

Appendix 1 – Summary for Research Participants

What did we do?	
	We did a project to see how helpful one of our hearing tests is for adults with Down Syndrome.
	The hearing test is called 2-choice audiometry.
	We asked people with Down Syndrome to listen to sounds.
	We compared a standard hearing test with 2-choice audiometry
	In a standard hearing test people wait for a sound and press a button when they hear it

In 2-choice audiometry people choose whether they heard the sound or not

What did we find?

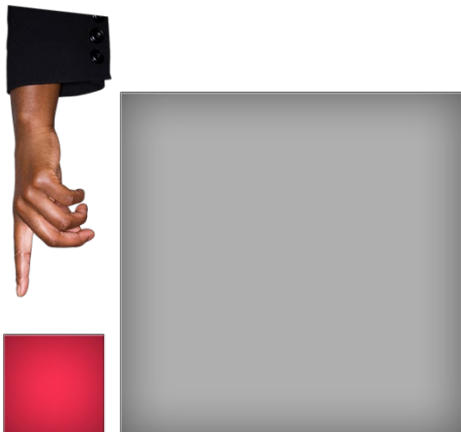

2-choice audiometry took longer

The results from 2-choice audiometry were not as reliable

2 choice audiometry might be a good test for some people

We can use 2 choice audiometry to measure really small differences between sounds in people with Down syndrome

What are we going to do now?

We want to do another project to make 2-choice audiometry better

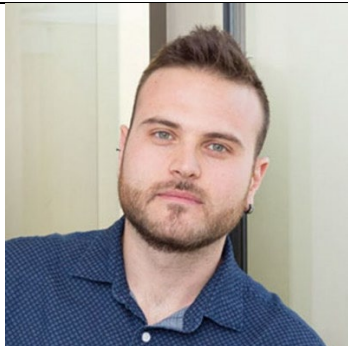

If you are worried about your hearing, talk to your doctor

If you, your relative or your carer would like to speak to us about our project, please contact me.

My name is Siobhan Brennan.
My phone number is 07917605544
My e mail address is skb41@kent.ac.uk

If you are unhappy with anything that I did you can contact my supervisor:
