PREFACE.

CONDORCET, proferibed by a fanguinary faction, formed the idea of addressing to his fellow-citizens a fummary of his principles, and of his conduct in public affairs. He set down a few lines in execution of this project: but when he recollected, as he was obliged to do, thirty years of labour directed to the public fervice, and the multitude of fugitive pieces in which, fince the revolution, he had uniformly attacked every inflitution inimical to liberty, he rejected the idea of a ufeles juftification. Free as he was from the dominion of the: passions, he could not confent to stain the purity of his mind by recollecting his perfecutors; perpetually and! fublimely inattentive to himfelf, he determined to confecrate the flort fpace that remained between him and: death to a work of general and permanent utility. That: work is the performance now given to the world. It: - has relation to a number of others, in which the rights of men had previoufly been difcuffed and eftablished; in which superstition had received its last and fatal blow; in which the methods of the mathematical fciences, applied to new objects, have opened new avenues to the moral and political fciences; in which the genuine principles of focial happiness have received a developement, and a kind of demonstration, unknown before; lastly, in.

which we every where perceive marks of that profound morality, which banishes even the very frailties of felflove—of those pure and incorruptible virtues within the influence of which it is impossible to live without feeling a religious veneration.

May this deplorable inftance of the moft extraordinary talents loft to his country—to the caufe of liberty—to the progrefs of fcience, and its beneficial application to the wants of civilized man, excite a bitternefs of regret that fhall prove advantageous to the public welfare ! May this death, which will in no finall degree contribute, in the pages of hiftory, to characterife the era in which it has taken place, infpire a firm and dauntlefs attachment to the rights of which it was a. violation ! Such is the only homage worthy the fage, who, the fatal fword fufpended over his head, couldmeditate in peace the melioration and happinefs of his: fellow-creatures; fuch the only confolation thofe can. experience who have been the objects of his affection<sub>20</sub> and have known all the extent of his virtue.

### OUTLINES

OF AN

## HISTORICAL VIEW, &c.

INTRODUCTION.

MAN is born with the faculty of receiving fenfations. In those which he receives, he is capable of perceiving and of diffinguishing the simple fensations of which they are composed. He can retain, recognise, combine them. He can preferve or recal them to his memory; he can compare their different combinations; he can afcertain what they poffels in common, and what characterifes each; laftly, he can affix figns to all these objects, the better to know them, and the more eafily to form from them new combinations. This faculty is developed in him by the action of external objects, that is, by the prefence of certain complex fenfations, the conftancy of which, whether in their identical whole, or in the laws of their change, is independent of himfelf. It is also exercised by communication with other fimilarly organifed individuals, and by all the artificial means which, from the first develope ment of this faculty, men have fucceeded in inventing.

Senfations are accompanied with pleafure or pain, and man has the further faculty of converting these momentary impressions into durable sentiments of a corresponding nature, and of experiencing these sentiments either at the sight or recollection of the pleasure or pain of beings sensitive like himself. And from this faculty, united with that of forming and combining ideas, arise, between him and his fellow creatures, the ties of interess and duty, to which nature has affixed the most exquisite portion of our felicity, and the most poignant of our sufferings.

Were we to confine our observations to an enquiry into the general facts and unvarying laws which the

developement of these faculties presents to us, in what is common to the different individuals of the human species, our enquiry would bear the name of metaphysics.

But if we confider this developement in its refults, relative to the mals of individuals co-existing at the fame time on a given space, and follow it from generation to generation, it then exhibits a picture of the progress of human intellect. This progress is subject to the fame general laws, observable in the individual developement of our faculties; being the result of that very developement confidered at once in a great number of individuals united in fociety. But the result which every instant prefents, depends upon that of the preceding instants, and has an influence on the instants which follow.

II

This picture, therefore, is hiftorical; fince fubjected as it will be to perpetual variations, it is formed by the fucceffive obfervation of human focieties at the different eras through which they have paffed. It will accordingly exhibit the order in which the changes have taken place, explain the influence of every paft period upon that which follows it, and thus fhow, by the modifications which the human fpecies has experienced, in its inceffant renovation through the immenfity of ages, the courfe which it has purfued, and the fteps which it has advanced towards knowledge and happinefs. From thefe obfervations on what man has heretofore been, and what he is at prefent, we fhall be led to the means of

fecuring and of accelerating the still further progress, of which, from his nature; we may indulge the hope.

Such is the object of the work I have undertaken; the refult of which will be to show, from reasoning as d from facts, that no bounds have been fixed to the improvement of the human faculties; that the pefectibility of man is absolutely indefinite; that the progress of this perfectibility, henceforth above the controul of every power that would impede it, has no other limit than the duration of the globe upon which nature has placed us. The course of this progress may doubtles be more or less rapid, but it can never be retrograde; at least while the earth retains its fituation in the fystem of the universe, and the laws of this fystem shall neither effect upon the globe a general overthrow, nor introduce

12

fuch changes as would no longer permit the human race to preferve and exercise therein the same faculties, and find the same resources.

The first state of civilization observable in the human species, is that of a society of men, few in number, fubfilting by means of hunting and fifting, unacquainted with every art but the imperfect one of fabricating in an uncouth manner their arms and fome household utenfils, and of constructing or digging for themselves an habitation; yet already in possession of a language for the communication of their wants; and a fmall number of moral ideas, from which are deduced their common rules of conduct, living in families, conforming themfelves to general cuftoms that ferve inftead of laws, and having even a rude form of government, In this flate it is apparent that the uncertainty and difficulty of procuring fublishence, and the unavoidable alternative of extreme fatigue or an absolute repose, leave not to man the leifure in which, by refigning himself to meditation, he might enrich his mind with new combinations. The means of fatisfying his wants are even too dependent upon chance and the feafons, ufefully to excite an industry, the progressive improvement of which might be transmitted to his progeny; and accordingly the attention of each is confined to the improvement of his individual skill and address.

For this reason, the progress of the human species must in this stage have been extremely slow; it could

13

make no advance but at diftant intervals, and when favoured by extraordinary circumftances. Meanwhile, to the fubliftance derived from hunting and fifting, or from the fruits which the earth fpontaneoufly offered, fucceeds the fuftenance afforded by the animals which man has tamed, and which he knows how to preferve and multiply. To thefe means is afterwards added an imperfect agriculture; he is no longer content with the fruit or the plants which chance throws in his way; he learns to form a flock of them, to collect them around. him, to fow or to plant them, to favour their reproduction by the labour of culture.

Property, which, in the first state, was confined to

٠.

his household utenfils, his arms, his nets, and the animals he killed, is now extended to his flock, and next. to the land which he has cleared and cultivated. Upon the death of its head, this property naturally devolves. to the family. Some individuals poffefs a fuperfluity capable of being preferved. If it be abfolute, it gives rife to new wants. If confined to a fingle atticle, while the proprietor feels the want of other articles, this want suggests the idea of exchange. Hence moral relations multiply, and become complicate. A greater security, a more certain and more constant leifure, afford time for méditation, or at least for a continued. feries of observations. The custom is introduced, as tofome individuals, of giving a part of their fuperfluity in 2 exchange for labour, by which they might be exempt: B. 2.

~

from labour themfelves. There accordingly exifts a clafs of men whofe time is not engroffed by corporeal exertions, and whose desires extend beyond their simple wants. Industry awakes; the arts already known, expand and improve : the facts which chance prefents to the observation of the most attentive and best cultivated minds, bring to light new arts; as the means of living become lefs dangerous and lefs precarious, population increases; agriculture, which can provide for a greater number of individuals upon the fame space of ground, fupplies the place of the other fources of fubfistence; it favours the multiplication of the species, by which it is favoured in its turn; in a fociety become more sedentary, more connected, more intimate, ideas that have been acquired communicate themselves more quickly, and are perpetuated with more certainty. And now the dawn of the sciences begins to appear; man exhibits an appearance distinct from the other classes of animals, and is no longer like them confined to an improvement purely individual. The more extensive, more numerous and more complicated relations which men now form with each other, cause them to seel the necessity of having a mode of communicating their ideas to the absent, of preferving the remembrance of a fact with more precision than by oral tradition, of fixing the conditions of an agreement more fecurely than by the memory of witneffes, of flating, in a way lefs liable to change, those respected customs to which the members of any fociety agree to fubmit their conduct.

Accordingly the want of writing is felt, and the art invented. It appears at first to have been an absolute painting, to which fucceeded a conventional painting, preferving fuch traits only as were characteristic of the objects. Afterwards, by a kind of metaphor analogous to that which was already introduced into their language, the image of a physical object became expressive of moral ideas. The origin of those figns, like the origin of words, were liable in time to be forgotten; and writing became the art of affixing figns of convention to every idea, every word, and of confequence to every combination of ideas and words.

There was now a language that was written, and a language that was fpoken, which it was neceffary equally to learn, between which there must be established a reciprocal correspondence. ٦

Some men of genius, the eternal benefactors of the human race, but whofe names and even country are for ever buried in oblivion, obferved that all the words of a language were only the combinations of a very limited number of primitive articulations; but that this number, finall as it was, was fufficient to form a quantity almost infinite of different combinations. Hence they conceived the idea of reprefenting by visible figns, not the ideas or the words that answered to them, but those fimple elements of which the words are composed.

Alphabetical writing was then introduced. A fmall number of figns ferved to express every thing in this

mode, as a fmall number of founds fufficed to express every thing orally. The language written and the language fpoken were the fame; all that was neceffary was to be able to know, and to form, the few given figns; and this last step fecured for ever the progress of the human race.

It would perhaps be defirable at the prefent day, to inflitute a written language, which, devoted to the fole use of the fciences, expressing only such combinations of simple ideas as are found to be exactly the same in every mind, employed only upon reasonings of logical strictness, upon operations of the mind precise and determinate, might be understood by men of every country,

and be translated into all their idioms, without being, like those idioms, liable to corruption, by passing into common use.

Then, fingular as it may appear, this kind of writing, the prefervation of which would only have ferved to prolong ignorance, would become, in the hands of philofophy, an ufeful inftrument for the fpeedy propagation of knowledge, and advancement of the fciences.

It is between this degree of civilization and that in which we ftill find the favage tribes, that we must place every people whose history has been handed down to us, and who, fometimes making new advancements, fometimes plunging themselves again into ignorance, fometimes floating between the two alternatives or ftopping at a certain limit, fometimes totally disappearing

from the earth under the fword of conquerors, mixing with those conquerors, or living in flavery; lastly, fometimes receiving knowledge from a more enlightened people, to transmit it to other nations,—form an unbroken chain of connection between the earliest periods of history and the age in which we live, between the first people known to us, and the prefent nations of Europe. In the picture then which I mean to sketch, three

distinct parts are perceptible.

۸

In the first, in which the relations of travellers exhibit to us the condition of mankind in the least civilized nations, we are obliged to guess by what steps man in an isolated state, or rather confined to the society necesfary for the propagation of the species, was able to acquire those first degrees of improvement, the last term of which is the use of an articulate language : an acquisition that prefents the most striking feature, and indeed the only one, a few more extensive moral ideas and a slight commencement of social order excepted, which distinguishes him from animals living like himself in regular and permanent society. In this part of our picture, then, we can have no other guide than an investigation of the developement of our faculties.

To this first guide, in order to follow man to the point in which he exercises arts, in which the rays of fcience begin to enlighten him, in which nations are united by commercial intercourse; in which, in fine, alphabetical writing is invented, we may add the history

of the feveral societies that have been observed in almost every intermediate state : though we can follow no individual one through all the fpace which 'feparates thefe two grand epochs of the human race.

Here the picture begins to take its colouring in great measure from the series of facts transmitted to us by history : but it is necessary to select these facts from that of different nations, and at the fame time compare and combine them, to form the supposed history of a single people, and delineate its progrefs.

From the period that alphabetical writing was known in Greece, history is connected by an uninterrupted feries of facts and observations, with the period in which

we live, with the prefent state of mankind in the most enlightened countries of Europe; and the picture of the progrefs and advancement of the human mind becomes strictly historical. Philosophy has no longer any thing to guels, has no more suppositions combinations to form; all it has to do is to collect and arrange facts, and exhibit the useful truths which arise from them as a whole, and from the different bearings of their feveral parts.

There remains only a third picture to form,-that of our hopes, or the progrefs referved for future generations, which the conftancy of the laws of nature feems to fecure to mankind. And here it will be necessary to shew by what steps this progress, which at present may appear chimerical, is gradually to be rendered possible,

and even eafy; how truth, in fpite of the transient fuccess of prejudices, and the Support they receive from the corruption of governments or of the people, must in the end obtain a durable triumph; by what ties nature has indiffolubly united the advancement of knowledge with the progress of liberty, virtue, and respect for the natural rights of man; how these bleffings, the only real ones, though fo frequently feen apart as to be thought incompatible, must necessarily amalgamate and become infeparable, the moment knowledge shall have arrived at a certain pitch in a great number of nations at once, the moment it shall have penetrated the whole mass of a great people, whofe language shall have become univerfal, and whole commercial intercourse shall embrace the whole extent of the globe. This union having once taken place in the whole enlightened clafs of men, this clafs will be confidered as the friends of human kind, exerting themselves in concert to advance the improvement and happinels of the species,

We shall expose the origin and trace the history of general errors, which have more or less contributed to retard or fuspend the advance of reason, and sometimes even, as much as political events, have been the cause of man's taking a retrograde course towards ignorance.

Those operations of the mind that lead to or retain us in error, from the fubile paralogism, by which the most penetrating mind may be deceived, to the mad reveries of enthusias, belong equally, with that just

- · ·

mode of reafoning that conducts us to truth, to the theory of the developement of our individual faculties; and for the fame reafon, the manner in which general errors are introduced, propagated, trafmitted, and rendered permanent among nations, forms a part of the picture of the progrefs of the human mind. Like truths which improve and enlighten it, they are the confequence of its activity, and of the difproportion that always exifts between what it actually knows, what it has the defire to know, and what it conceives there is a neceffity of acquiring.

It is even apparent, that, from the general laws of the developement of our faculties, certain prejudices must necessarily spring up in each stage of our progress, and extend their feductive influence beyond that ftage; becaufe men retain the errors of their infancy, their country, and the age in which they live, long after the truths necessary to the removal of those errors are acknowledged. In fhort, there exist, at all times and in all countries, different prejudices, according to the degree of illumination of the different classes of men, and according to their professions. If the prejudices of philosophers be impediments to new acquisitions of truth, those of the lefs enlighted classes retard the propagation of truths already known, and those of esteemed and powerful professions oppose like obstacles. These are the three kinds of enemies which reason is continu-

×,

•

#### 21

ally obliged to encounter, and over which the frequently does not triumph till after a long and painful struggle. The history of these contests, together with that of the rife, triumph, and fall of prejudice, will occupy a confiderable place in this work, and will by no means form the least important or least useful part of it.

If there be really fuch an art as that of forefeeing - the future improvement of the human race, and of directing and haftening that improvement, the hiftory of the progrefs it has already made must form the principal basis of this art. Philosophy, no doubt, ought to proscribe the superstitious idea, which supposes no rules of conduct are to be found but in the hiftory of paft ages, and no truths but in the fludy of the opinions of antiquity. But ought it not to include in the profeription, the prejudice that would proudly reject the lessons of experience? Certainly it is meditation alone that can, by happy combinations, conduct us to the general principles of the science of man. But if the study of individuals of the human species be of use to the metaphysician and moralist, why should that of societies be less useful to them? And why not of use to the political philosopher? If it be advantageous to observe the societies that exist at one and the fame period, and to trace their connection and refemblance, why not to observe them in a fuccellion of periods? Even supposing that fuch observation might be neglected in the investigation of speculative truths, ought it to be neglected when

the queftion is to apply those truths to practice, and to deduce from science the art that should be the useful refult? Do not our prejudices, and the evils that are the confequence of them, derive their source from the prejudices of our ancestors? And will it not be the furest way of undeceiving us respecting the one, and of prewenting the other, to develope their origin and effects?

Are we not arrived at the point when there is no Ionger any thing to fear, either from new errors, or the return of old ones; when no corrupt inftitution can be introduced by hypocrify, and adopted by ignorance or enthufiafm; when no vicious combination can effect the infelicity of a great people ? Accordingly would it

not be of advantage to know how nations have been deceived, corrupted, and plunged in mifery?

Every thing tells us that we are approaching the era of one of the grand revolutions of the human race. What can better enlighten us to what we may expect, what can be a furer guide to us, amidft its commotions, than the picture of the revolutions that have preceded and prepared the way for it? The prefent flate of knowledge affures us that it will be happy. But is it not upon condition that we know how to affift it with all our ftrength? And, that the happinefs it promifes may be lefs dearly bought, that it may fpread with more rapidity over a greater fpace, that it may be more complete in its effects, is it not requifite to fludy, in the hiftory of the human mind, what obftacles remain to be feared,

and by what means those obstacles are to be furmounted?

I shall divide the space through which I mean to run, into nine grand epochs; and shall presume, in atenth, to advance some conjectures upon the suture deftiny of mankind.

I shall confine myself to the principal features that: characterife each; I shall give them in the group, without troubling myself with exceptions or detail. I shall indicate the objects, of the results of which the work itself will present the developments and the proofs.

•

#### FIRST EPOCH.

#### Men united into Hordes.

WE have no direct information by which to afcertain what has preceded the flate of which we are now to speak; and it is only by examining the intellectual or moral faculties, and the physical constitution of man, that we are enabled to conjecture by what means he arrived at this first degree of civilization.

Accordingly an investigation of those physical qualities favourable to the first formation of fociety, together with a fummary analysis of the development of our intellectual or moral faculties, must ferve as an introduction to this epoch.

A fociety confifting of a family appears to be natural to man. Formed at first by the want which children have of their parents, and by the affection of the mother, as well as that of the father, though lefs general and lefs lively, time was allowed, by the long continuance of this want, for the birth and growth of a fentiment which must have excited the defire of perpetuating the The continuance of the want was also fufficient union. for the advantages of the union to be felt. A family placed upon a soil that afforded an easy subsistence,

25

might afterwards have multiplied and become a horde.

Hordes that may have owed their origin to the union of feveral diffinct families, must have been formed more flowly and more rarely, the union depending on motives lefs urgent and the concurrence of a greater number of circumstances.

The art of fabricating arms; of preparing aliments, of procuring the utenfils requifite for this preparation, of preferving these aliments as a provision against the feasons in which it was impossible to procure a fresh supply of them—these arts, confined to the most simplewants, were the first fruits of a continued union, and

the first features that distinguished human society from the fociety observable in many species of beasts...

In fome of these hordes, the women cultivate round is the huts plants which ferve for food and superfede the necessity of hunting and fishing. In others, formed in places where the earth spontaneously offers vegetables nutriment, a part of the time of the favage is occupied by the care of seeking and gathering it. In hordes of the last description, where the advantage of remaining united is less felt, civilization has been observed very little to exceed that of a fociety confisting of a single. family. Meanwhile there has been found in all the uses of an articulate language.

More frequent and more durable connections with: the fame individuals, a fimilarity of interests, the fuccour. C.a.

mutually given, whether in their common hunting or against an enemy, must have equally produced both the fentiment of justice and a reciprocal affection between the members of the fociety. In a short time this affection would transform itself into attachment to the fociety.

The neceffary confequence was a violent enmity, and a defire of vengeance not to be extinguished, against the enemies of the horde.

The want of a chief, in order to act in common, and thereby defend themfelves the better, and procure with greater eafe a more certain and more abundant fubsistence, introduced the first idea of public authority into these focieties. In circumstances in which the whole horde was interested, respecting which a common resolution must be taken, all those concerned in executing the refolution were to be confulted. The weakness of the females, which exempted them from the diffant chace and from war, the usual subjects of debate, excluded them alike from these confultations. As the resolutions demanded experience, none were admitted but fuch as were fupposed to posses it. The quarrels that arose in a fociety diffurbed its harmony, and were calculated to deftroy it : it was natural to agree that the decision of them fhould be referred to those whose age and personal qualities inspired the greatest confidence. Such was the origin of the first political institutions.

2<u>7</u>\_

The formation of a language must have preceded these inflitutions. The idea of expressing objects by conventional signs appears to be above the degree of intelligence attained in this stage of civilization; and it is probable they were only brought into use by length of time, by degrees, and in a manner in some fort imperceptible.

The invention of the bow was the work of a fingle man of genius; the formation of a language that of the whole fociety. These two kinds of progress belong equally to the human species. The one, more rapid, is the refult of those new combinations which men favoured by nature are capable of forming; is the fruit of their meditations and the energies they difplay: the other, more flow, arifes from the reflections and observations that offer themselves to all men, and from the habits contracted in their common course of life. Regular movements adjusted to each other in due proportion, are capable of being executed with a lefs degree of fatigue; and they who fee, or hear them, perceive their order and relation with greater facility. For both these reasons, they form a source of pleasure. Thus the origin of the dance, of mulic and of poetry, may be traced to, the infant flate of fociety. They were employed for the amufement of youth and upon occasions of públic feftivals. There were at that period love fongs and war fongs; and even mufical inftruments were invented. Neither was the art of eloquence absolutely unknown in these hordes; at least they could assume in

their fet speeches a more grave and solemn tone, and, were not strangers to rhetorical exaggeration.

The errors that diffinguish this epoch of civilizationare the conversion of vengeance and cruelty towards and enemy into virtue; the prejudice that configns the female part of fociety to a fort of flavery; the right of commanding in war confidered as the prerogative of an: individual family; together with the first dawn of various kinds of superstition. Of these it will be necessary to trace the origin and afcertain the motives. For man: never adopts without reason any errors, except what: his early education have in a manner rendered natural. to him : if he embrace any new error, it is either be-

cause it is connected with those of his infancy, or because his opinions, passions, interests, or other circum.stances, difpose him to embrace it:

The only fciences known to favage hordes, are a: flight and crude idea of aftronomy, and the knowledge. of certain medicinal plants employed in the cure of wounds and difeases; and even these are already corrupted by a mixture of fuperstition.

Meanwhile there is prefented to us in this epoch one. fact of importance in the hiftory of the human mind. We can here perceive the beginnings of an inflitution, that: in its progrefs has been attended with opposite effects,. accelerating the advancement of knowledge, at the fame time that it diffeminated error; enriching the fciences with new truths, but precipitating the people:

into ignorance and religious fervitude, and obliging them to purchase a few transient benefits at the price of a long and shameful tyranny.

I mean the formation of a clafs of men the depolitaries of the elements of the fciences or proceffes of the arrs, of the myfteries or ceremonies of religion, of the practices of fuperflition, and frequently even of the fecrets of legiflation and polity. I mean that feparation of the human race into two portions; the one deftined to teach, the other to believe; the one proudly concealing what it vainly boafts of knowing, the other receiving with refpect whatever its teachers condefcend to reveal: the one wifning to raife itfelf above

reafon, the other humbly renouncing reafon, and debafing itfelf below humanity, by acknowledging in its fellow men prerogatives fuperior to their common nature.

This diffinction, of which, at the clofe of the eighteenth century, we ftill fee the remains in our priefts, is obfervable in the leaft civilized tribes of favages, who have already their quacks and forcerers. It is too general, and too conftantly meets the eye in all the ftages of civilization, not to have a foundation in nature itfelf: and we fhall accordingly find in the ftate of the human faculties at this early period of fociety, the caufe of the credulity of the first dupes, and of the rude cunning of the first impostors.

#### SECOND EPOCH.

### Pastoral State of Mankind.—Transition from that to the Agricultural State.

HE idea of preserving certain animals taken in hunting, must readily have occurred, when their docility rendered the prefervation of them a talk of nodifficulty, when the foil round the habitations of the hunters afforded these animals an ample subsistence, when the family possessed a greater quantity of them than it could for the prefent confume, and at the fame. time might have reafon to apprehend the being exposed to want, from the ill fuccefs of the next chace, or the intemperature of the feafons. From keeping these animals as a fimple fupply against a time of need, it was observed that they might be made to multiply, and thus furnish a more durable. provision. Their milk afforded a farther resource : and those fruits of a flock, which, at first, were regard-ed only as a supplement to the produce of the chace, became the most certain, most abundant and least painful means of fubfiltence. Accordingly the chace ceafed to be confidered as the principal of these resources, and foon as any refource at all; it was purfued only as a pleafure, or as a neceffary precaution for keeping beafts.

of prey from the flocks, which, become more numerous, could no longer find round the habitations of their keepers a fufficient nourifhment.

A more fedentary and lefs fatiguing life afforded leifure favourable to the developement of the mind. Secure of fubfiftence, no longer anxious refpecting their first and indispensable wants, men sought, in the means of providing for those wants, new sensations.

The arts made fome progrefs: new light was acquired refpecting that of maintaining domeftic animals, of favouring their reproduction, and even of improving their breed.

Wool was used for apparel, and cloth fubstituted

in the place of fkins.

Family focieties became more urbane, without being lefs intimate. As the flocks of each could not multiply in the fame proportion, a difference of wealth was eftablished. Then was fuggested the idea of one man sharing the produce of his flocks with another who had no flocks, and who was to devote his time and strength to the care they require. Then it was found that the labour of a young and able individual was of more value than the expence of his bare substituence; and the custom was introduced of retaining prisoners of war as flaves, instead of putting them to death.

Hospitality, which is practifed also among favages, assumes in the pastoral state a more decided and important character, even among those wandering hordes

that dwell in their waggons or in tents. More frequent occasions occur for the reciprocal exercise of this act of humanity between man and man, between one people and another. It becomes a focial duty, and is fubjected to laws.

As fome families possefield not only a fure subsitence, but a constant superstuity, while others were destitute of the necessaries of life, natural compassion for the sufferings of the latter gave birth to the sentiment and practice of beneficence.

• Manners of course must have softened. The flavery of women became lefs fevere, and the wives of the rich were no longer condemned to fatiguing labours. A greater variety of articles employed in fatisfying the different wants, a greater number of instruments to prepare these wants, and a greater inequality in their distribution, gave energy to exchange, and converted it into actual commerce: it was impossible it should extend without the necessity of a common measure and a species of money being felt. Hordes became more numerous. At the fame time, in order the more eafily to maintain their flocks, they placed habitations, when fixed, more apart from each other; or changed them into movable encampments, as foon as they had discovered the use of certain species of animals they had tamed, in drawing or carrying burthens. Each nation had its chief for the conduct of war; but being divided into tribes, from the necessity of

### 33

fecuring pasturage, each tribe had also its chief. This fuperiority was attached almost universally to certain families. The heads however of families in possession of numerous flocks, a multitude of flaves, and who employed in their fervice a great number of poor, partook of the authority of the chiefs of the tribe, as these also shared in that of the chiefs of the nation; at least when, from the respect due to age, to experience, and the exploits they had performed, they were conceived to be worthy of it. And it is at this epoch of fociety that we must place the origin of flavery, and inequality of political rights between men arived at the age of maturity. The confuls of the chiefs of the family or tribe decided, from ideas of natural justice or of established ulage, the numerous and intricate disputes that already prevailed. The tradition of these decisions, by confirming and perpetuating the ulage, foon formed a kind of jurifprudence more regular and coherent than the progress of society had rendered in other respects necesfary. The idea of property and its rights had acquired greater extent and precision. The division of inheritances becoming more important, there was a necessity of subjecting it to fixed regulations. The agreements that were entered into being more frequent, were no longer confined to fuch fimple objects; they were to be subjected to forms; and the manner of verifying them, to fecure their execution, had also its laws.  $\{ \}$ 

The utility of obferving the stars, the occupation which in long evenings they afforded to the mind, and the leifure enjoyed by the shepherds, effected a slight degree of improvement in astronomy.

