PrimeGrid's
Sophie Germain Prime Search

On 25 Dec 2011 13:31:28 UTC, PrimeGrid's Sophie Germain Prime Search found World Record twin primes:

$$3756801695685 * 2^{666669} \pm 1$$

Twin Primes are pairs of primes which differ by two. The first twin primes are {3,5}, {5,7}, {11,13} and {17,19}. It has been conjectured (but never proven) that there are infinitely many twin primes.

The twin primes are 200,700 digits long, eclipsing the previous record of 100,355 digits. They will enter Chris Caldwell's "The Largest Known Primes Database" (http://primes.utm.edu/primes) ranked 1st for twins.

The discovery was made by Timothy D. Winslow of the United States using an Intel Core i7 920 @ 2.67GHz with 8 GB RAM running Windows 7 Ultimate. This computer, using LLR, took 26 minutes to complete the primality tests of both primes. Timothy is a member of The Knights Who Say Ni! team.

The prime was verified on 26 Dec 2011 1:58:19 UTC, by Brage E. Elliott of the United States using an Intel Intel Q8400 @ 2.66GHz with 4 GB RAM running Linux. This computer, using LLR, took 28 minutes and 42 seconds to complete the primality tests of both primes. Brage is a member of the USA team.

Credits for the discovery are as follows:

1. Timothy D. Winslow
2. PrimeGrid, et al.
3. TwinGen, sieving program developed by David Underbakke
4. LLR, primality program developed by Jean Penné

Entry in "The Largest Know Primes Database" can be found here:
http://primes.utm.edu/primes/page.php?id=103791 twin (p+2)
http://primes.utm.edu/primes/page.php?id=103792 twin (p)

The search took almost 2 1⁄2 years with 20,344 users completing just over 25.5 million tests. Over 3000 single primes were found...~2900 of these were added to the Top 5000 list. Almost 79% of the sieved search space was exhausted before the twins were found. This is PrimeGrid's 3rd World Record twin primes.

The search effort would have taken hundreds of years on a fast single core PC. Therefore, this timely discovery would not have been possible without the thousands of volunteers who contributed their spare CPU cycles. A special thanks to everyone who contributed their advice and/or computing power to the search - especially David Underbakke who was instrumental with advice and research. Additional thanks goes to Lennart Vogel for doing the tedious sieve work.

The Sophie Germain Prime Search will continue to search the remainder of the sieved search space to hopefully find a Sophie Germain Prime. To join the search please visit PrimeGrid: http://www.primegrid.com

PrimeGrid's
Sophie Germain Prime Search

About PrimeGrid

PrimeGrid is a distributed computing project, developed by Rytis Slatkevičius, Lennart Vogel, and John Blazek, which utilizes BOINC and PRPNet to search for primes. PrimeGrid's primary goal is to bring the excitement of prime finding to the "everyday" computer user. Simply download the software and let your computer do the rest. Participants can choose from a variety of prime forms to search. With a little patience, you may find a large or even record breaking prime.

BOINC

The Berkeley Open Infrastructure for Network Computing (BOINC) is a software platform for distributed computing using volunteered computer resources. It allows users to participate in multiple distributed computing projects through a single program. Currently BOINC is being developed by a team based at the University of California, Berkeley led by David Anderson.

This platform currently supports projects from biology to math to astronomy. For more information, please visit BOINC: http://boinc.berkeley.edu

PRPNet

PRPNet is a client/server application written by Mark Rodenkirch that is specifically designed to help find prime numbers of various forms. It is easily ported between various OS/hardware combinations. PRPNet does not run each PRP test itself, but relies on helper programs, such as LLR, PFGW, phrot, and genefer to do the work.

For more information, please visit PrimeGrid's PRPNet forum thread:
