Dear Mother
I received
your letter

of the 10th
and was glad
to hear from
you

THE
AMERICAN
ADVERTISING DIRECTORY,
FOR
MANUFACTURERS AND DEALERS
IN
AMERICAN GOODS.

FOR THE YEAR

1831.

NEW-YORK :
PUBLISHED BY JOCELYN, DARLING & Co.
No. 36, Wall Street.

1831.

Act of Congress, in the year 1831, by JOSEPH
the Clerk's office, of the Southern District

lowe, New Haven.

P R E F A C E.

THE AMERICAN ADVERTISING DIRECTORY, is offered to the public as the result of strenuous efforts to render it worthy of the patronage it has received. In the prosecution of our undertaking, a wide extent of country has been traversed, though we have been restricted to some extent, by the severity of the past winter, as well as by the very general wish that the work should appear as early as possible. This difficulty will be obviated another year, by the arrangements which are made for an earlier commencement of the labors attendant on collecting the materials of the work.

We have been gratified to find that the plan has met with the warm approbation of those for whose use it is designed; and if the execution of this first volume should equal their expectations, it may be hoped that their continued and increasing support will insure a more complete fulfilment of our intentions in the next.

In the first Directory, the names, business, and address are given under an alphabetical arrangement of the Cities, Towns, and Villages, in which the several manufacturing or mercantile establishments are located. It has been deemed important to the work, as a book of reference, to give, as far as possible, the distance and direction of these towns and villages, from the important cities or towns nearest to them.

A Classified Directory, not at first contemplated, has been added, in which, under the various articles of manufacture, as headings, the names, firms, or companies of the first Directory are repeated in alphabetical order, and reference is made to the page of the first Directory where the address is given at length. The advantages of this arrangement must be apparent to all, and it has been added to the work in compliance with the wishes of many manufacturers.

A third Directory is also given in which all the names, firms, or companies, are arranged in one general Alphabetical Index, referring to the first Directory in the same manner

as from the second. Thus, under whatever circumstances it may become necessary to refer to any advertisement contained in the book, these arrangements afford every requisite facility.

A few names have been inserted which do not come within the appropriate range of our plan. This has happened through the misapprehension of some individuals at a distance, who have assisted in collecting materials for the work. A similar defect will be prevented in future, as our intention will be more fully developed in the present volume.

The returns from Bath, N. H., and Bennington, Vt., having been received after the printing was commenced, they will be found in an appendix at p. 149.

The Errata at the end of the book, contains all the errors which have been discovered. That some should occur, with every care, in such a mass of proper names, cannot be surprising, but the number of such instances is small.

In the miscellaneous department, with which the volume closes, credit has occasionally been given for extracts from other publications, but, as this has not been done in all cases, we deem it but just to say, that we are particularly indebted to the *American Journal of Science*, and to *Niles' Register*, for many interesting and important articles.

To the first and most obvious feature of the work, however, we wish to attach the greatest consequence. It is designed to be a book of reference and advertisement, facilitating correspondence, and bringing, in many cases, more extensively into view than before, the various pursuits of those whose advertisements are inserted. In this sense it will be of primary importance to many, while it is presumed that there are none, however extensively engaged and known, who may not derive essential advantage from it, in their correspondence and business transactions.

From the favor with which the plan has been regarded by Manufacturers and Dealers, we are induced to publish this work yearly, on the conditions first proposed. The volume for 1832 will be issued in April or May of that year.

New York, June, 1831.

DIRECTORY.

ALBANY, ALBANY Co. N. Y.

On west bank of the Hudson, 160 Miles N. of New-York, 170 W. of Boston, 356 N. of Washington City, 230 S. of Montreal.

MISCELLANY.

COTTON MANUFACTURE.

Extracted from an article in the valuable Encyclopædia Americana, now publishing in Philadelphia, by Messrs. Carey & Lea.

IN the United States, the progress of cotton manufacture has partaken of the characteristic energy and vigor of the country. It is only since the introduction of the powerloom, that it can be considered as having been established on a permanent and useful basis: the scarcity of skilful weavers, and the high prices of weaving, had been found serious obstacles to its success, which was secured by this invention. The first successful experiment with this instrument was made at Waltham, Mass., in 1815, applied to the coarser fabrics; but so rapid has been the extension of the manufacture, that, besides furnishing the U. States with its full supply of the more staple productions, and a considerable export of coarse goods, the beautiful prints of Manchester and Glasgow are imitated in great perfection; and more than half the consumption of the country, in this important branch, is supposed to be now furnished from native industry. The actual extent of this manufacture in the U. States at the present time, (1830), is matter of estimate only; a very moderate one is believed to be the consumption of 35,000,000 pounds of cotton per annum, manufactured into 140,000,000 of yards of cloth, of which about 10,000,000 are exported, and upwards of 20,000,000 are printed; the value \$12 to 14,000,000, and employing a capital of \$25 to 30,000,000. Several improvements originating in the coun-

try, have been introduced into the manufacture, and the whole process is believed to be performed to as great advantage as in any part of the world. The descriptions of cottons exported, are mostly of a coarse fabric, which are taking the place of the cottons of India, and are known abroad by the name of American domestics. They have been extensively imitated by the English, and a competition is going on, between the manufacturers of the two countries, for the possession of the foreign markets. It is thought, that the possession of the raw material on the spot, and the use of the comparatively cheap moving power of water, instead of steam, with the proximity of the great markets of South America, are advantages in favor of the U. States, more than sufficient to counter-balance some disadvantage in the higher cost of machinery, and as is commonly supposed, in the higher wages of labor. But the labor in the cotton mills producing these goods being wholly performed by females, has been ascertained not to be dearer than the same description of work in England; and as it is not easily applicable to any other branch of industry, it would seem not improbable, that this country will be the future source of supply, in coarse cottons, for foreign markets. The great profits attending this manufacture have attracted to it in a very short period, a great amount of capital, and produced a violent competition; the consequence has been a sudden reaction and great depression of prices, producing considerable embarrassment in those establishments operating with inadequate capital, and unable to meet the shock of impaired credit.

But, although individuals may meet with heavy losses by imprudent speculations, there is no reason to distrust the eventual success of the manufacture, which must soon find relief, under the increasing consumption of the country. The price of coarse cottons, in 1829, was less than one-third of the price in 1815. The increase of the production of the

raw material is even more wonderful than that of the manufacture. In 1791, the whole export of the United States was 64 bags, of 300 pounds each; the average of 1826, '27 and '28, is 235,000,000 pounds; and, if we include that consumed in the country, the average production is two hundred and seventy million pounds, valued at twenty-seven million of dollars; the price having fallen to about one-third of that of 1815. This reduction of price seems destined to cause a still further immense extension of the manufacture, which is rapidly taking the place of hempen sail-cloth, and the different descriptions of coarse linens.

DOMESTIC MANUFACTURES.

From the Pawtucket Chronicle.

WE believe, notwithstanding the recent embarrassments of many of our most enterprising manufacturers, that the prospects of those now engaged in the business, have not been brighter since the receipt of the news of peace with Great Britain, than they are at present. Our cotton manufacturers seem to be aware of their error in keeping the business in a single channel, and they are correcting it. The machinery, instead of running, as formerly, almost wholly on coarse sheetings and shirtings, is employed in almost as many branches as there are mills. The consumption of calico cloths has increased to a great extent. Some idea of which may be formed from the fact that the spindles now running in the village of Fall River are hardly capable of supplying cloth for the single calico factory there. The manufacture of domestic cambrics has been commenced. One establishment at this place consumes about eight thousand dollars worth of cloth per week, and another equally large is now going up at Providence. This is a new branch of business, and bids fair to employ quite a number of mills.

Besides all this, the manufacture of cotton duck has been commenced in this vicinity, with every prospect of success.

Amount of Cotton imported into Boston.

The cotton imported into Boston in the year 1830, was 46,203 bales, of which about 1,000 were exported, and 45,203 remained for the consumption. One ship could have taken all the cotton exported from Boston to foreign countries during the year 1830. Not a pound was shipped to either of the two great cotton markets of Europe, England and France; and only about 1,000 bales to other countries, principally to the north of Europe. The import for the consumption of factories was equal to 90 full cargoes of such vessels as usually bring cotton, while the import for that portion re-shipped to Europe was equal to only two cargoes. Here is a strong proof in opposition to the assertion that our factories are destroying our commerce.

Consumption of Cotton in Providence, R. I.

The consumption of cotton at Providence, R. I. and its vicinity, for the year ending 30th Sept. 1830, was 43,000 bales, worth 1,700,000 dollars. The cotton has been manufactured into about 70,500,000 yards of cloth, which has sold at about 9 cts. per yard, averaging the different qualities and prices, thus producing a gross sale of \$6,450,000. Of this sum a very great proportion has been returned to the south in payment for cotton and provisions.

Sales of Cotton Goods in Boston.

At the semi-annual sales at Boston, on the 18th of March, 1830, more than 2000 packages of cambrics, calicoes, prints, sheetings, satinets, tickings, &c., were sold at an average advance of nine per cent. over the prices obtained last year.

Sales of Domestic Goods in Baltimore.

It is stated that the actual sales, for consumption in Baltimore, during the last year, of domestic dry goods, cottons, woolens, and mixed goods of all sorts, amounted to nearly *five millions* of dollars. If to this great sum shall be added leather and its manufactures, works in iron, copper, brass and lead, chemical preparations, hats, glass, &c. &c. probably the aggregate was eight millions, about five of which was of their own production.

Cotton Canvass.

Cotton canvass is advancing more and more into favor. There are several large factories of it, especially at Patterson, (N. J.) Baltimore, and at Dorchester, (Mass.) The latter makes sixty pieces of thirty-seven yards each daily.

The amount of checks, stripes and gingham, manufactured in the state-prison at Windsor, (Vt.) annually, is from 250 to 300,000 yards.

Domestic Cottons exported to Chili, &c.

Nearly six hundred bales of American cottons were lately sent from Boston in one vessel for Chili, Peru, &c. The demand for these goods is on the increase.

Domestic Cottons exported to Calcutta.

The ship Rome, of Salem, carried out last season about 300 bales of American cotton cloths, which were sold at a high profit in Calcutta. The manufacture of cotton has almost entirely closed there. Scientific power prostrates labor, let it be ever so cheap, and the steam engine concentrates a force not derived from hundreds of hands.

Improvement in Cotton Spinning.

An ingenious mechanic in America, named Danforth, has invented a very simple improvement in spinning machinery, which appears to afford the means of producing the finest yarns, without the great risk of breaking, to which yarns of the higher numbers have been much subject when wound on the bobbin by the flyer, as heretofore. The contrivance consists of a stationary spindle, from the top of which a circular polished rim is suspended instead of the flyer. The bobbin being made to revolve rapidly, spins or twists the yarn as it descends from the drawing rollers, and the slight friction of the yarn, as it goes round against the stationary polished rim, aided by the assistance of the atmosphere, produces the retardation which causes it to lap up, or wind on, the bobbins. The invention is secured by patents in the different European States; that in England is in the name of John Hutchinson, Esq. of Liverpool. A number of machines constructed upon the above principle, have been in successful operation for some weeks in the factory of Messrs. Stirling & Becton, in Lower Mosely St.—*Manchester (Eng.) Courier.*

The Patterson Intelligencer says, that Mr. Danforth, the ingenious inventor of the Machine here spoken of, was, previous to his departure for Europe, a resident in that town. It was there where he succeeded in bringing to perfection his ingenious and valuable improvement in cotton spinning, and it is believed that the first spinning frame constructed upon Mr. Danforth's plan, as also the one taken out by him to Europe, was manufactured in the establishment of Messrs. Godwin, Rogers & Co. of that place, who, together with the Messrs. Carricks, we understand, are joint owners with Mr. Danforth, of the Patents taken out. From experiments made in England, it is said the improvement is equally adapted to machinery for spinning wool, flax and silk, as for Cotton, and is likely to be extensively used there in

each of these departments. If so, the proprietors of the patent will be enabled to realize an ample compensation for their liberal investments, from the disposal of their rights to manufacturers in Great Britain, and in this country. It is said that large contracts have already been made by Manufacturers in England, for the right of constructing frames upon this plan.

Comparative view of the imports of Cotton into the United Kingdom of Great Britain and Ireland, from the 1st of January to the 20th November last, and the imports for the same period last year.

Into the Kingdom this year.

The great increase has been in American Cotton, and chief decrease in the East India—the effect of the lower

price of the former than heretofore. The East India Cotton is in greater or less request, as the American rises or declines in price.

Culture of Silk.

An important report on this subject was made in the Congress of the United States, March 12, 1830. It appears,

1. That American silk is superior to any other; and that eight pounds of American cocoons will produce one of raw silk, while twelve pounds of Italian or French cocoons are necessary for the same purpose.

2. That although silk has been long manufactured in some parts of the United States, and particularly in Connecticut, it has not been done in the most profitable manner; for the sewing-silk of Connecticut is made from the best silk, while that of France and Italy is made from the refuse silk, and still is of a superior quality.

3. That the proper reeling of the silk is indispensable to its being duly manufactured into the finer fabrics.

4. That the climate of the United States is in every part of the country adapted to the culture of silk, as the hatching of the eggs is accelerated or retarded by the variations of temperature, so as to suit the putting forth of the leaves of the mulberry, which is easily cultivated from the seed, and grows in almost every soil.

5. That the United States, in the year ending Sept. 30th, 1828, imported silk to the amount of \$8,463,563, of which \$1,274,461 were exported, and that the export of the materials for bread in the same period amounted to only \$5,414,665.

6. That silk may in a few years become an important article of export from this country; for even France, although she raises much silk, annually imports to the amount of \$20,000,000.

The report of the committee is sustained by an interesting letter from Peter S. Du Ponceau, Esq., a gentleman equally eminent for his talents and learning, for his private excellence, and for his patriotic views towards this, his long since adopted country.

Mr. Du Ponceau strongly recommends the establishment of a course of instruction in the filature or reeling of the silk; and to this end he proposes that the government should afford the necessary patronage to a young man who is represented as every way qualified for the undertaking; namely, M. D'Homergue, who has already appeared advantageously before the public in his Essays on the culture of silk, in which he has been aided by Mr. Du Ponceau.—These essays are highly interesting and instructive; and granting that the facts are as stated, (of which we cannot entertain a doubt) they establish a very strong case in favor of the culture of silk in the United States. It is proposed that the course of instruction shall be given at Philadelphia. It will require two years from July 1 to Nov. 30; and sixty young men can be instructed, and may begin on the 1st of July, 1830.

In the mean time it is proposed to instruct twenty women, who shall be able to exhibit the filature in actual operation, when the young men shall assemble in the following year.

As there can be no filature without cocoons, it is proposed that Mr. D'Homergue should travel variously in the U. States to obtain them, and to promote as much as possible the culture of the mulberry tree and the raising of silk worms.

It is proposed to encourage by suitable bounties the planting of the white Italian mulberry tree, as silk worms and cocoons will naturally follow where this is done.

To this important and patriotic effort we wish all possible success; and it cannot be in better hands than those of the

gentlemen who have undertaken to promote it in the United States.

Dr. Pascalis has made great efforts and sacrifices on this subject. Mr. Du Ponceau is giving the weight of his character to the same object, and it is fortunate for this country that eminent natives of France, so long distinguished for the manufacture of silk, are bringing their knowledge and early partialities to bear on this subject, which is evidently of the greatest national importance.—*Journal of Science.*

A Letter from Frederick Rapp, Esq. to Gideon B. Smith, Esq. dated

ECONOMY, Pa. June 30, 1830.

SIR—Your favor of the 29th ult. came to hand in due course. I am in some measure surprised to hear that the small experiment which has been made by our society in the culture of silk, should have drawn the attention of travellers so much as to transport the news to the principal cities of our great republic, and while you apologise for your inquiry, I have only to say that I feel pleasure in giving any information in my power, on a subject which I consider of very great importance to the general welfare of our enterprising country, and for the promotion of which you have done so much. In reply, I would mention that in the spring of 1828 we made a beginning to raise silk worms, which has been attended with good success. We made of the first crop some 15 or 18 yards of stripe, for female apparel and vesting. Last year, having about 30,000 worms, we again made some vesting, and near 100 handkerchiefs, of good quality, being the first ever made on this side the mountains. We did not wish to sell any, but distributed them for the sake of encouragement among the members of our society, particularly among those immediately engaged in attending and promoting this juvenile branch of domestic fabrication. Finding the experiment to answer well, we

have erected a two story house, 24 feet by 44, particularly arranged and adapted for the worms, as well as the various operations of the silk manufacture, and have at this time near one million of worms in a prosperous condition; two thirds are now spinning, and done spinning. Having only about 1500 of the white mulberry trees, from two to three years old, which do not furnish food enough, we gather the leaves of the black mulberry, in the surrounding timber land, which has heretofore answered as well as the white. This season, however, having been very wet with us, the worms fed on the black did not continue so healthy, neither did they produce so large a cocoon as those fed exclusively on the white. It is more proper to confine one set of worms to the same leaf, as a change from black to white, or from white to black, does not agree so well with the worm. Females from 12 to 15 years of age are amply sufficient to attend to the worms within doors; the leaves are gathered and brought in by the school children after school hours. Upon the whole, we are highly pleased with the experiment, and consider it a pleasant and agreeable employment, mostly for a class of people, who in a general way, do not apply their time to the best advantage. Adhering to the instructions given in the "American Farmer," and books treating on the culture and manufacture of silk, we find no difficulty in keeping the worms healthy, unwinding, or reeling the silk, or weaving.

The culture of this commodity, and the manufacturing it, cannot be too strongly recommended to the American public, as the people of the United States possess climate and soil in abundance, for the attainment of this desirable object. Not many years have elapsed since the first attempts were made by our society to manufacture broadcloth by machinery, this side of the mountains: the undertaking was then thought preposterous by many persons; but that enterprise

has now been crowned with good success. Numerous wool and cotton factories have been erected to accompany the former, and I have no doubt that in a few years we shall see the third branch, even silk manufactories added to the number in our happy country.

Remarkable Hank of Silk.

A hank of silk, produced by a single worm, says Niles' Register, was reeled in Bolton, which was 365 yards in length, and on being weighed was found to be of the texture of 15,000 hanks in the pound. A single pound of this silk would reach 716 miles. The worm was only seven days in spinning the hank, consequently it produced at the rate of fifty two yards per diem.

James Smith, Esq. of Bladen co. N. C., it is supposed, has made the season past, one hundred pounds of fine sewing silk, besides the floss, worth about \$700, the product of 200,000 worms. A few colored children attended them. We hope to learn similar results from our farmers.

A Market for Cocoons.

The Editor of the American Farmer is authorized to say that any quantity of Cocoons will be purchased the ensuing season, by a gentleman who is preparing to erect a filature in Baltimore. From forty to fifty cents a pound will be paid for them, according to quality.

Proceedings of the Chamber of Commerce at Lyons, France, in relation to American Silk, January, 1830.

The Chamber had requested one of its members to cause to be assayed at Lyons, the silk that has lately been prepared at Philadelphia.

The assay took place recently upon a sample prepared by Mr. d'Homergue, of Nismes, son of Louis d'Homergue,

late proprietor of a splendid filature of silk in the said town. It results from that assay, publicly executed at Lyons, by Pierre Mazel, licenced assayer of silk, that the silk obtained in Philadelphia is of an extraordinary quality, and is admirably adapted to all the uses of fabrication. Its degree of fineness is 16 dwts. so that it would produce singles of 50 dwts. organize of 23; a quality of silk extremely rare in our country. American silk is fine, nervous, good, regular, clean, of a fine color; in a word it unites all the qualities that can be wished for. Its market price, in the state of raw silk, well reeled, according to its different qualities, well prepared, would be 26 francs a pound, and the sale of it at Lyons, would be very easy, particularly if there was a constant supply of bales, weighing from one hundred to one hundred and fifty pounds.

The Chamber of Commerce loses no time in publishing information so satisfactory. They ought, more than ever to excite the Americans to plant mulberry trees, and raise silk—a kind of industry that will afford great advantages to both countries, and may in future give birth to establishments of various kinds, and be a new source of wealth to the United States.

Silk in Bavaria.

Above two millions of sapling mulberry trees are thriving in Bavaria. A full grown tree yields a hundred pounds weight of leaves, but only one half is gathered in a season; so that the proprietors of these nurseries, if all the trees attain to maturity, will glean 100,000,000 pounds of leaves annually. The worms from a pound of eggs, when properly fed, consume half a ton of leaves, and yield at least fifty pounds of cocoons, or five pounds of wound silk. The product of these 2,000,000 trees, if nothing hinder their prosperity, will therefore amount to 500,000 pounds weight of silk, in value from 500,000 to 1,000,000 pounds sterling.

Foreign Wool.

The Foreign Quarterly Review has an article on the German wool trade, which contains the following facts. From 1814 to 1819 the annual amount of wool imported into England from Germany, increased from 3,595,145 pounds, to 4,557,938 pounds, and in 1828 it was no less than 23,110,822 pounds. At the same periods, the annual amounts of wool imported into England from New South Wales, were 32,971—7,284, and 1,603,512 pounds. Some of the New South Wales wool is said to be fully equal to the best Saxony. Great efforts are now made to improve the breed of sheep in Russia, as well as in Silesia, Bohemia, Poland, &c. Merino's are also spreading into Italy. Spain has lost her credit; many of the best flocks of Merino's were driven to France by Napoleon's generals, and those that remain have become so degenerate as not to be worth more than one third as much as the same stock in Germany. The average weight of a German merino fleece is from two and a half to three pounds. The average annual production of Wool in England is 111,160,560 pounds.

Sale of Wool.

It is a matter of congratulation that the raising of sheep appears to be of increasing importance from the reward obtained. We are told by gentlemen conversant with the subject, that the demand for wool, and price for the article is on the increase at home and abroad. In unison with this, the wages of the laboring woolen manufacturer in Europe are represented as better, and his business wears a more prosperous appearance. Some lots of wool were lately sold in this village—4,000 lbs. Saxony, not entirely choice quality, at one dollar per pound, and 3,000 lbs. half blood, at 75 cents.—*Poughkeepsie N. Y. Telegraph.*

Sheep.

The number of Sheep in England is estimated at 45,000,000 ; and in Great Britain and Ireland, probably amount to 60,000,000 ; in France to 35 or 40,000,000 ; in Spain to 15,000,000. In the United States their number has considerably declined within the last two or three years, because of the low price and dull demand for wool. In 1827, the number was supposed to be 15,000,000, now perhaps 13,000,000, and on the increase, because of the present better price of wool. In England, the flocks are chiefly kept for food ; but in the United States, for their wool—particularly the large flocks ; and herein is the imposing reason why the number of sheep has not amounted to perhaps 25,000,000. As our population becomes more dense, the rate of consumption of sheep for food will be advanced.

Indigo.

Extracted from an article in the American Journal of Science, Vol. XVIII, communicated by WILLIAM PARTRIDGE.--Persons interested in the Manufacture, will find much important information by referring to the original article.

The value of the indigo consumed in this country, for the year 1829, cannot be estimated at less than two millions of dollars.

Of the quantity consumed, there was made in the United States about two hundred thousand pounds, or one tenth part of the consumption.

As the consumption is rapidly increasing, from the increase of population, from the extension of manufactures already established, and from the introduction of new articles of manufacture, I consider it an object of national importance, that it should be better made, and more extensively cultivated in this country.

I have been acquainted with the indigo market for more than thirty years, and never remember it in so depressed a state as it has been for the last twelve months. The average price of the sales for the last year cannot have been much over one dollar per pound. The average price of the imported has been about one dollar and fifteen cents, and of that made in this country about fifty cents.

The quantity of indigo made from an acre of the plant has been differently estimated by almost every maker from whom I have obtained information. Gen. Wade Hampton, who many years since made the article in South Carolina, informed me that he obtained sixteen pounds of fine indigo from the plant taken from a half acre, or thirty two pounds per acre. Other estimates make the quantity much larger, some nearly two hundred pounds to the acre. Taking the average of the different estimates, it would be at least fifty pounds. It will appear by this estimate, that it would require forty thousand acres of land to raise a supply for the present consumption; and as the demand is rapidly increasing, it is more than probable, that in ten years, it will require the product of eighty thousand acres to raise a supply for home consumption.

There are four points to be attended to in the making of indigo, which require much judgment, aided by practical skill. These are, the time of cutting the plant, the degree of fermentation to be given in the steeper, the degree of oxidisement of the coloring ferculæ, and the extrication of foreign matter from the pulp after the indigo is made. Three of these processes being purely chemical, it is not therefore, surprising, that ordinary workmen should frequently fail in producing a good article. There is probably more loss sustained by our planters, from the ignorance of the operators, than the whole value of the article now sold.

It appears from analysis made by Bergman, Quatremere, and other chemists, that indigo of good quality does not

contain more than from 46 to 47 per cent of coloring matter, and that the very best samples do not contain more than 48 per cent.

The following table will exhibit an analysis of indigo of a good quality, and of the menstrua in which the impurities are soluble.

Mucilaginous parts separable by water, . . .	12
Resinous parts soluble in alcohol, . . .	6
Earthy parts soluble in acetic acid, . . .	22
Oxide of iron soluble in muriatic acid, . . .	13
Coloring parts almost pure, . . .	47
	100

There cannot be a doubt, that manufacturers of indigo might produce, by attending to the analysis made by chemists, an article far superior to any hitherto offered to the public. It will also appear certain, when experience shall have confirmed the value of a superior indigo, that a more than remunerating price could be obtained for a purer article. For certain purposes a pure indigo would command double, and even treble prices, provided the supply were not too great for the consumption. This being the case, it would be well for our manufacturers to pay some attention to the subject, and endeavor, by some easy unexpensive process, to bring it to as great perfection as possible. To promote this object, I offer the following extracts and observations.

Bergman dissolved, by means of ebullition in water, a ninth part of the weight of indigo.

Quartremere also separated, by means of water, the parts which are soluble. He states their quantity to be more considerable, the worse the quality of the indigo; and that, after this operation, the residuum has acquired the qualities of the finest indigo. He therefore proposes to purify what is of inferior quality, by boiling it in a bag, and renewing the water till it ceases to acquire color.

If sulphuric acid be diluted with water, it attacks only the earthy matter that is blended with the indigo, and some mucilaginous ingredients.

Muriatic acid digested or even boiled with indigo, takes up the earthy part, the iron, and a little extractive matter, which colors it yellowish brown, but without attacking in any manner the blue color.

It is evident from the analysis, that to make indigo far superior to any now brought to market, requires only an application of known facts to the art of making it. It is a well ascertained fact, that if indigo be boiled in water containing muriatic acid, twenty five per cent. of the impurities contained in the best samples would be extracted, and that the coloring matter remaining would form an indigo far superior to the best now offered for sale.

The best Bengal indigo, and I never remember it in a more depressed state, is worth, wholesale, one dollar eighty cents per pound. The average value of all the indigo imported from foreign countries is about one dollar and fifteen cents per pound, whilst the average value of that made in the United States is not more than fifty cents, and this great difference in the value is owing almost entirely to the great impurity of the article. The first object with our manufacturers, therefore, should be to make their indigo equal in quality to the best Bengal, and the second to go as far beyond them as is practicable.

Dyers as well as indigo planters, would be highly benefited by attending to the analysis of indigo. Were they, when a superior color is wanted, to boil the ground indigo in a bag as described by Quartremere, there would be no difficulty of obtaining the desired result from indigo of any quality.

Iron Manufacture.

Those who recollect the deplorable condition of the iron manufacture in the United States, in 1820 and 1821, and re-

gard its present state, may appreciate the benefit of the tariff laws of 1824 and 1828. In '20, '21, though iron was worth considerably more than it now is, in the public market, the manufacturers were involved in one wide ruin; but if not making money rapidly at this time, they are generally in full operation, cheered with the hope of better times, as new roads and canals shall be opened, and new mines brought into use, &c., and as they shall also gradually possess the whole American market. The contest for this has been, and yet is, sharp and severe, but only a little more perseverance is needed to make victory certain—a victory that even the most “*judicious*” of pretended friends of the tariff must regard as important, and which every friend of the independence of his country should rejoice in. It is impossible that we should look to Europe for the supply of iron, and maintain our prosperity. But this is not all; the victory will much reduce the cost of iron to the consumer through competition, and especially if internal improvements are zealously prosecuted. We have no way to arrive at the real value of what may be called the primary manufactures of iron in the United States, such as in furnaces, bloomeries, forges, rolling and slitting mills, &c., but think that we shall not be far from right in putting down that value at \$30,000,000 annually, and as employing not less than 35,000 men as wood-cutters, colliers, wagoners, founders, forgers and other agents; and perhaps not less than 5,000 more in the after transportation of their product, by land and water; with at least 5,000 horses in the whole; all to be subsisted by the products of farmers, and for themselves and their families, requiring a greater value in provisions, than perhaps all the States north of the Potomac export of the products of their fields. The number of persons subsisted by the workmen in these factories, from first to last, must exceed 200,000, and at \$25 a year for each, we have an amount of five millions. Cast these 40,000 men

and their families, and the 5,000 horses, into the production of grain, and what consequences would follow? A market for the millions that they now furnish, would be the first and least loss to the farmers for the price of bread-stuffs, and meats would decline in a far greater sum because of the surplus created; and the general value of lands in Pennsylvania for example, would be instantly reduced; timber and coal, in the interior, would be nearly useless, except for family purposes; the home demand being lost for them. This great business in America has been severely felt in England. This will appear from an extract of a letter from a careful observer in Staffordshire to his friend in N. York, dated April 11th, 1830. "Gospel Oak iron works are likely to stand in the course of two or three months; they have called their creditors together, and how they are to raise the money to pay them is unknown, as all their funds are exhausted, and no one will trust them with any material. The works are now working about three days in a week: such is the effect of the last American tariff, that it has ruined almost all the iron masters in Staffordshire; the distress of the iron works is beyond description."