But we observe advancing at the fame time the art of deceiving men in order to rob them, and of affuming over their opinions an authority founded upon the hopes and fears of the imagination. More regular forms of worship begin to be established, and systems of faith less coarfely combined. The ideas entertained of supernatural powers, acquire a fort of refinement : and with this refinement we see spring up in one place pontiff princes, in another facerdotal families or tribes, in a third colleges of priest; a class of individuals uniformly affecting infolent prerogatives, separating themselves from the people, the better to enflave them, and feizing exclusively upon medicine and altronomy, that they may posses every hold upon the mind for subjugating it, and leave no means by which to unmalk their hypocrify, and break in pieces their chains. Languages were enriched without becoming lefs figurative or lefs bold. The images employed were more varied and more pleafing. They were acquired in pastoral life, as well as in the favage life of the fores, from the regular phenomena of nature, as well as from its wildness and eccentricities. Sorg, poetry, and instruments of music were improved during a leifure that

produced an audience more peaceable, and at the fame time more difficult to pleafe, and allowed the artift to reflect on his own fentiments, examine his first ideas, and form a felection from them.

It could not have efcaped obfervation that fome plants yielded the flocks a better and more abundant fubfiltence than others. The advantage was accordingly felt of favouring the production of thefe, of feparating them from plants lefs nutritive, unwholefome, and even dangerous; and the means of effecting this were difcovered.

In like manner, where plants, grain, the fpontaneous fruits of the earth, contributed with the produce of the flocks to the fubliftence of man, it muft equally have been obferved how those vegetables multiplied; and the care muft have followed of collecting them nearer to the habitations; of feparating them from ufeles vegetables, that they might occupy a foil to themfelves; of fecuring them from untamed beafts, from the flocks, and even from the rapacity of other men. These ideas muft have equally occurred, and even fooner, in more fertile countries, where the fpontaneous productions of the earth almost fufficed of themfelves for the fupport of men; who now began to devote themfelves to agriculture.

In fuch a country, and under a happy climate, the fame fpace of ground produces, in corn, roots, and fruit, wherewith to maintain a greater number of men than if

employed as pasturage. Accordingly, when the nature of the foil rendered not fuch cultivation too laborious, when the difcovery was made of employing therein those fame animals used by pastoral tribes for the transport from place to place of themfelves and their effects, agriculture became the most plentiful source of subsistence, the first occupation of men; and the human race arrived at the third epoch of its progrefs.

There are people who have remained, from time immemorial, in one of the two states we have described. 'They have not only not rifen of themfelves to any higher degree of improvement, but the connection and commercial intercourfe they have had with nations more civilized have failed to produce this effect. Such connec-· tions and intercourfe have communicated to them fome knowledge, fome industry, and a great many vices, but have never been able to draw them from their flate of mental stagnation. The principal causes of this phenomenon are to be found in climate; in habit; in the fweets annexed to this state of almost complete independence, an independence not to be equalled but in a fociety more perfect even than our own; in the natural attachment of man to opinions received from his infancy, and to the cuftoms of his country; in the averfion that ignorance feels to every fort of novelty; in bodily and more especially mental indolence, which suppress the feeble and as yet fcarcely existing spark of curiosity; and lastly, in the

37

empire which fuperstition already exercises over these infant focieties. To these causes must be added the avarice, cruelty, corruption and prejudices of polished nations, who appear to thefe people more powerful, more rich, more informed, more active, but at the fame time more vicious, and particularly lefs happy than themfelves. They must frequently indeed have been lefs struck with the superiority of fuch nations, than terrified at the multiplicity and extent of their wants, the torments of their avarice, the never ceasing agitations of their ever active, ever infatiable passions. This description of people has by fome philosophers been pitied, and by others admired and applauded; these have confidered. as wifdom and virtue, what the former have called by / the names of flupidity and floth. The queffion in debate between them will be refolved ] in the course of this work. It will there be feen why the progrefs of themind has not been at all times accompanied with an equal progrefs towards happiness and virtue; and how the leaven of prejudices and errors has : polluted the good that fhould flow from knowledge, a good which depends more upon the purity of that knowledge than its extent. Then it will be found that the . ftormy and arduous transition of a rude fociety to the state of civilization of an enlightened and free people, implies no degeneration of the human fpecies, but is a necessary crifis in its gradual advance towards absolute : perfection. Then it will be found that it is not the  $i_{+-}$ D 2

•

creafe of knowledge, but its decline, that has produced the vices of polifhed nations, and that, inftead of corrupting, it has in all cafes foftened, where it has been unable to correct or to change the manners of men.

# THIRD EPOCH.

## Progrefs of Mankind from the Agricultural State to the Invention of Alphabetical Writing.

THE uniformity of the picture we have hitherto drawn will foon difappear; and we shall no longer have to delineate those indistinct features, those slight shades of difference, that distinguish the manners, cha-

racters, opinions and fuperstitions of men, rooted, as it were, to their foil, and perpetuating almost without mixture a fingle family.

Invalions, conquelts, the rife and overthrow of empires, will fliortly be feen mixing and confounding nations, fome times differing them over a new territory, fometimes covering the fame fpot with different people.

Fortuitous events will continually interpose, and derange the flow but regular movement of nature, often retarding, fometimes accelerating it.

The appearances we observe in a nation in any particular age, have frequently their cause in a revolution happening ten ages before it, and at a distance of a thoufand leagues; and the night of time conceals a great portion of those events, the influence of which we see

Ľ

operating upon the men who have preceded us, and fometimes extending to ourfelves.

But we have first to confider the effects of the change of which we are speaking, in a single people, and independently of the influence that conquests and the intermixture of nations may have exercised.

Agriculture attaches man to the foil which he cultivates. It is no longer his perfon, his family, his implements for hunting, that it would fuffice him to transport; it is no longer even his flocks which he might drive before him. The ground not belonging in common to all, he would find in his flight no fubfishence, either for himfelf or the animals from which he derives

his support.

Each parcel of land has a mafter, to whom alone the fruits of it belong. The harvest exceeding themaintenance of the animals and men by whom it has been prepared, furnishes the proprietor with an annual wealth, that he has no necessity of purchasing with his personal labour.

In the two former states of society, every individual, or every family at least, practifed nearly all the necessary arts.

But when there were men, who, without labour, lived upon the produce of their land, and others who received wages; when occupations were multiplied, and the proceffes of the arts become more extensive and complicate, common interest foon enforced a separation

#### ĄI

of them. It was perceived, that the industry of an individual, when confined to fewer objects, was more complete; that the hand executed with greater readiness and precision a smaller number of operations that long habit had rendered more familiar; that a less degree of understanding was required to perform a work well, when that work had been more frequently repeated.

Accordingly, while one portion of men devoted themfelves to the labours of husbandry, others prepared the necessary instruments. The care of the flocks, domestic economy, and the making of different articles of apparel, became in like manner distinct employments. As, in families possessing but little property, one of these occupations was infufficient of itself to engross the whole time of an individual, feveral were performed by the fame perfon, for which he received the wages only of a fingle man. Soon the materials used in the arts increasing, and their nature demanding different modes of treatment, fuch as were analogous in this respect became diffinct from the reft, and had a particular class of workmen. Commerce expanded, embraced a greater number of objects, and derived them from a greater extent of territory: and then was formed another class of men, whole fole occupation was the purchase of commodities for the purpose of preserving, transporting, or felling them again with profit.

Thus to the three classes of men before distinguishable in pastoral life, that of proprietors, that of the

domestics of their family, and lastly, that of slaves, we must now add, that of the different kinds of artifans, and that of merchants.

Then it was, that, in a fociety more fixed, more compact, and more intricate, the neceffity was felt of a more regular and more ample code of legiflation; of determining with greater precision the punishments for crimes, and the forms to be observed as to contracts; of subjecting to severer rules the means of ascertaining and verifying the facts to which the law was to be applied.

This progrefs was the flow and gradual work of neceffity and concurring circumftances : it is but a flep or two farther in the route we have already traced in paftoral nations.

In the first two epochs, education was purely domestic. The children were instructed by residing with the father, in the common labours that were followed, or the few arts that were known. From him they received the small number of traditions that formed the history of the horde or of the family, the fables that had been transmitted, the knowledge of the national customs, together with the principles and prejudices that composed their pretty code of morality. Singing, dancing and military exercises they acquired in the fociety of their friends.

In the epoch at which we are arrived, the children of the richer families received a fort of common educa-

tion, either in towns, from converfation with the old and experienced, or in the houfe of a chief, to whom they attached themfelves. Here it was they were inflructed in the laws, cuftoms and prejudices of the country, and learned to chant poems defcriptive of the events of its hiftory.

A more fedentary mode of life had introduced a greater equality between the fexes. The wives were no longer confidered as fimple objects of utility, as only the more familiar flaves of their mafter. Man looked upon them as companions, and faw how conducive they might be made to his happinefs. Meanwhile, even in countries where they were treated with moft refpect, where polygamy was proferibed, neither reafon nor juffice extended fo far as to an entire reciprocity as to the right of divorce, and an equal infliction of punifhment in cafes of infidelity.

The hiftory of this clafs of prejudices, and of their influence on the lot of the human fpecies, must enter into the picture I have proposed to draw; and nothing can better evince how closely man's happines is connected with the progress of reason.

Some nations remained difperfed over the country. Others united themfelves in towns, which became the refidence of the common chief, called by a name anfwering to the word *king*, of the chiefs of tribes who partook his power, and of the elders of every great family. There the common affairs of the fociety were

decided, as well as individual difputes. There the rich brought together the most valuable part of his wealth, that it might be fecure from robbers, who must of course have multiplied with fedentary riches. When nations remained difpersed over a territory, custom determined the time and place where the chiefs were to meet for deliberation upon the general interests of the community, and the adjudication of fuits.

Nations who acknowledged a common origin, who fpoke the fame language, without abjuring war with each other, entered almost universally into a confederacy more or lefs close, and agreed to unite themselves, either against foreign enemies, or mutually to avenege their wrongs, or to discharge in common some religious duty. Hospitality and commerce produced even some lasting ties between nations different in origin, customs and language; ties that by robbery and war were often diffolved, but which necessity, stronger than the love of pillage or a thirst for vengeance, afterwards renewed.

To murder the vanquished, or to strip and reduce them to slavery, was no longer the only acknowledged right between nations inimical to each other. Cessions of territory, ransoms, tribute, in part supplied the place of those barbarous outrages.

At this epoch every man that posseled arms was a foldier. He who had the best, and best knew how to exercise them, who could furnish arms for others, upon condition that they followed him to the wars, and from

\*\* \*

the provision he had amaffed was in a capacity to supply their wants, neceffarily became a chief. But this obsdience, almost voluntary, did not involve them in a fervile dependence.

As there was feldom occasion for new laws; as there were no public expences to which the citizens were obliged to contribute, and fuch as it became neceffary to incur were defrayed out of the property of the chiefs, or the lands that were preferved in common; as the idea of refricting induftry and commerce by regulations was unknown; as offenfive war was decided by general confent, or undertaken by those only who were allured by the love of glory or defire of pillage;--man believed himfelf free in thefe rude governments, notwithstanding the hereditary fuccession, almost univerfal, of their first chiefs or kings, and the prerogative, usurped by other fubordinate chiefs, of sharing alone the political authority, and exercifing the functions of government as well as of magiftracy. But frequently a king furrendered himfelf to the impulse of personal vengeance, to the commission of arbitrary acts of violence; frequently, in these privileged families, pride, hereditary hatred, the fury of love and thirst for gold, engendered and multiplied crimes, while the chiefs affembled in towns, the inftruments of the passions of kings, excited therein factions and civil wars, appressed the people by iniquitous judgments, and tor-

mented them by the enormities of their ambition and rapacity.

In many nations the exceffes of thefe families exhaufted the patience of the people, who accordingly extirpated, banifhed, or fubjected them to the common law; it was rarely that their title, with a limited authority, was preferved to them; and we fee take place what has fince been called by the name of republics.

In other places, these kings, furrounded with minions, because they had arms and treasures to bestow on them, exercised an absolute authority: and such was the origin of tyranny.

Elfewhere, particularly in countries where the fmall nations did not unite together in towns, the first forms of those crude institutions were preferved, till the period in which these people, either fell under the yoke of a conqueror, or, instigated by the spirit of robbery, spread themfelves over a foreign territory. This tyranny, compressed within too narrow a space, - could have but a fhort duration. The people foon threw off a yoke which force alone imposed, and opinion had been unable to maintain. The monister was feen too nearly not to excite more horror than dread: and force as well as opinion could forge no durable chains, if tyrants did not extend their empire to a diftance fufficiently great to be able, by dividing the nation they oppressed, to conceal from it the fecret of its own power and of their weakness.

