eton and entered the grenadier service in 1870. He

served in Egypt, the Sudan, Uganda, and elsewhere, was knighted in 1885, and in 1897 was promoted major-general. He has published: 'A Ride in Petticoats and Slippers' (1879); 'The Accursed Land' (1884); 'History of the Sudan Campaign' (1887); 'The Land of the Nile Springs' (1895); 'The Work of the Ninth Division' (1901).

Colvin, kŏl'vĭn, **Sidney,** English critic: b. Norwood, Eng., 18 June 1845. He was professor of fine arts at Cambridge 1873–5, since when he has been keeper of prints and drawings at the British Museum. His writings include: 'Children in Italian and English Design' (1872); 'Life of Walter Savage Landor' (1881); 'Life of Keats' (1887); 'A Florentine Picture and Chronicle' (1898); 'Early History of Engraving in England' (1901).

Col'well, Stephen, American lawyer and writer: b. Brooke County, Va., 25 March 1800; d. Philadelphia 15 Jan. 1872. He graduated at Jefferson College, studied law, was admitted to the bar, and practised for some years in Pittsburg. About 1830 he removed to Philadelphia, became an iron merchant, and amassed a fortune. He early developed a fondness for the study of finance, political economy, and social science, and frequently published the results of his studies on questions of current interest or debate. During the Civil War he aided the administration with pen, purse, and voice, and was a liberal supporter of the work of the sanitary commission. He was appointed by the government one of the commissioners to examine the whole internal revenue system and suggest improvements. He left his large and valuable library of works on political and social science to the University of Pennsylvania, where he also endowed a professorship of social science. Of his writings the following may be mentioned: 'Relative Position in Our Industry of Foreign Commerce, Domestic Production, and Internal Trade' (1850); 'New Themes for the Protestant Clergy' (1851); 'The South; . . . Effects of Disunion on Slavery' (1856); 'Ways and Means of Commercial Payment' (1858), his last and most important work.

Colymbidæ, kō-lĭm'bĭ-dē, a family of birds which includes the divers and grebes. See DIVERS; GREBE.

Col'za Oil, or **Rape Oil,** an oil, familiar from its use as an illuminating agent in the moderator and other lamps, expressed from the seeds of several plants of the cabbage and turnip genus, the name being originally «kolzaad» (Dutch), that is kail- or cabbage-seed. It is yellowish brown, has a specific gravity of .92, and little or no smell, and dissolves in hot alcohol and in ether. It becomes thick and solid only at very low temperatures; when heated it volatilizes, but not completely, undergoing partial decomposition. It is purified for use by continued agitation with sulphuric acid, which destroys mucilaginous matter from the seed, and washing with water to remove all trace of the acid. The oil is largely used both in Great Britain and on the Continent in soap-making, tanning, fulling of cloth, lubricating machinery, and for burning. For the last it is so well adapted that it has been specially recommended for lighthouse purposes. It is brilliant and steady, is managed with very little attention, and is cheap. In these respects it is said to be superior to spermaceti.

Coma, in medicine, a state of complete or almost complete insensibility, resulting from various diseases, as apoplexy; from narcotics, as opium; from accident or injury to the brain; or from excessive cold. In cases of coma the pulse is usually low and soft, but sometimes quick, the breathing is rarely stertorous, the pupils of the eyes are commonly more or less dilated, and the face is often swollen and livid. The patient is either altogether unconscious and incapable of replying to any question, or he makes incoherent and rambling statements. Stimulating agencies and blistering are sometimes used in the treatment of comatose cases, but generally the disease or injury producing the condition determines the remedy.

Coma Berenices, bĕr-ĕ-nī'sēz («the Hair of Berenice»), a northern constellation, the name of which is due to the flattery of Alexandrine astronomers, who professed to see in the new constellation a lock of the beautiful hair of Berenice, wife of Ptolemy Energetes. Callimachus in Greek and Catullus in Latin wrote poems descriptive of the apotheosis of the curl. Ptolemy did not introduce it into the Almagest as a distinct constellation, but called it *Plokamos* (Gr., «hair,» or «curl»). Tycho Brahé restored it as a distinct constellation in his catalogue of 1602. It is formed of rather faint stars, none being brighter than the fourth magnitude. Baily, in the «B. A. C.» in 1845, attached the first three letters of the Greek alphabet to three of the brighter stars. The constellation is surrounded by Ursa Major, Canes Venatici, Boötes, Virgo, and Leo.

Comacchio, kō-mä-chē'ō (ancient COMACTIUM, Italy, town in the province of Ferrara, in Emilia, about 20 miles north of Ravenna and 30 miles southeast of the city of Ferrara. The town is built on islands which are connected by bridges. The chief industries are fishing and manufacturing salt.

Coman, Katherine, American teacher: b. Ohio 1857. She has been professor of economics in Wellesley College (Mass.) since 1900. She has written: 'Growth of the English Nation' (1895); 'History of England' (1899); 'History of England for Beginners' (1901), and in collaboration with her colleague Katherine Lee Bates, 'English History Told by English Poets' (1902).

Comana, kō-mā'na. 1. An ancient city of Cappadocia, supposed to be the modern Elbostan, on the river Sarus, celebrated in antiquity for its temple of Artemis Tauropolis, and for the great devotion of its inhabitants to the worship of that goddess. Over 6,000 persons were engaged in the service of the temple. The city was governed by the high priest, who was always a member of the reigning family, and took rank next to the king. 2. A city of Pontus, now Tokat, on the river Iris, and almost as famous for its devotion to Artemis as the other city of the same name.

Comanche, kō-măn'chē (also **Camanche, Chouman, Comande,** a Spanish name; their own name is Nüm, «people»; the Sioux gave them one which the French turned into Padouca), a powerful and ferocious tribe of the

widely distributed Shoshonean stock, speaking the same language as the Shoshoni of Wyoming, and traditionally their neighbors. When first made known to the whites by the French under Dutisné, they were located in eastern Colorado; they had already obtained horses from the Spaniards and become nomads and expert horsemen, and horse-breeders, for the French bought horses from them. In 1724 another French expedition made a treaty with them. They seem shortly after to have been pushed southward by the Sioux, and we find them later roving the plains of northwestern Texas, making plundering raids from Colorado through Texas, deep into Mexico, and westward to Santa Fe. They lived in skin wigwams, with few or no fixed villages except near the Spaniards, and were in eight bands, with a very loose organization. They probably numbered 5,000 warriors, and 25,000 in all, at their best estate; one village near the Spaniards had 800 warriors, and over 4,000 in all. They were at constant war, both with the Spaniards and the other Indian tribes, and in 1783 engaged in a wholesale war with the former; but Anza inflicted a crushing defeat on them, killing 30 of their chiefs, and there was peace for a time. In 1816 they are said to have lost 4,000 of their number by an epidemic of smallpox; but they were still estimated at 9,000; and in 1847 at 10,000 or 12,000, one fifth warriors. They recruited their numbers by kidnapping and adopting Mexican children, boys or girls. For all the years of immigration into those regions, down to 1875, they were the bloody and relentless scourge of the white settlers, and furnished a good part of the Indian horrors of the southwest. They were once placed on a reservation in Texas, but were driven off. In 1868 the bulk of them agreed to go on a reservation in western Oklahoma; but the Quahada or Staked Plain band refused, and kept up their murderous forays. They were sharply punished by Col. McKenzie at McClellan's Creek in 1872, in which year they were estimated at 3,218 on the reservation, with 1,000 more in roving bands. The last of these surrendered in 1875. In 1901 their reservation in Oklahoma was thrown open to settlement. At present they number about 1,400.

Comanche Stage, in American geology a great limestone formation of Lower Cretaceous age that covers much of northern Mexico, and parts of Texas, New Mexico, Indian Territory, and Kansas. The beds contain chalk in places and are mostly of marine origin. The thickness is 1,000 feet in central Texas and reaches a maximum of 20,000 feet in Mexico. See CRETACEOUS SYSTEM.

Comayagua, kō-mä-yä'gwä, or **Valladolid la Nueva,** Honduras, C. A., a town, capital of the department of the same name, situated on the southern border of the plain of Comayagua, on the Humuya River, 220 miles east of Guatemala. It is the seat of a bishopric, has a large and handsome cathedral, a richly endowed hospital, several convents, and a college. It was founded by Alonzo Caceres in 1540, and up to 1827 was a thriving place, with about 18,000 inhabitants. In that year, however, it was burned by the monarchical faction of Guatemala, and has never recovered. Pop. 3,100.

Comb (A.S. *camb*), an instrument to separate and adjust the hair, too well known to need description. We have no certain authority that either the Greek or the Etruscan women applied this useful article regularly to their hair in the operations of the toilet; although it was used by the Greek women, at least, to arrange their hair. The combs used by the Greeks were of boxwood, and had teeth on both sides, while those used by the Egyptians had teeth only on one side. The Romans also had combs of boxwood, and at a later time probably of ivory and other materials. In the work of Guasco Delle Ornatrici there are several representatives of ancient Roman combs. One of them is a long one of box, of which the handle is overlaid with ivory, and appears to have been ornamented with a small meander in gold. It has two rows of fine teeth, delicately wrought and well proportioned. In making combs the material is first cut to the form which the comb is to have, and the teeth are then made all at once by means of circular saws mounted on the same axle and placed at a suitable distance from one another. Large combs in horn or shell, with wide teeth, are sometimes made with a punch, which cuts in the piece the teeth of two combs by the same operation. The teeth are afterward finished with the file. Combs made of vulcanized india-rubber, which are now so common, are made by pressing the caoutchouc while soft into molds, and then bringing them to the desired degree of hardness by the process of vulcanization. Canova and other modern sculptors have made great use of the comb, placed in the heads of their women, to which they add much grace and elegance.

Comb, the wax cavities in which bees lodge their honey. The comb of a bee is composed of hexagonal cells, of which there are two tiers, the cells in which are placed end to end, so that the three plates of wax, which serve as the bottom of the cell in the one tier, constitute also that of the corresponding one in the other. The mathematical problem in "maxima and minima," how to construct the greatest number of cells within the smallest possible room, and with the least expenditure of material, is solved. This the natural theologians and the older naturalists were accustomed to adduce, as one of an infinite number of proofs, that design and a Designer were displayed in nature.

Combaconum, kŏm-bạ-kō'nŭm, Madras, British India, town in the district of Tanjore. It is regarded by the Hindus as a place of peculiar sanctity, and is inhabited largely by the Brahmans. It contains numerous pagodas and tanks with water, supposed to come from the Ganges River. It is one of the strongholds of Brahmanism, but a considerable number of the inhabitants are Roman Catholics, and a Protestant misson has been successfully established. Pop. 54,307.

Combat, Single, a very ancient usage, evidenced by Goliath (1 Sam. xvii.), and by Ajax in the 'Iliad.' The Norse practice of principals going alone to a small holm or island, to be free from disturbance while settling their quarrels by strength and skill, gave rise to the Saxon term *Holm-Gang.* In the days of chivalry the single combat received the strong support of law and custom, and was resorted to both in civil and in criminal cases. The accuser

or plaintiff swore to the truth of his tale, the other gave him the lie, a gage of battle was thrown down and taken up, and they fought it out under rules before an assembly, the supposition being that God would give victory to the right. The barbarous practice survives in European countries, without its excuse of superstition, in the modern duel, which is legally prohibited in the United States. In England it was still a legal method of trial well into the 19th century, but was abolished by statute 59 George III., cap. 48.

Combe, kōm or koom, **Andrew,** Scottish physiologist: b. Edinburgh 27 Oct. 1797; d. there 9 Aug. 1847. He was educated for the medical profession, and in 1822 he commenced practice at Edinburgh, and had considerable success. In 1838 he was appointed one of the physicians extraordinary to the queen in Scotland. His chief works are: 'Observations on Mental Derangement' (1831); 'Principles of Physiology' (1834); 'Physiology of Digestion' (1836); 'A Treatise on the Physiological and Moral Management of Infancy' (1840). Like his brother George (q.v.), he was a zealous phrenologist.

Combe, George, Scottish phrenologist: b. Edinburgh 21 Oct. 1788; d. Moore Park, Surrey, 14 Aug. 1858. He was a brother of Andrew Combe (q.v.), was bred to the law, and in 1812 admitted a member of the Society of Writers to the Signet. He was the first to introduce the doctrines of phrenology into Great Britain; and visited Germany and America, lecturing on his favorite science. He was also a zealous promoter of the cause of popular education and social progress; and was among the first to advocate compulsory education and the establishment of a board of health. Besides the 'Constitution of Man' (1828), which has had an enormous circulation, he was the author of: 'A System of Phrenology' (1825); 'Lectures on Popular Education' (1833); 'Moral Philosophy' (1840); 'The Life and Correspondence of Dr. Andrew Combe' (1850); 'Principles of Criminal Legislation and Prison Discipline Investigated' (1854); 'Relation Between Science and Religion' (1857).

Combe, William, English writer: b. Bristol 1741; d. Lambeth 19 June 1823. His 'Tour of Dr. Syntax in Search of the Picturesque' (1812), was once very popular. Other works by him: 'The Diabolical,' a poem (1776); 'The Devil Upon Two Sticks in England' (1790). After 43 years within the rules of a debtor's prison, and previous fortunes from officer to cook, he died in Lambeth.

Combermere, kŏm'- or kŭm'bėr-mēr, **Sir Stapleton Stapleton-Cotton,** Viscount, English general: b. Denbighshire 17 Nov. 1773; d. Clifton 21 Feb. 1865. He entered the army in 1790, served in Flanders and India, and with the rank of major-general accompanied the Duke of Wellington to the Peninsula in 1808. At Salamanca, in 1812, he headed the brilliant cavalry charge which greatly contributed to the decisiveness of that victory, and was subsequently present at the battles of the Pyrenees, Orthez, and Toulouse. Shortly after the last battle he was raised to the peerage with the title of Baron Combermere. From 1817 to 1820 he was governor of Barbadoes; and in 1825 was sent to India as commander-in-chief of the forces there, to put down the usurper Doorjun Sal. After a siege of less than two months, Bhurtpore, the chief city of Doorjun, was taken by storm on 6 Feb. 1826, for which Combermere was raised to the rank of viscount. The remainder of his life was passed in England. In 1852 he was appointed constable of the tower; and in 1855 made a field-marshal.

Combes, koomz, **Justin Louis Emile,** French statesman: b. Roquecourbe, Tarn, France, 6 Sept. 1835. He was educated in a Roman Catholic seminary for the priesthood, but subsequently studied medicine, and began practice in Pons, where he filled various posts of responsibility, such as those of mayor and county councilor. In 1885 he was elected to the Senate, of which he was vice-president 1893–4, becoming minister of public instruction in 1895. He has been active in the re-organization of primary and secondary education. In June 1902 he succeeded Waldeck-Rosseau as President du Conseil des Ministres. In this capacity he has enforced the Association Act, abolishing liberty of teaching in France and aimed at the clergy. His opponents have claimed that this has been done with needless severity. It has caused widespread disturbances throughout the country. On his becoming prime minister M. Combes announced his intention to reduce the period of military service to two years, and to establish a general income tax.

Combination, in mathematics, the selection, from a given set of objects, of a stated number without regard to their arrangement. Each combination can, by varying the arrangement of the constituent objects, be made to give rise to several permutations. Thus, of the four letters, *a, b, c, d,* four combinations, three at a time, are possible; namely, *a b c, a b d, a c d, b c d.* Each of these combinations, however, produces six permutations, according to the order of the letters. For example, the combination *a b c* yields the six permutations *a b c, a c b, b c a, b a c, c a b, c b a.* Thus, of the four letters *a, b, c, d,* the number of permutations three at a time is 24. It is easy to prove that the number of permutations of n objects two at a time is $n\ (n-1)$; three at a time $n\ (n-1)\ (n-2)$; four at a time $n\ (n-1)\ (n-2)\ (n-3)$; and so on, the number when r at a time are taken being $n\ (n-1)\ (n-2)\ldots\ldots (n-r+1)$. The number of permutations of n things n at a time is therefore $n\ (n-1)\ (n-2)\ldots\ldots$ 4, 3, 2, 1, a product usually represented by $\lfloor\underline{n}$ or $n!$, and read as "factorial n." The theory of permutations and combinations is of very great importance in higher mathematics, and may be studied in any text-book of algebra, such as those by Chrystal, Todhunter, and Smith.

Combination, a union of individuals, companies, or corporations formed for the purpose of accomplishing a particular object or purpose. At common-law combinations were unlawful, but in the United States a combination is not unlawful in itself, though it becomes so if it seeks to obtain its ends in an unlawful manner. Combinations may be divided into two general classes, those formed by employees or "labor," and those formed by employers or "capital." Combinations formed by employees, or labor, are generally designated unions. The

purpose of a union is to better the condition of its members in relation to the work in which they are engaged, by securing higher wages, less working hours, different methods of doing the work, and similar changes. A union generally tries to enforce its demands by striking, or threatening to strike. A strike is a combination effected by employees whereby at a prearranged time they all stop working unless their demands are granted. A strike is usually organized through a union.

A boycott is a combination to cause a loss to a particular person by restraining others from doing business with that person. It is often so conducted that the person is affected socially as well as in his business. When a boycott has been declared against a person, any one having either business or social relations with that person is also boycotted.

When the objects of such combinations are effected in a peaceful and lawful manner there is no legal means by which they can be interfered with; but it generally happens that when a number of working-people strike there is a breach of contract or a conspiracy, in which case there is a legal redress. The usual action is for the injured party to proceed in equity and ask for an injunction restraining the former employees from committing certain acts. Sometimes damages are asked for, and it makes no difference what the status is when the cause is heard, as damages can be recovered for acts committed during a strike, although the strike may have ended long before the demand for damages.

Combinations formed by employers, or capital, are usually known as trusts. Trusts are generally formed with the object of regulating the supply or price of a product, or both, or for the purpose of reducing expenses or competition.

It is very difficult to frame a law which will be effective against all the different arrangements under which a trust can do business. The State courts have no jurisdiction outside the limits of the State to which they belong, and it is very seldom that a trust would be formed whose business would be confined to any one State. The Federal government has passed several anti-trust laws, and up to the present time the most effective way of dealing with this class of combinations is by laws passed under the clause in the Federal Constitution (Art. I., § 8, cl. 3), which provides that Congress shall have power "to regulate commerce with foreign nations, and among the several States, and with the Indian tribes."

In recent years a great many combinations called trusts have been formed, and one of the most recent instances is that of the Northern Securities Company, which was decided by the United States circuit court of appeals in April 1903. In this case there were two parallel and competing railroad companies doing an interstate commerce business. These roads were controlled by a very few people, and they formed a corporation called the Northern Securities Company, which gave its stock in exchange for that of the competing railroads. The result was that the Northern Securities Company owned the two competing roads, and it naturally follows that the roads would be run as one line instead of, as formerly, competing lines. The court decided that the anti-trust laws covered such a case, and granted an injunction, declaring that the stock of the Northern Pacific Railroad and the Great Northern Railway companies (the two competing roads), held by the Northern Securities Company, was acquired in view of a combination among the defendants in restraint of trade and commerce among the several States, such as the anti-trust law denounces as illegal, and restrained the Northern Securities Company from exercising any control over either of the parallel and competing railroads.

Combustion. In consequence of the combination of the carbon and hydrogen in fuel with the oxygen of the air being the universal method of getting heat and light, and as when the action takes place the fuel is said to burn or undergo combustion, the latter term has been extended to those cases in which other bodies than carbon — for example, phosphorus, sulphur, metals, etc. — burn in the air, or in other substances than air — for example, chlorine. It is therefore but a special case of chemical action which, partly on account of its frequency and importance, partly on account of its obviousness, has attracted greater attention than the more recondite but not less potent manifestations of the same force. It is besides of peculiar interest in the history of chemistry, because all along it was felt to be of great importance to understand in what combustibility actually consists. The older chemists ascribed to bodies a combustible principle which assumed different shapes at different epochs, but continued till Lavoisier, in the end of the 18th century, pointed out the part which oxygen gas performs in the combustion of a body. One result of this was that the idea of a combustible principle quickly disappeared from chemical theory, and there grew up in its place a separation of bodies into combustibles and supporters of combustion, which is still retained in common language. The distinction, however, is accidental, for, as it requires the concurrence of a member of both classes to produce burning, it is plain that each must be regarded as supporting the combustion of the other; and it is experimentally possible to reverse the ordinary conditions, and exhibit that body as the combustible which is usually defined as the supporter of combustion, and as a necessary consequence the other acting as the supporter, which is usually regarded as a combustible.

For many years subsequent to Lavoisier his views were dominant, but increase of facts led to most important modifications of them. By degrees, combustion and oxygen, which was the chief element concerned, have lost their theoretical predominance, and have merged in ideas which are not limited to one set of actions, but which will ultimately attempt to comprise all the manifestations of chemical action in a general theory. See HEAT; LAVOISIER; METAL; OXYGEN; PHLOGISTON.

Combustion, Spontaneous, the ignition of bodies by the internal development of heat without the application of an external flame. It not infrequently takes place among heaps of rags, cotton, and other substances strongly lubricated with oil, when, if the oil is freshly made, it is very ready to combine with the oxygen of the atmosphere and give out carbon and hydrogen. The heat thus developed, diffusing itself through

a mass of highly inflammable substances, will in certain circumstances be sufficient to set them on fire. A remarkable instance of spontaneous combustion among hemp was afforded in June 1861, being the cause of the terrible conflagration in Tooley Street, London. Bituminous coal, piled up in heaps, is apt to ignite by the decomposition of the sulphuret of iron which it contains. In ships laden with coal impregnated with sulphur and iron in the form of bi-sulphuret of iron (pyrites), decomposition of this substance is sometimes occasioned by the access of moisture, and heat is evolved to such a degree as to cause the combustion of the coal, especially if air is admitted freely. Water poured upon the burning material only adds to the intensity of the action. The most singular instances, however, of spontaneous combustion are those of which human beings become the victims in their own persons — if we really can believe that such cases have occurred. Those whom it is alleged to have befallen have been individuals grossly addicted to intemperance, fat, and advanced in years. The chemical changes producing such a result are not well understood, and from the difficulties attending its explanation some eminent chemists, such as Liebig and others, have been led to reject the theory altogether as untenable, and maintain that none of the instances adduced are well authenticated. Among other hypotheses regarding the origin of this extraordinary phenomenon, it has been surmised to be owing to the development of phosphuretted hydrogen, which takes fire on coming into contact with atmospheric air, and might be formed and exhaled under certain conditions from the living body. The proximate cause of the ignition appears always to have been some burning substance, such as a candle, the fire, or a spark from a tobacco-pipe. The flame in cases of human combustion is described as having been of a bluish color, faint, and extinguished with difficulty by water. It is said to be the trunk which is first consumed, the extremities being the last to be destroyed. Dickens, in his 'Bleak House,' has introduced a gruesome case of spontaneous combustion.

Comédie Française, kō-mā-dē frăn-sāz, the official name of the national theatre of France which is supported from public funds, for the purpose of advancing dramatic art. After Molière's death, in 1673, the rivalries existing between the two factions into which his company of actors had divided, caused the decree of Louis XIV. of 21 Oct. 1680, that made this a national institution. This decree has remained in force with but slight modifications down to the present.

Comédie Humaine, ü-mān, La, a series of novels by Balzac, so classified by their author, and intended to form a picture of the manners and morals of the period.

Comedietta, kō-mā-dĭ-ĕt'ta, a dramatic composition of the comedy class, but not so much elaborated as a regular comedy, and generally consisting of one or at most two acts.

Comedones, kŏm'ę-dōnz, a name applied to the little cylinders of sebaceous and epithelial substance which are apt to accumulate in the follicles of the skin and to appear on the surface as small round black spots. When squeezed out they have the appearance of minute maggots or grubs with black heads, and thence have derived their name. They are generally associated with a weak state of the skin as well as of the individual. Generous diet and tonic treatment with soap-and-water cleansing and friction will be useful; as an astringent to invigorate a debilitated skin, a lotion of corrosive sublimate (two grains) in emulsion of bitter almonds (one ounce) and dilute alcohol will be effective. See ACNE.

Com'edy, a dramatic representation of a light and amusing nature, in which are satirized pleasantly the weaknesses or manners of society and the ludicrous incidents of life. Comedy took its origin in the Dionysian festivals, with those who led the phallic songs of the band of revelers (Gr. *kōmos*) who, at the vintage festivals, gave expression to the exuberant joy and merriment by parading about, dressed up, and singing jovial songs in honor of Dionysus. These songs were frequently interspersed with extemporized jokes at the expense of the bystanders. Comedy first assumed a regular shape among the Dorians. The first attempts at it among the Athenians were made by Susarion, a native of Megara, about 578 B.C. Epicharmus first gave comedy a new form and introduced a regular plot. That branch of the Attic drama known as the Old Comedy begins properly with Cratinus. It lasted from 458 B.C. to 404 B.C. The later pieces of Aristophanes belong to the Middle Comedy. The chorus in a comedy consisted of 24. The Middle Comedy lasted from 404 B.C. to 340 B.C., and the New Comedy till 260 B.C. Middle Comedy found its materials in satirizing classes of people instead of individuals. New Comedy answers to the comedy of the present day. The most distinguished of Roman comic writers were Plautus and Terence, whose plots were mainly derived from the Greek. See DRAMA.

Comedy of Errors, The, a play by Shakespeare, first acted at Gray's Inn 28 Dec. 1594. It is one of the shortest of the Shakespearean plays, and one of the very earliest written. The main story is from the 'Menæchmi' of Plautus, and the plot turns upon a series of mistakes caused by the wonderful likeness between two sets of twin brothers: Antipholus of Ephesus and Antipholus of Syracuse, and their two servants, each named Dromio. In recent years two American actors, Robson and Crane, have frequently presented the play with great success, their roles being those of the two Dromios.

Comenius, kō-mē'nĭ-ŭs (originally **Komensky), Johann** (yō hän) **Amos,** Moravian educational reformer: b. Nivnitz, Moravia, 28 March 1592; d. Amsterdam 15 Oct. 1671. In 1616 he received an appointment as teacher in Fulnek, on the plunder of which by the Spaniards after the battle of Prague, in 1620, he lost all that he possessed, including his books and manuscripts. He then went to Poland, where, in 1632, he was elected bishop of the Moravian and Bohemian Brethren in Lissa. In 1631 he published his 'Janua Linguarum reserata,' a work translated into many European languages, also into Persian, Arabian, and Mongolian. In this he laid down a new system for teaching languages to children by the use of visible signs in order to facilitate the learning of words. His 'Orbis Pictus,' or the 'Vis-

ible World,' an abridgment of the 'Janua Linguarum reserata,' with the addition of a large number of cuts, was published in 1657. In the latter part of his life he gave himself up to religious dreams, after the fashion of that time, and revered Bourignon as a prophetess. Comenius' place in the history of education is now generally recognized. Consult Laurie, 'John Amos Comenius' (1881); Payne, 'Lectures on the History of Education' (1892).

Comet (Greek, "hair," alluding to the luminous appendage or tail with which the brighter comets are always associated, and which formerly won for them the name of "hairy stars"). Comets may for convenience be divided into two classes, periodic and unexpected. From 2 to 3 of the former, and from 3 to 4 of the latter, appear on the average every year, but the number varies greatly. In 1898 as many as 10 were discovered, 5 being found in 12 days. Of the 10, 7 were unexpected.

Every comet, no matter how magnificent it may subsequently be, when first discovered, if remote from the sun, appears as a small, very faint, hazy ball. As it comes nearer it becomes brighter, and generally larger, although sometimes it contracts in size. If it is going to be a fine comet it gradually lengthens out, and develops a short tail. The tail rapidly brightens and lengthens as the comet approaches perihelion, as the point in its orbit is called when it is nearest the sun. If the earth is favorably situated the comet appears at its best a few days after the passage of perihelion, and then gradually fades out and disappears as it came. About one unexpected comet in five is visible to the naked eye. The periodic comets move in elliptical orbits about the sun in planes not in general greatly inclined to the ecliptic. The longest period so far definitely known, that of Halley's comet, is 76 years. The unexpected comets have still larger orbits, lying in all planes, with much longer periods. Many of them have a retrograde motion, and occasionally one visits the sun never again to return to it. When an unexpected comet arrives, its orbit is first computed from three observations made on different nights, on the assumption that it is moving in a parabolic orbit. If we are able to observe it through a long period we frequently find that its path differs slightly from a parabola. It is not likely that any comet moves in an exact parabola. If it moves a little slower than the parabolic velocity, its orbit is an ellipse, and the comet really becomes periodic, although it is not classed as such until it has been certainly identified at another return. If it moves a little faster than the parabolic velocity, its orbit is a hyperbola, and the comet will recede into space never to return.

Should a comet happen to pass near one of the larger planets, its orbit may be somewhat changed by the approach and its speed may be either increased or diminished. In this manner new members of the periodic class of comets are from time to time added to the list. On the other hand, its velocity may be so far accelerated as to change its orbit, or even drive it out of our system, never to return to it. In this way some of the members of our periodic family of comets are subject to change; others, however, have apparently come to stay for good. Out of 33 well-known periodic comets 24 have, or did have, periods lying between five and nine years. Many of these were doubtless brought into our system by the giant planet Jupiter. Some of them have already disappeared, owing to a change in their orbits, while some have lost a large part of their gaseous constituents and thus become invisible.

This last statement naturally brings us to the question, What is a comet? In early times they were supposed to be objects within our own atmosphere, presaging famines, wars, and the death of kings. It was first shown by Tycho Brahe that they were celestial bodies independent of the earth, and Newton proved that, excepting their tails, they were bodies subject to the law of gravitation. In the middle of the last century it was shown by H. A. Newton, Schiaparelli and others that our chief meteoric showers, those of 10 August and 14 November, were due to great swarms of meteoric bodies moving in elliptical orbits, practically coincident with the orbits of two well-known periodic comets, 1862, iii. (Tuttle's), and 1866 i. (Temple's).

In several instances two or more comets are known to be following practically the same path, and it was but a step from this to see that the head of a comet was only a concentrated swarm of meteors. It is only within the last few years, however, that we have begun to understand the nature of a comet's tail. That it is matter in a state of extreme tenuity is obvious, since, when millions of miles of it is interposed between us and the faintest stars, they are still visible and practically undimmed. What has puzzled astronomers since the time of Newton, however, is the fact that while all other bodies in the sidereal universe, as far as we are aware, obey the law of gravitation, comets' tails are clearly subject to some strong repulsive force, which drives the matter composing them away from the sun with enormously high velocities. The tail, therefore, always lies outside of the comet's orbit, being somewhat behind the comet when the latter is approaching the sun, and somewhat in advance of it when the comet is receding.

That the tail is gaseous is proved conclusively by the spectroscope, also that it is in an extremely rarified condition; but why the extremely small particles which constitute a gas should act in any way differently under the law of gravitation from the larger meteoric masses which constitute the head of the comet is not at first sight obvious. If, however, we consider the matter carefully, we shall see that if all objects are attracted to the sun in proportion to their mass, and repelled from it in proportion to their surface, then the attraction will vary as the cube of the diameter of the objects and the repulsion as the square. For objects of ordinary size the repulsion is so slight that we cannot detect it; but if the object becomes gradually smaller, the attraction of the mass will diminish much more rapidly than the repulsion on the surface, and a time will come when they will be equal, and if the particle becomes still smaller, the repulsion must exceed the attractive force. It therefore becomes evident that if such a repulsive force existed, and if the gaseous molecules were sufficiently small, we should have an effect exactly like that which we observe.

It has been shown by J. J. Thomson ('Proceeding of the Royal Society,' LVIII. No. 350)

that if hydrogen gas is electrified positively, the green line in its spectrum will be brighter than the red, and, on the other hand, if negatively charged, the red will be brighter than the green. In the case of the sun the red is the brighter line, so that we may infer that the solar surface is charged negatively.

It is a well-known fact that if the ultra-violet rays of the spectrum be allowed to fall upon a metallic body little corpuscles or electrons leave the atoms forming the metallic body and fly away from them with enormous velocity. These corpuscles either carry a negative charge of electricity, or what is perhaps more probable, constitute the negative electricity itself. The atoms lacking these corpuscles are as we usually express it positively charged.

Surrounding the meteor swarm and with it forming the comet's head is a mass of gas. When a flying corpuscle comes in contact with a molecule of this gas the two unite, the molecule becomes negatively charged, and both being repelled by the negatively charged sun, recede from it. The subject will be found treated in more detail by R. A. Fessenden, 'Astrophysical Journal,' III., 36. He there computes the potential of the sun's surface at about 15,000 volts. According to Arrhenius and Thomson the corpuscles which constantly deliver a negative charge to the earth, and would therefore also deliver it to a comet, proceed directly from the sun. The tail probably receives a charge from both these sources, but the latter would seem to be much the more effective of the two.

The question may now naturally be asked, since there is an abundance of extremely rarefied gas at an altitude of a few hundred miles above the earth's surface, and since we too are exposed to the flying corpuscles, why is not the earth itself provided with a comet-like tail? In answer we reply that at certain times it is. 'Annals of Harvard Observatory,' XXXII., 288. Our great auroras are indeed nothing else than the appearance of a small cometary tail. These great auroras, which exist at an altitude of several hundred miles, and envelope the whole earth, must not be confounded with the small but intensely brilliant local auroras always existing at low altitudes in the polar regions.

The reason that these great auroras only reach an altitude of a few hundred miles, instead of several millions, like the tail of a comet, is on account of the great mass of the earth, which does not permit the electrified gases to escape from it. The great auroras exhibit two notable characteristics. They appear only when the electro-magnetic condition of the sun is greatly perturbed, and they are most conspicuous at those times when the earth is approaching or receding most rapidly from it; that is, at the end of March and September. The same appears to be true of comets. The longest tails belong to those comets that approach closest to the sun's surface, and accordingly approach and recede from it with the greatest rapidity. Of the comets that do not approach remarkably close to the sun's surface, those which come during years of great solar activity are more likely to be provided with long tails than those coming when the solar surface is quiescent. Of the past 62 years during which sun spots have been recorded, 31 have been classed as of greater, and 31 as of less solar activity. If the sun's activity had no influence upon a comet's tail, we should expect that an equal number of comets provided with long tails would have appeared in each of these intervals of 31 years. During the 62 years 10 comets have appeared that were furnished with long tails, and yet did not pass within 10,000,000 miles of the sun's surface. Of these, 7 came during the years of great solar activity, and only 3 during those of less. From this we see that comets' tails, like our auroras, other things being equal, appear to be more pronounced during years of great solar activity.

Since the electric current spreads out from the nucleus on all sides as it recedes from the sun, there must, by the well-known laws of currents, be a rotation produced by the magnetic force of the sun acting upon the current ('Annals of Harvard Observatory,' XXXII., 275). The tendency would be for the tail to revolve about its axis, in one direction, if located north of the sun's magnetic equator, and in the other direction if located south of it. Such a rotation has in fact been observed in the case of the bright comets of 1825 iv., 1835 iii. (Halley's), and 1892 i. (Swift's).

Quite recently another explanation of comets' tails has been given by Arrhenius. He attributes the recession of the particles forming the tail, however, to the repulsion of light. It was first shown mathematically by Maxwell that light must exert a slight mechanical pressure upon all bodies above a certain size that are exposed to it. Gaseous molecules are too small to be affected by it. In the case of large bodies it would be concealed by the overwhelming attraction of gravitation. In order to be repelled from the sun, particles having the density of water must have diameters lying between 1-1000 and 1-14000 of a millimetre, or between 1-25000 and 1-350000 of an inch. For particles of greater specific gravity the dimensions will have narrower limits.

It is most likely that several causes combined produce the observed repulsion of the tail. Several of these are suggested by Nichols and Hull in their article describing their attempt to produce an artificial cometary tail ('Astrophysical Journal,' 1903, XVII. 352). It was shown in the 'Harvard Annals,' XXXII., 288, that the gaseous spectrum persisted in the tail of Swift's comet to a distance of 3,000,000 miles from the head. The presence of dust would be indicated by reflected light giving the solar spectrum. On account of the faintness of the tail we should hardly expect to distinguish the solar lines, but a distribution of photographic intensity in the spectrum similar to that which we find in the sun might be accepted as evidence of the presence of dust in the tail. Such a distribution was found in the case of the bright comet of 1881 iii.

We may therefore say that the most probable explanation of a comet is that the head consists of a more or less concentrated swarm of meteors enveloped in gas and dust and that the tail is a current of gas and sometimes dust proceeding from the head, being most pronounced when the comet crosses the greatest number of electro-magnetic equipotential surfaces.

The shape and size of the tail enable us to compute the intensity of the repulsive force causing the tail to recede from the sun. This

was done by Bredichin, who divided all comets' tails into three classes according to the sharpness of their curvature, and suggested that the sharpness of the curve indicated the atomic weight and therefore the general chemical constitution of the matter forming the tail. This last suggestion is open to doubt.

More recently, by means of photography, we have been enabled to detect condensed areas in the tails of certain comets, and by comparing the photographs upon successive nights we have measured directly the speed of recession of the particles forming the tail from the head of the comet. Two comets so far have been measured in this manner, that of 1892 i. (Swift's), by the writer, and that of 1893 ii. (Rordame's), by Hussey. For the comet of 1892 the repulsive force was 39.5 times that of gravity. In the case of the comet of 1893, the repulsive force was 36 times as great ('Pub. Astron. Soc. Pac.,' VII., 185).

Since the gaseous particles receding from a comet's head can never again return to it, and since a comet is visible to us chiefly, and generally wholly, by the electrical illumination of this gaseous medium, it is clear that a comet must become less and less luminous after each return to the sun. But not only does it become less luminous on account of the loss of the material forming its tail, but the meteors composing its head likewise become more and more widely distributed along the course of its orbit. This is in part due to the positive charge left by the tail, which neutralizes the gravitation — or pull of the various portions of the comet's head for one another — and therefore permits those portions of the meteoric swarm which are nearest to the sun to move at a higher speed than those portions which are more remote.

In some cases, like our August meteors, the distribution extends throughout the orbit, with but one luminous condensation, known as the comet of 1862 iii. In some cases there are two or more condensations. Thus Biela's comet was seen to split into two parts. Four distinct comets were found following in the track of the great comet of 1668.

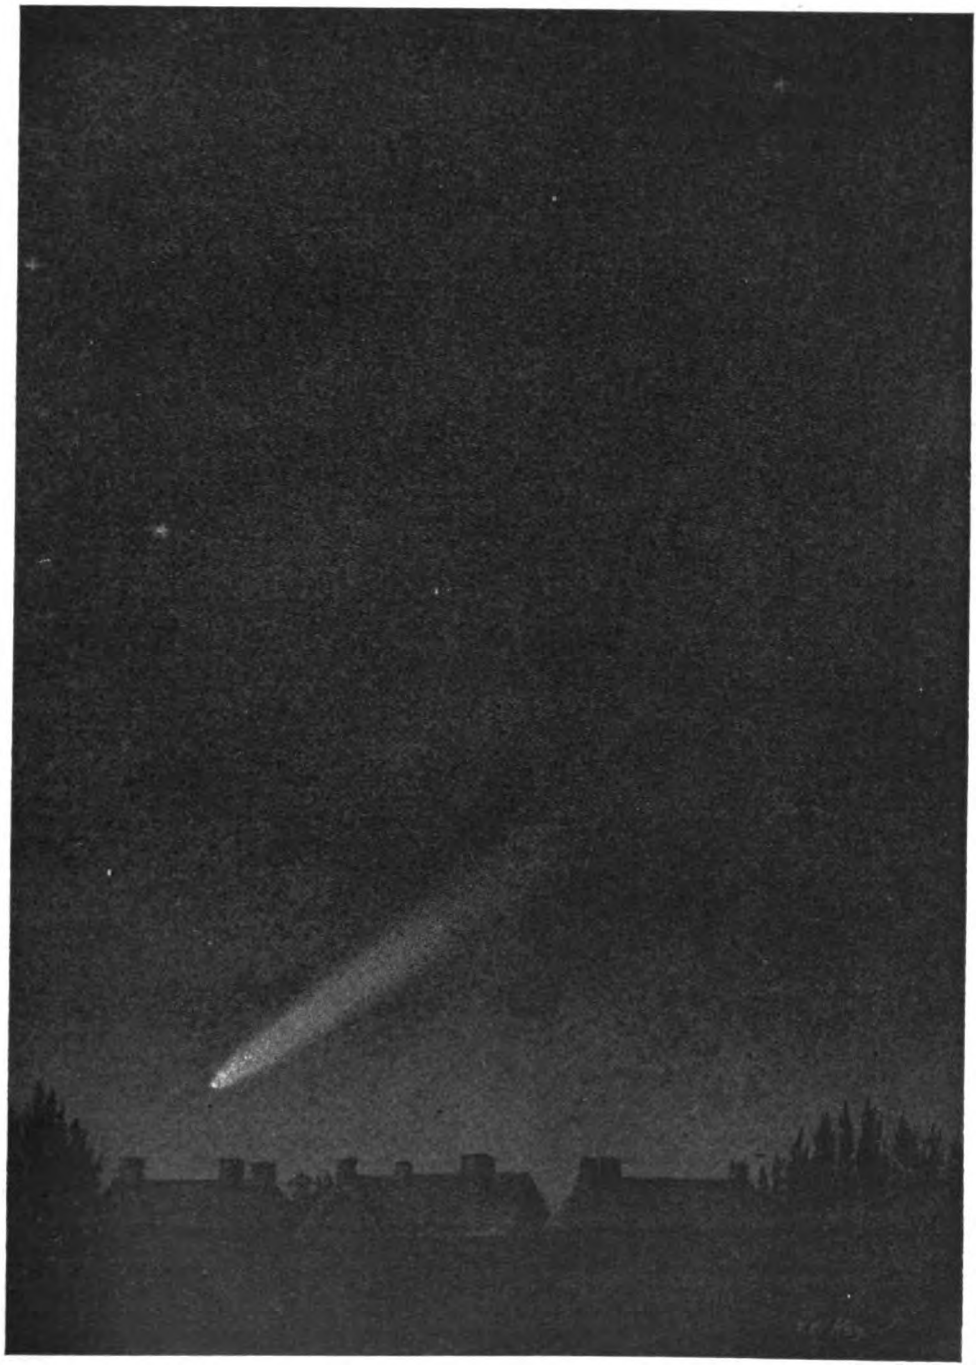
We must now discuss the important question, what is the origin of comets? It is known that the sun, with its attendent planets, is traversing space in the direction of the constellation Lyra at a speed about 12 miles per second. If comets come from remote interstellar space, or from the other stars, it is obvious that we should meet more comets coming from Lyra than would overtake us coming from the opposite direction. Also that those comets we met would have a greater velocity relative to the sun than would those that might overtake us. Nothing of the sort is found, however — the distribution is uniform in all directions. There is but one conclusion to be drawn from this, and that is that all the comets that we have observed possess the same common speed as the sun, omitting relative motion, and travel in the same direction. In short, they are all of them parts of the same original gaseous mass from which the solar system condensed, being merely those portions which were originally left on the outside, before the great common rotation was established, and which now occasionally drop in toward the centre, and then fly back again to their original position on the outskirts of the system. The normal path of every comet is therefore an ellipse. If the paths of some comets have become slightly hyperbolic through the action of some outside body, they can never again visit the sun. As we have just seen, a comet not belonging to our system would be most likely to approach us from the general direction of the constellation Lyra, with a high hyperbolic velocity. We are acquainted with the orbits of about 400 comets, but no such body is found among them.

From this point of view it is interesting to determine of what chemical elements comets are composed. To this the spectroscope gives a ready answer, and shows that by far the most common elements are hydrogen and carbon in chemical combination. This answer, however, is only a partial one, because most comets do not approach sufficiently near to the sun to enable their more refractory elements to be volatilized. The bright small comet of 1882 i. (Wells') approached so close to the solar surface that the distance at perihelion amounted to only about 5,000,000 miles. Some of its metallic constituents were accordingly vaporized, the most prominent of them being sodium. The great comet of 1882 iii. approached within 300,000 miles of the sun's surface. This was so near that not only the sodium, but even some of the iron lines appeared in its spectrum. This is what we should have expected, judging by the chemical composition of most of the meteors that reach the earth's surface. We thus see that incidentally comets are able to give us information regarding the temperature that bodies would attain at different distances from the sun. When the metallic lines are present in the spectra of these comets the carbon bands vanish. This is precisely the effect that is produced in our laboratories when the cause of the illumination is an electric current. The current by preference selects the molecules which are the best conductors. If the illumination of the comet were due merely to heat, there is no reason why the carbon bands should have disappeared.

Few persons now living remember distinctly the great comet of 1843. It appeared suddenly in the northern hemisphere about the middle of March, and was not long visible. It was notable for the great length of its tail and its small perihelion distance,— the smallest on record. This amounted to only 511,000 miles. Its centre therefore came within 78,000, and the nearer side of its head within 32,000 miles of the sun's surface.

The great comet of 1858, known generally as Donati's, was a magnificent object. Not only was it a fine comet in itself, but it seems as if everything conspired to enable it to be well seen from the earth. It was a most conspicuous object in the northern sky during the early evenings in October, and was nearest us shortly after the passage of perihelion. Its tail reached a length of 60° and swept as a broad curved plume across the heavens. It was visible for several months, which enabled it to be carefully observed, and there is no doubt but that it moves in an elliptic orbit. Its period is about 2,000 years.

The great comet of 1861 was discovered by Tebbutt in Australia. It appeared suddenly in the northern hemisphere at the end of June and, according to Sir John Herschel, was the brightest comet of the century up to that time. It was not long visible.



THE COMET OF 1882,

The great comet of 1882 was remarkable on many accounts. In the first place it was shown to be one of a group of five comets all following nearly in the same orbit. The four others were those of 1668, 1843, 1880, and 1887. The last was comparatively inconspicuous, but the others were all notable. The nucleus of the comet of 1882 moreover showed a tendency to fall apart, five different condensations in it being visible at once. Schmidt, Barnard, and Brooks all noticed small companion nebulesities in the immediate vicinity of the comet and moving with it. It was visible for about nine months — an unusually long interval, and in this time it traversed 340° of its orbit. It clearly follows an elliptical path with a period which lies between 772 and 1,000 years. The tail was very extraordinary. It measured about 200,000,000 miles in length, and was strongly forked at the end. Moreover it was accompanied by a clearly seen but filmy sheath of light, extending 3° or 4° towards the sun. The whole comet was surrounded by an elliptical envelope of enormous dimensions and of a still more filmy nature. That this most remarkable object was not more generally observed by the public is due undoubtedly to the fact that it was visible only in the early morning hours. It was certainly the brightest comet of the century, and it was so bright that it was watched in perihelion passage until in contact with the sun's limb, when it suddenly disappeared, being of too filmy a nature to be detected upon the sun's surface. For three days it was visible to the naked eye with the sun above the horizon. There have been so far 14 different comets placed on record which were bright enough to be seen under these circumstances.

Turning now to the periodic comets; by far the finest is Halley's. Our first record of it is in the year 11 B.C. Since then it has appeared regularly every 76 or 77 years, in all 25 times. We have a drawing of it as it appeared in 684, and another drawing of it in 1066. During its latter appearance it was considered to be the precursor of the conquest of England by William of Normandy. It was a magnificent object in 1145, and again in 1223, when it was supposed to foretell the death of Philip Augustus of France. In 1456 it was a superb object appearing shortly after the Turks had taken Constantinople. In 1682 it was observed by Halley, who computed its orbit, and showed that it was identical with the great comets of 1531 and 1607, and predicted its return for the end of 1758 or the beginning of 1759. This is the first time that the return of a comet was ever predicted, and although Halley knew that he could not expect to live to see his prediction fulfilled (he was born in 1656), yet he left a somewhat plaintive appeal to posterity, that in case the comet should reappear, it should be remembered that this first prediction was made by an Englishman. The comet appeared Christmas day 1758. At its next appearance, in 1835, the comet was a fine object, but did not correspond in brilliancy to the descriptions of some of its earlier apparitions. This may perhaps be explained by the fact that it was but two years after a sun-spot minimum. Its next appearance is scheduled for 1911 or 1912, also unfortunately very near a sun-spot minimum. But very likely the chief reason for its relative faintness in 1835 is that the material which formed the tail has been largely used up by its frequent visits to the sun, and that it will thus never again present the brilliancy of its past appearances.

The following table of the elements of the orbits of the periodic comets has been condensed and brought up to date (1 Jan. 1904) from Holden's tables of periodic comets given in the 'Encyclopedia Britannica':

TABLE OF THE MOST IMPORTANT PERIODIC COMETS.

T	ω	Ω	i	q	a	U	e	
1901 II. Sept. 15.....	184°	335°	13°	0.34	2.22	3.30	0.85	Encke.
1899 IV. July 28.....	186	121	13	1.35	5.28	5.28	0.54	Tempel II.
1884 II. Aug. 16.....	301	5	5	1.28	3.08	5.40	0.58	Barnard.
1879 I. Mar. 30.....	15	101	29	0.59	3.10	5.47	0.81	Brorsen.
1891 V. Nov. 15.....	107	296	5	1.09	3.13	5.53	0.65	Tempel—L. Swift.
1886 IV. June 7.....	177	54	13	1.33	3.15	5.60	0.58	Brooks.
1898 II. Mar. 20.....	173	101	17	0.92	3.24	5.72	0.72	Winnecke.
1894 IV. Oct. 12.....	297	49	3	1.39	3.25	5.86	0.57	De Vico—E. Swift.
1879 III. May 7.....	160	79	10	1.77	3.30	5.98	0.46	Tempel I.
1892 V. Dec. 11.....	170	207	31	1.43	3.38	6.23	0.58	Barnard.
1890 VII. Oct. 26.....	328	45	13	1.97	3.45	6.40	0.47	Spitaler.
1896 VII. Nov. 25.....	164	247	14	1.11	3.46	6.44	0.68	Perrine.
1896 V. Oct. 26.....	140	192	12	1.48	3.50	6.55	0.58	Giacobini.
1852 III. Sept. 23.....	223	246	13	0.86	3.53	6.62	0.76	Biela (I. and II.).
1893 III. July 12.....	316	52	3	0.99	3.53	6.62	0.72	Finlay.
1897 II. May 24.....	173	146	16	1.32	3.55	6.68	0.63	D'Arrest.
1898 IV. July 5.....	173	206	25	1.60	3.60	6.82	0.56	Wolf.
1900 III. Nov. 28.....	172	196	30	0.93	3.62	6.66	0.74	Giacobini.
1899 II. Apr. 28.....	14	332	21	2.14	3.62	6.87	0.41	Holmes.
1895 II. Aug. 21.....	168	170	3	1.30	3.68	7.06	0.65	L. Swift.
1896 VI. Nov. 4.....	344	18	6	1.96	3.69	7.10	0.47	Brooks.
1894 I. Feb. 10.....	46	84	6	1.15	3.80	7.42	0.70	Denning (II.).
1896 II. Mar. 19.....	201	210	11	1.74	3.85	7.57	0.55	Faye.
1889 VI. Nov. 30.....	70	331	10	1.35	4.18	8.53	0.68	L. Swift.
1881 V. Sept. 13.....	312	66	7	0.72	4.23	8.69	0.83	Denning (I.).
1899 III. May 4.....	207	270	54	1.02	5.74	13.66	0.82	Tuttle.
1866 I. Jan. 11.....	171	231	163	0.98	10.32	33.18	0.90	Tempel.
1867 I. Jan. 20.....	358	78	18	1.58	11.71	40.09	0.86	Stephan.
1852 IV. Oct. 13.....	57	346	41	1.25	15.44	60.7	0.92	Westphal.
1884 I. Jan. 26.....	199	254	74	0.78	17.2	71.56	0.96	Pons-Brooks.
1887 V. Oct. 8.....	65	84	45	1.20	17.4	72.65	0.93	Olbers.
1846. IV. Mar. 6.....	13	78	85	0.66	17.90	75.7	0.96	De Vico.
1835 III. Nov. 16.....	111	55	162	0.59	17.99	76.29	0.97	Halley.

The question is often asked the astronomer, what would happen if the earth should come into collision with a comet? As far as the tail is concerned, that is probably a frequent occurrence. It happened twice during the last

century, in the case of the comets of 1819 ii. and 1861 ii., but in neither case was it known until after the encounter had occurred. Should we come into contact with the head of a small comet there would undoubtedly be a fine meteoric display. That is in fact what probably happened in 1833, and also on a number of previous occasions, notably in 472, 902, 1029, 1202, and 1799, although the comet itself was not luminous. If the comet were moving rapidly with regard to the earth, as in these cases, the meteors would be consumed at a great altitude in our atmosphere, and no harm would be done. If the comet were moving in the same direction as ourselves, however, and at about the same speed, the matter would then become more serious, as many of the meteors might reach the earth's surface.

The self-luminous, and therefore visible comet, which has come nearest to the earth, as far as we are aware, was that of 1770 i. (Lexell's). It approached within 1,400,000 miles, or six times the distance of the moon. Its head appeared about four times the diameter of the moon, but its mass was imperceptibly small. Should the earth strike the nucleus of a great comet, like that, for instance, of 1858, it is impossible to foretell what would happen, but possibly the temperature and shock would be such that all life within several thousand miles of the point of contact would become extinct. Considering the vast recesses of celestial space, however, and the insignificant size of our earth, the probability of such an encounter may well be likened, as someone has suggested, to the chance that if a man should shut his eyes and fire a gun into the air, he would bring down a bird.

For a more detailed account of the individual peculiarities of the more interesting comets, see Clerke's 'History of Astronomy'; Chambers' 'Handbook of Astronomy.'

WILLIAM H. PICKERING,
Harvard College Observatory.

Comet, in ornithology, one of a group of humming-birds with long forked tails. One of the most imposing of all humming-birds is the Sappho comet (*Cometes Sappho*), or bar-tailed humming-bird, native to Bolivia, but migratory, and in the winter generally visiting eastern Peru. Specimens are secured only with great difficulty, owing to the rapidity of the complex evolutions of the bird when on the wing. Mounted examples, gorgeous as they are, do not convey an adequate idea of the brilliancy of the plumage. The Phaon comet (*Cometes Phaon*) is equally magnificent, but larger, inhabiting also Peru and Bolivia. It is distinguished from the Sappho comet by the fact that the tail is wholly crimson red, while that of the Sappho comet is ruddy brown at the base and is tipped with a black band. See HUMMING-BIRDS.

Comet-seeker (also called COMET-FINDER), a telescope of low power but optically so contrived as to have a wide field, used in searching for comets.

Cometas, called SCHOLASTICUS, Greek author, generally assigned to the 9th century A.D., although his time is doubtful. There are extant of his works a paraphrase of part of the eleventh chapter of Saint John's Gospel, in 57 hexameter verses, and six epigrams in the Greek Anthology. It appears from some of these epigrams that he made a new recension of the Homeric poems, effecting radical changes for the better in the punctuation. Clemens Alexandrinus refers to a Cometas of Crete as a commentator on Homer. By some he has been identified with the Cometas who was made professor of grammar at Constantinople in 856.

Comète, Pensées sur la, a work by Pierre Bayle, published in 1682, on the occasion of the appearance of the comet of 1680. It is a discussion of various questions of metaphysics, morals, theology, history, and politics, and is written with a boldness of thought unusual in those times. Its general thesis is that atheism is less to be feared than idolatry and superstition.

Comettant, Oscar, French musician, composer, and author: b. Bordeaux 18 April 1819; d. Montivilliers 1898. He was a pupil of Elwart and Carafa at the Conservatoire, and first became known as a pianist; he also wrote several works for the piano, duets for violin and piano, and choruses and songs. Among the piano compositions were 'Robert Bruce' and 'Le Juif Errant'; the vocal included 'L'Alboni' and 'L'Inde Révoltée.' For many years he was musical critic of the *Siècle,* and he was also a contributor to the 'Ménestrel,' the 'Gazette Musicalé,' and other journals of music. A great traveler, he visited the United States and wrote a book of impressions, 'Trois Ans aux Etats-Unis' (1857). Among his further works, most of which are marked by a humorous and brilliant style, are : 'Les Civilisations Inconnues' (1863); 'Le Danemark tel qu'il Est' (1865); 'La Musique, les Musiciens, et les Instruments de Musique' (1870); and 'Francis Planté' (1874).

Comez, or Comes, Juan Baptista, Spanish composer: b. province of Valencia about 1560. He was director of the music at Valencia in the Cathedral and in the Church del Patriarca. His reputation in Spain is very high. His compositions are preserved in manuscript at the Escurial and various churches. A two-volume collection of them appeared at Madrid in 1889.

