Acknowledgements

The editors thank the State and Territorial Injury Prevention Directors Association, the Council of State and Territorial Epidemiologists, and their respective members. These partners have facilitated the ongoing advancement and success of the development of the injury indicators. The editors also thank Kevin Webb from the Office of Statistics and Programming and Angela Marr from the Division of Injury Response, National Center for Injury Prevention and Control, for their consultation and guidance.

Foreword

The Centers for Disease Control and Prevention's (CDC) National Center for Injury Prevention and Control (NCIPC) is pleased to provide this third edition of the *State Injury Indicators Report* which presents 2004 data. We hope state public health officials and others will find the injury surveillance data presented in this report useful in making decisions about prevention efforts to reduce the burden of injury in the United States.

The methods used to prepare these data are consistent with those used in previous cycles of injury indicator data collection. The methods are based on recommendations presented in the *Consensus Recommendations for Using Hospital Discharge Data for Injury Surveillance* and from the National Public Health Surveillance System (NPHSS) indicators developed by the State and Territorial Injury Prevention Directors Association (STIPDA) and the Council of State and Territorial Epidemiologists (CSTE). With partner feedback and updated consensus recommendations, CDC continuously modifies and updates the instructions and methods used to prepare these data.

Thirty-four states participated in data submission either as a part of CDC Program Announcement 05027 or through voluntary submission. As more states and U.S. territories participate in this surveillance effort, a broader picture of the burden of injuries can be presented and priorities for prevention can be targeted. NCIPC looks forward to continuing to work with partners to advance and improve injury surveillance using state-based data on fatal and nonfatal injuries.

Abbreviations

BAC	Blood alcohol concentration
BRFSS	Behavioral Risk Factors Surveillance System
CDC	Centers for Disease Control and Prevention
CSTE	Council of State and Territorial Epidemiologists
FARS	Fatality Analysis Reporting System
HDD	Hospital discharge data
ICD-10	International Classification of Diseases – Tenth Revision
ICD-9-CM	International Classification of Diseases – Ninth Revision – Clinical Modifications
NCIPC	National Center for Injury Prevention and Control
NHTSA	National Highway Traffic Safety Administration
NPHSS	National Public Health Surveillance System
NVSS	National Vital Statistics System
SAVIR	Society for Advancement of Violence and Injury Research
STIPDA	State and Territorial Injury Prevention Directors Association
TBI	Traumatic brain injury
WHO	World Health Organization
WISQARS	Web-based Injury Statistics Query and Reporting System

Introduction

Surveillance is one of the most important and basic elements of injury prevention and control. It helps determine the magnitude of injury morbidity and mortality, the leading causes of injury, and the population groups and behaviors associated with the greatest risk of injury. Surveillance data are also fundamental to determining program and prevention priorities. Furthermore, these data are crucial for evaluating the effectiveness of program activities and for identifying problems that need further investigation.

Injury continues to be the leading cause of death and disability among children and young adults.¹ In 2004, more than 167,000 people died from injuries in the U.S. Of the deaths, 27% were from motor-vehicle crashes, 19% were from suicide, and 10% were from homicide.¹ Additionally, in 2004, more than 29.6 million people were treated for injuries in U.S. emergency departments.¹ The economic cost of injuries is also significant. The total cost of the 50 million medically treated injuries sustained in 2000 is estimated to be \$406 billion in medical expenses and productivity losses.²

The mission of public health includes prevention, mitigation, assurance of access to treatment, and reduction of injury-related disability and death.³ The scope of public health encompasses injuries involving any mechanism (e.g., firearm, motor vehicle, or burn) and includes both intentional and unintentional injuries. An important part of the public health mission is to emphasize that injuries are preventable and to dispel the misconception that injuries are unavoidable.

Recognizing the need for more comprehensive injury surveillance data, the State and Territorial Injury Prevention Directors Association (STIPDA) produced *Consensus Recommendations for Injury Surveillance in State Health Departments* in 1999.⁴ These recommendations were developed by a working group representing STIPDA, the Council of State and Territorial Epidemiologists (CSTE), the Centers for Disease Control and Prevention (CDC) and its National Center for Injury Prevention and Control (NCIPC), and the Society for Advancement of Violence and Injury Research (SAVIR).