The hiftory of republics belongs to the next epoch: But that which we are confidering will prefently exhibit a new spectacle.

An agricultural people, subjected to a foreign power, does not abandon its hearths: necessity obliges it to labour for its masters.

Sometimes the ruling nation contents itfelf with leaving, upon the conquered territory, chiefs to govern, foldiers to defend it, and efpecially to keep in awe the inhabitants, and with exacting from the fubmiflive and difarmed fubjects a tribute in money or in provision.

Sometimes it feizes upon the territory itfelf, diftributing the property of it to the officers and foldiers:

in that cafe it annexes to each effate the old occupiers that cultivated it, and fubjects them to this new kind of flavery, which is regulated by laws more or lefs rigorous. Military fervice, and a tribute from the individuals of the conquered people, are the conditions upon which the enjoyment of these lands is granted to them.

Sometimes the ruling nation referves to itfelf the property of the territory, and diffributes only the ufufruct upon the fame conditions as in the preceding inftance.

Commonly, however, all these modes of recompensing the instruments of conquest, and of robbing the vanquished, are adopted at the same time.

Hence we fee new claffes of men fpring up; the defcendants of the conquering nation and those of the

1

oppreffed ; an heriditary nobility, not however to be confounded with the patrician dignity of republics; a people condemned to labour, to dependence, to a flate of degradation, but not to flavery; and laftly, flaves attached to the glebe, a clafs differing from that of domeftic flaves, whofe fervitude is lefs arbitrary, and who may appeal against the caprices of their masters to the law.

It is here allo we may observe the origin of the feodal system, a pest that has not been peculiar to our own climate, but has found a footing in almost every part of the globe, at the fame periods of civilization, and whenever a country has been occupied by two people between whom victory has established an hereditary inequality. In fine, despotism was also the fruit of conquest. By defpotifm I here mean, in order to diffinguish it from tyrannies of a transient duration, the oppression of a people by a fingle man, who governs it by opinion, by habit, and above all, by a military force, over the individuals of which he exercises himself an arbitrary authority, but at the fame time is obliged to respect their prejudices, flatter their caprices, and footh their avidity and pride.

Perfonally guarded by a numerous and felect portion of this armed force, taken from the conquering nation or confifting of foreigners; immediately furrounded by the most powerful military chiefs; holding the provinces in

•

awe by means of generals who have the control of inferior detachments of this fame armed body, the defpot reigns by terror: nor is the possibility conceived, either by the depressed people, or any of those dispersed chiefs, . rivals as they are to each other, of bringing against this man a force, which the armies he has at his command would not be able to crush at the instant.

A mutiny of the guards, an infurrection in the capital, may be fatal to the defpot, without crushing defpotism. The general of an army, by destroying a family rendered facred by prejudice, may establish a new dynasty, but it is only to exercise a similar tyranny.

In this third epoch, the people who have yet not

experienced the misfortune, either of conquering, or of being conquered, exhibit a picture of those fimple but : ftrong virtues of agricultural nations, those manners of heroic times, rendered fo interesting by a mixture of greatness and ferocity, of generosity and barbarism, that we are still fo far seduced as to admire and even regret : them.

On the contrary, in empires founded by conquerors, we are prefented with a picture containing all the gradations and fhades of that abalement and corruption, to which defpotifm and fuperfitition can reduce the human fpecies. There we fee fpring up taxes upon induftry : and commerce, exactions obliging a man to purchafe the right of employing as he pleafes his own faculties, laws reftricting him in the choice of his labour and ufe of E 2.

•

bis property, other laws compelling the children to follow the profeffion of their parents, confifcations, cruel and atrocious punifhments, in fhort, all thofe acts of arbitrary power, of legalized tyranny, of fuperflitious wickednefs, that a contempt of human nature has been able to invent. In hordes that have not undergone any confiderable revolution, we may obferve the progrefs of civilization flopping at no very elevated point. Meanwhile men already felt the want of new ideas or fenfations ; a want which is the first moving power in the progrefs of the human mind, equally awakening a talle for the fuperfluities of luxury, inciting industry and a fpirit of curiofity,

and piercing with an eager eye the veil with which na-

ture has concealed her fecrets. But it has happened, almost univerfally, that, to escape this want, men have fought, and embraced with a kind of phrenzy, physical means of procuring fensations that may be continually renewed. Such is the practice of using fermented liquors, hot drinks, opium, tobacco, and betel. There are few nations among whom one or other of these practices is not observed, from which is derived a pleafure that occupies whole days, or is repeated at every interval, that prevents the weight of time from being felt, fatisfies the necessfity of having the faculties roused or employed, and at last blunting the edge of this necesfity, thus prolongs the duration of the infancy and inactivity of the human mind. These practices, which have proved an obstacle to the progress of ignerant and

5I

enflaved nations, produce also their effects in wifer and more civilized countries, preventing truth from diffusing through all classes of men a pure and equal light.

By exposing what was the state of the arts in the first two periods of fociety, it will be seen how to those of working wood, stone, or the bones of animals, of preparing skins, and weaving cloths, these infant people were able to add the more difficult ones of dyeing, of making earthen ware, and even their first attempts upon metals.

In isolated nations the progress of these arts must have been flow; but the intercourfe, flight as it was, which took place between them, ferved to haften it. A new method of proceeding, a better contrivance, discovered by one people, became common to its neighbours. Conquest, which has fo often destroyed the arts, began with extending, and contributed to the improving of them, before it stopped their progress, or was instrumental to their fall. We observe many of these arts carried to the highest degree of perfection in countries, where the long influence of superstition and despotism has completed the degradation of all the human faculties. But, if we scrutinise the wonderful production of this servile industry, we shall find nothing in them which announces the infpiration of genius; all the improvements appear to be the flow and painful work of reiterated practice; every where may be feen, amidst this labour which afto-

-

infhes us, marks of ignorance and flupidity that difclose its origin.

In fedentary and peaceable focieties, aftronomy, medicine, the most fimple notions of anatomy, the knowledge of plants and minerals, the first elements of the study of the phenomena of nature, acquired fome improvement, or rather extended themselves by the mere influence of time, which, increasing the stock of observations, led, in a manner slow, but fure, to the easy and almost instant perception of some of the general confequences to which those observations were calculated to lead.

Meanwhile this improvement was extremely flen-

der; and the fciences would have remained for a longer period in a ftate of earlieft infancy, if certain families, and efpecially particular cafts, had not made them; the first foundation of their reputation and power.

Already the obfervation of man and of focieties had been connected with that of nature. Already a fmall number of moral maxims, of a practical, as well as a political kind, had been transmitted from generation to generation. These were feized upon by those cafts : religious ideas, prejudices, and different superflitions contributed to a still farther increase of their power. They succeeded the first associations, or first families, of empirics and forcerers; but they practifed more art to deceive and feduce the mind, which-was now lefs rude and ignorant. The knowledge they actually

•

poffeffed, the apparent aufterity of their lives, an affected contempt for what was the object of the defires of vulgar men, gave weight to their impoftures, while thefe impoftures at the fame time rendered facred, in the eyes of the people, their flender flock of knowledge, and their hypocritital virtues. The members of thefe focieties purfued at first, almost with equal ardour, two very different objects : one, that of acquiring for themfelves new information ; the other, that of employing fuch as they had already acquired in deceiving the people, and gaining an afcendancy over their minds.

Their fages devoted their attention particularly to aftronomy : and, as far as we can judge from the

fcattered remains of the monuments of their labours, they appear to have carried it to the higheft poffible pitch to which, without the aid of telefcopes, without the affiftance of mathematical theories fuperior to the first elements, it can be supposed to arrive.

In reality, by means of a continued courfe of obfervations, an idea fufficiently accurate of the motion of the ftars may be acquired, by which to calculate and predict the phenomena of the heavens. Thofe empirical laws, fo much the eafier attained as the attention becomes extended through a greater fpace of time, did not indeed lead thefe first astronomers to the difcovery of the general laws of the fystem of the universe; but they sufficiently supplied their place for every pur-

.

pofe that might interest the wants or curiosity of many and serve to augment the credit of these usurpers of the exclusive right of instructing him.

It should seem that to them we are indebted for the ingenious idea of arithmetical scales, that happy mode of representing all possible numbers by a small quantity of figns, and of executing, by technical operations of a very simple nature, calculations which the human intellect, left to itself, could not have reached. This is the first example of those contrivances that double the powers of the mind, by means of which it can extend indefinitely its limits, without its being possible to fay to it, thus far shalt thou go, and no farther.

But they do not appear to have extended the fcience of arithmetic beyond its first operations.

Their geometry, including what was neceffary for furveying, as well as for the practice of altronomy, is bounded by that celebrated problem which Pythagoras carried with him into Greece, or difcovered anew.

The confiructing of machines they refigned to those by whom the machines were to be used. Some recitals, however, in which there is a mixture of fable, seem to indicate their having cultivated themselves this branch of the sciences, and employed it as one of the means of striking upon the mind by a semblance of prodigy.

The laws of motion, the science of the mechanical powers, attracted not their notice.

If they studied medicine and surgery, that part especially the object of which is the treatment of wounds, anatomy was neglected by them.

Their knowledge in botany, and in natural hiftory, was confined to the articles used as remedies, and to fome plants and minerals, the fingular properties of which might affift their projects.

Their chymistry, reduced to the most simple processes, without theory, without method, without analysis, confisted in the making certain preparations, in the knowledge of a few fecrets relative to medicine or the arts, or in the acquisition of some nostrums calculated to dazzle an ignorant multitude, subjected to chiefs not less

ignorant than itself.

The progress of the sciences they considered but as a secondary object, as an instrument of perpetuating or extending their power. They sought Truth only to diffuse errors; and it is not to be wondered they so feldom found her.

١.

In the mean time, flow and feeble as was this progrefs of every kind, it would not have been attainable, if thefe men had not known the art of writing, the only way by which traditions can be rendered fecure and permanent, and knowledge, in proportion as it increases, be communicated and transmitted to posterity.

Accordingly, hieroglyphic writing was either one of their first inventions, or had been discovered prior to the

-.

formation of cafts assuming to themselves the prerogative of instruction.

As the view of these casts was not to enlighten, but to govern the mind, they not only avoided communicating to the people the whole of their knowledge, but adulterated with errors such portions as they thought proper to disclose. They taught not what they believed to be true, but what they thought favourable to their own end,

Every thing which the people received from them had in it a ftrange mixture of fomething fupernatural, facred, celeftial, which led thefe men to be regarded as beings fuperior to humanity, as invefted with a divine character, as deriving from heaven itfelf information prohibited to the reft of mankind.

These men had therefore two doctrines, one for themselves, the other for the people. Frequently even, as they were divided into many orders, each order referved to itself its own mysteries. All the inferior orders were at once both knaves and dupes; and it was only by a few adepts that all the mazes of this hypocritical system were understood and developed.

No circumstance proved more favourable to the establishment of this double doctrine, than the changes which time, and the intercourse and mixtures of nations, introduced into language. The double-doctrine men, preferving the old language, or that of another nation,

.57

thereby fecured the advantage of having one that was understood only by themselves.

The first mode of writing, which represented things by a painting more or lefs accurate, either of the thing itself or of an analogous object, giving place to a more fimple mode, in which the refemblance of these objects was nearly effaced, in which fcarcely any figns were employed but fuch as were in a manner purely conventional, the fecret doctrine came to have a writing, as it had before a language to itself.

In the origin and upon the first introduction of language, almost every word is a metaphor, and every phrase an allegory. The mind catches at once both the figurative and natural fenfe; the word fuggests at the same inftant with the idea, the analogous image by which it has been expressed. But from the habit of employing a word in a figurative fense, the mind alternately fixed upon that alone, heedlefs of the original meaning : and thus the figurative fense of a word became gradually its proper and ordinary fignification. The priefts by whom the first allegorical language was preferved, employed it with the people, who were no longer capable of discovering its true meaning; and who, accultomed to take words in one acceptation only, that generally received, pictured to themfelves I know not what abfurd and ridiculous fables, in expressions that conveyed to the minds of the priests but a plain and fimple truth. The same use was made by the priests of

F

their facred writing. The people faw men, animals, monfters, where the priefts meant only to reprefent an aftronomical phenomenon, an hiftorical occurrence of the year.

Thus, for example, the priefts, in their contemplation's, invented, and introduced almost every where, the metaphysical fystem of a great, immense and eternal ALL, of which the whole of the beings that existed were only parts, of which the various changes observable in the universe were but modifications. The heavens struck them in no other light than as groupes of flars difperfed through the immenfity of fpace, planets describing motions more or lefs complicate, and phenomena purely phyfical refulting from their refpective politions. They affixed names to these constellations and planets, as well as to the fixed or moveable circles, invented with a view to reprefent their fituation and course, and explain their appearances. But the language, the memorials, employed in expressing these metaphysical opinions, these natural truths, exhibited to the eyes of the people the most extravagant fystem of mythology, and became the foundation of creeds the most abfurd, modes of worship the most fenfeless, and practices the most shameful and barbarous.

Such is the origin of almost all the religions that are known to us, and which the hypocrify or the extravagance of their inventors and their profelytes afterwards loaded with new fables.