Comfort, Samuel, American manufacturer: b. Morrisville, Bucks County, Pa., 5 May 1837. He enlisted for the Civil War in an independent cavalry company, subsequently recruited and equipped a cavalry company, and in 1865 was made major and mustered out. After the war he became interested in petroleum refining at Titusville, Pa., his business finally being merged with the Standard Oil Company. He was made representative of the company in western India, with headquarters at Bombay. In 1894–6 he was United States vice-consul, and in 1896–8 consul, at Bombay. He patented several mechanical devices.

Comfort, George Fisk, American scholar and educator: b. Berkshire, Tompkins County, N. Y., 20 Sept. 1833. Graduated from Wesleyan University in 1857, he studied archæology and the history of the fine arts in Europe, in 1865–8 was professor of modern languages and æsthetics in Allegheny College (Meadville, Pa.), and in 1868–72 lecturer on Christian art and archæology in the Drew Theological Seminary (Madison, N. J.). In 1872 he was appointed professor of modern languages and æsthetics in the newly-established Syracuse University, where he organ-

ized the college of fine arts, of which he was dean from 1873 to 1893. He organized the Syracuse Museum of Fine Arts in 1896, and became its director. He was also one of the chief organizers of the American Philological Association, and from 1869 to 1874 its secretary. From 1872 to 1893 he was editor of the art department of the 'Northern Christian Advocate.' He has also contributed extensively to periodicals, and published 'Art Museums in America'; 'Modern Languages in Education,' and other works.

Comfrey, kŭm'frĭ, the common name of the genus *Symphytum* of the natural order *Boraginaceæ* or *Borage* family. There are about 15 species, all natives of the Old World, where they are used in household medicine or for forage plants. Attempts have been made to naturalize them in America for commercial purposes, but the experiments have not given much promise of success. There is but one American species growing wild, *S. officinale,* naturalized from Europe or Asia. It is a coarse perennial weed, from two to three feet high, with flowers in long racemes. The roots are mucilaginous, and are supposed to have medicinal virtues as a cure for diarrhœa. It is known also as blackwort, bruisewort, and boneset. In England the leaves, gathered while young, are sometimes used as a substitute for spinach, and some people of unrefined taste eat the young shoots after blanching them by forcing them to grow through heaps of earth. Comfrey stewed in sugar, with a small amount of paregoric added, makes a highly prized domestic remedy for coughs and bronchial irritations.

Comines, kō-mēn, **Commines,** or **Comynes, Philippe de,** French statesman and historian: b. Comines near Lille 1445; d. Argenton 18 Oct. 1509. He stood high in the favor of Charles of Burgundy, afterward Charles the Bold, and on occasion of Louis XI.'s imprisonment by Charles at Péronne, succeeded in bringing about a treaty of peace between them. In 1472 he forsook the cause of the Duke of Burgundy and became councilor and chamberlain of Louis XI., who compensated him so amply for the loss of his property, which had been confiscated by Charles, that he soon became one of the most wealthy and influential noblemen in France. The death of Louis, however, proved fatal to his fortunes. He was no favorite with Anne de Beaujeu, the regent, and was imprisoned on a charge of conspiracy against her. On the accession of Charles VIII., however, he was again employed in the public service, but went into retirement after the advent of Louis XII., who seemed reluctant to favor him, although he left him in possession of a pension. The fame of Comines rests not only upon his astuteness as a statesman, but still more upon his 'Mémoires,' which give a complete view of the political affairs of his time, and present a vivid picture of the character of Louis XI. They have been frequently printed. Lenglet Dufresnoy's edition (London 1747), is still sought for, especially on account of its annotations; but the best are those published by Mlle. Dupont (Paris 1840–7); and Chantelauze (1881). Comines figures in Sir Walter Scott's romance of 'Quentin Durward.'

Coming Race, The, a story by Edward Bulwer-Lytton, published in 1871. It was a skit at certain assumptions of science; but its clever invention and brilliant treatment, added to the craving wonder of humanity as to what its evolution is to be toward, gave it a large popularity.

Comitat, kŏm'ĭ-tạt (L. *comitatus*), which means county, the name given to administrative districts of some size into which Hungary and Transylvania are divided.

Comitia, kō-mĭsh'ĭ-ạ, with the Romans, the assemblies of the people in which the public business was transacted, and measures taken in conformity with the will of the majority. They existed even under the kings. In the time of the republic they were convoked by the consuls; in their absence often by the dictator, the tribunes, and in extraordinary cases even by the pontifex maximus. There were three comitia among the Romans, which were called *comitia curiata, comitia centuriata,* and *comitia tributa.* The oldest of these was the *comitia curiata,* so called because in it the people voted by *curiæ* or wards. It consisted exclusively of the patricians, the original ruling class at Rome, and the class to which the name of populus was at first restricted. They were divided into three tribes, the Luceres, Ramnes, and Tities, each of which was divided into 10 curiæ, so that there were 30 curiæ who voted in the comitia curiata. The comitia centuriata was a mixed assembly of the patricians and plebeians, in which the people voted by centuries, as these had been formed by Servius Tullius. On the institution of this comitia the principal privileges of the comitia curiata were transferred to it, and in course of time the functions of the latter became a mere formality, so that even before the time of Cicero these were not performed by the curiæ themselves, but by 30 lictors representing them. The rights of the comitia centuriata were thus very important, comprising the right of electing the higher magistrates, the right of passing or rejecting laws proposed to them, the right of deciding upon war on the ground of a *senatus consultum* or decree of the senate, and the highest judicial power. This comitia could be held only on certain days, and it must be summoned 17 days before the day of meeting. On the day of the comitia itself the presiding magistrate, with an augur, went into a tent before the city in order to observe the auspices. If the augur declared them unexceptionable, the comitia was held; if not, it was postponed to another day. Before sunrise and after sunset no business was transacted in the comitia. The presiding magistrate, on his curule chair, opened the assembly by a prayer, which he repeated after the words of the augur. In earlier times, first the equites, then the centuries of the first class, etc., were called upon to vote. In later times lots were cast for the order of voting. The opinion of the century which first voted was usually followed by all the rest. In the earliest times every century voted verbally; in later times by ballot. What was concluded in each century by the majority, was proclaimed by the herald as the vote of this century. The comitia was interrupted if any one in the assembly was attacked by a fit of epilepsy (which was called for this reason *morbus comitialis*), or if a tribune of the people pronounced his veto, and under some other circumstances. The other comitia, the comitia tributa, which was also an institution of Servius Tullius, was essentially plebeian in its nature, for if the patricians were not, as some

think, entirely excluded from it, they were in so small a minority that their influence was scarcely felt. It was based upon the division which Servius Tullius made of the whole Roman territory into 30 local tribes, which were afterward increased to 35. Its power was at first very limited, being merely local, but it gradually increased, so that it in the end it came to possess the right of exercising electoral, legislative and judicial functions, though not so extensive as those of the comitia centuriata. It had the right of electing only the inferior magistrates; legislatively, it was merely entitled to pass resolutions proposed by the tribunes, which before becoming law had to be sanctioned by the senate; judicially, it had the right of trying only those who had committed offenses against the majesty of the people, and the only punishment it could inflict was a fine. It might assemble either within or without the walls of the city, but not at a greater distance than 1,000 paces, which was the limit of the power of the tribunes. The comitia centuriata, on the other hand, always met in the Campus Martius. Sometimes the comitia centuriata was mixed with the comitia tributa, but in what manner it is not known. The emperors retained these assemblies for the sake of appearance, but used them only as instruments for the accomplishment of their purposes.

Comitlan, kō-mēt-lān', or **Comitan,** kō-mē-tān', Mexico, a town in the state of Chiapas, on the Grijalva River, 35 miles southeast of Ciudad Real. It has a magnificent church, and is a place of considerable trade. It is supported chiefly by contraband trade, as the duties on foreign goods are excessive. Pop. 10,000.

Comitium, a square in the ancient city of Rome between the Curia and the Forum, where the comitia curiata (q.v.) met. It contained the original rostrum or speakers' platform.

Com'ity of Nations (more frequently mentioned by its Latin equivalent, *comitas gentium*), the international courtesy by which effect is given to the laws of one State within the territory and against the citizens of another State. "In the silence of any positive rule," says Story, "affirming, or denying, or restraining the operation of foreign laws, courts of justice presume the tacit adoption of them by their own government, unless they are repugnant to its policy or prejudicial to its interests." Consult Story, 'Conflict of Laws.'

Comma, the stroke or mark used in writing and printing to separate from each other phrases and clauses in a sentence. The word is of Greek origin and is the noun of the verb *kopto,* to cut; hence literally comma is section, and in grammatical works written in Greek and Latin *comma* or its diminutive *kommation* means a clause in a period as well as the punctuation mark, and in prosody the cæsura. In German typography the punctuation mark comma is a downward short stroke from right to left (/).

Comma Bacillus. See CHOLERA.

Commagene, kŏm-a-jē'nē, in ancient times a district in the north of Syria, bounded on the east by the Euphrates, on the north by Mount Amanus, and on the west by Cilicia, for some time attached to the kingdom of the Seleucidæ, but afterward for more than 100 years an independent state. It seems to have become independent about 100 B.C., and on the death of its fifth king, Antiochus III., in 17 A.D., it was made a Roman province. It was again for a time allowed by the Romans to hold a position of nominal independence, but was reduced to a Roman province by Vespasian, 73 A.D.

Commander-in-Chief, the supreme commander of the united forces of any country. In the United States the President for the time being is commander-in-chief of the army and navy, and of the militia of the several States when the latter is in the national service and forms part of the national provisional army. In all other cases the governor of each State is the commander-in-chief of the State troops. In England he is officially called the officer commanding-in-chief. He is the head of a department of the military administration. He acts, under the secretary of state for war, as the head of the army, and when military operations are undertaken on a sufficiently large scale to require his presence, is charged with the duty of commanding the army in the field, though, as a matter of fact, this very rarely occurs.

Commander Islands, two islands belonging to Russia lying east of Kamchatka in Bering Sea. The larger, Bering Island (q.v.), lies nearest the coast; the other island of the group, Miedni, is nearly 30 miles long but narrow; it is sometimes called Copper Island, because copper is found there in small quantities. The climate is mild and there are a few inhabitants.

Commander of the Faithful, a title assumed by the Caliph Omar, and retained by his successors. See CALIPH.

Comman'dery. (1) Among the Knights Templar, Hospitallers, etc., a district under the administration and control of a member of the order, called the commander or preceptor, who received the income of the estates within that district, expending part for his own use, and accounting for the rest. In England more especially applied to a manor belonging to the Knights Hospitallers or Knights of St. John of Jerusalem. These establishments formed at the same time branches. . . . On the first creation of these (branch) establishments, they were denominated Preceptories; the superior being called the preceptor; but eventually the name became changed to that of commandery, by which they were always afterward known. The council reserved to themselves the power of at any time recalling a commander from his post, and substituting another in his place, at their pleasure; he being merely considered as the steward of their property. Time, however, gradually wrought a great change in the relative position which the commanders held to the council; and, eventually, a nomination to a commandery came to be considered in the light of a legal acquisition, subject only to the payment of a certain amount of annual tribute to the public treasury, which tribute received the name of Responsions. (2) A regular assembly of Knights Templar, which confers certain degrees. Consult 'History of Knights of Malta.'

Commandite, kŏm-mŏn-det', a term used in France, primarily for a partnership or firm, in which one advances the funds, while another devotes his skill and assiduity; but by extension, a co-partnery en commandite oftener means a

company for manufacturing or trading, "with limited liability." In terms of French commercial law, those whom we would call the sleeping partners or silent partners in such associations are denominated commanditaires. Their names do not appear in the nominal title of the firm; they may assist it with their counsel, but they cannot order or sign for its behoof, nor act overtly for it in any way; on the other hand, they are not bound to incur a final loss in case of its failure, beyond that of the entire sum they have advanced, should indeed such be needed to satisfy the claims of agents and creditors. For all details on the rights and obligations of commanditaires, see the French 'Code de Commerce,' articles 23–28.

Commelin, kŏm-lăn, **Casper,** Dutch botanist; d. 1731. He was a nephew of Jan Commelin (q.v.).

Commelin, Hieronymus, hī-ē-rŏn'ĭ-mŭs. See COMMELIN, JEROME.

Commelin, Isaac, Dutch historian: b. Amsterdam 1598; d. there 1676. Among his works the history and description of Amsterdam is still much valued.

Commelin, Jan, yän, Dutch botanist: b. Amsterdam 1629; d. 1692. He was for many years a professor of botany in the university of his native city, where with his nephew, Casper, he founded the botanical gardens renowned throughout Europe.

Commelin, Jerome, Flemish printer: b. Douay; d. Heidelberg 1598. He was distinguished by his excellent editions of Greek and Latin classics. His emblem is a figure of Truth, and on many editions the words *Ex Officina Sanct. Andreana.*

Commelin, kŏm'mĕ-lĭn, **or day-flower,** is a genus of the spiderwort family (*Commelinaceæ*). It contains about 95 species widely distributed in warm and temperate zones. There are about eight species found in the United States, along streams and in waste places, from New Jersey to Missouri, southward to Florida and Texas. It is also common in Asia and Africa. The fleshy rhizomes of the plant may be eaten when cooked, as they contain much starch and mucilage. In Asiatic countries some species are used for medicinal purposes. The plant receives its name from Jan and Casper Commelin, two noted Dutch botanists.

Commencement. In the colleges of the United States this term denotes the day when the students are made bachelors of arts, and when the degree of master of arts and the honorary degrees of doctors in the professions are also conferred. The term is given also to the closing exercises of secondary and even elementary schools.

Commendam, kŏm-mĕn'dăm (Lat. *commendare,* that is, to intrust), used in ecclesiastic law to denote the administrative or provisional management of a benefice during a vacancy. The person intrusted with the management is called *commendator.* The grant or benefice was sometimes converted into a regular fief and was then said to be in *perpetuam commendam.* The practice gave rise to great abuses, and is now almost unknown.

Commensal, kŏm-mĕn'sal (Lat. *con,* together, and *mensa,* a table), literally, a messmate. This term is applied in zoology to animals which live on or in other animals for part or the whole of their life, simply sharing the food of their host without being parasitic on him: thus the pea-crabs live within the cavity of shell-fish, and find their food in the water introduced for the benefit of their host. There are various forms or degrees of commensalism. Sometimes the relation is more or less accidental, and of little, if any, use to either organism, or again it may be advantageous in a greater or less degree to one of the animals only, or yet again both host and guest may be benefited. In still higher cases the guest is, as it were, not only welcomed, but invited and induced to cling to a host. See SYMBIOSIS.

Commen'salism, the intimate connection or partnership between animals of quite different affinities; thus commensals, messmates, or fellow-boarders take up their abode together for their mutual benefit. A good example is a large sponge, whose canals and passages shelter innumerable worms, crustacea, etc., which lodge there without expense to their host. Floating jellyfish shelter certain pelagic crustaceans (*Hyperina*) and little fishes. The oyster-crab (*Pinnotheres*) is a typical case of commensalism; it does no harm to the oyster or mussel in whose shell it lives, and which protects it from danger; while, as the result of its sheltered life, its shell is soft and thin. The pearl-oyster, besides taking in a *Pinnotheres* as a boarder, admits a kind of shrimp. Certain small slender, eel-like fishes (*Fierasfer*) insinuate themselves into the body of holothurians, which also keeps open house for *Pinnotheres* and shrimps; hence a holothurian has been compared to a hotel with its *table d'hôte.* Other crustaceans board in different animals; thus a little crab (*Fabia chilensis*) lodges in the end of the intestine of a sea-urchin; another (*Porcellana*) lives on the Brazilian coast in a starfish. Polyps and corals shelter various species of crabs, snails, etc., all being of the same color, while a crinoid (*Comatula*) takes in as a permanent lodger a decapod crustacean (*Galathea*). Hermit crabs, taking up their abode in an empty snail-shell, are obliged to admit a variety of intruders who come to stay. Certain mollusks live in starfishes and other echinoderms and, as the result of their semi-parasitic life, become more or less modified and degenerate. Thus *Stylina* lives on a crinoid (*Comatala*); a species of *Stilifer* becomes encysted on the rays of a starfish (*Linckia*), and on the underside of the arms of the same *Linckia* lives a limpet-like snail (*Thyca*), while *S. astericola* lives in the body of a Bornean starfish, and so on with a number of similar cases. Ascidians throw their "front hall" (*atrium*) wide open to a variety of forms, such as small worms, polyps, mollusks, crustaceans of different orders, sea-spiders, brittle-stars. The "Venus flower-basket," a silicious sponge of the Philippine Islands, gives shelter to three different kinds of crustaceans: a prawn, a *Pinnotheres,* and an isopod.

Rising to the higher animals there occurs on an island off the New Zealand coast the case of the interesting lizard "tuatara," which shares its deep burrows with a petrel, though the latter

may at times be the work of the bird. Each builds its nest on opposite sides of the chamber, the lizard almost invariably choosing the right, and the petrel the left side. The former sits with its head close to the entrance ready for any attack; it feeds partly on worms and beetles, and in part on the remains of fishes and crustaceans brought to their common table by the petrel.

By far the most numerous assemblage of messmates are the different kinds of beetles and other insects which live in ants' nests, the number of kinds of which amount to upward of 1,500. See ANT; COCKROACH; SYMBIOSIS.

Commen'surable, among geometricians, an appellation given to such quantities or magnitudes as can be measured by one and the same common measure. Commensurable numbers, whether integers or fractions, are such as can be measured or divided by some other number without any remainder; such are 12 and 18, as being measured by six or three.

Com'mentary, a term used (1) in the same sense as memoirs, for a narrative of particular transactions or events, as the 'Commentaries' of Cæsar. (2) A series or collection of comments or annotations. These may either be in the form of detached notes, or may be embodied in a series of remarks written and printed in a connected form.

Commentry, kō-mäṅ-trē, France, a town in the department of Allier, eight miles south-east of Montluçon, in the midst of a vast coal field, to which the town owes its prosperity. There are important iron works in the vicinity. Pop. 9,200.

Commerce, a term which in its primary significance relates to an interchange of goods, merchandise or property of any kind. In its usual acceptance it relates to interchange of merchandise between countries or different parts of a country, distinguished respectively as "foreign commerce" and "internal commerce"; the commerce between the United States and other countries, for example, being of the class designated foreign commerce, that between the Atlantic seaboard and the Mississippi valley or the Pacific coast, internal commerce.

The earliest form of interchange was naturally that of man with his neighbor, the exchange of the products of the chase for those of the soil or of natural products for those ready for use; and when this was a mere exchange of article for article, and passed from hand to hand, it is more properly designated by the word "barter." But with the utilization of a common measure of value by which goods were purchased, usually to be sold again, the transactions are called commerce, especially when they occur between citizens of different localities. Among the early examples of commerce is that of the Phœnicians with the people and cities scattered along the coast of the Mediterranean, the caravans carrying the silks and spices of the far East to the Mediterranean countries, and later the markets and great fairs of the Middle Ages. With the introduction of a common and generally accepted measure of value, money, arose the class of middlemen, or merchants, who purchased the goods offered for sale and resold them. Following this came the establishment of trade centres, and when states or countries were formed and duties collected on goods entering or leaving them, a record of the international commerce began to be established. In England there is a record of commerce as early as the year 1355, in which the imports are reported at 120,000 pounds sterling and the exports at 294,000 pounds sterling; in 1573, imports, 2,100,000 pounds sterling, and the exports, 1,180,000 pounds sterling; in 1701, imports, 5,900,000 pounds sterling, and exports, 6,900,000 pounds sterling. In France official returns date continuously from 1716, the annual average of imports for that year to 1720, being 65,000,000 francs, exports, 1,050,000,000 francs. Mulhall presents figures of the commerce of 12 European countries in 1720, making the total recorded commerce of Europe for that date 62,000,000 pounds sterling; that of Spanish-America, 10,000,000 pounds sterling; India, 9,000,000 pounds sterling; British colonies, 2,000,000 pounds sterling; and "various," 5,000,000 pounds sterling, thus making the total recorded commerce of the world at that date 88,000,000 pounds sterling, or $428,252,000 of imports and exports combined. Accepting his figures as probably the best approximation possible for the earlier dates when official records of commerce of many of the countries were not available, the international commerce of the world from 1720 to 1900, including both imports and exports, may be stated as follows:

Year	Total Commerce	Year	Total Commerce
1720.....	$ 428,000,000	1850.....	$ 4,049,000,000
1750.....	681,000,000	1860.....	7,246,000,000
1780.....	905,000,000	1870.....	10,662,000,000
1800.....	1,470,000,000	1880.....	14,760,000,000
1820.....	1,660,000,000	1890.....	17,519,000,000
1830.....	1,980,000,000	1900.....	20,715,000,000
1840.....	2,788,000,000		

It will be seen from the above figures that by far the most rapid growth has occurred in the last half of the 19th century, the increase in the 80 years from 1720 to 1800 being, in round terms, but one billion dollars, and that of the 50 years from 1800 to 1850 but two and a half billions, while that of the 50 years from 1850 to 1900 was 16 billions. Meantime values of merchandise of all kinds have greatly decreased, so that the increase in the volume of merchandise exchanged is really much greater than that indicated by the mere figures of value. This increase is chiefly due to the facilities for transportation and communication which were developed in the later period. At the beginning of the 19th century there were no railroads to carry the products of the interior to the seaboard, no steam vessels to carry them from continent to continent, and no telegraphs for intercommunication. In 1850 there were but 24,000 miles of railway in the world, and this consisted of fragmentary lines not furnishing continuous communication for considerable distances; the steam vessels of the world had a tonnage of less than 1,000,000 tons; the land telegraph lines were but 5,000 miles in length, and the submarine cables of the world, 25 miles. In 1903 the railroads of the world are 500,000 miles in length, and have been brought into such relation that they furnish great through transportation systems from the interior of continents to the water's edge; the steam vessels of the world have a tonnage of 17,000,000 tons; the land telegraphs are 1,200,000 miles in length, and the submarine cables 200,000 miles. With this enormous increase in steam-carrying power on land and sea have come great reduction in charges

for transportation, a great increase in the currency of the world, and such improvements in its financial systems as to greatly facilitate international commerce.

FOREIGN COMMERCE OF THE PRINCIPAL COUNTRIES OF THE WORLD, 1900.

Year	Countries	Imports (000 omitted)	Exports (000 omitted)	Excess of exports (+) or imports (—) (000 omitted)

a Exclusive of commerce between the Australasian colonies, but inclusive of precious metals.
dd Including bullion and specie.
e Except Australasia, Canada, and British India.
f Includes imports and exports of precious metals, namely, $2,618,000 and $44,271,000, respectively.
h Includes dependencies.
q Figures for 30 June 1902.
s Trade over the European frontier only.

With this increase of facilities for transporting the products of the interior to the seaboard and from continent to continent came a great increase in production and a reduction in cost of both production and transportation, and this reduction in cost to the consumer was followed by a great increase in the quantity and variety of the articles utilized by man, for food, clothing, and in household and business affairs. The per capita of the world's international commerce is now about six times as great in value as a century ago, having been about $2.35 per capita in 1800 and $13.25 per capita in 1900, while the reduction in prices meantime indicates that the quantity represented by the per capita figures of 1900 is probably 20 times as great as that represented by those of 1800.

The commerce of the world at the latest available date, including all countries for which statistics are available, is given by the bureau of statistics of the treasury department in the table which follows, the figures being in most cases for the year 1901. It will be noted that, although the exports of one country always become the imports of some other country, the figures of total imports exceed those of total exports. This is accounted for in part by the fact that the cost of transportation is added in many cases to the stated value of the merchandise when it becomes an importation, while the fact that revenues are more generally collected on imports than on exports probably results in a more nearly complete record of the imports than of the exports.

United States Commerce.— The official record of the foreign commerce of the United States begins with the year 1790. During the existence of the Colonies the most of their commerce was with Great Britain, and during the period of confederation each State regulated its own commerce. It was not until the beginning of the present form of government that satisfactory statements of the foreign commerce of the United States became available. A record of the exports of the Colonies to Great Britain from 1697 to 1790, compiled by Mr. Charles H. Evans, shows a total of 279,852 pounds sterling, or $1,362,000 of exports from all the Colonies to Great Britain in 1697; 415,650 pounds sterling, or $2,023,000; in 1725, 814,766 pounds sterling, or $3,965,000 in 1750; 1,105,170 pounds sterling, or $5,403,000 in 1763; 1,373,846 pounds sterling, or $6,685,000 in 1774. In 1790, the first record under the Constitution, the total imports of the United States were $23,000,000, and the exports $20,205,156. The period of wars in Europe which began during that decade increased the figures of the commerce of the United States greatly, by reason of the fact that merchandise from the British, French, and Dutch colonies, although subject to seizure under the blockades if passing from the colony to the mother country, was not subject to seizure if first brought to the United States by American vessels, entered as an import and then sent forward to its destination as an export from the United States. Goods from those countries destined for their colonies sometimes also evaded the blockades by a similar process. As a result, the figures of both imports and exports of the United States from 1769 to 1807 showed during that period exports of foreign merchandise actually in excess of exports of domestic merchandise, while exports of foreign merchandise are now less than 2 per cent of the total exports. The domestic exports, which were $18,500,000 in 1791, never reached as much as $50,000,000 until 1819, and did not reach $100,000,000 until 1835. In 1854 they for the first time exceeded $200,000,000, and in 1860 for the first time passed $300,000,000. In 1871 they for the first time exceeded $400,000,000, but from that time rapidly increased, being over $800,000,000 in 1881, more than $1,000,000,000 in 1892, and since 1897 have never been below the $1,000,-

000,000 limit, the highest figure reached being in 1901, $1,460,462,806.

This rapid increase in exportations, beginning with 1870, was coincident with the opening up of the interior by railroads, and the development of the manufacturing industry. In 1870 there were 52,992 miles of railway in the country; the number of farms was 2,659,985, and the gold value of their products, $1,958,030,927, while the value of the manufactures of the country was $4,232,325,442, and the exports of manufactures but $68,279,764. In 1880 the number of miles of railway was 93,262, having nearly doubled in 10 years; the number of farms, 4,008,907, and the value of their products, $2,212,540,927; while the value of the manufactures was $5,369,579,191. In 1890 the number of miles of railroad was 166,654, the number of farms 4,564,641, the value of farm products $2,460,107,454, and the value of the manufactures $9,373,437,283. In 1900 the number of miles of railroad was 194,321, the number of farms 5,739,657, and the value of their products $3,764,177,706; while the value of manufactures had reached $13,039,279,566. During this period of 30 years in which the number of miles of railroad nearly quadrupled, the value of farm products doubled, the value of manufactures more than trebled, the exports of agricultural products grew from $361,188,483 in 1870 to $835,858,123 in 1900, and those of manufactures grew from $68,279,704 to $433,851,759, manufactures forming but 15 per cent of the total exports in 1870 and 31 per cent in 1900. The result of this rapid growth in exports is that the United States, which in 1870 stood fourth in the list of the world's exporting nations, being surpassed by the United Kingdom, Germany, and France, was in 1901 at the head of the list, the domestic exports of the United States in that year exceeding those of any other country. The imports into the United States usually exceeded the exports prior to the great increase in exports which began with 1870. In 1874 the exports began to exceed the imports, and have so continued during nearly the entire period since that date. There was during that period, however, a comparatively slow but steady growth in imports, from $436,000,000 in 1870 to $668,000,000 in 1880, $789,000,000 in 1890, and $850,000,000 in 1900, and in 1902 they for the first time exceeded $900,000,000. This growth is largely due to the increased demand for manufacturers' materials, the imports of which in 1870 amounted to $120,000,000 and formed 28 per cent of the total imports, and in 1902 amounted to $418,000,000 and formed 46 per cent of the total imports. This increase in manufacturers' materials imported is chiefly in articles not produced in the United States, such as raw silk, hemp, jute, rubber, tin, etc.

The foreign commerce is chiefly with Europe but is growing rapidly with other parts of the world. In 1880 55 per cent of the imports were from Europe, and 86 per cent of the exports went to Europe. In 1902 53 per cent of the imports were from Europe, and 73 per cent of the exports went to that continent. The exports to Asia and Oceanica have increased from $14,000,000 in 1870 to $116,000,000 in 1902, including in this statement the shipments to the Hawaiian Islands, which are not now stated as exports, but which should be so included in a comparative statement of this character. The commerce with the Hawaiian Islands, the Philippine Islands, and Porto Rico has grown rapidly since their annexation to the United States, the total imports from those islands having increased from $20,252,563 in 1897, to $39,610,551 in 1902, and the exports to them, from $6,733,530 in 1897, to $34,971,311 in 1902.

The tables which follow show the annual average of imports and exports in each decade from 1790 to 1900, and the total imports and exports for each fiscal year from 1790 to 1902. They are from the annual publications of the Bureau of Statistics, and are thus the official record of the foreign commerce of the United States.

Note.— Figures include specie prior to 1821.
*Fiscal year ended 30 September prior to 1843; since that date 30 June.

In 1903 a Department of Commerce and Labor was created by the Congress of the United States, its chief officer to be a member of the cabinet, the province and duty of the department being to "foster and develop the foreign and domestic commerce, the mining, manufacturing, shipping, and fishery industries, the labor interests, and the transportation facilities of the United States." The Bureau of Statistics, Bureau of Navigation, Steamboat Inspection Service, Light House Establishment, Coast and Geodetic Survey, Bureau of Standards, Bureau of Immigration, Department of Labor, Census Office, and Fish Commission were transferred from other departments to the Department of Commerce and Labor; also the Bureau of Foreign Commerce of the State Department, which was consolidated with the Bureau of Statistics; and two new bureaus, Bureau of Corporations and a Bureau of Manufactures, created as a part of the department. Hon. George B. Cortelyou, former secretary to the President, was nominated by the President and confirmed by the Senate as the secretary of Commerce and Labor. The other governments which have similar governmental organizations devoting their attention to commerce are Germany, France, Belgium, Austria-Hungary, Spain, Portugal, Italy, and the United Kingdom; the organization of the latter being designated the Board of Trade, its president, however, being a member of the cabinet.

Oscar P. Austin,
Treasury Dep't, Washington, D. C.

Commerce, a card game in which each player contributes an equal sum to the pool, and a full pack of cards is dealt to the players. The eldest hand, that is, the one who received the first card on the left of the dealer, then exchanges one of his cards with his left hand player, who, in turn, exchanges one with his left hand player, and so on, until some one finds that his hand consists entirely of cards of one suit, when he calls out "My Ship Sails." Aces count 11, court cards 10, the rest according to "pips." Each player, through all the exchanges, is aiming to hold a tricon, three cards alike; a sequence, three following each other in the same suit; or a point, the smallest number of pips on three cards. The winner of the pool is the player who has the highest tricon, or, if none is displayed, the highest sequence, or in its place the holder of the best point. See Cassell, 'Book of Pastimes.'

Commerce, Chambers of. See Chambers of Commerce.

Commerce, Interstate. The colonies, under the lead of Massachusetts, early attempted to provide roads; yet for more than two hundred years nothing existed in this country that by any stretch of the imagination could be called a postal service. The only carriers of commerce for nearly two hundred years after the first settlers sought these shores were the simple sailing vessels, that crossed the ocean only at the greatest hazard. Courageous attempts to navigate the ocean waters and the almost unknown rivers and lakes were numerous before 1800, and canals, even, were attempted. It can hardly be said, however, that anything deserving the name of interstate commerce existed in this country at the beginning of the 19th century, since at that time the total effects of the government were transported from Philadelphia to Washington in a frail sloop, and President John Adams and his wife lost their way, as tradition has it, in the woods beyond Baltimore, as they proceeded in their carriage toward the new capital. The Alleghanies constituted an almost impassable barrier between the East and the West, and such necessary products as the colonists could not obtain in their immediate neighborhoods were mostly brought from over seas.

There was another difficulty in the way of trade. The high price of labor rendered it impossible to manufacture linen, cotton, or woolen cloth, except at a cost 20 to 50 per cent greater than the same stuffs could be turned out for in England. The trade of New Hampshire was principally in lumber and fish, which were exported. In Massachusetts a little wool and flax were worked into a coarse cloth, and a few hats were made, but it was cheaper to import them. In the province of New York the export of furs, whalebone, oil, pitch, tar, and provisions included everything. So it was in New Jersey. Virginia produced nothing for intercolonial trade. Tobacco was a permanent staple, but it became chiefly an export. The early colonists were inevitably sailors. Therefore a considerable coasting trade grew up, but there were no means of internal transportation except by wagons and the rude craft plying the natural waterways. In spite of this the Constitution, which went into operation 4 March 1789, embraced the right to regulate domestic commerce,—a right not conferred by the previous Articles of Confederation,—and from that year one may find exhibits of the tonnage employed in the coastwise trade. In 1789 this tonnage was 78,607; in 1812 it was 477,971.

The Americans of those early times had only a vague knowledge of the country west of the Allegheny mountains; yet the hardy settlers along the coast soon beat out for themselves paths to this unknown region. The act to provide for the Cumberland road was passed March 29, 1806, and the first stage-coach driven from Cumberland to Wheeling in 1818. The length of the line first opened was 130 miles, and its cost $1,700,000. In those years, too, were tried the first experiments with steam-craft. Livingston and Fulton built the Clermont in 1807, and Fulton claimed under his patent a monopoly of transportation on the Hudson and other rivers. His claim was carried to the courts and defeated, so that after 1815 the rivers of the country were free to steam-vessels. In 1812 steamboats made their appearance on the western rivers. The first craft, the New Orleans, built at Pittsburg by Fulton at a cost of $40,000, a stern-wheeler of between 300 and 400 tons, put out for New Orleans. Others followed, but none proved able to ascend the river, until 1815, when the Enterprise, a stern-wheeler of 70 tons, made the trip from New Orleans to Cincinnati in 28 days. It was later than this, again, that steamships came gradually to ply up and down the coast.

The first charter for canal building was granted to the James River Company by the legislature of Virginia in 1785. Another of these projects was the Dismal Swamp Canal, begun in 1787, under a joint charter from Virginia and North Carolina, and opened in 1794. The owners of its stock included George Washington and Patrick Henry, and it was originally designed to facilitate the movement of lumber out of the Dismal Swamp. The Chesapeake and Ohio Canal, the Delaware and Chesapeake Canal, and the Union Canal, of Pennsylvania, intended to connect the Delaware and Susquehanna rivers, were only forerunners of the Erie Canal, 363 miles long, completed in 1825. A canal from Lake Champlain to the Hudson River was completed in 1823. On the opening of the Erie Canal the cost of freight fell, according to its class, all the way in amount from $15 to $25 per ton, and the time of transit from 20 to eight days. Wheat was worth $33 per ton in western New York, and it did not pay to send it to market, down the Susquehanna to Baltimore. The canal changed all that. Indeed, it has been said that the Erie Canal added $100,000,000 in value to the farms of New York State. It made New York city the commercial metropolis. Freight which had gone overland from Ohio to Pittsburg and Philadelphia, at a cost of $120 per ton, now went to New York by way of the lakes, the great canal, and the Hudson. The opening of the Erie Canal excited also a fever of enterprise in canal building in Ohio, Pennsylvania, Massachusetts, Maryland, and Virginia.

The first voyagers on the Great Lakes, La Salle and Hennepin, set sail in 1678 in a schooner of 10 tons, which they had launched near the present city of Kingston, Ontario. From the mouth of the Niagara River they continued their journey by land, and in the following May launched the Griffin, the first sailing vessel to navigate the upper lakes. In September they reached their destination at Green Bay. From 1700 until 1756 the construction and navigation of sailing vessels on the lakes was largely confined to Lake Ontario. Then the English began to build and sail vessels upon Lake Erie and Lake Ontario, and the commerce of Lake Ontario increased so fast, that in 1800 it exceeded that of all the other lakes together. The first American vessel to sail Lake Erie was launched at Erie in 1798. The first steam-vessel that navigated the lakes was built at Sackett's Harbor in 1817, and measured 240 tons. The next year the first steamboat above Niagara Falls was launched at Black Rock, and made voyages between that place and Detroit. The schooner Illinois, 100 tons, was the first vessel to arrive at Chicago from the lower lakes. "This event," writes one, "occurred 12 July 1834, when all the male inhabitants of the village, amounting to nearly 100, assisted in dragging the craft across the bar."

Gibson and Linn, according to Ringwalt, in 1776, descended the Ohio and the Mississippi from Pittsburg to New Orleans, and brought back a cargo of 136 kegs of gunpowder for the use of the continental army. When they reached the falls of the Ohio River they were obliged to unload their boats and carry the cargo around the falls; but the success of their trip gave an impetus to the flatboat trade which has continued in one form or another up to the present time. The first regular packet line between Pittsburg and Cincinnati was established in 1794, and consisted of four keel-boats of 20 tons each. They were much like the modern canal-boats, and could be either propelled by sails, pushed by poles, or towed by horses. Freight charges were high, the following rates for steamboats on the Mississippi having been established by the legislature of Louisiana in 1812: From New Orleans to Louisville, four and one-half cents per pound for heavy goods, and six cents for light, averaging five cents per pound, or per ton $112; from New Orleans to Natchez, three quarters of a cent per pound, or $1.50 per barrel; and the same rate for all intermediate landings from New Orleans to Louisville. Passage, $125 for the full trip, and $30 to Natchez. Half-rates were allowed for tonnage going down the river.

Hon. Levi Woodbury, who made a trip down the Mississippi in 1833, says: "At every village we find from 10 to 20 flat-bottom boats, which, besides corn on the ear, pork, bacon, flour, whiskey, cattle and fowls, have a great assortment of notions from Cincinnati and elsewhere. Among these are corn brooms, cabinet furniture, cider, apples, plows, cordage, etc. They remain in one place until all is sold out, if the demand be brisk; if not, they move further down. After all is sold out they dispose of their boat, and return with their crews by the steamers to their homes."

By 1856, however, the steam-tonnage of the Mississippi and its tributaries equaled the steam-tonnage of the whole of Great Britain. Until 1850 the boats measured from 200 to 400 tons; but the builders enlarged their vessels from year to year, until, in 1878, they attained the size of the transatlantic liners. The steam-tonnage of the inland and coast lines of the United States increased from 24,879 tons in 1823 to 1,172,372 tons in 1876, as follows:

INLAND AND COASTWISE FLEETS, 1876.

	Number of Vessels	Tonnage
Atlantic and Gulf coasts	2,081	665,879
Pacific coast	270	78,439
Northern lakes	921	201,742
Western rivers	1,048	226,312
Total	4,320	1,172,372

In 1891 there were on the Great Lakes 3,700 steam- and sail-vessels, with a net registered tonnage of 1,250,000 tons. In that year they carried 63,250,000 tons of freight, while in 1890 the ton-mileage carried by this fleet was 18,849,348 ton-miles, or 24.7 per cent of the ton mileage of all the railroads of the United States. The tonnage of the lake marine more than doubled during the five years from 1887 to 1892. On the 16,000 miles of the navigable waters of the Mississippi River and its tributaries there were afloat, in 1890, 7,445 crafts of all kinds, with a registered tonnage of 3,400,000 tons. During the year this fleet carried 30,000,000 tons of freight and 11,000,000 passengers. The Hudson River had, in the same year, a traffic of 5,000,000 passengers and 15,000,000 tons of freight, exclusive of 3,500,000 tons that passed through the canals of New York by way of the Hudson River to tide-water. The total for these four divisions of waterways alone was 111,750,000 tons. The Mississippi Valley rivers furnish transportation facilities for 24 States, embracing an area of 1,240,000 square miles. In 1903 about 23,255 vessels of 5,198,569 tons were engaged in our domestic trade.

The average freight rate on wheat from Chicago to New York in 1902 was 5.3 cents per bushel by lake and canal, and 17½ cents per bushel by rail, the water cost being $1.76 per ton, and the rail cost $5.82 per ton. The Erie Canal is only a little over 300 miles long, yet Mr. Albert Fink says that it regulates the freight rates of all the railroads east of the Mississippi River, not only on those whose tracks run parallel with the canal, but upon those in every part of that territory.

The development of the railway system of the United States has been without a parallel. Time and distance have been overcome, and the products of the farmers, the lumbermen, the miners, and the artisans now reach in successful competition the markets of the world. The railway had its inception less than 70 years ago in the little four-mile tramway constructed to the granite quarries in the town of Quincy, Mass., and operated by horses. The first really important railway was the Baltimore and Ohio, 14 miles of which were opened in 1830. In the same year the South Carolina Railway was begun; in 1833 it was completed for 136 miles, and was then the longest railway in the world. It was also the first railway to carry the United States mails. In 1834 the opening of the Philadelphia and Columbia Railroad, as part of the system of internal improvements of Pennsylvania, gave that State a continuous line of railways and canals from Philadelphia to Pittsburg. In 1835 the Washington branch of the Baltimore and Ohio road was opened. The completion of the Boston and Albany road in 1841, and a connecting-link composing the line from Albany to Buffalo in 1842, marked the opening of the first great railway line. The real beginning of interstate commerce in this country may be said to date from this time.

The total railway mileage of the United States in 1902 was above 200,000 miles, or nearly one half the railway mileage of the world. The total mileage of all tracks reaches 274,195.36 miles, representing a capital of nearly $13,000,000,000 — an amount equal to one sixth of the entire wealth of the country, and five times greater than the entire circulating currency of the United States. The annual gross earnings and other income of this capital is more than $1,900,000,000 — an amount more than three times the entire annual revenues of the government; and it operates lines having an annual traffic of nearly 650,000,000 passengers and more than 1,200,000,000 tons of freight. An idea of the magnitude of this single branch, concerned with the transportation of freight, may be conveyed when it is stated that 1,000,000,000 tons means that a train of cars long enough to reach more than six times around the earth would be required to transport it all at a single load. The average distance over which this freight was hauled by the railroads was about 128 miles. Set a single team to the task, and it would take it something like 1,400,000 years to move the same amount 25 miles.

The total number of tons of freight carried by the steamers and sailing vessels of the rivers, lakes, and coastwise transportation routes of the United States in 1902 may be reckoned one third that of the railways. Add to this amount the freight traffic of the railways during the year 1902, namely, 1,200,315,787 tons; this would make the total average tonnage of the railways and waterways of the country more than a billion and a half tons, or 20 tons for every inhabitant of our continental possessions.

As late as 1850 there seems to have been little conception of the influence which the railways were to wield in the development of the interstate traffic of this great country, and of the country itself. It was thought that they could not successfully compete with waterways and canals, except where a speedy carriage was essential. The solution of the problem of cheap transportation from Pittsburg, for example, was not reached until the railroads threatened to take away all traffic from the traders; so that Pittsburg coal can now be delivered in New Orleans for about $2.60 per ton, although New

Orleans is 2,000 miles away by river. Cow Island, on the upper Missouri, is 4,300 miles from Pittsburg; yet coal is carried to market there, a distance as great as from New York to the Baltic Sea. Not less than 20,000 miles of inland navigable waters are accessible to these Pennsylvania coal traders. The aggregate number of vessels engaged in this business is more than 4,000, and of the 13,000,000 tons of coal that were mined in 1893 in the counties near Pittsburg about 4,500,000 tons were carried to market by water. Yet let me illustrate further the growth of domestic trade in a part of our country which was only lately as remote and undeveloped as the westernmost provinces of Brazil. This growth, due to the transition from the pony express to the transcontinental steam-car, quickened the activities of California and of the whole Pacific slope like the inspiration of a new life. The assessed value of all property within California rose from $260,563,886 in 1869 to $584,578,036 in 1879. In 1889 shipments were made over the lines of the Southern Pacific system of 1,140,596,010 pounds from San Francisco, and of 1,571,347,605 to San Francisco. The probable duration of an overland journey from the Missouri River to California before the continental railways were constructed was about 110 days.

Chittenden in his early steamboat navigation on the Missouri River says the traffic reached high-water mark in 1867. That profits on a single voyage of a boat between Saint Louis and Fort Benton had reached as high as $65,000.

Freight rates were 12 cents a pound in 1866, or $240 a ton. Insurance rates 6½ cents on sidewheel and 8 cents on sternwheel steamers; a cabin passenger paying $300, and the salary of a pilot whatever he might be pleased to ask, as high as $1,200 per month being paid.

It is claimed that the practically unobstructed competition which has prevailed among railways has been a main cause of many consolidations of railway interests. On the other hand, in defense of consolidation and combination, it is asserted that these result in better and swifter service and lower rates. Whatever the cause or causes, rates generally are much lower than they were 10 years ago. On 30 June 1894, 44 railways, each with an operated mileage of over 1,000 miles, out of a total of 1,039 operating corporations, controlled and operated 56.30 per cent of the total railway mileage in the United States. Extend the classification to include all roads operating over 400 miles of line, and it appears that 90 corporations operate 72.90 per cent of our total railway mileage. In 1837 the superintendent of motive power of the Columbia and Philadelphia Railroad reported that the following charges were imposed on the railroads named:

FREIGHT RATES ON RAILROADS IN 1837.

Railroad	Per Ton per Mile Cents
Baltimore & Ohio	4½
Baltimore & Washington	4
Winchester & Potomac	7
Portsmouth & Roanoke	8
Boston & Providence	10
Boston & Lowell	7
Mohawk & Hudson	8
Petersburg	10

These rates seem preposterous when compared with the .757 of one cent per ton per mile, which was the average charge on all the railroads of the United States during the year 1902.

The growth of lake commerce in this country is something marvelous. The increase of freight shipments through the Saint Mary's Canal, both east and west bound, was from 1,560,000 tons in 1881 to 28,403,065 tons in 1901. There was an increase in the valuation of this tonnage from $28,965,612.92, in 1881, to $290,000,000 in 1901. During the season of 225 days in 1901 in which this canal was open there passed through it 14,372 steamers and 4,482 sail-vessels — a total, with unregistered craft, of 20,041 vessels, or an average of about 90 per day during the entire season. The total registered tonnage for the season was 8,400,680. The freight which passed through the canal in 1900 was carried an average distance of about 825 miles, at a cost per mile per ton of 1.18 mills. The size of the vessels passing through the canal continues to increase. The average registered tonnage per vessel in 1867 was 626.3 tons, while in 1891 it was 962.1 tons, and in 1901 there were over 100 vessels, steam and sail, of from 5,000 to 8,000 tons and 10 above 8,000 tons. This freight-tonnage during the season of 1889 amounted to 19,717,860 tons. The tonnage passing through the same canal during the season of 1890, including the foreign and coastwise traffic, amounted to 21,888,472 tons, while the tonnage of all vessels of the Atlantic coast engaged in foreign trade during 1890 was but little more — 22,497,817 tons. All the vessel-tonnage engaged in the foreign trade, entering and clearing at London, England, during the same year was 13,480,767 tons, and at Liverpool the same year it was 10,941,800 tons; so that the vessel-tonnage passing through the Saint Mary's Canal in 1890 was more than 8,000,000 more than that of London, about double that of Liverpool, and nearly equal to that of the two combined. Another comparison: The tonnage passing through the Suez Canal in 1900 was 13,699,237 — less than one half of that passing through the Saint Mary's which was open for navigation during the season of 1890 only 228 days, while the Suez Canal was open during the entire year. The total tonnage, entrances, and clearances, of the foreign and coastwise trade of Chicago and Buffalo for the season of 1901, as compared with the total foreign trade tonnage of the four great British ports, was as follows:

CHICAGO AND BUFFALO TRADE.

	Tons
Chicago	13,831,882
Buffalo	10,455,032
London	17,275,645
Liverpool	12,636,225
Glasgow	3,825,890
Hull	4,425,356

Carrying the comparison still further, the volume of this inland trade is again shown in the figures giving the foreign trade of the following great commercial ports in 1901–2:

FOREIGN TRADE TABLE.

	Tons
New York	12,646,555
Hamburg	16,441,470
Antwerp	14,967,921
Marseilles	9,563,544
Havre	4,406,159
Bremen	4,377,824
Boston	4,498,785
Philadelphia	3,871,928
San Francisco	2,562,655

It will be seen that the commerce of the two inland cities, Chicago and Buffalo, consisting almost wholly of a coastwise trade within the confines of the Great Lakes, compares most favorably with the tonnage movement of the great maritime cities of the world. In 1867 the average rate for carrying iron ore from Escanaba to Lake Erie was $4.25 per ton; in 1870 the average rate was $2.50 per ton; in 1891 the average rate was 82 cents per ton; and at one time in that year it was as low as 55 cents per ton.

The benefit of these great reductions in lake transportation rates appears very forcibly in the movements of the huge cargoes of coal that are sent from ports on Lake Erie to the harbors of the upper lakes. In 1887 the average rate per ton for lake transportation of coal from Buffalo to Chicago was $1.05; in 1891 the average rate was 50 cents per ton; and from 10 Nov. 1891 to the close of navigation, coal was carried from Buffalo to Duluth, a distance of 1,000 miles, for 10 cents per ton. Using the common unit (cost per ton per mile) for comparison, and taking the official report of the movement of freight through the St. Mary's Falls Canal, the ton-mileage rate has decreased as follows: 1887, 2.3 mills; 1888, 1.5 mills; 1889, 1.5 mills; 1890, 1.3 mills. The average revenue per ton of freight per mile on all the railroads of the United States was given at 9.4 mills in 1890, or more than seven times as much as the cost of freight carriage through the St. Mary's Falls Canal.

The regulation of interstate commerce before the Declaration of Independence was by Parliament. Under the Articles of Confederation trade was controlled, where it was controlled at all, by the legislatures of 13 distinct sovereignties. It soon became evident that the several States would not unite in any general or fixed rule to govern commerce. Discriminations naturally followed, which resulted in confusion and discord among the different parts of the confederacy. Accordingly one of the reforms demanded under the old confederacy, and introduced in the Constitutional Convention, was that "Congress shall have power . . . to regulate commerce . . . among the several States." The dissatisfaction among the States in respect to the interchange of trade, and the urgent demand for a uniform and general principle controlling their commerce, were clearly shown in the debates of the Constitutional Convention. The following contemporaneous opinions are of interest:

"The want of authority in Congress, under the confederation, to regulate commerce had produced in foreign nations, particularly Great Britain, a monopolizing policy injurious to the trade of the United States. . . . The same want of a general power over commerce led to an exercise of the power, separately, by the States, which not only proved abortive, but engendered rival, conflicting, and angry regulations." (Madison Papers, Vol. V., p. 119.)

"The oppression of the uncommercial States was guarded against by the power to regulate trade between the States." (Mr. Sherman, Deb. on Fed. Cons., Mad. Pap., Vol. V., p. 434, 1787.)

"Mr. Carroll and Mr. L. Martin expressed their apprehensions, and the probable apprehensions of their constituents, that, under the power of regulating trade, the general legislature might favor the ports of particular States, by requiring vessels destined to or from other States to enter thereat." (Ibid., p. 455.)

To cover this defect, Art. I., Sec. 9, Cl. 6, of the Constitution was enacted, to wit: "No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another, nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another."

Gen. Washington, in a letter to a friend on the weakness of the confederation, and pleading for a stronger government, wrote: "We have abundant reason to be convinced that the spirit of trade which pervades these States is not to be repressed. It behooves us, then, to establish just principles, and this cannot, any more than other matters of national concern, be done by 13 heads differently constructed and organized. The necessity, therefore, of a controlling power is obvious, and why it should be withheld is beyond my comprehension."

Alexander Hamilton, in the 'Federalist,' Letter VII., wrote: "The competition of commerce would be another fruitful source of contention. The States less favorably circumstanced would be desirous of escaping from the disadvantages of local situation, and of sharing in the advantages of their more fortunate neighbors. Each State or separate confederacy would pursue a system of commercial probity peculiar to itself. This would occasion distinctions, preferences, and exclusions which would beget discontent. The habits of intercourse on the basis of equal privileges, to which we have been accustomed from the earliest settlement of the country, would give a keener edge to those causes of discontent than they would naturally have, independent of the circumstances." Also, in Letter XXII.: "The interfering and unneighborly regulations of some States, contrary to the true spirit of the Union, have, in different instances, given just cause of umbrage and complaint to others; and it is to be feared that examples of this nature, if not restrained by a national control, would be multiplied and extended till they became not less serious sources of animosity and discord than injurious impediments to the intercourse between the different parts of the confederacy."

In the debates of the Constitutional Convention, the clause regulating commerce, etc., was agreed to *nem. con.*, not even a yea-and-nay vote being taken. When the grant of this power to regulate commerce among the States was made by the Constitution, the traffic which might be controlled under it was quite insignificant. On the land there was nothing that could approach the dignity of interstate commerce, and its regulation, as also of that which was exclusively State traffic, was for the most part left to the rules of the common law. The exceptional regulations, if any seemed to be called for, were made by the State laws. For the regulation of commerce on the ocean and other navigable waters, Congress very promptly passed the necessary laws; but its jurisdiction within the limits of the States was not very clearly understood, and it was not until the celebrated case of Gibbons *v.* Ogden, decided in 1824, that it was authoritatively and finally determined that the waters of a State, when they constituted a highway for foreign and interstate commerce, are, so far as concerns such commerce, as much

within the reach of Federal legislation as are the high seas, and consequently that exclusive right for their navigation cannot be granted by States whose limits embrace them. But while providing from time to time for the regulation of commerce by water, Congress still abstained from undertaking the regulation of commerce by land. The reasons were the same. The land commerce was insignificant, and the rules of the common law were in general found adequate for the settlement of any questions. When Congress provided for the construction of the Cumberland road, it was thought undesirable to regulate its use by national law, or to take national supervision of the commerce upon it; and it was left to the supervision and care of the States through or into which the road was built. With the application of steam as a motive power for propelling vessels, conditions were immediately changed. But even then the circumstances were favorable to a prolongation of State control. The first improved highways were turnpikes, the next in grade canals; but the highways by water, as well as the highways by land, were provided for by the States. It was not unnatural that they should be left in charge of the regulation of trade upon them, especially as no complaint was made that their regulations were unjust, or that they discriminated unfairly as against the citizens or the business of other States. When, in 1830, steam-power began to be applied to the propulsion of vehicles upon land, the same conditions continued to prevail. The power of the Federal government in the regulation of commerce between the States was put forth negatively rather than affirmatively; that is to say, it was put forth in restraint of excessive State power, instead of by way of affirmative national regulation.

The subject of the management of railways in respect to interstate commerce had been more or less discussed in Congress, when in March 1885, a resolution was adopted by the United States Senate empowering a select committee, known subsequently as the Cullom Committee, to investigate it. On 18 Jan. 1886, this committee submitted a report based upon testimony contained in more than 1,450 printed pages. On page 40 the committee says: "Unjust discrimination is the chief cause of complaint against the management of railroads in the conduct of business, and gives rise to much of the pressure upon Congress for regulating legislation."

In summing up the testimony, on pages 180–2 the committee says: "The complaints against the railroad systems of the United States expressed to the committee are based upon the following charges: (1) That local rates are unreasonably high, compared with through rates; (2) that both local and through rates are unreasonably high at non-competing points, either from absence of competition or in consequence of pooling agreements that restrict its operation; (3) that rates are established without apparent regard to the actual cost of the service performed, and are based largely upon what the traffic will bear; (4) that unjustifiable discriminations are constantly made between individuals in the rates charged for like service under similar circumstances; (5) that improper discriminations are made between articles of freight and branches of business of a like character, and between different quantities of the same class of freight; (6) that unreasonable discriminations are made between localities similarly situated; (7) that the effect of the prevailing policy of railroad management is, by an elaborate system of secret special rates, rebates, drawbacks, and concessions, to foster monopoly, to enrich favored shippers, and to prevent free competition in many lines of trade in which the item of transportation is an important factor; (8) that such favoritism and secrecy introduce an element of uncertainty into legitimate business that greatly retards the development of our industries and commerce; (9) that the secret cutting of rates, and the sudden fluctuations that constantly take place, are demoralizing to all business except that of a purely speculative character, and frequently occasion great injustice and heavy losses; (10) that in the absence of national and uniform legislation the railroads are able, by various devices, to avoid their responsibility as carriers, especially on shipments over more than one road, or from one State to another, and that shippers find great difficulty in recovering damages for the loss of property or for injury thereto; (11) that railroads refuse to be bound by their own contracts, and arbitrarily collect large sums in the shape of overcharges, in addition to the rates agreed upon at the time of shipment; (12) that railroads often refuse to recognize or be responsible for the acts of dishonest agents acting under their authority; (13) that the common law fails to afford a remedy for such grievances, and that in case of dispute the shipper is compelled to submit to the decision of the railroad manager or pool commissioner, or run the risk of incurring further losses by greater discriminations; (14) that the differences in the classifications in use in various parts of the country, and sometimes for shipment over the same road in different directions, are a fruitful source of misunderstandings, and are often made a means of extortion; (15) that a privileged class is created by the granting of passes, and that the cost of the passenger service is largely increased by the extent of this abuse; (16) that the capitalization and bonded indebtedness of the roads largely exceed the actual cost of their construction or their present value, and that unreasonable rates are charged in the efforts to pay dividends on watered stock and interest on bonds improperly issued; (17) that railroad corporations have improperly engaged in lines of business entirely distinct from that of transportation, and that undue advantages have been afforded to business enterprises in which railroad officials are interested; (18) that the management of the railroad business is extravagant and wasteful, and that a needless tax is imposed upon the shipping and traveling public by the unnecessary expenditure of large sums in the maintenance of a costly force of agents engaged in a reckless strife for competitive business."