The *State Health Department Consensus Recommendations* identified 14 specific injuries and injury risk factors to be placed under surveillance by all states and 11 data sets to monitor these injuries and risk

factors.⁴ The goal is to improve state-based injury surveillance to better support injury prevention programs and policies. By enhancing and standardizing methods used to track fatal and nonfatal injuries at the state level, its integration with overall public health surveillance as part of the National Public Health Surveillance System (NPHSS) will be much easier.⁵ With the *State Health Department Consensus Recommendations*, CSTE and STIPDA developed injury indicators that were formally adopted for inclusion in NPHSS.^{6,7} The NPHSS injury indicators add to other indicators developed by CSTE for chronic diseases and other areas.⁶

The Consensus Recommendations for Using Hospital Discharge Data for Injury Surveillance, published in 2003, has provided clear and specific recommendations about the evaluation and use of hospital discharge data.⁸ It presents important considerations for the evaluation of data quality and outlines the methods for developing an injury hospitalization data set.

The collection and dissemination of injury indicators in this report is the implementation of the foundation laid by the publication of the STIPDA and CSTE documents. It is the next step in the collaborative progress of building strong state-based injury surveillance that is comparable between jurisdictions.

Discussion of Indicators

Methods

The data presented in this report are drawn from a combination of state vital statistics records, state hospital discharge data (HDD), the National Vital Statistics System (NVSS), the Behavioral Risk Factor Surveillance System (BRFSS), and the Fatality Analysis Reporting System (FARS). The methods used to prepare this report were fully delineated in the companion publication, *State Injury Indicators: Instructions for Preparing 2004 Data*.⁹ In brief, injury hospitalization cases were identified from state-based HDD using the principal diagnosis (or first-listed diagnosis code) along with other selective factors. Injury deaths were identified from vital statistic using the underlying-cause-of-death codes. For the fatal TBI indicator, all multiple-cause-of-death fields were searched. For comparison purposes, national rates for the fatality indicators were generated by using the NVSS.

What is an Injury Indicator?

An injury indicator describes a health outcome of an injury, such as hospitalization or death, or a factor known to be associated with an injury.

The following *International Classification of Diseases – Tenth Revision* (ICD-10)¹⁰ and *International Classification of Diseases – Ninth Revision – Clinical Modifications* (ICD-9-CM)¹¹ code groupings were used to identify cases of injury-related death and hospitalizations, respectively.

Hospitalizations for all injuries

Diagnosis codes: 800–909.2, 909.4, 909.9–994.9, 995.5–995.59, 995.80–995.85

Traumatic brain injury fatality

Diagnosis codes: S01.0–S01.9, S02.0, S02.1, S02.3, S02.7–S02.9, S06.0–S06.9, S07.0, S07.1, S07.8, S07.9, S09.7–S09.9, T01.0, T02.0, T04.0, T06.0, T90.1, T90.2, T90.4, T90.5, T90.8, T90.9

Traumatic brain injury hospitalizations

Diagnosis codes: 800.0–801.9, 803.0–804.9, 850–854, 959.01

Unintentional drowning fatality

W65–W74, V90, V92

Nonfatal drowning hospitalizations

Diagnosis code: 994.1
E830, E832, E910, E954, E964, E984

Unintentional fire-related fatality

X00–X09

Unintentional fire-related hospitalizations

E890–E899

Firearm-related fatality

W32–W34, X72–X74, X93–X95, Y22–Y24, Y35.0

Firearm-related hospitalizations

E922.0–E922.3, E922.8, E922.9, E955.0–E955.4, E965.0–E965.4, E985.0–E985.4, E970

Homicide

X85–Y09, Y87.1

Suicide

X60–X84, Y87.0

Suicide attempt hospitalizations

E950–E959

Unintentional motor vehicle traffic fatality

V02–V04 (.1, .9), V09.2, V12–V14 (.3–.9), V19 (.4–.6), V20–V28 (.3–.9), V29–V79 (.4–.9), V80 (.3–.5), V81.1, V82.1, V83–V86 (.0–.3), V87 (.0–.8), V89.2

Unintentional motor vehicle traffic and non-traffic hospitalizations

E810–E825

Poisoning fatality

X40–X49, X60–X69, X85–X90, Y10–Y19, Y35.2

Poisoning hospitalizations

E850–E858, E860–E869, E950–E952, E962, E972, E980–E982

For the BRFSS data, weighted percentages were generated by state by using the 2004 public-use data file for the questions of interest.¹² Alcohol-related crash death rates were calculated by state by using the number of alcohol-related crash deaths from FARS data as the numerator and state-provided population totals for the denominator.¹³ An alcohol-related crash death is defined as a death due to a motor vehicle traffic crash where either the driver or a non-occupant (e.g., pedestrian) had a blood alcohol concentration (BAC) ≥ 0.01 g/dL.