Thefe cafts feized upon education, that they might failion man to a more patient endurance of chains, embodied as it were with his exiftence, and extirpate the poffibility of his defiring to break them. But, if we would know to what point, even without the aid of fuperflitious terrors, thefe inflitutions, fo deftructive to the human faculties, can extend their baneful power, we must look for a moment to China; to that people who feem to have preceded all others in the arts and fciences, only to fee themfelves fucceffively celipfed by them all; to that people whom the knowledge of artillery has not prevented from being conquered by barbarous nations; where the fciences, of which the numerous fchools are

open to every class of citizens, alone lead to dignities, and at the fame time, fettered by abfurd prejudices, are condemned to an internal mediocrity; lastly, where even the invention of printing has remained an instrument totally useles in advancing the progress of the human mind.

~```

Men, whole interest it was to deceive, soon felt a diflike to the pursuit of truth. Content with the docility of the people, they conceived there was no need of further means to secure its continuance. By degrees they forgot a part of the truths concealed under their allegories; they preferved no more of their ancient science than was strictly necessary to maintain the confidence of their disciples; and at last they became themselves the dupes of their own fables.

Then was all progrefs of the fciences at a fland; fome even of those which had been enjoyed by preceding ages, were lost to the generations that followed; and the human mind, a prey to ignorance and prejudice, was condemned, in those vast empires, to a shameful flagnation, of which the uniform and unvaried continuance has fo long been a dishonour to Asia.

The people who inhabit thefe countries are the only inflance that is to be met with of fuch civilization and fuch decline. Thofe who occupy the reft of the globe either have been flopped in their career, and exhibit an appearance that again brings to our memory the infant days of the human race, or they have been hurried by events through the periods of which we have to illuftrate the hiftory. At the epoch we are confidering, thefe very people of Afia had invented alphabetical writing, which they fubflituted in the place of hieroglyphics, probably after having employed that other mode, in which conventional figns are affixed to every idea, which is the only one that the Chinefe are at prefent acquainted with.

Hiftory and reflection may throw fome light upon the manner in which the gradual transition from hieroglyphics to this intermediary fort of art, must have taken place; but nothing can inform us with precision either in what country, or at what time, alphabetical writing was first brought into use.

The difcovery was in time introduced into Greece, among a people who have exercifed fo powerful and happy an influence on the progrefs of the human fpecies, whofe genius has opened all the avenues to truth, whom nature had prepared, whom fate had defined to be the benefactor and guide of all nations and all ages : an honour in which no other people has hitherto fhared. One only nation has fince dared to entertain the hope of prefiding in a revolution new in the deftiny of mankind. And this glory both nature and a concurrence of events feem to agree in referving for her. But let us not feek to penetrate what an uncertain futurity as yet conceals from us.

, F-2 .

### FOURTH EPOCH.

Progrefs of the Human Mind in Greece, till the Division of the Sciences about the Age of Alexander.

THE Greeks, difgufted with thofe kings, who, calling themfelves the children of the Gods, difgraced humanity by their paffions and crimes, became divided into republics, of which Lacedemonia was the only one that acknowledged hereditary chiefs; but thefe chiefs were kept in awe by other magiftracies, were fubjected, like citizens, to the laws, and were weakened by the divifion of royalty between the two branches of the family of the Heraclides. The inhabitants of Macedonia, of Theffaly, and of Epirus, allied to the Greeks by a common origin and the ufe of a fimilar language, and governed by princes weak and divided among themfelves, though unable to opprefs Greece, were yet fufficient to preferve it at the north from the incurfions of Scythian nations.

At the weft, Italy, divided into fmall and unconnected flates, could occasion no apprehensions; and already nearly the whole of Sicily, and the most delightful

parts of the fouth of Italy, were occupied by Greek colonies, forming independent republics, but preferving at the fame time ties of filiation with their mother countries. Other colonies were established in the islands of the Ægean sea, and upon part of the coasts of Asia-Minor.

Accordingly the union of this part of the Afiatic continent to the vaft empire of Cyrus, was in the fequel the only real danger that could threaten the independence of Greece, and the freedom of its inhabitants.

Tyranny, though more durable in fome colonies, and in those particularly the establishment of which had preceded the extirpation of the royal families, could be confidered only as a transient and partial evil, that inflicted misery on the inhabitants of a few towns, but without influencing the general spirit of the nation. The Greeks had derived from the eastern nations their arts, a part of their information, the use of alphabetical writing, and their system of religion: but it was in confequence of the intercourse established between herself and these nations by exiles, who fought an afylum in Greece, and by Greek travellers, who brought back with them from the East knowledge and errors.

The fciences, therefore, could not become in this country the occupation and patrimony of an individual caft. The functions of the priefts were confined to the worship of the Gods. Genius might difplay all its energies, without being fettered by the pedamic obfervances,

the fystematic hypocrify of a facerdotal college. All men possessed an equal right to the knowledge of truth. All might engage in the pursuit of it, and communicate it to all, not in fcraps or parcels, but in its whole extent.

This fortunate circumstance, still more than political freedom, wrought in the human mind, among the Greeks, an independance, the furest pledge of the rapidity and greatness of its future progress.

In the mean time their learned men, their fages, as they were called, but who foon took the more modelt appellation of philofophers, or friends of fcience and wifdom, wandered in the immenfity of the two valt and comprehenfive plan which they had embraced. They were defirous of penetrating both the nature of man, and that of the Gods; the origin of the world, as well as of the human race. They endeavoured to reduce all nature to one principle only, and the phenomena of the univerfe to one law. They attempted to include, in a fingle rule of conduct, all the duties of morality, and the fecret of true happinefs.

Thus, inftead of discovering truths, they forged fyftems; they neglected the observation of facts, to pursue the chimeras of their imagination; and being no longer able to support their opinions with proofs, they fought to defend them by subtleties.

Geometry and aftronomy, however, were cultivated with fuccefs by thefe men. Greece owed to them the first elements of these sciences, and even some new truths,

.

or at leaft the knowledge of fuch as they had brought with them from the Eaft, not as established creeds, but as theories, of which they understood the principles and proofs.

We even perceive, in the midft of the darkness of those systems, two happy ideas beam forth, which will again make their appearance in more enlightened ages.

Democritus confidered all the phenomena of the universe as the refult of the combinations and motion of fimple bodies, of a fixed and unalterable form, having received an original impulse, and thence derived a quantity of action that undergoes modifications in the individual atoms, but that in the entire mass continues always

the fame.

Pythagoras was of opinion that the univerfe was governed by a harmony, the principles of which were to be unfolded by the properties of numbers; that is, that the whole phenomena of nature depended upon general laws capable of being afcertained by calculation.

In these two doctrines we readily perceive the bold fystems of Descartes, and the philosophy of Newton.

Pythagoras either difcovered by his own meditation, or learned from the priefts of Egypt or of Italy, the actual difposition of the heavenly bodies, and the true fystem of the world. This he communicated to the Greeks. But the fystem was too much at variance with the testimony of the fenses, too opposite to the vulgar opinions, for the feeble proofs by which it could then be

Supported to gain much hold upon the mind. Accordingly it was confined to the Pythagorean school, and afterwards forgotten with that school, again to appear at the close of the sixteenth century, strengthened with more certain proofs, by which it now triumphed not only over the repugnance of the senses, but over the prejudices of superstition, still more powerful and dangerous:

The Pythagorean fchool was chiefly prevalent in Upper Greece, where it formed legislators, and intrepid defenders of the rights of mankind. It fell under the power of the tyrants, one of whom burnt the Pythagoreans in their own school. This was fufficient, no doubt, to induce them not to abjure philosophy, not to abandon the caufe of the people, but to bear no longer a name become fo dangerous, or obferve forms that would ferve only to wake the lion rage of the enemies of liberty and of reason. A grand bafis of every kind of found philosophy is to form for each science a precise and accurate language, every term of which shall represent an idea exactly determined and circumscribed; and to enable ourselves to determine and circumferibe the ideas with which the feience may be conversant, by the mode of a rigorous analysis. The Greeks on the contrary took advantage of the corruptions of their common language to play upon the meaning of words, to embarrafs the mind by contemptible equivoques, and lead it altray by expressing successively

•

-

different ideas by the fame fign; a practice which gave acutenefs to the mind, at the fame time that it weakened its ftrength against chimerical difficulties. Thus this philosophy of words, by filling up the spaces where human reason seems to stop before some obstacle above its ftrength, did not assist immediately its progress and advancement, but it prepared the way for them; as we shall have farther occasion to observe.

The course of philosophy was stopped from its first introduction by an error at that time indeed excusable. This was the fixing the attention upon questions incapable perhaps for ever of being folved; fuffering the mind to be led away by the importance or fublimity of objects,

without thinking whether the means exifted of compaffing them; withing to effablish theories, before facts had been collected, and to frame the universe, before it was yet known how to furvey it. Accordingly we see Socrates, while he combated the sophists and exposed their fubtleties to ridicule, crying to the Greeks to recal to the earth this philosophy which had loss tifelf in the clouds. Not that he despised either aftronomy, or geometry, or the observation of the phenomena of nature; not that he entertained the puerile and false idea of reducing the human mind to the study of morality alone: on the contrary, it was to his fchool and his disciples that the mathematical and physical sciences were indebted for their progress; in the ridicule attempted to be thrown upon him in the entertained representations, the reproach

1

which afforded molt pleafantry was that of his cultivating geometry, studying meteors, drawing geographical charts, and making experiments upon burning-glasses, of which it is pleafant to remark, the earliest mention that has been transmitted to us, we owe to a buffoonery of Aristophanes.

Socrates merely wished by his advice to induce men to confine themselves to objects which nature has placed within their reach; to be fure of every step already taken before they attempted any new one, and to study the space that furrounded them, before they precipitated themselves at random into an unknown space.

The death of this man is an important event in the

hiftory of the human mind. It is the first crime that the war between philosophy and superstition conceived and brought forth.

The burning of the Pythagorean fchool had already fignalized the war, not lefs ancient, not lefs eager, of the oppreffors of mankind against philosophy. The one and the other will continue to be waged as long as there shall exist priests or kings upon the earth; and these wars will occupy a confpicuous place in the picture that we have still to delineate.

Priefts faw with grief the appearance of men, who, cultivating the powers of reafon, afcending to first principles, could not but difcover all the abfurdity of their dogmas, all the extravagance of their ceremonies, all the delution and fraud of their oracles and prodigies.

This difcovery they were afraid these philosophers would communicate to the disciples that frequented their schools; from whom it might pass to all those who, to obtain authority or credit, were obliged to pay attention to the improvement of their minds; and thus the priestly empire be reduced to the most ignorant class of the people, which might at last be itself also undeceived.

۰.

Ą

Hypocrify, alarmed and terrified, haltened to bring accufations, against the philosophers, of impiety to the Gods, that they might not have time to teach the people that those Gods were the work of their priests. The philosophers thought to escape perfecution by adopting, in imitation of the priests themselves, the practice of a double doctrine, and they consided to such of their disciples only whose sidelity had been proved, doctrines that too openly offended vulgar prejudices.

But the priefts reprefented to the people the most fimple truths of natural phifosophy as blasphemies; and Anaxagoras was profecuted for having dared to affert, that the fun was larger than Peloponness.

Socrates could not escape their fury. There was in Athens no longer a Pericles to watch over the fafety of genius and of virtue. Besides, Socrates was still more culpable. His enmity to the sophists, and his zeal to bring back the attention of misguided philosophy to the most useful objects, announced to the priests that truth alone was the end he had in view; that he did not wish to enforce upon men a new system, and subject.

their imagination to his; but that he was defirous of teaching them to made use of their own reason: and of all crimes this is what facerdotal pride knows least how to pardon.

It was at the very foot of the tomb of Socrates that Plato directed the leffons which he had received from his mafter.

His enchanting stile, his brilliant imagination, the cheerful or dignified colouring, the ingenious and happy traits, that, in his dialogues, dispel the dryness of philosophical discussion; the maxims of a mild and pure morality which he knew how to infuse into them; the art with which he brings his perfonages into action, and preferves to each his distinct character; all those beauties, which time and the revolutions of opinion have been unable to tarnish, must doubtless have obtained a favourable reception for the visionary ideas that too often form the basis of his works, and that abuse of words which his mafter had fo much cenfured in the fophifts, but from which he could not preferve the first of his disciples. In reading these dialogues we are astonished at their being the production of a philosopher who, by an inscription placed on the door of his school, forbad the entrance of any one who had not studied geometry; and that he, who maintains with fuch confidence fystems fo far fetched and fo frivilous, should have been the founder of a sect by whom, for the first time, the foundations of the certainty of human knowledge were

fubjected to a fevere examination, and even others made to tremble that a more enlightened reafon might have been induced to refpect.

But the contradiction difappears when we confider that in his dialogues Plato never fpeaks in his own perfon; that Socrates, his master, is made to express himself with the modesty of doubt; that the fystems are exhibited in the names of those who were, or whom Plato supposed to be, the authors of them; that hereby these dialogues are a fchool of pyrrhonifm, and that Plato has known how to difplay in them at once the adventurous imagination of a learned man, amufing himfelf with com-. bining and diffecting iplendid hypotheses, and the referve. of a philosopher, giving scope to his fancy, but without · fuffering himfelf to be hurried away by it; becaufe his reason, armed with a falutary doubt, had wherewithal to defend itself against illusions, however feducing might be their charms. The fchools, in which were perpetuated the doctrine and efpecially the principles and forms of a first institutor, to which however their refpective fucceffors by no means obferved a fervile adherence, thefe schools poffessed the advantage of uniting together by the ties of a liberal fraternity, men intent upon penetrating the fecrets of nature. If the opinion of the master had frequently an influence in them that ought to belong only to the province of reason, and the progress of knowledge was

thereby fulpended; yet did they still more contribute to its speedy and extensive propagation, at a time when, printing being unknown, and manuscripts exceedingly rare, these institutions, the same of which attracted pupils from every part of Greece, were the only powerful means of cherissing in that country a taste for philosophy, and of diffeminating new truths.