The report of Senator Cullom's committee formed the basis of the law commonly known as the Interstate Commerce Act, which became effective 3 April 1887. The supreme court in the case of the Union Pacific Railway Company against Goodridge, October term, 1892, in speaking of a similar act of the State of Colorado, said: "This act was intended to apply to interstate traffic the same wholesome rules and regulations which Congress two years thereafter applied to commerce between the States, and to

cut up by the roots the entire system of rebates and discriminations in favor of particular localities, special enterprises, or favored corporations, and to put all shippers on an absolute equality."

The statute recognizes the fact that it is no proper business for a common carrier to foster particular enterprises or to build up new industries; but, deriving its franchise from the legislature, and depending upon the will of the people for its very existence, it is bound to deal fairly with the public, to extend reasonable facilities for the transportation of persons and property, and to put all its patrons upon an absolute equality. The laws making the giving of transportation privileges a criminal offense are at present difficult of enforcement. Public opinion has not yet been roused to the energetic condemnation which is necessary to make these special favors as completely unknown as they are at the post-office window, where the value of every stamp must be paid.

At the head of all the vast machinery employed in moving interstate commerce are men of integrity, and of ability rarely developed in other walks of life, broad-gauged men, to whom the public is indebted for the efficiency with which they carry on their stupendous enterprises. Under the railway presidents are the traffic managers, the passenger and freight agents. The feeling of these men that they must serve solely the corporations which employ them has grown to be a second nature with them. Their duty to the government and to the public, therefore, is sometimes obscured, and it is hard for them to realize that many practices which they have come to regard as ordinary business methods are wrong. So also the shipper and the merchant find it hard to realize that the push and barter and dicker that have made them successful must be abandoned when they ship their merchandise; that it is no longer to be bargained for, and cannot be carried except at a rate open to every competitor.

On 4 Feb. 1887, the Act of Congress creating the Interstate Commerce Commission, and investing it with authority to regulate certain matters with respect to commerce which were detrimental to the public interest, and with authority to require annual reports from all carriers engaged in carrying interstate commerce, was passed. This act, being in the nature of experimental legislation, has not accomplished all that its framers hoped or intended, but that great good has been accomplished cannot be denied. Various defects in its practical application have from time to time been brought to the attention of Congress, and amendments to remedy some of them have been adopted. The statistics compiled from the reports required under the provisions of this act have marked a new era in railway statistics in this country. Being compiled from sworn reports made up on a uniform plan and for a uniform period, in compliance with a requirement of law, and published as official documents of the government, they are accepted as authority, and eagerly sought after by the public and by railway officers.

I may observe in closing that within the last two or three years the courts have taken advanced ground in asserting the power of the Federal government over interstate commerce. It was held by the supreme court in the case of Debs that "the government of the United States is one having jurisdiction over every foot of soil within its territory, and acting directly upon each citizen; that while it is a government of enumerated powers, it has within the limits of those powers all the attributes of sovereignty; that to it is committed power over interstate commerce and the transmission of the mail; that the powers thus conferred upon the national government are not dormant, but have been assumed and put into practical exercise by the legal action of Congress; that in the exercise of those powers it is competent for the nation to remove all obstructions upon highways, natural or artificial, to the passage of interstate commerce or the carrying of the mail; that while it may be competent for the government (through the executive branch, and in the use of the entire executive power of the nation) to forcibly remove all such obstructions, it is equally within its competency to appeal to the civil courts for an inquiry and determination as to the existence and character of any alleged obstructions, and if such are found to exist, or threaten to occur, to invoke the powers of those courts to remove or restrain such obstructions." In this case the extent and nature of the power of the Federal government over interstate commerce, and the methods by which that power can be applied, were discussed. It was decided that the United States circuit court, sitting as a court of equity, has power to enjoin, at the instance of the attorney-general of the United States, acts of obstruction to interstate commerce, notwithstanding that the acts enjoined, or some of them, might amount to offenses against the criminal law of the United States.

While it is clearly the fact that, under our form of government, the national authority has no excuse for interfering with the relations existing between employer and employee in ordinary business transactions, it is maintained by many that as the government has control of the agencies engaged in interstate commerce, those who are employed by such agencies are also engaged in the public service, and for that reason an obligation exists on the part of Congress to enact such legislation as will tend to settle differences which may arise between railroads and their employees without causing inconvenience to the public.

EDW. A. MOSELEY,
Secretary Interstate Commerce Commission.

Commercial Courts are tribunals distinct from the ordinary civil courts, and in some countries are established in various commercial towns, or within certain districts, to settle disputes with regard to rights and obligations between persons engaged in trade, with the assistance of experienced merchants, by a brief process, according to equitable principles. The general introduction of tribunals of this sort began in the Middle Ages. The first was probably that established at Pisa in the 11th century, and the basis of its decisions was the code of maritime laws of Pisa, confirmed by Pope Gregory VII. in 1075. At first the commercial tribunals were not so much courts established by government as arbiters of disputes, freely chosen by the merchants and confirmed by the governments. Under the name of commercial consuls such committees of arbitration were appointed in all the great commercial cities of Europe; and in the

course of time they really became tribunals of justice, and were, in part at least, administered by men of legal learning and experience. Pope Paul III. confirmed the commercial consuls in Rome. Francis II. in 1560 granted to the Parisian merchants particular arbiters for the adjustment of commercial disputes; and in 1563 was established the Parisian Court of Commerce, consisting of a judge and four consuls. The same thing soon followed in all the important commercial towns of France. In London Henry VII. appointed particular commercial judges. The president of the commercial tribunal for the Hanse towns, established in 1447, bore the name of alderman. At Nuremberg, in 1621, a similar tribunal was instituted under the name of inspectors of the markets. The diets of the empire even called upon the German princes and commercial cities to follow this example, as the decrees of the empire in 1654 and 1668, and the decree of the imperial commission of 10 Oct. 1663, show. In many of these cities, as in Frankfort-on-the-Main, and in Leipsic, they were not so much independent authorities as delegates from the city councils. When commercial courts take cognizance particularly or solely of disputes relating to maritime affairs, they may be called courts of admiralty. Such a court was erected in Hamburg in 1623. The internal regulations of commercial courts commonly require that a part of the members, or at least the presidents, should be lawyers; the rest are for the most part experienced merchants, who are better adapted than regular judges to give counsel on commercial affairs, with which they are more acquainted, and which very often are not to be reduced to simple principles of law, but are to be decided according to commercial practice. Their jurisdiction commonly extends over all commercial disputes, matters of exchange, insurance, freight, bottomry, average, etc.; and further, over bankrupts, the hiring of shops and stores, clerks, and apprentices; the debts of those who receive goods from merchants upon credit; and all natives and foreigners who traffic in the place, and are found there; all shipowners, contractors for transporting goods, brokers, factors, etc., are obliged to submit to their decisions. They do as much as possible by oral investigation; and the intention of their institution is that they shall avoid the long and formal process of other courts. But when the difficulty and confusion of the matters in dispute occasion the necessity of an investigation in writing, recourse is had thereto. The greater despatch of these courts consists principally in this — that the defendant is orally summoned, once or several times, to appear before them at an early day, and if he fails to come, he can be brought by force. The complaint is then made orally, both parties are heard, and sentence is given, if possible, immediately after. But as this can seldom be done, and most cases require reference to written documents, a day not far distant is appointed for the answer to the complaint and for the evidence on both sides, and the time is seldom or never prolonged. The remedies against a sentence must be sought from the same judges, and are not easily obtained. Appeals are only allowed in very important cases, and upon the deposit of a large sum as a pledge that the final decision shall be obeyed without delay. The principal features of this process form the basis of most commercial codes. From the sentence of these tribunals appeal is made to the court of appeal within whose jurisdiction they happen to be. The other countries where these tribunals exist are Belgium, Spain, Portugal, and Italy. See COMMERCIAL LAW.

Commercial Education. It is not known when commercial education was begun in the United States, and the facts about its subsequent development are difficult to ascertain. The opportunities for formal school preparation for a business career which are now offered in the United States may be roughly divided into four classes. First: The "commercial college" of the well-known type. Second: The business courses of the public high school. Third: Private endowed schools, more or less technical in character. This class might include business courses in the unclassifiable, but increasingly important and popular correspondence schools. Fourth: College and university courses.

The "commercial college" is the best known and almost the only well-known method of business training. Its almost spontaneous origin, its rapid and wide diffusion, its rough adaptation of primitive material to the satisfying of immediate and pressing needs, its utter disregard of all save the direct answer to current demand, its gradual recognition of present inadequacy, and its determination toward broader, fuller usefulness, mark it as a product of a young, eager and gradually maturing people. It is claimed that Bartlett of Cincinnati was the first American to assume for his undertaking the name of business "college," and he was unquestionably one of the earliest and most successful workers in this field. He gave commercial instruction to private pupils in the forties. About the middle of the fifties there were not more than a dozen commercial schools scattered in the large cities from Boston and Philadelphia to Chicago and St. Louis. They had arisen with the idea of facilitating the entrance of young men into minor positions as clerks and bookkeepers. The instruction offered was very meagre,— commercial arithmetic, a little practice in keeping accounts, and a certain amount of ornamental penmanship made up the total. A school of this kind did not require a large force of teachers,— in many cases the entire instruction was given by one man. The equipment was not elaborate and the fees were low, $40 being an average charge, not for one term or for one year, but for an indefinite or life scholarship, and often valid at any of a large number of schools, embraced in single "chain." In those early days there were no text-books for the "commercial colleges"; and arithmetic and bookkeeping were taught by manuscript prepared by actual accountants engaged in business. The students also came primarily from business houses, a fact which necessitated the institution of evening classes. The average time spent in a business college was not more than three months. Poor as such education was, it filled a need, for commercial colleges throve and multiplied and with success became still more successful. Increased popularity led to higher fees and longer courses, to the preparation of printed texts; life and interchangeable scholarships were abolished; the teaching force was increased; day classes largely took the place of evening instruction; school equip-

ment improved and gradually these institutions grew into the apparently permanent place in public favor which they enjoy to-day.

But apart from mere numerical increase, considerations of the lengthened course of study, improved teaching, and better average preliminary preparation, there is evidence of broadening views and sounder conceptions among the business college teachers. Of course, even in the limited field of preparing for subordinate mechanical labor, good work may be done and the business college accomplished excellent results. But to-day the directors of commercial schools realize that for clerical positions more technical instruction is necessary; that a broader education pays, even if no higher position is ever won; and that the business college can equip the student through liberal and fundamental studies for subsequent promotion. These ideas produce their logical outcome, a course of study which is at once broader and more technical. The process is slow, but evidences of advance are apparent in the printed announcements of various schools, in the discussions of business teachers' conventions, and in the periodicals, weekly and monthly, issued in the interests of business education. Secondly, the necessity of pedagogical training has been recently forced upon the consciousness of business school directors. So that to-day there is a growing proportion of men and women of collegiate or other special preparation in this work. A third favorable influence on the work of the business college has been the recent and marked growth of a new form of competition, that of the public high school, a rivalry which can only prove to the advantage of each. It is not too hazardous to predict that the commercial college may hereafter be glad to see much of its work go over to the system of public education, thus giving it better equipped students and freedom to evolve a still higher course of instruction. The probability of this further evolution of the business college into a supplementary educational instrument of a somewhat better type is foreshadowed in a fourth fact favorable to commercial training, its formal recognition as a factor in public education by the University of the State of New York, whose regents trusted that this standard would create a demand for higher qualifications and lead to a repetition of the experience with the professional schools of medicine and law, when similar actions led to a large increase in the attendance at secondary schools. Conditions of recognition of a business school are in brief: Instruction by at least six teachers giving all their time to the work; an equipment worth not less than $5,000, exclusive of buildings and fixtures; and a satisfactory one-year course, supplementary to the high school and consisting of at least 500 hours of actual instruction, in preparation for the State business diploma. Out of 30 schools in the State reported by the bureau of education, the regents granted full recognition to 11 and provisional registration to 13. Besides granting registration to business schools on these conditions, the university decided to issue business credentials, including a State business diploma and a State stenographer's diploma and corresponding certificates. The distinction between the two is the requirement of graduation from a registered high school in the case of the diploma, but not of the certificate. To obtain the diploma, candidates must be certified as having completed also a full one-year registered business course, and must pass regents' examinations in advanced bookkeeping, commercial law, business English, arithmetic, practice, and office methods, commercial geography, and the history of commerce. If the high school course previously taken did not include United States history, civics, and economics, the regents' examination in these subjects must be passed. The requirements in general are much higher than for the corresponding subjects in the high school course, and require a higher degree of theoretical and practical knowledge.

The annual tuition fee varies in the better commercial colleges from $50 to $150 and even $200 for a school year of 10 months. It is perfectly safe to say that in the quality of the work which they do, and in the equipment for this particular work, the American commercial colleges have no rivals, largely because they are engaged in the mechanical work in which Americans excel the rest of the world. They are not educational institutions in any broad sense of the term at all, but trade schools pure and simple. They train for facilities. That hundreds of the students of the colleges have been successful business men of initiative and independent enterprise simply proves that they had native ability for that sort of thing; not that this sort of training was especially helpful, though it is only fair to say that many of these men trace their start in business to the technical skill in bookkeeping, etc., which they acquired in the schools.

The Packard Commercial College opened in New York, in the spring of 1858, as a link in the Bryant and Stratton chain of business colleges, and may be considered a type of these colleges. In 1867 Mr. Packard bought the interest of his partners, Bryant & Stratton, and changed the name from Bryant, Stratton & Packard's business college to Packard's business college. The most important result of the change of proprietorship was in doing away with the life-scholarship plan under which the "chain" had been conducted, and putting an end to the interchangeability of tuition. Mr. Packard's lead was followed by the other schools, and thus the foundation was laid for individual,— if not competitive work, which has done so much to advance the character of business education in this country. In the first years of the existence of the school, Mr. Packard wrote text-books on bookkeeping for the use of Bryant & Stratton schools, which in revised form are still used. The school was first located in two small rooms in the Cooper Union building, of which it was the first tenant. In the fall of 1863 it was removed to the Mortimer block, corner of Broadway and 22d Street and Fifth Avenue, and in the spring of 1870 to the Methodist building, corner of Broadway and 11th Street, occupying the entire fourth story of the structure. Here it remained for 17 years, until it outgrew its accommodations, and moved to its present quarters. In 1865 commercial law was added to the course, and later practical English and civics. In 1872 stenography was first taught, in classes only. A very small proportion of students studied this branch, and always in connection with the commercial course. The following year the

typewriter was introduced. This was the first school to teach stenography or typewriting. At the present an important feature of the work, from which no student is excused, is public speaking without any attempt at elocution. Another feature is the character record, a brief history of the student's career from the beginning to the end of his course, showing not only progress in study, but also comments by his various teachers on any special characteristics or performance that is deemed worthy of comment. It has proved not only efficacious as discipline, but is useful as reference after the student has passed out from the school and refers to it for recommendation in business. This record is never destroyed. A specimen of the student's work is also preserved. The commercial course now covers about a year and a half, or 15 months, the students entering at any time and being graduated not in classes, but as they finish the course, in greater or less time, according to their ability. The instruction is largely individual. The school graduates yearly about 150 pupils, the number in recent years being almost equally divided between the stenographic and commercial departments.

The career of Thomas May Pierce, of Philadelphia, illustrates in a similar way the growth of this department of our educational system. Starting in 1865 with the meagre curriculum then offered, he increased the scope of the work, improved the equipment, introduced regularity and system into the instruction until, when he died in 1896, he had built up what might fairly be called a typical school of the better sort. He employed some 25 instructors, and occupied quarters in one of the best office buildings in Philadelphia, where he used 15 rooms containing 10,000 feet of actual floor space. The charge for tuition was $15 per month, or $100 for a course of seven months.

Commercial instruction in the American public school system is only beginning to attract general attention, despite the fact that a certain amount of this work has been carried on for many years. A commercial course was not infrequently announced, although it differed from other courses in the same school only by the inclusion of a little typewriting, bookkeeping, and possibly stenography. Of late years a considerable change has come about, and high schools which had offered some business training have improved the course of study. Commercial instruction has been introduced for the first time into many schools, and gradually distinct and separate courses are being established in connection with city systems to give opportunities for the future business man, comparable to the aid already furnished to those looking forward to higher studies of a professional or technical kind. The natural order of development in this matter can be seen in a glance at the course of high school study in some typical cities. Omaha represents one stage, presenting a commercial course in which commercial arithmetic is substituted for elementary science and botany in the 9th grade of the regular English course, bookkeeping for zoology and mediæval history in the 10th, commercial law and bookkeeping for chemistry and French history in the 11th, and stenography and typewriting for American history and political economy in the 12th grade. Some question might arise as to the advisability of the substitution in one case or another, yet there remains a fairly liberal plan of study, covering four years. Even if the aggregate of special preparation for business does not exceed the ordinary work of the year, it is preferable from an educational point of view at any rate either to place this late in the high school programme or to distribute it as indicated above. Boston with a two years' commercial course and little special business training, Pittsburg with one year's work in place of the second high school year, and Washington with a two years' course, are all in an early stage of development in this direction. Possibly Washington with a distinct business high school even though the course of study covers only two years, is nearer the final form than Milwaukee with its new four-year commercial course. The evolution of a real secondary business school may come more easily through the addition of successive years to the course than through the gradual specializing of an ordinary high school curriculum. Indeed this view is borne out by the experience of the Hillhouse high school in New Haven with an admirably outlined three years' course and by the development in Paterson, N. J., of a commercial department in the city high school into practically a distinct school operated in a separate building by an entirely independent faculty, with a special course of two years, requiring one year of secondary study for admission. What is desirable seems perfectly clear. First of all the course of study should be at least four years. We cannot successfully defend commercial instruction in the public high school unless the work is as broadly educational as any other of the secondary courses. Secondly, the course should be thoroughly outlined as distinctly commercial. A mere substitution of a few business studies in the usual English course does not make for commercial training and such action is not only an inadequate provision for present needs, but it is destructive of future possibilities. A separate building is strongly desirable, not only on the ground of superior adaptability for the uses of a commercial school, but for absolute independence in fact, and full differentiation in the public thought. When a few such independent schools have solved the problem of commercial instruction, the ordinary schools will have a better basis for «commercial courses.» With these considerations in view, we can readily say that between the two-year, strictly commercial course of Washington, for example, and the four-year course slightly specialized, of some other cities, the choice should be made not on the basis of what is offered now, but of approximation to the real type, namely, a well-planned, fully-specialized scheme of commercial training covering at least four years of secondary grade. This standard of secondary commercial training has been more nearly approximated in Philadelphia than in any other American city. In 1898 a department of commerce was established in connection with the Central high school. For reasons of expedience and economy, the department was housed in the new high school building, and much of the instruction given by the regular teaching force. Under a special director, however, the work promises to grow into an entirely differentiated institution, which may parallel the success of the

manual training high schools of that city. The commercial department in the Pittsburg high school was organized in 1872 for the benefit of those who could not spend four years in the high school and yet desired some scholastic training in addition to that given in an elementary school, and especially such training as will best prepare for business positions. Its commercial studies are essentially those of a so-called commercial college, at the same time it undertakes to give general training. The curriculum is two years, one given up chiefly to general studies, the second to bookkeeping, typewriting, stenography. Almost one third of the students of the high school were enrolled in the commercial course and of these 50 per cent were girls. The commercial course in the Boston high schools is likewise only two years long. Commercial arithmetic, bookkeeping, and stenography are begun in the first year, occupying about one half of the time, while the rest is devoted to general studies like English, history, drawing, music, etc. The second year is much like the first; about one half the time is given to the study of commercial subjects. In the Hillhouse high school, New Haven, Conn., while all the other courses are four years each, the commercial course is three years. About five hours a week, approximately one third of the time, is given to strictly commercial subjects, the rest are of a general nature. Students who do the regular work well are permitted to take stenography and typewriting extra.

The work in the commercial courses of other high schools is along one or the other of the lines indicated above. It is at present a concession to a popular demand. It does not grow out of a conviction on the part of high school principals and teachers, that it is an essential part of the high school system. It will undoubtedly continue to grow and after a few good commercial high schools have formulated and solved the purpose of this kind of instruction, the average high school, profiting by their experience, will be able to organize commercial courses which will be better than those thus far elaborated. In the opinion of the writer the technical work of the commercial courses in high schools is not as well done as in the better commercial colleges.

The third division of business courses is the private secondary schools with the usual wide variation in what is offered, and a total registration of nearly 20,000. The influence of this form of competition upon the ordinary business college has been already mentioned. How widely it may be felt can, perhaps, best be seen through an outline of what is open to business students in one of the best endowed secondary schools of the country, the Drexel Institute of Philadelphia. Special departments of such schools and new endowments by private or semi-public bodies will, we may expect, play a large part in the work of business training in the United States, if the experience of other countries be a good basis for prophecy.

The Drexel Institute of arts, science, and industry at Philadelphia was founded and endowed by Anthony J. Drexel of that city. It included from the beginning in the scope of its instruction courses in commerce and finance. As the school is well endowed and independent of State control, one may see from an examination of its work in this department a type, and, indeed, a very good type, of the best work which such institutions can do in the field of commercial education. The departments of commerce and finance consist of three special departments: (1) The course in commerce and finance; (2) the office course; (3) the evening course. The course in commerce and finance in its general features resembles the commercial schools of Europe, and is intended to place commercial education in its proper relation to other departments of educational work. The object of the course is to train the young men to do business rather than simply to record business. It has been organized with a view of meeting these conditions. It provides a liberal, and at the same time, thoroughly practical course of study, including two years' training in the knowledge of the world's industries and markets, the law of trade and finance, and the mechanisms and customs of business. The first special department gives a fundamental training including: (1) the production, manufacture, sale, and transportation of articles of commerce; (2) management of stock companies and corporations; (3) buying and selling of securities; (4) importing and exporting of merchandise; (5) borrowing and lending of money and credit; (6) advertising of commercial concerns; (7) keeping of business records. The work of this course is divided into two years. In addition to the general course in commerce and finance, described above, and requiring two years for its completion, three distinct office courses are offered. The bookkeeping course occupies one year and includes the following subjects: Bookkeeping, business forms and customs, typewriting, commercial arithmetic, English and penmanship. Another office course trains stenographers and typewriter operators. It includes stenography, typewriting, English, business forms, and office practice. The private secretary's course has been organized in response to applications that have been made to the institute for clerks fitted to do work of a different character from that required in a purely business office. The subjects included in the course are as follows: Stenography, typewriting, penmanship, English, correspondence, accounts, office practice, and business printing. Applicants for admission must show by examination, or otherwise, that they are prepared to meet the requirements of the course. The course occupies one year, divided into two terms. The department of evening classes is fully organized, and includes the following courses: (1) Beginners' course in bookkeeping and arithmetic. (2) Accountants' commercial course. (3) Office course in stenography and typewriting. The fee for each of the courses, for the entire season of six months, $5. In the course in commerce and finance, the fee is $25 for each of the two terms; and there is the same charge in the office courses.

The work done in the Drexel Institute is paralleled to a greater or less extent by similar work done in many private institutions, such as the Heffley School, formerly of Pratt Institute of Brooklyn, the Armour Institute of Chicago, and other schools founded by private initiative. Many of these schools have the advantage of ample funds, so that they are not as dependent

upon the whims of individual students as are the commercial schools described in previous paragraphs, and on the other hand they are independent of the injurious influences at work elsewhere. I think it is not too much to say that the two years' course offered in the Drexel Institute forms in its way a model, and furnishes the basis for the elaboration of a curriculum which will compare favorably with the best of the European commercial schools of the same grade. The work done in the evening course of this institution corresponds more closely to the work of the ordinary business college as described above. The business courses of the "correspondence schools," although classified with the privately endowed schools, correspond more closely to the "commercial colleges," especially in their attention to the individual, their over-technical and practical purpose, their lack of the ideal of educational value in their work, and their freedom from the bondage of definite curriculum or class-room work. The "correspondence schools" are a factor of growing importance, but from the nature of the case their methods admit of little analysis or examination.

In the fourth class of institutions of commercial instruction, namely, the colleges and universities, the movement for instruction is of comparatively recent origin, and has affected few of these institutions. It is also a matter of interest that the attitude of these higher institutions of learning toward this subject is a radically different one from that of the other classes of institutions which we have been discussing. It has been very difficult indeed in this whole development to get the so-called commercial colleges, the high schools and other commercial courses of the various institutes in their departments of commerce to give any instruction, whatever, except in the so-called practical subjects, and of any kind whatever except of the most immediate, technical, special sort. In the colleges and universities on the other hand, even where they have been willing to accord a certain recognition to the necessity of higher education in commercial and business matters, it has been difficult to get them to give any attention, whatever, to the more practical sides of the work. While the commercial colleges have felt that political economy, commercial geography, and similar subjects were too remote and impracticable to make it worth while for them to admit these subjects into their curricula, the colleges have felt that accounting, commercial arithmetic, and similar subjects were too elementary to deserve any attention, whatever, from higher institutions of learning. The colleges and universities, moreover, have seen scores and hundreds of young men complete the old-fashioned classical courses of study, and enter the ranks of business men with ability and success. They have felt, therefore, that in a certain sense every man who wished to go into business, would find it worth his while to take the old-fashioned course. And they were very slow, indeed, to recognize that there were scores and hundreds of young men in the community who would take a higher education if an emphasis were laid upon subjects in which they were interested and which had to do with their future careers, who could not be persuaded to follow out an old-fashioned classical curriculum.

Four institutions in the United States, the University of Pennsylvania, in Philadelphia; the University of Chicago, in Chicago; the University of California, in Berkeley, Cal.; and Columbia University in the city of New York, deserve special mention for their connection with this subject of higher commercial education. Some other institutions, notably, New York University and the University of Vermont (where a department of commerce and economics opened in 1900), have important commercial schools.

In 1881 Joseph Wharton, Esq., a manufacturer of Philadelphia, gave to the University of Pennsylvania the sum of $100,000 in order to establish a department in that institution for higher commercial training. The Wharton school of finance and economy had a curriculum two years in length and made up largely of political economy, political science, accounting, mercantile law and practice, etc. A bachelor's degree was conferred upon the graduates from this school. To enter as a regular student the candidate must have completed the first two years of the regular four years' college course. After some 10 years' experience it was decided to enlarge the course by extending it downward into the first two years of the college course, and at present the course in finance and economy covers four years and is included together with the other courses in arts and science in the so-called school of arts. The requirements for admission are the same as for other departments and represent the ordinary requirements of first-class American colleges. The faculty is composed of some 13 members. The nucleus of the course is in the study of economics and politics, supplemented by practical courses in accounting, business law, and business practice.

The growing demand for higher instruction in commercial subjects, combined with the success of the experiments in the University of Pennsylvania, turned the attention of several institutions toward the subject about the same time.

The University of Chicago, which opened its doors in October 1892, had included within its plan of work from the beginning a college of practical affairs. But it was not found practicable to undertake the organization of such a department until the year 1898, and students were enrolled in this college for the first time on 1 July of that year. The new department received the title of the college of commerce and politics, and was organized as a co-ordinate department with the other colleges of arts and literature and science. The purpose of the new college, like that of those already existing in the university, is two-fold. First, it aims at the attainment of general culture; in the second place the weight of work is put in the lines of the courses offered in certain specified departments. In the new college those departments include political economy, political science, history, and sociology. It is by no means a technical school, but is intended to give a kind of knowledge and training which may enable those who enter commerce, politics, journalism, or diplomacy to begin their work with a certain degree of equipment. The course of study covers four years. The first two years, however, are essentially the same as the first two years in one or another of the

liberal courses, political economy, or political science being the only subject in these two years having a specific relation to the special work of the college. The other studies of the first two years are history, French or German, English, mathematics, science, and a small proportion of the time (about one sixth) is given to any other subject which the student may desire to pursue from among the courses offered in the university. The admission to the course covers about the curriculum of the typical four years' high school course, including at least four years' work in Latin, two in mathematics, and the usual time devoted to English history, physics, and German or French. It is during the last two years of the work that the special character of the college becomes apparent. The work of the last two years is divided into three groups: Commerce, politics, journalism and diplomacy. In the first group, commerce, there are four special sub-groups: (*a*) Railways; (*b*) banking; (*c*) trade and industry; (*d*) insurance. The student must elect, at the beginning of the third year's work in this college, one of these groups to which he wishes to devote his time. One third of the course for the next two years must be selected from within the group chosen. Another third may be selected by the student from a list of specified courses. The remaining third may be chosen by the student from any course offered by the departments of political economy, political science, history, or sociology. It will be seen that in this work the nucleus consists of economics and politics, using those terms in a large sense. But the University of Chicago has not added special technical courses in accounting, business law, business practice, etc., which forms a characteristic feature of the Wharton school.

About the same time that the University of Chicago determined to adopt a scheme of higher commercial training, a report was made to the board of trustees of the University of California, by one of its members, urging the adoption of a similar course there. After an elaborate discussion, it was decided to erect an additional college in the university, to be known as the college of commerce. The course extends over four years, similar to that of the other colleges in the university. The requirements for admission are essentially the same, and correspond to graduation from the typical high schools with the four years' course. In the first annual report of the president, after work was begun, it was stated that many details were yet to be determined, among others, the question of what degree should be conferred upon students who completed the course. In the same report the following statement is contained as to the scope of the new college: "It is the intention of the authorities of the university to place the course in commerce upon a high scientific plane, otherwise it is not justified in claiming a place in the university curriculum beside those advanced scientific, philosophical and literary courses which have already won recognition." The student will be encouraged to acquire a knowledge of them elsewhere possibly, before entering college. Thus the college of commerce will supplement, not compete with, the work of the older business commercial schools. The courses of the college of commerce of the University of California fall into the general divisions: Economic studies, economic history, legal, political, historical, and geographical studies, technical studies of transportation, and of the materials of commerce, and mathematical, linguistic and philosophic studies related to commerce.

On 3 Nov. 1898, the Chamber of Commerce of the State of New York adopted the report of a committee which had been previously appointed by that body on the subject of commercial education. This report, after strongly commending the establishment of a department of sounder commercial education, both in secondary schools and in higher institutions of learning in this country, advised the appointment of a special committee by the president of the Chamber of Commerce for the further consideration of the subject of commercial education. This committee was appointed and, after various sessions and conferences with authorities of Columbia University, a report was submitted to the Chamber of Commerce recommending that the chamber assist Columbia University in the establishment of a collegiate course in commerce by the grant of certain funds. This report presents in a certain way the most complete scheme of higher commercial instruction which has thus far been submitted for the consideration of the public. It unites the practical elements in the course of the Wharton school with the wider range of the courses and subjects offered at California and Chicago. It was framed upon the plan of utilizing as largely as possible the existing courses of instruction in Columbia University, and supplementing and adding to such courses the subjects necessary to offer a complete and well-rounded scheme of higher commercial instruction. It planned a college course of commerce covering 4 years of 15 hours a week. It presupposes graduation from a secondary school, public or private, in which English, mathematics, history and natural science, and one modern language will have been systematically studied to the extent now required for admission to the college department of Columbia University. In form and in content it is adapted to students of college age, namely, 16 to 20 years. In addition to the training provided in commercial subjects, the course includes two years in writing English, two years in a modern European language, two years in European and American history, and three years in political economy and social science. It offers opportunities for the study of industrial chemistry, of a selection of three modern languages and literature, if any of these be desired.

Of the 60 hours required (4 years of 15 hours each) 4 hours are devoted to instruction in writing English; 6 hours to European and American history; 6 hours to the modern European languages; 10 hours to political economy and social sciences, and 34 hours to the study of commerce itself in its various phases. It will be observed that this curriculum comprises fundamental courses in the principles governing business combined with a detailed course in practice. It is intended that many of these latter courses, as well as some of the former, shall be given by men having an intimate personal acquaintance with actual business life. Among such courses would be those in accounting and transportation, technique of trade and commerce, commercial ethics, com-

mercial credits, insurance and commercial business. Aside from the general subjects included in liberal courses we note a course of three hours per week for one year in accounting and a similar course in economic geography; a course of two hours a week following a course in chemistry on the study of commercial products; a course of three hours a week upon the technique of trade and commerce, such as weights and measures, currency, and banking systems, customs regulations, markets, fairs, etc. There are also courses in banking, accounting, commercial geography, railroad and public accounting, history of commercial theory and merchant-shipping and trade routes, commercial treaties and insurance. No degree is given for this course, but a certificate of graduation testifying that the candidate has completed the work of the four years will be given to all students who pass the requisite examinations after attending the courses.

It is plain from the foregoing account that instruction in commercial subjects is to be introduced into all higher institutions of learning upon a broader scale than ever before. It cannot be maintained, however, up to the present, that our experience has been large enough to afford any accurate indication of what the ultimate form or purpose of such instruction will be. We have as yet established no independent college of commerce in the United States upon an adequate foundation. We have not even established any institution which may be fairly called a commercial high school, that is, a school with an adequate equipment, with a differentiated curriculum and with an opportunity under favorable conditions to show what it can accomplish in an educational and a technical way. None of our colleges and universities have as yet been willing to give such departments a fair opportunity to show what they might accomplish in the same directions. But with every passing year the demand for better facilities on the part of young people who desire to prepare themselves for business careers will force those who have charge of public education to give a larger space in our secondary schools to this branch of work; will lead the managers of our private secondary schools to offer better facilities, and will finally compel our colleges and universities to do something for the education of the future business man which may be compared with what they are doing for the future engineer, or lawyer, or physician, so far as the peculiarities of a business career may render such a scheme feasible.

EDMUND J. JAMES,
President Northwestern University, Evanston.

Commercial Law, or **Law Merchant,** that branch of law which relates to trade, navigation, maritime contracts (such as those of insurance, bottomry, bills of lading, charter-parties, seamen's wages), bills of exchange, bills of credit, factors, and agents. Lord Mansfield describes it as a branch of the public law, and applied to its universal adoption the language of Cicero respecting the great principles of morals and eternal justice — "*Nec erit alia lex Romæ, alia Athenis*" ("Nor shall there be one law at Rome, another at Athens"). The body of rules constituting this law is substantially the same in the United States and Europe, the rules, treatises, and decisions of one country and one age being in general applicable to the questions arising in any other. The reason is obvious why this law should be common to different nations, for it regulates those contracts and transactions in which they come in contact, being a sort of neutral ground between their hostile interests, institutions, customs, and prejudices. International law, which regulates the conduct of different nations toward each other, is distinguished from maritime law, by which private contracts between individuals are regulated.

The first known collection of marine laws was that of Rhodes, of which some fragments have come down to us in the 'Digest' of Justinian, in the title 'De Lege Rhodia de Jactu'; the collection under the title of 'Rhodian Laws,' published at Basel in 1561, and at Frankfort in 1596, being generally considered as spurious. This title and that 'De Nautico Fænore' recognize the first broad principles on the subject of jettison and maritime law. The law 'De Exercitoria Actione,' in the 'Digest,' also transmits to us their principles as to the liability of the owners for the acts and contracts of the master of a vessel. The remaining rules and principles by which the commercial transactions of the ancients in the Mediterranean were governed have for the most part passed into oblivion. The reason of so small a space being assigned to this branch of jurisprudence in the Roman laws may be the low estimation in which trade was held by the Romans, who prohibited men of birth and rank from engaging in commerce, of which the Code (4, 63, 3) speaks contemptuously; and Cicero says it was not fitting that the same people should be both the porters and the masters of the world. The Greeks adopted the Rhodian laws with modifications. The Athenian law on the subject of maritime loans is stated particularly in Boeckh's 'Economy of Athens' (b. i. § 23), from which it appears that the rules on this subject were very definitely settled. The laws of trade naturally followed the trade which they were designed to regulate. Accordingly we find them first revived in the Middle Ages, on the shores of the same sea, in one of the islands of which they had their origin; a collection of them being made at Amalfi, in Italy, at one time a great centre of Mediterranean trade, about the time of the first crusade toward the close of the 11th century, called the Amalfitan Table, the authority of which was acknowledged throughout Italy.

The origin of the compilation of sea laws which passes under the title of 'Consolato del Mare,' though involved in some obscurity, is most generally assigned to the city of Barcelona in Spain. Some writers, however, and particularly Azuni, claim the honor of this collection also for Italy. But Casaregis, a profound commercial jurist, who published an edition of it in Italian at Venice in 1737; and M. Boucher, who published a French translation in 1808, from what he considers the original edition of Barcelona of 1494, both admit the Spanish claim. These laws are supposed by M. Boucher to have been adopted and in use as early at the 9th century, and their authority was acknowledged in all the maritime countries of Europe, and some of the articles of this collection form a part of the present commercial law of all civilized nations. It has been translated into German also, but no entire English translation has yet

been made. It is an ill-arranged, confused compilation; and, though it is interesting as a historical record of the marine laws and customs of the Middle Ages, a large proportion of its provisions do not apply to the modes of transacting business and making contracts in modern times. The 'Jugemens d'Oléron' ('Laws of Oleron'), are supposed to have been compiled about the time of Richard I.; and the honor of this collection, like that of the 'Consolato,' from which it is partly borrowed, is in dispute being claimed for the French by Valin, Emerigon, and Cleirac, who say it was made by order of Queen Eleanor, Duchess of Guienne, for the use of that province, and adopted by her son Richard I., Duke of Guienne. But Selden Coke and Blackstone assert that it is an English work published by Richard I. in his character of king of England. The maritime codes of Wisby and the Hanse Towns are also of historical celebrity, and constitute a part of the legal antiquities of this branch of jurisprudence. These were the principal marine codes down to 1673, the date of the French ordinance of commerce, which treated largely of bills of exchange and negotiable paper. In 1681 was published also the French 'Ordinance of the Marine,' one of the most glorious monuments of the reign of Louis XIV. It was framed under the influence of Colbert, and merits all its celebrity, being comprehensive and including provisions, not only on many of the subjects of commercial law as we have defined its limits, but also ample regulations on the subject of prizes. These ordinances are the foundation of the present system of marine law in Europe and America. Valin's 'Commentary upon the Ordinance of the Marine,' published in 1760, is a profound, original, comprehensive, learned, and accurate work. In 1763 he also published his commentaries on the provisions of the ordinance in relation to prizes. About 20 years afterward (1782) Emerigon published his masterly treatise on insurance. The two ordinances, with the commentary of Valin and the treatise of Emerigon, made the commercial law a science, of which the principles were now settled, and their application also traced out into a great number of examples. It was now in the power of jurists, judges, and legislators to make every new question and case that should arise only a confirmation and extension, in application of doctrines which had been established upon conclusive reasons and made parts of a harmonious system; and all the commercial nations have adopted the system thus formed. It forms the basis of the French code of commerce and appears everywhere in the British, American, and continental treatises and decisions. The other French writers of greatest celebrity on this branch of law are Pothier, Cleirac, and Boucher. M. Jacobsen, a jurisconsult of Altona, has published a useful work on the subject of sea laws. The earlier English writers on commercial law were Malynes (a merchant), Molloy (a lawyer), Beawes (a merchant), Postlethwaite, Magens (a *dispacheur*, or adjuster of marine losses, originally of Hamburg, afterward of London), and Wiskett (a merchant). But the marine law cannot be considered as having become a branch of the general science of jurisprudence in Britain until the time of Lord Mansfield, who appears to have had some considerable acquaintance with the treatise of Valin, from which he drew principles and reasons and incorporated them into the reluctant common law. By degrees during his judicial career this branch of jurisprudence gained popularity, and from that time has occupied an important part of the British legal administration, though very few legislative enactments have either disturbed or promoted its progress. Though the maritime law in Great Britain continued in a very rude and undigested state long after it was arranged into an admirable system in France, yet the assiduity with which it has been cultivated since its introduction, and the splendid talents which have been brought to its illustration, have contributed to advance it with a rapid progress. Among the ornaments of this branch of law was Lord Stowell, judge of the British high court of admiralty. Lord Tenterden, chief justice of the court of king's bench, by his learned and well-arranged 'Law Relative to Merchant Ships and Seamen,' contributed very materially to the present advanced state of British commercial jurisprudence. The other principal writers on this law are Millar, Park, Marshall, Bayley, Chitty, Levi, Smith, Tudor, etc. Nor have the Americans been idle spectators of this improvement in a branch of law in which their industry and prosperity are so deeply interested. Though they have supplied but few original systematic treatises and digests, yet in the numerous, important, and interesting questions that have been brought under discussion before the legal tribunals, the research, comprehensive views, and logical power displayed by both the counsel and the courts, will support a comparison with those of their European contemporaries, who might derive very useful additions to their own adjudications, particularly on the subjects of merchants' shipping and insurance, from the American reports. Among the most eminent of those who have contributed to the elucidation of the commercial law are Chief Justice Marshall and Justices Washington, Story, and Blatchford, of the Supreme Court of the United States, and Chancellor Kent, of New York.

Commercial Organizations. In the early part of the 19th century the commercial organizations then existing which had any material influence upon the home and foreign commerce of the nations of the earth were exceedingly few. Indeed, it is doubtful if at that period there were more than 14, namely, 3 in Great Britain, 7 in France, and 4 in the United States. All of these, save two notable exceptions,— The Board of Trade of England and the Council General of Commerce of Paris,— were largely synonymous in their vocations and operations.

In France chambers of commerce had been instituted at a very early date — notably at Marseilles, at the close of the 14th or the beginning of the 15th century; at Dunkirk, in 1700; at Paris, in the same year; at Lyons, in 1702; at Rouen and Toulouse, in 1703; at Montpellier, in 1704; and at Bordeaux, in 1705. While England had her board of trade as early as 1660, it was not until 1786 that the present department was established in council, being a permanent committee of the privy council for the consideration of all matters relating to trade and the colonies, with functions partly ministerial and partly judicial. Of chambers of commerce, Great Britain then had only two: that of Glasgow, instituted in 1783, and of Edinburgh,

founded in 1785, and incorporated by royal charter in 1786.

In the United States the oldest existing chamber of commerce is that of New York, organized in 1768, and incorporated by royal charter in 1770. Shortly afterward a second was established at New Haven, Conn.; another at Charleston, S. C., about 1775; and that in Philadelphia in 1802. It is true that New York about this time had also a board of brokers, organized about 1792 or 1793, and had erected the Tontine Coffee-house, where merchants and others met and discussed mercantile and semi-commercial questions.

The Chamber of Commerce of New York is in some respects not only the forerunner but the type of many like institutions which have been organized in our leading cities, representing, both locally and otherwise, our multiplying and diversified industrial interests. In some instances, however, it essentially differs from other kindred institutions, since, while caring for local welfare, it is also broadly national in its sympathies and work. In this connection it may be interesting to trace back this time-honored organization to the names of the old and respected merchants who founded it. They were: John Cruger, Elias Desbrosses, James Jauncey, Jacob Walton, Robert Murray, Hugh Wallace, George Folliot, William Walton, Samuel Verplanck, Theophylact Bache, Thomas White, Miles Sherbrook, Walter Franklin, Robert Ross Waddell, Acheson Thompson, Lawrence Kortwright, Thomas Randal, William McAdam, Isaac Low, Anthony Van Dam, John Alsop, Philip Livingston, Henry White, and James McEvers. It also may not be out of place to reproduce the original terms used in its formal organization, reciting its usefulness as follows:

"WHEREAS, Mercantile societies have been found very useful in trading cities for promoting and encouraging commerce, supporting industry, adjusting disputes relative to trade and navigation, and procuring such laws and regulations as may be found necessary for the benefit of trades in general. . . ."

Of the history and character of the persons who are here recorded as the original founders of this chamber the memories of the present generation will not be wholly oblivious. The first public place of meeting of the original chamber was at the house now standing, on the corner of Pearl and Broad streets. This building had been originally erected as a town residence, and had undergone many alterations in size and form. During the period of Washington's first residence in this city it was chiefly remarkable as being a public tavern, where in later days Washington was entertained and took his farewell of the officers of the army on his departure for his home in Virginia at the close of the Revolutionary War. The subsequent meetings of the chamber were held, first, in 1769, in the "great room of the building commonly called the 'Exchange,' at the lower end of the street called Broad"; afterward, in 1779, at the Merchants' Coffee-house, on the south-east corner of Wall and Water streets; in 1817 at the Tontine Coffee-house, on the northwest corner of Wall and Water streets; in 1827 in the original Merchants' Exchange (in a room specially set apart for the purpose), until that building was destroyed by fire in 1835; then for a time in the directors' room of the Merchants' Bank on Wall Street; then in premises on the corner of William and Cedar streets, where the chamber remained for many years prior to its final removal to its present commodious quarters on Nassau Street.

At the close of the Revolution the legislature of New York passed an act (on 13 April 1784) "to remove doubts concerning the corporation of the Chamber of Commerce, and to confirm the rights and privileges thereof." Under this act the title was changed from the "Chamber of Commerce" to the "Chamber of Commerce of the State of New York." From the earlier days down to the present period the membership has been principally confined to citizens engaged in finance and commerce, although at different times our records show that public officers of the highest rank, including presidents, governors, senators, congressmen, foreign ministers, and members of the State legislature, have been either honorary or regular members of the Chamber of Commerce. In the earlier steps taken, almost a century ago, to form a code of commercial laws and regulations, the most prominent merchants of that era determined and bound themselves reciprocally to prevent "the scandalous practice of smuggling." Within two years after the evacuation of the city of New York by the British a strong effort was made in the new State legislature to adopt a plan for issuing paper money, to be made by law a legal tender in the transaction of business. A memorial was adopted by the chamber, setting forth in the most forcible terms the evils and immorality of such an issue, and through its influence the proposed measure was defeated. It may be safely alleged that to the good sense and active management of the chamber may be attributed the policy which the general government adopted at this period of peril, whereby the credit of the nation was maintained. At an early period in the active movements of the chamber in January 1786, a resolution was considered asking the assistance of the legislature of New York for the creation of a fund to connect the city of New York by artificial navigation with the lakes. This action clearly connects the sentiments of the chamber of that early day with the great purpose of Gov. Clinton for the construction of the Erie Canal. A few years later we find the chamber entertaining the project for the construction of a ship-canal around Niagara Falls, and a railroad from Lake Erie to the Hudson River.

The question of tribunals of commerce was also considered at several periods of its history; but the legislature was not friendly to this new departure in commercial jurisprudence until 1874, when an act was passed establishing a court of arbitration, to be presided over by a judge appointed by the governor; and this court continues to this day. Another highly important subject had from time to time occupied the attention of the chamber, that of the pilot laws of New York and New Jersey, resulting in the present excellent system. At the annual meeting in 1848 the chamber took formal measures to assist in organizing a savings bank for the benefit of "merchants' clerks and others"; and a charter was granted by the legislature as the result of this thoughtful action, and since then this institution has grown to be one of the most

successful of similar organizations in the country. In 1849 the chamber was interested in Whitney's project for the construction of a Pacific railroad across the continent, and a report favoring its construction was unanimously adopted and forwarded to Congress. It was also instrumental in getting the United States government to remove the sunken rocks from the channel of the East River and to widen the passage through Hell Gate. In 1852 the chamber took active measures in regard to the reciprocity agreement with the North American provinces for the free interchange of the natural productions of the respective countries, embracing also a full and joint participation in the fisheries and the free navigation of the river St. Lawrence. It also repeatedly declared its sentiments on the subject of privateering, and has at all times maintained its inviolable determination to adhere rigidly to the principles avowed by the government of the United States.

The treaty negotiated with Japan by Commodore Perry, in behalf of the United States, opened up a new pathway to commerce with an almost unknown nation, and the chamber took a prominent part in giving signal testimony of its appreciation of that officer's conduct in a graceful gift of a silver service of plate. At a special meeting of the chamber, held 21 Aug. 1858, the successful result of the united efforts of the English and American nations to lay the first Atlantic telegraph cable to connect the continent of the Old World with the New was announced, and the sum of $10,000 was appropriated and applied to the presentation of gold medals to the prominent officers engaged in carrying out the enterprise. At the meeting of the chamber, 6 Sept. 1860, the following resolution was adopted:

"*Resolved*, That in the judgment of this chamber an urgent necessity exists for the establishment, at an early day, of mail facilities between the cities of San Francisco in California and Shanghai in China, with connections at such intermediate ports as the interests of commerce may indicate."

It seems hardly necessary to add that the above is the germ from which has sprung the magnificent line of American steamships which traverses the Pacific Ocean to-day.

A remarkable epoch in the affairs of this country, and one especially affecting all its business interests, occurred shortly after this period. The southern States of the Union had united in revolt against the government, and the President had issued his proclamation calling for military aid. The chamber responded to this appeal by holding a large and enthusiastic meeting on 19 April 1861, at which an ample sum of money was raised to forward at once for the defense of the national capital two regiments of the State National Guard, and also to organize several additional regiments of volunteers, who left shortly afterward for the seat of war. At this meeting attention was called to the fact that a part of the advertised loan of the government remained untaken. A special committee was appointed, and the balance, amounting to $8,000,000, was at once subscribed, and the Treasury Department notified that the same could be drawn for at once. The great mass-meeting at Union Square — now a matter of history — and the Union Defense Committee were the outcome of the action of the chamber. The valuable aid rendered to the government by this committee, composed, as it was, mainly of merchants and bankers of New York, was frequently acknowledged by the highest military authorities, and 66 regiments were equipped and fitted for service and forwarded in the early stages of the war, as standing evidences of its loyalty and efficiency.

At a special meeting of the chamber held on 15 May 1872, "to give expression to the views of the chamber on the Treaty of Washington (resulting in the Geneva award arbitration), and to urge the ratification by the Senate of an additional article thereto, as proposed by Minister Schenck," the following preamble and resolutions were adopted:

"WHEREAS, The Treaty of Washington, referring the differences between this country and Great Britain to arbitration, has justly been regarded as a measure of great importance to the interests of civilization and peace, and the honor of proposing it belongs to this country; and

"WHEREAS, Differences of opinion have arisen between the governments of the two countries respecting the proper construction of the treaty in regard to the claims for indirect damages, and a supplemental article for settlement of those differences has been proposed by the government of Great Britain, and by the President laid before the Senate for its advice, which article appears to this chamber to be sound in principle, binding the two governments to the adoption of a beneficent rule for the future, and especially beneficial to the United States and its commerce; and

"WHEREAS, The failure of the treaty would be a great public calamity; therefore,

"*Resolved*, That this chamber, without meaning thereby to imply that our government has at all erred in its construction of the treaty, and believing that the supplemental article is more than an equivalent for the claims of our government as originally presented, and feeling the importance of removing all obstacles in the way of the execution of the treaty, earnestly recommends the adoption of the supplemental article, and prays the Senate to ratify it."

As the Senate was "hanging fire" in regard to the ratification of this treaty, and war between the two countries was apparently imminent, the action of the chamber in this matter was not only timely and praiseworthy, but also wise, patriotic, and influential, as the sequel showed.

Thus it will be seen that to outline the history and operations of the New York Chamber of Commerce is largely to portray the political, commercial, industrial, and financial development of the country; for really no great politico-economic question has arisen in the United States from the War of 1812–15 to the present time in which it has not been vitally and patriotically interested. The foregoing are, however, but few of the services which it has so signally performed. It has been concerned in nearly everything which related to the commercial welfare and prosperity, not only of the city and State of New York, but also of the country at large, of which it is in a measure the commercial guardian.

The class of people who possessed the most means and experience before and immediatelv after the Revolution were the merchants and ship-owners, and they were the first to per-

ceive the advantages and value of mercantile or commercial organizations, which, as already outlined, they perfected in New York, New Haven, Charleston, and Philadelphia. These commercial bodies were the initial organizations of the kind in America. Their foundations were broad and deep, and each in its way and time performed substantial service for the public good, both local and general. The Chamber of Commerce of Baltimore, instituted in the early decades of the century, but subsequently reorganized as the Board of Trade, still continues its usefulness. The Merchants' Exchanges of New York and Philadelphia, which were founded at an earlier date, have passed away, probably from having been too heavily handicapped at first with expensive buildings and inadequate revenues.

Succeeding the War of 1812–15, and later, other chambers of commerce, exchanges, and boards of trade were organized in various cities of the Union, which also have done much toward developing the industries, trade, and traffic of their localities, as well as taking more or less active part in promoting the general commercial welfare of the country. But the commercial associations which are the most numerous, and withal the strongest, are those founded by people who deal in like things in towns or cities which are to some extent centres of particular callings, such as cotton in New Orleans, leather or wool in Boston, iron in Philadelphia, crockery in Trenton, paper in Holyoke, or print cloths in Fall River or Providence. Among the earliest of the general boards of trade which still retain their vitality, and form an important element in the town or city in which they are located, is the Chicago Board of Trade, which came into existence 13 March 1848, but did not begin business until 2 May 1850. From the beginning it has been an important centre for grain, animal food products, and lumber. Similar boards were established in Detroit, Milwaukee, Cincinnati, St. Louis, Toledo, Minneapolis, and other western cities. That in St. Louis is also an important centre for the cotton trade. Smaller organizations exist in towns numbering less than 10,000 inhabitants, and have proved valuable adjuncts by the infusion of greater local pride and energy among their citizens.

Next to the New York Chamber of Commerce is the Associated Board of Trade of Boston. This is probably the best representative body among strictly business associations in this country. Founded on a new idea or plan, it has so demonstrated, during the few years of its existence, its great practicability and usefulness as to become the exemplar of the newer boards of trade throughout the country. The Boston Associated Board of Trade is not a promiscuous grouping of business men coming together as individuals, but is made up of delegates from the various regularly organized trade associations of that city, these representatives being duly elected by their own organizations, and attending the Associated Board of Trade meetings, to speak and act not only for themselves, but as voicing the wishes of the associations which send them. Thus, when the members of the Associated Board of Trade make a decision, their action is at once of importance (because of its comprehensiveness) in forming commercial and legislative opinion.

As New York is the commercial metropolis of the United States, her merchants, of necessity, must be equally comprehensive in their dealings, not only in home products, but also in those of all other countries with whom they hold commercial relations. To facilitate the operation of this great concentration of business it was found expedient to organize separate exchanges and boards of trade, which as time passed have grown into large proportions. It is impossible in this short article to describe them all,— some 70 in number,— but a few of the more prominent may be mentioned. The New York Produce Exchange, with its 3,000 members, specially deals in grain, flour, provisions, lard, tallow, etc. It possesses one of the finest exchange buildings in the United States, and its business and influence are proportionally great in the line of its specialties. The Stock Exchange confines its dealings to stocks and bonds and other similar securities of this and other countries, and has given great impetus to the development of transportation in this country. The Cotton Exchange, which deals almost exclusively in that staple, buys and sells more cotton for future delivery than any other cotton exchange either at home or abroad. The Petroleum — now the Consolidated — Exchange first dealt in petroleum and mineral oils, but of late years it has turned its attention to stock securities, and is to some extent a competitor of the Stock Exchange. The Coffee Exchange has lately grown into very great prominence, and now surpasses in the volume of its business that of Havre, France, which is believed to be the largest in Europe. The Mercantile Exchange confines its operations to farm products, such as butter, cheese, eggs, poultry, and the like, and now aggregates an enormous business. The Wool Exchange and the Metal Exchange are other important associations, which, with the foregoing, own their buildings; but besides these there are the Maritime Exchange, the Board of Trade and Transportation, the Coal Exchange, the Mechanics' Exchange, and many more with names indicative of their trade specialties, which have organized from time to time as the city developed.

