Brain Trivia

The average number of neurons in the brain = *100 billion.*

more than *100,000* kilometers of inter-connections

The adult brain weighs *about 3* pounds.

The average number of glial cells in the brain = *10-50 times the number of neurons.*

Complexity of the Brain

100 billion neurons plus
>1 trillion glia cells connected by
100 Trillion synapses
in a single human brain
organized into exquisitely
complex circuits...

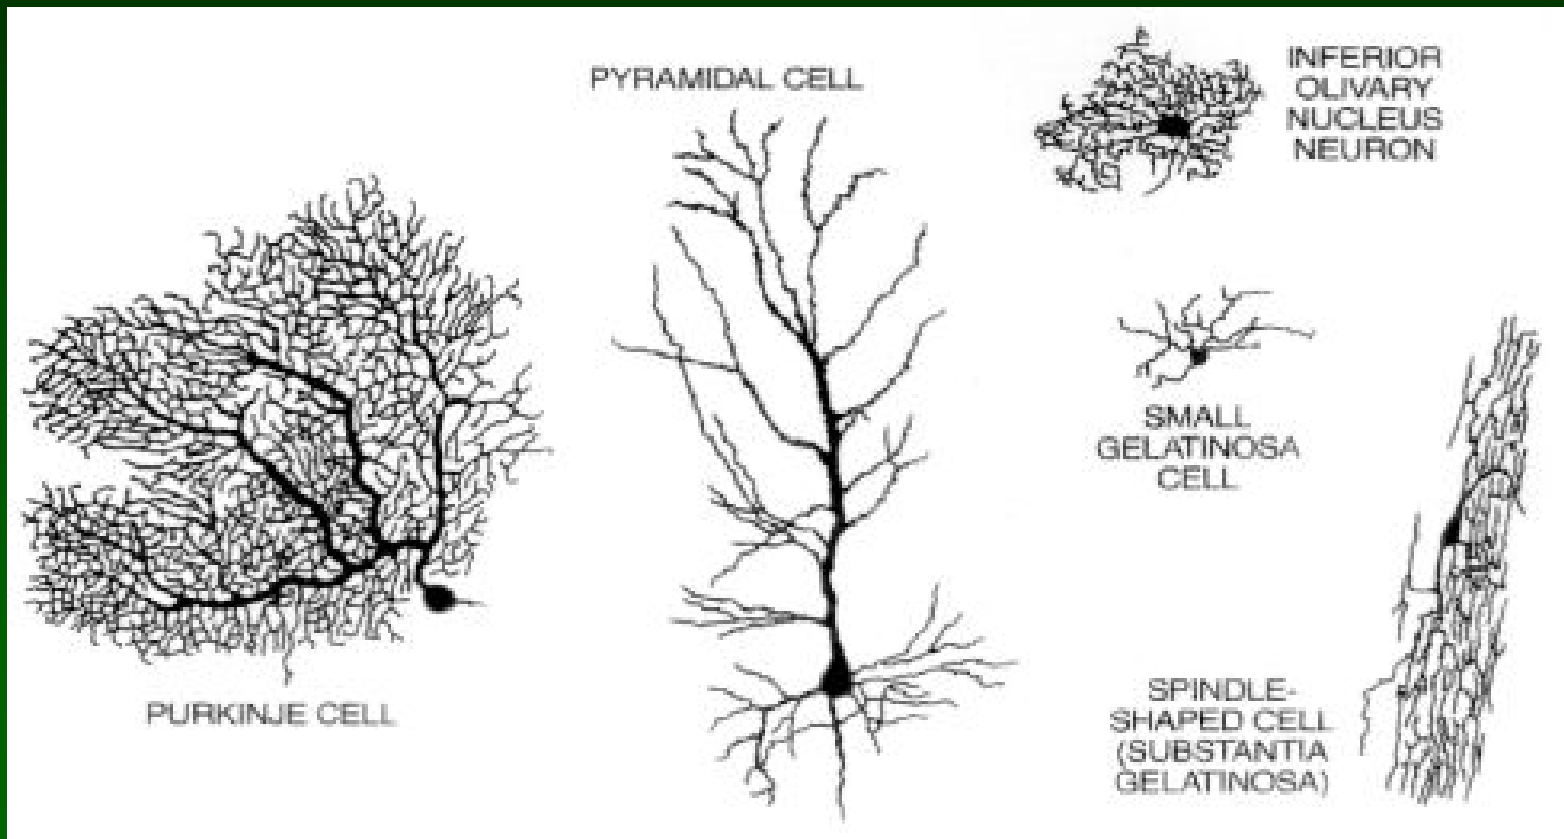

responding to experience, drugs,
disease, and injury...

