

Molecular Studies on Complex Biological Systems:

Sources for Transcriptome and Proteome Complexity

SMAAS

What accounts for the often massive and seemingly arbitrary differences in genome size observed among eukaryotic organisms?

The fruit fly
Drosophila melanogaster

180 Mb

The mountain grasshopper
Podisma pedestris

18,000 Mb

Is an Expansion in Gene Number driving Evolution of Higher Organisms?

From genes to proteins

Gene splicing: Removal of non-coding introns

Alternative splicing: One gene, several proteins!

RNA editing

Effects of Editing

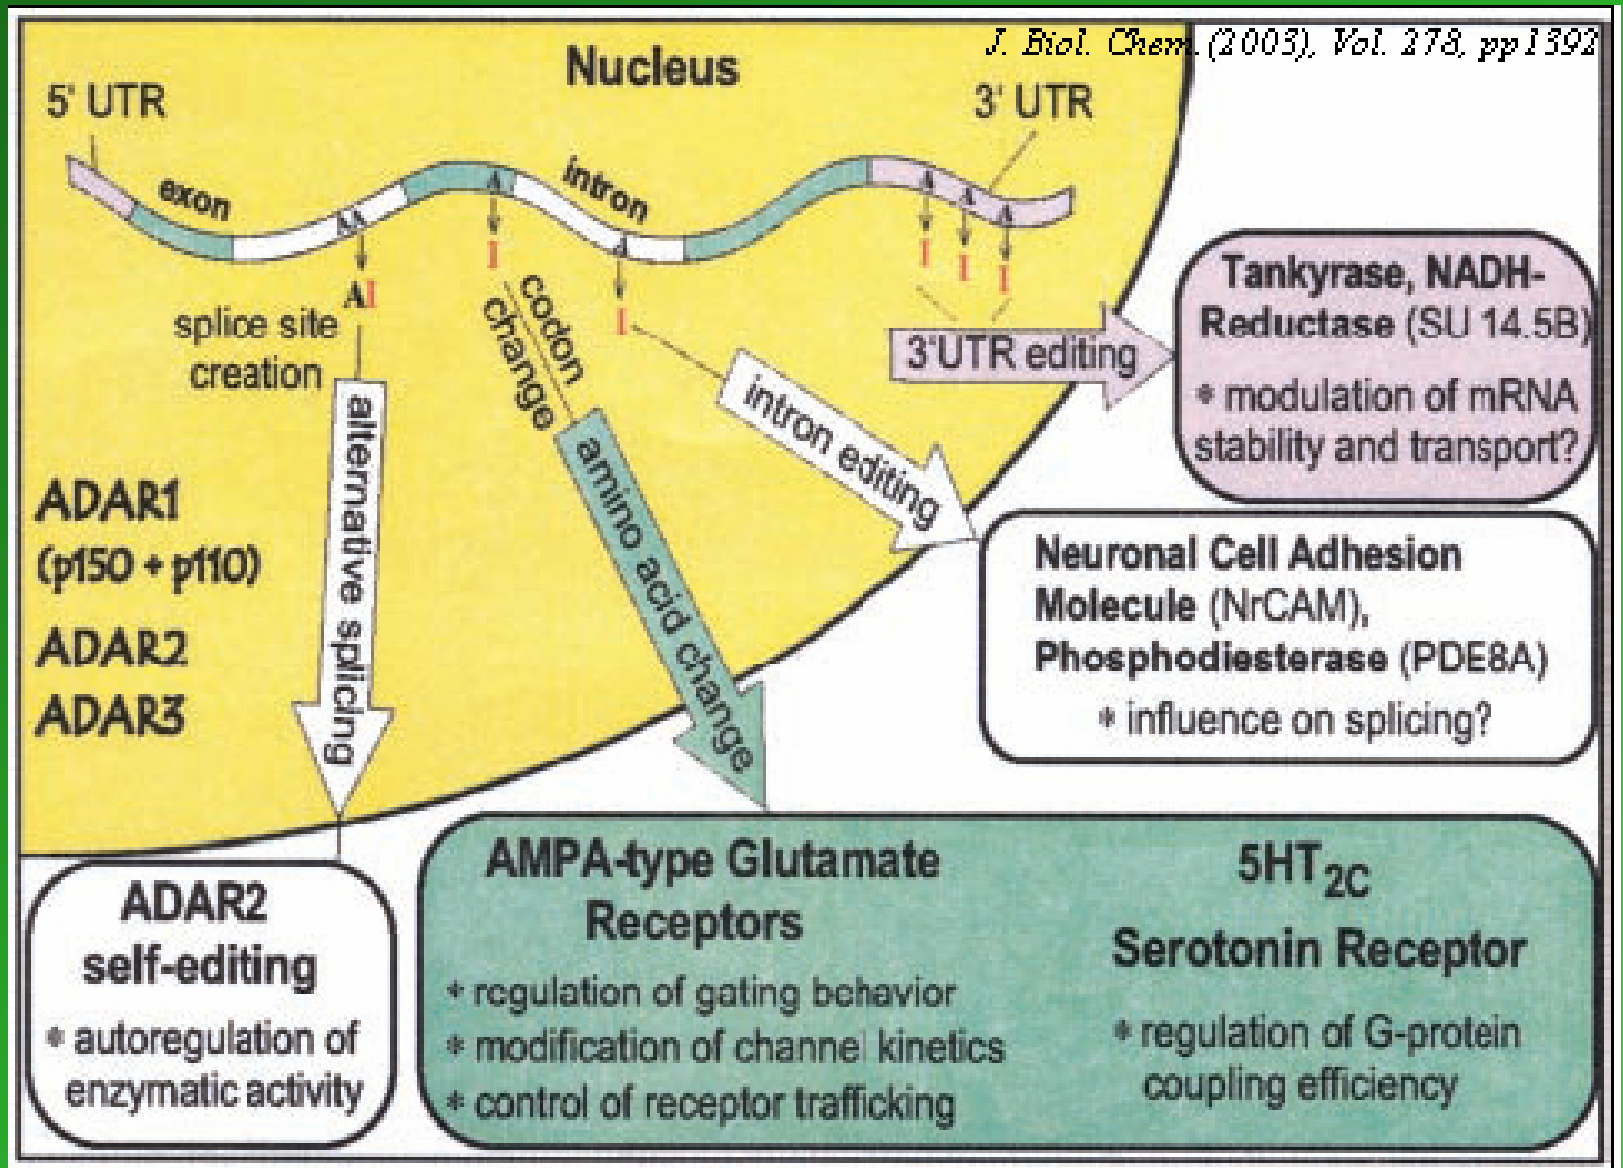

Adenosine

Inosine

- Adenosine converted to Inosine
- Interpreted as Guanosine
- Expand the proteome

Consequences of Editing

Mammalian substrates of A-to-I pre-mRNA editing

Gene	codon	amino acid	editing [%]
GluR-B	CAG/CIG	Q/R	100
GluR-B,-C,-D	AAG/AIG	R/G	60-80
GluR-5,-6	CAG/CIG	Q/R	40-80
GluR-6	AUU/IUU	I/V	80
	UAC/UIC	Y/C	80
5-HT _{2C} Serotonin- receptor	AUA/IUA	I/V	40-90
	AAU/AIU	N/S	35-40
	AUU/IUU	I/V	45-75

RNA editing and cancer

Too little editing:

- Malignant growth,
- Activation of oncogenes/repression of tumor suppressor genes

[Glioblastoma (GluR-B)]

Too much editing:

- activation of oncogenes or
- inhibition of tumor suppressor genes

[BC10, leukemia (PTPN6), pancreatic cancer (prox1); hepatoma (APOBEC1), neurofibromatosis (NF1), Wilm's tumor (WT1)]

A-to-I RNA editing and human diseases

- ❖ Glioblastoma multiforme => GluR-B underediting due to ADAR2 deficiency
(*Maas et al PNAS 2001*)
- ❖ Amyotrophic Lateral Sclerosis (ALS) => GluR-B Q/R-site underediting in motor neurons
(*Kawahara et al Nature 2004*)
- ❖ Suicidal Depression => Change in Serotonin receptor editing
(*Gurevich et al., Neuron 2002*)

Hyperediting phenotypes: Lupus erythematosus, inflammatory lung disease

Question:

**How many genes are subject to
RNA editing in the human genome?**

→ Investigate using the complete human genome sequence as an important tool.