The approximate numbers of the various commercial associations located in the principal cities, not previously enumerated, are as follows: Philadelphia, 20; Boston, 48; Pittsburg, 11; Baltimore, 21; San Francisco, 15; Indianapolis, 8; Louisville, 9; New Orleans, 11; Minneapolis, 12; Kansas City, 9; St. Louis, 26; Omaha, 9; Buffalo, 16; Cincinnati, 17; Cleveland 9; Milwaukee, 10; and the entire number of such organizations throughout the whole country is about 2,000.

Thus it will be seen that, starting with but four commercial organizations, of the character and scope outlined, at the beginning of the 19th century, their number at its close had increased 500-fold. What they have accomplished for the people of this country is simply incalculable. The record is found in our extensive manufacturing industries; in the products of the soil, forests, and mines; in our enormous interstate commerce; in our foreign trade; in our circulating medium and monetary institutions; and, finally, in the unprecedented increase in national wealth, prosperity, and development.

A. E. Orr.
President New York Chamber of Commerce.

Commercial Traveler, a person whose occupation is to transact business as the accredited traveling representative of a jobbing-house or wholesale commercial establishment to other trading houses or commercial establishments. The commercial traveler, or "drummer" (in England commonly called "bagman" and "rider") is the successor to the chapman, or traveling merchant or peddler, who carried with him not samples merely, but stock. The commercial traveler carries only samples and price lists, and he takes orders for goods which are shipped to the buyer direct from headquarters. He has been the means of bringing the goods of the manufacturer in the large and remote city, not only to other cities, but to the smallest towns and hamlets. The number of commercial travelers in the United States (1903) is estimated at a number not much less than 300,000, but previous to the existence of large trusts, the number was greater. They have several associations, organized for social and business purposes. Among them are the Commercial Travelers' Association of New York; the Northwestern Traveling Men's Association of Chicago; one at St. Louis; an Order of Commercial Travelers, a secret society organized in 1888; also a Travelers' Protective Association for providing against overcharges by railroads, hotels, etc. The American and the German commercial traveler were at one time so successful in introducing their goods into Great Britain that in England a school was established to train the "drummer" in special branches that he might compete successfully with the American and German. Early in 1900 night schools of commerce were opened in London, and departments of commerce were added to some of the existing schools. Consult Jenks, 'The Trust Problem'; Volume IV. of the 'Report of the United States Industrial Commission.'

Commercial Treaties, compacts between countries for the purpose of improving and extending their commercial relations; each country engaging to abolish or to reduce to an agreed rate or otherwise modify the duties on articles of production and manufacture imported from the one country into the other. They are usually for a limited period, but may be renewed and modified according to changing conditions. In these treaties the phrase, "most favored nation," implies concessions equal to the most favorable ones granted under similar treaty. The first treaty of commerce made by England with any foreign nation was entered into with the Flemings in 1272; the second was with Portugal and Spain in 1308. The first commercial treaty made by the United States with China was entered into in 1844, and among other things provided that "If additional advantages and privileges of whatever description be conceded hereafter by China to any other nation, the United States and the citizens thereof shall be entitled thereupon to complete, equal, and impartial participation in the same." This provision has substantially been repeated in all subsequent treaties between the United States and China, and forms the basis on which the United States demanded of the Powers of Europe a recognition of the "open-door policy" in their spheres of influence in China.

The commercial treaties of the United States have been based almost wholly upon the principle of reciprocity. Among the most noteworthy of recent years are the following:

Country	Date	Subject
Brazil	1891	Manufactures.
San Domingo	1891	Foods, manufactures.
Salvador	1891	Foods, merchandise.
Germany	1892	Foods, raw materials.
Great Britain	1892	Manufactures, etc.
Nicaragua	1892	Foods, implements.
Guatemala	1892	Manufactures, etc.
Austria	1892	Cotton goods, etc.
Spain	1892	Miscellaneous.
France	1898	Miscellaneous.
Portugal	1899	
Italy	1900	Miscellaneous.
Germany	1900	Food products, etc.

and several others of wider scope which require confirmation by the Senate.

Commercial treaties have also been concluded with Colombia, Honduras, and Venezuela. The terms upon which the United States negotiates treaties of this character have been twice indicated in tariff bills (1890 and 1897), the last one being known as the Dingley Act; but under the Constitution the President and Senate have full right to make such treaties. Concessions to foreign governments in respect to duties are authorized by the Dingley Act upon certain specific conditions, of a reciprocal character, to be ascertained by diplomatic negotiation. The great expansion of the commerce of the United States in recent years has led the government to extend the application of commercial reciprocity wherever practicable. The last tariff bill provided certain commercial arrangements by the President alone, and for treaties under certain limitations which required approval by Congress. To execute this law the President appointed a special commission plenipotentiary, in whose charge the negotiation of such treaties was placed. John A. Kasson was appointed the first reciprocity commissioner. As a further means of promoting the foreign trade of the country, a movement was inaugurated during the congressional session of 1899–1900 for the creation of a separate executive department to have charge of the purely commercial affairs of the nation. In 1903 a new department of "commerce and labor" was created, and a secretary of commerce and labor was added to the President's Cabinet.

JOHN A. KASSON,
United States Reciprocity Commissioner.

Commercy, kō-mär-sē, France, a town in the department Meuse, on the left bank of the Meuse River, about 180 miles east of Paris. In its ancient castle the Cardinal de Retz wrote his memoirs. The town is tolerably well built, and has tanneries and breweries. The cavalry barrack was once the residence of King Stanislas of Poland. Pop. 7,000.

Commere, Léon François, lā-ôṅ fräṅ-swä kō-mär, French genre and portrait painter: b. Trelon, France, 10 Oct. 1850. He studied under Cabanel and obtained the Grand Prix de Rome in 1875. His famous portrait of a ballet dancer, called 'A Star' (1882), is owned in the United States.

Commerson, kō-mär-sōṅ, **Philibert,** French botanist: b. Chatillon-les-Dombes 18 Nov. 1727; d. Mauritius 1773. At the request of Linnæus he composed a treatise on the 'Fishes of the Mediterranean,' the most important ichthyological work that had as yet appeared. In 1767, at the command of the king of France, he ac-

companied Bougainville on his voyage round the world. He died on the Isle de France (Mauritius), after residing there for about four years. He wrote, among other things, a botanical martyrology — a biography of those who have fallen victims to their efforts in the cause of botany. He left his plants, drawings, and papers to the royal cabinet at Paris. Commersonia, a genus of the family *Sterculiacæ*, was named in his honor.

Commina'tion, an office in the liturgy of the Church of England, appointed to be read on Ash Wednesday (the first day of Lent), containing a recital of God's anger and threatenings toward sinners.

Commines, kō-mēn, or **Comines,** France and Belgium, towns on opposite sides of the Lys, eight miles north of Lille. The one on the right bank is in the department of the Nord, France, and communicates by a drawbridge with the other, which is in the province of West Flanders, Belgium. Anciently they formed a single town, which was fortified and had a castle, in which the celebrated historian, Philip de Commines, was born. The manufactures are chiefly ribbons and cotton goods. Pop. of French Commines, 6,000; of Belgian Commines, 5,829.

Commissariat, kŏm-mĭs-sār-ĭ-at, that department of an army which provides provisions, forage, camp equipage, and all the daily necessaries other than those connected with actual fighting. In the United States army the provisioning, etc., is in the care of the Department of Subsistence, presided over by a commissary-general, assisted by 5 assistant commissary-generals, ranking as colonels and lieutenant-colonels; 9 commissaries of subsistence, ranking as majors, 8 as captains, and 200 commissary sergeants. There are also regimental commissaries of the rank of captain. The transportation of supplies belongs to the quarter-master-general's department. In the British army the duties of the commissariat have been managed by different bodies at different times, and at present there is no department so named. The commissariat duties now partly fall on the Army Service Corps, while there is also an ordnance store department for the supply of warlike stores. It is only in the latter body that there are officers designated commissaries.

Commissary, an officer of a bishop who exercises spiritual jurisdiction in remote parts of a diocese, or one entrusted with the performance of duties in the bishop's absence. For this term in its military sense, see COMMISSARIAT.

Commission. (1) Formal act of trust; a warrant by which any trust is held or authority exercised. (2) A written document investing a person with an office or certain authority. (3) A certificate issued by authority by which a military officer is constituted; as, a captain's commission. (4) A body of persons joined in an office of trust, or their appointment; as, a building commission. (5) Brokerage, allowance, or compensation made to a factor, agent, etc., for transacting the business of another; as one per cent commission on sales. (6) A warship is said to be "in commission" when she is fitted out for service and her commanding officer has taken charge under his commission (see definition 3, above). (7) In an official sense, a commission is a legally created body of persons invested with limited but well-defined jurisdiction, as the Interstate Commerce Commission, the Civil Service Commission, the Anthracite Coal Commission, etc.

Commission of Bankruptcy.—A commission appointed to investigate the facts relative to an alleged bankruptcy and to secure all available assets and effects for the creditors concerned.

Commission Merchant.— One who sells goods on behalf of another, being paid by a certain percentage which is called his commission.

Commissionaire, kŏm-mĭs-sē-ō-nār', the attendant attached to continental hotels, who waits the arrival of the trains to secure customers, to look afer their luggage, etc. They may also be employed as guides or otherwise. In London, Edinburgh, and elsewhere, bodies of commissionaires have been established, the men being drawn from the ranks of military pensioners of undoubted character.

Commis'sioner, a member of a commission. See COMMISSION.

Com'missure, an anatomical term applied to nervous connections between adjacent parts of the nervous system. Though it is not always used in quite the same way, the general signification of the term, and the physiological import of the structure, is that of a uniting bridge.

Commit'tee, one or more persons elected or deputed to examine, consider, and report on any matter of business.

Large deliberative assemblies, with a great variety of business coming before them from time to time, are unable, when sitting as a whole, sufficiently to discuss and investigate many subjects on which they are obliged to act. Committees, therefore, are appointed to examine and report to the assembly from which they are selected. In the legislative bodies of the United States, and in the British Parliament, in fact, in all legislative bodies in representative governments, there are committees for various purposes. What are known as "standing committees" and "grand committees" are regularly appointed at the beginning of every session, and have a definite class of subjects with which to deal, the object being to divide the work of the assembly among several bodies, and so facilitate the progress of legislation. In the British Parliament there were formerly four grand committees — of Religion, of Grievances, of Courts of Justice, and of Trade, but they fell into disuse, and were discontinued in 1832. Another ancient committee is that of Privileges, which is still appointed at the beginning of every session, but has seldom any work to do, questions of privilege being generally laid before a select committee specially appointed. Two grand committees have again been constituted since 1882, to deal respectively with Law and Courts of Justice, and with Trade. In the United States Congress the standing committees are very numerous. Among the most important of them in both Senate and House (though each House has not the same committees) are those on Appropriations, Commerce, Elections, Foreign Affairs, Judiciary, Military and Naval Affairs, Rules, and Ways and Means. (See CONGRESS, UNITED STATES.) "Select committees" are appointed by both Houses of the British Parlia-

ment and of the United States Congress to take up special questions and investigate them previous to legislation. In these witnesses may be examined upon oath, and evidence of all kinds brought forward, the proceedings being such as could not be carried on before the whole House. When their reports are given in, measures may be based upon them and passed into laws. What is known as a Committee of the Whole House can only be regarded as a committee in so far as its procedure is concerned, since it consists of all the members who are present. Matters of great concernment (as supply, ways and means, etc.) are usually referred to a committee of the whole House, in which bills, resolutions, etc., are debated and amended till they take a shape which meets the approbation of the majority. The sense of the whole assembly is better taken in this way, because in all committees every one speaks as often as he pleases. When, in the British Parliament, the House is in committee, the chair is regularly taken by the chairman of committees, a member who receives a salary and holds the post during the duration of the Parliament, acting as deputy speaker. (See PARLIAMENT.) When the House is desirous of forming itself into committee, the speaker, on motion, puts the question whether the House will resolve itself into a committee of the whole, to take into consideration such a matter, naming it. The previous question cannot be put in committee; nor can the House in committee adjourn, as ordinary committees may, but, if the business is unfinished, must hold an entirely new sitting. If the business is finished, the chairman reports, either immediately, or, if the House wish, at a later period.

A committee of the person consists of one or more persons to whom the care of one *non compos mentis* or laboring under any other disability is legally committed. Ordinarily one next of kin, or otherwise closely related to the subject is appointed, if duly qualified, but the appointment rests in the discretion of the court.

Committee of Public Safety (*Comité du Salut Public*), a body elected by the French Convention, 6 April 1793, from among its own members, at first having limited power conferred upon it — that of supervising the executive and of accelerating its actions. Later, its powers became extended; all the executive authority passed into its hands, and the ministers became merely its scribes. At first composed of nine, it was increased to 12 members — Robespierre, Danton, Couthon, St.-Just, Prieur, Robert-Lindet, Hérault de Séchelles, Jean-Bon St.-André, Barrère, Carnot, Collot d'Herbois, and Billaud Varennes. In the terms of its constitution the members should have been elected only for one month, but all the above-mentioned held their seats for a whole year. The prevailing party acted on the ground that France, threatened from within and without, could not be governed as if at peace, but could only be saved by desperate measures, as in times of the greatest danger. But after the downfall of the Girondists, 1 and 2 June 1793, when the Mountain, on the recommendation of the Committee of Safety, declared that the population of France consisted of but two parties — patriots and enemies of the Revolution — and consigned the latter to the persecution of all good citizens, terror took the place of law. From this time the committee governed the Mountain party, and through it the Convention. As the sole rule of his conduct Robespierre declared that the mainspring of a popular government in a state of revolution was *la vertu et la terreur!* Carnot confined himself to the direction of the armies, and left to his colleagues the affairs of the interior. At the motion of these men the new constitution was suspended for a time, and the revolutionary government conferred on the Committee of Safety by a decree of the Convention of 4 Dec. 1793. The committee now instituted in all the communes of the republic, as judges of the suspected, revolutionary committees, composed of the most furious zealots: the number of these new tribunals was as great as 20,000. The last remaining forms of regular process were abolished; their place was supplied by violence, and often by avarice and folly. In this time of internal revolutions, and danger from without, it was not in the power of man to restrain the exasperated fury which probably alone prevented France from being conquered. Finally Danton, who had absented himself for a time from the committee on account of the influence of Robespierre, declared himself against the system of bloodshed; and Robespierre himself acquiesced in the condemnation of the ringleaders of the Paris mob (24 March 1794), among whom was Hébert; but soon after (5 April) Danton, with Hérault de Séchelles, was himself overthrown by Robespierre. Till 28 July 1794 the latter now remained master of the lives of 30,000,000 of men. He appointed Fouquier-Tinville public accuser. Prisons were multiplied and crowded; the prisoners were cruelly treated, betrayed by spies, and condemned without being allowed the privilege of defense; the property of all imprisoned on suspicion was confiscated, and the guillotine remained *en permanence*. The same violence was practised in the provinces by some of the delegates of the committee. Among the numberless victims of the system were the noble Malesherbes and the celebrated Lavoisier. The members of the Committee of Public Safety and of the *comité de sureté générale* at last disagreed among themselves. Each committee contained three parties. These, and not Tallien, were the real causes of the 9th Thermidor (27 July). In the committee of public safety Robespierre, Couthon, and St.-Just (*gens de la hautemain*) formed one party; Barrère, Billaud, and Collot d'Herbois (*les gens revolutionnaires*) another; and Carnot, Prieur, and Lindet (*les gens d'examen*) a third. In the *comité de sureté générale* one party comprised Vadier, Amor, Jagot, Louis (*du bas Rhin*), and Voulland (the *gens d'expédition*); to a second belonged Danton and Lebas (*écouteurs*); to the third Moise Bayle, Lavicomterie, Elie Lacoste, Dubarran (*les gens de contrepoids*). Robespierre attempted to remove the unyielding Carnot from the Committee of Safety. On the other hand Billaud Varennes labored to effect Robespierre's downfall. Couthon, St.-Just, the Jacobins, and the commune of Paris alone adhered to Robespierre. But when St.-Just actually proposed in the committee a dictatorship for the safety of the state an opposition was raised against Robespierre in the National Convention by Vadier, Collot d'Herbois, Billaud Varennes, and especially by Tallien and Fréron; the dictator and his faction were proscribed, and the victory of Barras (q.v.)

on the 9th Thermidor brought Robespierre, his brother, St.-Just, Couthon, and others, 105 in all, to the scaffold, 28 July. The Convention now recovered its authority; the Jacobins and the partisans of terrorism (*le queue de Robespierre*) were completely overthrown; at the same time the Convention gave the Committee of Safety and the revolutionary tribunal a more limited power and jurisdiction. The bloody despotism ceased; and when a new constitution introduced (28 Oct. 1794) a directorial government (see DIRECTORY), the Convention was dissolved, and with it sank into its grave the revolutionary government, the reign of terror, and the Committee of Public Safety.

Committees of Correspondence, in American history, public functionaries of a type first appearing in England, created by the parliamentary party of the 17th century in their struggles with the Stuarts. In 1763, when the English government attempted to enforce the trade and navigation acts on America after the Peace of Paris, the colonial leaders advised the merchants to hold meetings and appoint committees to memorialize the legislature and correspond with each other to forward a union of interests. This was done in Massachusetts, Rhode Island, and New York 1763–4. On 13 June 1764 the Massachusetts General Court appointed a committee to communicate to other colonial governments its instructions to its agent in London, to protest against the Sugar Act and the proposed Stamp Act. When the latter was passed in 1765, the Sons of Liberty formed committees of correspondence to organize resistance. Samuel Adams, during the decade 1764–74, constantly urged the adoption of this plan by the patriots of every town and county in each colony, and moved the general court to that effect in 1770–1. A few public bodies in the country appointed such committees, but there was no general concert. The payment of judges' salaries by the royal government in 1772 was seized upon by Adams as a fresh incitement, at first with scant effect, but on 21 November a slender town meeting at Faneuil Hall, Boston, appointed a correspondence committee of 21 to communicate with other Massachusetts towns concerning infringements of popular rights. It consisted of the foremost popular leaders — Adams, Otis, Warren, Quincy, etc. — and until late in 1774 (see COMMITTEES OF SAFETY) remained the real executive of the town and largely of the province. A report of its first meeting was printed and sent to all the towns and to other provinces, and in a few weeks 80 Massachusetts towns had appointed similar committees, many more doing so in a short time. No fresh places in other colonies joined, though the report was printed in their newspapers. But the royal commission to investigate the burning of the Gaspee in Rhode Island and send the culprits to England for trial effected Adams' purpose — curiously, not in Rhode Island itself, but in Virginia, where the House of Burgesses, on 12 March 1773, appointed a committee of 11 to communicate with other colonies on the doings of the administration, especially in Rhode Island, and report. The plans were characteristically different, the Massachusetts being by the town voters, the Virginia by the legislature, but the latter was immediately effective in eliciting response. Committees were appointed by Rhode Island 7 May, Connecticut 21 May, New Hampshire 27 May, Massachusetts 28 May, South Carolina 8 July. This threat of united opposition daunted the government; the Gaspee prosecutions were not pressed, and the commission found adversely to its commander. There being nothing more to do, the legislative committees stopped for the time, after exchanging proceedings. The Boston committee alone continued its political activities, and the tea question (see BOSTON TEA-PARTY) soon revived the others. The Boston committee, followed by that of Connecticut, sent out circulars urging the defeat of British purposes; and the former, by legal town-meeting, was made the executive of Boston. It called the committees of five surrounding towns into consultation, and sat "like a little Senate," Hutchinson said. Under its direction the tea was thrown into the harbor. The Tea Act roused the remaining colonies: Georgia in September, Maryland and Delaware in October, North Carolina in December, New York and New Jersey in February, chose legislative committees of correspondence; and new municipalities joined the movement — several in New Hampshire and Rhode Island and the city of New York. After the Boston Port Bill came into effect the Boston committee invited those of eight other towns to meet in Faneuil Hall, and the meeting sent circulars to the other colonies recommending suspension of trade with Great Britain, while the legislative committee was directed by the House to send copies of the Port Bill to other colonies, and call attention to it as an attempt to suppress American liberty. The organization of the committees was at once enormously extended; almost every town, city, or county had one, though a few dismissed theirs in fear of the coming storm. The Boston opposition attempted this, but were crushingly defeated. In the middle and southern colonies the committees were empowered, by the terms of their appointment, to elect deputies to meet with those of other committees, to consult on measures for the public good. The history of the committees from this time on is the history of the preliminaries of the Revolution. Consult Frothingham, 'Rise of the Republic' (1872).

Committees of Safety, in American history, these were a later outcome of the committees of correspondence (q.v.). In Massachusetts, as affairs drew toward a crisis, it became usual for towns to appoint three committees of correspondence, of inspection, and of safety. The first was to keep the community informed of dangers either legislative or executive, and concert measures of public good; the second to watch for violations of non-importation agreements, or attempts of loyalists to evade them; the third to act as general executive while the legal authority was in abeyance. In February 1776 these were regularly legalized by the General Court; but consolidated into one, called the "Committee of Correspondence, Inspection, and Safety," to be elected annually by the towns. This possessed all the powers of the other three, but in addition was empowered to notify the proper authorities of all violation of any of the acts, resolves, or recommendations of the legislature; also to send for persons and papers, call out the militia, take charge of confiscated property and prisoners of war, and carry out

the laws against Tories. An appeal lay from them to the legislature, but was not often thought judicious. Previous to this, however, in October 1774, the first Provincial Congress of Massachusetts had appointed a provincial committee of safety, with 11 members, to act as the general executive of the province; and in the next few weeks it made arrangements to raise and support an army. On 9 Feb. 1775 the second Provincial Congress constituted five members a permanent executive, and instructed it to "alarum, muster, and cause to be assembled with the utmost expedition, and completely armed, accoutred, and supplied, such and so many of the militia of the province as they shall judge necessary," such levy to be made when the committee thought a forcible attempt was to be made to carry out the Boston Port Bill. It was this committee's decision to take possession of Charlestown and Dorchester Heights, on the rumor that Gage was to have heavy reinforcements and occupy them, which led to the battle of Bunker Hill. New York had also a committee of safety, of 100 men, but it is characteristic of the undeveloped politics of the time that several of these were conservatives who afterward joined the British side. Partly from this, and partly from the unwieldy size of the committee, an inner committee was formed consisting entirely of Sons of Liberty, and directed its operations. At the news of the battle of Lexington, they called a public meeting in New York at the city hall, and secured the arms and ammunition in the arsenal. John Lamb and Isaac Sears led the action, arrested all British vessels about to sail for Boston, locked up the custom-house, and discharged the cargo of a vessel detained by British authorities as loaded with supplies for the patriots, formed a military company, armed it from the arsenal, surprised and captured the chief depot of British stores at Turtle Bay, and when the British commander ordered his men to join the army in Boston, refused to allow them to take any arms but those in their hands. Otherwise they were to be allowed to embark unmolested. The more ardent members were displeased at this, but kept the letter of the promise and no more. The muskets being carried in wagons, they confiscated them as not "in the hands," the soldiers declaring that they should not be used against their brethren in Boston. Consult the functions of the committees, Sparks, 'Life of Gouverneur Morris,' Vol. I., chap. 2.

Commodore, in the United States navy, formerly an officer ranking next above a captain, and commanding a few ships when they were detached for any purpose from the rest of the fleet. The grade was abolished by Congress in 1899, when all commodores became rear-admirals.

The word is also a title given in courtesy to the president of a yachting club, or to the senior captain of a line of merchant vessels.

Commodus, kŏm mō-dŭs, **Lucius Aelius Aurelius,** Roman emperor: b. 161 A.D.; d. 31 Dec. 192. He was the son of Marcus Aurelius and gave early proofs of his cruel and voluptuous character. On the death of Marcus Aurelius, 180 A.D., Commodus ascended the throne, and showed himself a more execrable monster than even Caligula, Domitian, or Nero. For his amusement he cut asunder persons whom he met, put out their eyes, mutilated their noses, ears, etc. He was endowed with extraordinary strength, and often appeared in imitation of Hercules, dressed in a lion's skin, and armed with a club. To fill the treasury, exhausted by his extravagances, he imposed unusual taxes upon the people, sold governments and offices to the highest bidder, and pardoned criminals for money. To display his strength and skill in arms he appeared publicly in the amphitheatre. He is said to have fought in this way 735 times, and as his opponents were armed with weapons of tin or lead, while he was encased in impenetrable armor, he had naturally an easy victory on every occasion. In his combats with wild beasts he was securely protected by a screen of network, through which he hurled his darts or shot his arrows. A part of the city having been consumed by fire, and the people reduced to despair by famine, disturbances broke out, and the emperor was obliged to consent to the death of his minister, Cleander, who was charged with being the author of these calamities. Commodus was strangled by the gladiator Narcissus, and on the news of his death, which was reported to be the consequence of an apoplexy, the senate declared him an enemy of the state, ordered his statues to be broken to pieces, and his name to be erased from all public inscriptions. Rome was indebted to him for her handsomest baths — the Thermæ Antoninianæ. He established also an African fleet, in addition to the Egyptian one, for the purpose of supplying the city with corn.

Common, that which belongs as a privilege or right equally to more than one, to many, or to the public at large; free to all; general; universal; public; having no separate owner; as, the common weal.

In logic the word is applied to terms or names, in opposition to individual, singular, or proper. "Common terms, therefore, are called 'predicables' (namely, affirmatively predicable), from their capability of being affirmed of others; a singular term, on the contrary, may be the subject of a proposition, but never the predicate unless it be of a negative proposition (as for example, the first-born of Isaac was not Jacob); or, unless the subject and predicate be only two expressions for the same individual object, as in some of the above instances."

The word is also applied to an open and (generally) unenclosed space, the use of which is not restricted to any individual, but is free to the public or to a certain number. In most of the cities and towns in the United States there are considerable tracts of land appropriated to public use. These commons were generally laid out with the cities or towns where they are found, either by the original proprietors or by the early inhabitants.

Common Carriers, such as carry goods for hire indifferently for all persons. The term includes carriers by land and by water. On the one hand they comprise stage-coach proprietors, railway companies, truckmen, wagoners and teamsters, carmen, porters, and express companies, whether such persons undertake to convey goods from one portion of the same city to another, or through the whole extent of the country, or even from one country to another; and on the other hand they include the owners and masters of every kind of vessel or water-

craft, who undertake to carry freight of any kind for all who choose to employ them, whether the extent of their navigation be from one continent to another or only in the coasting trade, or whether employed in lading or unlading goods or in ferrying, with whatever motive power they may adopt. (Story, Bailments, §§484–496.) Common carriers are liable for all damage or loss during the transportation from any cause, except the act of God or the public enemy. Common carriers both by land or water, when they undertake the general business of carrying every kind of goods, are obliged to carry all which offer, and if they refuse without just excuse, they are liable to an action. Common carriers may qualify their common-law responsibility by special contract. The bill of lading is usually the written evidence of the contract between the parties. The responsibility of the carrier begins on receipt of the goods from the owner. Carriers of passengers are not held responsible as insurers of the safety of those whom they transport, as common carriers of goods are. They are, however, bound to a high degree of care in the selection of appliances, employees, etc., in order to secure the safety of their passengers. See COMMERCE, INTERSTATE.

Common Council, the council of a city or corporate town, empowered to make by-laws for the government of the citizens. In American cities the city council is generally composed of two branches, called, respectively, select and common. They are elected by the people.

Common Law in America. See LAW, COMMON, IN AMERICA.

Common Life, Brethren of the, or **The Common Lot,** a religious institute founded about 1376 by Geert or Gerhart Groot at Deventer, in the Low Countries. Groot on a visit to the noted mystic Ruysbroek was so impressed by the spectacle of peace and joyful co-operation shown in the community of Austin friars over which Ruysbroek presided that he resolved to form a society embracing both clerics and laymen who, without taking the monastic vows, should lead an austere Christian life in common. One of the aims of the brotherhood was to conduct schools for the religious and moral education of children, and their labors in that field were so successful and so highly appreciated that their school at Hertogenbosch had 1,200 pupils and another school even a larger number. Establishments of the brotherhood were founded in Italy, Sicily, and Portugal, and in 1430 there were in existence 130 societies of the institute. At the same time there was formed a similar institute for women: here the superior of each society was styled the Martha. Among the eminent characters who were members of the brotherhood or alumni of their schools were Thomas à Kempis, Nicolaus Cusanus and Erasmus. Many of the «obscurantist» letters in the 'Epistolæ Obscurorum Virorum' purported to be written by members of the Deventer Brotherhood, who are made to appear as irredeemable blockheads.

Common Pleas, Court of. See COURT.

Common Prayer, Book of, the book which contains the public form of prayer prescribed by the Church of England to be used in all churches and chapels, and which the clergy are to use under a certain penalty. The Book of Common Prayer is used also by the English speaking Episcopal Churches in Scotland, Ireland, America, and the colonies, as well as by some non-Episcopal bodies, with or without certain alterations. It dates from the reign of Edward VI.; was published in 1549, and again with some changes in 1552. Some slight alterations were made in it when it was adopted in the reign of Elizabeth. In the reign of James I., and finally soon after the Restoration, it was revised.

Common Schools, schools for the common people or the people in general; in the United States the term means schools to which all persons within certain ages, except criminals and those with contagious diseases, may attend. The common schools in nearly all the States and Territories are supported by public funds. At first the term was confined to elementary and secondary schools, but there is a growing tendency to include in the common schools of the United States all grades and degrees from the kindergarten to the university. At present (1903) laws relating to compulsory education have been enacted by 31 States, one Territory, and the District of Columbia. There are enrolled in the elementary and secondary common schools 17,299,230 persons or over 22 per cent of those of school age, namely, between the ages of 5 and 21 years. There are about 420,000 teachers employed in about 300,000 school houses. The common school system in general use in the United States is now being extended into Porto Rico, Hawaii, and the Philippine Islands. Cuba has adopted the same system. See EDUCATION; NATIONAL EDUCATION, SYSTEM OF.

Common Sense, the philosophy of the so-called Scotch school of philosophy founded by Thomas Reid (1710–96), who aimed to establish a series of fundamental truths indisputable as primitive facts of consciousness. He taught that the general consent of mankind as to the existence of an external world, as to the difference between substance and qualities, between thought and the mind that thinks, is sufficient to establish the reality of a permanent world apart from ourselves; and he maintains that sensations are not the objects of our perception, but signs which introduce us to the knowledge of real objects.

The name is applied in colloquial language to that power of mind which arrives at correct conclusions, even if the thinker has no knowledge of laws of thought.

Common-time, time with two beats in a bar or any multiple of two beats in a bar. The beats may be of the value of any note or rest or compound of notes and rests, providing the sum required by the time sign be exactly contained in each bar. Common-time is of two kinds, simple and compound. Simple common-time is that which includes four beats in a bar, or any division of that number, or square of the number of its divisions. The signs used to express simple common-time are the following: $\frac{2}{1}$, $\frac{2}{2}$, $\frac{2}{4}$, $\frac{4}{4}$, $\frac{4}{8}$, and the characters C and ₵. In these signs the upper figure denotes the quantity of notes required in the bar, and the lower figure the quality of the notes. Compound common-time is expressed by the signs $\frac{6}{4}$, $\frac{6}{8}$, $\frac{12}{8}$, such signs meaning two or four beats of three crotchets or quavers to each beat.

Commons, John Rogers, American economist: b. Darke County, Ohio, 13 Oct. 1862. He graduated at Oberlin College 1888, studied at Johns Hopkins University 1888–90, and became professor of sociology in Syracuse University, resigning in 1899 to become director of the Bureau of Economic Research. He is the author of many articles on wealth, social reform, representation, municipal government, etc., which have appeared in the leading American journals devoted to those subjects, and of 'Social Reform and the Church,' 'Proportional Representation,' 'The Distribution of Wealth,' etc.

Commons. The commons of Great Britain, in a general sense, consist of all such men in the kingdom as have not seats in the House of Lords, and every one of whom has a voice in Parliament, either personally or by his representatives. Commons in Parliament are the lower house, consisting of representatives elected by the counties or divisions of counties, and by the cities and boroughs. In the election of representatives anciently all the people had votes; but in the 8th and 10th of King Henry VI., for avoiding tumults, it was enacted that in counties none should vote but such as were freeholders, did reside in the county, and had 40s yearly revenue, equivalent to nearly £20 a year of the present money; the persons elected for counties to be *milites notabiles*, at least esquires or gentlemen fit for knighthood; native Englishmen, or at least naturalized, and 21 years of age; no judge, sheriff, or ecclesiastical person to sit in the House for county, city, or borough. The House of Commons, in Fortescue's time, who wrote during the reign of Henry VI., consisted of upward of 300 members: in Sir Edward Coke's time their number amounted to 493. At the time of the union with Scotland, in 1707, there were 513 members for England and Wales, to which 45 representatives for Scotland were added; so that the whole number of members amounted to 558. In consequence of the union with Ireland, in 1801, 100 members were added for that country; and the whole House of Commons therefore consisted of 658 members. By the reform bill of 1832 the number of members was altered as follows: 500 for England and Wales, 53 for Scotland, and 105 for Ireland. The reform acts of 1867 and 1868 introduced a further alteration, the numbers being 493 for England and Wales, 60 for Scotland, and 105 for Ireland; by the act of 1885 they became respectively 495, 72 and 103. See PARLIAMENT.

Commonwealth, the state or prosperity of a country without any reference to the form of government under which it may be at the time. Owing to the semi-independent position of the States of the American Union the term commonwealth is of frequent application to the various members of the great Federal government, which itself is spoken of as the National or Federal Commonwealth in contradistinction from its constituent autonomies. In many of the States the legal proceedings against criminals, etc., are instituted in the name of the (for example) "Commonwealth of —— *v.* John Doe."

The word is also applied to the period in the history of England during which the parliamentary army and the Protector Oliver Cromwell exercised the power of government. King Charles I. was beheaded on 30 Jan. 1649; but if the beginning of the commonwealth be deferred to the time when Oliver Cromwell became Protector, then its beginning was not till 16 Dec. 1653. It received an all but fatal blow by the death of its great chief, 3 Sept. 1658. On 22 April 1659, Richard Cromwell, his incompetent son and successor, resigned, and on 29 May 1660, Charles II. was restored to the throne.

Communalism, kŏm'mū-nal-izm, the theory of government by communes or corporations of towns and districts, adopted by the advanced republicans of France and elsewhere. The doctrine is that every commune, or at least every important city commune, as Paris, Marseilles, Lyons, etc., should be a kind of independent state in itself, and France merely a federation of such states. This system must not be confounded with "Communism" (q.v.), with which, however, it is naturally and historically allied, though the two are perfectly distinct in principle.

Commune, kŏm'mūn, the unit or lowest division in the administration of France, corresponding in the rural districts to the English parish or township, and in towns to the English municipality. In France there are about 36,000 communes, with a considerable measure of self-government, with the power of holding property, etc. Each commune has a council elected by universal suffrage, and the council is presided over by a *maire* and one or more *adjoints* or assistants. In the larger communes the *maire* is selected by the central government out of the members of the council; in others he is appointed by the prefect of the department. The central government, through its officials, exercises generally a very large control over the affairs of the commune.

The rising of the Commune of Paris in 1871 should not be confounded with "communism" (q.v.). It was a revolutionary assertion of the autonomy of Paris; that is, of the right of self-government through its commune or municipality. The theory of the rising was that every commune should have a real autonomy, the central government being merely a federation of communes. The movement was based on discontent at Paris, where the people found themselves in possession of arms after the siege of the Germans. The rising began on 18 March 1871, and was only suppressed 10 weeks later after long and bloody fighting between the forces of the commune and a large army of the central government; 6,500 Communists having fallen during 20–30 May, and 38,578 being taken prisoners.

Communicatio, Communio, Idiomatum, kŏm-mū-nē-kā'shĭ-o, ĭd-ĭ-ō-mā'tŭm, a term or phrase hardly capable of translation into English, which is used to signify the appropriation mutually of divine attributes to Christ as man, and of human attributes or human affections to Christ as God: this because of the hypostatic union of the divine nature and the human nature in Christ: thus, we say "God died for us," and the mother of Jesus is *theotokos, deipara*, mother of God. *Idioma*, plur. *idiomata*, is Greek equivalent to Latin *proprietas*, and means that which belongs to one, an attribute: the theological phrase in Greek is *antidosis idiomaton*.

Communion, the reception of the Eucharist. In the Roman Catholic Church the Eucharist is administered to the faithful only in one kind, the species of bread: only the priest who performs the act of consecration receives the sacrament in both kinds: in the Protestant churches the laity receive the sacrament in both kinds, and the usage of the Greek and Oriental churches is the same. The withholding of the cup from the laity was not required by the laws of the Latin Church till the Council of Constance ordered it in 1414, though by that time usage had made it an almost universal custom. Yet down to the 11th century communion under both species was universal, and as late as the middle of the 13th century St. Thomas Aquinas notes the communion under one kind as the usage only of "some churches." As it is purely a Church regulation, the Church can and does dispense from it, or the Church can abrogate it and bring back the original usage of communion in both kinds. Even in the earliest times communion under one kind was the rule when the sacrament was to be administered to the sick and infirm in their homes: in that case the one kind was under the species of bread; but in the same early period it was customary to administer the Eucharist to infants immediately after baptism, but only under the one species of wine.

Communism. Although aiming at the abolition of private property, communism must not be understood as including at all times an equal division of all property. In its limited application it may mean the common management of industry and the sharing of the fruits of some of these in common. Socialism is not communism, though some socialistic schools are communistic, that of Edward Bellamy's 'Looking Backward' being purely so.

Communism, or the sharing of things in common, is, in a limited form, practised by every civilized community. There is to-day common management of parks, schools, and other utilities, and practical communism in water, which is supplied free to the poorest inhabitant of our cities. In the case of commodities which are plentiful and cheap, as, for example, matches, there is a kind of communism prevailing among individuals. But perfect communism as a social theory finds few adherents, and practical experiments in the past in such directions have been, save for limited periods, unsuccessful. Even where the communism of certain societies or settlements has succeeded temporarily it has done so largely by their trading with or manufacturing for the greater world of capital and labor that touches them from without. Few of such communities that have remained entirely isolated have attained even a measurable degree of success.

It is not too much to say that in primitive times property was in common, and that individual ownership arose as a natural development out of communism. The Cretans and the Spartans possessed communistic societies, and there seems to be little doubt that communism as a supernatural ideal was practised among the early Christians. That it was successful for a time in the primitive state of society then prevailing among the disciples of Jesus also seems highly probable. The communistic societies that have since been formed have been successful in the measure of religious devotion that inspired sacrifice, and have declined as this religious ardor subsided, or became corrupted by other elements. But whatever their temporary success may have been among the early Christians, the experiments were soon utterly abandoned, and the principle of individual ownership of property finally and fully asserted itself. That even the early Christians adopted without qualification the theory of communism may be doubted. Certainly authorities are disagreed, so that even here we are without the necessary data to conclude that perfect communism was temporarily successful. During the Middle Ages many of the religious orders, notably those that strove to preserve the apostolic simplicity of the early Church, the Franciscans, the Brothers of the Common Lot, and others, taught and practised communism.

The communities that have been formed in the United States, mostly in New England and the West, have nearly all died out, or exist in a moribund condition. We need not speculate upon the reasons, though it would seem that the desire of individual ownership, with the incentive to action which such ownership inspires, is indestructible and therefore fatal to perfect communism. The most famous of all American communistic or semi-communistic societies that arose as a result of the teachings of Charles Fourier (q.v.), was that of Brook Farm (q.v.) because of the intellectual and literary eminence of its founders. Horace Greeley (q.v.) was a warm friend of the Fourierite movement from the first, advocated it powerfully in the New York *Tribune,* and was vice-president of the North American Phalanx, in Monmouth County, N. J., one of the most successful of the Fourierite communities, for it lasted over 12 years, dying in 1856. It was intended as the model of its kind, and at the beginning it prospered. Perhaps no similar movement has ever received anything like the influential support accorded to Fourierism. The teachings of this remarkable man, the insight and value of much that he wrote, as well as the warmth that suffused his prophecies, enlisted the enthusiasm and aid of some of the most eminent men of the time. But feuds and inharmony set in, and slowly the movement began to disintegrate. The noble dreams of Fourierism were either founded upon mistaken generalizations, or were too early anticipations of the industrial and social development of mankind. It was only at a late period of its career that Brook Farm came to be modeled on the Fourier plan, and its simple life became perhaps too systematized. Work was in common, and at the most menial occupations men who became the glory of American letters, and women of the highest New England culture cheerfully took their turns. But with the ebbing of the tide of Fourierism the Brook Farm experiment came to an end. The North American Phalanx outlived it for a short period, but with the death of that settlement a movement which embodied one of the most pretentious and sweeping philosophies of social regeneration perished from the American continent. Fourierism, which in France had died for lack of funds, had received in America as fair and adequate a trial as was ever accorded to any mooted social reform. For years its disciples had taught and experimented, only to end with failure. When

the New York *Tribune* abandoned its advocacy it ceased even to be a topic of general discussion, and in 1856 came its final collapse.

In connection with early attempts in the last century to found communistic settlements in this country the name of Robert Owen (q.v.) is conspicuous. This English manufacturer, an enthusiastic communist, having seen his efforts in Great Britain fail of fruition, visited this country and founded a number of communities, the best known of which was that of New Harmony, Ind. Most of the others were short-lived, and that of New Harmony, born in 1825, expired in 1827. Among the communities that owe their origin to religious fervor, and which still survive at Mount Lebanon, N. Y., Union Village, Ohio, Watervliet, N. Y., and elsewhere are those of the Shakers (q.v.). Their founder, Ann Lee (q.v.), landed in New York in 1774, with eight followers from England. They had fled to escape the persecution which had followed her bold assertion of divine revelation. The Shakers are celibates, and thus their communities have not grown very rapidly, yet 15 are said to exist to-day. The Oneida Community, another of the very few survivals of that communistic spirit which swept over the country in the middle forties, was established in 1848. It ignored the regulation of marriage, founding the union of the sexes purely on the mutual consent of the man and woman. It was because of this that the Oneida Community fell into evil repute, and this reputation extended in many cases to communities less deserving of the stigma. The union of one man with one woman the community expressly discouraged as an "exclusive and idolatrous attachment." When a man and woman were brought together, and showed a tendency to "fall in love," everything was done by the society to discourage such relationship, even to the extent of forcing them apart by publicly expressed condemnation. A more extraordinary view of sex relationship has probably never suggested itself among all the confused and eccentric beliefs of mankind. The Oneida Community was founded by John Humphrey Noyes, in Madison County, N. Y. They practised communism, and a change of occupation (a Fourierite principle). They have, it is said, forbidden the admission of new members.

The Harmony Society, which was succeeded in 1825 by New Harmony, Robert Owen having purchased the land of that settlement from George Rapp (q.v.) and his followers, was a notable experiment. Rapp's notions were queer enough, but he had great influence with his followers, who regarded him as possessed of supernatural powers. They practised communism and celibacy from 1805, the date of the founding of the community in Butler County, Pa., where they remained until 1814, when they changed their location to the Wabash valley. Here the settlement flourished until the purchase of the lands by Robert Owen. The Amana Community, still surviving, was formed in 1842 by emigrants from Germany and Switzerland, who originally belonged to the peasant class. They settled in New York State, near Buffalo, and later removed to Iowa. They were spiritualists who regarded themselves as the subjects of special revelation. This religio-communistic settlement is probably the earliest in origin in this country, for it traces the beginnings of its creed as far back as the early part of the 18th century. Their rules of life are rigid and forbidding; amusements are prohibited; and much that ministers to innocent pleasure is banished as sinful.

To mention even the names of all the communities that exist or have existed in the United States would take more space than can be given to the subject. The appended bibliography will guide to all the information of which the reader may be in search. But special mention ought not to be omitted of the Icarian Community, remarkable as owing its origin to a book, 'A Voyage to Icaria,' by Etienne Cabot (born 1788), who had been a member of the French legislature and a leader of the Carbonari. He sailed in 1848 with a number of his followers from France, and established the community in Illinois in accordance with the ideas contained in his work. They numbered as many as 1,500 at one time. Later they were compelled to seek other settlement in Iowa. This community was peculiar in that it came nearer to the ideal of democratic communism; the rigid regulations of other communities were absent, the point aimed at being to let every one do as he pleased. A settlement in which no community of property save that of land obtains, and in which the government is nearly as purely democratic, is that of Fairhope, Ala., founded a few years ago by a handful of the disciples of Henry George. It is organized as a corporation, by which its real estate is administered. The annual value of the land is taken for communal purposes. It numbers about 300 members, and up to the present time is prosperous.

All these experiments which have been reviewed have failed to demonstrate the feasibility of communal life. Existence within its confines is, for the most part, meagre and unsatisfying. Though these communities sometimes grow rich, progress in its finer sense there is none; they do not rise in culture and intelligence above their original level. Yet some things they have demonstrated, among which are the possibilities of a more peaceful industry, more unselfish lives, together with a fuller leisure, and freedom from the harassing fear of want. Abnormal as they seem, they are really protests against what in our civilization is abnormal. Clothed, as the most successful of them are, in religious guise, the fact that they are impulses, even when most eccentric, of the more profound and imperishable nature of man, is vastly significant.

Bibliography.— Lavaleye, 'Primitive Property'; Nordhoff, 'The Communistic Societies of the United States'; W. A. Hinds, 'American Communities'; J. W. Noyes, 'History of American Socialisms'; R. W. Emerson, 'Reminiscences of Brook Farm'; Lindsay Swift, 'Brook Farm'; and W. H. Dixon, 'New America,' for an interesting account of the Shakers.

Community of Interest. See RAILROADS.

Com'mutator, a piece of apparatus used in connection with many electrical instruments for reversing the current from the battery. There are various forms, which will generally be found described with their proper instruments. See DYNAMO.

Comneni, kŏm-nē'nī, an extinct family of sovereigns, according to an unsupported tradition, of Italian origin, which numbered, on the throne of Constantinople (1057 to 1204) and on that of Trebizond (from 1204 to 1461), 18 emperors, besides 19 kings and numerous independent princes. When the Crusaders had overturned the throne of the Comneni in Constantinople, and established the Latin empire there in 1204, a prince of the ancient house of the Comneni founded an independent state at Trebizond in Asia Minor, where he was governor. The last sovereign of this house was David Comnenus. From him, it is said, was descended Demetrius Comnenus, a French captain of dragoons, who died without children at Paris in 1821, with the title of *maréchal de camp*. But his descent cannot be historically traced. Ducange asserts without hesitation that Mohammed II., the conqueror of Constantinople, after he had obtained the empire of Trebizond, so called (which was scarcely as large as a French department), from the Emperor David, by a treaty, sent for this prince and his seven children to Constantinople. In order to get possession of the income which had been secured to the Greek prince he ordered him to be put to death, with all his children, at Adrianople in 1462, under pretence of a conspiracy. This is confirmed, according to Ducange, by all contemporary writers — Chalcondylas, Ducas, Phranzes. A remarkable member of the family was the Princess Anna Comnena, daughter of the Emperor Alexius I., who flourished in the first half of the 12th century. See ANNA COMNENA.

Como, kō'mō (anciently COMUM), Italy, capital of the province of Como, in Lombardy, 24 miles northwest of Milan in a delightful valley at the foot of Lake Como. It is a bishop's see. The city contains some antiquities, a splendid marble cathedral dating from the 14th century, and 12 beautiful churches; also a cabinet of natural history and natural philosophy. During the 11th and 12th centuries Como was at the head of the Ghibelline party, and the rival of Milan. Here was born Pliny the Younger and Volta and Giovio, writers, also the popes Clement XIII. and Innocent XI. A number of the inhabitants travel about with small-wares, such as mirrors, spectacles, little pictures. Even in the time of the Roman emperors this taste for emigration manifested itself. The inhabitants of Como were then to be found in all parts of Italy in the capacity of masons. Silk and knit wear are manufactured. The province of Como has an area of 1,049 square miles and a population of 515,134. It has fine pastures, and yields grain, olives, wine, and silk. Population of the commune 25,800.

Como, Lake (LAGO DI COMO, lä' gō dē kō'mo, anciently LACAS LARIUS), a lake in the north of Italy, at the foot of the Alps. Toward the middle it is divided into two branches by the point on which is situated Bellagio. The branch extending toward the southwest to the city of Como goes under the same name; that which turns to the southeast to Lecco takes the name of Lake Lecco. The length of the lake to Bellagio is 16 miles, that of the southwest branch 19 miles, and that of the southeast branch 12½ miles. The greatest width is two and a half miles. More than 60 rivers and rivulets flow into it, and the Adda passes through it. It is about 700 feet above the level of the sea, and about 190 feet above Milan. Lake Como, the most delightful of all the lakes in Upper Italy, is surrounded by mountains 3,000 or 4,000, or even 7,000, feet high, which descend toward the lake, and in many parts are clothed with woods. It is bordered by delightful gardens and country seats. Fish, particularly trout, are caught in the lake. The neighboring country is rich in minerals — iron, copper, and lead.

Como Stage, a thin mass of shales and sandstones representing clays and sands deposited in a fresh-water lake that covered southern Wyoming and extended into Colorado. The exact age of the beds is still in dispute; they have been assigned to the top of the Jurassic, though there are good reasons for placing them at the base of the Cretaceous. The beds are remarkably rich in fossils of land reptiles and mammals, including such giant saurians as *Atlantosaurus*, and are typically developed near Como, Wyo. See CRETACEOUS SERIES; JURASSIC SERIES.

Comonfort, Ygnacio, ĭg-nä'sē-o kō-mŏn-fōrt', Mexican general: b. Pueblo 12 March 1812; d. 13 Nov. 1863. He became a captain of cavalry in 1832, in 1834 was made prefect and military governor of the district of Tlapa, and in 1842 he was elected member of the National Congress. This Congress was soon dissolved, and Comonfort resumed his functions in Tlapa, displaying great energy in repelling the aggressions of hostile Indians. Appointed 3d alcalde of the capital, and afterward prefect of western Mexico, he relinquished these positions to engage in the war with the United States; and on Santa Anna's dissolving the army and leaving the capital open for the Americans, Comonfort commenced organizing guerrillas, when he was summoned to the Congress of Queretaro, where a treaty of peace was concluded with the United States. He was now chosen senator by his native state, and served in this capacity until 1851. In 1852–3 he was the representative in Congress of the newly created state of Guerrero, and acted as custom-house director of Acapulco and other places until Santa Anna's return to power, when he was dismissed from office. He now joined Alvarez, raised the standard of rebellion, proclaimed the plan of Ayutla, 11 March 1854, and compelled Santa Anna, who endeavored to seize that town, to retreat. At the end of the campaign in 1855, Santa Anna was finally compelled to abdicate. Alvarez assumed the supreme government, but shortly afterward delegated his authority to Comonfort, who became provisional president of Mexico, 11 Dec. 1855. He soon met, however, with the most strenuous opposition on the part of the clergy, the army, and the large body of the Conservative party. The junta of Zacapoastla declared itself on 19 December against the president, and a little later the seat of revolution was transferred to the city of Puebla. Over 5,000 men assembled there in February 1856. Comonfort marched against them, forced the rebels to surrender on 20 March, promulgated on 31 March a decree ordering the confiscation of the property of the Church, followed on 28 June by another decree forbidding the clergy to hold landed estate. At the same time he sent a Mexican envoy to Rome to settle with the holy see the questions raised by these measures; but the Mexican clergy made

all possible effort to prevent his reception, while at home they labored to undermine the government. Congress, which was opened by the president, 5 Feb. 1857, assembled under very inauspicious circumstances. It proceeded, however, to draw up a new constitution, which vested the legislative power and the control over religious and military affairs exclusively in Congress. The president, finding it impossible to meet the difficulties which agitated the country under such restrictions, was eventually constrained, on October 1857, to apply for extraordinary powers. These were granted by Congress on 4 November and he was proclaimed constitutional president on 1 December. His position, however, became more and more critical. Opposed by the clergy and the army, he found himself isolated, and could only depend upon the brigade of Gen. Zuloaga, which was attached to him personally. By a pronunciamiento at Tacubaya, 17 December, this brigade, too, declared itself against the new constitution, but appointed Comonfort chief of a new government. By a new pronunciamiento, however, of 11 Jan. 1858, they discarded him altogether, and the insurrection which broke out on that day in the capital led to a fierce struggle of several days. Appointing Juarez, president of the supreme court, provisional president, Comonfort attempted to regain his authority by force of arms, but in vain. On the morning of 21 January the capital was in the hands of the rebels. The House of Representatives, convoked on the same day by Zuloaga, appointed that general provisional president, while Juarez convened a congress at Guanajuato, to guard the rights of Comonfort. The latter in the meantime, deserted by his soldiers, and unable any longer to maintain his power, repaired to the United States. He returned in 1862 and was minister of war in the Juarez cabinet.

Comorin. See CAPE COMORIN.

Com'oro Islands, a volcanic group in the Indian Ocean, between the northern extremity of Madagascar and the continent of Africa. They are four in number — Angareja (called also *Comoro*), Mohilla, Johanna, and Mayotta. In 1843 France took possession of the last-mentioned island, and the others were taken under the protection of the same country, by treaty, in 1886. They are extremely fertile, well stocked with cattle, sheep, hogs, and birds of various kinds. They produce, likewise, sweet and sour oranges, citrons, bananas, honey, sugar-canes, rice, ginger, cocoanuts, etc. The people are chiefly engaged in rearing cattle, and in the manufacture of coarse cloths, jewelry, and small arms. They are professed Mohammedans, but fetish worship is customary. Pop, Arabs and negroes, 70,000.

Compagnie des Indes, koṅ-pan-yē dā zard ("Company of the Indias"), an organization which owned Louisiana for several years. See MISSISSIPPI BUBBLE.

Company (Old Fr. *companie,* from Lat. *companirem,* "mess," from *com-,* "with," and *panis,* "bread"), an association of individuals formed for some purpose of mutual advantage, especially for business purposes. The commercial use of the word which bulks most largely now has two separate uses: in general of a firm or corporation; and particularly of the silent members of a business house whose names do not appear in its style but are comprehended by the affix "and Company." Historically the earliest occurrence of the term in connection with business enterprise dates in England back to the 14th century, when the Merchant Adventurers of England about 1359 began trade. English commerce and empire are equally indebted to the efforts of the companies formed in the early part of the 17th century. The Eastland Company, the Muscovy Company, and the Turkey Company carried English trade into eastern Europe. The East India Company won the major part of the Asiatic trade for England, and gained possession of India and administered that country until the middle of the 19th century. The Virginia Company and the Massachusetts Bay Company prepared the way for English colonization in America, but never flourished. The history of the Hudson Bay Company is another interesting episode because of the combination of territorial and trading grants which it long held and because it still enjoys trading privileges. England still employs the same method of opening up trade, and the North Borneo Company, the British East Africa Company, and the famous South Africa Company were formed between 1880 and 1890. Germany with her new imperial policy fosters the formation of such associations, and in 1884 the German East Africa Company was started, with the object of extending trade and colonization. The London City companies also are historically important as outgrowths of the mediæval guilds and because for many years membership in them was a necessary preliminary to political privilege of any sort; their authority was curtailed in 1725 and by the reform bills of the 19th century, but members of the companies are still the only electors for civic offices.

In modern commerce companies may be most conveniently divided into the simple firm or partnership, which is a mere mutual agreement, and the stock company, which, by reason of its complex character and quasi-public nature, comes under State control and has displaced to a great degree the simpler method. In the stock company, instead of a private agreement, the members, under State authorization, make a company with a fixed capitalization divided into a certain number of shares, possession of which carries the right to vote, proportionally to holdings, on matters of business policy. State regulations require in all cases that one of the contracting parties be a resident of the State in which the company is incorporated, and that an office of the concern be located in the State. Other requirements vary in different States, especially in the matter of fees, which some of the western States have reduced to a minimum for the sake of attracting business to the State, and replenishing its treasury; and in the breadth and range of powers granted by the charter. The corporation laws of the State of New Jersey, together with its convenient situation near New York, have drawn a tremendous volume of this business to it. See CORPORATIONS; TRUSTS.