Hospital Discharge Data Quality

The quality and completeness of hospital discharge data is affected by factors including the completeness of external-cause-of-injury coding and the inclusion or exclusion of residents in out-of-state hospitals. Both incomplete external-cause-of-injury coding completeness and the loss of state residents treated in out-of-state hospitals decrease the number of cases that can be identified and result in reporting artificially lower rates. Readers are encouraged to consider the representativeness of data from individual state hospital discharge data systems when interpreting rates based on hospital discharge data.

For the 2004 data, hospital discharge data with external cause coding ranged from 66% to 100% (Table A). Ninety-four percent of the reporting states have >80% of their hospitalization data external-cause-of-injury coded; this is an increase from 56% in the 2nd edition. A parallel increase is seen in the number of states with >90% of hospitalization data external-cause-of-injury coded; 66% have >90% coded in this edition while only 35% had >90% coded in the second edition.¹⁴

Highlights

The injury indicator data presented here provides a unique state-specific look at the magnitude of nine injury topic areas. With 34 states participating, an increase from 26 states in the second edition, the national representativeness of the data continues to increase. By using state-specific datasets and an agreed upon methodology, states are able to compare findings both within indicators and among states. Within a state, comparisons can be made relative to magnitude and impact of the various causes of injury. Also, as the completeness of reporting and external-cause-of-injury data continues to improve, interstate comparisons become possible.

The thirty-four states are geographically diverse and both urban and rural areas are represented. These states, when considered together, provide an overview of injury in each of the indicator areas.

All-Injury Indicator

The individual state rates of Hospitalizations for All Injuries ranged from 321.0 to 812.3 per 100,000 persons. The median rate for Hospitalizations for All Injuries across the reporting states was 555.4 per 100,000 persons.

The individual state rate of Hospitalizations for All Injuries ranged from 333.0 to 824.1 per 100,000 persons among males and from 296.5 to 784.2 per 100,000 persons among females. The median rate for Hospitalizations for All Injuries was 585.7 per 100,000 persons among males and 509.9 per 100,000 persons among females.

In each of the reporting states, the highest Hospitalizations for All Injuries rate was among people 85 years and older, with a range of 2,557.7 to 6,845.1 per 100,000 persons.

* Percentage of hospital discharge data injury hospitalizations with external cause coding. Incompleteness may lead to bias.

† Subjective assessment by health department staff whether a substantial proportion of state residents injured in-state who require hospitalization are hospitalized in a neighboring state.

‡ No data available.

Traumatic Brain Injury (TBI) Indicators

The individual state rates of TBI Fatalities ranged from 7.1 to 25.2 per 100,000 persons. The national rate for TBI Fatalities was 17.9 per 100,000 persons.

The individual state rate of TBI Fatalities ranged from 10.9 to 40.9 per 100,000 persons among males and from 3.8 to 12.9 per 100,000 persons among females. The national rate for TBI Fatalities was 27.8 per 100,000 persons among males and 9.1 per 100,000 persons among females.

In each of the reporting states, the highest TBI Fatality rate was among people 65 years and older, with a range of 24.2 to 61.9 per 100,000 persons.

The individual state rates of TBI Hospitalizations ranged from 37.2 to 122.2 per 100,000 persons. The median rate for TBI Hospitalizations across all reporting states was 74.2 per 100,000 persons.

The individual state rate of TBI Hospitalizations ranged from 50.1 to 164.4 per 100,000 persons among males and from 26.0 to 82.2 per 100,000 persons among females. The median rate for TBI Hospitalizations was 96.7 per 100,000 persons among males and was 49.1 per 100,000 persons among females.

In each of the reporting states, the highest TBI Hospitalization rate was among people 85 years and older, with a range of 228.4 to 678.7 per 100,000 persons.

Drowning Indicators

The individual state rates of Unintentional Drowning Fatalities ranged from too few cases to report to 2.6 per 100,000 persons. The national rate for Unintentional Drowning Fatalities was 1.3 per 100,000 persons.

The individual state rate of Unintentional Drowning Fatalities ranged from too few cases to report to 4.5 per 100,000 persons among males, and from too few cases to report to 1.2 per 100,000 persons among females. The national rate for Unintentional Drowning Fatalities was 2.1 per 100,000 persons among males and 0.5 per 100,000 persons among females.

The individual state rates of Nonfatal Drowning Hospitalizations ranged from too few cases to report to 4.4 per 100,000 persons. The median rate for Nonfatal Drowning Hospitalizations across all reporting states was 0.7 per 100,000 persons.

The individual state rate of Nonfatal Drowning Hospitalizations ranged from too few cases to report to 6.4 per 100,000 persons among males, and from too few cases to report to 1.7 per 100,000 persons among females. Median rates for male and female Nonfatal Drowning Hospitalizations were not reported due to low case counts.