Cut and Wrought Nails.

Mr. Jeremiah Wilkinson, of Cumberland, R. I. was probably the first person who made a cold, or cut nail. During the revolutionary war, he carried on the manufacture of hand cards, but finding it difficult to obtain tacks and nails for the purpose, (none being made in this country,) he conceived the idea of making them cold, and finally succeeded by cutting nails from thin plates of iron with a large pair of shears, which were headed in a smith's vice. Subsequently, improvements were made by several persons, until the machine has arrived to its present state of perfection, which has rendered the business one of the most important in our

country. Mr. W. made the wire for his cards, also made pins and needles, and although his pacific principles would not permit him to take up arms in the defence of his country, yet probably he contributed his full share towards gaining her independence. Another Rhode Islander has perfected a machine for the manufacture of wrought nails; they are made at the rate of 200 a minute, and their quality is fully equal to the imported wrought nail. It is said that the right of this machine was sold for \$100,000.

*Report from the Ordnance Department.—Armories and
Arsenals—Lead Mines.*

It appears from the report of the United States ordnance department, that 26,124 muskets have been made at the several United States' armories and arsenals, during the past year; also 90 gun carriages.

From the same report, it is seen that the rents which accrued from the public lead mines the last year, were 563,567 lbs., being 890,564 lbs. less than the rents of the preceding year. The quantity of lead made, was 3,332,056 lbs., being less than the product of the preceding year by 6,209,252 lbs. The falling off is to be attributed to the low price of the article for the last two years. The lead accruing to the United States in the shape of rents during the past year, would, if sold in the market, barely suffice to pay the expenses of collection: the supply from the mines is greater than the country requires, and unless a market for the excess be found in foreign countries, it is not to be expected that even this rate of production will be sustained. It appears from the treasury statements, that the whole quantity of lead, in all its various forms, imported during the ten years, commencing with 1819, has averaged 7,835,933 lbs., and that the quantity exported averaged 1,338,218 lbs., leaving for domestic consumption an average of 6,497,704 lbs. Prior to 1828, the product of the public mines had been so

considerable as to affect the market; but during that year more than 12,000,000 of pounds were obtained. In 1829, the public mines yielded 14,500,000 lbs., and the average for the last three years is more than 12,000,000, being about double the quantity consumed prior to the year 1829.

United States' Armory at Springfield.

This establishment, under the superintendence of Col. R. Lee, was inspected in October, 1829, by Brig. Gen. John E. Wool, Inspector-General of the U. S. army. In his report to the United States' government, he states that the affairs of the armory appeared to be conducted with system, accuracy, and great efficiency.

There had been completed, during the past year, 16,500 muskets; a greater number than have ever been fabricated before in one year. The expense of the establishment for the year, including repairs and other improvements, amounted to \$190,000.

The establishment was commenced in 1795: since that time to the 31st Dec. 1829, there have been manufactured at the armory 296,989 muskets, 250 rifles, 1,000 pistols, 1,202 carbines, 12,840 ball screws, 93,631 wipers, 139,700 screw drivers, 12,720 spring vices, 1,936 sets of verifying instruments for muskets, 2,890 arm-chests, and 46,545 muskets repaired. For all of which has been expended, including pay of officers and workmen,	\$3,700,559 76
During the same period, there was expended for lands, buildings, work-shops, coal houses, arsenal, &c. &c.	237,856 11
During the same period, for miscellaneous purposes	37,002 80
Total amount expended from 1795 to 1829	

\$3,975,418 67

The cost of each musket from 1795 to 1815, exclusive of lands, buildings, work-shops, machinery, &c., was \$12,34,

and from 1815 to 1829, \$11,75. The cost of each musket, as near as can be estimated, exclusive of repairs, improvements, machinery, &c., for 1829, will be about 10,66.—From our advancement in knowledge, and the improvements in machinery, a farther reduction in the cost of muskets is anticipated.

United States' Lead Trade.

There was received at New Orleans, from the mines in Missouri, Illinois and Michigan, in the years ending Sept. 30, 1822, 12,962 pigs; 1823, 41,123; 1824, 45,454; 1825, 58,479; 1826, 86,242; 1827, 106,405; 1828, 183,712; 1829, 146,203; 1830, up to March 30th, 100,288. Made at the upper mines, in the years ending December 31st, 1825, 489,473 lbs.; 1826, 1,560,536; 1827, 6,824,389; 1828, 12,957,100; 1829, 13,994,430. Made at the lower mines in 1829, (estimated) 4,500,000. On hand, Jan. 1st, 1830, at the lower mines, St. Louis, and the upper mines, (estimated) 12,000,000 lbs.; at Boston, March 1, 1830, 30,000 pigs; New York, do. 75,000; Philadelphia, do. 18,000; Baltimore, do. 18,000; Louisville, Cincinnati, Wheeling and Pittsburg, do. 2,000,000 lbs.

Sheet Lead Manufacture.

It is stated, that at the sheet lead manufactory, lately put into operation at Galena, (Illinois) by Messrs. Tilton & Parker, they are able to roll 5,000 lbs. per day. The lead is delivered from the rollers in sheets of fifty feet in length, and three feet breadth, and of any required thickness. It is believed that sheet lead will soon supply the place of shingles for the roofs of houses.

Mint of the United States—Operations, 1830.

Mint of the U. S. Philadelphia, 1st Jan. 1831.

SIR—I have the honor to submit a report of the general transactions of the mint within the last year. The coinage effected within that period amounts to \$3,155,620; comprising \$643,105 in gold coins, \$2,495,400 in silver coins, \$17,115 in copper, and consisting of 8,357,191 pieces of coin, viz. :—

Half Eagles,	126,351,	making	\$631,755
Quarter do.	4,540	“	11,350
Half dollars,	4,764,800	“	2,382,400

	8,357,191		\$3,155,620

Of the amount of gold coined within the last year, about \$125,000 were derived from Mexico, South America and the West Indies; \$19,000 from Africa, \$466,000 from the gold region of the United States, and about \$33,000 from sources not ascertained. Of the gold of the United States, above mentioned, \$24,000 may be stated to have been received from Virginia, \$204,000 from North Carolina, \$26,000 from South Carolina, and \$212,000 from Georgia. In the last annual report, the progressive development of the gold region of the United States was illustrated by referring to the increase of the annual receipts from North Carolina, which previous to 1824 had been inconsiderable, but from that year to 1829 inclusive, had advanced from \$5,000 to \$128,000, and also to the then novel occurrence of gold having been received at the mint from Virginia and South Carolina, about \$2,500 having been received from the former, and \$3,500 from the latter. The past year exhibits in relation to all those states a conspicuous increase

in the production of gold, and presents also the remarkable fact of \$212,000 in gold received from Georgia, from which state no specimen thereof had been presented at the mint in any previous year. The coinage above exhibited, exceeds the amount of any previous year; the demand remains, nevertheless, unabated, and the mass of bullion in the vaults of the mint, is large beyond any previous example. These facts confirm the expediency of the provisions for extending the mint establishment, and indicate that the measure has not been premature. In relation to the structure erecting under those provisions, I have the satisfaction to state, that, although its progress has been, during a part of the season, unexpectedly impeded, the preparations making for a vigorous prosecution of the work at the earliest practicable moment, authorize the hope that the commencement of the operations of coinage in the new edifice will be deferred but for a short period beyond the time contemplated when the foundation of the building was laid, namely, the fourth of July of the present year. Nor is a less confident hope entertained that the character of the structure as a public edifice, and its efficacy for the purpose of its destination, will be found to accord with the wishes of government, as indicated by the appropriations granted for the object.

I have the honor to be, with great respect, your most obedient servant,

SAMUEL MOORE.

The President of the United States.

Value of Gold.

The following statement from an authentic source may be interesting to some concerned in the gold regions of the South.

Standard gold, ($\frac{1}{2}$ fine), of the United States mint, is worth $88\frac{2}{3}$ cents per penny weight. Pure gold is worth $96\frac{9}{10}$ cents per penny weight. The gold of North Caroli-

na, as by assays at the mint, averages at 86 cents per penny weight. That of South Carolina averages at 96 cents. That of Georgia and Virginia 90 $\frac{3}{4}$.

Gold Mines of the Southern States.

The great richness of large portions of the Southern States, in this precious metal, will be seen from the following statements, which are sustained by respectable authority.

Charlotte, N. C. Nov. 22d, 1830.

We have been informed from undoubted authority, that at Mrs. H. Harris's mine, in Cabarrus co. there was found by Mr. Isaac M'Clellan, a few days ago, two thousand five hundred and forty pennyweights of gold, in one hundred and ten bushels of earth, one half of which was obtained from six bushels only. The whole was found in a vein about fifteen feet below the surface. This is the most extraordinary product that we have yet heard of, and the manner in which it was communicated leaves no doubt of its correctness. The whole amount of 2,540 pwts. was sold in this place.—*Miner's Journal.*

The *Salisbury Journal* says that a large vein of gold has recently been discovered, in the mine belonging to Messrs. Henderson & Wilson, near King's mountain, Lincoln co. the ore from which is said to be worth \$3,20 per bushel.

The *Rutherford Spectator*. says, We have just received a letter from R. L. Powell, Esq. an owner of one of the principal mines in Habersham co. Ga. from which we make the following extract.

“I will give you some little idea of the production of the mines in this country. I secured a few days since, out of the creek, a piece of gold which weighed 227 pennyweights, and 27 grains. I have no doubt in declaring my opinion

that gold is deposited in the same ratio with the magnitude of the stream it is found in. Our attention at present is a little turned to the hills; I think they will be equally profitable."

A remarkably rich deposit of gold has been discovered about 18 miles from Charlotte, N. C. The land on which it was found had been examined two or three years without success, but recently there was found in a small space, two or three feet below the surface, grains and masses of gold weighing from ounces and pounds, to pieces of five, seven, and eight pounds; in all about one hundred pounds, estimated to be worth about \$20,000.

On further pursuing the labor of digging, no more gold was discovered, and it seemed that this deposit was entirely isolated, promising no continuance of the extraordinary development.

Virginia Gold.

Mr. Lewis, a scientific gentleman of Spottsylvania has communicated many important facts in relation to the gold region in Virginia, which extends like a belt through Spottsylvania, and some of the contiguous counties. The gold is found on the surface, and in a stratum of quartz; but the most gold in quantity rests upon slate, and enters into its fissures. In this region gold is diffused over large surfaces, and is not sufficiently in mass to make mining productive of profit, excepting a few locations, richer than the others. The method of obtaining the gold is by filtration, or washing of the earth, and by an amalgam of quicksilver. Foreign or northern capitalists are said to have been attracted to this region, and, as the richer mines fall into their hands, more scientific methods of obtaining the precious metal may be resorted to with success.

Description of the Gold Mines in Georgia and the Cherokee Nation.

Gold is more generally found in small pieces and fine grains; sometimes, as in the mines in Habersham county, in smooth cubes, weighing from 150 dwts. to 2 or 3 dwts. It is found in a stratum of granite, stone and sand, one to two feet thick, resting on slate. It is frequently found in the cavities of the slate. Some experiments have been made in breaking the softer parts of the slate, in which also gold has been found.

The stratum of gold is near the surface. After digging off the soil, and the clay which succeeds it, probably one to two and a half feet deep, the stratum of gold is found. The margin of rivulets and creeks is selected for experiments, and gold has been generally found not only on the margins of water courses, but higher up on the sides of the hills;—the stratum of gold rising with the rise of hills, though not so rich as in the valleys. The extent of country containing gold has not been ascertained. It probably extends in length from the foot of the Apalachian mountains in North Carolina, to Alabama.—The width varies from 10 to 20 miles.

Native Gold in Vermont.

A mass weighing eight and a half ounces, of a conical shape, and having adhering to it a number of small crystals of quartz, has been found in New Fane, Vt. It occurred in an alluvial situation, consisting of thin strata of clay, sand, and water worn stones. The rocks, *in situ*, are all of the primitive class, consisting of hornblende, hornblende slate, and green stone porphyry, which are often found alternating with mica slate.

Russian Mines.

One of the periodical journals of St. Petersburg furnish-
es an interesting statement of the produce of the gold and
silver mines of Russia. From 1818 to 1823, the mines be-
longing to the crown had yielded 4145 pounds (livres) of
pure gold, and 340 pounds of pure silver; and the mines
appertaining to private owners, 10,385 pounds of pure gold,
and 821 pounds of pure silver. During the second half of
the year 1824, the crown mines afforded 970 pounds of gold
and 86 of silver, and the private mines 3,067 pounds of gold
and 245 pounds of silver.

Copper Mines in Connecticut.

A pamphlet has been issued, entitled *Proposals of the
Phenix Mining Company*, giving a view of the history and
character of the Simsbury Copper Mines, in the State of
Connecticut, and of the investigation lately made to deter-
mine the richness of the ore. It appears that they began
to be worked at a very early period of our colonial history.
When they were first opened is not known. An act of the
colony of Connecticut, relating to the Simsbury Mines was
passed in 1709, by which it appears that their discovery was
antecedent to that period. Early in the eighteenth century
they were worked under the direction of Gov. Belcher, of
Massachusetts, for the proprietors in London, Amsterdam
and New York. The business of extracting copper from
these mines continued to be carried on for about forty years,
during which the rock had been excavated to considerable
extent, and mills had been erected for stamping the ore.
Copper ore is set down among the articles of export from
the colonies to Great Britain, from 1725 to 1730. The
mines were abandoned, it is supposed, about the year 1744,
for causes which at the present distance of time, can only
be conjectured. They were afterwards used as the State

Prison of Connecticut, known by the name of Newgate, and the convicts were immured in cells framed in the ancient excavations in the solid rock.

An enterprise is now on foot for resuming the working of these mines. The Phenix Mining Company have purchased the mines and buildings which formerly constituted the prison, and have obtained leases of the neighboring farms, embracing about three miles of the mining field north and south, granting the exclusive privilege of mining for the term of 999 years. The pamphlet contains some testimony in regard to the richness of the Simsbury ore, and a comparison of its value with that of copper ores in other parts of the world. Samples of the ore have been assayed by various persons in Europe and in this country, by which it appears that their average product is about 12 per cent. of copper, being, as the pamphlet affirms it to be, nearly 50 per cent. more than the ores of Cornwall. Several certificates in respect to the value of these ores are given, by which it appears that the English smelters would pay for them an average of thirty three dollars per ton. Two other points are treated of, viz. whether the mines can be worked to advantage, and whether the ore is abundant—both which questions are answered in the affirmative.—*N. Y. Evening Post.*

Copperas.

In Shrewsbury, Rutland co. Vt. a mine has been discovered within a few years, from which copperas of a superior kind is manufactured—300 tons annually. From the richness of the mine, as well as the advantages of its location, it promises to become one of the most extensive establishments in our country.

A rich bed of iron pyrites has been discovered in Hubbardstown, Mass. from which copperas is manufactured.

Manganese.

A manganese mine has lately been discovered at Chittenden, Rutland County, Vermont, said to be superior to any found in America, from which already, from 150 to 200 tons are manufactured annually, and from 40 to 50 tons sold in a crude state. Having the necessary materials for the manufacture of bleaching salts—lime, coal, &c. it promises soon to be able to furnish a supply of that article equal to the demands of the whole country.

Emery.

An emery mine has been discovered near Wilmington, Delaware; it is better than the imported, and is going into common use.

Plumbago.

Numerous localities of this valuable mineral are known in the United States; and it is found in large quantities and of an excellent quality, at Sturbridge, in Massachusetts. It is very pure, soft and sub-crystalline in its structure. The saw cuts it easily into any form, and it admits of a high polish. The appearance of the melting pots and crucibles manufactured from it is excellent, and such a manufacture is an acquisition to the arts of our country.

It is said that forty tons of plumbago, of the quality above named, were taken from the mine during the last year.

A small specimen more recently examined, is found to be very fine, and it would seem is good enough for the manufacture of pencils. An eminent pencil maker in England, has written that it is inferior only to that of Borrowdale, and the appearance fully justifies this recommendation.

Middlebury Marble.

The marble factory at Middlebury, Vt. on Otter Creek, and owned by Messrs. Judd & Harris, manufacture from

10,000 to 12,000 feet annually, having in operation from 40 to 50 saws constantly. The marble is taken from a quarry immediately surrounding the manufactory, and for various purposes such as tomb stones, building stones, and ornamental work, it is of the finest quality. The black marble particularly, it is said, is capable of being wrought and finished in a style of elegance not surpassed by any in the world.

Cement for hard Stones, Porcelain and Glass.

This cement is a natural product, which, without being abundant, is in sufficient quantities for all ordinary uses. The large snails which are found in gardens and woods have a vesicle at the extremities of their bodies filled with a whitish substance, having a greasy and gelatinous appearance. If it be applied between two surfaces, whatever be their hardness or compactness, and the surfaces be brought together throughout, so strong an adhesion is ultimately occasioned, that if violent blows or thrusts be given to the substances, they frequently break elsewhere than at the junction. A flint about the size of the fist, having been broken into two pieces and rejoined by these means, being thrown with violence on the pavement, broke into fragments by fresh fractures crossing the former junction, but not going along with it. All that is necessary to give this cement its full power, is to allow it time to dry.

Salt Springs, and Manufacture of Salt at Salina, Syracuse, &c. N. Y. ; by STEPHEN SMITH, Superintendant at Salina.

From the American Journal of Science.

In the town of Salina, and State of New York, nearly equi-distant from Albany on the river Hudson, and Buffalo at the north-eastern extremity of Lake Erie, are situated the works, the most extensive in the United States, for the man-

ufacture of salt from natural brine. The indications of that substance along the margin of Onondaga Lake, were similar, as is believed, to those found at the salt licks so common in the interior of this country; and the knowledge of their existence was derived, by the travellers or white settlers who first visited this region, from the aborigines, to whom, we may presume, they must have been known for ages anterior to the discovery of the American continent by Columbus.

One of the earliest settlers in the county of Onondaga has informed the writer that, to procure salt for his family, about forty years since, he, with an Indian guide in a canoe, descended a small river, that discharges into the lake at its south-eastern termination, along the shore of which he passed a short distance to the right, and ascending a rivulet (now Mud creek) a few rods, arrived at the spring or natural discharge of salt water, which was obtained by lowering to the bottom, then four or five feet beneath the surface of the fresh water of the lake, an iron vessel, which, filling instantly with the heavier fluid, was drawn up, and the brine poured out. In this way, he got enough to make on the spot, by boiling, and without any separation of the earthy impurities that were held with the salt in solution, a small quantity of brownish colored and very impure salt. Since that time, other springs have been discovered, at various and almost opposite points on the shores of the lake, and many wells have been sunk to procure brine for the manufactories at the villages of Liverpool, Salina, Syracuse, and Geddesburgh.—The wells did not exceed eighteen feet in depth, and in the strength of the water which they respectively afforded there was great difference, which varied very much with the seasons, with this remarkable circumstance, that it sometimes diminished fifteen to twenty per cent., and in some instances one-third, as the adjoining lands, on the advance of summer,

became drained ; and the lake, which in the spring overflowed the wells, had subsided six or eight feet.

Until the close of the summer of 1822, the salt water had been pumped principally by men, who were then superseded by hydraulic machinery, capable of elevating to a height of seventy feet between fifteen and twenty thousand gallons per hour. Its operation produced a more rapid influx of the brine, with an increase of strength from twenty to twenty-five per cent., standing at 13° on the hydrometer of Beaumé, of which the point of saturation was 22° , and has continued at that degree, with very little change, to the present time.

In the course of the last eight years, a manufacturer at Salina, under a law of the state for the encouragement of the undertaking, has made several unsuccessful attempts, by boring in different places, to discover rock salt : and, within eighteen months, the same operation has been performed, with partial success, to obtain brine of increased strength and quantity. At one place, in Syracuse, the boring was two hundred and fifty feet, eighty feet lower than the deepest places in Onondaga lake, and principally through indurated clay, but the adventurers, meeting with very hard rock, supposed to be granite, the work was discontinued, without the discovery of any vein of salt or even fresh water. At another place, salt water of inferior strength appeared at the commencement, but at the depth of fifty feet the boring was abandoned, owing to the difficulty of forcing down the tube, of sheet iron, through a bed of rounded smooth stones, which were of every size from common coarse gravel to that of a man's head, and of a variety of colors and texture.

About a mile from the south end of the lake, and on the border of Onondaga creek, (the small river before mentioned,) among stones resembling those just described, a well had been sunk thirty feet, and the work suspended three years ; but last summer a tube was driven down in the cen-

tre of the well, fifty feet further, into a stratum, the thickness of which is undetermined, of clean washed gravel: ten feet from the surface of the ground the saltness of the water was first perceptible, increasing with the descent of the well, and afterwards of the tube, till the boring ceased at the depth of eighty feet, where it was found to contain twenty-two ounces of salt and impurities in the gallon. When the water of the well is lowered eight feet by pumping, the quantity discharged from the tube, which has the upper part cut off at that depth, is one hundred gallons per minute, and when the pumps are stopped, it rises to the surface of the earth and discharges in a small stream.

At Geddesburgh and Green Point, places on opposite shores of the lake, there has been boring to considerable depths, not over eighty feet, and other veins have been opened of salt water which is extensively used at the former place and Liverpool.

Three large metallic pumps, moved by the surplus water of the Erie canal, and one, worked by a small steam engine, raises the brine from the wells to the reservoirs, from which it is conveyed, by means of wooden pipes, to every manufactory.

A great number of plans and experiments, *called improvements*, have been or are still in operation, but the works erected for the making of salt, and now principally used, are denominated Blocks, Solar Works, and Steam Works.

The Blocks, constructed with potash kettles, containing from eighty to one hundred and twenty gallons each, are of the greatest extent,—the kettles are placed in masonry, in two parallel lines, having from eight to twenty in each line, (of course from sixteen to forty in a block,) under which there are separate passages for the heat, with fire places or *arches* at one end, and a flue or chimney, common to both, at the other end of the block. The fuel is exclusively wood, of the kinds most common in the forests of this part of the

country, such as beach, maple, elm, hemlock, bass wood, &c., of which the prices, for the last six years, have been from seventy-five cents to one dollar and fifty cents per cord, delivered at the works.

In the boiling down of the water to saturation, a portion of the impurities, sulphate and carbonate of lime stained with iron, is deposited in ladles and taken out, and the *vaporization* of the brine is continued until but a small quantity remains; when the salt which has been made, and which is, even at first, beautifully white and of fine grain, is taken out into baskets, drained, and removed; and the kettles are again filled with salt water, and the operation repeated. The inner surface of the kettles soon becomes firmly incrustated with a compound of the earthy substances and salt, which require frequent removal to prevent injury from overheating and cracking the metal.

Next in extent, or more properly in production, are the erections adjoining the Erie canal for evaporation by solar heat: they are vats of wood, resting horizontally upon a great number of small posts driven into the ground, according to the inequalities of the surface over which they are built, touching it in some places, and at a height of ten feet in others; but the most convenient height is between eighteen and thirty-six inches from the ground. Their width is eighteen and a half feet, depth from six to fifteen inches, and length from eighty to six hundred and forty feet; and they have roofs in divisions of sixteen feet each, sustained by rollers which travel on level supporters, and are moved on and off by the strength of one man. The water from the reservoirs is received first into the deepest vats, in which is deposited much of the iron or coloring matter, which appears in the form of a pellicle as soon as the temperature (at the wells it is 50°) is increased by the action of the sun or warm atmosphere. From those it is passed by means of pipes into vats of less depth, not exceeding six inches, and

at a lower level, in which it remains till, by the evaporation and consequent concentration of the brine, and the precipitation of sulphate and carbonate of lime, it is sufficiently depurated for the crystalization of the salt which will then begin to appear on the surface. The brine, leaving behind the substances that have been separated, is again drawn off into vats of a level still lower, which are kept clean, and in which the salt is made with greater or less rapidity, according to the altitude of the sun, the clearness of the atmosphere from clouds and moisture, and the strength of the wind. As the brine, by the formation of the salt in the last vats, diminishes, and as it is necessary that it be preserved of a proper depth, which seldom exceeds five inches, and should always cover the salt at the bottom, further supplies are drawn occasionally, and as they are needed, from the second gradation or tier.

The removal of the salt from the vats is without any regularity as to time or quantity, and is dependant upon the convenience of the manufacturer, who sometimes leaves it till there is an accumulation of three or four inches, or takes it out when there is barely enough to cover the bottom. It is shovelled into tubs, holding about one hundred pounds, in which it is drained for a few minutes, and, without further drying, is conveyed in carts to the store-houses.

The measured bushel will weigh from seventy-four to eighty-five pounds—the product of the slowest evaporation being the heaviest. When the weather has been clear and calm, and the salt water free from agitation, the surface has often been heated to 106° , while that in contact with or near the bottom of the vat was 122° , and, by the hydrometer, was ascertained to be specifically lighter than the upper portions.

The mother-water (remaining after the extraction of the salt) is a solution of the muriates of lime and magnesia, pos-

sessing a pungent taste, unlike the bitter in that from the ocean, and probably containing very little magnesia.*

It is estimated that the solar establishments at Syracuse, including the land necessary for the roofs and passages, occupy one hundred and ten acres; that the aggregate length of the vats is thirteen miles, and their superficial surface one million two hundred and fifty thousand square feet, of which the annual product is about three thousand five hundred tons.

The steam-works are similar in their construction to the blocks, the kettles of which are covered, to save the steam produced in the boiling of the water to saturation, and, by condensation in its passage through metallic pipes, immersed in the brine which is in deep wooden vats, the heat is applied a second time to the crystallizing of the salt.

Some of the earliest laws for the regulation of the manufacture were passed by the state of New York in 1797, anterior to which year the business was in its commencement, but has since been gradually extending; and last year, in the town of Salina, the quantity made was about thirty thousand tons, one million two hundred thousand bushels, of which the average price at the works, exclusive of the state duty, was twelve and a half cents per bushel of fifty-six pounds. It is commonly packed, for sale, in barrels that contain five bushels, and is inspected and branded before it can be removed.

“An account of the Salt Springs at Salina, by Lewis C. Beck, M. D.” published in the “New York Medical and Physical Journal, No. 18,” contains analyses of the brine, salt, and impurities, with geological and other information.

In regard to the saltiness of the water at the bottom of Onondaga lake, (very commonly called *Salt* lake,) it is ap-

* According to my experiments, there is, in that which I examined scarcely a trace of magnesia.—ED.

prehended that Dr. B. was misinformed, as an experiment with a bottle, let down in the way that he mentions, in the deepest places, about one hundred and fifty feet, brought up cold fresh water only. The following is his analysis of the brine, in which there is an omission of the iron, which evidently exists in the salt water of every spring yet discovered in this vicinity.

Carbonate of lime,	1.79
Sulphate of do.	4.20
Muriate of do.	3.48
Muriate of magnesia,	2.57
Muriate of soda,	143.50
		<hr/>
		155.54

The weight of the dry residuum from a like quantity of water was 156.

Water has been repeatedly taken from the different wells, as it flowed in from the earth, and where it could not possibly have been in contact with the iron of any part of the pumping machinery, and, on scraping into it some nutgall, with a piece of broken glass, there has been observed, in a short time, a change from limpid transparency to a purple color, which soon became green, and finally of a reddish brown; and, after standing two or three weeks, there was a dark brown deposit that covered the bottoms of the tumblers in which the experiments were made.

Bubbles of carbonic acid are continually escaping, and frequently in great quantity, from the brine of the springs.

Wheat.

The Waterloo, N. C. paper, states that upwards of 400,000 bushels of wheat have been purchased in that county during the last six months, a great portion of which has been purchased in that village.

FLOUR.

Exports of Flour from Rochester, N. Y.

Rochester has exported 529,725 barrels of flour in two years and a half, ending 1st Dec. last.

In one year to August 12, 1829, 88,374 bbls.

“ “ “ 1830, 235,216 “

August 12, 1830, to December 206,136 “

Of all which about 40,000 barrels were sent down the lake.

Manufacture and Trade of Rochester.

From the Rochester Daily Advertiser.

Our Mills now make over 2000 barrels of flour per day, and can make 3000, containing with two more, now building, 70 run of stones. Within the last 20 days we have sent \$50,000 in cash into Ohio for produce. This seems to be the natural market for cashing it from southwestern New York, and the western Lakes, destined for New York and Montreal, and it must inevitably be done here *almost wholly*, as this is the angle or turning point of water conveyance to both with equal convenience of transport to, and daily advices from each, giving the choice of a domestic or foreign market up to the moment of shipment. The choice enables us to pay the highest price that either will justify; while a place turning only to one, can pay only what this will warrant. Our wholesale trade has recently grown to be very extensive, and is fast increasing, reaching through our natural wheat region, and all along the western lakes, quite up to Detroit, and since the farmers of our interior have, by the two last good crops, and the lessons of prudence taught by the prior bad one, become freed from debt, and consequent dependance upon their neighboring retail shops, their cash taken here for wheat comes back to us in due time in support of a now rapidly increasing trade.

From the Hagarstown Torch Light.