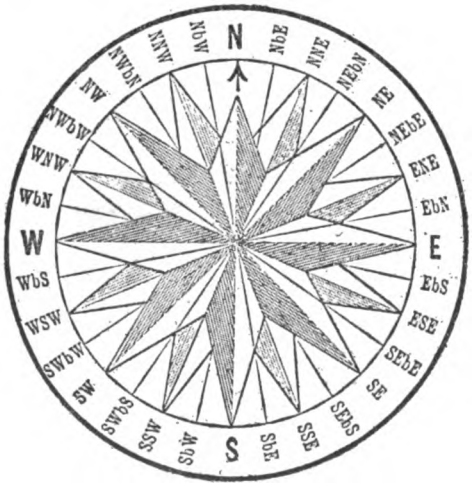
A particularly American class of stock company is the industrial, which is especially adapted to mine-exploiting or the development of agricultural business. In mode of government it differs from the usual share-holder controlled company, as it is largely managed by a promoter. The capitalization of American industrial com-

panies in 1903 is estimated at $150,000,000,000, of which a large fraction is paid in in cash.

In military nomenclature a company is regularly an integral part of a regiment or battalion and consists of 100 men. A looser and typically American use of the word applies it to any small body of soldiers or uniformed men, especially as independent of a State or national soldiery. These independent companies, numbering something like 25,000 in the United States, form a valuable supplement to army and State militia, as was evidenced by their service in the Spanish war.

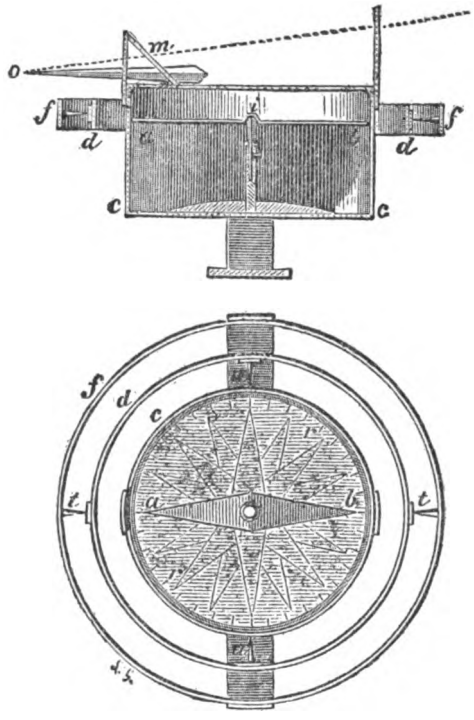
Compar'ison, Degrees of, in grammar, inflexions of adjectives denoting the degree in which a quality is possessed by a substance, either generally or in reference to other substances. The positive can scarcely be considered as a degree, as it denotes the quality generally without comparison. The comparative compares two things only, the superlative compares one thing with any number of others. In English the comparative is generally formed by the addition of *er*, the superlative by the addition of *est*, to the positive or monosyllabic adjectives and dissyllabic adjectives ending in *y*, or by the use of the words *more* and *most*. *less* and *least*, when the adjective is of more than one syllable and does not end in *y*. Adverbs are nearly always compared by the latter method. There are some adjectives, such as *good, better, best; little, less, least*, that do not form their degrees of comparison in the regular manner.

Compass, Mariner's, a form of compass specially adapted for use at sea. A thin circular sheet of mica is supported so as to turn with great freedom in a horizontal plane about its centre. This is called the compass-card. The bearing usually consists of a small plate of agate let into the card, and has a conical hole at the



Compass Card.

centre, and this rests on a fine needle-point of hard steel. This arrangement gives very little friction. To the under surface of the compass-card a magnet is attached, or often in the best instruments several parallel magnets. Many experiments have been made to find the best arrangement for the magnets, but there is probably still something to be learned on this question. The compass-card is marked with a star of 32 rays, which are called the rhumbs, or the points of the compass. A line joining two of these points diametrically opposite is or ought to be exactly parallel with the magnetic axis of the arrangement below; and at the extremities of these points are marked N. (north) and S. (south). E. (east) and W. (west) are marked at the extremities of another diametral line at right angles to the first. The other points have also names; and to repeat these from memory in order, beginning at north and going



Ship's Compass.

a b, Needle. *c c*, Box. *d d*, Inner gimbal. *f f*, Outer gimbal. *i*, Pivot upon which the card is placed. *m*, Reflector. *r r*, Card. *t t*, *u u*, Supporting pivots.

round the whole circle, is what sailors call «boxing the compass.»

The card is supported, as we have said, on a steel point, which is attached either to a hemispherical bowl of thick copper, or to a thick copper ring when the compass is to be used for night-sailing, in which case a lamp placed below the ring shines up through the mica card and makes the markings on it visible. This thick copper bowl or ring is called the compass-box. Its use is to damp the vibrations of the needle; for it is found that the presence of a large mass of copper properly placed damps the vibrations of a freely suspended magnet rapidly, while it does not at all prevent it from coming to rest in the proper position. The compass-box is suspended on gimbals, which are two concentric copper rings. The larger turns on a horizontal axis, whose extremities rest on the inside of the case that contains the compass. The smaller ring turns on a horizontal axis

at right angles to the former, and resting on the outer ring. The compass-box is attached to the inner ring, and its weight tends to keep both horizontal. Thus supported, the compass-box and card always remain horizontal however the ship rolls or pitches. The chief difficulty in making use of the compass arises from the magnetism of the ship itself. In iron ships particularly, the magnetism of the ship greatly interferes with its indications. The effect of the ship's magnetism is determined by swinging the ship, and determining a correction to be applied for every position. This, however, is liable to some uncertainty, for it is found that rough weather and other circumstances alter the magnetism of the ship, and therefore its effect on the compass. It is usual to place a compass at the mast-head of large ships, and from time to time to compare the deck compass with it.

The origin of this instrument cannot be traced with anything like certainty. There is reason to believe that the Chinese knew something about the polaric property of loadstone more than 2,000 years before the Christian era. In the year 1242 A.D. Bailak Kibdjaki gave an explicit description of a primitive kind of compass in common use on the Syrian coast; and it is said that on the return of Marco Polo from Cathay, in 1260, he brought a knowledge of this as well as several other Chinese inventions with him. The Italians ascribe the invention of the compass to Flavio Gioja, a native of Amalfi, giving the dates 1300–20, but it is obvious from the dates given above that he can be credited only with some important improvement of the instrument. The discovery of the variation of the needle has been generally attributed to Columbus, but is now supposed to have been known much earlier.

Bibliography.— Cornwell, 'Compass Disturbance in Iron Ships'; Bowditch, 'The American Practical Navigator'; Capt. F. J. Evans and Archibald Smith, 'The Admiralty Manual for the Deviations of the Compass.'

Compass Plant (*Silphium laciniatum*), a tall composite yellow-flowered plant growing on the prairies of the Mississippi Valley, and remarkable from the fact that its erect radical leaves stand so that their edges point almost exactly north and south, especially in midsummer. This is said to be due to the action of light, and to depend on the leaves having an equal number of stomata on either face. The plant is known in some localities as "resin-weed," because it contains such an amount of resinous matter. A European species of lettuce (*Lactuca scariola*) has received the same name.

Com'passes, a mathematical instrument used for describing circles, measuring lines, etc. They consist simply of two pointed legs movable on a point or pivot. For describing circles the lower end of one of the legs is removed and its place supplied by a holder for a pencil or pen. Hair compasses are compasses having a spring tending to keep the legs apart, and a finely threaded screw by which the spring can be compressed or relaxed with the utmost nicety, and the distance of the legs regulated to a hair's-breadth. Bow compasses are compasses having the two legs united by a bow passing through one of them, the distance between the legs being adjusted by means of a screw and nut. Proportional compasses are compasses used for reducing or enlarging drawings, having the legs crossing so as to present a pair on each side of a common pivot. By means of a slit in the legs, and the movable pivot, the relative distances between the points at the respective ends may be adjusted at pleasure in the required proportion. Beam compasses are used where greater lengths are needed than can be secured by the ordinary pivot compasses. Points are arranged on a sliding bar so they can be clamped at certain distances from each other. Triangular compasses, having three legs, are used when it is desired to transfer the vertices of a triangle. Club compasses, called also bullet compasses, are constructed with a ball instead of one of the points of the ordinary compasses; the ball being arranged so as to turn in a hole or socket.

Compensa'tion, that which is given or received as an equivalent for services rendered, losses sustained, sufferings endured, or in payment of a debt; amends, remuneration, payment, recompense. When one is sued for a debt, it is competent for him, partially or wholly, to bar the claim by alleging that he is the plaintiff's creditor for services rendered or money lent. If the sum claimed from the plaintiff is found to be the exact equivalent of that for which he sues, the two are held to compensate or balance each other; if, on the contrary, it be less, it diminishes by so much the prosecutor's claim. If, however, the defendant feels that he owes the plaintiff more than that individual is indebted to him, he is required at the outset to pay into court the smaller sum for which he admits himself to be responsible.

Compensatio injuriarum is a defense against actions for damages claimed for slander, false accusations, and like causes.

Compensation Balance, a balance-wheel for a watch or chronometer, so constructed as to make isochronal (equal time) beats, notwithstanding changes of temperature. This effect is usually attained by having the balance-wheel cut into two segments, the arcs being fixed at one end each. This allows space for the expansion and contraction with no variation in size of the wheel. See CHRONOMETER.

Compensation Pendulum, a pendulum constructed of two different metals, as brass and iron, which so work against each other, that the expansion of the one downward is counteracted by that of the other upward. By this arrangement the pendulum does not vary in length, and consequently in frequency of vibration, whatever the temperature may be. Arnold's compensation balance-wheel for chronometers and watches is constructed on a similar principle.

Competition, a term nearly equivalent to the phrase "struggle for existence." Lamarck was the first to point out definitely the fact of competition in the cases of man and the sloth, but it was not until a half-century later that Darwin and Wallace emphasized its far-reaching importance as a biological agent in evolution. Competition may be most strikingly illustrated by a case in which it is entirely absent. The Great Salt Lake of Utah is inhabited by the brine shrimp (*Artemia fertilis*), which abounds in enormous numbers in the dense briny waters; hundreds may be dipped up in a dish of water and thousands captured by a few sweeps of the tow-net. As the water is so

salt that no other animal can live in it except a maggot near shore, it has absolutely not an enemy, and there is no other form to compete with it. Its food is a floating green alga (*Polycystis packardii*). It is absolutely harmless and without means of defense, and lays but few eggs; yet its success in point of numbers is beyond all precedent. Another case is that of a fly (*Ephydra gracilis*) whose larva abounds at the margin of the same lake. These two cases illustrate how a species may abound in profusion, though not crowding out other forms, since there are no competitions.

A familiar example of the crowding out of native species by those introduced from foreign countries in the struggle for existence among plants is the ox-eye daisy, which was introduced from Europe, first appearing in Leicester, Mass., in 1740. Many years ago what were once throughout New England green fields of grass became white with its flowers; it drove out even the grasses introduced. On the other hand, in central Europe, throughout France, the Pyrenees, and the Alps, as recently observed, it grows sparsely, never in extensive patches. Other examples are the introduced European injurious insects, the gipsy moth, the scale insects, and many others, whose numbers in the Old World are kept within due limits by ichneumon parasites, but which in the United States and Canada, owing to the absence of their natural enemies, breed in unlimited numbers. Another case is that of the Colorado potato-beetle, which spread eastward from comparatively limited tracts in the Rocky Mountain region, and invaded the eastern States to the shores of the Atlantic. The English sparrow, introduced during a period from 1850 to 1870 has become, owing to the lack of competition, a grievous pest, driving out the native birds. The periwinkle (*Littorina littorea*) of the European coast, introduced on our shores, about 1855, has multiplied to such an extent that it lives between tide-marks in millions, to one of our native species of the same genus. Such cases as these throw light upon the subject and prove that there is a silent but unceasing struggle for existence going on over nearly all the earth's surface. Yet in the case of desert plants which grow sparsely, separated by barren spaces, there is, as Henslow has observed, no struggle for existence.

Nowhere is the agency of competition more marked than in human society. In the lower savage races, as in the black race of Africa or the natives of Australia, the scattered tribes have confined their contests to simple raids, and no single people or sub-race has gained marked pre-eminence over another, with the exception of the Hottentots and Bushmen, who were largely exterminated by negro tribes from the north. But as we ascend to the higher or white race, to the Semitic, the western Asiatic and European peoples, we have examples of the sudden rise to power and pre-eminence of vast hordes of barbarian peoples under Tamerlane, the Grand Mogul, Attila, and other conquerors, which have swept over vast territories and crushed the weaker, more peaceful, or even civilized but less resistant nations. The rapidity with which the Arabs overran and still dominate northern Africa in language, social customs and religion; the Mongolian movements eastward into China, and westward to the borders of Europe; the successive rise and irresistible waves of migratory hordes from eastern to northern Europe, throughout prehistoric and historic times; the colonizing and expansion of the powers of Greece, of Rome, of the Norsemen, Anglo-Saxon, the Spanish, French, and German peoples; the success of the white race in the struggle for pre-eminence; the disappearance of the lower, weaker races, less favored intellectually and morally, some of which had become fossilized, or semi-fossilized, and practically inept and unfit,— all these phenomena, which are historic facts, are of a piece with what we witness, though in a less distinct and marked way, in the plant and brute realms. The results are in the long run beneficent, though the injustice, moral degeneration, suffering, and evils which attend human progress are pitiful and deplorable. Consult: Darwin, 'Origin of Species'; Wallace, 'Darwinism'; Fredericq, 'La Lutte puer l'existence chez les Animaux Marins.'

Compiègne, kôn-pē-ān'yŭ, France, a town in the department of Oise, and on the left bank of the river Oise, 45 miles north-northeast of Paris. It has a tribunal of commerce, a communal college, a public library, a theatre, manufactures of muslin, hosiery, and cordage, besides a trade in wood and grain. The splendid château, surrounded by its extensive and beautiful park, bordering on the celebrated forest of Compiègne, was a favorite autumnal residence of Napoleon III. Charles VI. took this town from the Duke of Burgundy in 1415. In 1430 Joan of Arc was taken prisoner here by the English. Pop. (1902) 14,106.

Com'plement, that which fills up to a certain unit. Thus the complement of an angle is the angle which would, by addition, make the given angle a right angle; and the complement of a number is a number which would, by addition, make the given number equal to the next higher unit, or the next higher power of 10. Thus 2 and 98 are example arithmetical complements.

In medicine the complement or the complementary body is supposed to be a substance in the blood serum that is necessary for its antibacterial or bacteriolytic action. In order to bring about a lysogenic action (*Pfeiffer phenomenon*, q.v.), two bodies seem to be necessary in the blood serum. One known as the immune serum is developed during the process of immunization. It alone cannot however cause bacteriolysis. There must be present in the blood serum another body, the complement. Also called, alexine or cytase. See IMMUNITY.

Complemental Males, according to Darwin minute, very degenerate males of peculiar form which live attached like parasites to the body of hermaphroditic barnacles, as *Illa* and *Scalpellum*.

Complete Angler, The, a famous book by Izaak Walton, first published in 1653. It was designed primarily by its author to teach the art of angling, of which long experience with hook and line had made him master. It is written in dialogue form, and is filled with conversations touching the theme in question, which are carried on by an angler, a hunter, a falconer, a milkmaid, and others. The book is filled with descriptions of rural scenery and interspersed with many charming lyrics, old songs and ballads.

The 'Angler' is not alone devoted to sport, but is filled with precepts which recommend the practice of religion and the exercise of patience, humility, contentment, and other virtues. Whether considered as a treatise on the art of angling, or as a delightful pastoral filled with charming descriptions of rural scenery, 'The Complete Angler' ranks among English classics. In 1676, when Walton was preparing a fifth edition for the press, Charles Cotton, also a famous angler, and an adopted son of Walton, wrote a second part for the book, which is a valuable supplement. Walton, though an expert angler, knew but little of fly-fishing, and so welcomed Cotton's supplement, which has since that time been received as a part of his book.

Complex'ion, the term generally used to signify the special color or hue of a person's skin. The human skin, till the time of Malpighi, was supposed to consist only of two parts —the epidermis or outer skin, and the cutis or true skin; but that anatomist, about the middle of the 17th century, discovered between these a cellular texture, soft and gelatinous, to which the names of rete mucosum, rete Malpighi, or Malpighian tissue, have been given. He demonstrated the existence of this membrane at first in the tongue and in the inner parts of the hands and feet; but by his subsequent labors, and also by those of Ruysch and other anatomists, it was proved to exist, between the epidermis and cutis, in all parts of the human body. Malpighi, on the discovery of this membrane, offered a conjecture respecting the cause of the color of negroes. He supposed that this membrane contained a juice or fluid of a black color, from which their blackness arose. The actual existence of a black pigment has been since ascertained. The rete mucosum is of very different colors in different nations; and the difference of its color so completely agrees with the difference of their complexions, that there can be no doubt that it is the sole, or, at least, the principal seat of the color of the human complexion. Its thickness varies in different parts of the body; and the depth of its color, for the most part, is in proportion to its thickness. It is now, however, not regarded as altogether a distinct tissue, being considered rather as the innermost and newest layer of the epidermis or cuticle. The black color of the negroes is destroyed by whatever destroys the rete mucosum, as wounds, burns, etc.; the scar remaining white ever afterward. The greatest contrast in complexion is between the fair white peoples of northern Europe and the ebony colored negro of Africa.

There are several remarkable instances of the color both of whites and of negroes being either entirely or partially changed, from the operation of causes which cannot be detected or explained. An American girl, whose father was of English, her mother of American birth, and both persons of light complexion, began to change color about the age of puberty, and at the age of 16 presented the appearance, as regards color, of a dark mulatto. Latterly she presented the appearance of a white person whose skin had been covered with a thin coating of lamp-black, through which some appearance of the hue of the surface was apparent, with here and there spots, from a few lines to a fourth of an inch in diameter, which were as black as the skin of an African. A boy who was born in Virginia of black parents, continued of his native color till he was three years old: at that period a change of color began to take place, though the health of the boy continued good, and there was no assignable cause for the alteration, either in his food or mode of life. At first white specks made their appearance on his neck and breast, which soon increased in number and size; from the upper part of his neck down to his knees he was completely dappled; his hair was also changed, but not to the same degree, since, though some parts of it were white, in general it retained the black color and crispature of the negro.

The nature and color of the hair seem closely connected with the complexion. In proportion to the thinness of the skin and the fairness of the complexion the hair is soft, fine, and of a white color: this observation holds good not only in the great varieties of the human race, but also in albinos. Next to them in fairness of complexion is the Teutonic race, the *rutilæ comæ* (fair locks) of whom were a distinguishing characteristic even in the time of the Romans. The Celtic people are not so fair as the Teutonic, and their hair is darker and less inclined to curl; but it is perhaps more difficult than in the case of the Teutons to be sure of unmixed blood. But though the color of the hair is evidently connected with the complexion, yet its tendency to curl does not appear to be so. Many brown complexioned Celts have curled hair; the Mongolian and American races, of a much darker complexion, have hair of a darker color, but long and straight. Among that portion of the Malay race which inhabits some of the South Sea Islands, soft and curled hair is said to be met with. The color of the eye is also connected with the complexion. In the Africans, Prof. Sommering remarks that the white of the eye is not so resplendently white as in Europeans, but rather of a yellowish brown, something similar to what occurs in the jaundice. The iris in the negroes, in general, is of a very dark color; but the iris in the Congo negro is said to be frequently of a bluish tinge. The Teutonic tribes are not more distinguished by their fair complexion than by their blue eyes, —*cærulei oculi,* while the iris of the darker colored Finn is brown, and that of the still darker Laplander black. The color of the eyes also follows, in a great degree, in its changes, the variations produced by age in the complexion. Newly born children in Germany, it is stated, have generally blue eyes and light hair, both of which become gradually of a darker hue as the complexion of the individual grows darker; and similar changes are recorded of other peoples. The most singular class of people in point of complexion are the albinos, but albinoism is not confined to the human race. An intermediate complexion is produced where children are born from parents of different races. If the offspring of the darkest African and the fairest European intermarry successively with Europeans, in the fourth generation they become white; when the circumstances are reversed, the result is reversed also. Along with the successive changes of complexion is also produced a change in the nature and color of the hair; though, in some instances, the woolly hair remains when the complexion has become nearly

as fair as that of brown people in Europe. It does not, however, always happen that the offspring is the intermediate color between that of the respective races to which the father and mother belong; it sometimes resembles one parent only, while, perhaps, in the second or third generation, the color of the other parent makes its appearance. An instance has been given of a negress who had twins by an Englishman: one was perfectly black; its hair was short, woolly, and curled: the other was white, with hair resembling that of a European. In another case the child of a black man and an English woman was quite black; and still more remarkable: a black married a white woman, who bore him a daughter, resembling the mother in features, and as fair in all respects, except that the right buttock and thigh were as black as the father's.

The generally received opinion concerning the varieties of complexion which are found in the different races of man throughout the globe is, that they are caused entirely by the influence of climate. Respecting the primary color of man the supporters of this opinion are not agreed. The opinion that climate alone will account for the various complexions of mankind is very plausible, and supported by the well-known facts that in Europe the complexion grows darker as the climate becomes warmer; that the complexion of the French is darker than that of the Germans, while the natives of the south of France and Germany are darker than those of the north; that the Italians and Spaniards are darker than the French, and the natives of the south of Italy and Spain darker than those in the north. The complexion also of the people of Africa and the East Indies is brought forward in support of this opinion; and from these and similar facts the broad and general conclusion is drawn, that the complexion varies in darkness as the heat of the climate increases; and that, therefore, climate alone has produced this variety. But it can be shown that the exceptions to this general rule are very numerous; that people of dark complexions are found in the coldest climates, people of fair complexions in warm climates, people of the same complexion throughout a great diversity of climate. and races differing materially in complexion dwelling near together.

1. In the coldest climates of Europe, Asia, and America we find races of a very dark complexion. The Laplanders have short, black, coarse hair; their skins are swarthy, and the irides of their eyes are black. According to Crantz the Greenlanders have small, black eyes; their body is dark gray all over; their face brown or olive; and their hair coal-black.

The complexion of the Samoiedes and other tribes who inhabit the north of Asia is very similar to that of the Laplanders and Greenlanders, who are Eskimos by race. Humboldt's observations on the South American Indians illustrate and confirm the same fact. If climate rendered the complexion of such of these Indians as live under the torrid zone, in the warm and sheltered valleys, of a dark hue, it ought also to render or preserve fair the complexion of such as inhabit the mountainous part of that country; for certainly, in point of climate, there must be as much difference between the heat of the valleys and of the mountains in South America as there is between the temperature of southern and northern Europe; and yet this author expressly assures us that "the Indians of the torrid zone, who inhabit the most elevated plains of the Cordillera of the Andes, and those who, under the 45th degree of south latitude, live by fishing among the islands of the archipelago of Chonos, have as coppery a complexion as those who, under a burning climate, cultivate bananas in the narrowest and deepest valleys of the equinoctial region." He adds, indeed, that the Indians of the mountains are clothed, but he never could observe that those parts which were covered were less dark than those which were exposed to the air. The inhabitants also of Tierra del Fuego, one of the coldest climates in the world, have dark complexions and hair.

2. Fair complexioned races are found in hot climates. Ulloa informs us that the heat of Guayaquil is greater than at Carthagena; and by experiment he ascertained the heat of the latter place to be greater than the heat of the hottest day at Paris; and yet in Guayaquil, "notwithstanding the heat of the climate, its natives are not tawny"; indeed they are "so fresh-colored, and so finely featured, as justly to be styled the handsomest, both in the province of Quito and even in all Peru." According to a statement of Humboldt, in the forests of Guiana, especially near the sources of the Orinoco, "are several tribes of a whitish complexion of whom several robust individuals, exhibiting no symptom of the asthenical malady which characterizes albinos, have the appearance of true Mestizos. Yet these tribes have never mingled with Europeans, and are surrounded with other tribes of a dark brown hue." The inhabitants of Boroa, a tribe in the heart of Araucania, are white, and in their features and complexion very like Europeans. Even in Africa darkness of complexion does not increase with the heat of the climate in all instances; the existence of comparatively fair races in this quarter of the globe is noticed by Ebn Haukal, an Arabian traveler of the 10th century, and has been confirmed by subsequent travelers.

3. The same complexion is found over immense tracts of country, comprehending all possible varieties of climate. The most striking and decisive instance of this is on the continent of America, all the inhabitants of which, with the exception of the Eskimo, exhibit the copper-colored skin and the long and straight black hair. Australia is an instance of a similar nature, though on a less extensive scale: over the whole of the island, even in the comparatively cool climate of the southern parts, the complexion of its inhabitants is of a deep black, and their hair is curled like that of negroes.

4. Different complexions are found under the same physical latitude, and among the same people. Illustrations and proofs of this have already been given. The physical latitude in which the Norwegians, the Icelanders, the Finns, and the Laplanders live scarcely differs; and yet their complexion, and the color of their eyes and hair, are widely different. There is a great diversity of color and features among the Morlachs, who inhabit Dalmatia. The inhabitants of Kotar, and of the plains of Seigu and Knin, have fair blue eyes, broad face, and flat nose. Those of Duare and Vergoraz, on the contrary, have dark-colored hair; their face is long, their complexion tawny, and their stature tall. M.

Sauchez, who traveled among the Tartars in the southern provinces of Russia, describes a race or tribe as having countenances as white and fresh as any in Europe, with large black eyes. In the south of Africa we find the Kafirs, who are of a brown or iron-gray color, and the Hottentots of a yellow color. In the island of Madagascar, according to Mr. Sibree, the observer "finds almost every shade of color from a very light olive, not darker than is seen in the peoples of southern Europe, down through all gradations of brown to a tint which although not black is certainly very dark. In the quality of the hair, too, there is a good deal of difference; the lighter-colored people having usually long, black, and straight hair, while the darker tribes have, as a rule, shorter and more frizzly hair."

Besides a Malayan olive-colored race, people with the negro complexion and features are found in the Philippine Islands; and in Java, the Hindu, and Malay character may be clearly traced in the complexion and features of the two classes of inhabitants which are found in that island. In several of the Moluccas is a race of men who are blacker than the rest, with woolly hair, inhabiting the interior, hilly parts of the country. The shores of these islands are peopled by another nation, whose inhabitants are swarthy, with curled, long hair. In the interior hilly parts of Formosa the inhabitants are brown, frizzle-haired, and broad-faced; while the Chinese occupy the shores.

It is observed that there are two great varieties of people in the Pacific islands; the one more fair, the other blacker, with their hair just beginning to be woolly and crisp. The first race inhabits Tahiti and other of the Society Islands, the Marquesas, the Friendly Isles, Easter Island, and New Zealand; the second race peoples New Caledonia, Tanna, and the New Hebrides, especially Mallicolo. If we examine the relative situation and latitudes of these islands on a map, we shall be convinced not only that darker complexioned people are found where the climate is comparatively colder, but that the same complexion is found under very different latitudes. It is not meant to be denied that a burning climate will render the complexion very dark, and that a climate of less extreme heat will bronze the complexion of the fairest European; but there are some material points in which the dark complexion of the Caucasian, or naturally fair-skinned variety of mankind, caused by climate, differs from the dark complexion of all the other varieties of the human race.

1. The offspring of the Caucasian variety is born fair; the offspring of the other varieties is born of the respective complexion of their parents. Ulloa informs us that the children born in Guayaquil of Spanish parents are very fair. The same is the case in the West Indies. Long, in his history of Jamaica, expressly affirms "that the children born in England have not, in general, lovelier or more transparent skins than the offspring of white parents in Jamaica." But it may be urged that this is not the case with respect to the other nations of the Caucasian variety, who have been settled in warm climates from time immemorial, and that the question ought to be decided by the Moors, Arabians, etc. Their children, however, are also born fair complexioned, as fair as the children of Europeans who live under a cold climate. Russell informs us that the inhabitants of the country round Aleppo are naturally of a fair complexion, and that women of condition, with proper care, preserve their fair complexion to the last. The children of the Moors, according to Shaw, have the finest complexions of any nation whatsoever; and the testimony of Poiret is directly to the same effect. "The Moors are not naturally black, but are born fair, and when not exposed to the heat of the sun remain fair during their lives."

2. Individuals belonging to the Caucasian variety, that inhabit warm countries, preserve their native fairness of complexion if they are not exposed to the influence of the climate; while there is a uniform black color over all the parts of a negro's body. The hue which Europeans assume is the same, though the tinge may be lighter or darker, whether they settle in Africa, the East Indies, or South America. They do not become, like the natives of those countries, black, olive-colored, or copper-colored; their complexion merely resembles that of a tanned person in this country, only of a darker tinge. The negroes that are settled in the West Indies or America do not assume the copper color of the Indians, even though a milder climate may have some effect on the darkness of their complexions. The children of Europeans, of negroes, and of Indians are all born, in America, of the same reddish hue; but in a few days those of the negro begin to assume the black complexion of their parents, those of the Indian the copper complexion, while those of the European either continue fair, if kept from the influence of the sun, or become tanned; not black like the negro, or copper-colored like the Indian, if exposed to its influence. Europeans who settle in Canada, or in the northern parts of America, where the climate resembles that of their native country, do not assume the complexion of the Indians, but continue fair like their ancestors. The same observation may be made respecting the Russians who are settled among the Mongolian variety, in those parts of the Russian empire in Asia, the climate of which resembles the middle or northern parts of European Russia. Indeed the wide extent of country over which the Mongolian variety is spread, including the extreme cold of Lapland and the north of Asia, the mild temperature of the middle parts of that continent, and the warmth of the southern parts of China, is in itself a proof that dark complexion does not arise either from the influence of heat or cold.

Lastly, radical varieties of complexion are always accompanied with radical varieties of features. We do not find the olive color of the Mongolian variety with the features of the Malay; nor the brown color of the Malay with the features of the Mongolian; nor the black skin of the Ethiopian variety, or the red color of the American, united with any set of features but those which characterize their respective varieties. It, however, by no means follows that the hypotheses of different races having been originally formed must be adopted, because climate is not adequate to the production of the radical varieties of complexion which are found among mankind. Man, as well as animals, has a propensity to form natural varieties; and the variations may in process of time involve all the tissues so as to yield permanent differences in color and quality of hair, color of skin, size

and form of bones, especially those of the skull and limbs. See EPIDERMIS; HISTOLOGY; MALPIGHI; RUYSCH.

Com'pline, the last or seventh of the daily canonical hours in the Roman Catholic breviary; the complement of the Vespers or evening office. St. Benedict, in the 6th century, added Compline to the hours, thus making the number seven, answering to the praises of which the psalmist speaks of "seven times a day." Matins and lauds were classed as one hour.

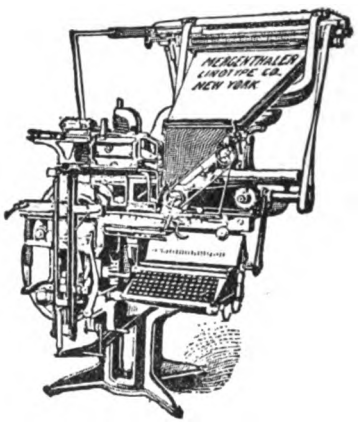
Complutensian (kŏm-ploo-tĕn'sĭ-ạn) **Pol'yglot,** a polyglot made by seven scholars under the auspices and at the expense of Cardinal Ximenes. It was begun in 1502, and finished in 1517, but was not actually published till 1522. It consists of six folio volumes. In the Old Testament, on the left hand page, are the Hebrew original, the Latin Vulgate, and the Greek Septuagint; and on the right hand page, the Vulgate, the Septuagint, with Latin translation above, and the Hebrew, with primitives belonging to that language on the outer margin. At the lower part of the page are two columns used for a Chaldee paraphrase, and a Latin translation. The Greek Testament, constituting part of the Complutensian Polyglot, was the first complete edition of that part of Scripture printed.

Composing-machines, a general title for all classes of machines that compose or set either type or matrices, arranging them in lines and columns for printing. There are three prominent types of these: (1) Those that set matrices in line and cast therefrom a solid line or slug, as the linotype, monoline, and typograph; (2) those that cast and set type at the same operation, as the monotype and graphotype; and (3) those that set and distribute ordinary founders' type, these being the only ones properly styled type-setting machines, as the Simplex (modernized Thorne), Empire (improved Burr), Dow, Frasier, Kastenbein, etc.

Historically, the type-setting machine comes first, William Church of Connecticut, devising a machine about 1822 that was the first practical effort in this direction. He employed a keyboard, and stored the type in channels. From 1822 to 1872 there were 35 United States patents granted on composing-machines, and a like number in Great Britain. The most noteworthy of these were the Alden and the Mitchell machines in the United States, and the Hattersley machines in England. These three machines all came into use during the period between 1850 and 1860, and, though not successful commercially, they served to lay the foundation for better machines that followed. The difficulty with all of them seems to have been that they required several persons to operate each machine, and that the consequent cost was very nearly the same as for composition by hand. From 1860 up to 1880 there were invented and constructed probably 100 different machines designed to supersede the compositor, nearly all of which failed of any commercial success. During the period between 1880 and 1890 the Thorne type-setting machine, originating in Connecticut, came into considerable use, being employed by many newspapers throughout the United States, and beginning to find a market abroad. At this latter date the Burr and McMillan machines had also found some sale in the United States, and the Frasier and Kastenbein in England and Germany.

About 1890 the linotype became a commercial machine and began to take the market, and since that time has far outsold all others combined, there being at this writing (1903) about 8,000 in use as against probably 1,000 of all other makes.

The linotype is the invention of Ottmar Mergenthaler, who spent nearly 20 years of his life in Baltimore perfecting the machine which has largely revolutionized methods of printing. It is based on the idea of substituting

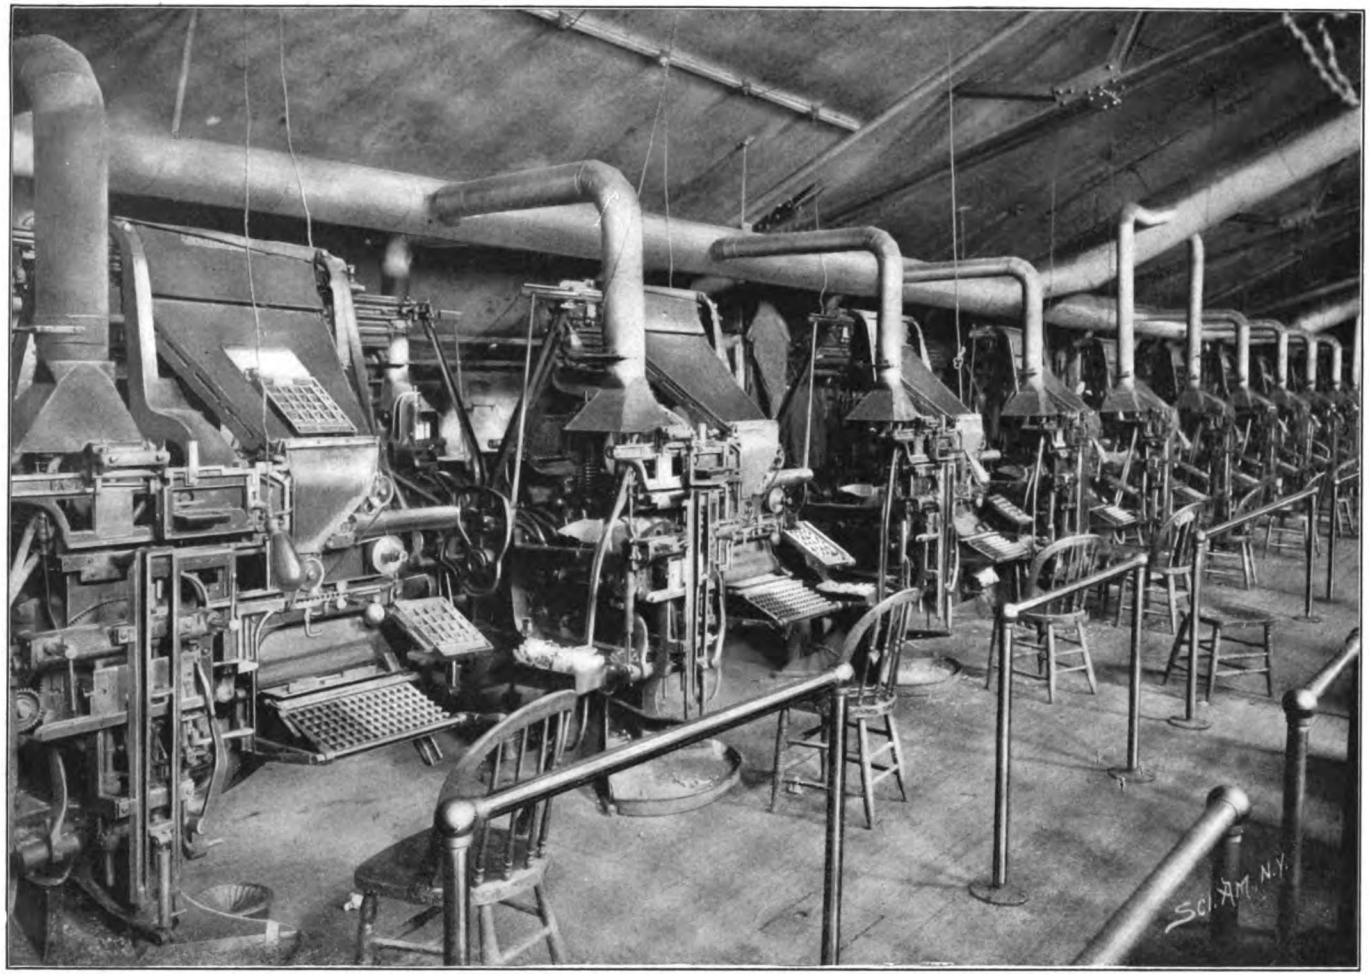


The Linotype

the solid line as a unit instead of the single type invented by Gutenberg. This solid line, or linotype slug, is formed by bringing together such matrices (or reverse types) as are required for a line, spreading them by wedges to the proper width, and then bringing them to the mouth of a mold, against which they are tightly clamped, while the molten metal is pumped into the mold. The parts are then released, and the linotype slug is pushed out ready for printing.

The matrices employed in the linotype machine are flat pieces of brass, about an inch in the longest dimension, and having the reverse of a type face stamped or sunk in one edge. By means of a series of notches in the heads of the matrices they are suspended on a rail at the top of the machine, and being pushed along are arranged to drop off into the tops of their respective channels. There are 90 of these channels, each representing a separate type character or letter, the channels together constituting a magazine in which they are contained when not in use.

To produce linotype slugs from the machine a special metal is first supplied to a pot, which is heated by a gas flame to a temperature approximating 550° F. When this is ready the operator sits down to the keyboard, which includes six horizontal rows of keys arranged in a sloping bank. As he manipulates the keys for a line, the matrices fall one by one into an elevator. At this point errors may be corrected by hand, or unusual characters, as accented letters, may be inserted in the same way. Between each word the operator strikes a key that calls for a space-band, or double-wedge device. When there are sufficient characters to



BATTERY OF LINOTYPE COMPOSING MACHINES.

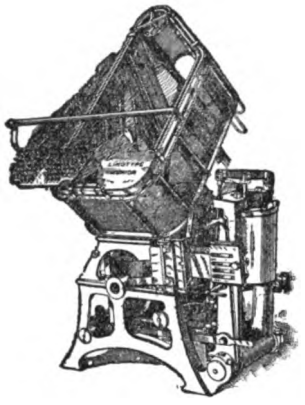
fill a line, he pulls the elevator lever, and the wedges of the space-bands are automatically closed up, spreading the matrices to the width of the proposed column, while the line of matrices is gripped in a vise and carried to the mold-wheel. This wheel has a slot that corresponds in size to the linotype slug that is to be cast. The matrices are clamped against one side of the wheel, while the mold-pot is tilted until the nozzle tightly connects with the other side. Then a pump gives a stroke, and the molten metal is forced in under pressure. It sets solid in a second, when the parts are separated, and the line of matrices is picked up by a long lever and carried upward to the distributing rail, while the linotype slug is pushed out between trimming-knives to a galley. The entire work after the operator touches the elevator lever is automatic. As soon as he has disposed of one line, he begins fingering the keys for another, without waiting for the machine.

Corrections or changes are made by resetting and recasting the lines affected. Four thousand ems an hour, the equivalent of about 7,000 type characters, is an average amount of work for a good operator at the keyboard, though there have been records made of a little more than three times this speed for an hour. The metal used for casting linotype slugs is a special composition, softer than type metal, because it requires to flow more easily. It is principally lead, with varying proportions of tin and antimony. After using it for a time it deteriorates, largely through the loss of antimony evaporated, and is returned to the smelter to be renewed.

About 1898 the capacity of the linotype was increased by placing two type characters on a single matrix, and this enabled the user to employ both italics and small capitals in composition, which had been impracticable before, owing to the limitation of 90 characters. This, together with other improvements, brought the machine into considerable use for book and magazine composition, for which it had been previously considered inadequate, though reducing the cost. In 1902 the Mergenthaler Linotype Company brought out a junior machine, selling at half the price, but confined in use to two sizes of typeface, and narrow widths of column. The linotype proper sets any size type from 5 to 12-point, any width up to five inches, and any one of 100 or more faces. The latest 1903 machine is built with two magazines, giving it a capacity of 360 characters. As many as six faces of type can be set from the same keyboard.

Although Ottmar Mergenthaler is the inventor of this machine, credit for its development should be given also to Whitelaw Reid, who furnished a large share of the original capital, and introduced it on the New York *Tribune;* and to Philip T. Dodge, who has successfully managed the business interests of the company, besides protecting the machine with strong patents and inventing many valuable devices that have improved the mechanism.

Of the same general character as the linotype machine is the Rogers typograph, brought out in the United States about 1888, and which has had some sale in Europe, but was stopped from introduction in the United States through interference with Mergenthaler's patents. The Linotype Company needed some devices used on the Rogers machine, however, and bought one of their patents, taking the inventor into the employ of the manufacturing company, where he assisted in the development of the linotype proper and perfected the junior linotype, which is very similar to the original typograph. In this machine the matrices travel on wires instead of in channels. It is smaller and simpler



The Linotype Junior

than the linotype, but slower of operation and less extended in range.

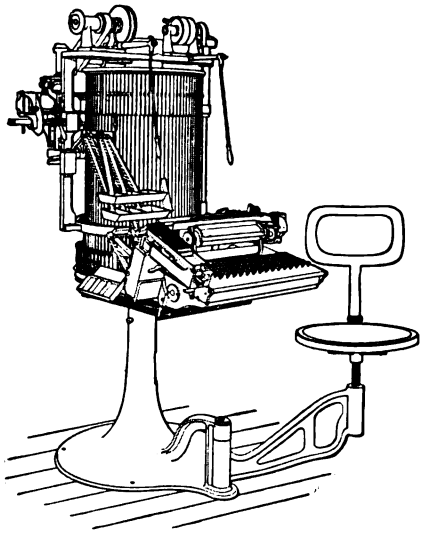
The Scudder monoline machine produces a slug like that of the linotype, and, like the typograph, has been barred out of the United States as an infringing machine. It was taken to Canada, and has been supplied to a considerable number of printing-offices there. It is much smaller than the linotype, and does a more restricted grade of work. Twelve characters are carried on a single matrix, and the position as to height in the line determines which of the 12 shall be used. Eight kinds of matrices thus serve to give a total of 96 characters, and because there are so few matrices the mechanism for distributing them after using becomes very simple. The matrices have hooks on top, and readily slide back to position.

The Lanston monotype is the leading machine of the class that both casts and sets type. It employs first a keyboard, the operation of whose keys results in punching holes in a paper tape. The combinations of holes represent the different type characters. This tape is carried to a type-casting machine and fed in; as it passes along it indicates to the caster which character to cast next, so that the characters are cast and pushed out into lines and columns in the proper order for printing. The keyboard machine or perforator is entirely distinct and separate from the casting mechanism, and is usually operated in a room apart. It includes 225 characters and a set of justifying-keys. The operator, having decided on the size and face of type and width of column, adjusts certain gauges and proceeds to manipulate the keys. As he approaches the end of a line, a pointer on a dial indicates to him what justifying-keys he should strike in order that the line, when cast in type, may be of proper length. Any errors he may make are of course repeated in the casting-machine, and must be corrected later by hand. The product of his machine is a paper tape about two and a half inches wide, with rows of holes, each row representing a type character.

This tape is taken to the type-casting machine and fed in backward, so that the caster may receive information, before casting a line, what thickness of spaces are required to justify that line accurately. The tape is fed in with a step-by-step motion and as each row of holes is presented to the proper part of the machine, a blast of air is driven through each of the holes of the row, and this serves to set in position the proper parts to produce whatever type character is called for. The casting-machine is automatic, but, being delicate and complicated, requires one attendant to two machines. The matrices are made separately, but are locked together in a frame that jumps from point to point, in order to bring the required letter to the face of the mold for casting. By changing the matrices and mold, any size or face of type within certain limitations can be produced from the one machine. A width of seven inches is also provided for, being the greatest on any composing-machine.

The Goodson graphotype machine operates on principles very similar to those of the monotype just described. Its mechanism is electrical, however, and both perforator and caster are much smaller machines. The number of characters on the keyboard is limited to 100, so that italics and small capitals cannot be produced with the full complement of other characters.

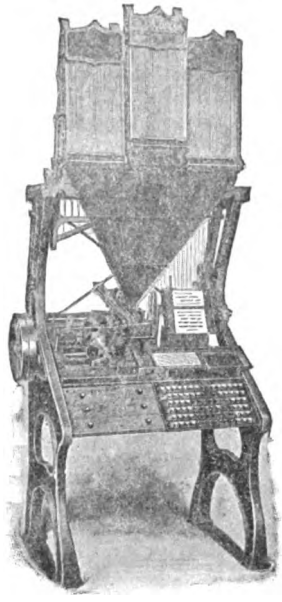
Of all the machines devised for setting founders' type, the Thorne is the best known. The types are contained in 90 channels, set radially in the periphery of an upright cylinder. As the operator fingers the keys, the types called



The Simplex

for are pushed out of the lower ends of the channels and carried around on a circular raceway to the point where they are brought into line. This line extends to a considerable length, without any reference to the length of line in which the matter set up is to appear finally. A second operator picks up from the composed type thus emerging enough to form a line of the desired length. This he puts in the galley and justifies, or spaces out to length, by hand. The leads, or spaces between lines, are also inserted by hand.

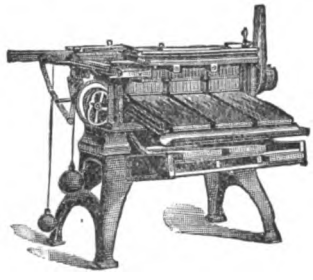
After type set on the Thorne machine has been printed from, or molded for electrotyping, it is redistributed by a boy, who puts the type, a line at any time, into a short cylinder su-



The Empire

perimposed over the type-cylinder previously mentioned, from which it passes to the lower cylinder ready for composition again. As distribution proceeds more rapidly than composition, the boy can attend to more than one machine.

About 1898 an improvement on the Thorne machine was placed on the market, under the name of the Simplex machine. In this the distributor boy was dispensed with, the type for distribution being loaded in quantity from time to time by the operator. The arrangement was such that the keyboard operator could also do the justifying (by hand), or two operators could be employed, as suited the convenience of



The Empire Distributor

the user. The Simplex and Thorne machines have enjoyed a larger sale than any other composing-machines except the linotype.

The Empire machine, originally known as the Burr, that being the name of the inventor, is a production of New York, and, like the Thorne

machine, requires three operators. The distributor is a separate machine, that, when loaded with pages of type, separates them one by one and pushes them into the channels of a magazine. This magazine is placed in the top of the setting-machine, which is supplied with a keyboard. The operator releases the lower type from the channels by manipulating the keys, and the lines are justified by a second operator by hand. The builders of this machine are now (1903) adding a justifying mechanism to do away with the labor of one operator.

The Kastenbein machine, which has had some sale in Europe, is very similar to the Empire, and does not require a separate description.

The McMillan machine, developed in Ilion, N. Y., was the first type-setting machine to be provided with automatic justification, thus dispensing with the labor of one operator. When a line of type was composed, it was taken up automatically by a carrier and transferred to a point where the spaces between the words were exchanged for a size larger spaces; if the line was not then filled to measure, it was carried on to a third and a fourth stage, until large enough spaces were supplied to spread it to the width of the column. This justifying mechanism was very ingenious, but complicated, and only a few of the machines were built and sold. The distributor was a separate machine, operating quite simply at a speed of about 10,000 ems an hour.

The Cox type-setting machine attracted considerable notice in the printing trade in Chicago and New York in 1897. It was purchased by the Unitype Company of New York, and its best features were incorporated in the Simplex or improved Thorne machine. The most unique feature of Cox's machine was the employment of crimped or corrugated spaces made of lead. The line was overset in length, and then squeezed down to measure by compressing the corrugations. This justification was satisfactory in most respects, but the crimped spaces created difficulty in stereotyping and electrotyping, and its use was abandoned.

The Calendoli type-setting machine, developed in France by a priest of that name, has attracted much attention because of the wonderful claims made for its speed. Though exploited for several years, it has not yet (1903) been perfected for the market. It employs short types grooved so as to slide on wires, and the keyboard has numerous combinations to enable the operator to strike whole words or syllables at a single motion of the hand.

Many other type-setting machines might be mentioned, that have been built and used somewhat, but practically all of them have been dropped by their owners, because the labor involved in operating them is much greater than with the linotype, which is a one-man machine, —that is, a machine delivering a full product with the labor of one operator. Many inventors have labored to produce a one-man type-setting machine handling single type, because such a machine is available for some purposes that a linotype machine is not. No such machine is yet on the market, though there was exhibited at the Pan-American Exposition in Buffalo, in 1901, a one-man type-setting machine that appears to be a success. It is the invention of Alexander Dow, and is the only machine handling founders' type that is adapted to handle the several sizes in one machine. The justification, or spacing out of the lines, is entirely automatic, requiring no thought by the operator. The machine measures the line, calculates the proper size and number of spaces, and, discarding the dummy spaces inserted during the original setting, substitutes the proper sizes and pushes the type into the galley. A distributor adapted to supply this machine has been constructed with a capacity for supplying three setting-machines, and a company is now (1903) preparing to market the two machines.

Among other composing-machines that have been built in the United States, and attracted the attention of the printing trade at one time or another, are the Alden, projected about 1860, which did good work, but failed to economize labor; the Paige, on whose development nearly $2,000,000 was spent, and which proved too costly to construct for the general market, the two machines built being now stored with Cornell and Columbia universities as mechanical curiosities; the St. John typobar, consisting of cold-pressed metal clamped on an iron base, to form a line; the Chadwick or Lagerman typotheter, a little machine for enabling a compositor to set with both hands; the Johnson, which justified the lines by sawing out a space of the required width; the composite type-bar machine, by which short hooked type were incorporated in a line by casting metal around their bases and between them; the Sears, in which type are impressed in a block of wood, and a slug cast from the matrix thus formed; the Risley and Lake, in which the type were impressed in a soft sheet like blotting paper, and a stereotype taken after a quantity had been thus impressed.

For further information on this subject consult 'Wonders of Modern Mechanism,' and the files of 'The Inland Printer.'

CHARLES H. COCHRANE.

Compositæ (Lat. "compound," "put together"), a family of dicotyledonous plants, the greatest order in the vegetable kingdom, usually herbaceous in temperate and colder climates and shrubby in dry and hot regions, and seldom, apparently only in tropical zones, growing as trees. The leaves are never accompanied by stipules; they most commonly are alternately arranged, and sometimes opposite or whorled. But the true mark of the order is the compound flower, from which it gets its name and which makes it one of the simplest orders to identify, the daisy or aster being the commonest type and the name aster family or sun-flower family being sometimes used. The true blossom is a head made up of many florets, flat as in the aster or approaching a conical shape as in the black-eyed-susan. This head is set in an involucre of leafy bracts, which to the lay observer resemble petals and give the compound flower the appearance of a single bloom. The calyx, joined to the ovaries, crowns them, save in a few cases, with the pappus, which is usually hairy, toothed, or bristly, and coming to maturity at the time of fruition frequently furnishes the seed with a sort of wing facilitating dispersion by the wind. The corolla, tubular, ligulate or labiate, divides into five lobes at the summit. The anthers are united in a tube by which the five stamens are also joined into one. The ovules at fruition dry up and become

achenes (q.v.). Among the florets, which naturally fall into two classes, the fertile ones of the disk and the sterile ones of the ray, grow bracts called paleæ or chaff, except where the receptacle is naked. The classification of the order *Compositæ* is difficult, if for no other reason because it contains about 11,000 genera and more than 1,000 species, that is about one-tenth of the higher vegetable forms. The simplest division is into *Liguliflora*, with all florets ligulate or strap-shaped, and *Tubuliflorœ*, with disk florets not ligulate. The latter class is by far the larger. The *Liguliflorœ* contains only the one tribe, *Cichoricæ*, of which the food-plants, lettuce, salsify, and chicory, are the best known members. In the other sub-order the *Tubuliflorœ* are 12 tribes; *Vernonieæ*, with 41 genera, iron-weed being a common member; *Eupatoricæ*, with 35 genera, including the medicinal plants, ayapana, bitterbush, boneset and hemp agrimony; *Astereæ*, including the typical asters, dahlias, etc.; *Helianthea*, with the artichokes and other tuberous plants; *Inuleæ*, of which elecampane may be mentioned as an example; *Helenieæ*, sneezeweed being an American member; *Anthemideæ*, including the different varieties of camomile, the chrysanthemum and the marguerite; *Senecioneæ*, with four sub-tribes, and the old-fashioned foliage plant called dusty miller; *Calendulaceæ*, including the marigolds; *Arctotideæ*, with only one genus, occurring in South Africa and Australia; *Mutiseæ*, another scantily diffused tribe; and *Cynareæ*, including the thistles.

The *Compositæ* may be regarded, especially from a consideration of their flowers, as the highest order in a scale of vegetable evolution. Their peculiarly efficacious methods of pollination, this process being simplified by the close set florets which permit of insect-fertilization or wind pollination, and by a peculiar action of the style which in the individual flower pushes itself in the way of wind or insect. Dissemination also is highly developed, there being three prominent types, the plumose pappus, as in dandelion and thistle, which is wind-sown; the hooked achenes, as in the burdock and tickseed, which fastens to passing animals, and the gummy seeds of other plants, which are dispersal adaptations. On the order in general consult Bentham, 'On the Classification, History, and Geographical Distribution of the Compositæ' (1873).

Composite Order, a term denoting the last of the five orders of architecture. As its name implies, it is composed of two orders, the Corinthian and the Ionic. Its capital is a vase with two tiers of acanthus leaves, like the Corinthian; but, instead of stalks, the shoots appear small, and adhere to the vase, bending round toward the middle of the face of the capital; the vase is terminated by a fillet, over which is an astragal crowned by an ovolo. The volutes roll themselves over the ovolo, to meet the tops or the upper row of leaves, whereon they seem to rest. The corners of the abacus are supported by an acanthus leaf bent upward; and the abacus itself resembles that of the Corinthian capital. In detail, the Composite is richer than the Corinthian, but it is less light and delicate in its proportions. Its architrave has only two fasciæ, and the cornice varies from the Corinthian in having double modillions. The column is 10 diameters high. The principal ancient examples of this order are the temple of Bacchus at Rome, the arch of Septimius Severus, that of Titus, and the baths of Diocletian.

Composition of Forces and Motions. See MECHANICS.

Com'post, any mixture of decomposed organic matter with earth, used as a fertilizing compound, or as a prepared soil in which to grow plants. Such mixtures are of small importance to the farmer, but to the trucker and florist they are indispensable. They are most frequently made by alternating layers of sods and stable manure in piles three or four feet thick and sprinkling them with lime, kainit, and some potash salt, such as the sulphate or muriate. After several weeks, during which they are kept moist by applications of water or, better, liquid manure, they are cut with a spade and turned over to form a new heap in which the various substances are mixed as much as possible. They may be turned several times to insure the decay of the various organic materials. By varying the proportions of manure and fertilizer to soil and organic matter composts may be obtained suitable for various purposes; rich ones for succulent crops and less rich for plants that must be kept stocky. In a general way the term compost is also used for any heap of decaying vegetable or animal matter which is to be used as a manure. Thus stable manure and litter become compost heaps; also the piles of leaves, etc., from which leaf mold is obtained for greenhouse use. Directions for making composts for particular kinds of plants may be found in all books on gardening, floriculture, etc., and many of the works dealing with manures and manuring also devote space to composting. See MANURES AND MANURING.