The “Smoking Gun” of A-to-I RNA editing

-TTT ATG C**A**G CAA GGA- genomic DNA

-UUU AUG C**A**G CAA GGA- unedited mRNA

-UUU AUG C**I**G CAA GGA- edited mRNA

Reverse transcription

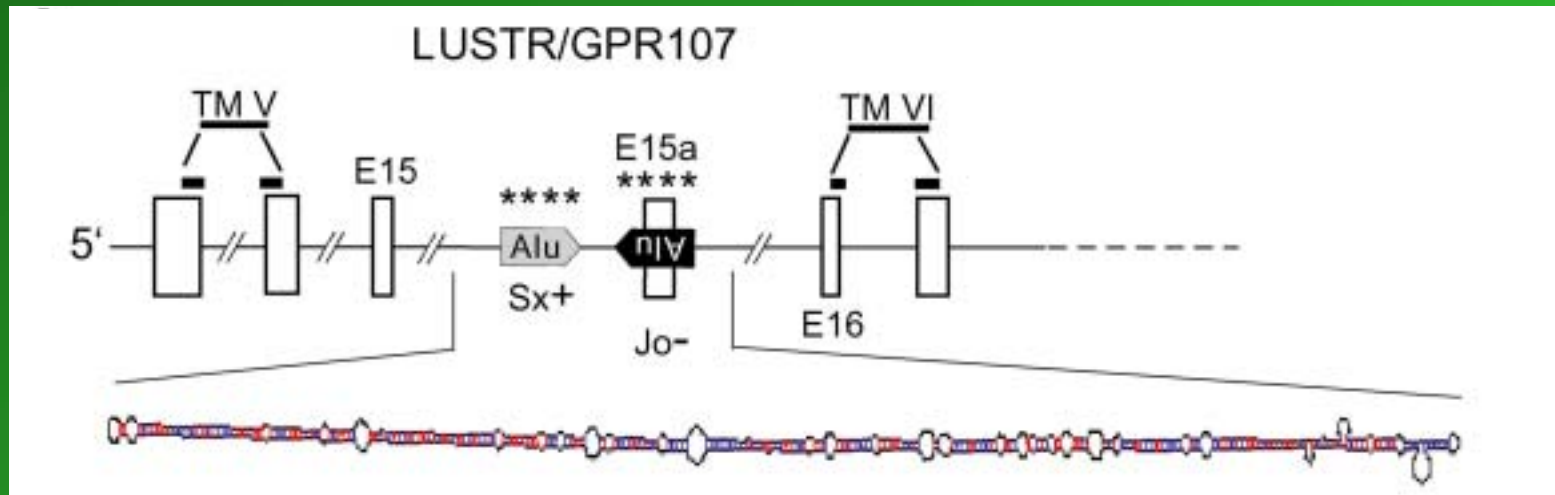

-TTT ATG C**A**G CAA GGA-

Functions (?)

- None
- Accelerated evolution
- Alu biology
- prevent RNAi
- RNA transport, stability, translation

Spectrum of edited human RNAs

Summary - Conclusions

We do know:

- Complexity is generated by processes of alternative splicing and RNA editing
- RNA editing regulates the function of genes through recoding and probably through other mechanisms
- We can use genomic and transcriptomic sequence information to search for RNA variations

We don't know:

- What is the total impact of RNA editing on complexity ? How is it regulated in vivo ?
- Are there other molecular phenomena that contribute to complexity ?
- What is all the non-coding RNA (and DNA) doing ?