Fire-Related Indicators

The individual state rates of Unintentional Fire-Related Fatalities ranged from too few cases to report to 2.5 per 100,000 persons. The national rate for Unintentional Fire-Related Fatalities was 1.1 per 100,000 persons.

The individual state rate of Unintentional Fire-Related Fatalities ranged from too few cases to report to 3.6 per 100,000 persons among males and from too few cases to report to 1.7 per 100,000 persons among females. Among males, the national rate for Unintentional Fire-Related Fatalities was 1.4 per 100,000 persons and among females the national rate was 0.8 per 100,000 persons.

The individual state rates of Unintentional Fire-Related Hospitalizations ranged from too few cases to report to 6.5 per 100,000 persons. The median rate for Unintentional Fire-Related Hospitalizations across all reporting states was 3.3 per 100,000 persons.

The individual state rate of Unintentional Fire-Related Hospitalizations ranged from too few cases to report to 10.2 per 100,000 persons among males and from too few cases to report to 3.4 per 100,000 persons among females. The median rate for Unintentional Fire-Related Hospitalizations was 5.3 per 100,000 persons among males and 2.1 per 100,000 persons among females.

Firearm-Related Indicators

The individual state rates of Firearm-Related Fatalities ranged from 3.1 to 19.6 per 100,000 persons. The national rate for Firearm-Related Fatalities was 10.0 per 100,000 persons.

The individual state rate of Firearm-Related Fatalities ranged from 5.5 to 35.0 per 100,000 persons among males, and from too few cases to report to 5.3 per 100,000 persons among females. The national rate for Firearm-Related Fatalities was 17.7 per 100,000 persons among males and 2.7 per 100,000 persons among females.

In the reporting states, the highest Firearm-Related Fatality rate was most commonly found among persons in the 15-24 year age group. However, in some states the highest rates were in persons 25-44 years, 65 years and older, or 45-64 years.

The individual state rates of Firearm-Related Hospitalizations ranged from 1.6 to 15.8 per 100,000 persons. The median rate for Firearm-Related Hospitalizations across all reporting states was 7.5 per 100,000 persons.

The individual state rate of Firearm-Related Hospitalizations ranged from too few cases to report to 29.2 per 100,000 persons among males, and from too few cases to report to 5.3 per 100,000 persons among females. The median rate for Firearm-Related Hospitalizations was 13.3 per 100,000 persons among males and 2.1 per 100,000 persons among females.

In most of the reporting states, the highest Firearm-Related Hospitalization rate was among person 15-24 years.

Based on results from the Behavioral Risk Factor Surveillance System, 0.6% to 10.3% of adults lived in a home with a loaded and unlocked firearm for the 34 states reporting indicator data. The median percent was 3.8%.

Homicide Indicator

The individual state rates of Homicides ranged from too few cases to report to 13.0 per 100,000 persons. The national rate for Homicides was 5.9 per 100,000 persons.

The individual state rate of Homicides ranged from too few cases to report to 21.2 per 100,000 persons among males and from too few cases to report to 5.7 per 100,000 persons among females. The national rate for Homicides was 9.2 per 100,000 persons among males and 2.6 per 100,000 persons among females.

In the reporting states, the highest Homicide rate was most commonly found in the 15-24 year age group. However, in several states the highest rate was among person 25-44 years.

Suicide Indicators

The individual state rates of Suicides ranged from 6.3 to 18.9 per 100,000 persons. The national rate for Suicides was 11.0 per 100,000 persons.

The individual state rate of Suicides ranged from 10.6 to 31.7 per 100,000 persons among males, and from too few cases to report to 8.0 per 100,000 persons among females. The national rate for Suicides was 18.0 per 100,000 persons among males and 4.5 per 100,000 persons among females.

In the reporting states, the highest Suicide rate was most commonly found in the 45-64 year age group. However, in some states the highest rates were for persons 25-44 years, 65 years and older, or 15-24 years.

The individual state rates of Suicide Attempt Hospitalizations ranged from 29.0 to 87.6 per 100,000 persons. The median rate for Suicide Attempt Hospitalizations across all reporting states was 47.7 per 100,000 persons.

The individual state rate of Suicide Attempt Hospitalizations ranged from 21.1 to 64.4 per 100,000 persons among males and from 33.5 to 115.6 per 100,000 persons among females. The median rate for Suicide Attempt Hospitalizations was 36.2 per 100,000 persons among males and 56.9 per 100,000 persons among females.

In the reporting states, the highest Suicide Attempt Hospitalization rate was most commonly found in the 15-24 year age group. However, in approximately a third of the reporting states, the highest rate was for person 25-44 years.