Generation of Complexity

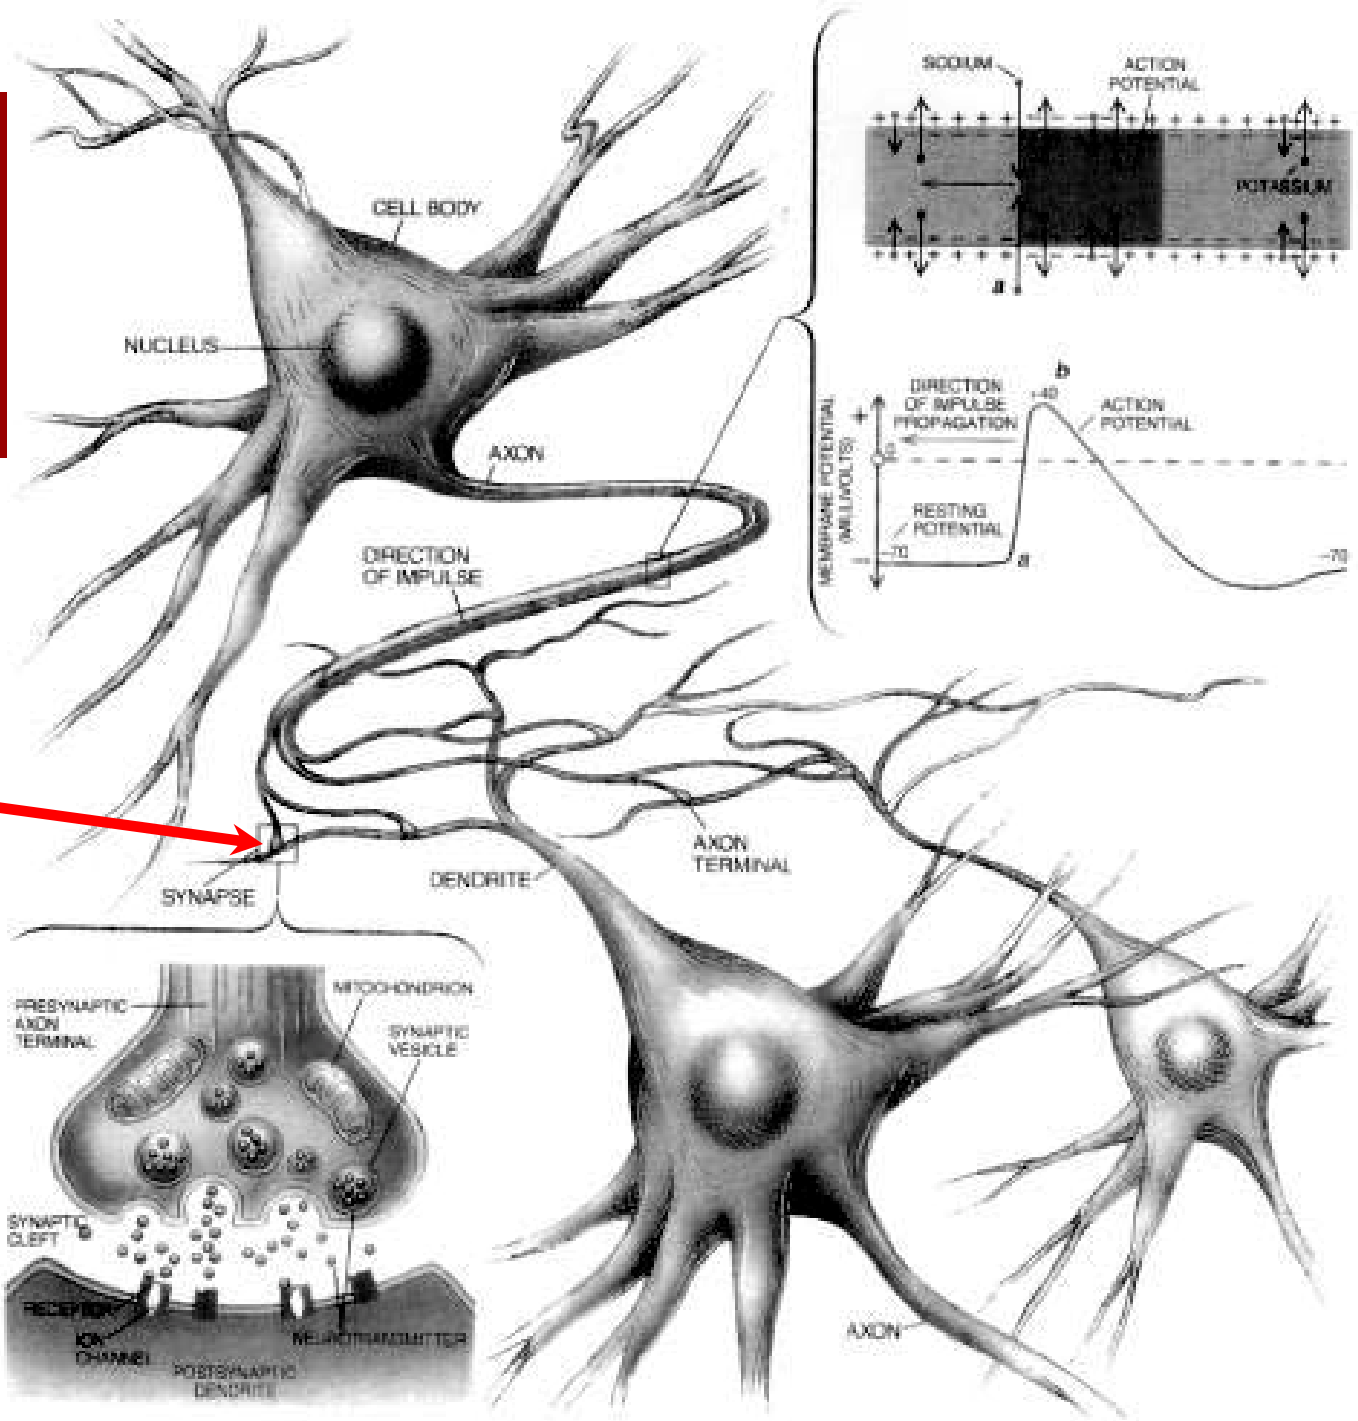

Areas generated = $2^n - 1$ where n is the number of "things"

Complexity of the Brain

Nerve Cell Communication

Synapse

Complexity of the Brain

The synapse typically has two parts:

A presynaptic structure containing packets of neurotransmitters

and a postsynaptic structure of the receiving neuron

Cerebral cortex

Sensory input

Motor output

acetylcholine

norepinephrine

serotonin

dopamine

histamine

From Genes to Proteins

Genes code for Proteins with RNA as an intermediate

Nucleotide sequence in DNA molecule

A T G T C C A C T G C G G T C C T G G A A
T A C A G G T G A C G C C A G G A C C T T

TRANSCRIPTION

An RNA intermediate plays the role of "messenger"

TRANSLATION

Two-step decoding process synthesizes a polypeptide.

Amino acid sequence in polypeptide chain

(Met) (Ser) (Thr) (Ala) (Val) (Leu) (Glu)
A T G T C C A C T G C G G T C C T G G A A

DNA triplets encoding each amino acid

Gene splicing: Removal of non-coding introns

RNA editing

Adenosine

Inosine

- Adenosine converted to Inosine
- Interpreted as Guanosine
- Expand the proteome

Mammalian substrates of A-to-I pre-mRNA editing

Gene	codon	amino acid	editing [%]
GluR-B	CAG/CIG	Q/R	100
GluR-B,-C,-D	AAG/AIG	R/G	60-80
GluR-5,-6	CAG/CIG	Q/R	40-80
GluR-6	AUU/IUU	I/V	80
	UAC/UIC	Y/C	80
5-HT _{2C} Serotonin- receptor	AUA/IUA	I/V	40-90
	AAU/AIU	N/S	35-40
	AUU/IUU	I/V	45-75

Q/R site editing in normal human brain and gliomas

Schizophrenia

SMAAS

@

lehigh.edu

True or False ?

