

# Get Prepared.

Put your family's  
future on solid ground.

Strengthen your house  
against earthquake  
shaking today.

# Get prepared. Worry less.

You can't predict an earthquake,  
but you can be prepared for one.

---

## Protect Your Home

Most Californians live within 30 miles of an active earthquake fault.

There's a 99% chance a M6.7 or greater earthquake will strike California within the next 30 years.

If your home was built before 1980, it may be more vulnerable to earthquake damage. Strengthen it against shake damage with a seismic retrofit to make it safer and more secure.

---

## Protect Your Family

Create a family plan and build an earthquake kit.

Secure your belongings inside your home: strap heavy furniture that could topple, install cabinet latches so items don't fall out, and use museum putty to secure breakables.

For additional safety, avoid hanging heavy frames or mirrors over a bed or couch. And for security, ensure your water heater is braced, anchored, or strapped to prevent it from falling during a quake.

---

## Protect Your Finances

Your homeowners insurance policy does not cover earthquake damage.

Consider a separate homeowners earthquake insurance policy from CEA to protect you, your family, and your finances.

For certain house types, a verified seismic retrofit can earn you a premium discount of up to 25% on your CEA insurance policy.