Maryland.—There are in Washington county, upwards of sixty four flour mills ; those of the first class manufacturing 10,000, and those of the lowest say 500 barrels per annum. We are told that the average of the whole would not be high at 3,000 barrels. In this estimate the grist work for the consumption of the county is not included, but the flour sold by the barrel in our towns and villages is. With the latter deduction from the above statement, it is believed that we send annually to market 130,000 bbls. being about one-fifth of all the flour inspected in Baltimore. The purchase of wheat in Hagarstown alone, disburses \$1,000 per day during the whole year.

Carpet Weaving.

The business of manufacturing carpets in this country, has not existed much beyond four years, and yet with such signal success has it been prosecuted, and so good are the articles made, that the domestic manufactures have superseded the foreign ones, and they are now almost excluded from the market. One of the principal establishments in this country for weaving carpets, is at Tariffville, Connecticut, about eleven miles north west of Hartford, on the Farmington river ; there are four other establishments of equal magnitude in this country, namely, Enfield, Lowell, Great Falls, and Hights, near New York, which supply the American market, and are admitted by the most prejudiced individuals, to be equal to the best imported.

The village of Tariffville is wholly supported by the Carpet Factory, and numbers between three and four hundred individuals ; the Factory buildings consist of a spacious five story stone mill and a stone dye house ; a weaving house, machine shop and six other wooden buildings connected with the working departments ; there are sixteen dwelling

houses, besides tavern, stores, machanics' shops, and other buildings attached to the establishment. It employs eighty three males and forty two females, and pays out annually, for labor and fuel, about \$25,000 ; the quantity of wool used yearly amounts to 150,000 pounds, and much of it is brought from South America and the Mediterranean ; about 100,000 yards of carpeting are manufactured annually, and the capital invested amounts to upwards of \$100,000.

This establishment has been in operation only about three years, and has already an established reputation for the beauty and durability of its carpets. The process of weaving is singularly intricate and perplexing, particularly the formation of the figures and the intermingling of the various colors and tintings : this operation is performed entirely by males, principally by Scotchmen, whose skill and experience cannot be surpassed scarcely in Europe. The high price of wool has tended to enhance the value of American Carpeting ; but when our farmers turn their attention to the more general growing of wool, we may expect a vast quantity of money will be kept at home, and the price of American Carpets proportionally reduced.

Another carpet manufactory is just going into operation, in New Haven, Conn. on a liberal scale, for weaving carpets of a fine quality. Most of the workmen in this establishment are Scotchmen, who have recently arrived in this country.

Advantage of Machinery.

In 1769, Richard Arkwright, a Barber of Preston, invented the principal part of the machinery for spinning cotton, and by so doing he gave bread to about two millions of people, instead of fifty thousand ; and assisted by subsequent inventions, raised the importation of cotton wool from India,

from less than two millions of lbs. per annum, to two hundred millions; set in motion six millions of spindles, instead of fifty thousand; and increased the annual produce of the manufacture from two hundred thousand pounds sterling to thirty six million pounds. We make it cheaper, and we make it better. The trade in cotton, as it exists in the present day, is the great triumph of human ingenuity. We bring the raw material from the country of the people who grow it, on the other side of our globe; we manufacture it by our machines into articles which we used to buy from them ready made, and taking back those articles to their own markets, encumbered with the cost of transport for 14,000 miles, and encumbered also with the taxes which the state has laid upon it in many various ways, we sell it to these very people cheaper than they can produce it themselves, and they buy it therefore with eagerness. Mark, therefore, if the cotton spinners of Lancashire had triumphed sixty years ago over Arkwright's machinery, there would not have been a single man, woman or child, of those spinners, employed *at all*, within twenty years after that most fatal triumph. The manufacture of cotton would have gone to other countries; cotton spinning in England would have been at an end.

The same thing would have happened had the power-loom, 20 years ago, been put down by combination, that is, if the hand loom weavers had not been as well informed and as reasonable as we see they are. Mr. Fielding says, "The introduction of the power-loom, I conceive, will be the cause of saving the manufactures to this kingdom; without the power-looms, manufactories must be annihilated entirely, for the Americans are making use of the power-loom."

Distress caused by Manufactures.

The distress and miseries of the population of England is often attributed to the extent of her manufacturing estab-

lishments, but it is to the production of these establishments that England is indebted for a mighty power, which enables her to grasp the north, the south, the east, the west, to gather to herself much of the surplus profit of the wealth of all nations, and to be the Warehouse and Banker of the commercial world. Every body knows that it is her enormous civil and military lists, and priests rates, with her gigantic public debt, that oppresses her people. Taking in all these, and adding thereto the county and parish rates, the whole amount of the requisitions of the people of the United Kingdom cannot amount to less than four pounds per head—say twenty dollars—and sophistry, do what it may, labor at last pays the whole of it. The money is collected by the government of the landlord, by the landlord of the tenant, by the tenant screwed out of his hirelings, or created by the sweat of his own brow. There is no other way by which value can be produced—labor is the only source of it.

Now the taxes in the United States, including all the state and county requisitions, do not amount to \$2,50 per head. A family of six persons in the United States, paying \$15, would pay in the United Kingdom \$120. Here is the cause of British distresses—the reason why hundreds perish annually for want of food—the cause why squalid poverty is exhibited all over the country—why tens of thousands of persons, after laboring 14 to 16 hours in 24, go supperless to bed.

But we are not about to discuss this subject. Our object is to present facts.

I. *As to the sufferings of the people of England.*—A late London paper says, “the abstract of the returns of the poor rates levied in England and Wales, for the year ending March, 1829, which has just been distributed, proves that the statements of members of the Legislature, of a rapidly increasing poor rate, can at most have been founded on extreme causes. The total of the sums expended for the re-

lief of the poor in the year alluded to amounts to £6,332,410. The increase in some counties seems balanced by the decrease in others. In Lancaster, for instance, the decrease is 10 per cent. ; Yorkshire (West Riding) 3 per cent. ; Warwick 3 per cent. ; Nottingham 3 per cent. ; Somerset 3 per cent. ; Gloucester 2 per cent. ; Leicester 3 per cent. ; Norfolk 2 per cent. *In short, in all the manufacturing districts there is a decrease, more or less. In the agricultural districts again there is generally an increase.* In Suffolk it is twelve per cent. ; Berks ten per cent. ; Cambridge three per cent. ; Essex six per cent. ; Huntington six per cent. ; Wilts ten per cent. ; Sussex three per cent. Lancaster is one great work shop—Suffolk, Wilts and Berks agricultural counties. But the extract is sufficiently marked without further observation. Colquhoun says that the paupers in the agricultural districts exceed those in the manufacturing, as 2 to 1. We add the following facts from an article in the Edinburgh review. “The returns [of the poor rates] for the years ending in March, 1825, and in March 1828, are now before us. In the former year we find the poor rate highest in Essex—about 20s. to every inhabitant. Then came in Buckinghamshire, Essex, Suffolk, Bedfordshire, Huntingdonshire, Kent and Norfolk. In all these the rate is above 15s. per head. We will not go through the whole. Even in Westmoreland, and the North Riding of Yorkshire, the rate is not more than 8s. In Cumberland and Monmouthshire, the most fortunate of all the agricultural districts, it is 6s. But in the West Riding of Yorkshire, it is as low as 5s. ; and when we come to Lancashire, we find it at 4s.—one fifth what it is in Sussex. The returns of the year ending in March 1828, are a little, and but a little more unfavorable to the manufacturing districts. Lancashire, even in that season of distress, required a smaller poor rate than other districts, and little more than one fourth of the poor

rate raised in Sussex. Cumberland alone, of the agricultural districts was as well off as the West Riding of Yorkshire (a great manufacturing district.) These facts seem to indicate the manufacturer is both in a more comfortable and in a less dependant situation than the agricultural laborer."

II. *As to effects on the mind.*—A pamphlet has lately been published by Sir Andrew Haliday, combining a report of the number of lunatics and idiots in England and Wales, from which it appears that the number of insane, has been more than tripled, during the last twenty years. It has been remarked that insanity prevails more in England than in any other country. At present there are 6,806 lunatics, and 5,741 idiots—total, 12,547 in England alone according to the returns made by Sir Andrew. The average is about one to every thousand.

The disease is more prevalent in the agricultural districts than in the manufacturing population,—it is more general in the interior than on the seaboard,—and the laborers in the mines are less subject to it than those on the surface. In Wales there are 133 lunatics, 763 idiots; the proportion is one to every 800 of the inhabitants. In Scotland there were (in 1821,) 3,652 insane persons, about one to every 574 of the population. We have no means of determining the comparative number of persons who can read and write in the English agricultural and manufacturing districts—but at the present, and since the general introduction of Sunday Schools, we have no hesitation in believing educated persons in the latter, as two to one in the former.

III. *As to effects on morals.*—The facts before us are not numerous in this respect, but very imposing. Mr. Colquhoun, the best authority in England in such things, says that criminal cases, (according to population,) are sixty per cent. higher in the agricultural than in the manufacturing counties. In a certain part of Norfolk, out of 77 births, only

23 were legitimate. Manchester has nothing to compare with this. These facts afford conclusive evidence of the greater comfort, better morals, and superior intelligence of those who labor in factories. And there are substantial reasons for the two last especially, as shall be shown below.

IV. *As to health.*—In 1780, (when the manufactures of England were comparatively small, when labor saving machines were rare, and great establishments few, not perhaps one to twenty in 1820,) the average deaths in England and Wales was as 1 to 40, of the whole population—but as only 1 to 58 in 1820. In Manchester, the deaths were 1 in 28, in 1770—but in 1825, only 1 in 74—so says an extract from Silliman's Journal. In Lincolnshire, the deaths were as 1 to 62; in Sussex, the lowest of the English counties, 1 in 72, being less healthy than the crowded population of Manchester, filled with thousands pent up to labor in the factories, at least twelve hours in the day. It proves that the latter are better fed and clothed, more carefully attended to by those having charge over them, and better nursed and supplied when sick. We do not pretend that this large proportionate decline of mortality has been wholly caused by manufactures—it has been powerfully brought about by various INTERNAL IMPROVEMENTS, such as the draining of lands to furnish food for the manufacturers—the making of good roads and canals, by which fatigued and exposure is avoided, and a general advance in the comfort of persons oppressed as they are by an inquisitous government. We shall conclude with a few general remarks on the communities collected about our own manufacturing villages and hamlets. They are better clothed and fed—better educated and more virtuous than those of their own class scattered through the country.—Because

1. They have always means to feed and clothe themselves prudently. The display of one hundred and twenty

young ladies, from the Union Cotton Factory, near Baltimore, when the corner stone of the Baltimore and Ohio Rail Road was laid, by Carroll, of Carrollton, July 4, 1828, excited the wonder and gratified the hearts of fifty thousand friends of the "American System." And on Sunday, in all the manufacturing states, (though well dressed and cleanly all the week,) thousands of these "factory girls," appear at church, as neatly and as comfortably dressed, as the daughters of those who hold their hundreds of "involuntary laborers,"—or slaves.

2. They attend the Sunday Schools. Take all the Cotton and Woollen Factories, north of the Potomac, and there is not one child in twenty, of twelve years old, who cannot at least read, if employed two or three years, though drawn from the darkest "swamps of the Patapsco," or most rugged "mountains of Vermont," and from what is called the "lowest orders of society." Though as it regards extensive districts in some of the states, not one in twenty of this class, at that age, knows B from a bull's foot.

3. More virtuous—because they act as guardians over the conduct of one another, to preserve the good name of the establishment. It is a common cause with them; for these girls look towards a happy marriage and respectable standing; and know the value of reputation as well as those who are esteemed their "betters,"—being also in general more zealous to preserve it, as their most precious property. They would be suspected in doing what others may do, without censure, and they know it. The gentleman who took the census of Lowell, Mass. though daily occupied from sun-rise till ten o'clock at night, has stated that he had seen only *one* person under the "influence of liquor." 2,750 of the 6,477 persons which this town contains, are between the ages of twenty and thirty.—*Extracted from an article in Niles' Register.*

Live Oak.

From the Georgia Constitutionalist.

The Secretary of the Navy proposes to abandon the attempt made by the government to establish plantations of live oak. He supposes the navy can never be in want of this timber, when it is indigenious to the coasts of the United States, from St. Mary's to the Sabine; and he does not perceive the necessity of cultivating it from the acorn. We are not prepared to speak with certainty upon this subject, but it is one of the first importance, and much caution and investigation should be exercised before the policy already adopted is abandoned. The live oak, if we mistake not, is found to the north of the St. Mary's, but we think Mr. White of Florida, who is opposed to the Secretary's views, is correct when he says "the live oak is found sparsely scattered, at most remote distances, and in small bodies. If artificial culture be not resorted to, and the fires kept out of the reservations, there will not be enough, in fifty years to build a West India squadron." The same authority declares "there are seventy thousand live oak trees upon the land purchased by the government, which in a century, or even a quarter, will be worth ten times the amount ever expended upon them." The idea of planting acorns for the navy, has been sometimes ridiculed, by those who do not remember how true it is that "large oaks from little accorns grow." The most venerable grove we have ever seen was of live oak, the acorns of which had been planted seventy years ago. Whoever visits *Bonaventure*, near Savannah, will see that it is not impracticable to cultivate plantations of these noble trees. And in the woods of Florida, avenues of large oak are found, planted it is supposed by a race long since extinct—a race civilized and industrious, of whose existence no evidences now remain, but the scattered and worn implements of husbandry found in the soil, the traces of roads, and these majestic trees.

The manufacture of Wine from immature Grapes.

From a correspondent in the Georgetown, Columbian Gazette.

Although wine may be made in any stage of their growth and of any kind of grape, I would advise them to be left on the vines until they have attained their full size, and as the skin and stem of the unripe grape has no bad flavor, the grapes may be used in any stage of their growth. Grapes of different sorts and sizes may be mixed together. The following receipt is for ten gallons, which may be increased to any quantity by taking the fruit, &c. in proportion.