Motor Vehicle Indicators

The individual state rates of Unintentional Motor Vehicle Traffic Fatalities ranged from 6.6 to 27.4 per 100,000 persons. The national rate for Unintentional Motor Vehicle Traffic Fatalities was 14.7 per 100,000 persons.

The individual state rate of Unintentional Motor Vehicle Traffic Fatalities ranged from 10.7 to 36.5 per 100,000 persons among males and from 4.3 to 18.8 per 100,000 persons among females. The national rate for Unintentional Motor Vehicle Traffic Fatalities was 20.6 per 100,000 persons among males and the national rate was 9.1 per 100,000 persons among females.

In the reporting states, the highest Unintentional Motor Vehicle Traffic Fatality rate was most commonly found in the 15-24 years age group. However, in a few states, the highest rate was among those 65 years and older.

The individual state rates of Unintentional Motor Vehicle Traffic and Non-Traffic Hospitalizations ranged from 35.0 to 131.0 per 100,000 persons. The median rate for Unintentional Motor Vehicle Traffic and Non-Traffic Hospitalizations across all reporting states was 88.0 per 100,000 persons.

The individual state rate of Unintentional Motor Vehicle Traffic and Non-Traffic Hospitalizations ranged from 42.8 to 164.3 per 100,000 persons among males and from 27.7 to 96.5 per 100,000 persons among females. The median rate for Unintentional Motor Vehicle Traffic and Non-Traffic Hospitalizations was 114.2 per 100,000 persons among males and 63.6 per 100,000 persons among females.

In the reporting states, the highest Unintentional Motor Vehicle Traffic and Non-Traffic Hospitalization rate was most commonly found in the 15-24 years age group. However, in a few states, the highest rate was among persons 75-84 years or persons 85 years and older.

Based on results from the Behavioral Risk Factor Surveillance System from the 34 states reporting indicator data, 2.2% to 6.4% of the adults who reported drinking at least one alcoholic beverage in the past month also reported driving after perhaps having too much to drink. The median percent was 3.4%.

Based on data from the Fatality Analysis Reporting System, alcohol-related crash death rates ranged from 2.9 to 11.1 per 100,000. The alcohol-related crash death rate for the United States was 5.7 per 100,000.

Poisoning Indicators

The individual state rates of Poisoning Fatalities ranged from 3.1 to 18.6 per 100,000 persons. The national rate for Poisoning Fatalities was 10.3 per 100,000 persons.

The individual state rate of Poisoning Fatalities ranged from 3.9 to 24.0 per 100,000 persons among males and from 2.2 to 14.0 per 100,000 persons among females. The national rate for Poisoning Fatalities was 13.3 per 100,000 persons among males and 7.4 per 100,000 persons among females.

In the reporting states, the highest Poisoning Fatality rate was most commonly found in the 25-44 year age group. However, in approximately a third of the reporting states, the highest rate was for person 45-64 years.

The individual state rates of Poisoning Hospitalizations ranged from 40.6 to 105.2 per 100,000 persons. The median rate for Poisoning Hospitalizations across all reporting states was 74.1 per 100,000 persons.

The individual state rate of Poisoning Hospitalizations ranged from 32.6 to 99.5 per 100,000 persons among males and 48.7 to 126.9 per 100,000 persons among females. The median rate for Poisoning Hospitalizations was 62.4 per 100,000 persons among males and 81.1 per 100,000 persons among females.

In the reporting states, the highest Poisoning Hospitalization rate was most commonly found in the 35-44 year age group. However, in some states the highest rates were for persons 15-24 years, 25-34 years, or 45-54 years.

Limitations and Future Efforts

While this report provides important information for understanding injury, the following limitations are should be considered:

- Only injuries severe enough to lead to either hospitalization or death are reported. Injuries that lead to emergency department visits, physician office visits, or remain untreated need to be accounted for if the total burden of injury is to be understood.
- Not all causes of injury have been included in this report. The absence of fall-related indicators is noted.
- Representation from all states and territories has not yet been achieved.
- Quality and completeness of external-cause-of-injury coding, while improving, continues to be incomplete.

Future editions of the *State Injury Indicators Report* will strive to address these limitations. NCIPC, STIPDA, and CSTE, in conjunction with participating states, will continue to refine current indicators and define new ones for inclusion in future editions of this report. In keeping with the consensus building process and the publication of *Consensus Recommendations for Surveillance of Falls and Fall-Related Injuries*¹⁵ the next edition will include the recommended indicators for fall-related injuries. The incorporation of emergency department data into future editions is under exploration and consideration. Finally, submission of data from additional states and territories is encouraged and welcomed.