Compostella, kōm-pōs-tā'la, **Order of St. James of,** an order of Spanish knights formed in the 12th century to protect the Christian pilgrims who had flocked in vast numbers to Santiago de Compostella, in Spain, where the relics of St. James the Great were preserved. At first there were but 13 members of the order, but it grew rapidly in numbers, and they became not only strong defenders of the relics of their patron, but defenders of Christianity against the invasion of the Moors. In time this order attained great wealth, thereby exciting the jealousy of the crown, which succeeded in securing the grand-mastership in 1522, after which the order rapidly declined.

Compound Alcohol, rectified spirits to which has been added one or more flavoring ingredients. They are called also compounds. The chief compounds are gin, British rum, British brandy, and some grades of American whiskey, cordials, and liqueurs, such as curaçao, lovage, cherry brandy, noyeau, rum shrub, etc., are also denominated compounds. These are prepared by adding to clean rectified spirits various essences or oils, and sweetening with sugar or syrup. Sweetened compounds usually contain from 20 to 35 per cent of proof spirit.

Compound Ammonias, or Amines, a large and very important class of bodies derived from ammonia by replacement of the hydrogen with an organic radical. They are termed primary, secondary, or tertiary, according as one third, two thirds, or the whole of the hydrogen is replaced by an organic radical.

They are all basic in function, combining with acids to form crystalline salts. They have an alkaline reaction, and some are volatile and pungent. They are of great importance in the investigation of the constitution of various organic bodies.

Compound Animal. See COLONIAL ANIMALS.

Compound Steam-engine, a form of steam-engine originally patented by Hornblower in 1781, in which steam at a relatively greater pressure was allowed to expand in a small cylinder, and then, escaping into a larger cylinder, to expand itself against a larger piston. Compound engines are of two classes, which may be called compound and independent compound engines. The former are those in which the cylinders are near each other, and the pistons commence their respective strokes simultaneously, or nearly so, the steam expanding from one cylinder direct to the other through as small a passage as convenient. To this class belong most land engines, and the compound marine-engines with cranks at about 130°.

Compounding a Felony, the act of accepting from a felon, by the person aggrieved, a return of the goods, a consideration, or a reward, on the express condition that he will not prosecute the felon. The mere failure to prosecute a person committing a crime is not, even if the goods are returned, compounding a felony; but the essence of the action is the agreement not to prosecute, for a consideration of any kind,— and the return of the goods is a sufficient consideration. The person aiding the felon is an accessory to the crime and can be prosecuted, although the person committing the crime has never been tried. In English law, to advertise a reward for the return of stolen goods renders the advertiser liable to a fine of $250.

Compressed Air. Early inventors and experimenters found the air a most prolific medium for producing effects of various grades of utility. Hero of Alexandria a century before Christ wrote on this subject. He put into practical application an invention for opening and closing temple doors which was accomplished by the alternate rarefaction and condensation of air brought into contact with the heated and cooled surfaces of altar tops.

Elagabulus, a Roman emperor, in the beginning of the 3d century invented and used luxurious couches inflated by air. In the 16th century Galileo discovered the underlying principles of the power of air. Otto von Guericke of Madgeburg invented the air pump in 1654. In 1640 a system for compressing air was invented in Italy. It was called a trompe and was used for blowing forges. Air was compressed by means of falling water. About 1800 compressed air was first used for diving bells, and caisson work. Air pumps or compressors began to be developed about 1850. Since then they have undergone various changes in construction until to-day various enormous machines are built.

Air Compressors.— These machines consist of a metal cylinder; valves for inlet of free air, and for discharge of air being compressed; a piston for drawing in and discharging the air; a piston rod attached to the piston and connected to a crosshead connecting rod; crank shaft and means of driving. They are actuated by steam, water wheel, electricity, gas engine, etc.

An air compressor produces air under pressure from one pound to the square inch up to 3,000 pounds or more. The usual working pressure ranges from 50 to 100 pounds a square inch.

The air is forced from the cylinder into a storage tank called a receiver, where it accumulates pressure up to the desired point, and is regulated by checks, valves, and other devices for controlling and transmitting power. Air under pressure is called compressed air, and is simply air increased in density by pressure or by heat. When under pressure it gives forth power, moves the piston of an engine or drives objects before it. Air when being compressed becomes heated owing to the friction of the air upon itself. When compressed rapidly and under high pressures the temperature rises as high as 500° above zero. This necessitates the cooling of the cylinder of the air compressor by what is known as a water jacket, which is a means of circulating water in the walls of the cylinder. Hence we have for a working compressed air plant, an air compressor, air receiver, and piping for the air to travel in to the point where it is used.

The use of compressed air is of great importance. It is employed on locomotives, in ship-building, railroad shops, manufactories, waterworks, mines, quarries, tunneling and bridge-building, for glass-blowing, forging, foundry work, structural iron erection in residences, offices and various other industrial and domestic plants.

Some of the Important Uses of Compressed Air Showing Requirements, Volumes, and Pressures.— An air lift pump outfit consists of an air compressor, air receiver, air and water piping for the well and the devices in the well for properly applying compressed air. Pressure required, 80 pounds per square inch; volume, contingent.

Carrier system in stores.— Air compressor, receiver, tubing from cashier to various stations. Receiver approximately, 4′ by 8′. Pressure, minimum, six pounds; maximum, nine pounds.

Pneumatic hammer for chipping, caulking, flue beading.— Air compressor, air receiver, piping hose and hammer. Pressure, 80 pounds; volume, 10 to 14 cubic feet per minute.

Rivetting hammer.— Air compressor, air receiver, piping and tool. Pressure, 85 pounds; volume, 16 to 23 cubic feet per minute.

Drilling machines for iron and wood.— Air compressor, air receiver, piping and drill. Pressure. 80 pounds; 16 to 35 cubic feet per minute.

Foundry rammer.— Air compressor, air receiver, piping and rammer. Pressure, 60 to 90 pounds per square inch; volume, 11 to 25 cubic feet per minute.

Rock drill.— Air compressor, air receiver, piping and rock drill. Pressure, 75 pounds; volume, 35 cubic feet of air per minute, and upward.

Beer pumping.— Air compressor, receiver, piping. Pressure, 15 pounds; volume, contingent.

Sand blast.— Air compressor, receiver, piping, and sand blast machine or mixer. Pressure, 20 pounds; volume contingent.

Cleaning nozzles.— Air compressor, receiver, piping and nozzles. Pressure, 80 pounds; volume contingent.

Painting machine.— Air compressor, receiver, piping and paint spraying machine. Pressure, 80 pounds; volume, contingent.

Air hoists.— Cylinder or motor, for lifting 15,000 pounds. Air compressor, receiver, piping, and appliance. Pressure, 80 pounds; volume, 1 to 35 cubic feet per minute.

House-cleaning renovator.— Air compressor, receiver, piping and renovator. Pressure, 80 pounds; volume, 20 cubic feet per minute.

Lifting jacks or elevators.— Air compressor, receiver, piping and apparatus. Pressure, 80 pounds per square inch; volume, 1 to 35 cubic feet of air per minute.

The above give an idea of the range of usefulness of compressed air.

OTHER USES.

Torpedo boats
Vulcanizing wood.
Welding.

Compressed Air for Operating Street Cars.— Experiments were made in New York (1899–1900), on the 28th and 29th Street lines for operating street cars by compressed air. Air under 3,000 pounds pressure to the square inch was stored in long flasks of steel placed under the seats and cars. It was passed out through a reducing valve and after being reheated went into a motor built along the lines of a steam engine. The operation was controlled by valves on the platform. These cars ran for over a year but were abandoned.

Liquid Air.—Air is compressed to 1,200 to 2,000 pounds to the square inch; passed into receptacles where it is purified by separating the moisture, oil, etc.; and passed thence into expansion chambers and through coils of pipe of considerable length. During this process it becomes intensely cold, reaching finally 312° below zero, at which point it becomes liquid. It is drawn off into insulated vessels, where it remains for days at a time, lessening in quantity until it evaporates entirely.

ANDREW E. KENNEY.

Compromise of 1820, in American political history, a national law enacted by Congress 6 March 1820. In 1819 the territory of Missouri, with a population of 60,000, demanded admission into the Union as a slave State. Arkansas was preparing to make similar demands. Such action would have given the South the balance of power in Congress, and the North made this a national issue. The North controlled the House of Representatives, while the South controlled the Senate. A deadlock was inevitable, and a party of compromise sprang up, which succeeded in producing a temporary arrangement acceptable to both parties. This was the compromise of 1820. It divided the Louisiana Purchase between freedom and slavery by a line drawn at 36° 30′ N. lat. See UNITED STATES — ABOLITION AND THE FREE SOIL MOVEMENT.

Compromise of 1833. This was Henry Clay's tariff compromise, to prevent Civil War on account of nullification by South Carolina. The tariff of 1828 was regarded by the South as very injurious and inequitable, raising its expenses and reducing its income, and laying burdens upon it without compensating advantages. The tariff was borne in the hope that Jackson, a southern man, would throw his influence against it, but when he signed the amended act of 1832, leaving the duties much as they were, South Carolina took the lead in revolt. On 19 Nov. 1832, a convention called by its legislature, declared the act of 1828 and its amendments null and void, forbade its enforcement in the State or appeal to the supreme court regarding it, and decreed secession in case the United States should attempt to use force. On 4 Dec. 1832, Jackson's annual message mildly criticised the tariff as overgrown and needing gradual retrenchment to a revenue basis, and apologized for the popular resistance, which he thought the laws adequate to suppress. The nullifiers and their opponents alike thought he had surrendered to the former as in the Cherokee case (see CHEROKEE NATION *v.* GEORGIA); but on the 10th, apparently from a sudden shift of emotional feeling, he issued a powerful proclamation against them, characterizing nullification as an absurdity "incompatible with the existence of the Union," and declaring that it would be resisted by the entire national force. There was great enthusiasm throughout the North, and general approval even in the South, but South Carolina returned a defiant counter-proclamation, and Calhoun resigned the vice-presidency, to be immediately returned to the Senate as the champion of nullification. To remove the grievance the House Committee of Ways and Means on the 27th reported the Verplanck Bill, reducing the tariff within two years to the standard of 1816, the primitive basis. But the President, angered by the new South Carolina threat, asked for a bill to enforce the law by military power, and extend Federal jurisdiction over revenue cases — called by the people the Force Bill, and by the South Carolinians the "Bloody Bill." All parties were perplexed and unable to act. South Carolina had relied on Southern support, which was not forthcoming; the House could not agree on the Verplanck Bill nor the Senate on the Force Bill. On 12 February, 20 days before final adjournment of the 22d Congress, Clay undertook a compromise. He introduced a bill into the Senate which reduced the duties to a general 20 per cent by a sliding scale to end in 1842, enlarged the free list, etc. Clay's assigned motive was, that without some such measure the protective system was likely to be abolished altogether, but not before there had been civil war, in which the South would not let South Carolina stand alone. A further motive was, that he dreaded to see Jackson made a virtual dictator with a large army in his hands, as none could tell what he might do with it. Calhoun, to men's great surprise, struck hands with Clay, though the pending Verplanck Bill was a far greater relief to the South. But Calhoun was far more anxious for a triumph of nullification, and the consequent mastery by the

COMPRESSED AIR INDUSTRIAL LOCOMOTIVE FOR SURFACE USE.

South of her own destinies, than for mere lightening of material burdens, and the compromise bill would be notoriously a concession wrung from the North by the threat of nullification, while the Verplanck Bill, even if passed (which was dubious), would be only a bill like another. The compromise bill was referred to a select committee with Clay for chairman. The manufacturers' lobby insisted on amendments, of which the chief was very obnoxious to the South — that for computing *ad valorem* duties on the basis of valuation at the home ports. As they made this an ultimatum, Clay supported it in the Senate, while Calhoun denounced it as both oppressive to the South and unconstitutional. Finally Clayton of Delaware, a strong Protectionist, threatened for his party to lay the whole on the table unless the Calhounists and their leader voted for the amendment, which they did. Meantime the Force Bill had passed the Senate; and Clay urged it to pass the compromise tariff bill also, so that the bill for violence should have that for harmony to counteract it. The objection was raised that the bill was one to raise revenue, and could not originate in the Senate. This was met by the shrewd device of moving the House to strike out all but the enacting clause of the Verplanck Bill and substitute Clay's bill, and send it to the Senate for concurrence — which it did the next day, 119 to 85, and the Senate adopted it, 29 to 16. South Carolina, which had appointed 1 February for the nullification ordinance to go into effect, repealed it, and the country hailed it as a great deliverance. Clay himself later confessed, however, that he doubted whether he had done wisely. The nullifiers denied that they had abandoned a jot of their contention; hailed the result as a proof that it was the only means by which the South could obtain justice; and professed to have postponed the date of its operation only out of friendship to Virginia, which sent a commissioner to deprecate it. It is certain that the South won both the material and the moral fruits of the victory. Consult Schurz, 'Life of Henry Clay,' Vol. II., chap. xiv.; also other lives of Clay, and biographies of Jackson and Calhoun.

Compromise of 1850. The Missouri Compromise of 1820 (q.v.) had divided the Louisiana Purchase between free and slave territory at 36° 30′ (the general boundary between Arkansas and Missouri), except that Missouri was to be slave. The extreme pro-slavery members, about one fifth of the House and one fourth of the Senate, based their opposition on the ground that Congress had no power to legislate on slaveholding in the Territories, it being a fundamental right implied in the Constitution; but the majority admitted the jurisdiction by passing the bill. The joint resolution for admitting Texas in 1845 extended the same line to any new bodies formed out of that State; and was supported by the most ultra slavery men, as taking the merest sliver from them and securing solidly the enormous remainder. When the Mexican war seemed likely to add new territory, the Wilmot Proviso (q.v.) of 8 Aug. 1846, attempted to bar slaveholding from it, as did existing Mexican law; and the struggle to prevent this transformed political parties. After the annexation had taken place, 2 Feb. 1848, bills for organizing the Territories of New Mexico and California were introduced: at first in an omnibus bill with Oregon (the Clayton Compromise), to force all of them to permit slaveholding, then to extend the Missouri compromise line to the Pacific (including in slave territory nearly all the present New Mexico and Arizona, and the entire southern half of California); then the Democratic Senate receded from the Oregon "hold-up," and the House repeatedly attempted to organize the other bodies as territories with the proviso; while the Senate regularly killed the bills, and once attempted to attach its own as rider to an appropriation bill. This went on till the end of 1849, when the gold discoveries in California forced the hand of both the Southern slavery party and its Northern allies. The immense immigrant population there formed a constitution prohibiting slavery, and demanded admission of California as a State. Even the deniers of the right of Congress to legislate on slavery had always admitted that the people of a State had the right to live under any constitution they pleased; and the Democrats, to hold their vote in North and South, now took the position that the inhabitants of an inchoate State should be allowed to decide their own destinies. As this meant the immediate reinforcement and ultimate supremacy of the free States, the Southern Whigs and Democrats began to draw together, and formulated the doctrine that the people of a Territory had no right to exclude the industrial or social system of any part of the Union; that Congress should force them to rescind such exclusion if made; and that the exclusion, if permitted, was a wrong which justified secession. But California was not a Territory: it was a body of unorganized settlers who would come in as a State from the first, and certainly could be admitted by Congress on their own terms. The Southern leaders, therefore, resolved that they should not be admitted except by passing through the territorial stage, so as to come under the congressional prohibition. Zachary Taylor, a slaveholder, but a moderate and just-minded man, had been inaugurated as President in March 1849, and his first congress met in December. The Senate had a large Democratic majority; the House was so evenly divided that the few Free-Soilers held the balance, and it required 63 ballots and three weeks to elect a speaker, Howell Cobb of Georgia. On their meeting Taylor had sent a message recommending California's wish to become a State, to their favorable consideration; on 21 Jan. 1850, he sent a special message, declaring that the people would not sustain them in denying the Californians the right of self-government. The South, nevertheless, was passionately determined not to yield; and Henry Clay undertook one of the great compromises which were the pride of his life, the shortest-lived and most destructive compromise in American history. The difficulty was to find anything that either side wanted badly enough to take as a price for yielding. For the South, this was found in the Fugitive Slave Law (q.v.), which Alexander H. Stephens declared to be the very essence and heart of the whole compromise, and the breach of which by the Northern personal-liberty laws was accounted the crowning justification of secession; and in a money indemnity to Texas for abandoning her claim to the Rio Grande as a western boundary, which that State was ready to fight for, but the payment for

which would raise the market value of her bonds, largely held in the South. For the North, it was found in the admission of California as a free State, and the prohibition of the slave-trade in the District of Columbia — the latter a mere sop, as slavery was not abolished in the District. The sacrifices were, that the South gave up the right of insisting that no free State should be admitted into the Union except as paired with a slave State, and so in her own view gave the North the fruits of the Mexican war; the North gave up the proviso, and the right of stopping the interstate slave trade, though this was later stricken out. On 16 January a bill had been brought into the Senate to organize "the Territories of California, Deseret [Utah], and New Mexico"; on the 29th Clay unfolded his compromise, in eight resolutions: (1) admitting California with her free-State Constitution; (2) organizing the remainder of the newly acquired lands as territories, without restriction as to slavery, as it "did not exist [there] by law, and was not likely to be introduced," — merely staving off the question till they formed State governments; (3, 4) annulling Texas' claim to New Mexico, but paying her a blank indemnity; (5, 6) non-abolition of slavery in the District of Columbia without the consent of Maryland, but prohibition of the slave trade in it; (7) a more effectual fugitive slave law; (8) non-interference with the interstate slave trade. Clay said that the question with the South was one of interests, with the North one of sentiment, and the latter was easier to sacrifice than the former. The northern members and their constituents did not agree to this, nor did the South as to the equivalents; and after two months' debate the question was referred to a compromise committee of 13, of which Clay was chairman. On 8 May it reported a bill of four parts, known in history as the Omnibus Bill (*par excellence*, for there have been others), to be passed or rejected as a whole. The essential changes were, that New Mexico and Utah were forbidden to pass laws respecting slavery, that California should not be admitted unless this were granted, that the blank for the Texas indemnity should be filled with $10,000,000, and that no mention was made of the interstate slave trade. It will be observed that the gains in this revised "compromise" were pretty much all by the South. The bill of course embodied the specific legislation needed to make the resolutions effective. Part 1 consisted of the provisions for admitting California, New Mexico, and Utah, and indemnifying Texas; Parts 2 and 3 were the Fugitive Slave Law of history; Part 4 the provisions about the District of Columbia. This bill was stormily debated for nearly three months more, until 31 July, and amended until one item only was left, that admitting Utah, which passed the next day. Meantime Texas was arming and threatening war, and other States proposing to aid it; and Congress saw that the bills must be passed in some shape. The items were therefore voted on as separate bills, and all passed in Clay's form: Texas bill — Senate, 10 August, 30 to 20; House, 4 September, 108 to 97. California — Senate, 13 August, 34 to 18; House, 7 September, 150 to 56. New Mexico — Senate, 14 August, 27 to 10; House (together with the Texas bill), 4 September, 108 to 97. Fugitive Slave Bill — Senate, 23 August, 27 to 12; House, 12 September, 109 to 75; District of Columbia — Senate, 14 September, 33 to 19; House, 17 September, 124 to 47. The Fugitive Slave Law, the vital part of the compromise, was also its assured ruin, as it gradually turned the entire North into abolitionists; but the immediate cause of its collapse was the Kansas-Nebraska Bill (q.v.), which repealed not only the Missouri Compromise, but the present compromise which practically reaffirmed that. Consult: Von Holst, 'Constitutional History of the United States,' Vol. III.; Benton, 'Debates of Congress'; Stephens, 'War between the States,' Vol. II.; and lives of Clay.

Compromises of the Constitution. See CONSTITUTION, FORMATION OF THE.

Compsognathus, kŏmp-sŏg'nā-thŭs, a genus of carnivorous dinosaurs (see DINOSAURIA) of the Jurassic Period, of very small size, hardly larger than a domestic cat, and slenderly proportioned. A very perfectly preserved skeleton has been found in the lithographic limestone of Solenhofen in Bavaria.

Comp'ton, Alfred George, American teacher: b. London, Eng., 1 Feb. 1835. He graduated at the College of the City of New York in 1853, and since then has taught chiefly mathematics. At present (1903) he holds the chair of physics in the College of the City of New York. He has written: 'A Manual of Logarithmetic Computation' (1881); 'First Lessons in Wood-working'; 'First Lessons in Metal-working' (1890); with De Groodt, 'The Speed-lathe' (1898); and 'Some Common Errors of Speech' (1898).

Compton, Henry, English bishop: b. Compton, Wynyates, 1632; d. Fulham 7 July 1713. He was the youngest son of Spencer, second earl of Northampton, studied at Oxford, and after the Restoration became a cornet in a regiment of horse. Afterward he left the army for the Church, became bishop of Oxford in 1674, and bishop of London in 1675. Charles II. made him a member of his privy council, and intrusted to him the education of his nieces Mary and Anne. He was distinguished for his hostility to the Roman Catholic Church. After the accession of James II., Dr. Sharp, rector of St.-Giles'-in-the-Fields, having become highly obnoxious to the court, Compton was required by a royal order to suspend him. His refusal to obey was made the ground of his own suspension. He was restored to his see at the time of the Revolution, and, together with the bishop of Bristol, made up the majority of two in the house of lords for filling the vacant throne. He performed the ceremony of the coronation of William and Mary, and was afterward appointed one of the commissioners for revising the liturgy. During the reign of Anne he was put on the commission for the union of England and Scotland. The reconciliation of dissenters with the Church of England was one of his favorite projects.

Compton, Herbert Eastwick, English novelist and miscellaneous writer: b. 16 Nov. 1853. He was educated at Marlborough College, and has traveled extensively. He has published: 'The Dead Man's Gift' (1890); 'A Master Mariner' (1891); 'Military Adventures of Hindustan' (1892); 'A King's Hussar' (1893); 'A Free Lance in a Far Land' (1894); 'The Inimitable Mrs. Massingham' (1900);

'The Ashanti War'; 'A Fury in White Velvet' (1901); 'Facts and Phantasies of a Foliogrub' (1902).

Compulsory Arbitration. See NEW ZEALAND.

Compurga'tion, a mode of defense allowed by the Anglo-Saxon law in England, and common to most of the Teutonic tribes. The accused was permitted to call a certain number (usually 12) of men, called compurgators, who joined their oaths to his in testimony to his innocence. They were persons taken from the neighborhood, or otherwise known to the accused, and acted rather in the character of jurymen than that of witnesses, for they swore to their belief, not to what they knew; that is, on the accused making oath of his innocence they swore that they believed he was speaking the truth. Compurgation in the ecclesiastical courts was not abolished till the reign of Elizabeth. Consult Blackstone, 'Commentaries on the Laws of England'; Pollock and Maitland, 'History of English Law.'

Comstock, Anthony, American reformer: b. New Canaan, Conn., 7 March 1844. In 1863 he enlisted in the 17th Connecticut regiment, served under Gen. Gilmore, and was mustered out in July 1865. In March 1873 he became secretary and special agent of the New York Society for the Suppression of Vice, and has completely identified himself with its work. It is said that largely through his special efforts 2,500 criminals have been brought to justice, and over 80 tons of indecent literature and pictures have been seized and destroyed. He has written: 'Frauds Exposed; How the People are Deceived . . . and Youth Corrupted' (1880), an exposure of various schemes operated through the mails; 'Traps for the Young' (1883); 'Gambling Outrages; or, Improving the Breed of Horses at the Expense of the Public Morals' (1887), and minor tracts for the furtherance of his work.

Comstock, kŭm'stŏk, **Cyrus Ballou,** American soldier: b. West Wrentham, Mass., 3 Feb. 1831. He graduated at West Point 1855, was chief engineer of the Army of the Potomac 1862–3, and attained the brevet rank of major-general of volunteers 26 March 1865, having been successively promoted for gallant, faithful, and meritorious services. He was later president of the Mississippi River Commission, and a member of the permanent board of engineers for fortifications. He was retired in 1895 as brigadier-general in the regular army. He wrote: 'Notes on European Surveys' (1876); 'Survey of the Northwestern Lakes' (1877); 'Primary Triangulation, United States Lake Survey' (1882).

Comstock, George Cary, American astronomer: b. Madison, Wis., 12 Feb. 1855. He graduated at the University of Michigan 1877 and from the law department of the University of Wisconsin 1883. He practised law for a time, but later devoted himself entirely to astronomy, and is now (1903) professor of that subject and director of the Washburn Observatory in the University of Wisconsin. He is a member of the National Academy of Sciences. He has written: 'Text-book of Astronomy' (1901); 'Text-book of Field Astronomy for Engineers' (1902).

Comstock, John Henry, American entomologist: b. Janesville, Wis., 24 Feb. 1849. He graduated at Cornell University 1874; was United States entomologist at Washington, D. C., 1879–81, and since that date has been instructor and professor of entomology and general invertebrate zoology at Cornell. He has been a constant contributor to the literature of his subject, the following being the more important of his works in book form: 'Report on Cotton Insects' (1879); 'Introduction to Entomology' (1888); 'Manual for the Study of Insects'; 'Insect Life' (new ed. 1901); and 'Elements of Insect Anatomy' (3d ed. 1903), (with Kellogg).

Comstock, John Lee, American writer on physics; b. Lyme, Conn, 1789; d Hartford, Conn., 21 Nov. 1858. He received a common-school education, studied medicine, and during the War of 1812 was assistant surgeon at Fort Trumbull, Conn., and on the northern frontier. He settled in Hartford, Conn., practised medicine until 1830, when he became an author by profession, and attained remarkable success in the compilation of text-books for educational purposes. His 'Introduction to Mineralogy' (1832) was used at West Point; of the 'Elements of Chemistry' over 250,000 copies were sold; while the 'System of Natural Philosophy' (1831) had a sale of over 900,000 copies (94th ed. N. Y. 1847), and was translated into the chief European languages. Others were: 'History of the Greek Revolution' (1828); 'History of the Precious Metals' (1849); 'Natural History of Quadrupeds' (1829); 'Grammar of Chemistry' (1825); 'Introduction to Botany' (3d ed. 1835).

Comstock, Theodore Bryant, American geologist: b. Cuyahoga Falls, Ohio, 27 July 1849. He graduated at Pennsylvania State College 1868, and at Cornell 1870, where he was professor of economic geology 1875–9. He accompanied Hartt's expedition to Brazil 1870, and Jones' Wyoming expedition 1873. He was professor of mining engineering and physics in the University of Illinois 1885–9, and assistant State geologist of Arkansas 1887–8, and of Texas 1889–91. He founded the Arizona School of Mines, was its director 1891–5, and president of the University of Arizona 1893–5. He has been manager, engineer, and consulting expert to many mining companies and syndicates, both American and foreign. He has published: 'Outline of General Geology' (1878); 'Classification of Rocks' (1877); 'Notes on the Geology of the San Juan Country' (1882); 'The Geology and Vein Structure of Southwestern Colorado' (1886); the last two in the 'Transactions' of the American Institute of Mining Engineers; and numerous papers in the 'American Journal of Science'; 'American Naturalist'; and 'Engineering and Mining Journal.'

Comstock Lode, a remarkable vein carrying silver sulphides with some native silver and considerable native gold, near Virginia City, Nev. The wide vein is a faulted fissure following the contact of a basaltic dike with the andesite country rock, the latter of Tertiary age. The gangue is mainly quartz. The ores are of recent origin, and the waters ascending along the fissure are hot, making mining costly. Some wonderfully rich ore bodies, «bonanzas,» were found in certain of the mines along the

lode, and the history of its discovery, the great mining speculations based on it, and the final abandonment of nearly all the mines, reads like a romance. At present the deepest shaft on the lode is being reopened. The total yield of the lode from its discovery in 1859 up to July 1880 was over $306,000,000.

Comte, François Charles Louis, frăṅ-swā shärl loo-ē kôṅt, French writer on politics and jurisprudence: b. St. Enimie, department of Lozère, 1782; d. 1837. In 1814 he united with Dunoyer in starting a journal, called 'Le Censeur,' in which the adherents, both of Napoleon and the Bourbons, were roughly handled. On the second restoration of the Bourbons judicial proceedings were taken against the 'Censeur,' and the editors were fined and imprisoned. In 1819 Comte converted his journal into a daily newspaper, under the name of 'Le Censeur Européen,' and shortly after amalgamated it with the 'Courrier Français.' In 1821 a new prosecution condemned him to two months' imprisonment and a fine of 2,000 francs. He then went to Geneva, where he obtained a chair of public law, and taught with great success till the Helvetic Diet, in consequence of diplomatic complaints, found it necessary to refuse him an asylum. The work by which his name will be best known to posterity is his 'Traité de Législation Criminelle' (1827).

Comte, Isidore Auguste Marie François (ē-zä-dōr ôg-üst mä-rē frăn-swä), **Xavier,** French philosopher, founder of the "positive" system of philosophy: b. Montpellier 12 Jan. 1798; d. Paris 5 Sept. 1857. He was educated at the École Polytechnique, and embraced enthusiastically the socialist tenets of St. Simon, which became greatly in vogue in France after the Restoration. As one of his most distinguished pupils, he was employed, in 1820, to draw up a formula of the doctrines professed by the St. Simonian school, which he accordingly accomplished in his 'Système de Politique Positive.' This work did not, however, meet with the entire approbation of St. Simon, who asserted that Comte had made a very important omission by overlooking the religious or sentimental part of human nature. In 1826 he began lecturing on mathematics, and had for an audience such men as Humboldt, Blainville, Carnot, etc. In 1830 he began the publication of his 'Cours de Philosophie Positive,' completed in six volumes in 1842, and freely translated into English and condensed by Harriet Martineau (2 vols. 1853). The following is an abstract of the philosophical system propounded by Comte in that work. It consists of three leading positions. The first is, that the human mind in its progress, historically and individually, passes through three stages of development: (1) The theological, in which all the phenomena of nature are imputed to the active agency of the gods. (2) The metaphysical, in which the gods are supplanted by certain abstractions called "nature," "harmony," "number," etc. (3) The positive or scientific, in which it is discerned that man can know nothing of causes, and is only able to refer phenomena to their general laws of existence or succession. Arrived at this stage, science is born, and knowledge, no longer baffled by the inscrutable or misled by the imaginary, advances from one generalization to another, to a comprehensive perception of the universe as a whole. The second position is, that in this advance the mind proceeds in a regular hierarchical order, from the simple to the complex, or from the most elementary relations of numbers to the highest and deepest complications of society and life. The hierarchical order of the sciences is arranged by Comte as follows: 1. The most general and simple of all, dealing only with numbers and magnitudes — mathematics. 2. The application of the principles of mathematics to the phenomena of the celestial sphere, or astronomy. 3. The application of mathematics and astronomy to the phenomena of the terrestrial sphere or general physics, including heat, light, optics, electricity, etc. 4. The science of the phenomena of individually organized being, or vegetable and animal life, termed biology. 5. The science of the phenomena of corporate or social life, which he terms *sociology,* and which, as presupposing and containing all the former, he represents as the essence and perfection of all the sciences. The third position lays down the laws and principles which regulate social life, constituting order and liberty. The first element of order is the family; the second the community, composed, not of individuals, but of families, and co-operating, to a certain extent, in their employment; and the third, the government or state. Liberty is the effect of this harmonious organization, and progress the development of it, by the conquest (1) of material nature; (2) of the lower propensities by the higher intellectual faculties; and lastly, of the selfish passions by the noblest social affections. In 1832 he became one of the professors at the École Polytechnique. In 1843 he published a mathematical work, 'Traité Élémentaire de Géometrie Analytique,' and in 1848 'Discours sur l'Ensemble du Positivisme,' in which the doctrines laid down in his previous work are recapitulated. But some change had, in the interval, taken place in Comte's views. The death of a lady, whom he calls Clotilde, and for whom he had conceived the most ardent affection, impressed his mind deeply with the conviction that something more than a mere material array of facts was needed to satisfy the cravings of the human soul. The religious tendencies of the heart had been hitherto wholly overlooked by him, and he now perceived the necessity of presenting some object to supply this want. He invented a religion which consists in referring the whole harmony of existence to, and concentrating its essence in one great Being, whom he termed Humanity. As manifestations and representatives of this Being, he maintained that the proper objects of worship are those who have shown themselves the greatest benefactors to the human race — in fact, a hero-worship. This system is propounded by him in a book published in 1849, entitled 'Culte Systematique de l'Humanite Calendrier Positiviste, ou Système Général de Commemoration Publique,' in which he has drawn up a regular calendar of demigods, presiding over the months, weeks, and days of the year, and having each their appropriate festivals. The 13 months into which he divided the year, he called Moses, Homer, Aristotle, Archimedes, Cæsar, St. Paul, Charlemagne, Dante, Gutenberg, Shakespeare, Descartes, Frederick, and Bichat. He assumed the office of high priest of this new religion, performing marriage and

funeral rites on behalf of the disciples induced to adopt his system. These, however, were never very numerous, and by the time of his death had nearly all dropped off one after another. The last work published by him was entitled 'Système de Politique Positive, ou Traité de Sociologie, instituant la Religion de l'Humanité,' (1851–2). However extravagant many of Comte's theories may appear to be, they nevertheless display in their enunciation a powerful intellect with much universality and comprehensiveness of knowledge. Many new and original ideas are brought forward, and much matter afforded for thought and reflection. His works have been made known to English readers mainly by Mr. G. H. Lewes, 'Comte's Philosophy of the Sciences,' and Miss Martineau's translation above mentioned. See POSITIVISM.

Bibliography.— Robinet, 'Notice sur lœvure et sur la vie de Comte' (1860); Mill, 'Comte and Positivism' (1865); Fiske, 'Outlines of Asmic Philosophy' (1st vol. 1874); Littre, 'Auguste Comte et la Philosophie Positive' (1877); Caird, 'The Social Philosophy and Religion of Comte' (1885); Gruber, 'Auguste Comte, sein Leben und Seine Lehre' (1889).

Comte, Pierre Charles, pē-ār shärl, French painter: b. Lyons 23 April 1823; d. 1895. He studied at Paris as a pupil of Robert Fleury, and exhibited his picture 'Lady Jane Grey,' in 1847, which won him considerable attention. His other works include: 'Henry III. Meeting the Duke of Guise'; 'Joan of Arc at the Coronation of Charles VII.'; 'A Scene at Fontainebleau' (at Washington, D. C.); 'Gipsies Before Louis XI.'; and 'The Last Visit of Charles V. to the Castle of Ghent.'

Comte de Paris, dė pä-rē. See PARIS, COMTE DE LOUIS PHILIPPE ALBERT D' ORLEANS.

Comus, kō'mŭs (Greek *kōmos*), in ancient Greece the name given to a kind of festal procession in honor of some of the gods (as Bacchus) and sometimes in honor of victors in the public games. The term had also the wider sense of revel and merry-making. This name was also given to a divinity supposed to preside over such festive occasions, but as his name does not occur in early ancient writers whose works have been preserved, he is evidently a creation of later times. He is first mentioned by Philostratus (about 200 A.D.).

Comus, a masque by John Milton, given before the Earl of Bridgewater at Ludlow Castle, Shropshire, England, 29 Sept. 1634. It was first printed in 1637. An altered version of it was played at Covent Garden Theatre, London, in 1773, and in 1901 it was played at Tufts College, Massachusetts, by the students of that institution.

Comyn, kŭm'ĭn, **John,** the elder, Scottish noble: d. about 1300. He was one of the commissioners sent to confer about the marriage of the Maid of Norway to Prince Edward of England. On the competition for the Scottish throne in 1291 Comyn put in a claim as a descendant of Donald Bane.

Comyn, John, Scottish noble: d. Dumfries 1306. He was called the "Red Comyn," was chosen one of the three guardians of Scotland, and defeated the English at Roslin in 1302. He submitted to Edward I. in 1304, and was killed by Bruce in the Convent of the Minorites at Dumfries in 1306, a well-known episode in the life of the great Scottish king.

Con, kŏn, an Italian preposition signifying with, and of frequent occurrence in musical phraseology; *con amore,* with feeling: *con brio,* brilliantly; *con gusto,* with taste, etc.

Conan'icut, an island of Rhode Island, situated in the lower part of Narragansett Bay. It is about nine miles long. The town of Jamestown is near the east shore, and there is a lighthouse at the north end.

Co'nant, Alban Jasper, American artist: b. Chelsea, Vt., 24 Sept. 1821. He settled in St. Louis in 1857, and during the Civil War visited Washington, and painted portraits of President Lincoln, Secretary Stanton, and Attorney-General Bates. He was a curator in the University of Missouri for eight years, and made valuable studies of the archæology and antiquities of the Mississippi Valley. In 1880 he was appointed Délégué Correspondant de l'Institution Ethnographique of Paris. He has published: 'Footprints of Vanished Races in the Mississippi Valley' (1879, 4to 1); 'The Archæology of the Missouri Valley'; 'My Acquaintance with Abraham Lincoln,' etc.

Conant, Charles Arthur, American economic writer: b. Winchester, Mass., 2 July 1861. He was for some years after 1880 a journalist in Boston, and in 1889 became the Washington correspondent of the 'New York Journal of Commerce.' He has published: 'A History of Modern Banks of Issue'; 'The United States in the Orient: the Nature of the Economic Problem' (1900); 'Alexander Hamilton'; 'Securities as Payment'; 'The Law of the Value of Money.'

Conant, Hannah O'Brien Chaplin, American author: b. Danvers, Mass., 1809; d. Brooklyn, N. Y., 18 Feb. 1865. In 1830 she married Thomas Jefferson Conant (q.v.). She was a woman of versatile talent, having an excellent knowledge of Oriental tongues, which enabled her to share in the biblical studies of her husband. She frequently contributed to the literary and religious periodicals of the day, and in 1838 became editor of the 'Mothers' Monthly Journal' at Utica, N. Y. She published: 'Lea: or the Baptism in the Jordan, by G. F. A. Strauss,' (1844); 'First Epistle of John Practically Explained, by A. Neander' (1852); 'The New England Theocracy, by H. F. Uhden' (1859), all translations from the German; 'The Earnest Man: Sketch of the Character and Labors of Dr. A. Judson' (1855); 'The English Bible: Popular History of the Translation of the Holy Scriptures into the English Tongue' (1856; English ed. 1859; new ed 1881).

Conant, Thomas, Canadian descriptive writer: b. Oshawa, Ont., 15 April 1842. He was educated in the public schools and at Eddystone Seminary in Geneva, N. Y., and has achieved distinction with brilliant sketches of scenery and articles on Canadian and other subjects. In 1896 he visited Australia, India, and the Orient.

Conant, Thomas Jefferson, American biblical scholar: b. Brandon, Vt., 13 Dec. 1802; d. Brooklyn, N. Y., 30 April 1891. He was graduated from Middlebury College in 1823,

and between 1825 and 1857 taught the classics and biblical literature in Columbia College, Waterville (now Colby) College, Maine, Madison, now Colgate, University, Hamilton, N. Y., and Rochester Theological Seminary. Taking up the studies that soon gave him a wide reputation, he was appointed by the American Bible Union one of a committee to prepare a revision of the English version of the New Testament. He was also a member of the American committee on the English revision of the Old Testament, and his versions were highly esteemed and constantly used by the English revisers. His numerous publications include translations of the 11th and 17th editions of Gesenius' 'Hebrew Grammar'; 'Job; Revised Version, and Notes' (1856); 'Matthew, Revised Version' (1860); 'Baptizein, Its Meaning and Use' (1860); 'Genesis, Revised Version' (1868; 1873); 'The New Testament; Common Version Revised' (1871); 'Psalms, Revised' (1871); 'Proverbs, Revised' (1872); 'Greek Text of the Apocalypse, as edited by Erasmus' (1873); 'Prophecies of Isaiah, Chapters 1–12' (1874); and 'Historical Books of the Old Testament, Joshua to II. Kings' (1884).

Cona'tion (from Lat. *conari*, to attempt), a term in its original sense used simply to express the idea or to designate the act of attempting or undertaking something. In present usage it is appropriated by psychologists to the expression of desire and volition as manifested in or constituting voluntary agency, although as a factor in consciousness and effort its precise implications appear not to have been finally determined. In the exertion of the muscles, and in direct conscious attention, the agency of conation in an individual finds its two representative aspects. Attention, desire, and endeavor, with their accompanying states of thought and feeling, are held by some psychologists to be the completing aspects of conation; while others maintain that its function is limited to the sensations of straining, with consequent states of consciousness, pleasurable or otherwise, attendant upon contraction of the muscles. Whether conation is to be regarded as simple or complex in its psychological aspects, remains therefore a question for further research and experiment. Consult: James, 'Principles of Psychology'; 'Experimental Psychology'; Scripture, 'The New Psychology'; Titchener, 'Outline of Psychology'; Hyslop, 'Syllabus of Psychology'; Stout, 'Analytic Psychology.'

Conaty, Thomas James, American Roman Catholic clergyman: b. Ireland 1 Aug. 1847. He was graduated at Montreal Theological School and ordained priest in 1872. From 1880 to 1897 he was pastor of the Church of the Sacred Heart and from 1893 to 1897 president of the Catholic Summer School. In 1896 he was made rector of the Catholic University of America, in Washington, D. C., and on 24 Nov. 1901 was consecrated titular bishop of Samos. In 1903 he was appointed Bishop of Los Angeles, California. He has published 'New Testament Studies' (1898), and lectured much on education.

Concan, kŏn'kăn, British India, a maritime subdivision in the presidency of Bombay. It consists of a long belt of seacoast, stretching from north to south for about 220 miles, with an average breadth of 35 miles, and bounded on the east by the Western Ghauts. It is divided into North and South Concan, and though the surface is much broken, contains many spots well adapted for cultivation. It contains the town of Bombay itself. Pop. over 3,000,000.

Concarneau, kôn-kär-nō, France, a seaport in the department of Finisterre, on an island in the bay of La Forêt, 12 miles southeast of Quimper. It has an extensive establishment for the rearing of fish, important sardine fisheries, and a harbor somewhat difficult of access, but with good anchorage for vessels of 500 tons. From 15,000 to 20,000 barrels of sardines are exported each year. Pop. 5,800.

Concave Lens, a lens ground so that it is thinnest in the centre, thick toward the edges. See LENS.

Concentra'tion, in chemistry, the act of increasing the strength of solutions. This is effected in different ways: by evaporating off the solvent, as is done in the separation of salt from sea-water; by distilling off the more volatile liquid, as in the rectification of spirit of wine; by the use of low temperatures, as in the purification of benzol; by difference of fusibility, as in Pattinson's process for desilverizing lead.

Concentration Camp, a camp into which non-combatants are gathered in time of war. During the Cuban rebellion of 1895–8 many peaceable and defenseless people were forced to abandon their homes in the agricultural regions and were imprisoned upon the barren waste outside the residence portions of the cities, and within the lines of entrenchment. It is estimated that at least 400,000 persons, mostly old men, women, and children were thus subjected to concentration under Weyler's administration. They were known as reconcentrados. The British also carried on a scheme of concentration of non-combatants during the Boer war, but those who were kept in the concentration camps were not subject to physical hardships such as disgraced the camps in Cuba. In the "appeal" issued by the Boer generals 25 Sept. 1902, thanks were tendered to those sympathizers who had rendered pecuniary and other assistance to Boer wives and children in the concentration camps. The British government expended about $1,000,000 per month on the burgher camps and stated that they were still maintained after the close of the war, "only in the cause of humanity." Provision was made at great expense in these camps for the education of the Boer children. The term concentration district may be applied to the rendezvous where troops are gathered during the process of mobilizing an army.

Concen'tric. Similar figures having a common centre are called concentric.

Concepción, kōn-thāp-thē-ōn' or kŏn-sĕp'-shŏn, Bolivia, a province of the department of Tarija, near the Argentine frontier and the San Juan and Vermejo rivers.

Concepción, Chile, a province lying between the provinces of Ñuble and Bio-bio. Area 3,532 square miles. It is divided into the departments of Coelemu, Puchacay, Rere, Concepción, Talcahuano, and Lautaro. The importance of its capital, its commercial activity, and its numerous ports make this the most interesting province in the south of Chile. Two of the

largest bays in the republic are on its coast, those of Talcahuano, which is defended by fortifications, and Arauco, which includes the ports of Lota and Coronel, notable for their coal mines. The city of Concepción is the capital. Talcahuano (15,500 inhabitants) is a military port, with a dry-dock for repairing warships and mercantile vessels, and at the same time an active commercial port. Products of the whole southern region are brought to it for exportation, and it supplies cities of the interior with a large part of their merchandise. The port of Tomé (5,000 inhabitants), situated near rich agricultural districts, exports a large quantity of wine and has a woolen mill, etc. Penco, a small port 10 miles by rail from the city of Concepción, is a favorite seaside resort and has a sugar refinery and coal mines in the neighborhood. The population of the province is 225,000.

Concepción, Chile, the capital of the province of the same name. It is situated on the banks of the Bio-bio River, and has a street-railway, theatre, electric lights, breweries, furniture, and carriage factories, saw-mills, flour-mills, distilleries, etc. It is in importance the third city of Chile. Pop. 55,000.

Concepción, Paraguay, also called Villa Concepción, the second city of the republic in commercial importance, though not in the number of its inhabitants. It is situated on the left bank of the Paraguay River, 213 kilometers from Asunción. It is a port of entry and delivery, where the steamers navigating the Upper Paraguay regularly touch. The principal buildings are the city hall, custom-house, parish church, market, and some fine private residences. It has a line of street-cars, telephone service, two banks, and several commercial houses that trade directly with Argentine and European cities. Yerba-maté and cattle are the principal items of the city's commerce. Pop. 13,654.

Concepción, Philippines, a former district of the island of Panay, now part of the province of Iloilo, situated on the northeast part of the island; area 683 square miles. The former capital, Concepcion, is a pueblo situated on the east coast of the island, 47 miles northeast of Iloilo; pop. 5,736. Pop of the district (1900) 19,342.

Concepción, Philippines, a town (pueblo) in Tarlac province in the island of Luzon, 12 miles south of the town of Tarlac. Pop. 13,499.

Concepción, a lake in the central portion of the department of Santa Cruz, Bolivia.

Conception, Immaculate, of the Blessed Virgin Mary, a dogma of the Roman Catholic Church, defined as such by Pope Pius IX. The purport of this definition is very commonly misapprehended, being understood to relate to the virginal motherhood of Mary: but the doctrine of the Roman Catholic Church, as expressed in the definition proclaimed by Pius IX. in his Letter Apostolic of 8 Dec. 1854 is that Mary «at the first instant of her conception was, by a singular privilege and grace of Almighty God, in virtue of the merits of Jesus Christ the Saviour of mankind, preserved immaculate from all stain of original sin.» This doctrine, though thus formally declared an article of Catholic belief only in the middle of the 19th century, had for many centuries been believed either explicitly or implicitly by saints and fathers of the Church. When at last the sense of all the bishops and all the churches of the Catholic communion with regard to this belief was elicited by a letter of Pius IX. addressed to them, the reply from the great majority of them was strongly in favor of a definition: yet a good many held it unwise to make the definition for the reason that neither in Scripture nor in Christian tradition could, as they thought, sufficiently clear intimations of it be found, or they doubted the wisdom of promulgating a definition at that time. Some of the bishops feared that a definition would alienate many minds outside of the Church that were favorably disposed toward the Catholic religion.

Conception of Our Lady, Sisters of the, an order of nuns, founded in Portugal in 1484 by Beatrix de Sylva, in honor of the Immaculate Conception. It was confirmed in 1489 by Pope Innocent VIII., and the Cistercian rule was adopted. In 1489 Cardinal Ximenes put the nuns under the direction of the Franciscans, and imposed on them the rule of Saint Clara. The order subsequently spread into Italy and France.

Conception. See EMBRYOLOGY.

Conceptualism, kŏn-sĕp'tū-ạl-ĭzm, in metaphysics, a doctrine in a sense intermediate between realism and nominalism. Conceptualism assigns to universals an existence which may be called logical or psychological, that is, independent of single objects, but dependent upon the mind of the thinking subject, in which they exist as notions or conceptions. See NOMINALISM; REALISM.

Concep'tualist, one of a metaphysical sect —if indeed it has coherence enough to be called a sect — which arose in the Middle Ages during the disputes between the Nominalists and the Realists; or one who holds the views of conceptualism. The conceptualist school sought to occupy an intermediate position, but it approximated much more nearly to the Nominalists than to the Realists. The conceptualists held that general ideas, such as genus, species, etc., were not merely names, but mental conceptions. The eminent metaphysician, John Locke (q.v.), held views essentially conceptualist.

Concert Pitch, the pitch of a certain note in the musical scale adhered to by the general body of musicians. The middle C (seated on the ledger-line which unites the G and F clefs) is produced by a string making, according to theorists, 512 vibrations per second. In England, however, the pitch has risen to 538, while in Germany it is 528, and in France 522. The gradual rise of the pitch from the theoretical 512 vibrations is attributed to the necessities of piano-tuning on the one hand, and the desire to attain a more intense and brilliant tone on the other. See PITCH.

Concertina, kŏn-sẽr-tē'na, a musical instrument invented by Sir Charles Wheatstone. It is generally polygonal in shape, is held between the hands so that the fingers drop naturally down on studs which raise the valves and allow the air (supplied by the bellows between the finger-boards) to act upon a series of metal tongues of the same construction as those of the accordion or harmonium. The usual range

of the instrument is from the lowest G on the violin to the C three and a half octaves higher, including the chromatic tones. The German concertina is a much less perfect instrument, as only tunes on a limited number of keys can be performed on it.

Concerto, kŏn-chār'- or kŏn-sĕr'to, a kind of composition first introduced by the Italian musicians of the 17th century, for the purpose of showing the capabilities of the violin, or of a particular performer on that instrument. The principal composers and artists in this department are Corelli, Viotti, Rodes, Baillot, Kreutzer, Alard, Beriot, and Vieuxtemps. Subsequently concerti were written for other instruments, such as the flute, the piano, etc. Among the most successful composers for the piano are Bach, Mozart, Hummel, Chopin, Schumann, Ries, Czerny, and Thalberg. Concerti usually consist of three movements, an *allegro,* an *andante,* or *adagio,* and a lively *rondo.* Except in the *tutti* the orchestra should be as subservient to the instrument for which the piece is written as it should to a vocalist.

Concerto grosso is an expression applied to the great or grand chorus of the concert, or to those places of the concert in which the *ripienos* and every auxiliary instrument are brought into action, for the sake of contrast and to increase the effect.

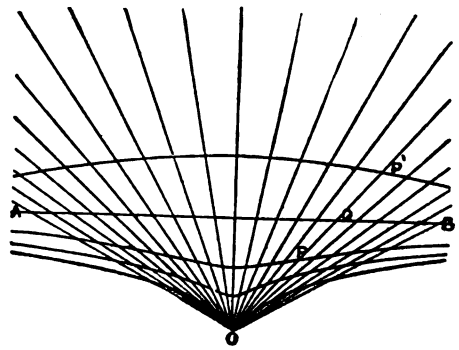
Concerto spirituale was a concert at Paris, performed in the religious seasons, when the theatres were closed. The pieces performed, however, were not always of a spiritual kind. It was introduced in 1725 by Anne Danican, called Philidor.

Conch, kŏnk, a name of certain large marine gastropods, especially of the king conch (*Strombus gigas*), abundant in the southern United States and parts of the West Indies. In Florida the shells are made into horns used for calling the farm hands, as is still done in the East Indies with shells of the genus *Triton.* This is one of the shells used for making cameos, and great quantities are collected in the Bahamas and shipped to Liverpool for this purpose to some extent, but more for conversion into buttons and similar small articles, in allusion to which industry the native whites of the Bahamas are called "Conchs." The name is also applied to two large sea-snails, the *Fulgur carica* and *Sycotypus canaliculata,* common on most parts of the Atlantic coast.

Concha, José Gutierrez de la, hō-sā' dā la kŏn'chä (MARQUES DE LA HABANA), Spanish general: b. Cordoba, Argentine, 4 June 1809; d. Madrid, Spain, 5 Nov. 1895. He went to Spain in childhood, entered the army, took part in the struggles in South America, and against Don Carlos, was appointed lieutenant-general in 1839, and officiated as captain-general of the Basque provinces 1843–6. He was captain-general of Cuba 1849–52, when he was replaced by Cañedo. Joining his brother in opposing the government, he was banished from Spain in 1854, and fled to France, where he was detained at Bordeaux. After the July revolution of 1854, he was re-appointed captain-general of Cuba, and, with the exception of a short suspension of his functions by Narvaez's administration in 1856, when Lersundi was appointed as his successor, he continued to hold office until December 1858, when he tendered his resignation. Returning to Spain he was at various times minister to France, president of the senate, and minister of war, and captain-general of Cuba again 1874–5.

Concha, Manuel (mä'noo-ĕl) **de la** (MARQUES DE DUERO), Spanish general and statesman: b. Cordoba, Argentina, 25 April 1808; d. Muro 28 June 1874. He was a brother of José de la Concha (q.v.), fought in early life against Napoleon and the revolted Spanish colonists in South America, and afterward against Don Carlos. In 1847, during the complications with Portugal, he was put in command of 6,000 men, and took possession of Oporto. Having issued at the end of 1853, in concert with O'Donnell and Bravo-Murillo, the famous protest against the policy pursued by the government, he was banished from Spain after the revolution of July 1854, and repaired to Paris; but was soon recalled to Madrid by the outbreak which terminated in the exile of Maria Christina, the downfall of Narvaez, and the restoration of Espartero. Concha was now made inspector-general of cavalry and marshal; but on 12 Oct. 1856, when Narvaez came again into power, he was compelled to relinquish these posts. He was killed in the battle of Muro while serving in the republican army against the Carlists.

Conchoid, kŏng'koid, a curve, shell-like in flexure (whence the name), invented by Nicomedes in the 2d century B.C., and used by him for finding two mean proportionals. If a straight line always passes through a fixed point O, and a point Q, fixed into the revolving line, always moves along the line A B, then any point P in the revolving line always at the same distance from O will trace out a conchoid. And, since the length Q P can in any position of the revolving line be measured either toward or from O, it is evident that, corresponding to any given length assigned to Q P, two conchoids can be described, one above and the other below the line A B. These are known as superior and inferior conchoids. Moreover, with a given point O, and a given straight line A B, any number of pairs of different conchoids can be described by varying the length QP. Moreover, the shapes



Conchoid.

of all such curves will vary according to the length of Q P. Thus, if Q P is less than the perpendicular from O on A B, the shape is as given in the adjoining figure, and this isolated point O is also a point on the curve.

Conchology, kŏng kŏl'ō jē, the science of shells. Two well-marked stages in its develop-

ment are traceable. At first shells were studied without any reference to the animals of which they constituted the hard framework or skeleton. Subsequently the study took a wider scope, and for the first time became worthy of being called a science, when the animals and their shells were viewed as parts of one common whole. When shells were looked upon as little more than ornamental objects, those who studied conchology were not generally of a high order of intellect; but since the rise of geology and the discovery that, of all fossils, shells are able to furnish the most definite information regarding the several strata, and consequently regarding the history of by-gone times, scientific minds of the very first class have given keen attention to shells. Some of these belonging to land animals, others to those inhabiting fresh water, and the great majority to those which are marine.

When shells, and they alone, were studied, conchology was a not unsuitable name, except that the termination -ology suggested that the investigation was more scientific than in most cases it really was. When the animals came to be carefully examined, M. de Blainville proposed for this deeper study the name malacozoology — that is, the study of the softer animals, mollusks; this has been since abbreviated into malacology. At the present time malacology is a highly developed branch of zoological science which treats of everything relating to the great phylum *Mollusca* (q.v.). Conchology is frequently used in the same sense, but cannot altogether escape the opprobrium which attaches to it as a mere collector's pastime. Consult Tryon and Pilsbry, 'Manual of Conchology.'

Conchos, kŏn'chōs, or **Conchas,** Mexico, a river in the state of Chihuahua; rises high up in the Sierra Madre, flows southeast, northeast, and then north through a beautiful country, comprising rich table-land, and empties into the Rio Grande near Presidio del Norte, after a course of about 350 miles. It is the largest tributary of the Rio Grande, and very little inferior in size to that river itself. Its principal branches are the Florido, Buenavista, San Pedro, Chihuahua, and Balleza, which, with their lesser tributaries, water more than one third of the state.