The rival fchools contended with a degree of animofity that produced a fpirit of party or fect; and not feldom was the intereft of truth facrificed to the fuccefs of fome tenet, in which every member of the fect confidered his pride in a manner as concerned. The perfonal paffion of making converts corrupted the more generous one of enlightening mankind. But at the fame time, this rivalfhip kept the mind in a ftate of activity that was not without its ufe. The continual fight of fuch difputes, the intereft that was taken in thefe combats of opinion, awakened and attached to the ftudy of philofophy a multitude of men, whom the mere love of truth could neither have allured from their bufinefs and pleafure, nor even have roufed from their indolence.

In fhort, as thefe fchools, thefe fects, which the Greeks had the wifdom never to introduce into the public inftitutions, remained perfectly free; as every one had the power of opening another fchool, or forming a new fect, at his pleafure, there was no caufe to

apprehend that abasement of reason, which, with the majority of other nations, was an infurmountable obstacle to the advancement of the human mind.

Let us confider what was the influence of the philofophers of Greece on the understanding, manners, laws and governments of that country; an influence that must be afcribed in great measure to their not having, and even not wishing to have, a political existence; to its being held as a rule of conduct common to all their fects, voluntarily to keep aloof from public affairs; and lastly, to their affecting to distinguish themselves from other men by their lives, as well as their opinions. In delineating these different fects, we shall attend

lefs to the fyftems, and more to the principles of their philofophy; we fhall not attempt, as has frequently been done, to exhibit a precife view of the abfurd doctrines which a language become almost unintelligible conceals from us; but shall endeavour to shew by what general errors they were feduced into those deceitful paths, and to find the origin of these in the natural i course of the human mind.

Above all things we shall be careful to display the progress of those fciences that really deferved the appellation, and the successive improvements that were introduced into them.

At this epoch philosophy embraced them all, medi-, cine excepted, which was already feparated from it... The writings of Hippocrates will shew us what was at  $c = \frac{G_2}{2}$ .

**-**

that period the state of this science, as well as of those naturally connected with it, but which had yet no existence distinct from that connection.

The mathematical fciences had been cultivated with fuccefs in the fchools of Thales and of Pythagoras. Meanwhile they rofe there very little above the point at which they had flopped in the facerdotal colleges of the eaftern nations. But from the birth of Plato's fchool they foared infinitely above that barrier, which the idea of confining them to an immediate utility and practice had erected.

This philosopher was the first who solved the problem of the duplication of the cube, by the hypothesis,

indeed, of a continued motion; but the procefs was ingenious, and strictly accurate. His early disciples discovered the conic fections, and demonstrated their principal properties; thereby opening upon the human mind that vast horison of knowledge, where, as long as the world shall endure, it may exercise its powers without ceasing, while every step the horison retires as the mind advances.

The fciences connected with politics did not derive from philofophy alone their progrefs among the Greeks. In thefe fmall republics, jcalous of preferving both their independence and their liberty, the practice was almost generally prevalent of confiding to one man, not the power of making laws, but the function of digesting and prefenting them to the people, by whom they were

75

examined, and from whom they received their direct fanction.

Thus the people imposed a talk on the philosopher, whofe wifdom or whofe virtues had recommended himto their confidence, but they conferred on him no authority; they exercised alone and of themselves what we have fince called by the name of legislative power. But: the practice, fo fatal, of calling superstition to the aid. of political institutions, has too often corrupted the execution of an idea fo admirably fitted to give that fystematic unity to the laws of a country which alone can render their operation fure and eafy, as well as maintain: the duration of them. Nor had politics yet acquired principles fufficiently invariable not to fear that the legislators might introduce into these institutions their prejudices and their paffions. Their object could not be, as yet, to found uponthe basis of reason, upon the rights which all men have equally received from nature, upon the maxims of universal justice, the superstructure of a society of menequal and free; but merely to establish laws by which the hereditary members of a fociety, already exifting, might preferve their liberty, live secure from injustice, and, by exhibiting an imposing appearance to their neighbours, continue in the enjoyment of their independence.

.

As it was fuppoled that these laws; almost univerfally connected with religion, and confectated by oaths;

were to endure for ever, it was lefs an object of attention to fecure to a people the means of effecting, in a peaceable manner, their reform, than to guard from every poffible change fuch as were fundamental, and to take care that the reforms of detail neither incroached upon the fystem, nor corrupted the spirit of them.

Such inftitutions were fought for as were calculated to cherifh and give energy to the love of country, in which was included a love of its legiflation and evenufages; fuch an organization of powers, as would fecure the execution of the laws against the negligence or corruption of magistrates, and the rest less disposition of the multitude.

The rich, who alone were in a capacity of acquiring knowledge, by feizing on the reins of authority might opprefs the poor, and compel them to throw themfelves into the arms of a tyrant. The ignorance and ficklenefs of the people, and its jealoufy of powerful citizens, might fuggeft to fuch citizens both the defire and the means of eftablishing ariftocratic defpotifm, or of furrendering an enfeebled state to the ambition of its neighbours. Obliged to guard at once against both these rocks, the Greeklegislators had recours to combinations more or lefs happy, but always bearing the stamp of this fagacity, this artifice, which accordingly characterised the general spirit of the nation.

It would be difficult to find in modern republics, or even in the plans sketched by philosophers, a single

.

inflitution of which the Greek republics did not fuggest the outlines, or furnish the example. For, in the Amphictyonic league, as well as in that of the Etolians, Arcadians, Achæans, we have instances of federal conflitutions, of a union more or less close; and there were established a less barbarous right of nations, and more liberal rules of commerce between these different people, connected by a common origin, by the use of the fame language, and by a fimilarity of manners, opinions and religious persuasions.

The mutual relations of agriculture, industry and commerce, with the laws and constitution of a state, their influence upon its prosperity, power, freedom, could not have escaped the observation of a people ingenious and active, and at the fame time watchful of the public intereft: and accordingly among them are perceived the first traces of that science, so comprehensive and useful, known at prefent by the name of political economy. The obfervation alone of established governments was therefore sufficient speedily to convert politics into an extensive science. Thus in the writings even of the philosophers, it is a science rather of facts, and, if I may fo speak, empirical, than a true theory founded upon general principles, drawn from nature, and acknowledged by reafon. fuch is the point of view in which we ought to regard the political ideas of Ariflotle and

78

Plato, if we would discover their meaning, and form of them a just estimate.

Almost all the Greek institutions suppose the existence of flavery, and the poffibility of uniting together, in a public place, the whole community of citizens: two most important distinctions, of which we ought never to lose fight, if we would judge rightly of the effect of those institutions, particularly on the extensive and populous nations of modern times. But upon the first we cannot reflect without the painful idea, that at that period the most perfect forms of government had for object the liberty or happiness of at most but half the human fpecies. With the Greeks, education was an important part of polity. Men were formed for their country, much more than for themfelves, or their family. This principle can only be embraced by commonities little populous, in which it is more pardonable to fuppose a national interest, feparate from the common interest of humanity. It is practicable only in countries where the most painful labours of culture and of the arts are performed by flaves. This branch of education was reftricted almost entirely to fuch bodily exercises, such manners and habits as were calculated to excite an exclusive patriotism; the other branches were acquired, as a matter of free choice in the schools of the philosophers or rhetoricians, and the shops of the artist; and this freedom was a farther cause of the superiority of the Greeks.

In their polity, as in their philosophy, a general principle is observable, to which history scarcely furnifhes any exceptions: they aimed lefs in their laws at extirpating the causes of an evil, than destroying its effects, by opposing these causes one to another; they wished rather to take advantage of prejudices and vices, than to difperfe or suppress them; they attended more frequently to the means by which to deform and brutalize man, to inflame, to millead his fensibility, than to refine and purify the inclinations and defires which are the necessary refult of his moral conflitution: errors occasioned by the more general one of mistaking for the man of nature, him who exhibited in his character the actual state of civilization, that is to fay, man corrupted by prejudices, by the interest of factitious passions, and by focial habits.

This obfervation is of the more importance, and it will be the more neceffary to develope its origin, in order the better to deftroy it, as it has been transmitted to our own age, and still too often corrupts both our morals and our politics.

If we compare the legislation, and particularly the form and rules of judicature in the Greek, or in the eastern nations, we shall find that, in fome, the laws are a yoke to which force has bowed the necks of slaves; in others, the conditions of a common compact between the members of the fociety. In some the object of legal forms is, that the will of the master be executed; in

others that the liberty of the citizens be not opprefied. In fome the law is made for the party that impofes it; in others for the party that is to fubmit to it. In fome the fear of the law is enforced, in others the love of it inculcated. And thefe diffinctions we also find in modern nations, between the laws of a free people, and those of a country of flaves. In Greece we fhall find that man poff fied at least a confectous of his rights, if he did not yet know them, if he could not fathom the nature, and embrace and circumferibe the extent of them.

At this epoch, of the first dawn of philosophy and first advance of the sciences among the Greeks, the fine arts rose to a degree of perfection known at that time to

no other people, and fcarcely equalled fince by almost any nation. Homer lived at the period of those diffentions which accompanied the fall of the tyrants, and the formation of republics. Sophocles, Euripides, Pindar, Thucydides, Demosthenes, Phidias, Apelles, were the contemporaries of Socrates or of Plato.

We shall give a delineation of the progress of those arts; we shall enquire into its causes; we shall distinguish between what may be confidered as a perfection of the art itself, and what is to be ascribed only to be happy genius of the artist: a distinction calculated to destroy those narrow limits to which the improvement of the fine arts has been restricted. We shall explain the influence that forms of government, fystems of legislation, and the spirit of religious observances have exercised

on their progrefs, and shall examine what they have derived from the advances of philosophy, and what philosophy itself has derived from them.

We shall shew that liberty, arts, knowledge, have contributed to the fuavity and melioration of manners; that the vices of the Greeks, so often afcribed to their civilization, were those of ruder ages, and which the acquirements we have mentioned have in all instances qualified, when they have proved unable to extirpate them. We shall demonstrate that the eloquent declamations which have been made against the arts and fciences, are founded upon a mistaken application of history; and that, on the contrary, the progress of virtue has ever accompanied that of knowledge, as the progress of corruption has always followed or announced its declinc.

7: j

## FIFTH EPOCH.

## Progress of the Sciences, from their Division to their Decline.

PLATO was still living when Aristotle, his disciple, opened, in Athens itself, a school, the rival of that of his master.

He not only embraced all the fciences, but applied

the method obferved in philofophy to the arts of eloquence and poetry. He was the first whose daring genius conceived the propriety of extending this method to every thing attainable by human intelligence; fince, as this intelligence exercised in all cases the fame faculties, it ought invariably to be governed by the fame laws. The more comprehensive was the plan he formed, the more he felt the necessity of separating the different parts of it, and of fixing with greater precision the limits of each. And from this epoch the majority of philosophers, and even whole fects, are feen confining their attention to fome only of those parts.

The mathematical and physical sciences formed of themselves a grand division. As they were founded upon calculation and the observance of the phenomena.

• • •

## 83

of nature, as what they taught was independent of the opinions which embroiled the fects, they feparated themfelves from philosophy, over which these fects still reigned. They accordingly became the study of the learned, who had the wisdom almost universally to keep aloof from the disputes of the schools, which were conducted in a manner calculated rather to promote the transfient same of the profess, than aid the progress of philosophy itself. And foon this word ceased to be employed, except for the purpose of expressing the general principles of the system of the world, metaphysics, logic, and morals, of which the science of politics formed a part:

Fortunately the era of this division preceded the period in which Greece, after long struggles, was deflined to lose her freedom. The sciences found, in the capital of Egypt, an asylum, which, by the despots who governed it, would probably have been refused to philosoften been resulted to philosoften been as the princes derived no inconfiderable portion of their riches and power from the united commerce of the Mediterranean and Asiatic sciences, it was their interest to encourage sciences useful to navigation and commerce.

Accordingly, they escaped the speedy decline that was soon experienced by philosophy, the splendour of which vanished with the departure of liberty. The tyranny of the Romans, so regardless of the progress of knowledge, did not extend to Egypt till a late period,

and when the town of Alexandria was become necessary to the fublistence of Rome. By its population, its wealth, the great influx of strangers, the establishments formed by the Ptolemies, and which the conquerors did not give themfelves the trouble to destroy, this town, the centre of commerce, and already possessing wherewith to be the metropolis of the sciences, was sufficient of itself to the prefervation of their facred fiame.

The fect of Academics, in which, from its origin, the mathematics had been cultivated, and which confined its philofophical inftruction almost entirely to proving the utility of doubt, and afcertaining the narrow limits of certainty, must of courfe have been a fect of men of learning; and as the doctrine had nothing in it calculated to give alarm to despots, it flourished in the school of Alexandria.

The theory of conic fections, with the method of employing it, whether for the conftructing of geometrical loci, or for the folution of problems, and the difcovery of fome other curves, extended the limits, hitherto fo narrow, of the fcience of geometry.

Archimedes discovered the quadrature of the parabola, and measured the furface of the sphere. These were the first advances in the theory of limits which determines the ultimate value of a quantity, or, in other words, the value to which the quantity in an infinite progression incessantly approaches, but never attains; that theory which teaches how to determine the ratios of evanes-

85

cent quantities, and by other processes to deduce from these ratios the propositions of finite magnitudes: in a word, that very calculus which the moderns, with more pride than justice, have termed the calculus of infinities. It was Archimedes who first determined the proportion of the diameter of a circle to its circumference in numbers nearly true; who taught us how to obtain values approaching nearer and nearer to accuracy, and made. known the methods of approximation, that happy remedy for the defects of the known methods, and frequently of the science itself.

