Opening template.

Your SPARQL query goes here. Two differences between this and a traditional SPARQL query. 1) You must use the variable ?item 2) You do **not** have to create variables or query for every statement you want to draw from.

Customize columns and other features of the list. Columns are created with variables from your query or using Wikidata properties, descriptions, etc.

This blank space is where the bot will put the list. Anything manually added or changed in between the two templates will be overwritten by the bot.

Don't forget the closing template!

# What if I don't have a SPARQL query?

```
{{Wikidata list
|sparql=
SELECT ?item WHERE { VALUES ?item {
  wd:Q42
  wd:Q23
}
}
|sort=P569
```