To a tub of the capacity of 15 or 20 gallons take forty pounds of immature grapes, (no matter for the variety whether wild or cultivated) and bruise them in successive portions by a pressure sufficient to burst the berries without breaking the seeds; four gallons of water are then to be poured into the vessel and the contents are to be carefully stirred and squeezed by the hand until the whole of the juice and pulp are separated from the solid matters. The materials are then to remain at rest for a period from six to twenty-four hours, when they are to be strained through a coarse bag, by as much force as can be conveniently applied to them. One gallon of fresh water may afterwards be passed through the marc, for the purpose of removing any soluble matter, which may have remained behind. Twenty-five pounds of clean sugar, either brown or white, are now to be dissolved in the juice thus procured, and the total bulk of the fluid made up with water to the amount of ten gallons and a half. The liquor thus obtained is the artificial *must*, which is equivalent to the juice of the grape. It is now to be introduced into a tub of sufficient capacity, over which a blanket or similar texture, covered by a board, is to be thrown, the vessel being placed in a temperature of from 60° to 80° of Fahrenheit's thermometer. Here it may remain

for twenty-four hours or two days, according to the symptoms of fermentation which it may show, and from this tub it may be drawn into the cask in which it is to ferment. When in the cask it must be filled to the bung hole, that the scum which arises from the bottom may be thrown off. As the fermentation proceeds, and the bulk of the liquor in the cask diminishes, the superfluous portion of the *must*, (viz. the half gallon,) which was made for the express purpose, must be poured in so as to keep the liquor still near the bung hole. When the fermentation becomes a little languid, which may be known by the diminution of the hissing noise, the bung is to be driven in and a hole bored by its side, into which a wooden peg is to be fitted. This peg may be drawn once in two or three days, for a few minutes, to let the air which has been generated escape; and in about three weeks or a month it may be drove in permanently tight. The wine thus made must be put into a cool cellar, as it is no longer necessary to promote the fermentating process. If the operator is not inclined to bestow any further labor or expense, he may examine it in some clear cold day in January or February, or the beginning of March, when, if it is fine and bright, as it frequently will be, it may be bottled without further precautions. To insure its fineness, however, it is the better practice to rack or decant it, towards the end of December, into a fresh cask (fumigated with sulphur) so as to clear it of its lees. At this time also, the operator will be able to determine whether it is not too sweet for his views. In this case, instead of racking it, &c. he will stir up the lees, so as to renew the fermenting process, taking care also to increase the temperature at the same time. At whatever time the wine is racked it ought to be fined. Sometimes it ought to be racked the second time, (*if the wine is not perfectly bright,*) and again repeat the operation of fining. All these removals should be made in

clear, dry, and if possible, in cold weather; in any case it must be bottled during the month of March. The wine produced will generally be brisk and similar in its qualities to the wines of Champaign, with the strength of the best Sillery.

The culture of the vine is extensively increasing. More than 100,000 lbs. of grapes are said to be annually raised in the vicinity of Boston.

American Hemp.

A quantity of *American hemp* was exhibited in Boston, last year, grown and fitted by the Northampton hemp company. The company had then in preparation for market, more than one hundred and thirty tons of hemp grown the past season. This quantity at \$200 per ton, which is not more than the average price for this article, of a good quality, will amount to the sum of \$26,000. It is said that this quantity of hemp is the product of about four hundred acres of land, yielding on the average about sixty-five dollars to the acre; and this too when the season was known to have been extremely unfavorable for this crop. This enterprise is highly creditable to the individuals engaged, to the state, and to our country. It is also a profitable business to the growers, and to those who prepare the hemp for market.

Strength of American Hemp.

An experiment was made at the navy yard, Charlestown, Mass. by the officers of that station on the relative strength of American and Russian cordage. The result will be highly interesting to the American public.

First experiment : a single yarn of Russian hemp raised	} 69 pounds.	
Second "		71 "
Third "		68 "

A single yarn of American hemp, of the same size and length, raised,

First experiment,	80 pounds.
Second “	79 “
Third “	91 “

250

Thus giving the American hemp the preference in the three trials, in point of strength, of more than 20 per cent.

Two deep sea lines of equal size, length and weight, one made of Russian, and the other of American hemp, were then connected and force applied; when the Russian parted. They were again joined, positions reversed, and on the application of force, the Russian parted again.

Two three inch ropes of equal size, length and weight, the one made of Russian and the other of American hemp, were thereupon fastened together, and force applied, when the Russian parted without in the least fracturing the American. It is proper to add that the cordage thus tried, was made of the best Russian clean, and the common hemp from the Northampton machine.

Tariff and Manufactures.

January 13, 1831.

Mr. Mallary, from the Committee on Manufactures, to which the subject had been referred, made the following

REPORT :

The Committee on Manufactures, to whom was referred so much of the President's Message "as relates to the tariff of duties on imports, and so much thereof as respects manufactures," report :

That they have taken this delicate subject into full consideration. This was due alike to the source from whence a review was recommended, and to the importance of the

subject itself. They feel confident that they have done it without mingling with the operation of their reasoning powers unreasonable "likes and dislikes," either to the system of protecting domestic industry, or to the views expressed by the Chief Magistrate.

It is not the intention of the committee to present to the House a mass of statistics or labored arguments in favor of the protecting system. In the recent discussions of the tariff, all that could illustrate theory, or be proved by experience in our own and other countries, has been presented. Our Government has adopted, and endeavored to sustain, by repeated legislative enactments, a policy which has had the sanction of Washington, Jefferson, Madison, and Monroe. It has been sanctioned by "the continued acquiescence of the States, and the general understanding of the people." Confidence in its permanent duration is warmly inspired. It is this alone which can give it vigorous and successful action. A system of protection may appear perfect on our statute books, and yet be useless to the country, if exposed to perpetual danger. Skill, already matured, will not venture upon uncertainty. The power of invention will never be exerted, if it has no confidence in the promise and repeated promise of support. Capital will never come to the aid of skill and enterprise, if it has no security for investment. It must have confidence; it must find solid honesty in individuals, as well as firmness in government, or it will not be employed.

During the last session of Congress, the declaration was often repeated, that the system of protection should and would be maintained. It was presumed to have come from the people, and dictated by them to their representatives. This was expressed by the most decisive majorities in Congress, on repeated occasions.

Its effects, so far as they have been developed, have answered the hopes of its most ardent friends. Capital flows

widely, and freely through our extended country. The genius of our people has been stimulated to greater and more diversified exertion. The useful arts are improving in every form that stern necessity or elegant taste may desire.

The committee most cheerfully concur with the President in the animated view which he has taken of the condition of our country. They adopt his language in describing that condition. "With a population unparalleled in its increase, and possessing a character which combines the hardihood of enterprise with the considerateness of wisdom, we see in every section of our happy country a steady improvement in the means of social intercourse, and correspondent effects upon the genius and laws of our extended republic." This is the language of truth and justice. It forms a subject of high and deep congratulation to every patriot mind. While other nations are suffering under oppressive burthens, or convulsed with bloody revolutions, we witness among ourselves, in general, a calm and confident repose. We see, over all portions of our broad country, prosperity and happiness most evenly and equally diffused.

Such is the prospect before us. It is the offspring of our fortunate government, and the wise policy which has been adopted, of cultivating our own resources by the skill and industry of our own people. In considering that imperfection must be stamped on the highest and best of human institutions, it is a matter of surprise that "the apparent exceptions to the harmony of the prospect" are so few. They seem to arise rather from the exercise of fervid imagination, than from evils which really exist. It cannot, however be expected that any code of laws, or any form of government, can dispense precisely the same benefits to every individual under their influence, wherever he may reside, and what.

ever may be his genius or pursuits. Nature herself has failed to do this. But when we see a great nation moving on with stately steps, unimpeded, to the height of happiness, opulence and grandeur—when every portion, however minute, partakes amply of general prosperity—it would seem that the “apparent exceptions to the harmony of the prospect” might be permitted to melt down in warm felicitations that the “prospect” of our whole country is so nobly gratifying. It is to this wide and comprehensive prospect that we may safely look for substantial reasons to preserve that union, which, it is “most devoutly hoped, may prove imperishable.”

The committee are much gratified to have the opinion of the President clearly and fully expressed, that the tariff for protecting domestic industry is constitutional. They think it proper to quote language so clear and unequivocal. He says, that “the power to impose duties on imports originally belonged to the several States. The right to adjust those duties with a view to the encouragement of domestic branches of industry, is so completely incidental to that power, that it is difficult to suppose the existence of one without the other. The States have delegated their whole authority over imposts to the General Government, without limitation or restriction, saving the very inconsiderable reservation relating to their inspection laws. This authority having thus entirely passed from the States, the right to exercise it for the purpose of protection does not exist in them; and consequently, if it be not possessed by the General Government, it must be extinct.

“Our political system would thus present the anomaly of a people stripped of the right to foster their own industry, and to counteract the most selfish and destructive policy which might be adopted by foreign nations. This surely cannot be the case; this indispensable power, thus surrender-

ed by the States, must be within the scope of the authority on the subject, expressly delegated to Congress." The committee would recommend this argument to the candid consideration of the House. Most especially would they invite to its calm consideration, those of our fellow-citizens who honestly believe that a protecting tariff violates the Constitution. If there are any who have become regardless of the rights, interests, and welfare of the great majority of the nation: who are determined that all shall yield to their opinions; who insist that they are infallibly right, and every one else is absolutely wrong; on such, reason and argument can have no influence. Still the cause which enables our Chief Magistrate to give us such a glowing view of the prosperity of our country, as he has done, must and will continue. The States, in their sovereign capacity, as expressed in the message, and cannot be denied, had the original power of imposing duties on imports. It is now transferred to the Government of the Union, in the most ample manner. Had the States retained it, they might have exercised it as they pleased, to accomplish any object they deemed proper. It might have been for revenue alone. It might have been employed *solely* to counteract the selfish policy of other states or nations. It could have been exercised for any purpose which suited the pleasure of sovereign power. But the States have delegated their whole power over imposts to the United States. It would indeed be a strange anomaly, if it could not now be exercised by the Government to which it has been transferred, as fully as it could have been by the States from which it was derived.

The President has declared that, "while the *chief object* of duties should be *revenue* they *may* be so adjusted as to encourage manufactures." It seems to the committee, that this remark is in plain collision with the sentiments which he has previously maintained. He has observed that the

authority to impose duties on imports having passed from the States, "the right to exercise it for the purpose of *protection* does not exist in *them*." If it is "not possessed by the General Government," it must be extinct. Our political system would *thus* present an "anomaly of a people stripped of the right to foster their own industry, and to counteract the most selfish and destructive policy which might be adopted by foreign nations." If *revenue* alone is wanted, duties for *that* object should be imposed. If *protection* to domestic industry is required, let duties be imposed to "*foster it*." Why should the *chief* object be revenue? Why protection *secondary*, when the treasury may be full? Many now apprehend that our revenue is, and will be, too abundant. But protection against the "most selfish and destructive policy of foreign nations," can be secured by duties on imports—by them alone. Then they should be adjusted to secure protection. This should be the *primary* object. The protecting power having once belonged to the states, and now transferred to the General Government, it may be used, as the good of the nation demands, for a *primary*, not a *secondary* object. It ought not to be loosely attached to the skirts of revenue. Domestic industry is a single, great, even pre-eminent interest of the nation. It has been entrusted to the guardian care of the constitution. It now demands the exercise of that power which the States have surrendered, for its promotion and preservation.

The President, in his message, further observes, that in the adjustment of protecting duties, the government should "be guided by the general good." As an abstract proposition, this may be admitted. "The general interest is the interest of each;" and it is only necessary "that that interest should be understood," to insure the cordial support of some who think "it encourages abuses which ought to be corrected, and promotes injustice, which ought to be obviated." He also advises Congress that "objects of na-

tional importance ought alone to be protected. Of these, the productions of our soil, our mines, and our workshops, essential to national defence, occupy the first rank. Whatever other species of domestic industry, having the *importance* to which I have referred, may be expected, after *temporary* protection, to compete with foreign labor on equal terms, merit the *same attention in a subordinate degree.*" Suppose the opinion to be correct, "that objects of *national* importance ought alone to be protected;" what then? The President has not, by this general expression, afforded the least aid in adjusting the *details* of a protecting tariff. If the action of Government could be confined to abstract rules and principles, little difference of opinion would probably exist in the nation. The great embarrassment is found in making an application of excellent theory to practical and useful purpose. The protecting system, the tariff, is composed of humble items; these united, make up the great mass of national industry. Had the President been pleased to designate a few items only, which he supposes to possess "national importance," or had he pointed out what comforts of life are taxed unnecessarily high;" what are the "interests too local and minute to justify a general exaction," which it undertakes to protect, and what kinds of manufactures, "for which the country is not ripe, it attempts to force," we should then have the light and benefit of illustration.

General theory may be adopted with perfect unanimity. Its application to real use, its coming down to the every day exertion of our farmers and mechanics, is a different affair. Under general theory, any one can make a retreat, and maintain that it has been done with consistency and honor. Theory is best explained by its application to the axe, the plough, the hammer, and the spindle. The Chief Magistrate presides over a people who are engaged in unceasing and un-

tiring industry. Congress has for years, and on repeated occasions, exercised its wisdom on the tariff. Its best efforts have been made. If errors exist, it would seem reasonable to expect that the Chief Magistrate, looking abroad from his high station, over all interests of the country, and observing their mutual relations and dependencies, should intimate to the representatives of the people what particular business of life has been too warmly cherished, what too coldly neglected. In adjusting the details of the tariff, Congress has done what it deemed best for the general good. To reach the employments of life, it must go down to particulars. If the President is still dissatisfied, it might have been hoped that he would have designated the precise error. It will always be borne in mind by practical men, and they compose the mass of the nation, that abstract theory, however splendid, does but little good, unless it comes to the aid of every muscle of labor. In what consists the defects of the existing tariff? Individuals may discover imperfections, but the collected wisdom of the nation has repeatedly declared that material change is not demanded. Nothing better, under existing circumstances, can be done. Then let doubt and uncertainty be avoided. They are evils next to the surrender of the whole system.

The message advises Congress that "objects of national importance alone ought to be protected: of these, the productions of our soil, our mines, and our workshops, *essential to national defence*, occupy the first rank." It is to be presumed that Congress has not been unmindful of productions "essential to national defence." But the President says "the present tariff taxes some of the comforts of life unnecessarily high." They are not defined. In the minds of many, what might be essential to national defence might also promote the comforts of life. If the message meant only guns, powder, and bullets, difference of opinion, even

then, might exist, as to the extent of protection which ought to be afforded to the various elements of which they are composed. Its practical meaning is therefore obscure. Iron, it is presumed, would be considered essential to "national defence;" and being the product of "our mines," should be protected. But that protection which would produce the material for a musket, would also furnish it for axes and ploughs. A duty that would give us domestic bullets is all that might be required to supply the country with domestic lead for every use. But are muskets, and powder, and bullets, *all* that may be essential to "national defence?" An army might be most abundantly provided with these, and yet be totally inefficient in the field, if it wanted hats, and coats, and shirts, and shoes, and blankets. The condition of our country during the last war furnishes a well defined illustration of this sentiment. Various manufactures *then* were considered of national importance, which the doctrines of free trade *now* erase from the catalogue. But a duty imposed for promoting the domestic manufacture of these articles for *military* purposes alone, would be an anomaly in the annals of any nation. That protecting policy which would supply the wants of an army in war, must be allowed to operate in peace. Hence the difficulty of any classification of interests, while all are distinctly and equally governed by the same great constitutional power, derived from the States. It is also to be remembered, that peace with the world is the natural condition of this country. It is not the foreign bayonet that we have the most reason to apprehend: it is the "selfish and destructive policy which might be adopted by foreign nations." To guard against this is an object of "national importance." For peace or war, the protecting system is equally adapted. And it is believed by the committee, that the best preparation for national defence may be found in the vigorous cul-

tivation of the arts of peace. Our people ought not to be perpetually dependent on orders in council, or decrees of emperors. Our country ought not to wait until invasion surrounds it, and then beg blankets from invaders, to warm a shivering army, engaged in "national defence."