1. Schizophrenia is a rare illness
2. Schizophrenia generally strikes older people
3. People with Schizophrenia have multiple or split personalities
4. More hospital beds are occupied by people with Schizophrenia than any other medical illness

Schizophrenia

- Mental illness
- One of the top ten causes of long term disability
- currently ca. 1% of population affected across countries and cultures
- same in developed and developing countries
- incidence of 0.2-0.4 per 1000
=> lifetime risk of 1% for women and men

Schizophrenia

- develops between ages 15 and 25 and mostly persists throughout the patient's lifetime
- cause unknown
 - => genetic factors
 - => early environmental influences
 - => social factors

Symptoms and Disease Progression

Three broad types of Symptoms:

- **Positive (psychotic) Symptoms**
- **Negative (depressive) Symptoms**
- **Cognitive and Social Impairment**

Symptoms and Disease Progression

➤ Positive (psychotic) Symptoms

- > Occur last, after several years of onset
- > Most apparent and often lead to first psychiatric contact, tend to be episodic
- ❑ Loss of contact with reality
- ❑ Delusions (false beliefs)
for example: persecutory delusions, delusions of control, grandiose delusions and somatic delusions
- ❑ Hallucinations (auditory, visual, olfactory, tactile)
Auditory hallucinations most common

Symptoms and Disease Progression

➤ Negative (depressive) Symptoms

> Occur first

> Less dramatic but more pervasive
and fluctuate less over time

❑ Blunted affect

eg, immobile facial expression, monotonous voice tone

❑ Anhedonia (lack of pleasure)

❑ Apathy

diminished ability to initiate and follow through on plans

❑ Alogia

reduced quantity of speech

Symptoms and Disease Progression

➤ Cognitive and Social Impairment

> Occur second

- ❑ Attention and Concentration deficits
- ❑ Problems with Learning and Memory
- ❑ Deficiency in executive Function
abstract thinking, problem solving

Genetic factor

Genetic factors

Genetic transmission does not follow simple Mendelian single-gene inheritance patterns

→ Multiple susceptibility genes, each with small effect and acting in concert with environmental factors

Several genes shown to be linked with schizophrenia

Gene	Locus	Populations studied
<i>NRG1</i>	8p12-p21	Icelandic
<i>DTNBP1</i>	6p22	Irish
<i>G72</i>	13q34	French Canadian, Russian
<i>DAAO</i>	12q24	French Canadian
<i>RGS4</i>	1q21-22	USA ×2, Indian
<i>COMT</i>	22q11	USA, Israel, Chinese
<i>PRODH</i>	22q11	USA

Environmental factors

Biological:

Prenatal events or birth complications

Infections, hypoxia, winter birth, maternal malnutrition or use of psychoactive drugs

Psychosocial:

Poverty and lower social class

Stressful environmental conditions

Urban versus rural background

Pathophysiology

- Enlargement of the ventricular system
- Accompanied by overall reduction in brain volume and cortical grey matter

MRI

Changes are not directly linked to illness progression

Pathophysiology

Is Schizophrenia a demyelinating disorder?

- Some symptoms (psychosis, cognitive impairments) are similar to MS symptoms
- Time of onset is similar

Is Schizophrenia a neurodevelopmental disorder?

- prevailing pathogenic model for Schizophrenia
- anatomical changes due to abnormal early brain development (visible *before* first episode)
- No sign of repair or degenerative processes (glial reactions, plaques)
- indications of defect in neuronal migration

Late onset related to processes during adolescence and early adulthood (excessive synaptic pruning?)

Therapy - Management

Therapy - Management

Neurotransmitter	Drug	Mechanism of action	SZ symptom
Dopamine	Neuroleptics	Antagonists of D2 receptor	↓
	Amphetamine	Increase dopamine in synaptic cleft	↑
Glutamate	Phencyclidine	Antagonist of NMDA receptor	↑
	D-serine,	Agonist of NMDA receptor	↓
	D-cycloserine, glycine		
Serotonin	Atypical antipsychotics (clozapine)	Binding to 5-HT ₂ receptor	↓

Also: antidepressants, mood stabilizers, benzodiazepines

Combination therapy (**polypharmacy**) common

Therapy - Management

Major problem: **non-compliance**
ca. 50% (and higher soon after onset of disorder)

- ⇒ injectible depot
- ⇒ simplifications of regimen
- ⇒ direct delivery..

Therapy - Management

Early intervention

- prolonged untreated psychosis requires extended treatment
- Clinical symptoms worsen over the first several years
- worse prognosis after prolonged social isolation

Increased efforts to detect first-episode schizophrenia

Even better: before major symptoms appear

True or False ?

1. Schizophrenia is a rare illness

False: world-wide rate is 1:100

2. Schizophrenia generally strikes older people

False: age of onset is 15-25

3. People with Schizophrenia have multiple or split personalities

False: they are split from reality

4. More hospital beds are occupied by people with Schizophrenia than any other medical illness

True 8% of hospital beds