He may, in some respect, be considered as the father

of rational or theoretical mechanics. To him we are indebted for the theory of the lever, as well as the difcovery of that principle of hydroftatics, that a body immerfed in any fluid, lofes a portion of its weight equal to the mass of fluid it has displaced.

The fcrew that bears his name, his burning glasses, the prodigies of the fiege of Syracufe, atteft his skill in the art of constructing mechanical instruments, which the learned had neglected, becaufe the principles of the theory at that time known were inadequate to the attainment. These grand discoveries, these new sciences, place Archimedes among these happy geniuses whose life forms an epoch in the hiftory of man, and whole existence may be considered as one one of the munificent gifts of nature.

It is in the ichool of Alexandria that we find the first

86.

traces of algebra; that is to fay, of the calculation of quantities confidered fimply as fuch. The nature of the problems proposed and refolved in the work of Diophantus, made it neceffary that numbers should be confidered as having a general value, undetermined in their particular relations, and subject only to certain conditions.

But this science had not then, as at prefent, its appropriate figns, methods and technical operations. The general value of quantities was represented by words; and it was only by means of a feries of reafonings that the folution of problems was difcovered and developed.-The observations of the Chaldeans, transmitted to Aristotle by Alexander, accelerated the progress of altronomy. The most brilliant portion of them was due to the genius of Hipparchus. And if, after him in astronomy, as after Archimedes in geometry and mechanics, we no longer perceive those discoveries and. acquifitions which change, as it were, the whole face of . a science, they yet for a long time continued to improve,... expand, and enrich themfelves by the truths of detail. In his hiftory of animals, Ariftotle had laid down the principles and furnished an excellent model for observing ( with accuracy, and defcribing according to fystem, the objects of nature, as well as for classing those observations, and catching with readinefs the general refults which they; exhibited. The hiftory of plants and of minerals were treated afterwards by others, but with inferior precision, and with views lefs extensive and lefs philosophical.

.

The progrefs of anatomy was very flow, not only becaufe religious prejudices would not admit of the diffection of dead bodies, but from the vulgar opinion which regarded the touch of fuch bodies as a fort of moral defilement.

The medinal fystem of Hippocrates was nothing more than a fcience of observation, which as yet had led only to empirical methods. The spirit of fect, and the love of hypothetical politions foon infected it. But if the number of errors was greater than that of new truths, if the prejudices or fyslems of the practitioners did more harm than their observations were calculated to do good, yet it cannot be denied that the fcience made during this epoch, a real, though very flight progrefs. Aristotle introduced into natural philosophy neither the accuracy nor the prudent referve which characterife his hiftory of animals. He paid tribute to the cuftoms of his age, to the talke of the schools, by disfiguring it with those hypothetical data, which, from their vague nature, explain every thing with a fort of readinels, because they are able to explain nothing with precision.

Befides, obfervation alone was not enough; experiments were neceffary: thefe demanded inftruments; and it appears that at that time men had not fufficiently collected facts, had not examined them with the proper minutenefs, to feel the want, to conceive the idea of this mode of interrogating nature, and obliging her to anfwer us.

88

At this epoch alfo, the hiftory of the progrefs of natural philofophy is confined to a fmall number of truths, acquired by chance, and derived from obfervations furnished by the practice of the arts, rather than from the refearches of the learned. Hydraulics, and especially optics, prefent us with a harvess formewhat lefs sterile; but these also consist rather of facts, which were remarked because they fell in the way and forced attention, than of theories or physical laws discovered by experiments, or obtained by meditation and study.

Agriculture had hitherto been confined to the fimple routine and a few regulations, which priefts, in tranfmitting them to the people, had corrupted with their fuperfition. It became with the Greeks, and ftill morewith the Romans, an important and refpected art; and men of greateft learning employed themfelves in collecting its ufages and precepts. These collections of facts, precifely described and judiciously arranged, were useful to enlighten the practical cultivator, and to extend fuch methods as had proved valuable; but the age of experiment and regular deduction was ftill very far off.

The mechanic arts began to connect themfelves with the fciences. Philosophers examined the labours, fought the origin, and studied the history of these arts; at the fame time they described the processes and fruits of those which were cultivated in different countries, and were induced to collect together their observations, and transmit them to posterity.

•

Thus Pliny, in the comprehensive plan of his natural history, includes man, nature and the arts. This work is a valuable and complete inventory of what at that time conflituted the true stores of the human mind: nor can his claims to our gratitude be superfeded by the charge, however merited, of his having collected with too little difcrimination and too much credulity, what the ignorance or lying vanity of historians prefented to his avidity, not to be fatiated, of knowing every thing.

In the midft of the decline of Greece, Athens, which, in the days of its power, had honoured philofophy and letters, owed to them, in its turn, the preferving for a longer period fome remains of its ancient fplendour. In its tribune, indeed, the deftinies of Greece and Afia were no longer decided; it was, however, in the fchools of Athens that the Romans acquired the fecrets of eloquence; and it was at the feet of Demosthenes' lamp that the first of their orators was formed.

The academy, the lyceum, the portico, the gardens of Epicurus, were the nurfery and principal school of the four sects that disputed the empire of philosophy.

It was taught in the academy, that every thing is doubtful; that man can attain, as to any object, neither abfolute certainty nor a true comprehension; in fine, and it was difficult to go farther, that he could not be fure of this very impossibility of knowing any thing, and that it was proper to doubt even of the necessity of doubting.

The opinions of different philosophers, were explained, defended and opposed in this school, but merely as hypotheses calculated to exercise the mind and illustrate more fully, by the uncertainty which accompanied these disputes, the vanity of human knowledge and absurdity of the dogmatical confidence of the other sects.

1

This doctrine, if it go no farther than to difcountenance reasoning upon words to which we can affix noclear and precise ideas; than to proportion our belief in any proposition to the degree of probability it bears; than to afcertain, as to every fpecies of knowledge, the bounds of certainty we are able to acquire,-this scepticifm is then rational; but when it extends to demonstrated truths; when it attacks the principles of morality, it becomes either weaknefs or infanity; and fuch is the extreme into which the fophists have fallen, who fucceeded in the academy the first disciples of Plato. We shall follow the steps of these sceptics, and exhibit the cause of their errors. We shall examine what, in the extravagance of their doctrine, is to be ascribed to the passion, fo prevalent, of distinguishing themselves by whimfical opinions; and shall shew, that, though fufficiently refuted by the inffinct of other men, by the inftinct which directed these fophists themselves in the ordinary conduct of life, they were neither properly refuted, nor even understood, by the philosophers. of the day.

÷ •

•

Meanwhile this fceptical mania did not possible the whole fect of academics; and the doctrine of an eternal idea, just, comely, honess, independent of the interests and conventions of men, and even of their existence, an idea that, imprinted on the foul, becomes the principle of duty and the law of our actions, this doctrine, derived from the Dialogues of Plato, was still inculcated in his school, and constituted the basis of moral instruction.

Aristotle was no better skilled than his master in the art of analysing ideas; that is, of ascending step by step to the most simple ideas that have entered into their combination, of observing the formation of these simple ideas themfelves, of following in thefe operations the regular procedure of the mind, and developement of its faculties.

His metaphysics, like those of the other philosophers, consisted of a vague doctrine, founded sometimes upon an abuse of words, and sometimes upon mere hypotheses.

To him, however, we owe that important truth, that first step in the science of the human mind, that OUR IDEAS, EVEN SUCH AS ARE MOST ABSTRACT, MOST STRICTLY INTELLECTUAL, So to speak, HAVE THEIR ORIGIN IN OUR SENSATIONS. But this truth he failed to support by any demonstration. It was rather the intuitive perception of a man of genius, than the refult of a feries of observations accurately analysed, and systematically combined, in order to derive from

them fome general truth. Accordingly, this germ, call in an ungrateful foil, produced no useful fruit till after a period of more than twenty centuries.

сці. Т Aristotle, in his dialectics, having reduced all demonstrations to a train of arguments drawn up in a fyllogistical form, and then divided all imaginable propofitions under four heads, teaches us to discover, among the possible combinations of propositions of these four classes in collections of three and three, those which answer to the nature of conclusive fyllogistics, and may be admitted without apprehension. In this way we may judge of the cogency or weakness of an argument, merely by knowing to what class it belongs: and thus

the art of right reafoning is fubjected in some measure to technical rules.

This ingenious idea has hitherto remained ufelefs; but perhaps it may one day become the leading fteps toward a perfection which the art of reafoning and difcuffion feems fill to expect.

Every virtue, according to Aristotle, is placed between two vices, of which one is its defect, and the other its excess; it is only, as it were, one of those natural inclinations which reason equally forbids us too strongly to result, and too slavishly to obey.

This general principle must have been fuggested to him by one of those vague ideas of order and conformity, fo common at that time in philosophy; but he proved its truth, by applying it to the vocabulary of words which,

in the Greek language, expressed what were called the virtues.

About the fame period, two new fects, founding their fystems of morality, at least in appearance, upon two contrary principles, divided the general mind, extended their influence beyond the limits of their schools, and hastened the fall of Greek superstition; but, unhappily a superstition more gloomy, more dangerous, more inimical to knowledge, was soon to succeed it.

. K

The floics made virtue and happiness confist in the possession of a foul alike infensible to pleasure and to pain, free from all the paffions, fuperior to every fear, every weaknefs, knowing no absolute good but virtue, no real evil but remorfe. They believed that man was capable of raifing himfelf to this elevation, if he poffeffed a strong and constant defire of doing fo; and that then, independent of fortune, always master of himself, he was equally inacceffable to vice and calamity. An individual mind animates the world : it is prefent in every thing, if it be not every thing, if there exist any other thing than itself. The fouls of human beings are emanations of it. That of the fage, who has not defiled the purity of his origin, is re-united, at the inftant of death, to this universal spirit. Accordingly, to the fage, death would be a bleffing, if, fubmiffive to nature, hardened against what vulgar men call evils, it was not more glorious in him to regard it with indifference.

٩

.\*

By Epicurus, happinefs is placed in the enjoyment of pleafure, and in freedom from pain. Virtue, according to him, confifts in following the natural inclinations of the heart, at the same time taking care to purify and direct them. The practice of temperance, which prevents pain, and, by preferving our faculties in their full force, fecures all the enjoyments that nature has provided for us; the care to guard ourselves against hateful and violent paffions that torment and rend the foul delivered up to their bitterness and fury; the farther care to cultivate, on the contrary, the mild and tender affections; to be frugal of pleafures that flow from benevolence; to preferve the foul in purity, that we may avoid the shame and remorfe which punish vice, and enjoy the delicious fentiment that is the reward of laudable actions: fuch is the road that conducts at once both to happiness and virtue. Epicurus regarded the universe only as a collection of atoms, the different combinations of which were fubjected to necessary laws. The human foul was itself one of those combinations. The atoms which composed it united when the body began to live, were dispersed at the moment of death, to unite themfelves again to the common mass, and enter into new combinations.

Unwilling too violently to shock popular prejudices, he admitted of Gods; but, indifferent to the actions of men, strangers to the order of the universe, and governed, like other beings, by the general laws of its

mechanism, they were a fort of excrescence of the fystem.

Men of morofe, proud, and unjust characters, fcreened themfelves under the mask of stoicism, while voluptuous and corrupt men frequently stole into the gardens of Epicurus. Some calumniated the principles of the Epicureans, who were accused of placing the fovereign good in the gratification of sensual appetites. Others turned into ridicule the pretensions of the stage Zeno, who, whether a state at the mill, or tormented with the gout, was equally happy, free, and independent.

The philosophy that pretended to foar above nature, and that which wished only to obey nature; the morality which acknowledged no other good than virtue, and that which placed happiness in the indulgence of the natural inclinations, led to the fame practical confequences, though departing from fuch opposite principles, and holding fo contrary a language. This refemblance between the moral precepts of all fystems of religion, and all fects of philosophy, would be fufficient to prove that they have a foundation independent of the dogmas of those religions; or the principles of those fects; that it is in the moral conflitution of man we must feek the basis of his duties, the origin of his ideas of justice and virtue: a truth which the fest of Epicureans approached more nearly than any other; and no circumstance perhaps so much contributed to draw upon it the enmity of all classes of hypocrites with whom

\*

morality was no commercial object of which they ambitioufly contended for the monopoly.

The fall of the Greek republics involved that of the political fciences. After Plato, Aristotle, and Xenophon, they almost ceased to be included in the fystem of philosophy.

But it is time to fpeak of an event that changed the lot of a confiderable part of the world, and exercifed on the progrefs of the mind an influence that has reached even to ourfelves.

If we except India and China, the city of Rome had extended its empire over every nation in which human intelligence had rifen above the weaknefs of its

earliest infancy.

It gave laws to all the countries into which the Greeks had introduced their language, their fciences, and their philosophy; and these nations, held by a chain which victory had fastened to the foot of the capitol, no longer existed but by the will of Rome, and for the passions of its chiefs.