Conchyolin, kŏn-kī'ō-lĭn, an organic base allied to chitin (q.v.), which enters into the composition of the shells of mollusks. The conchyolin forms a thick cuticular layer of organic matter containing carbonate and a slight proportion of phosphate of lime. In dead shells the conchyolin soon disappears, leaving the shell much more brittle than when it was alive.

Conciergerie, La, lä kôṅ-sē-ėr-zhė-rē, a noted prison in Paris, which was a part of the Palais de Justice. Many royal prisoners were there confined, and during the Reign of Terror it was the scene of fearful butcheries, 328 prisoners being put to death in one week. Marie Antoinette went from her cell in this prison to her execution.

Concil'ium in Trullo, or **Concilium Quinisextum** (Council in Trullus, Fifty-Sixth Council), a council or synod of the Church convened in a hall (called the Trullus) of the imperial palace at Constantinople in the year 692. It was an assembly of eastern and western bishops called for the purpose of enacting canons of Church discipline: this the council did, both adding to the existing canons 102 new ones and confirming ancient canons that had fallen into desuetude. Its work was to supplement the decrees of the 5th and 6th councils of the Church: hence it is known as the Quinisext Council.

Conclave, both the apartment in which is conducted the election of a Pope and the college of cardinals assembled there. The procedure in electing popes is substantially the same to-day as it was in 1274 when it was prescribed by the Council of Lyons. When a Pope dies, a secretary of the college of cardinals summons all the cardinals to an election to be held on the 10th day after the demise. In whatever city the Pope dies, there the conclave must be held. The conclave apartment must be immediately prepared in such a place and manner as will insure safety of person and non-interference from outsiders. If the conclave is held in Rome, the great halls of one of the papal palaces is divided by wooden partitions into small rooms or cells, two or at most three cells for each cardinal and his personal attendants. The apartments all open on one corridor, and to that there is but one means of access from without, and that is strictly guarded. After the 10 days have elapsed, the cardinals all assemble in the Vatican church and assist at the Mass of the Holy Ghost, after which they form a procession and proceed to the conclave, each one taking the apartments assigned to him. The first day the conclave is open to the public, and numerous persons, high and low, avail themselves of the permission to enter. In the evening all outsiders leave, and the cardinals must remain until a Pope is chosen. A two thirds majority vote is requisite. Daily provision of food is brought in from outside, which is closely scrutinized lest any written communication should reach the cardinals: if no election is had after five days the food supply is restricted to bread, wine, and water, or rather used to be, for the rigor of the law is now much relaxed. A cardinal coming from a distance is admitted after closure. The election is made by scrutiny, that is, by ballot, or by compromise, that is, by a committee chosen by a majority of the conclave, or by acclamation. Sometimes a conclave has sat many weeks, or even months, before reaching an election: the conclave which elected Pius VII. (1799) sat during six months. The conclave in which Leo XIII. was elected Pope consisted of 62 cardinals, and it began its session the evening of 18 Feb. 1878. The scrutiny of the morning of the 20th showed that Cardinal Pecci was chosen. The election was then ended and he was made Pope by acclamation. The conclave at which Pius X. (q.v.) was elected began its session 31 July 1903, and the first ballot was cast the morning of 1 Aug. The scrutiny of the morning of 4 Aug., the seventh ballot, showed that Cardinal Sarto, patriarch of Venice, was elected. He chose the name of Pius X. This conclave was remarkable as being the only one of which a cardinal from the United States was a member.

Concone, Giuseppe, joo-sĕp'pĕ kōn-kō'nā, Italian teacher of vocal music: b. Turin 1810; d. there June 1861. From 1838–48 he was a teacher at Paris, and then became organist of the royal chapel at Turin. He wrote a large

number of vocal exercises which are still used in the teaching of music.

Concord, kŏng'kẽrd, Mass., a town in Middlesex County, on the Concord River and on the Boston & M. R.R., 20 miles northwest of Boston; settled in 1635. It is situated in a beautiful rural district, and has several manufacturing establishments. Here is located the Massachusetts Reformatory. The town has an excellent public library, a national bank, and an assessed property valuation of over $4,000,000. At the beginning of the Revolution the Americans had a large stock of arms and military stores at Concord. Gen. Gage, the British commander in Boston, hearing of this, sent a body of soldiers to destroy these stores, and on their way (19 April 1775) they fought the battle of Lexington, the first of the war. When they reached Concord, the same day, they destroyed what stores they could find, but were soon driven off by the Americans. Concord is celebrated as the home of many authors — of Ralph Waldo Emerson, Nathaniel Hawthorne, Henry David Thoreau, Amos Bronson Alcott, Louisa May Alcott, the poet William Ellery Channing, and others.

Concord, N. H., a city, capital of the State and county-seat of Merrimack County, on the Merrimack River, and on the Boston & M. R.R., 75 miles northwest of Boston. The city has an abundance of water-power, and manufactories of carriages, shoes, twine, electrical apparatus, silverware, leather goods, machine-shop products, etc. Near Concord are extensive quarries of a fine-grained white granite. There are three national banks with a combined capital of $500,000 and a surplus of $300,000, and several private banking houses. The assessed property valuation exceeds $20,000,000. The city is well laid out, has finely shaded streets, is well lighted, and its waterworks are excellently constructed. The noteworthy buildings include the State-house, a fine building of Concord granite, the city hall and courthouse, the State prison, State insane asylum, and the United States government buildings. The public schools are admirably organized and conducted, and represent a property valued at more than $325,000. This city is the seat of the well-known St. Paul's School (Episcopal) for boys. Concord was settled by whites in 1725, on the site of the Indian village of Pennacook. It was called by this name until 1733, then incorporated as the town of Rumford, and became a city in 1853. It is noted as the place near where Hannah Dustin (q.v.) made her escape from Indian captors. Pop. (1900) 19,632.

Concord, N. C., a city and county-seat of Cabarrus County, on the Southern R.R. Here are large industrial interests, and among the principal manufactures are those of cotton goods, foundry and machine-shop products, etc. There are also roller mills, a cannon manufactory, and brick works. Concord is an old place to which in recent years new industries have brought rapid growth. Pop. (1890) 4,339; (1903) about 9,000.

Concord, kŏng'kôrd, an expression used in music denoting the combination of two or more sounds pleasing to the ear, and requiring no further combination before or after it to make it so. Concords are the eighth (or octave), the fifth, third, and sixth. Their ratios are 2:1, 3:2, 5:4, 5:3. The two first are called perfect, because as concords they are not liable to any alteration by sharps or flats. The two last are called imperfect, as being alterable. The fourth is considered as a discord by some authorities; as a component part of an inversion of the perfect chord it may be classed among the concords. See COUNTERPOINT.

Concord, Book of (*Liber Cŏncordia*), the name given to a collection of confessions of faith which are generally accepted by the Lutheran Church. The Formula of Concord (1580) was the result of a series of conferences and discussions upon the following subjects: The Rule of Faith and the Creed; Original Sin; Free Will; Justification; Good Works; The Law and the Gospel; The Third Use of the Law; The Lord's Supper; The Person of Christ; The Descent of Christ into Hell; The Customs of the Church; Predestination and Election; Heresies and Sectaries. The whole received the sanction of a large number of the Germans. Other subjects treated in the Book of Concord are: The Three Ecumenical Creeds — Apostles, Nicene, and Athanasian; The Six Particular Confessions of the Lutheran Church — Augsburg, Apology of the Augsburg, Schmalkald Articles, Catechisms of Luther (larger and smaller).

Concor'dance, a book in which the more important words of a volume or collection of writings are arranged alphabetically, part of a passage being extracted with each and the place of its use specifically given. The first known concordance of the Bible in any language was that of St. Anthony of Padua, who was born in 1195, and died in 1231. His work was called 'Concordantiæ Morales,' and was of the Latin Vulgate. It formed the basis of a more elaborate concordance, also of the Vulgate, that of Hugo de Santo Caro, better known as Cardinal Hugo. This was published in 1244 A.D. The first Hebrew concordance was that of Rabbi Mordecai Nathan, begun in 1438 and finished in 1448. The first Greek concordance to the New Testament was that of of Xystus Betuleius, whose real name was Birck; it came forth in 1546 A.D. The first English concordance to the New Testament was that of Thomas Gybson, before 1540 A.D.; the first to the whole English version of the Bible that of Marbeck, 1550 A.D. These, of course, preceded the appearance in 1611 A.D. of the authorized version of the Bible. The elaborate and well-known work of Cruden appeared first in 1737.

The first known concordance to Shakespeare was that of Ayscough, in 1790. Mrs. Mary Cowden Clarke's elaborate and most useful work was first published in London in 1845, and in 1894 appeared a still more excellent one, that of John Bartlett, published in New York. A concordance to Milton was published in Madras in 1856 and 1857, and one to Tennyson in London in 1870.

Concordat, kŏn-kôr'dăt (*concordatum,* or, plur., *concordata*), a compact or convention entered into by the Holy See and a secular government to determine their respective powers and rights in the regulation of ecclesiastical affairs within the jurisdiction of the state which is a party to the compact. The earliest example of such compacts is the convention between Calix-

tus II. and the Emperor Henry V., concluded at Worms in 1122: it marked the end of the great dispute about investitures. In 1448 was concluded the so-called concordat with the German nation, or with the Emperor Frederic III., under which the patronage of ecclesiastical dignities in the empire was divided between the imperial crown and the holy see. Memorable is the concordat of 1515 between Leo X. and Francis I.; the king agreed to annul the pragmatic sanction of Charles VII., which restricted the right of appeal to Rome; and in return the Pope conceded to the king the right of nomination to all Church benefices within the realm, with a reservation of the *annates* to the holy see, and with the proviso that the nominees should be acceptable to the Pope. Another celebrated corcordat is that concluded 15 July 1801 between Pius VII. and Napoleon as first consul: it recognizes the legal existence of the Catholic Church in France which had been annulled by the revolution. The ecclesiastical topography of France was altered, the number of episcopal sees being reduced from more than 100 to 80. The confiscation of ecclesiastical property by the republican government was to pass for *fait accompli* and *res judicata* and the Pope and his successors were not to move to disturb purchasers or grantees of such properties. The government was to have the right of nomination of bishops, but the Pope that of canonical institution. Provision was to be made by the state for the support of bishops and clergy in lieu of their property, which had been appropriated by the Revolutionary Government. Ever since the concordat was concluded there has been in France an agitation for its abrogation, and this agitation was never more insistent than in 1903.

Concor'dia, or **Concord,** personified and worshipped as a goddess in Rome, where she had several temples, the most important of which was that in the capital, erected by Camillus. An annual feast was celebrated in her honor 16 January. She was represented with wreaths of flowers on her head, and in one hand a cornucopia, in the other an olive branch or a *patera.*

Concor'dia, Kans., a city and county-seat of Cloud County, situated on the Republican River and on the Atchison, T. & St. F.; the Missouri Pac.; and the Union Pac. R.R.'s, 110 miles northwest of Topeka. It has good water power and shows considerable manufacturing activity. There are iron-works and flour-mills and factories for making plows, wagons and cigars. Nazareth Academy is located here, and there is a United States land office. Pop. (1900) 3,400.

Concordia, kōn-kôr-dē'ä, Argentine Republic, a town of the state of Entre Rios, on the Uruguay, 302 miles north of Buenos Ayres by river. It has a custom-house and a river trade exceeded only by that of Buenos Ayres and Rosario, exporting salted meat and Paraguay tea. It has railway connection with Paraná, Uruguay, and South Brazil. Pop. about 13,000.

Concor'dia College, an educational institution in Fort Wayne, Ind., organized in 1839 under the auspices of the Lutheran Church; reported at the end of 1899: Professors and instructors, 8; students, 169; volumes in the library, 4,310; grounds and buildings valued at $100,000; income, $12,400; number of graduates, 754; president, Joseph Schmidt, A.M.

Concrete (Lat. "to grow together"), an artificial stone, a composition of hydraulic cement, sand and broken stone, used for foundations, especially submarine, and now more and more in place of building stone even when exposed to the air. In place of hydraulic cement pure lime was originally used and the name concrete applied only to this compound, "beton" being the proper term for the composition based on hydraulic cement until it became the only method. The mixture of sand and cement is termed the matrix, and the broken stone or other addition is styled aggregate and is composed of slag, coke, broken bricks, gravel or pebbles. The ideal aggregate is broken, sharply angular and irregular stone, as this material mixes better with the matrix than rounded pebbles, minute particles of gravel, or the more spongy brick, shell or coke, although broken stone or gravel may be used advantageously in connection with pebbles, even in such small proportion as 3 to 5. Broken limestone is considered especially efficacious as an aggregate, possibly because of an affinity between the molecules of carbonate of lime in it and the matrix. The proportions of the various parts approximate 1 part of cement, 1 to 3 parts of sand, and 4 to 6 parts of aggregate, but no fixed norm is to be followed the true rule being that the cement paste is to be thoroughly incorporated with sand coating each particle and that the matrix thus formed shall fill all interstices in the aggregate. In the process of mixture there are two extreme methods of watering, one very wet and the other scarcely more than moist. The spraying is followed by a mixture by shovel or by mixing machines. These machines are of two types: continuous, a trough or cylinder with a revolving screw shaft which works until the mixture is complete; and intermittent, a box being rotated slowly. The concrete is most commonly made into blocks, one layer of comparatively small depth being made at a time. By the newer method it is applied to its place on the building or foundation in the soft state and allowed to harden there. For submarine construction the concrete is usually sent under water in bags, which break because of pressure, or in closed chutes. While concrete is a comparatively modern invention, it was employed in ancient times, and in some of the most renowned works of history. The factitious stones employed by the Babylonians and the early Egyptians, as well as among the Greeks and Romans, and at the present day in Barbary and among the nations of Malabar, were all a species of beton. Pliny mentions that the columns which adorn the peristyle of the Egyptian labyrinth were of this material, and the great length of time it has existed (over 3,600 years) shows the durability of this mode of construction. In Rome the pyramid of Ninus is formed of a single block, as was also the square stone that formed the tomb of Porsena, which was 30 feet wide by 5 feet high. The Romans made free use of this material in constructing their walls, aqueducts, piers, and roads, many portions of which exist at the present day. The mole which shelters the harbor of Algiers is so much exposed to the effect of winds that breaches were continually being made in it by the force of the sea, and to such an extent that in former times the Moors were compelled to employ a large number of workmen constantly repairing it, at an annual

expenditure of over $60,000. When the French commenced the reconstruction of the mole in 1833, after the failure of partial repairs, the first operation was to raise an outer embankment of large stones, under whose cover the foundation might be properly restored, it being intended to form this embankment of *pierre perdue*, that is, of stones thrown in at random, and allowed to arrange themselves to the necessary slope for equilibrium by the action of the sea. But during the first ensuing winter the embankment was completely destroyed by the action of the waves, one block of 141 cubic feet having been carried completely across the mouth of the harbor. This rendered it necessary to rebuild the entire embankment of blocks so large that no action of the sea could move them; this was of course possible, since the action is proportioned to the surface struck, while the resistance of the block increases as its mass, and there must necessarily be a point where the latter predominates; this was found on trial to be about 353 feet. The expense of quarrying and transporting such enormous blocks of stone, led to the employment of artificial stone or beton. Two kinds of blocks were manufactured: the first in the water, in the place they were intended to occupy, and the second on shore, to be afterward thrown into the sea. In the process of reconstruction, these blocks were used as follows: Those of the first kind, made in lined caissons, formed an outer sea line; on these blocks molds were placed filled with beton, and after these second blocks had set, they were launched into the sea, forming a line in front of the first; the intervening space was then filled up with blocks of natural stone. Behind this embankment thus formed, the ground was dredged to a depth of over six feet, and the whole of this space filled up with a continuous mass of beton. The entire work was performed in five years, at a cost of less than $420,000, notwithstanding that the mole, at the time of the occupation of Algiers by the French army in 1830, was in a state of complete dilapidation, in spite of the extensive repairs which had been annually executed upon it by the Moors during a period of two centuries. Marine works of the above character present numerous advantages over constructions in which natural stone is employed, of which the following are some of the most prominent: (1) immediate stability, while ordinary pierre perdue is never secure; (2) incomparably greater facility in transportation, which is always expensive and troublesome when blocks of stone are to be quarried exceeding 100 cubic feet; (3) a considerable reduction in the sectional area of the pier, and consequent economy of cost; and (4) that the system can be applied in every locality, now that our advanced knowledge of the subject of hydraulic mortars enables us to manufacture beton in any place where it may be needed. On the use of concrete in modern building consult I. O. Baker, 'Treatise on Masonry Construction' (1900).

Concrete Construction. The use of concrete for purposes of construction, while not entirely a new idea, has within the last few years received an enormous impetus, and its use for all kinds of engineering construction has been thoroughly tested by American engineers. As a substitute for stone, steel, hollow tile, etc., its service has been demonstrated by a constantly increasing use. Concrete may be defined as an artificial stone. It can be used for all structural purposes as a substitute for stone and in addition it has a wide variety of applications where the use of stone is impracticable.

Composition.— Concrete is composed of broken stone or gravel, sand and cement with the addition of water sufficient, after allowing for evaporating and absorption, to unite chemically with the cement. A typical concrete is made as follows: To one barrel of a standard Portland cement is added three barrels of clean sharp sand. The two are intimately mixed — either manually or by a mechanical mixer — and then enough water is added to bring the mixture to a certain consistency, the proper amount of water being readily judged by one experienced in this work. Five barrels of broken stone are then added, the whole thoroughly intermixed and the concrete thus formed is ready to be conveyed to the forms or the excavations prepared for it. Concrete made in the above proportions would be known as a 1:3:5 mixture. The permissible proportions, however, vary widely from 1:2:4 to 1:5:10 according to the nature of the ingredients and the service for which it is intended. In general, the concrete with the smaller proportion of cement will not sustain the same strains as the concretes wherein the proportions are about as indicated in our typical mixture.

The composition of a properly proportioned concrete may be thus considered; sand fills up the interstices between the pieces of rock, and the cement, in turn, fills up the interstices between the particles of sand and between the sand and the rock. As 90 per cent of a standard cement will pass through a sieve of 10,000 meshes to the square inch, it is evident that the cement will effectually fill up all the voids. But the cement also performs an even more important function. It enters into chemical combination with the water used in mixing and acts as a binder, tenaciously holding the whole mass together. As soon as the cement is mixed with water this chemical change commences, or the concrete begins to "set" as it is generally expressed. Therefore the concrete must be put in place immediately after mixing. At the end of about three or four days, the concrete is solid enough for the supporting forms to be removed and after possibly thirty days it is ready for the loads for which it is designed. The hardening continues for months and the concrete becomes stronger as time elapses.

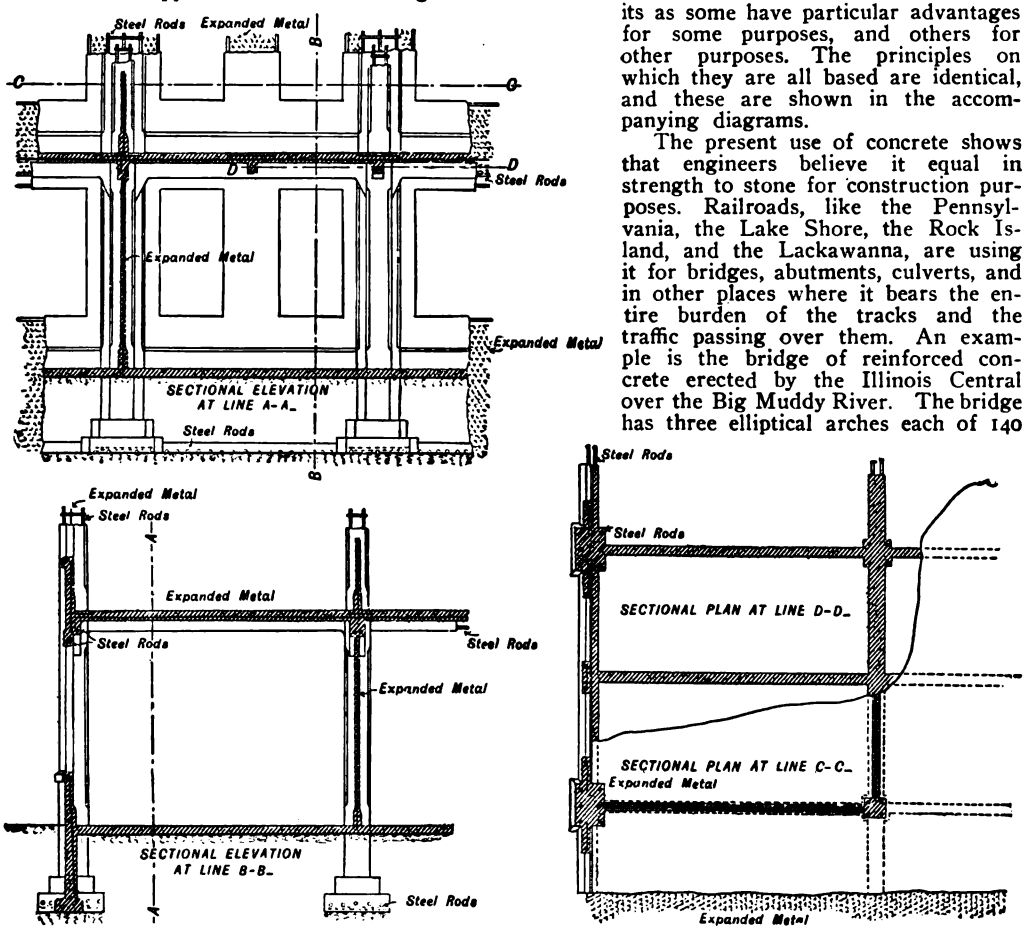
Merits and Advantages.— Concrete as a material for construction has been known for centuries. Some of the most enduring monuments of antiquity are constructed either wholly or in part of this material. The dome of the Pantheon, erected at the beginning of the Christian era, is built of concrete, as are some of the other historic structures of that period. Concrete has ever since been used to a greater or less extent. With the discovery and application of the methods of making Portland cement, which we may ascribe to the period 1820–50, concrete assumed its place as one of the principal materials of engineering and we may say that each year has shown an increase in the amount of concrete construction with a constant widening of the field of its application. Concrete reinforced with steel, has been successfully used in office buildings, apartment houses, theatres, schools, court-houses, public libraries, factories,

mills, warehouses, foundries, grain elevators, stables, cisterns, bins, stand-pipes, bridges, culverts, abutments, sea-walls, breakwaters, jetties, piers, reservoirs, tanks, dams, aqueducts, sewers, subways, dust-chambers, and chimneys, besides a great number of minor uses in buildings constructed primarily of other material.

The fact that concrete can be molded into any form desired is a most valuable quality and one which is largely availed of in practice. Aside from such uses as being simply deposited for foundations, abutments, etc., it is molded into shapes as intricate as may be desired, one of the recent applications which is being extensively developed at the present time being the use of concrete for making hollow blocks for building purposes. The facility with which it can be molded for producing decorative effects, is, of course, well known. Another highly important advantage resulting from the plasticity of the newly-mixed concrete is that other materials, such as iron, may be imbedded in it.

The strength and durability of all concrete depend, of course, upon the quality of the ingredients and the care exercised in mixing and handling. When the work is done under experienced supervision, however, the characteristics of the resulting concrete can be accurately predicted. Concrete will withstand enormous compression strains. When heavy strains other than those of compression are to be provided for, the concrete is so strengthened with steel that the metal takes the tensile and shearing strains, and the concrete the compression strains. This construction, known as armored or reinforced concrete, is rendered entirely feasible by the facts that concrete has considerable adhesion for iron and steel, and the co-efficients of expansion (by heat) of the two materials are practically identical. There are a number of "systems" of reinforcing concrete with steel. We need not here discuss their relative merits as some have particular advantages for some purposes, and others for other purposes. The principles on which they are all based are identical, and these are shown in the accompanying diagrams.

The present use of concrete shows that engineers believe it equal in strength to stone for construction purposes. Railroads, like the Pennsylvania, the Lake Shore, the Rock Island, and the Lackawanna, are using it for bridges, abutments, culverts, and in other places where it bears the entire burden of the tracks and the traffic passing over them. An example is the bridge of reinforced concrete erected by the Illinois Central over the Big Muddy River. The bridge has three elliptical arches each of 140 feet clear span. It was erected at less cost than a bridge of structural steel, it is more enduring and is decidedly more pleasing to the eye. A typical bridge of concrete alone, built on the straight masonry principle, is that of the Pennsylvania Railroad over the Susquehanna River, near Harrisburg, Pa. This structure is faced with a thin veneer of natural stone, which is not, however, an essential part of the structure. The United States government is using concrete in enormous quantities for all sorts of purposes. In the reconstruction of the fortifications around New York harbor during the last few years, concrete has been used to the practical exclusion



Reinforced Concrete Building Sections Showing Column, Pilaster, Floor Beam, Girder, Footing, Curtain Wall and Partition Construction.

of all other materials. In other words, the 13-inch guns which guard the City of Steel-frame Skyscrapers are mounted on concrete foundations and are protected from hostile projectiles by the same material. The Ingalls Building, Cincinnati, Ohio, 16 stories high, is made entirely of reinforced concrete. The plans for this building were approved by the city authorities only after a great number of tests had been made which proved beyond the possibility of doubt that the building would be absolutely safe. Concrete enthusiasts predict that this building will be standing long after the steel skeleton structures in the neighborhood have disintegrated. The deterioration of steel when protected by nothing more than terra-cotta slabs, noted in a number of cases, tends to lend strength to this view. In fact, superior durability is one of the best-substantiated claims for concrete buildings. It has long been recognized that concrete becomes stronger with age, and the same is not true of any other material. Engineers are divided in their estimates as to how long a steel-framed structure will endure.

In reinforced concrete construction the steel is completely imbedded in the concrete which absolutely protects it from fire as indeed it does from rust and all other corrosive action. It has been demonstrated in several instances that cast-iron piping which has been covered with a coat of liquid neat cement and buried underground for from 10 to 15 years, showed no signs of rust or other external deterioration. A lining of «rich» concrete has been found to be the only material which will withstand the corrosive action of the acids in the large storage tanks or vats at pulp mills.

As regards the all-essential quality of ability to resist fire, concrete is absolutely and unqualifiedly superior to all other building materials. This has been shown many times in tests conducted by the building and fire departments of various large cities in this country and abroad. The usual way of conducting such tests is to build a small structure of concrete and to maintain therein a fire of a temperature of about 1,700° F. for a number of hours. A stream of water is then turned on the fire and concrete and results are carefully noted. In general, a few hair-like cracks in the concrete is the only effect noticeable, the strength of the material being unimpaired. In the great Baltimore conflagration every known type of construction was subjected to the flames. After the fire, engineers came from all over the country to observe what type of construction had best withstood the fire. The opinion of these experts was strikingly unanimous and decisive to the effect that concrete has stood up better than the steel frames with terra-cotta protection and, of course, better than brick and stone. Prof. Norton of the Massachusetts Institute of Technology re-

flected the general expert opinion in his report to the 'Boston Transcript': «Stone, whether granite, marble, sandstone or limestone fared badly. Where floor arches and steel coverings were of concrete they stood the test much better than terra cotta. This was due probably to the fact that concrete and steel expand at the same rate while terra cotta expands 2½ times as fast as steel and so the partitions or floor arches buckle or break. In general, the unfitness of terra cotta for beam and post covering and floor construction in comparison with concrete was demonstrated.»

Cost.— It might be expected that a material with so many desirable qualities would be more expensive than the materials which it is displacing. The contrary is the case. Concrete is cheaper than stone, or steel frame and terra cotta. It can be manipulated by unskilled labor to a greater extent than any other material. There are many localities in the country where no stone suitable for building purposes exists, but where there is much stone admirably adapted for being crushed and used for concrete. In short, the raw materials for concrete can be laid down at almost any point in this country cheaper than any other material and the cost of putting it in place is less. It will therefore be seen that the strength and durability of concrete, the ease with which it may be reinforced with steel to form a combination of universal applicability, its fire-resisting and time-defying qualities and its low first cost, stamp it as the great construction material of the future.

Concretionary Structure. Among the strata of rocks formed by deposition of sediment it is a common thing to find lumps of material differing more or less in chemical composition from the strata in which they lie, and, though separated from each other by short intervals, still arranged in layers conforming to the general stratification. The balls of argillaceous iron ore found in the shales of the coal formation are examples of these concretions. They have no regular form, but are generally flattened spheroidal masses, and are commonly called «kidney-shaped.» In the clay beds of the Tertiary group, in various parts of the country, are found curious collections of clay concretions, harder and more compact than the rest of the clay, and presenting forms in imitation of nuts, fruits, and different organic substances. The resemblance is so striking that common observers are satisfied that they see actual relics and petrifactions instead of mere aggregations of inorganic matter. Through each one of these clay concretions a hole may be traced, which was at some time filled with a rootlet, the carbonaceous residue of which, if not the form of the root itself, may be observed. This appears to have been a nucleus around which the material collected, following the law of attraction by which neighboring particles of the same composition seek out and join with each other when in a medium that admits of their movement. In argillaceous deposits, even among the older stratified rocks, the same tendency appears to have obtained after the deposition of their materials. The calcareous portions separated from the shaly or sandy strata, and arranged themselves in these concretionary layers. But if the quantity of calcareous matter was sufficient to form a stratum of itself, this force appears not to have been exerted to produce the spheroidal masses; except occasionally the rock is said to have a concretionary structure when it displays a tendency to form here and there along its course bunches or knots, as if these parts had curled and rolled over, presenting very much such an appearance as is observed in very gnarled and knotty wood. In the shales of the Lower Secondary in New York State, particularly in those of the Hamilton and Portage groups, numerous dark-colored calcareous concretions are found of extraordinary size and forms. They abound along the shore of Lake Erie, washed out of the banks by the action of the waves. Very often they are formed about some nucleus of entirely different substance from their own as a fossil shell or a nodule of iron pyrites; and the fossil shell not infrequently has first served as a nucleus for an incrustation of pyrites, by which it was completely buried before both were concealed within the large concretionary mass. After the forming and hardening of the concretions, they appear to have cracked by shrinkage, the cracks sometimes radiating from the centre or taking other irregular directions. The cracks afterward became filled with light-colored clay or calcareous matter, and now appear like mineral veins. As the shape of these bodies often

approaches that of the large sea turtles, and the seams resemble the divisional lines of the plates of the shell, they are very naturally supposed by most people who meet with them to be the petrified remains of this animal; and looking at those specimens deposited in the State collection at Albany, one may well suppose that this common belief will not soon be corrected. At Erie and other places in this part of Pennsylvania, concretions in a light-blue limestone are found, which consist of a number of cones closely arranged side by side, and forming a thin layer not more than two inches thick, of which the flat base of the cones constitutes one side, and their points reach nearly through to the other. Little is known of the laws that have caused these matters thus to assume at different localities similar, and, as they appear, fantastic forms. Extraordinary clay concretions from the banks of the Park River in Hartford, Conn., are to be found in many museums.

Concretions, Morbid, in animal economy, hard substances that occasionally make their appearance in different parts of the body, as well in the solids as in those cavities destined to contain fluids; in the former case they are denominated concretions or ossifications; in the latter, calculi. The concretions are named from the parts of the body in which they occur. Pineal concretions, from their being found in that part of the brain called the pineal gland, consist of carbonate and phosphate of calcium with organic matter; salivary concretions, as being discovered occasionally in the salivary glands, also consist mainly of earthy phosphates; pancreatic concretions are hard substances found in the pancreas; pulmonary concretions, which have been sometimes coughed up by consumptive persons, contain mucus and albumen in addition to the salts; hepatic concretions, of which the liver is sometimes full, are composed chiefly of cholesterin, mucus, and coloring matter; urinary concretions are found in the bladder, and their constituents are very variable, uric acid, urates, fibrin, oxalates, phosphates, and several other bodies being found. Gouty concretions consist of urate of sodium and small quantities of other salts with organic matter. Concretions have been discovered in the intestines and stomach of man, but more frequently in the bodies of other animals. Those found in the intestines of a horse were examined by Fourcroy, and found to consist of magnesia, phosphoric acid, ammonia, water, and animal matter. See CALCULUS.

Concu'binage, the cohabitation of a man with a concubine. Among the Greeks concubinage was allowed even to married men: the number of their concubines, also, was unlimited. Among the Romans concubinage was neither unlawful nor disgraceful. It was moreover, formally permitted to unmarried men by the Lex Julia, and by the Lex Papia Poppæa, but with the provision that it should be limited to a single concubine, and that only women of mean descent, as freed women, actresses, and the like, should be chosen for the purpose. The children begotten in concubinage were not considered as legitimate, but were called natural, and the right of inheritance of the concubine and her children was very much limited. With the introduction of Christianity concubinage ceased; and, indeed, Constantine the Great made laws intended to put a stop to it. Concubinage also signifies a marriage with a woman of inferior condition, to whom the husband does not convey his rank. By French law the presence of a concubine in the house entitles the wife to a divorce. The term is used in a more general sense to mean the cohabiting of a man and woman who are not legally married.

Concurrent Jurisdiction, the jurisdiction of different courts authorized to take cognizance of the same case. In criminal cases the court which first takes up a case has what is called the right of prevention, that is, the right of deciding upon that case exclusive of the other courts, which but for that right would have been equally entitled to take cognizance of it. In civil cases it lies with the suitor to bring his cause before any court he pleases, which is competent to take it up. Concurrent, also called cumulative, jurisdiction is opposed to privative jurisdiction.

Concussion of the Brain, a term applied to certain injuries of the brain resulting from blows and falls, though unattended with fracture of the skull. Stupor or insensibility, sickness, impeded respiration, and irregular pulse are the first symptoms, and though these may subside there is always for a time more or less risk of serious inflammation of the brain setting in. The patient should be put to bed at once with the head low, and kept warm; but stimulants should, except in special cases, be withheld. All excitement should be avoided, and for some time after apparent recovery great care is necessary.

Condé, kôn-dā, the name of a French family, the younger branch of the Bourbons, who took their name from the town of Condé, department of Nord. One Godfrey de Condé, about 1200, was in possession of a part of the barony of Condé. His great-granddaughter, Jeanne de Condé, married in 1335, Jacques de Bourbon, Comte de la Marche, and the barony of Condé went to their second son, Louis de Bourbon, Comte de Vendôme, whose great-grandson, Louis de Bourbon, Prince of Condé, in virtue of his blood-relationship to the royal family, assumed the title of Prince, and is regarded as the founder of the new house of this name.

Condé, Henri (ŏn-rē) **II. de Bourbon,** PRINCE DE: b. 1588; d. 1646. At the request of Henry IV. he became a Catholic. In 1616 he was sent to the Bastile, where he remained for three years. After the death of Louis XIII. the prince was liberated, and was made minister of state to the regent.

Condé, Louis (loo-ē) **I. de Bourbon,** boor bôn, PRINCE DE, French general: b. Vendôme 7 May 1530; d. 15 May 1569. He married the grandniece of the Constable de Montmorenci. He served his early campaigns in Piedmont, but first distinguished himself at the defense of Metz, besieged by Charles V. in 1552. Affronted at court, and hated by the Guises, he joined his brother, the king of Navarre, at Nérac, and became a Protestant. In 1560 he was arrested and sentenced to death, but was discharged after the death of Francis I. He soon after appeared as head of the Protestants, and was defeated and captured at the battle of Dreux. In 1567 he fought the battle of St. Denis without decisive result. Two years later the Protestants were defeated, and Condé was slain at Jarnac.

Condé, Louis II. de Bourbon, PRINCE OF, French general: b. Paris 8 Sept. 1621; d. near Fontainebleau 11 Dec. 1686. He was the son of Henri II., Prince de Condé (q.v.) and during the life of his father bore the title of Duc d'Enghien. He immortalized this name at the battle of Rocroi, in which, at the age of 22, he defeated the Spaniards (1643). Wherever he appeared he was victorious. He besieged Dunkirk in sight of the Spanish army, and gained this place for France in 1646. During the troubles of the Fronde he at first took the side of the court against the parliament and the nobles, and after a siege of a few months brought back the young Louis XIV. to Paris (1649); but believing himself ill requited by Mazarin for his services he put himself at the head of the faction of the *Petits Maîtres.* Being captured, however, he was imprisoned by Mazarin (1650), and was not released till after the lapse of a year. He at once put himself at the head of a new Fronde, and entered upon negotiations with Spain. In spite of several checks he then marched upon Paris, where he was met and opposed in the suburb St. Antoine (1652). The battle which ensued was indecisive; and Condé, finding himself abandoned by many of his friends, retired to the Netherlands, and joined the Spaniards, who appointed him generalissimo of the Spanish armies. In 1658 he was defeated before Dunkirk, by Turenne, and was only restored to royal favor by the Peace of the Pyrenees in 1659. In 1668 he was charged with the reduction of Franche Comté (then belonging to Spain), which he accomplished in three weeks; and in 1674, at the head of an army sent by Louis XIV. against the United Provinces, defeated the Prince of Orange (afterward William III. of England) at Senef. He was unable, however, to take advantage of this victory, as he was obliged to withdraw into Alsace to defend it against Montecuculi, to whom it was thrown open by the death of Turenne in 1675. He succeeded in driving Montecuculi across the Rhine. This was his last triumph. Four years later he retired to Chantilly, near Paris, where he devoted himself to the sciences.

Condé, Louis Joseph (loo-ē zhō zĕf) **de Bourbon,** PRINCE OF: b. Chantilly 9 Aug. 1736; d. Paris 13 May 1818. In the Seven Years' war he distinguished himself by his courage and skill, and afterward formed in 1792, at Worms, a little corps of emigrant nobility, which joined the Austrian army under Wurmser. In 1795 he entered with his corps into the English service. In 1797 he entered the Russian service, but in 1800, after the separation of Russia from the coalition, reentered the English service. The campaign of 1800 ended the military career of the prince. He returned to Paris in 1814; where, being appointed president of a bureau of the chamber of peers, he remained some time, but at last retired to Chantilly. He published: 'Essai sur la Vie du Grand Condé, par L. J. de Bourbon, son 4me Descendant' (1806).

Condé, or **Condé-sur-l'Escaut,** France, a town in the department of Nord, seven miles northeast of Valenciennes, at the junction of the Hayne and Schelde rivers. It is well built, and has a superb arsenal. The fortifications were constructed by Vauban. It has manufactories of starch and chicory, oil and salt refineries, nail and ropes, etc. Pop. 3,000.

Condé - sur - Noireau, kôṅ-dā-sür-nwä-rō, France, town in the department of Calvados, at the junction of the Noireau and Drouance rivers. It is supposed to be of Roman origin, and has two ancient churches, Saint Sauveur and Saint Mark. Dumont d'Urville, the navigator, was born there 23 May 1790. Cutlery and leather are manufactured, and the local trade is chiefly in the products raised on the surrounding farms. Pop. 6,483.

Condell, kŭn'dĕl, **Henry,** English actor: d. Fulham, England, December 1627. With John Heming (q.v.) he edited the famous first edition of Shakespeare's plays, 1623. He belonged, as did Shakespeare, to the lord chamberlain's company of players and is named in Shakespeare's will.

Condensa'tion, the reduction of anything to another and denser form, as of a vapor or gas to a liquid, or a liquid to a solid; the passage of gases or vapors from the aëriform to the liquid state. It is sometimes called also the liquefaction of vapors. It may be due to one of three causes: cooling, compression, or chemical affinity. Before the first or second of these causes can operate, the vapor must be saturated. Various salts also condense vapors by means of chemical affinity. When vapors are condensed their latent heat becomes free. The condensation of liquids is the reduction of a liquid to smaller bulk, with a proportionate increase in the specific gravity.

Condensed Milk, milk reduced greatly in bulk and rendered proportionately denser. Gail Borden in 1849 invented a process for the condensation of milk, which has since been carried out extensively in the United States and Europe.

Conden'ser, one who or the thing which condenses. Some of the methods in general use are:

Steam-engine.— An apparatus for reducing to a liquid form the steam in front of the piston, so as to obtain a partial vacuum at that point, and thus utilize the natural pressure of the atmosphere. Watt invented the injection condenser and the separate condenser. The surface condenser has a series of flat chambers or tubes, usually the latter, in which the steam is cooled by a body of water surrounding the tubes. Distilled water for ships' use is obtained by the condensation of steam in a surface condenser.

Distilling.— The still-condenser is an apparatus generally made of the worm-tube form; the coil containing the alcoholic vapor traversing a tub which receives a constant accession of cold water, condensing the vapor in the coil. The liquid escapes at a cock valve below.

Metal.— An apartment in which metallic or deleterious gaseous fumes are condensed to prevent their escape into, and contamination of, the atmosphere. The device consists of a prolonged duct for the fumes, with showers of water to condense the arsenical, sulphurous, and other fugitive volatile matters. It also serves an economical purpose in saving fugitive fumes of lead, zinc, mercury, sulphur, antimony, etc.

Electricity.— (1) An instrument for concentrating electricity by the effect of induction. It usually consists of a confolded sheet of tin-foil, whose layers are separated by a thin sheet having a non-conducting surface. (2) With induction apparatus, a device for absorption or sup-

pression of the extra current induced by the rapid breaks in the main current. (3) An instrument in which an electric spark passes between the poles in a closed glass cylinder, so as to be employed in burning metals in an atmosphere of any given tenuity or specific chemical character, to obtain the spectra of metals or gases free from accidental characteristics of the general atmosphere for the time being.

Condensing and Non-condensing Engines. Steam-engines are classified according to the method in which they use steam. In the non-condensing engine, the steam, after having performed its work in the cylinder, is exhausted into the atmosphere at a pressure equal to that of the atmosphere (14.7 pounds on each square inch of surface at the level of the sea), thereby giving a back pressure equal to that amount which the steam actuating the piston has to work against, or overcome constantly. It is entirely possible, however, to so arrange a method of using the steam that, after having performed its work in the cylinder instead of being exhausted into the atmosphere at a pressure of 14.7 pounds, it shall be exhausted into a reservoir within which a vacuum is constantly maintained, and thus conserve the energy lost in overcoming the back pressure in the cylinder. The most convenient method of securing a vacuum is by condensing the steam which fills a given volume or reservoir back to the form of water, and engines operating on this principle of exhausting into a vacuum are classified as condensing engines. The physical principle on which a partial vacuum is caused by the condensation of steam is, that one cubic inch of water forms 1,700 cubic inches of steam at a pressure of one atmosphere. Therefore, if that volume of steam is condensed back to water, the reduction of volume is in the same proportion less only the volume occupied by the tenuous vapor given off even by cool water in a vacuum. To maintain a vacuum thus obtained, it is only necessary to provide suitable apparatus to draw off the water as it is being created by the condensation of the steam. The earliest steam-engines were all of the condensing type. Steam at pressures slightly above that of the atmosphere was admitted to the cylinder for the working stroke, and the absence of pressure on the working side of the piston due to the vacuum caused by the condensation of the steam was the principal dependence for the power of the stroke. They were called low-pressure engines, while those of the non-condensing type which necessarily required a higher boiler pressure to overcome the back pressure in the cylinder were designated as high-pressure engines, so that at one time the terms high-pressure and low-pressure were synonymous with the terms non-condensing and condensing, respectively. This relation, however, does not apply at the present time, since the majority of modern condensing engines are operated by steam at high-pressure. The advantages of the condensing engine may be stated as follows: The same power can be secured by a smaller cylinder of the condensing type than of the non-condensing type, with all the attendant advantages of diminished bulk, while the condensation of the steam to a temperature of about 130° F. (usual practice) affords a quantity of pre-heated water which can be used to replace the amount turned out of the boiler in the form of steam, thus saving fuel, and extending the wear of the boiler. Its disadvantages are partly inherent, and partly accidental. The inherent disadvantages are due to four conditions: (1) The lowering of the temperature and pressure of the steam lowers the temperature of the metal of the cylinder and increases the amount of condensation to be expected within the cylinder, so that the actual economy is much less than the theoretical economy; (2) the maintaining of the vacuum imposes an amount of work upon the engine, directly or indirectly, which a non-condensing engine is not required to perform; (3) the serious annoyance caused by the introduction of lubricating material into the cylinder where it fouls and stops up the passage, thence into the condenser, and finally into the boiler, where, by forming a coating on the heating surfaces, causes overheating by preventing the intimate contact of the water with the metal; (4) the condition that it can only be used where a sufficient quantity of water for condensation can be obtained at a small expense, thus limiting the application of the principle to stationary engines on land, although for that very reason it is pre-eminently applicable to all types of marine engines. Locomotives cannot be operated as condensing engines. The accidental disadvantages depend upon the methods employed to apply the principle — (1) if the pumps attached to the condensing apparatus are driven by the engine itself, a high rotative speed is impracticable, since the engine cannot be run at a speed faster than that required for the proper working of the pumps; and (2) if the engine operates its own condensing apparatus at low speeds, the weight and bulk of such appliances become inconvenient.

Condillac, Etienne Bonnot de Mably de, ā-tē-ēn bŏn nō de mä-blē de, French philosopher: b. Grenoble 30 Sept. 1715; d. Beaugency 3 Aug. 1780. He founded an international reputation on 'The Essay on the Origin of Human Knowledge (or Sense Perceptions)' (1746); duly succeeded by the celebrated 'Treatise on the Sensations' (1754), the central standpoint of these and other works being what is, philosophically speaking, sensationalism; a belief, that is, that what we know we know only through the senses, and hence our ideas of deity, love, the soul, etc., are largely modified forms of the objects that impress us in our daily material experience. These standpoints were practically those of French philosophy till the advent of Cousin. Among his other works are: 'Traite des Sensations' (1755); 'Cours d'Etudes' (1755); 'Le Commerce et le Gouvernement Considérés Relativement l'un à l'autre' (1776); 'La Logique' (1781); 'Langue des Calculs' (1798).

Condition, in law a statement of terms, a provision or stipulation, as in a contract, by which the parties thereto consent to be bound; or an undertaking to do something, pay money or other consideration, etc., as a proviso in an agreement by which the other parties thereto bind themselves to perform some act in return. Conditions must be made at the same time as the original conveyance or contract, but may be by a separate instrument, which is then con-

sidered as constituting one transaction with the original. Unlawful conditions are void. Conditions in restraint of marriage generally are held void; but this is not true of conditions restraining from marriage to a particular person, or restraining a widow from a second marriage. A condition in general restraint of alienation is void, but a condition restraining alienation for a limited time is good. Where land is devised, there need be no limitation over to make the condition good, but where the subject of the devise is personalty without a limitation over, the condition, if subsequent, is held to be *in terrorem* merely, and void. But if there be a limitation over, a non-compliance with the condition devests the bequest. A limitation over must be to persons who could not take advantage of a breach. Performance should be complete and effectual. An inconsiderable casual failure to perform is not non-performance. Any one who has an interest in the estate may perform the condition, but a stranger gets no benefit by performing it. Conditions precedent, if annexed to land, are to be strictly performed, even when affecting marriage. Conditions precedent can generally be entirely performed, and usually at any rate equity will not interfere to avoid the consequences of non-performance.

The word «condition» also means the situation of every person in some one of the different orders of persons which compose the general order of society and allot to each person therein a distinct separate rank. For instance, at common law, a person under 21 is an infant, with certain disabilities and privileges. Every person is presumed to know the condition of the person with whom he deals.

Conditional Immortality, a tenet held by a theological school which denies the inherent immortality of the soul, and the consequent doctrines both of eternal misery and of Universalism as contrary to the teachings both of nature and of revelation. Its advocates maintain that the Bible sets immortality before men as something to be sought after (Rom. ii. 7), as a divine gift offered on certain conditions (Rom. vi. 23; John iii. 15, 16), and as a matter of hope and promise in the present life (Titus i. 2); that this immortality is not a present possession (Mark x. 30), and is to be realized by the assumption of a spiritual body at the resurrection of regenerate men from the dead (Luke xx. 35, 36), an event synchronous with the second coming of Christ (1 Cor. xv. 51, 52). Divine testimony, no less than experience, they say, declares unequivocally that man has the same natural life as all other animals (Eccles. iii. 19), and only those who by faith and obedience are united to Christ have the promise of immortality. The Calvinistic doctrine of eternal misery is untenable, the punishment of sin being death or everlasting destruction, to be inflicted subsequent to a judgment after the Lord returns (2 Thess. i. 9, 10). The dogma of Universalism, the only alternative to endless torment if the soul must live forever, is also, they maintain, unfounded, since the punishment of sin (death) is said to be everlasting, like the life which is the reward of the righteous (Matt. xxv. 46). The Conditional Immortality Mission began in Great Britain in 1878. It has an organ 'The Bible Standard,' published monthly by the secretary. Churches have been established in the United States.

Conditioned, Philosophy of the, or **Philosophy of the Unconditioned,** the name given by Sir William Hamilton to certain philosophical views first promulgated by him in an article contributed to the 'Edinburgh Review,' in October 1829, forming a critique on Victor Cousin's philosophy, especially of his doctrine of an absolute cause. The Unconditioned is regarded by Sir William Hamilton as a genus including two species: the Infinite, or the unconditionally unlimited, and the Absolute, or the unconditionally limited; and the thesis which he maintains and expounds in the essay referred to, and which forms one of the leading doctrines of his philosophical system, is that the Unconditioned, as thus explained, is entirely unthinkable. In his own words, «the mind can conceive, and consequently can know only the limited, and the conditionally limited. . . . Conditional limitation is the fundamental law of the possibility of thought.» This he illustrates by stating that we can neither conceive an absolute whole, that is, a whole so great that we cannot conceive it also as a part of a still greater whole; nor an absolute part, that is, a part so small that we cannot conceive it as a relative whole, divisible into still smaller parts. And this he declares to hold good as to space, time, and degree. «The Conditioned,» he goes on to say, «is the mean between two extremes — two unconditionates, exclusive of each other, neither of which can be conceived as possible, but of which, on the principles of contradiction and excluded middle, one must be admitted as necessary.» The Unconditioned, on the other hand, being merely negations of the Conditioned in its opposite extremes, bound together by the aid of language and their common character of incomprehensibility, is not even a notion, either simple or positive. It presents no object to the thought, and can afford no real knowledge. From this, however, we are only to learn that our faculties are weak, and that hence we have no right to constitute our capacity of thought into the measure of existence. Although then we are unable to conceive anything above the relative and finite, it is quite competent to us to believe in the existence of something unconditioned beyond the sphere of all that is conceivable by us. This doctrine was adopted by Mansel, dean of St. Paul's, and applied by him to determine the limits of religious thought. It was combated by John Stuart Mill. Consult: Mansel, 'Limits of Religious Thought'; Mill, 'Examination'; Sir William Hamilton, 'Discussions.'

Condom, kôn-dôn, France, a town in the department of Gers, on the Baïse River, which is here crossed by two stone bridges, 25 miles northwest of Auch. It contains an ancient church, a Gothic edifice, and in the outskirts are a number of handsome villas. The manufactures are porcelain, woolen yarn, leather, and brandy. It was formerly the capital of Pays-de-Condomois. Bossuet was appointed Bishop of Condom in 1669, but remained here only one year. Pop. 4,500.

Condona'tion, in law, a forgiveness of injury, such as to restore the person who has committed an offense to the same position which he or she held before it was committed. In

an action on the ground of adultery it is a legal plea in defense.

Condor, the popular name of the great vulture of the Andes, formed by a mispronunciation of the Indian name *kunter,* which, according to Humboldt, is derived from another word in the language of the Incas, signifying "to smell well." This species (*Vultur gryphus,* Linn., or *Sarcoramphus gryphus*) belongs to the family (*Cathartidæ*) of diurnal rapacious birds, and which is distinguished by the following characters: The bill is elongated and straight at base; the upper mandible is covered to the middle by the cere; the nostrils are medial, approximate, oval, pervious, and naked; the tongue is canaliculate, with serrated edges; the head is elongated, depressed, and rugous; the tarsus rather slender; the lateral toes equal; the middle toe is much the longest, the inner free, and the hind one shortest; the first primary is rather short, the third and fourth are longest.

The natural history of the condor was in a fair way to rival the ancient fables of griffins, basilisks, and dragons, or even of exceeding the roc of Sinbad the Sailor, in extravagant exaggeration, until Humboldt placed it upon the basis of truth. His careful measurements established the fact that the wonderfully gigantic condor is not generally larger than the lämmergeyer, or bearded vulture, of the Alps, which it closely resembles in various points of character. These birds prefer to dwell above all animal life, and at the extreme limit of even Alpine vegetation, inhaling an air too highly rarefied to be endured, unless by creatures expressly adapted thereto. From such immense elevations they soar upward until their great bulk diminishes to a scarcely perceptible speck, or is lost to sight. The condor is a carrion bird, and is quickly lured to the plains by the sight or scent of a carcass. To such a feast considerable numbers repair, and commence their banquet by first plucking out the eyes, and then tearing away the tongue of the animal; next to these the bowels are eagerly sought for, and devoured with that gluttony which distinguishes the whole vulture tribe. The appetite of these birds seems to be limited only by the quantity of food that can be gorged into their stomachs; and when thus overloaded they appear sluggish, oppressed, and unable to raise themselves into the air. The Indians profit by this condition to revenge themselves for the robberies which they commit upon their flocks, and, watching while they eat until flight has become exceedingly difficult, attack and secure them by nooses, or knock them down with poles before they can get out of the way. If the condor, thus loaded, succeeds in rising a short distance from the ground, he makes a violent effort, kicking his feet toward his throat, and relieves himself by vomiting, when he soon ascends out of reach. Many, however, are surprised, and are captured or killed before they are able to ascend. But the condor does not exclusively feed upon dead or putrefying flesh; he attacks and destroys deer, vicuñas, and other middling-sized or small quadrupeds; and when pinched by hunger a pair of these birds will attack a bullock, and by repeated wounds with their beaks and claws harass him until, from fatigue, he thrusts out his tongue, which they immediately seize and tear from his head; they also pluck out the eyes of the poor beast, which, if not speedily rescued, soon falls a prey to their voracity. It is said to be very common to see the cattle of the Indians on the Andes suffering from the severe wounds inflicted by these rapacious birds. It does not appear that they have ever attacked man. When Humboldt, accompanied by Bonpland, was collecting plants near the limits of perpetual snow, they were daily in company with several condors, which would suffer themselves to be quite closely approached without exhibiting signs of alarm, and never showed any disposition to act offensively. The nesting-time of the condor varies with the latitude, and the place selected for the nest is usually some inaccessible ledge of rock. It lays two white eggs from three and a half to four inches long, which are hatched in about seven weeks. The development of the young birds is very slow, since they are not able to fly until they are a year old, and they have to remain with the parent birds for a year or two longer. They are occasionally seen even on the shores of the southern ocean, in the cold and temperate regions of Chile, where the Andes so closely approach the shores of the Pacific. Their sojourn, however, in such situations is but for a short time, as they seem to require a much cooler and more highly rarefied air, and prefer lofty solitudes from 10,000 to 15,000 feet above the level of the sea. When they descend to the plains they alight on the ground rather than upon trees or other projections, as the straightness of their toes renders the first-mentioned situation most eligible. Humboldt saw the condor only in New Granada, Quito, and Peru, but was informed that it follows the chain of the Andes from the equator to the seventh degree of north latitude into the province of Antioquia. There is now no doubt that it ranges from nine or ten degrees north of the equator to the Straits of Magellan. The king vulture (*S. papa*) is another bird of the same genus.

The head of the male condor is furnished with a sort of cartilaginous crest, of an oblong figure, wrinkled, and quite slender, resting upon the forehead and hinder part of the beak for about a fourth of its length; at the base of the bill it is free. The female is destitute of this crest. The skin of the head in the male forms folds behind the eye, which descend toward the neck, and terminate in a flabby, dilatable, or erectile membrane. The structure of the crest is altogether peculiar, bearing very little resemblance to the cock's comb or the wattles of a turkey. The auricular orifice is of considerable size, but concealed by folds of the temporal membrane. The eye, which is peculiarly elongated, and farther distant from the beak than the eagle's, is of a purple hue and very brilliant. The neck is uniformly marked by parallel longitudinal wrinkles, though the membrane is not so flabby as that covering the throat, which appear to be caused by the frequent habit of drawing the neck downward to conceal or warm it within the collar or hood. The collar in both sexes is a fine silken down, forming a white band between the naked part of the neck and beginning of the true feathers, and is rather more than two inches broad, not entirely surrounding the neck, but leaving a very narrow naked space in front. The rest of the surface, the back, wings, and tail, are of a slightly grayish-black, though sometimes they are brilliantly black; the feathers are triangular, and placed over each other tile-wise. Humboldt

never saw male condors with white backs, though descriptions of such have been given by Molina and others. The primaries are black; the secondaries in both sexes are exteriorly edged with white. The wing-coverts, however, offer the best distinction of the sexes, being grayish-black in the female, while in the male their tips, and even half of the shafts, are white, so that his wings are ornamented with beautiful white spots. The tail is blackish, wedge-shaped, rather short, and contains 12 feathers. The feet are very robust, and of an ashen blue color marked with white wrinkles. The claws are blackish, very long, and but slightly hooked. The four toes are united by an obvious but delicate membrane; the fourth is the smallest, and has the most crooked claw. The largest male condor described by Humboldt was three feet three inches long from the tip of the beak to the tip of the tail; height, when perched, with the neck moderately extended, two feet eight inches; from the tip of one extended wing to the tip of the other, eight feet nine inches. Humboldt states that he never saw a condor which measured more than nine feet across the wings; but a specimen described by Dr. Shaw measured 14 feet. Notwithstanding, therefore, what is said by Humboldt of the general correspondence in size of the Alpine lämmergeyer and the condor of the Andes, we cannot avoid believing that a full-grown individual of the latter species would be much more than a match in every respect for any European species. The condor is peculiarly tenacious of life, and has been observed, after having been hung for a considerable time by the neck in a noose, to rise and walk away quickly when taken down for dead, and to receive several pistol bullets in its body without appearing greatly injured. Its plumage defends its body to a considerable degree from the effects of shot. It is easily killed when shot, or struck sufficiently hard, about the head.

A very similar species is the California condor or vulture, which may be easily distinguished from the true condor, which it nearly equals in size, by the lack of the white neck-ruff and of the caruncle of the male. The California vulture formerly ranged northward on the Pacific coast into British Columbia, but its habitat is said to be shrinking and now reaches only to Monterey on the north. The species may be approaching extinction. Like the condor, in addition to feeding on carrion, it attacks and kills young or sick animals, particularly lambs and calves. The rough nest of sticks, in which two dirty-white eggs are laid, is built on the ground, rock ledges, or stumps.

Condorcanqui, José Gabriel, hō-sā gä'-brē-ĕl kŏn-dōr-kän-kē' ("Tupac Amaru"), Peruvian revolutionist: b. Tinta 1742; d. Cuzco, 18 May 1781. He is called "The Last of the Incas," and in 1771 took the name of Tupac Amaru. In 1780 he incited the Peruvian Indians to rebellion against Spain, professing a design of restoring the dynasty of Manco Capac. This rebellion was the most important in South American colonial history. For three years the contest raged with doubtful success; at length, however, the natives fell away from him, and he was taken and executed. The cruelty of the Spaniards in this insurrection ultimately led to the independence of Peru.

Condorcet, Marie Jean Antoine Nicolas de Caritat, mä-rē zhŏn än-twän nīk-ō-lä de kä-rē-tä kôn-dōr-sā, Marquis de, French philosopher and mathematician: b. Ribemont, Picardy, 17 Sept. 1743; d. Clamat 28 March 1794. At the age of 21 he presented to the Academy of Sciences an 'Essai sur le Calcul Intégral.' His 'Memoire sur le Problème des Trois Points' appeared in 1767. Both works were afterward united under the title of 'Essais d'Analyse.' The merit of this work gained for him in 1769 the distinction of a seat in the Academy of Science. With astonishing facility and versatility Condorcet treated the most difficult problems in mathematics; but his genius inclined him rather to lay down beautiful formulas than to pursue them to useful applications. In 1777 his 'Theory of Comets' gained the prize offered by the Academy of Berlin. The aversion of the minister Maurepas to Condorcet delayed his entrance into the French Academy till 1782. During the troubles of the French Revolution his sympathies were strongly engaged on the side of the people. On the intelligence of the flight of King Louis XVI. he represented in a speech which was highly admired, the royal dignity as an anti-social institution. In the national convention, in which the legislative assembly was merged 20 Sept. 1792, he voted for the most part with the Girondists. On the trial of Louis he was in favor of the severest sentence not capital; at the same time he proposed to abolish capital punishments, except in case of crimes against the state. The fall of the Girondist party 31 May 1793 prevented the constitution which Condorcet had drawn up from being accepted. The constitution then adopted he attacked and was accused 3 October of being an accomplice of Brissot. To save his life he concealed himself, and was declared out of the protection of the law. While in hiding Condorcet wrote his curious 'Esquisse d'un Tableau historique des Progrès de l'Esprit humain,' full of enthusiasm for liberty. At Clamat he was arrested as a suspicious person by a member of the revolutionary tribunal of Clamat, and thrown into prison to undergo a more strict examination. On the following morning he was found dead on the floor of his room, apparently having swallowed poison. A collection of his numerous writings, complete with the exception of his mathematical works, appeared in Paris in 1804. Consult Arago, 'Biographie de Condorcet' (1849).

Condottieri, kŏn-dŏt-tē-ā'rē, a class of mercenary adventurers in the 14th and 15th centuries, who commanded military bands, amounting to armies, on their own account, and sold their services for temporary engagements to princes and states. The bands under command of the Condottieri were well armed and equipped. Their leaders had in many instances considerable military skill; but, as they took no interest in national contests, except to receive pecuniary advantages, the wars between them became a sort of bloodless contest, in which the only object of each party was to take as many prisoners as possible for the sake of the ransom. This singular system of warfare was put to an end by the more serious military operations of the French, who invaded Italy under Charles VIII. Though many Condottieri acquired much honor as well as emolument, one only attained to high rank and independent

power; this was Francesco Sforza, originally a peasant, who in 1451 made himself Duke of Milan, and transmitted that sovereignty to his descendants.

Conduction of Heat. See HEAT.

Conduit, kŏn'dĭt, in architecture, a long narrow passage between two walls or underground, for secret communication between various apartments, of which many are to be found in old buildings; also a canal of pipes for the conveyance of water, a sort of subterraneous or concealed aqueduct. The construction of conduits requires science and care. The ancient Romans excelled in them, and formed the lower parts, whereon the water ran, with cement of such an excellent quality that it has become as hard as the stone itself which it was employed to join. There are conduits of Roman aqueducts still remaining, of from five to six feet in height, and three feet in width. Conduits in modern times are generally pipes of wood, lead, iron, or pottery, for conveying the water from the main spring or reservoirs to the different houses and places where it is required.

Condurango, kŏn-dŭ-răng'gō, or **Cundurango,** the bark of the Marsdenia Condurango, a medium-sized twining plant of Ecuador and adjacent states. It is somewhat bitter; at one time it was much vaunted as a specific in the treatment of cancer.

Condylarthra, kŏn-dĭ-lär'thrą, a primitive order of ungulates of the early part of the Tertiary Period, collateral ancestors of the later hoofed animals, and connecting them with the primitive clawed animals, especially with the *Creodonta.* They were mostly of small size, five-toed, omnivorous, with bunodont teeth like those of the pigs, long tail, small brain and other primitive features. *Phenacodus,* of the Lower Eocene, of the size of a wolf, is the largest and best known. Remains of *Condylarthra* are found chiefly in North America, but also in Europe and in South America. They became extinct in the Middle Eocene.

Condyle, kŏn'dĭl, in anatomy, a protuberance on the end of a bone serving to form an articulation with another bone, and more especially applied to the prominence of the occipital bone for articulation with the spine.

Cone, Helen Gray, American poet: b. New York City 8 March 1859. Since 1899 she has been professor of English in the New York City Normal College. She is the author of 'Oberon and Puck: verses Grave and Gay' (1885); 'Baby Sweethearts' (1890); 'The Ride to the Lady and Other Poems' (1891).

Cone, Orello, American educator and author: b. 16 Nov. 1835. He was professor of biblical languages and literature in St. Lawrence University, N. Y., 1865–80; president of Buchtel College, Ohio, 1880–96; and has been Richardson professor of biblical theology in St. Lawrence University from 1900. He has published: 'Gospel-Criticism and Historical Christianity' (1891); 'The Gospel and Its Earliest Interpretations' (1893); 'Paul, the Man, the Missionary, and the Teacher' (1898); edited 'Epistles to the Hebrews, Colossians, Ephesians, Philemon, etc.' (1901); 'Rich and Poor in the New Testament' (1902).

Cone, Spencer Houghton, American clergyman: b. Princeton, N. J., 30 April 1785; d. 28 Aug. 1855. After a varied career as school teacher, actor, journalist, and government clerk, he was converted November 1813, and baptized into the fellowship of the Baptist Church, and soon began to preach with great success. He was chaplain of the House of Representatives, 1815–16; pastor at Alexandria, Va., for 7 years; of the Oliver Street Church, New York, for 18 years, and of the First Baptist Church in the same place until his death. He was president of the American and Foreign Bible Society, 1837–50, and of the American Bible Union from its formation until he died. For many years he was one of the most popular and influential clergymen of his denomination in the United States. There is a 'Memoir' of him by his son, Spencer Wallace Cone (1819–88).

Cone. 1. In geometry, the solid figure traced out when a right-angled triangle is made to revolve round one of the sides that contain the right angle; this is more strictly a right circular cone. A more comprehensive definition may be given as follows: Let a straight line be held fixed at one point, and let any other point of the line be made to describe any closed curve which does not cut itself; the solid figure traced out is a cone. The moving line is known as a generating line or generator of the cone. When the axis of the cone, that is, the line joining the fixed point to the centre of the closed curve, is perpendicular to the plane of the base, the cone is right; and when in addition the curve which the second point describes is a circle, the cone is a right circular cone. Cones whose axis is inclined to the base at any angle other than a right angle are known as oblique cones. If a cone be cut in two by a plane parallel to the base, the lower portion is called a frustum or a truncated cone. The geometry of the cone is important on account of the curves called conic sections, which are obtained by cutting a right circular cone by planes in various directions. The cubic content of a right circular cone is one third of that of a cylinder on the same base and of the same altitude. The cubical content of the cone is therefore found by multiplying the area of the base by the altitude, and taking one third of the product. The area of the slant or curved surface is obviously equal to that of a sector of a circle of radius equal to the slant height, and arc equal to the circumference of the base. It is therefore obtained by multiplying the slant height by the circumference of the base, and taking one half of the product.

2. In botany, a dry compound fruit, consisting of many open scales, each with two seeds at the base, as in the conifers; a strobilus.

Cone-Nose. A true bug (*Conorhinus sanguisuga*) of the family Reduviidæ, related to the bedbugs and having similar habits in the South; it is nearly an inch long, and black, blotched with red. In 1898 much excitement was occasioned in the North by newspaper accounts of attacks by "kissing-bugs," which were two related species, *Reduvius personatus* and *Melanolestes picipes,* the former frequently found in dirty houses feeding upon cockroaches, bedbugs, etc., and breeding in dusty corners. The bite is painful, but not poisonous.

Conepate, kō'nĕ-pāt, the name given in Mexico to the large white-backed skunk of that region. See SKUNK.

Cone-shells, or **Conidæ,** a family of ctenobranchiate *Gastropoda,* so called on account of their form. All the cones have a similar external outline; the aperture is long and narrow, the head of the living animal is more or less lengthened, the proboscis elongated, the foot is splay and abruptly cut off in front, the tentacles are rather widely separate and the eyes are placed on these organs. All of the species are carnivorous, and the bite of some of those found in the South Seas is reputed poisonous. Several hundred species have been described, about one fifth of them from tropical American waters. Owing to their beauty and variety the cones are much sought by collectors, who pay extravagant prices for the rarer forms. The textile cone-shells (*Conus textilis*), brought from Mauritius, a handsome species four or five inches in length, are marked with narrow, angular lines of dark brown, variegated with dashes of yellow and irregular white spots. It haunts the fissures and holes in rocks and the warmer pools in coral reefs. They all take a moderate range of depth, varying from 1 to 40 fathoms.

Cones, Pyromet'ric, or **Seger Cones,** instruments for measuring heat, consisting of three-sided pyramids about two and a half inches high and one half inch base. They are composed of fusible substances, and are graded so that they melt, each at its own temperature. The cones were invented by Dr. Herman Seger, of Berlin, for use in pottery kilns, and have since been largely adopted. An earlier method of heat measurement was the fusible alloys invented by Prinsep. Alloys of silver, gold, and platinum were so calibrated that they would, as to melting-point, cover the whole range between the two extremes of fusion of the metals. Many objections to these were found in practice, notably the expense and liability to loss. The Seger cones perform the same service and are very inexpensive. The cones range in numbers from 1 to 36 and back from .— 1 to .— 22. In practice two or three cones, approximating the required temperature, are set upright in the kiln upon a morsel of soft clay. The softer of them will, as the temperature reaches the proper point, bend over and melt, to be followed in regular order by the successive higher numbers. They can be easily seen through the hole left in the kiln wall for the inspection of trials.

Cones'si-bark, the bark of *Holarrhena antidysenterica,* a plant of India, used as a tonic, a febrifuge, and an astringent in diarrhœa. The plant is a shrub with opposite leaves and terminal cymes of flowers.

Conestoga, kŏn-ĕs-tō'gą, or **Conestogas,** a tribe of Indians belonging to the Iroquois linguistic stock, and formerly living on the lower course of the Susquehanna and at the head of Chesapeake Bay. At the time of the settlement of Virginia (1607) the Conestoga were at war with the Mohawks, whom they had almost exterminated. Later they became a source of serious trouble to the white settlers. With the Dutch and Swedes they were more friendly than with the English. By 1675 the tribe was holding land on the eastern bank of the Potomac River in Maryland. Giving way before the Iroquois they retreated southward, committing depredations upon the white settlements. Some of the refugees of the tribe escaped to North Carolina; others after submission to the Iroquois returned to the Susquehanna. In 1701 the Conestoga made a treaty with William Penn.

Coney, the name formerly given in England to the rabbit. In the western United States, the name is applied to a distant relative, the pika (q.v.), although this creature has little resemblance to the rabbit. The term as found in Scripture is a translation of the Hebrew *shaphen,* the local name for the Syrian species of hyrax, or daman. See HYRAX.

Coney Island, New York city, a small island in the borough of Brooklyn, about 10 miles southeast of the borough of Manhattan. It is about five miles in length and from half to three quarters of a mile in width; separated from the mainland by Coney Island creek. It is connected with the borough of Manhattan and Brooklyn by steam and electric railroads and steamboat lines. It is a noted day summer resort, and has numerous bathing houses, hotels, concert and other amusement halls, carousels, pavilions, electric lights, and a fine cycle path connecting it with Prospect Park, Brooklyn. Coney Island is divided into four sections: Sea Gate, the home station of the Atlantic Yacht Club; West Brighton; Brighton Beach, and Manhattan. There is a lighthouse at Sea Gate and many summer cottages, besides the Atlantic Yacht Club House. Sea Beach is the site of several charitable sanitariums, and is a popular pleasure resort. Brighton and Manhattan have extensive hotels, and are the preferred resorts for the wealthier class. Coney Island was one of the first landing places of the Dutch, and for over 200 years was considered a worthless waste. In 1840 steamboats began making excursions there, and for 25 years it was a popular resort. In 1875 steam railroads were built and since then the island has been the most popular resort in the immediate neighborhood of New York. In 1899 a scheme was proposed by the city authorities to purchase and reclaim a large portion of Coney Island and convert it into a public park. In 1903 the city opened a small public park on the island.

Confarreatio, kŏn-fär-ē-ā'tē-ō, the most solemn of the three ceremonies of marriage used among the ancient Romans. The other forms of marriage were *coemptio* and *usus.* These last are the only ones mentioned by Cicero, which shows that confarreation had fallen into disuse before his time. The ceremony was performed by the *pontifex maximus,* or *flamen dialis.* A formula was pronounced in the presence of 10 witnesses, and the man and woman partook of a cake of salted wheaten bread; part of which only they ate, the rest being thrown upon the sacrifice, which was a sheep. The cake was called *far,* or *panis farreus,* hence the term "confarreatio." By this form the woman was said to come into the possession of her husband by the sacred laws, and became a partner of all his substance and sacred rites, those of the penates as well as the lares. If the husband died intestate and without children, the wife inherited the whole property like a daughter; if there were children, she received with them an equal share. The offspring of this form of marriage were called *patrimi* or *matrimi;* and from them were chosen priests and priestesses, especially the *flamen dialis* and vestal virgins. In the reign of Tiberius, he wished for a priest of this pure

lineage, but the ceremony had fallen into disuse, so that three patricians thus qualified could not be found. Confarreatio could only be dissolved by a form of divorce equally solemn, called *disfarreatio.* The custom of bride cake is a relic of confarreatio; until within 200 years it was made of wheat or barley, without fruit.

Confec'tionery (Lat. "to put together," "compound," "prepare"), a general term for any preparation with sugar as a base, used as a sweetmeat and containing nuts, fruits, or other flavoring. In the United States confectionery is commonly called "candy," a name which suggests etymologically conserved fruits or seeds; in England "boiled sweets" is the usual term, derived from the commonest method of preparation. Historically the earliest use of confectionery was to disguise the taste of unpleasant medicines, a method dating back to the primitive smearing with honey the rim of a cup holding a bitter draught, a practice common with Greek and Roman doctors. The medicinal use was long the commonest, fruit conserves being the first exception. In Italy, even in the Middle Ages, *confetti* were used in the mock battles of the carnival maskers. The true development of the manufacture of confectionery begins in the 19th century, and in England, whence the trade spread after the great exhibition of English dealers at the Exposition of 1851, to Germany and France. The latter country took the lead in the manufacture of elaborate bonbons and confitures and was especially superior in its chocolate candies. But the greatest growth of the business and especially the greatest increase in the variety of confections has been in the United States. In the manufacture of cheap confections poisonous mineral dyes are used, especially for the more brilliant colors; and other dangerous adulterants, such as kaolin and terra alba, are employed.

Confectionery Trade in America. The early history of the confectionery business of this country is somewhat obscure, as little was published in relation to it until within the last 50 years. The term "confectionery" embraces a vast number of edibles or compounds that have sugar as a base or principal ingredient.

The art of manufacturing confections and sweet preparations was at first largely confined to apothecaries and physicians, who used sugar and honey to disguise their medicines; but in later years the making of confectionery became a separate and distinct branch of business, although the druggist is still dependent upon the manufacturing confectioner for an important line of his goods, known as medicated candies. Few modern industries have experienced more frequent or more radical changes during the last century than the confectionery business. Previous to the year 1851 the manufacture of "boiled sweets" was largely an English specialty, and its extension to other countries had its origin in the unique display of these goods made by the London confectioners at the first international exposition in that city in that year. The interest then attracted to the business gave it a new impulse and caused it to extend to Germany, as well as to France, which in the manufacture of chocolate bonbons and comfits excelled all other countries.

In the United States we find that as early as the year 1816 there were published the names of 20 confectioners in the city of Philadelphia who were manufacturing and selling candies. Among the pioneers in the business appear the names of Sebastian Henrion, who was succeeded by Henrion & Chauveau in the year 1844, and Sebastian Chauveau, who was the first to manufacture gum-drops, jujube paste, and marshmallows in this country. Another was Paul Lajas, who in 1831 changed his business from the manufacture of confectionery to that of sugar refining; George Miller in 1833, William N. Herring in 1834, S. S. Rennels in 1838, and J. J. Richardson. In the city of New York among the old-time confectioners were Ridley & Company, established in 1806, R. L. Stuart in 1828, James Thompson, John Stryker, and Delmonico Brothers. In Boston, in 1816, the names of Arnold Copenhagen, Lawrence Nichols, and William Fenno occur; and in Baltimore, Joseph Bouvey, Augustus M. Price, and John L. Bridges were pioneers in the business before 1831.

Previous to the year 1845 the manufacture of confectionery was in a somewhat crude state. As a rule each confectioner made his own goods, his stock in trade being limited to the ordinary stick candies, sugar-plums, and molasses candy, while all fancy goods were imported from France and other foreign countries. The introduction of machinery in the manufacture of confectionery has added much to the development and increase of the business. The foreign manufacturers were using some machines in their factories, but very little was done in the United States in this way until about the year 1845, when Sebastian Chauveau, of Philadelphia, imported the first revolving steam-pan used in the country; and in the year 1846 the first machine for making lozenges was invented and built in the city of Boston by Oliver R. Chase, who with his brother formed the firm of Chase & Company, and began the manufacture of lozenges as a special branch of business. In the year 1866 the first machine for making printed work or conversation lozenges was built and used by Daniel G. Chase, also of Boston.

Many improvements are constantly being made and new and improved machinery has been invented that is adapted to the manufacture of the various kinds of goods, and to meet the constantly growing demands of the business, so that the manufacture of special machinery for confectioners' use has become a separate and important industry. Nothing can convey a more complete idea of the wonderful growth and increase of the industry in the United States in the last half-century than the official census returns, as published at Washington from 1850 to 1890, with the following comparisons:

THE CONFECTIONERY INDUSTRY 1850 TO 1900.

Year	No. of Establishments	Hands Employed	Capital Invested	Total Wages Paid	Value of Material Used	Value of Product
1850..	383	1,733	$1,035,551	$458,904	$1,691,824	$3,040,671
1860..	541	2,340	1,568,478	668,423	2,991,186	5,361,100
1870..	941	5,825	4,995,293	2,091,826	8,703,560	15,922,643
1880..	1,450	9,801	8,486,874	3,242,852	17,125,775	25,637,033
1890..	2,921	21,724	23,326,799	7,783,007	31,116,629	55,997,101
1900..	4,297	33,583	35,155,361	10,867,687	45,534,153	81,290,543

Imposing as these figures are, they are somewhat misleading as to the real growth and

magnitude of the business. They take no account of the large amount in the aggregate that is produced by the small manufacturers in all sections of the country. They give only the result of production in the large manufactories, that are chiefly centered in the great cities. The great increase as noted between the years 1880 and 1890 shows a gain of more than 100 per cent in value of production in the 10 years, and in the succeeding 10 years, which closed the 19th century, though the former figures were not doubled the annual output of the large factories of the country reached the remarkable total of $81,290,543. In addition to the great increase of home production, the growth of the import trade has been an important factor. Previous to the year 1837 all confectionery that was imported was classed with sugars, but in that year the total importation as reported was 8,386 pounds, valued at $912. In the 10 years following that date the total of imports, as reported for the whole time, was only 12,000 pounds, at a value of $1,400. From 1847 to 1857, 258,374 pounds were imported, valued at $34,447; from 1857 to 1867, 260,860 pounds valued at $39,169; and from 1867 to 1877, 865,812 pounds, valued at $145,797. From 1877 to 1887 the total value of imports was $151,632; and in the eight years following, up to the present time, there has been a gain of more than 150 per cent, the total value being $387,152. The analysis of the returns shows that from the year 1837 up to 1849 the value of foreign confectionery imported in no year equaled that of 1837. But in subsequent years there was a gradual increase in the amount and value up to 1855, when the figures reached 74,371 pounds and $8,949 in value. From that date there was an irregular falling off in the importations until 1865, when there were 35,388 pounds, valued at $4,094. Following that period there was an irregular increase up to 1876, when the returns showed 87,955 pounds, valued at $18,500; and this increase continued in successive years until 1892, when confectionery to the value of $97,741 was received from foreign countries. This was the largest amount in any one year, the figures rapidly falling in the three following years, the amount in 1895 having dropped to $30,745. While the rapid increase and growth of our home market has made large demands upon the facilities of our manufacturers for their productions, the enterprise and push of the men who have been and are now engaged in the business has led them to reach out into other fields and larger markets.

The foundation of the American export trade in confectionery was laid in 1865, when goods to the value of $26,429 were exported. This was a good start, and with the exception of the following year, when none was shipped or the amount was overlooked, this branch of our foreign trade showed a fairly steady increase between that date and 1880, when the total export was valued at $81,757, the quantity in pounds not being given. Since then the United States has sent large amounts of confectionery to foreign countries every year, the amount increasing more than 10-fold in the years from 1881 to the close of the century.

Hence it appears that while our home market has been constantly broadening and extending, and the consumption of the products of our factories has largely increased, the markets of the world are being opened to us. Our foreign trade is steadily enlarging, American confections meeting with much favor in all markets where they have been introduced.

Of the important factors that have largely contributed to the wonderful development and growth of this industry, more especially in the last 35 or 40 years, may be mentioned the rapid growth and increase of our population during this period, the opening up of new territory, and the development of new industries that have resulted in bringing general prosperity to all classes of our citizens. The low price of sugars and other materials used in the manufacture of confectionery, together with the introduction of new and improved machinery in our factories, has made it possible to produce goods of superior quality at a comparatively low price, thus bringing them within the reach of the poor as well as the rich. There has been constant rivalry among our leading manufacturers to improve the quality of their productions.

The late Edward A. Heintz, of Philadelphia, who in the year 1874 established the 'Confectioners' Journal,' the pioneer trade paper in the interests of our business, and who through its columns constantly advocated progress and suggested improvements, thereby giving to the members of the trade a new impulse and inspiration, rendered incalculable service in popularizing the confectionery business among the people. The two great international expositions of Philadelphia and Chicago, where the fine display made by our manufacturers attracted the attention of the world, gave new importance to the industry and added much to the extension of the business. The organization of the National Confectioners' Association of the United States in the year 1884 was an important and prominent factor in this development. It was organized by and included in its membership all the leading manufacturers of the country, having for its declared purpose, as stated in its constitution, "to advance the standard of confectionery in all practicable ways, and absolutely to prevent hurtful adulterations; to promote the common business interests of its members, and to establish and maintain more intimate relations between them; to take united action upon all matters affecting the welfare of the trade at large."

The results of the work of this association are clearly manifest on every hand in the securing of necessary legislation in the different States whereby the manufacture or sale of any candy containing any harmful ingredients or poisonous colors is prohibited by law; by the effectual stamping out of adulterations in the manufacture of our goods, and by establishing in the minds of consumers a feeling of confidence in the purity of our productions.

The results of this combination of factors are shown in the investment of many millions of capital in this industry; in the building of large factories and warehouses for the transaction of its business; in the employment of many thousands of working-people in the manufacture of confectionery; in the enormous value of the annual product of all these establishments; and in the birth and successful growth of a competition in the United States against the markets of the world. Of the men who have been actively engaged in this development and growth of an important industry we may not speak in detail. Those who have honored their calling, men of

sterling integrity and uprightness of character, men of courage, energy, and foresight, constantly pushing forward toward larger and better achievements than their predecessors, would make a long list of names. Their work is evidenced in the record that has been made of the growth and development of an industry which, though small in its beginnings, has become a business of such large proportions as to be entitled to rank with other important manufacturing and mercantile industries of our country.

A. T. HAYWARD,

Confederacy, Daughters of the. See UNITED DAUGHTERS OF THE CONFEDERACY.

Confederate Veterans' Association, a federation of all organizations of survivors of the Civil War on the Southern side. This association was organized at New Orleans 10 June 1889. Its avowed purpose is strictly social, literary, historical, and benevolent. Its constitution says that it "will endeavor to unite in a general federation all associations of Confederate veterans, soldiers, and sailors now in existence or hereafter to be formed; to gather authentic data for an impartial history of the War between the States; to preserve relics or mementoes of the same; to cherish the ties of friendship that should exist among men who have shared common dangers, common sufferings, and privations; to care for the disabled and extend a helping hand to the needy; to protect the widows and the orphans, and to make and preserve a record of the resources of every member, and, as far as possible, of those of our comrades who have preceded us in eternity." State organizations are authorized, and are called Divisions.

REV. J. WILLIAM JONES,
President Southern Historical Society.

Confederate States of America, the name adopted by the southern States which seceded from the Union and formed a government at Montgomery, Ala., 9 Feb. 1861, comprising South Carolina, Georgia, Florida, Alabama, Mississippi, and Louisiana, with Jefferson Davis of Mississippi President, and Alexander H. Stephens of Georgia Vice-President. Texas, Arkansas, Tennessee, North Carolina, and Virginia afterward joined, and Missouri and Kentucky became disputed territory, the Federal Congress and the Confederate each receiving and welcoming delegations claiming to represent those States.

The act of secession was passed by each State in full confidence that the legal right peaceably to secede was assured by the Constitution. And if the interpretation of any ambiguous provisions or expressions in any contract is to be governed by the joint intent of the parties at the time of making it, this right to secede must be conceded by all impartial historians.

Goldwin Smith, the English historian, has written: "Few who have looked into the history can doubt that the Union originally was, and was generally taken by the parties to it to be, a compact, dissoluble, perhaps most of them would have said, at pleasure; certainly on breach of the articles of union."

Henry Cabot Lodge of Massachusetts has written: "It is safe to say that there was not a man in the country, from Washington and Hamilton on the one side, to George Clinton and George Mason on the other, who regarded the new system as anything but an experiment entered upon by the States, and from which each and every State had the right peaceably to withdraw, a right which was very likely to be exercised."

In 1803, at the purchase from France of the Louisiana territory, and again in 1812, at the declaration of war with Great Britain, influential and leading public men in New England not only asserted the right of secession, but urged its exercise, in the celebrated Hartford Convention (q.v.) in 1814–15.

Nowhere, however, until 1860, was the issue actually made. Had it been made in the earlier days, it would doubtless have been accomplished peacefully. But in all human affairs, political, social, moral, or commercial, there are silently but forever at work forces which make for the survival of the fittest, and the passing away of the unfit; and these forces, when at last a crisis has been reached, declare themselves, and operate with a volcanic power, against which the barriers of no constitution can prevail.

Within the lifetime of a generation the moral sense of a majority of the civilized world had grown to condemn the institution of slavery: and the invention of steam-power, railroads, and telegraphs had begun to knit communities into nations, to their great commercial advantage. The prejudices against slavery gave rise to issues between the sections of the country, which became inflamed by events — such as the raid of John Brown — until certain States were wrought up to the point of seceding.

But now — born, not legitimately of the Constitution, nor of consent between the States, (which could never have generated anything more cohesive than a rope of sand), but of inexorable laws of nature — there stood a giant in the path. Perhaps, indeed, it was of origin unsanctioned by legal form. But it was born of proximity and geographical dependency, and it was nourished by the prosperous tide of commerce already beginning to transform the entire world. It already felt itself the natural heir to the vast and rich territory within its grasp. There it stood in the way of peaceable secession — a young nation, which denied the right of secession and stigmatized it as rebellion.

In vain did President Davis plead his constitutional rights, in a message to his Congress: "We protest solemnly, in the face of mankind, that we desire peace at any sacrifice, save that of honor. In independence, we seek no conquest, no aggrandizement, no concessions of any kind, from the States with which we have lately been confederated. All we ask is to be let alone; that those who never held power over us shall not now attempt our subjugation by arms."

It needed now but a first blow to precipitate a war to the death. Concerning first blows, Richard Cobden once said: "From the moment the first shot is fired, or the first blow is struck, in a dispute, then farewell to all reason and argument: you might as well attempt to reason with mad dogs as with men when they have begun to spill each other's blood in mortal combat."

The first blow came speedily, but by deliberate intent of neither party. In Charleston a *status quo* had been agreed upon by both sides,

to permit negotiations. On 25 Dec. 1860, Major Robert Anderson seized Fort Sumter. He did so by night, without orders, and contrary to his instructions, abandoning Fort Moultrie and disabling its guns. President Buchanan was about to order him to return to Fort Moultrie; but before the order could be issued the act was approved so enthusiastically by northern politicians that he did not dare to reverse it. Holding Fort Sumter, he was then constrained to dispatch an armed force to provision and supply it. Thus the Civil War was begun, the Confederates not waiting for the arrival of the armed force, but making their attack.

This breaking out of hostilities brought into the Confederacy the Border States, not so vitally interested in the subject of slavery, but with every tradition and instinct keenly alert to their legal rights under the original Constitution.

This was the real issue of the War, and not slavery, as is often loosely asserted. It is attested, not only by the titles "Union" and "Rebel," universally applied to the two armies by the North, but by the passionate claim of the Confederates that their struggle was for that liberty of self-government so dear for ages to the Anglo-Saxon race. And at the Fort Monroe conference in February 1865 between President Lincoln and Vice-President Stephens, the South's surrender of her claim to integrity of the Union was the one point upon which Lincoln insisted, and the one which Stephens could not yield, although utter destruction awaited him scarcely 60 days off. It is further shown in the desperate character of the struggle upon both sides, involving, with equal ardor, individuals and communities of most diverse degrees of interest in the question of slavery.

The combatants were very unequally matched, and as each side was in deadly earnest, the final outcome of the contest was inevitable from its beginning. On the Union side was a population of over 20,000,000, with an army, a navy, a treasury, a highly developed system of transportation by land and sea, as well as of manufactures, of commerce, and of credit. On the Confederate side was a much scattered population, almost entirely agricultural, of about 5,000,000 whites, comparatively destitute of all those elements of military strength. Even their agriculture was so little devoted to food products that actual starvation of men and horses in their armies finally hastened the inevitable end.

Besides the whites, there was a population of 3,000,000 slaves. It was believed by many at the North that if their freedom was proclaimed by President Lincoln, as a war measure, while their masters were absent in the field, they would rise in insurrection, or at least desert their labor in mass. The experiment, however, being tried, proved a failure. The slaves generally remained faithful everywhere, except in the sections overrun by the enemy. During the four years of the war there were actually mustered into the Union army 2,898,304 men. The Confederate numbers cannot be accurately known, but the total white population between the ages of 18 and 45 was, by the census of 1860, 984,475. In 1864 the ages for military service were extended to include all between 17 and 50, an act which was described by Gen. Grant as "robbing the cradle and the grave." Nearly 2,000 battles and skirmishes were fought, and in them the number of killed and wounded on the Union side is officially given as 389,345. The numbers on the Confederate side are not accurately known, no complete records existing, but they are estimated at about 300,000.

Of lives lost in the war from battle, wounds, and disease, the official records of the Union army report 316,516. The lives lost in the Confederate army could not have been less than 250,000.

The Confederates appreciated the odds against them, but with firm conviction of the righteousness of their cause, they trusted to be able by fortitude and endurance to wear out and discourage their adversaries. The fighting was often very desperate as shown by the casualties upon both sides, which frequently exceeded the casualties of the severest battles of Europe. Upon three occasions, some historians have imagined, the Confederates were within reach of very important results.

At Bull Run, the first battle of the War, the Federals were more completely routed than ever again, and Washington might have been captured, it is supposed, had the victory been followed up. Gettysburg is considered by many to have been the crisis of the war, a desperate attack by the Confederates being repulsed. But there is strong evidence that the greatest period of discouragement on the Union side followed the battle of Cold Harbor, 3 June 1864. It was, however, of brief duration and of no effect. Successes elsewhere soon followed, and made it apparent that the Confederate resources were approaching exhaustion.

There are notable parallels between the war for the Union and the recent war between Great Britain and the Boers, in the issues involved, and in the course of their events. Like the Confederates, the whole of the Boer population considered themselves fighting for personal liberty as against subjection to a foreign power. Like the Confederates, the Boers fought practically without pay; and although they were inferior in numbers, their important engagements were generally victories; or, if not victories, were drawn battles. And as the end came to the Confederates, so it came to the Boers only with their utter exhaustion — through their being worn out, rather than defeated in battle.

But a great contrast is to be found in the treatment of the two peoples after their defeat. That of the Boer was liberal and generous, fully in accord with the civilization of the day. To parallel the treatment of the South every effort must have been made to put the political control of the country into the hands of the Kaffirs. Of course the efforts to give the negro political control over the Anglo-Saxon at the South were foredoomed to failure. They prolonged ill-feeling for 10 years; but subsequent events, notably the Spanish war, at last inaugurated a new era in which few traces of it yet linger. And it is due to history to record that it is unlikely that any such effort would ever have been made, but for the assassination of Lincoln. Although for this unspeakable crime and folly the South was in no way responsible, it brought upon her a whirlwind of resentment, and at the same time it removed a President who, there is evidence to show, had already risen to the height of his great opportunity as a statesman, and was now planning terms

of liberality upon which to reconstruct the Southern States.

Within the few days that intervened between the surrender at Appomattox and the assassination of Lincoln, one in his close confidence prophesied that his plans of reconstruction would "win over the South's good will and affection, and astonish the world." And in giving his plans effect, no one can doubt that he would have had the cordial as well as powerful aid of Gen. Grant, who had already set the example of magnanimity, and won the gratitude of Lee's army by the generosity of his terms of surrender.

History records no crime greater than that of the assassin, who cheated the civilization and humanity of the world of the great example which Lincoln would have set to all nations, and who sowed bitterness and ill-will between the sections, bringing poverty and distress to the South, to the North the mortifying failure of its political experiment, and to the negro only an injury. But in connection with the negro question, as it confronts us to-day, it may be remarked that the problem of the races can be safely committed to time, and to the racial instincts implanted by the Creator.

The Constitution which was adopted by the six States in Montgomery, February 1861, and in turn accepted by the others, was modeled closely after that of the United States. It forbade the slave-trade, or the importation of slaves from any foreign country other than the slaveholding States and Territories of the United States. It forbade "bounties" or "trusts," and provided a "tariff for revenue." It allowed the President to veto any part of a bill and approve the remainder, giving his reasons for such action; and fixed his term of office at six years, and made him ineligible for a second term.

The internal history of the Confederate States during the Civil War furnished a most instructive lesson as to the weakness of the bond by which they had associated themselves. Already, before the close of the war, it had proved itself but little better than the federation of the colonies for the Revolutionary War. The last message of President Davis to the Confederate Congress, and the answering report upon the message by a committee of the Senate, contained much crimination and recrimination, and revealed an utter loss of confidence between the executive and the legislative branches, fatally paralyzing all action, and impossible to be healed. In a letter to the secretary of war, on 5 March 1865, Judge John A. Campbell, assistant secretary, wrote: "The political condition is not more favorable. Georgia is in a state that may properly be called insurrectionary against the Confederate authorities. Her public men of greatest influence have cast reproach upon the laws of the Confederacy and the Confederate authorities, and have made the execution of the laws nearly impossible." In several of the other States there were also very serious issues between State and Confederate authorities.

In view of these facts, and of the history of all confederations of many small countries, it may now be clearly seen that the prize for which the South contended so strenuously would have proven but a calamity had she won it. There would have been in the country a condition of unstable equilibrium, with many centres of disturbance, which would surely have involved further division and probably further wars. To-day her people are citizens of a nation second to none in military renown or commercial strength, or in its power and influence for peace and civilization among the peoples of the earth. Were the right peaceably to secede, for which the South cheerfully endured all the bitterness of war, now tendered her as a free gift, every State would unanimously reject it as a curse.

Few generations of modern times have confronted sterner problems than did the men of the South in 1861. In the natural world, whenever the climate has changed, the fauna and flora have had to change to conform to new conditions. This is the law of evolution, the one great truth of which mankind may feel assured. It is not "Eternal Justice" which will prevail. It is "Conformation to Environment." And the natural resistance to change by all interests in possession, makes evolution mean war to the death of the least fit, and the survival of the fittest.

Had the South been quick to apprehend these truths, then being first published to the world by Darwin, she might have accepted compensation for her property in slaves, and surrendered her constitutional right to secede. Had she done so, over 500,000 lives, and $10,000,000,000 of property, would have been saved.

But the Anglo-Saxon is not a ready barterer of what he deems his "rights." Nor would any nation thus founded upon "consent" have commanded confidence, or ever inspired the national pride and loyalty which form the greatest treasures of a people. The conflict, with all its death and destruction, its sorrows, and its sufferings, was but the necessary baptism of this nation, legitimating its disputed birth by a verdict in the great high court of war, rendered in accordance with the laws of evolution, beyond which there is no appeal.

But while the generation which so lavishly poured forth blood and treasure may rightfully cherish to the last an ardent affection for its "Lost Cause," with its leaders and its heroes; not only its own children, but all succeeding generations, will enjoy great and enduring benefits and blessings, the very fruit of the desperation of its struggle, and of the utterness of its defeat.

And in its influence upon national character, and upon the standing of this nation among other nations, it is no small matter to have made the record for valor and devotion to principle which the South has set; or to have produced such leaders and types as Lee and Jackson and their colleagues.

Briefly it may be said that the rise and fall of the Confederate States of America constitute the most important feature of modern history, marking the sudden birth of a great nation. Such a nation could never have been founded in peaceful debate. The world may eventually reach a stage of development where such an event may be possible, but it had not done so in 1860. Previous to that date there was no assurance of stability to the nation. Since 1865 no convulsion could shake it. Succeeding years only demonstrate to the inhabitants of every section the increasing advantages of living in an undivided and an indivisible country.

Confederation, Articles of. With the American resolve to be free came the necessity of a government with defined legal powers, and the Continental Congress, on the same day (10 June 1776) it appointed a committee to draft a Declaration of Independence, appointed another, one member for each colony, to frame an instrument of government. This was entitled the "Articles of Confederation and Perpetual Union," and reported 12 July; but after debate on it till 20 August, it was laid by till 8 April 1777, and not adopted till 15 November. The Congress sent a circular to the State legislatures, recommending its acceptance, and under their instructions all but five States signed it 9 July 1778, North Carolina and Georgia following on the 21st and 24th, respectively. But there had already been wrangling and heart-burning over the question of the unsettled western lands (see TERRITORIES) which, if given to the respective States according to their theoretical limits, extending to the Pacific, would have made a few overwhelmingly great, and left others too small to maintain their rights, and New Jersey, Delaware, and Maryland held aloof, insisting that the uncolonized lands should be ceded to the general government, for the common behoof of the Union whose common sacrifices must win them. New Jersey, its judgment clarified by the fact of its commerce being at the mercy of New York, protested further that the new government should have power to regulate commerce; but it signed 26 November, relying on the "justice and candor" of the rest in the territorial matter. Delaware, under protest, joined 5 May 1779, but Maryland held off nearly two years longer, till New York had ceded a blanket claim to the entire northwest, and Virginia showed signs of yielding. It finally signed 1 March 1781, and the Articles went into operation as follows:

1. "The style of this confederacy shall be 'The United States of America.'" 2. Reserving to the States full sovereignty, and all rights not expressly delegated to Congress. 3. Declaring a mutual defensive league. 4. Securing mutual citizenship of freemen, and mutual extradition. 5. Organizing a single-chamber Congress; members elected annually by the State legislatures, and subject to recall at any time; each State to have two to seven delegates, but only one vote (population not being then ascertainable). 6. Prohibiting State alliances or treaties with each other or foreign countries, grant of titles of nobility, customs dues infringing treaties already proposed, maintenance of naval or military forces except militia, or engaging in war except on declaration by Congress or imminent danger. 7. Providing for national expense by requisitions of Congress upon the States, which were to levy the needful taxes within the time set. 8. Empowering Congress (but only on the consent of nine States for the chief powers and seven for the rest) to make peace and war, treaties, etc., save that no treaty should restrain States from laying customs duties binding on their own citizens, even up to prohibition, making it the arbiter of territorial disputes between States; empowering it to fix the standard of coins, weights and measures, to manage Indian affairs (subject to State legislation), and to regulate the postal service; to direct military and naval operations; to borrow money, and make requisitions for that and men on the States; and to appoint committees. The only function it could exercise at will, however, was to adjourn from day to day. 9. On minor matters it could delegate its powers during recess to a "committee of the States," one member from each, nine being a quorum. 10. Authorizing Canada to join, but no other colony except on vote of nine States. 11. Pledging the faith of the States for the money borrowed or appropriated by Congress. 12. Binding the States to abide by the votes of Congress and to observe all these articles inviolably, and declaring that "the union shall be perpetual"; the articles not to be altered except by vote of Congress, confirmed unanimously by the State legislatures.

The organized and carefully barricaded impotence of this scheme of government is probably unequaled in history, with any nation surviving, and is only to be accounted for by a mutual fear on the part of the States greater than their fear of the common enemy — which is usual in federations. The States were independent sovereignties, united in a league of which the first object was, not to guard against Great Britain, but against each other. Its units were the State legislatures, which made and minutely controlled it, of which the delegates were the mouthpieces, and through which every power had to be exercised; and a small minority of which could at any moment quench even its feeble vitality by recalling or not appointing their delegates. Its action was entirely confined to States; it could not even order an individual to do anything, much less compel him to do it; and even as to the States its nominal orders were only requests, which they could and did disregard. If it arbitrated their quarrels, they could disregard its decisions. A "perpetual union" but if any State chose to withdraw there was no power to prevent it except by requesting the others to wage war against it; and no power to bring it about. "Solemnly pledging" their faith to pay the requisitions and abide by the determinations of Congress, they gave no guaranty of the pledge but the empty words. Congress could pass laws and make treaties, but could not move to enforce them or punish their infraction, either by States or persons; could declare war, but not raise or maintain army or navy; could make appropriations, and constitute national departments, but not raise money to make good the one or operate the other; could borrow money, but not repay it. To cap the climax of a balance of powers which paralyzed all movement, while Congress was debarred from executing national functions, the States were debarred from exercising them; all initiative was given to one and all power to the other. And as commerce of any magnitude centred in a half-dozen seaports, the States owning them could strangle their neighbors and cripple the national revenue by levying interstate duties.

The practical result of the scheme more than fulfilled all theoretical calculations of evil. The

eight years of its duration, until the Constitution was inaugurated in 1789, cover the most deplorable and discreditable section of United States history; and foreign nations looked on with a perfectly rational expectation that the republic would shortly fall to pieces, and a fresh European struggle to become its legatees ensue. So distasteful to able men was service in this paper government, issuing edicts in the air, that political ambition sought careers rather in the State legislatures. While the Articles provided for 91 delegates from the 13 States, the actual attendance rarely rose to 30, the ratification of the treaty of peace with England was delayed for some time because only seven States were represented, nine being requisite, and it was not till 14 Jan. 1784 that nine were represented, with 23 delegates. The requisitions of Congress for money were refused or delayed, scarcely ever paid by any State in full and never on time, and generally but in small part and far in arrear. Hence, not only were the principal and interest of the debt heavily defaulted, but the very soldiers were left unpaid and almost unfed and unclothed till the end of the war, and then were only given a scanty sop in terror of their leaving the country to its enemies; and a few unpaid militia broke up the session of Congress in Philadelphia by hooting and pointing muskets at them. Treaties were made which the States and individuals on our part, and foreign nations on theirs, trampled on; American commerce was barred from the markets it held before the Revolution, the powerless Congress ignored, and the States offered treaties severally. The British government refused to surrender the northwestern forts on the ground of the States refusing to keep the agreements of the treaty of peace; and the people on the frontier were subjected to the horrors of Indian warfare, which the British commandants did nothing to check, and were accused of abetting. Lastly, an insurrection in Massachusetts (see SHAY'S REBELLION) overturned civil government there for months, and showed that there was literally no power in the country to preserve public order, for the States would not let Congress do it, and could not do it themselves. This gave the final impetus to the movement which turned a commercial convention into one for remodeling the entire framework of the government (see CONSTITUTION, FORMATION OF THE), and rescuing the country from an abyss of degradation and the brink of imminent ruin. The one good piece of work to be credited to the Confederation — due to its being a paper instrument which needed no material execution at the moment — was the framing of the Ordinance of 1787, for the government of the Northwest Territory, which barred slavery from it and furnished a fighting ground for others. On 14 July 1788, the ratification of the new Constitution by the requisite nine States was announced, to be inaugurated 4 March 1789. After 1 Jan. 1789, there was no business session of the Congress of the Confederation, there being only one or two delegates present, who adjourned from day to day (the single act not requiring the assent of seven States), till 2 March, when they adjourned *sine die*. The one useful function of the Confederation was in convincing the States that they must have something better; and without the miserable practical experience of the fact they would never have admitted it. Something of the kind was an absolutely inevitable stage in the existence of the Union; and there was much honest public spirit and ability put into — but for the utility just mentioned, one would say wasted on — its attempts at action. Consult Bancroft's and Hildreth's 'Histories of the United States'; Frothingham, 'Rise of the Republic'; and Curtis, 'History of the Constitution.' See UNITED STATES — ARTICLES OF CONFEDERATION.

Confederation of the Rhine. In the war of 1805, which turned out so unfortunately for Austria, several of the princes of the south of Germany allied themselves to France. The Peace of Presburg (26 Dec. 1805) gave the first impulse to the entire dissolution of the German empire, by conferring crowns on the electors of Bavaria and Würtemberg, and on both, as well as on Baden, complete sovereignty, such as had been already exercised by the other great German states. Ultimately 16 German princes made a formal declaration of their separation from the emperor and the empire, in the act of confederation signed at Paris 12 July 1806, by the kings of Bavaria and Würtemberg, the elector arch-chancellor of the empire, the elector of Baden, the new Duke of Clèves, and Berg (Joachim Murat), the Landgrave of Hesse-Darmstadt, and other less important rulers. Other princes soon joined, and ultimately the confederacy extended over a space of 125,160 square miles, with 14,608,877 inhabitants; and the confederate forces were increased from the originally stipulated number of 63,000 to 119,180. After Napoleon's Russian campaign of 1812 the whole structure fell to pieces.

Conference. 1. In general, a meeting for consultation, discussion, instruction, or the like; or any interview for interchange of views. The term is specifically applied to consultations between committees of the two Houses of Congress in the United States, and to similar consultations between delegates of the two houses of Parliament in Great Britain. Such conferences are usually called to discuss the provisions of a bill with regard to which the two houses are disagreed, with the object of effecting an agreement between them.

2. A term much used in ecclesiastical government, etc. The annual meetings of Wesleyan preachers in England for deliberation on the affairs of the body are called conferences. In the United States the Methodist Episcopal Church has an assembly called the general conference, which meets once in four years; numerous assemblies called annual conferences; district conferences; and quarterly conferences; these assemblies variously dealing with local or general interests of the Church. In the Roman Catholic Church there are instituted pastoral conferences, chapter conferences, etc.; and in various Protestant denominations there are stated local or general assemblies of chosen delegates from individual churches, who meet to consider or adjust denominational affairs.

Conferva, kŏn-fĕr'va, a genus of green algæ. Most of the species are marine, though a few are fresh-water.

Confes'sion, in law, is when a prisoner indicted of an offense, and brought to the bar to be arraigned, upon the indictment being read to him, and the court demanding what he can say thereto, confesses the offense and indictment

to be true. Confession, in civil cases, is where the defendant confesses the plaintiff's right; or, in prosecutions under penal statutes, by which confession there may be a mitigation of a fine against the penalty of a statute, though not after a verdict. When the confession is entirely voluntary on the part of the accused it is admissible as evidence; but if it is obtained through fear or by promises of escape, it is not allowed. If the confession is made in answer to questions not containing, or in any way implying threats or bribes, it is then admissible. See CRIMINAL LAW.

It is sometimes applied to a profession of faith; for instance, the Confession of Augsburg; the Westminster Confession. (See AUGSBURG, CONFESSION OF FAITH). It sometimes also signifies a religious sect; as the three Christian confessions — the Roman Catholic, the Lutheran, and the Calvinistic.

Confession, Sacramental, the act of a penitent accusing himself of his sins to a priest who has power to grant absolution: it is called auricular confession because addressed to the ear (*auricula*) of the minister of the sacrament of penance, and not made in open congregation: though of course were such public confession to be made the priest would, unless the laws of the Church should forbid, possess the same power of absolution as in auricular confession. The law of the Catholic Church as defined by the Council of Trent, requires that the faithful shall confess to a duly commissioned priest all their mortal sins, and advised to confess venial sins, committed after baptism and since a previous confession and absolution, so far as they can recall them by a diligent examination of their conscience. The penitent is strictly required to confess all his mortal sins, their kinds and their number as well as he can recall them: wilful concealment of a mortal sin or even of what the penitent may erroneously deem a mortal sin, renders the confession of the penitent and the absolution of the minister null, and both of these acts must be done over again and made good. If a penitent, after examination of his conscience, fails to recall any mortal sin he is under obligation to confess that sin afterward and to receive absolution for it. See ABSOLUTION.

Confession of Faith, Westminster, a document prepared by the Assembly of Divines which met at Westminster in obedience to an ordinance of Parliament issued 12 June 1643. The whole number of the Assembly amounted to 174 members, 32 of whom were members of Parliament appointed as lay assessors. The greater part of the Assembly were Puritans. One of the chief results of the deliberations of the Assembly was the framing of the Confession of Faith, intended to be that of the national Church of Great Britain. In England it nominally held this position for a short time. On the return of the Scottish commissioners it was laid before the General Assembly of the Church of Scotland, by whom it was adopted as the creed of the Church by the act of Assembly of 27 Aug. 1647. It has been adopted by the other Presbyterian churches generally, in some cases, however, with certain reservations. Its theology and discipline are thoroughly Calvinistic. See CREED; WESTMINSTER ASSEMBLY.

Confessional, in Roman Catholic churches and chapels, a kind of enclosed seat in which the priest sits to hear persons confess their sins. The confessional is often not unlike a sentry-box, the priest sitting within and the penitent kneeling without and speaking through an aperture. Many confessionals are in three divisions or compartments, the centre, for the reception of the priest; the side compartments, which communicate with the centre by grated apertures, are for the penitents.

Confessions of an English Opium-eater, The, a work by Thomas De Quincey, first published in the 'London Magazine' during 1821. The book is one of the most brilliant in literature. As an English critic has said, "It is not opium in De Quincey, but De Quincey in opium, that wrote the 'Suspiria' and the 'Confessions.'" All the essays are filled with the most unexpected inventions, the most gorgeous imagery, and, strange to say, with a certain insistent good sense. As a rhetorician De Quincey stands unrivaled.

Confes'sions, Les, an autobiographical work of Jean Jacques Rousseau. It was written during the six most agitated years of his life, from 1765 to 1770; and his state of health at this time, both mental and bodily, may account for some of its peculiarities. The first six books were not published until 1781, and the second six not until 1788. According to more than one critic, the 'Confessions,' however charming as literature, are to be taken as documentary evidence with great reserve. They form practically a complete life of Rousseau from his earliest years, in which he discloses not only all his own weaknesses, but the faults of those who had been his friends and intimates..

Confessions of Saint Augustine, The, the autobiographic memoirs of Saint Augustine, written in 397. It is divided into 13 books. The first 10 contain an account of his life down to his mother's death, and give a thrilling picture of the career of a profligate and an idolater who was to become a Father of the Church. Side by side with the pictures he paints of his childhood and of his wayward youth and manhood, we have his variations of belief and his attempts to find an anchor for his faith among the Manichæans and Neo-Platonists, and in other systems that at first fascinated and then repelled him, until his conversion at the age of 32. The narrative is intermingled with prayers (for the Confessions are addressed to God), with meditations and instructions, several of which have entered into the liturgies of every section of the Catholic Church. The last three books treat of the opening chapters of Genesis, of prime matter, and the mysteries of the First Trinity. They are, in fact, an allegorical explanation of the Mosaic account of the Creation.

Confessor, in the Roman Catholic Church has two principal significations. 1. Denoting a canonized male saint outside of the classes of the apostles, evangelists, and martyrs. The only saints, who in the earliest times were publicly venerated in the Church after death were, in addition to the Blessed Virgin and the apostles, the martyrs; and such are all the saints named in the Roman canon of the Mass, though the Milan canon (Ambrosian) has the name of other saints. 2. The other meaning of the

word confessor, the priest who hears confessions, answers to the more correct Latin word *confessarius.* The confessor, minister of the sacrament of penance, does not exercise that ministry simply in virtue of his having received priestly order: he must receive jurisdiction from the bishop of the diocese. The general law of the Church requires each of the faithful to resort to the confessional at least once in every 12 months, and to make confession each to his own parochus or parish priest: but under the law they may now lawfully confess to any priest who has due authorization from the bishop.

Confidential or Privileged Communication, in law, a communication made by one person to another which the latter cannot be compelled to give in evidence as a witness. The laws of the United States and of some other countries are, that all communications made between a client and his agent, between the agent and the counsel in a suit, or between the several parties to a suit, shall be treated as confidential; but in some minor points the practice varies in the different States. Legal agents are of course required to produce any papers intrusted to them by their clients, which the clients themselves would otherwise have been required to produce. The privilege of confidentiality regarding disclosures made to a medical adviser, even although it may have been necessary for the patient to make them in order to enable the physician to understand and treat his case, have not been defined by statute, but the custom has been that such communications are privileged. The same holds true regarding confessions made to a priest. No instances are cited where the confession of a penitent has ever been revealed by a priest. Communications made between husband and wife during marriage are in some States not admissible as evidence, although in most civil cases a husband and wife may legally be called as witnesses against each other. The laws in the United States differ in different States regarding the admission of testimony of husband or wife for or against each other.