The president alludes to another species of industry, having the importance to which he had before referred, and which may be expected, after "temporary protection, to compete with foreign labor on equal terms." This species of industry, in his opinion, merits "the same attention in a *subordinate* degree;" while, in speaking of objects "essential to national defence," he prescribes no limitation, either as to the extent of protection, or its duration. The other class he considers entitled to the "same attention," yet qualified by the expression, "in a *subordinate degree*." This qualification seems to render it difficult, if not impossible, to ascertain the extent of the rule which he has adopted for his own action, and the guidance of Congress. Instead of opening a luminous pathway, in which all branches of the Government may move on in union and safety, new embarrassments appear to be added to those already encountered by Congress in adjusting the detailed provisions of the tariff.

It would seem to be the meaning of the President, that, after a temporary protection has been extended to a manufacture for a reasonable period, if it "cannot then compete with foreign labor on equal terms," it does not merit protection. This doctrine has been repeatedly advanced in Congress, and the committee presume it to be the doctrine of the message. But it will not stand the test of experiment. Prior to the late war, the coarse muslins consumed in the United States were imported from India, and cost the consumer about *twenty-five cents* the yard. By the war, the supply was cut off; our cotton mills began to move, and a partial supply was furnished. At its close, when the India cot-

tions were again imported, most of these establishments were ruined. By the tariff of 1816, establishing what was called the minimum duty on coarse cottons, the home market was effectually secured to our home manufacturers. Under its fostering influence, they have flourished and multiplied; and such have been our improvements in skill and labor, and machinery, that the consumer, instead of paying *twenty-five cents*, now purchases at home a much better article for *eight cents* the yard. Large exportations of them are made to foreign countries. They are carried to India, China, and South America, where they are sold to advantage. But suppose the protecting duty withdrawn, and the American manufacturer left to "compete with foreign labor on equal terms." Admit the cottons of India, England, and Scotland, and what would be the effect? Within two years, not a single cotton mill in the United States would be in motion. The immense capital invested in them, amounting to many millions, would be utterly sunk to the country, and their owners irretrievably ruined. And why? Not because we cannot make the goods as cheap as in Manchester or Glasgow, but because a war would be waged by British capital against American capital—a war of *extermination*. Such a war has been waged upon every article of American industry, wherever the protecting duty has been inadequate, or the law extending the duty so framed that mercantile cupidity, and the cunning of foreign manufacturers, could evade it.

There is another rule laid down by the President, which the committee have thought proper to examine. It is contained in the expression, that "objects of *national* importance *alone* ought to be protected." The committee will not here enter into a discussion of the question, whether Congress may not protect objects *local* in character? The States, in their original independence, before the adoption of the Constitution, could have used the power of imposing duties on imports for the express purpose of protecting *local*

objects. According to the doctrine entertained by the President, in which the committee fully concur, the several States no longer possess that power. Where is it? Where has it fled? On what shelf is it laid? The government of the Union possesses it, or it has become "extinct." If an object did present itself, purely local in its character, and its protection was demanded by the prosperity and happiness of a single State, and this could be *best* done, or done only, by the delegated power from the States to impose duties on imports, it should be well considered before Congress rejected a proposition for that purpose. The discussion of this subject, at this time, is not intended. It may, however, be intimated, that it is the duty of the General Government to protect every State, county, and town in the Union from invasion. The Government of the Union is bound to protect every inch of our soil from a hostile bayonet. It has equal *power* to protect every finger of domestic industry against foreign competition. Let it be firmly exercised. It matters but little to real national independence, whether foreign guns or foreign labor conquer us. However this may be considered, it is fully believed by the committee that the present tariff, taken together or in the minutest detail, is national in its character, although the language of the President may seem to imply that in this respect it is defective. He has also told us in his message, that "it is an infirmity of our nature to mingle our interests and prejudices with the operation of our reasoning powers, and attribute to the objects of our likes and dislikes qualities they do not possess, and effects they cannot produce;" that our deliberations on this interesting subject should be uninfluenced by "partisan conflicts," and should not be made subservient "to the short sighted views of faction." The committee have a due regard, both to the admonition and the sentiments expressed by the President; and they, also, entertain a most ardent hope that our fellow citizens will keep a steady searching eye on every

movement of political ambition, in whatever quarter of our country it may appear. It may speak well and pleasantly to the public ear in favor of a national protecting system, and yet, with a calm, fair, honest looking countenance, scatter such mysterious, yet captivating doubts, as to the value of its different provisions, that "small minorities" may be taught how to form a "combination" to overthrow it.

What gives national importance to an object or production of domestic industry? How is its national importance discovered? Whence derived? By what principle decided? Is it the *place* of production in the United States that imparts to it the character of "*national importance*?" Must production be found in every narrow subdivision of the country? Must it, of necessity, be "*general, not local*?" Should the answer be in the affirmative, the concentrated wisdom of the nation could never provide a protecting tariff. Our various soils, our different climates, our diversified objects of industry, would present an impassable barrier against the adoption of any system of protection. The farmer who grows wheat asks the aid of Government to protect that article. He knows that Poland, Russia, the Barbary States, and France, may furnish, at times, wheat cheaper on the seaboard than he can afford it. When he asks protection, an objection is made. Some portions of the Union do not produce wheat. Its production is not general. It must be rejected.

Butter and cheese are presented for protection. Our farmers can produce them in abundance. The Irish tenant, who subsists on the humblest fare that unfeeling oppression deals out, may furnish them *cheaper* than the cultivators of *our* soil. Yet, it is discovered that *portions* of our extended country are unable to produce butter and cheese. They cannot be protected. They are "*local, and not general*."

Iron is mentioned. It is indispensable in peace and war. It may, perhaps, be for a time furnished by boors and serfs,

laboring under the command of Russian and Swedish nobility, a little cheaper than the Pennsylvania and New Jersey forgemens can produce it, and live as independent citizens ought to live in a free country. But iron is a "*local* object, not *general*." It must be rejected.

Hemp is named—an article so valuable to the independence of all branches of the navigation of our country. The strong arm of protection holds foreign navigation away from our domestic trade. It should unfurl American canvass with delight. It should also be well kept in mind, that the great body of American consumers of foreign productions sustain navigation engaged in *foreign* commerce. The splendid ship that carries and brings is still subordinate to the interests of those who buy, and use, and pay for the cargo. The merchants on our seaboard may heap up wealth, build palaces, command all the luxuries of life; but they must well keep in mind that they all owe their prosperity to the strong arm of labor. They owe it to the daily toil of our yeomanry whether engaged in subduing the summits of the Green mountains, or cultivating the glens of the Allegany. Let, then, the hemp of Ohio, Kentucky, and Tennessee, be protected. Let the people of those States have a share in the advantages of the policy which they are willing to defend. If it has *so happened* that navigation engaged in our *foreign trade* is suffering from foreign competition, it is owing to itself. All which it asked for protection was freely given. When it had gained such an ascendancy as it supposed would enable it to challenge foreign competition, it triumphantly told the Government that protection was no longer wanted. Hence, treaty after treaty has been concluded for reciprocal navigation. This was urged by the advocates of free trade. If, now, it is a little crippled, if other nations supply us with a little more navigation, is it a greater evil than if foreigners supplied us with a little more iron, or hemp, or sugar, or cottons, or woolens? Must the great

system of protection be abandoned because navigation has been indulged in its wish, and has been *somewhat* disappointed? The advocates of free trade ought rather to rejoice that one interest is free from the fetters of protection. If foreign nations can build ships cheaper than the people of the United States, why not cheerfully employ them? According to the doctrines of free trade, so much would be gained. But yet, if navigation wants assistance, there is every reason to believe that the power which protected its infancy, if desired, will come cheerfully again to its support, in every way and by all means consistent with other great interests of the country. But hemp is "*local, not a general*" production; and must, therefore, be rejected.

Sugar is proposed. It is an article of necessity, comfort, and luxury. It cannot be produced in Maine or Pennsylvania. Its production must be confined to the warm regions of our country, where the great staples of other parts are uncongenial. But it must be rejected according to the rule. Its production is *local, not general*.

The same may be said of cotton and wool—of every article named in the tariff. The greatest and most valuable productions of domestic industry are more or less local in their origin—not general. Hence, if the rule is, that every portion of the country must alike contribute to the production of an article which the Constitution will allow to be protected, there never can be a protecting tariff at all: human wisdom could not devise one which would confer the least benefit on the country.

The rule that any particular object of domestic industry must possess "*national importance*" to entitle it to protection, may be safely adopted, if properly understood and applied. A broad view must be taken of the condition of our country, of its productions, of its various business, of its perpetually blending and mingling interests. We must see the mutual relations which exist between the narrowest sec-

tions of our country, and ascertain how widely and generally the various productions of domestic industry are distributed among the people. We should ascertain, for the practical purpose of legislation, what articles of domestic production, *great* or *small*, may be required for general use; what articles the people want; what their comfort and convenience demand; what articles are gathered up and distributed by the trade, business, and commerce of the country.

The name of the articles may be humble: it may be broadcloths, wood screws, thimbles, bar iron, steam engines, or the fabrics of cotton. But, whatever its name, the right to protection must be considered with reference to the great principles before mentioned. By these principles, it is believed, the present tariff can be fully sustained.

The President has advised Congress that the tariff is considered by almost all as defective in many of its parts. Suppose this correct: it is proper to inquire whether greater perfection can be obtained? If so, how? The President has left Congress unadvised. The representatives of the people have recently, after their maturest consideration, come to their best result. The details may be imperfect. As a system, it "works well." Those whose interests are involved are generally satisfied. It is a subject of so much delicacy, that "it should be touched with the utmost caution." The committee must be fully convinced that improvement can be made, or they cannot, with a proper respect to the "extended interests it involves," hazard an effort.

Such is the "infirmity of our nature," that the enemies of the protecting system would rejoice to have the benefit of little "likes and dislikes" to aid them in their attack.

The President also expresses his opinion, that "the effects of the present tariff are doubtless overrated, both in its evils and advantages." The committee are confident that its *evils* are most unreasonably overrated." Its advantages are so manifest, that they have been, in the estimation of many, too greatly undervalued.

The President advises us, that the decreased price of raw material, manufactured articles, provisions and lands, arises from a cause "deeper and more pervading than the tariff of the United States." He supposes "it may, in a measure, be attributable to the *increased value* of the precious metals." The committee are unable to say how far this remark may apply to *other* countries. As applied to this country, it is clearly erroneous. Appreciation in any commodity, gold, silver, corn, or lumber, depends, in a great degree, on abundance or scarcity. If currency, whether composed of silver, gold, or bank notes, is plenty, the nominal price of all articles required for general consumption *will rise*, because the owners of currency must use it for profit. The greater the plenty, the more it will be used. In such case, less profit will satisfy. This cause enhances the price of every thing that currency purchases; for it must and will be employed. "The precious metals are the base of our national currency." Our commercial emporiums are filled with them. Exchange on foreign nations was never lower; and if it *seems* to be against us, it is only because we have, *by law*, established a relative value between silver and gold which the rest of the world will not adopt. It cannot, therefore, be supposed that "the *reduced price*" of domestic productions is caused by "the *increased value*" of the precious metals. It is to be attributed to domestic competition, and to an addition to the great supply of the world; and that the advance in the price of cotton, and the steady support of other agricultural products," is owing to the diversified employments encouraged by the protecting system. Had the precious metals "increased in value," the benefits of the tariff would have been far more *perspicuous*. Prices would have been lower still. The *tendency* of such opinions of the President, as to the cause of the low prices of domestic manufactures, is to excite prejudice against the protecting system, to render it, in the estimation of our fellow citizens, an object of little

importance. The error of such opinions, the committee considered it their duty to expose.

The President has informed us that "the best as well as fairest mode of determining whether, from any just considerations, a particular interest ought to receive protection, would be to submit the question singly for deliberation. If, after due examination of its merits, unconnected with extraneous considerations, *such as a desire to sustain a general system, or to purchase support for a different interest,* it should enlist in its favor a majority of the representatives of the people, there can be but little danger of wrong or injury in adjusting the tariff with reference to its protective effect." The committee pass over the caution against "extraneous considerations;" that will be duly appreciated by the representatives of the people. The suggestions of the President, which relate to the *manner* in which a protecting tariff should be formed, the committee believe, cannot be adopted. If such views had prevailed since the adoption of the constitution, no tariff for the protection of domestic industry would have existed. If they now prevail in all branches of the government, the tariff has no escape from total destruction.

The framers of our constitution were equally distinguished for profound intelligence and the purest patriotism. In their great design to provide a government for this republic which should promote and secure the various interests of every portion, did they adopt a *single* provision but with open and avowed desire to make a general system? Did not every State present in bold relief its separate claims and interests? Was not each separate and distinct claim and interest presented by the different members of the convention, and well considered by the whole? It was by uniting interests, great and small, scattered far and wide, that our system of government was adopted. Had "a particular interest" been submitted "singly" from some portion of the country, and that *alone* must have been regarded, the convention would have dissolved without giving it a glance of

notice. But the members of that august assembly did make mutual concessions and compromises in order to establish a general system.

The President has advised Congress that the power of protecting domestic industry by the aid of duties on imports belongs to the General Government. This, all know, is secured by a constitution, founded on liberal concession and compromise. The committee believe that the protecting power may be exercised, without exposure to impeachment for motives, on the same principles as governed the convention which framed and recommended our constitution, and the people who ratified it. The application of this protecting power must be made by the representatives of the people. There is no other way by which it can be exercised. Then, how can this be done? How can it be brought down home to business and bosom? If a blacksmith asks the Government of the Union to protect the manufacture of an axe, must his question be submitted "singly" for deliberation? Must a separate bill be introduced, and a vote of Congress taken? Shall abstract theory place the seal of silence on the lips of the blacksmith, and forbid him to say that he wishes the forge, the loom, the sugar plantation, also, to be protected? The consequences are too plain for extensive commentary. The great interests of the nation will hold generous communion among themselves. They will make common cause. They will make mutual concessions, compromises, and even sacrifices, to promote the general welfare, in imitation of the example set by the great founders of our Government. Different interests have a right to consult each other. They will do so. They have always done so. They must and will act in concert, if they expect to exist. Mutual aid may be required by the civil interests of the country, as much as mutual assistance was once required from the different States at New Orleans or Plattsburg. Statesmen who understand human nature must admit it. It is sanctioned by the purest examples of our country—of all coun-

tries. In the adjustment of the existing tariff, it might be presumed by another branch of the Government that Congress did its duty; that it did not improperly obtain support for different interests. It must still be kept in mind, that, if the infirmity of our nature rendered it defective in its origin, an attempt at revision might add to its imperfections. American manufactures have had a long and arduous conflict with the popular, yet delusive doctrine, that additional duties for their protection are taxes on the consumer; and that every man who wears a coat pays the duty imposed into the pockets of the manufacturer. The committee will not go into any train of reasoning to show its fallacy. They will merely advert to a few facts: and they congratulate the friends of the American system, that the memory of every man in the nation can furnish abundant evidence, that, in all cases where the material is found at home, and the protecting duty has been adequate, the domestic article becomes cheaper in price, and improved in quality. Cotton goods furnish a striking example of this truth, and every man who wears a cotton shirt knows it. The article of nails furnishes another proof, as is well known to every man who builds a house. The committee might enumerate hundreds of articles, such as hats, caps, shoes, boots, and cheese, to sustain them; but they know it would be superfluous. The tax is not paid, because the articles are not imported. The duty secures the market to the home manufacturer, and domestic competition among the manufacturers reduces the cost to the lowest possible price, while, at the same time, it improves the quality. This is the plain truth of the matter, and is now so well understood by the great mass of the nation, that the American system will not be surrendered nor abandoned, so long as the people elect their own rulers. It has taken deep root in our soil: the tree is flourishing—its branches have extended far and wide; and the people will frown indignantly upon every effort to wither its leaf, or to blast its fruit.

The President having, in the proper exercise of his duty,

submitted to Congress his views of the tariff; and these having been referred to the Committee on Manufactures, it became the committee to give them a candid and respectful consideration. This they have endeavored to do. Being representatives of the people, they have no apology to make for the freedom with which the opinions of the Chief Magistrate on this interesting and delicate subject have been examined.

In framing the tariff, they believe that the acknowledged principles of the Constitution have been applied as faithfully as "Washington, and Jefferson, and Madison, and Monroe," could have desired; that the present tariff, although it may be defective in parts, is adjusted on principles which those great statesmen approved. Had they been employed to consider its details, and adapt them to the present condition of our country and the world, and their united wisdom had been exerted, every one might have discovered "imperfection in many of its parts;" yet as a system, *all* of them would most cheerfully have given it their powerful and hearty support. They understood the "infirmity of our nature" too well to designate a *single* interest, and trust it to *single* consideration. They would have made all interests that required protection come forth together, stand side by side, and then provide a system by which all could be mutually sustained.

The committee are satisfied that the provisions of the existing tariff are national in their character: that no interest which it has undertaken to protect is "too minute;" that it contains no evidence of attempts "to force manufactures for which the country is not ripe," of sufficient importance to require revision; that "no comforts of life are taxed unnecessarily high," with a proper regard to revenue and protection; that the "low prices of manufactured articles" have not been caused by the "increased value of the precious metals," for the precious metals were never before so abundant and cheap in the United States; but that the low

prices of manufactured articles are caused, in a great degree by the existing tariff, which has made the labor, skill, and enterprise of our people add a vast supply for consumption to the stores of the world.

The committee fully believe that the present general prosperity of our country is mainly to be attributed to the protecting system; and if our fellow-citizens can retain full faith and confidence that our Government will firmly execute its repeated and solemn promises; that it will maintain the high assurances of support, which our people have a right to demand from its dignity and honor, their prosperity will be daily and more rapidly promoted, and the resources of our country more and more amply developed.

The committee repeat that they cannot concur in the opinion of the President, that in framing a protecting tariff, each interest should be submitted "singly for deliberation," without any reference to a general system. By such a rule, it is believed that no protecting system could ever have been adopted; and by its influence, it is strongly apprehended, none can stand. The fears of the committee are the more explicitly declared, because enemies of the system have, in a manner that cannot be misunderstood, exposed their plan of operations. It is to present each interest "singly" for deliberation, and conquer the whole system in detail.

The committee have thus presented to the House their undisguised and undissembled opinions on the subject referred, "with the freedom and candor" which they considered "the occasion for their expression" required. They believe that the tariff having been so recently revised, any attempt to change its provisions at this time would spread alarm among the great interests of our country, shake confidence in the plighted faith of Government, destroy the supposed well founded hopes of millions of our fellow citizens, reduce them to penury, and expose the whole country to the dangers of a "most selfish policy, which might be adopted by foreign nations."

UNITED STATES' TARIFF ;

OR,

Rates of Duties on Imports, arranged for the year 1831.

Extracted by permission from Williams's N. Y. Annual Register.

Acetate of lead, or white lead, dry or ground in oil, 5 cents per lb.	pal material, not otherwise enumerated, 25 do.
Acid sulphuric, or oil of vitriol, 3 do.	Articles imported for the use of the United States, free.
Adzes, 35 per cent.	Artificial flowers, 30 per cent.
Ale, beer, and porter, imported in bottles, 20 cts per gallon.	Arrack, 57 cts. per gallon.
Do. do. do. otherwise than in bottles, 15 do.	Assafœtida, 15 per cent.
Almonds 3 cts per lb.	Awl hafts, 30 do.
Alum, \$2,50 per cwt.	Axes, 35 do.
Anatomical preparations, free.	B.
Angora goat's wool or hair, free.	Bacon, 2 cts per lb.
Animals, imported for breed, do.	Balsams, all kinds of, 30 per cent.
Do. not do. 15 per cent.	Bark of cork tree, unmanufactured, free.
Antimony, regulus of, free.	Baggage, personal, in the actual use of persons arriving in the U. States, free.
Antiquities, all collections of, specially imported, free.	Barilla, do.
Do. not do. according to materials.	Baizes, the actual value of which, at the place whence imported, shall not exceed fifty cents the square yard, shall be deemed to have cost fifty cents the square yard, and be charged thereon a duty of 45 per cent. advalorem.
Anvils and anchors, 2 cts per lb.	Bandanas, silk, from India, 30 do.
Any articles of the growth, or manufacture of the U. States, exported to a foreign country, and brought back again, on which no drawback, bounty or allowance had been made, free.	Do. from any other place, 20 do.
Anchovies in bottles, 30 per cent.	Baskets, wood or osier, 30 do.
Do. in kegs, 15 per cent.	Do. palm leaf, 15 do.
Apparatus, philosophical, specially imported by order, for societies, colleges, schools, &c. free.	Beam knives, 25 do.
Apparel, wearing, and other personal baggage in actual use, free.	Beef, 2 cts per lb.
Apples, pine, 15 per cent.	Bed ticking, flax or cotton, 25 p. ct.
Aquafortis 12 1-2 per cent.	Bellows, 25 per cent.
Articles, not free and not subject so any other rates of duty, 15 per cent.	Bells, 25 do.
Articles, all composed wholly or chiefly of gold, silver, pearl, and precious stones, 12 1-2 do.	Belts, sword, with gold or silver thread, done with the needle, 12½ do.
Articles manufactured from copper or of which copper is the princi-	Binding, quality, carpet, coat, chintz, and woolen, 35 do.
	Do. galloon, of silk & cotton, 25 do.
	Do. do. entirely of silk, 20 do.
	Do. shoe, leather, 30 do.

- Birds, 15 per cent.
 Bits, bridle, of all descriptions, 35 do.
 Black, ivory and lamp, 15 do.
 Black lead, unmanufactured, 15 do.
 Do. do. pencils, 40 do.
 Bladders, 15 do.
 Blanketing, sold by the yard, 35 do.
 Blankets, 35 do.
 Blue, or Roman vitriol, 4 cts. lb.
 Boards of wood, 30 per cent.
 Bobbin wire, 30 do.
 Bolting cloths, 15 do.
 Bombazeens, 33 1-3 do.
 Bone, whale, not of the American fisheries, 15 do.
 Bonnets for women, not of Leghorn, chip, or grass, 30 do.
 Books, specially imported, &c. free.
 Do. all printed previous to the year 1775, and also on all books printed in other languages than English, except Latin or Greek, 4 cts. per vol.
 Do. Latin or Greek when bound, 15 cts. per lb.
 Do. do. do. when not do. 13 do.
 Do. all others, when bound, 30 do.
 Do. do. in sheets or boards, 26 do.
 Do. blank, 30 per cent.
 Boots or bootees, laced, \$1 50 pair.
 Botany, specimens in, free.
 Box boards, paper, 3 cts. per lb.
 Boxes, Japan dressing, 25 per ct.
 Braces, cotton 25; silk 20; worsted 33 1-3; leather 30 do.
 Brandy, 1st and 2d proof, 53 cts. per gal.
 Do. 3d do. 57 do.
 Do. 4th do. 63 do.
 Do. fruits preserved in do. 30 p. ct.
 Brass manufactures, if not otherwise specified, or of which brass is a component material, 25 do.
 Brass, in pigs, bars, plates, or old, fit only to be manufactured, free.
 Do. wire, nails, and handles, 25 do.
 Bricks, baked or burnt, 15 do.
 Bridles, 30 per cent.
 Brimstone or sulphur, free.
 Bristles, 3 cts. per lb.
 Brown sugar, 3 do.
 Brushes, all kinds of, 30 per cent.
 Buckram, 25 do.
 Bugles, (or glass beads) 2 cts. pr. lb. and in addition an ad val. duty of 20 per cent.
 Bullion, free.
 Burlaps, 15 per cent.
 Burr stones, not manufactured, free.
 Busts, specially imported, free; of marble, 30 per cent.
 Butter, 5 cts. per lb.
 Button moulds, bone or pearl without shanks, 20 per cent.
 Buttons, made of wool or of which wool is a component part 33 1-3; silver and gold 12½; ivory, shell, horn, bone, and silk 20; iron, steel, pewter, brass, and tin 25 do. C.
 Cabinet wares, 30 per cent.
 Cabinets of coins, free.
 Cables and cordage, tarred, 4 cts. per lb; untarred, 5 do.
 Do. made of grass or bark, 5 do.
 Camel's hair pencils, 30 per cent.
 Camphor, crude, 8 cts. per lb.; refined, 12 do.
 Candles, tallow, 5 cts. per lb.; spermaceti, 8 do.; wax, 6 do.
 Cards, playing, 30 cts. per pack; visiting, 15 cts. per lb.
 Cards, wool and cotton, 25 per ct.
 Carpets and carpeting, Brussels, Turkey, and Wilton, 70 cts. per sq. yd; Venetian and ingrain, 40 do. do.; on all other kinds of wool, flax, hemp, or cotton, or parts of either, 32 do. do.
 Carpeting of oil cloth, 50 do. do.
 All other carpets and carpeting, mats and floor cloth, made of tow, flags, or any other material, 15 cts. sq. yard.
 Caps of wool, fur, leather, silk and lace, 30 per cent; linen, cotton, and hemp, not for women, 25 do.
 Cap wire, 30 do.
 Carriages of all descriptions, and parts thereof, 30 do.
 Casement rods slit or rolled 3 1-2 cts per lb.
 Cashmere shawls (real) 15 per cent.
 Cast iron vessels not otherwise specified, 1 1-2 cts. per lb.
 Castings of iron, on all other not specified, 1 do.

Castor oil, 40 cts per gal.
 Casts, specially imported, free.
 plaister not do. 15 per cent.
 Caulking mallets, 30 do.
 Chafing dishes, copper, 35 do.
 Chairs, 30 do.
 Chalk, 15 do.
 Champaign wine, 30 cts. gal.
 Chambray, silk 20; Wool 40 p. ct.
 Charts, specially imported, free.
 Cheese, 8 cts. per lb.
 Chemical preparations, 15 per cent.
 Chinese cassia, 6 cts. lb.
 Chisels, socket, 35 per cent.
 Chip hats and bonets, 50 do.
 Chocolate, 4 cts. lb.
 Cider, same as ale.
 Cinnamon, 25 cts. lb.
 Clay, unmanufactured, free
 Clocks, 25 per cent.
 Clothing, ready made, 50 per cent.
 Cloth rags of any kind, free.
 Cloves, 25 cts. lb.
 Coal, 6 cts. bushel.
 Coal hods, iron 25; copper 35 p. ct.
 Cocoa, 1 ct. lb.
 Codfish, dry, 1 dol. per quintal.
 Coffee, 2; after Dec. 31, 1831, 1 ct. lb.
 Coffee mills, 25 per cent.
 Cologne water, 30 do.
 Colors, water, 15 do.
 Combs, horn 15; iron, lead, copper, and brass 25; wood 30 do.
 Coney wool, free.
 Confectionary preserved in sugar or brandy, 30; other 15 per cent.
 Copper, for sheathing ships, free; braziers' 15; vessels 35 per cent.
 Copperas, \$2 per cwt.
 Cordage, yarns, twine, packthread and seines untarred, 4 cts. lb.
 Cordials, 53 cts. gal.
 Corks, 12 cts. lb.; bark, free.
 Corn fans, 30 per cent.
 Cosmetics, 30 do.
 Cotton, 3 cts. lb.
 Cotton bagging, 5 cts. sq. yard.
 Cotton, manufactures of, or which shall be a component part, 25 p. c.
 Provided that all cotton cloths whatsoever, or cloths of which cotton shall be a component material, excepting nankeens imported directly from China, the original cost of which, at the place whence imported; with the addition of 20

per centum, if imported from the Cape of Good Hope, or any place beyond it, and of 10 per centum if imported from any other place, shall be less than 35 cents per sq. yard, shall with such addition be taken and deemed to have cost 35 cents per sq. yd. and shall be charged with duty accordingly.
 Cotton yarn, twist or thread, unbleached and uncolored, 25 p. ct.
 All unbleached and uncolored cotton yarn, twist or thread, the original cost of which shall be less than 60 cents per lb. shall be deemed and taken to have cost 60 cents per lb. and shall be charged with duty accordingly, 25 per cent.
 Cotton yarn, twist or thread, bleached or colored, 25 per cent.
 All bleached or colored cotton yarn, twist or thread, the original cost of which shall be less than 75 cents per lb. shall be deemed and taken to have cost 75 cents per lb. and shall be charged with duty accordingly, 25 per cent.
 Crapes, silk from the Cape of Good Hope, 30 per cent; from any other country, 20 do.
 Crayon pencils of lead, 40 do.
 Currants, 3 cts. lb.
 Cutlery, 25 per cent.
 Cutting knives, 40 do.
 D.
 Demijohns, 25 cents each.
 Diamonds, 12 1-2 per cent.
 Diaper, linen and hemp, 25 do.
 Drawings specially imported, free.
 Drawing pencils 40; knives 35 p. ct.
 Drugs, dyeing, not subject to other rates of duty, 12 1-2 per cent.
 Duck, sail, 10 cts. the sq. yd. and half a cent yearly after 30th June until it amounts to 12 1-2 cts do.
 Dye woods, free.
 E.
 Earth, brown, red, blue, yellow, dry, being considered as ochre, 1 ct lb. but if in oil, 1 1-2 do.
 Earthen ware, 20 per cent.
 Elephants' teeth, 15 do.
 Embroidery done with a needle and with thread of gold or silver 12 1-2 do.