A true picture of the conflictution of this fovereign city will not be foreign to the object of this work. We fhall there fee the origin of hereditary patrician rank, and the artful means that were adopted to give it greater ftability and force, by rendering it lefs odious; we fhall there fee a people inured to arms, but never employing them in domestic differitors; uniting real power to legal authority, yet fcarcely defending themfelves against-

• • a hanghty fenate, that, while it rivetted the chains of fuperstition, dazzled them at the fame time with the fplendor of their victories; a great nation, the sport inturn both of its tyrants and its defenders, and the patient dupe, for four centuries, of a mode of taking votes, absurd but confecrated.

We shall fee this constitution, made for a single city, change its nature without changing its form, when it was necessary to extend it to a great empire. unable to maintain itself but by continual wars, and prefently destroyed by its own armies; and lastly, the people, the sovereign people, debased by the habit of being; maintained at the expence of the public treasury, and. corrupted by the bounty of the fenators, felling to an. individual the imaginary remains of their useless freedom. The ambition of the Romans led them to fearch in ~ Greece for masters in the art of eloquence, which in. Rome was one of the roads to fortune. That tafte for exclusive and refined enjoyments, that want of new pleafures, which fprings from wealth and idlenefs, made : them court others arts of the Greeks; and even the conversation of their philosophers. But the sciences, philosophy, and the arts connected with painting, were plants foreign to the foil of Rome. The avarice of the conquerors covered Italy with the mafter-pieces of Greece, taken by violence from the temples, from cities. of which they conflituted the ornament, and where they served as a confolation under flavery. But the produc-

•

tions of no Roman dared mix with them. Cicero, Lucretius and Seneca wrote eloquently in their language upon philosophy, but it was upon Grecian philosophy; and to reform the barbarous calendar of Numa, CEsar was obliged to employ a mathematician from Alexandria. Rome, long torn by the factions of ambitious generals, busied in new conquests, or agitated by civil difcords, fell at last from its restless liberty into a military despotifm still more restless. And where, among the chiefs that aspired to tyranny, and soon after under the defpots who feared truth and equally hated both talents and virtue, were the tranquil meditations of philofophy and the sciences to find a place? Besides, the fciences and philosophy are necessarily neglected as barren and unprofitable in every country where fome honourable career, leading to wealth and dignities, is open to all whom their natural inclination may difpofe to fludy: and fuch at Rome was that of jurifprudence. When laws, as in the east, are allied to religion, the right of interpreting them becomes one of the ftrongeft supports of facerdotal tyranny. In Greece they had conflituted a part of the code given to each city by its respective legislator, who had assimilated them to the fpirit of the conflitution and government which he established. They experienced but few alterations. The magistrates frequently abused them, and individual instances of injustice were not lefs frequent; but the vices of the laws never extended in Greece to a regular fystem

į.

98

· · · ·

of rebbery, reduced to the cold forms of calculation. In Rome, where for a long time no other authority was known but the tradicion of cuftoms, where the judges declared every year by what principles difputes would be decided during the continuance of their magiftracy, where the first written laws were a compilation from the Greek laws, drawn up by the decemvirs, more anxious to preserve their power than to honour it by presenting a found code of legislation: in Rome, where, after that period, laws, dictated at one time by the party of the fenate, and at another by the party of the people, fucceeded each other with rapidity, and were inceffantly either destroyed or confirmed, meliorated or aggravated by new declarations, the multiplicity, the complication and the obscurity of the laws, an inevitable confequence of the fluctuation of the language, soon made of this study a science apart. The senate, taking advantage of the respect of the people for the ancient institutions, foon felt that the privilege of interpreting laws was nearly equivalent to that of making new ones; and accordingly this body abounded with lawyers. Their power furvived that of the fenate itself: it increased under the emperors, becaufe it is necessarily greater as the code of legiflation becomes more anomalous and uncertain.

Jurifprudence then is the only new fcience for which we are indebted to the Romans. We shall trace its hiftory, fince it is connected with the progress which the fcience of legislation has made among the moderns, and

-- •

particularly with the obstacles which that legislation has had to encounter.

We shall show, that respect for the positive law of the Romans has contributed to preferve some ideas of the natural law of men, in order afterwards to prevent these ideas from increasing and extending themselves; and that while we are indebted to their code for a small quantity of truths, it has furnished us with a far greater portion of tyrannical prejudices.

The mildness of the penal laws, under the republic, is worthy our notice. They in a manner rendered facred the blood of a Roman citizen. The penalty of death could not be inflicted, without calling forth that extraordinary power which announced public calamities and danger to the country. The whole body of the people might be claimed as judge between a fingle individual and the republic. It was found that, with a free people, this mildnefs was the only way to prevent political diffentions from degenerating into cruel massacres; the object was to correct, by the humanity of the laws, the ferocious manners of a people that, even in its sports, fquandered profusely the blood of its flaves. Accordingly, stopping at the times of the Gracchi, in no coun-. try have ftorms fo numerous and violent been attended with fo few crimes, or cost fo little blood.

No work of the Romans upon the fubject of politics has defcended to us. That of Cicero upon laws was probably but an embellished extract from the books of

the Greeks. It was not amidd the convultions of expiring liberty, that moral science could refine and perfect Under the despotism of the Cæsars, study itself. would have experienced no other construction than a confpiracy against their power. In short, nothing more clearly proves how much the Romans were ignorant of this fcience, than the example they furnish us, not to be equalled in the annals of hiftory, of an uninterrupted fuccession, from Nerva to Marc Antony, of five emperors, possessing at once virtue, talents, knowledge, a love of glory, and zeal for the public welfare, without a fingle inftitution originating from them that has marked the defire of fixing bounds to defpotifm, of preventing revolutions, and of cementing by new ties the parts of that huge mafs, of which every thing predicted the approaching diffolution. The union of fo many nations under one fovereignty; the fpread of too languages which divided the empire, and which were alike familiar to almost every well-informed mind, these causes, acting in concert, must have contributed, no doubt, to the more equal diffusion of knowledge over a greater space. Another natural effect must have been to weaken by degrees the differences which feparated the philosophical fects, and to unite them into one, that fhould contain fuch opinions of each as were most conformable to reason, and which a sober investigation had tended to confirm. This was the point to which reafon could not fail to bring philosophers "

•

when, from the effect of time on the enthusias of sectaries, her voice alone was fuffered to be heard. Accordingly, we find already, in Seneca, marks of this philosophy: indeed it was never entirely distinct from the fect of the academics, which at length appeared to become entirely the fame with it; and the most modern of the difciples of Plato were the founders of the feet: of electics.

Almost every religion of the empire had been national; but they all possessed frong lines of refemblance, and in a manner a family likenes. No metaphysical doctrines; many strange ceremonies, of the meaning of which the people, and frequently the priefts, were ignorant; an abfurd mythology, in which the multitude read the marvellous hiftory of its Gods only, but which men better enlightened fuspected to be an allegory of doctrines more fublime; bloody facrifices; idols representing Gods, and of which fome possessed a celestial virtue; pontiffs devoted to the worship of each divinity, but without forming a political corps, and even without being united in a religious communion; oracular powers attached. to certain temples, refiding in certain statues; and lastly, mysteries, which their hierophants never revealed without imposing an inviolable law of fecrecy. These were the features of refemblance.

Let us add, that the priest, arbiters of the religious conscience, had presumed to assert no claim upon the moral confcience; that they directed the practice

of worship, but not the actions of private life. They fold oracles and auguries to political powers; they could precipitate nations into war; they could dictate to them crimes; but they exercised no influence either over the government or the laws.

When the different nations, fubjects now of the fame empire, enjoyed an habitual intercourfe, and knowledge had every where made nearly an equal progrefs, it was foon difcovered, by well-informed minds, that all this multifarious worfhip was that of one only God, of whom the numerous divinities, the immediate objects of popular adoration, were but the modifications or the minifters.

Meanwhile, among the Gauls, and in fome cantons of the eaft, the Romans had found religions of another kind. There the priefts were the arbiters of morality; and virtue confifted in obedience to a God, of whom they called themfelves the fole interpreters. Their power extended over the whole man; the temple and the country were confounded : without being previoufly an adorer of Jehova, or Œfus, it was impoffible to be a citizen or fubject of the empire; and the priefts determined to what human laws their God exacted obedience.

These religions were calculated to wound the pride\_. of the masters of the world. That of the Gauls was too powerful for them not to seek immediately its destruction. The Jewish nation was even dispersed. But

104

the vigilance of government either difdained, or elfe was unable to reach, the obfcure fects that fecretly formed themfelves out of the wreck of the old fystems of worfhip.

One of the benefits refulting from the propagation of the Greek philosophy, had been to put an end to a belief in the popular divinities in all classes of men who had received any tolerable education. A vague kind of deism, or the pure mechanism of Epicurus, was, even at the time of Cicero, the common doctrine of every enlightened mind, and of all those who had the direction of public affairs. This class of men was necessarily attached to the old religion, which however it fought to purify from its drofs; for the multiplicity of Gods of every country had tired out even the credulity of the people. Then were feen philosophers forming fystems upon the idea of interposing genii, and submitting to preparatory observances, rites, and a religious discipline, to render themselves more worthy of approaching these superior effences; and it was in the dialogues of Plato they fought the principles of this doctrine.

•

The inhabitants of conquered nations, the children of misfortune, men of a weak but fanguine imagination, would from preference attach themfelves to the facerdotal religions; because the interest of the ruling priests dictated to them that very doctrine of equality in flavery, of the renunciation of temporal enjoyments, of rewards

in heaven referved for blind fubmillion, for fufferings, for mortifications inflicted voluntarily, or endured without repining; that doctrine fo attractive, fo confolatory to opprefied humanity! But they felt the neceffity of relieving, by metaphyfical fubtleties, their großs mythology: and here again they had recourfe to Plato. His dialogues were the arfenal to which two opposite parties reforted to forge their theological arms. In the fequel we shall fee Aristotle obtaining a similar honour, and becoming at once the master of the theologians, and chief of the athies.

Twenty Egyptian and Jewish fects, united their forces against the religion of the empire, but contending against

each other with equal fury, were lost at length in the religion of Jefus. From their wreck were composed a history, a creed, a ritual, and a fystem of morality, to which by degrees the mass of these fanatics attached themselves.

They all believed in a Chrift, a Meffiah fent from God to reftore the human race. This was the fundamental doctrine of every fect that attempted to raife itfelf upon the ruins of the ancient fects. They difputed refpecting the time and place of his appearance, and his mortal name : but a prophet, faid to have flarted up in Palestine, in the reign of Tiberius, eclipfed all the other expected prophets, and the new fanatics rallied under the standard of the fon of Mary.

106

In proportion as the empire weakened, the progrefs of this religion of Chrift became more rapid. The degraded state of the ancient conquerors of the world extended to their Gods, who, after prefiding in their victories, were no longer regarded than as the impotent witnesses of their defeat. The spirit of the new sect was better fuited to periods of decline and misfortune. Its chiefs, in fpite of their impostures and their vices, were enthulialts ready to fuffer death for their doctrine. The religious zeal of the philosophers and of the great, was only a political devotion : and every religion which men permit themselves to defend as a creed useful to be left to the people, can expect no other fate than a diffolution more or less distant. Christianity soon became a powerful party; it mixed in the quarrels of the Cæsars: it placed Constantine on the thorne; where it afterwards feated itself, by the fide of his weak succeffors. In vain did one of those extraordinary men whom chance fometimes exalts to fovereign power, Julian, with to free the empire from this plague which was calculated to hasten its fall. His virtues, his indulgent humanity, the simplicity of his manners, the dignity of his foul and his character, his talents, his courage, his military genius, the fplendor of his victories, every thing feemed to promife him fuccefs. No other reproach could be caft upon him than that of flowing for a religion, become ridiculous, an attachment unworthy of him if fincere, indifcreet from its extravagance if political;

-

but he died in the midft of his glory, after a reign of two years. The Coloffus of the Roman Empire found its arms no longer fufficiently forong to fupport the weight of it; and the death of Julian broke down the only mound that might yet have opposed itself against the torrent of new fuperstitions, and the inundations of barbarians.

Contempt for human sciences was one of the first features of Christianity. It had to avenge itself of the outrages of philosophy; it feared that spirit of investigation and doubt, that confidence of man in his own reafon, the peft alike of all religious creeds. The light of the natural sciences was even odious to it, and was regarded with a fuspicious eye, as being a dangerous enemy to the fuccels of miracles: and there is no religion that does not oblige its sectaries to swallow some physical absurdities. The triumph of Christianity was thus the fignal of the entire decline both of the fciences and of philosophy. Had the art of printing been known, the sciences would have been able to preferve their ground; but the existing manuscripts of any particular book were few in number; and to procure works that might form the entire body of a science, required cares, and often journies and an expence to which the rich only were competent. It was easy for the ruling party to suppress the appearance of books which shocked its prejudices, or unmasked its impostures. An incursion of barbarians might, in one

•

day, deprive forever a whole country of the means of knowledge. The deftruction of a fingle manufcript was often an irreparable and universal loss. Besides, no works were copied but fuch as were recommended by the names of the authors. All those investigations which can acquire importance only from their affemblage, those detached observations, those improvements of detail, that ferve to keep the fciences flowing in a level channel, and that prepare their future progrefs; all those materials which time amaffes, and which await the birth of genius, were condemned to an eternal obscurity. That concert of learned men, that combination of all their forces, so advantageous, so indispensible at certain periods, had no existence. It was necessary for the same individual to begin and complete a discovery; and he was obliged to combat with his fingle strength all the obstacles which nature opposes to our efforts. The works which facilitate the fludy of the sciences, which throw light upon difficulties, which exhibit truths under more commodious and more simple forms, those details of observation, those developements which ferve to detect erroneous inferences, and in which the reader frequently catches what the author himfelf has not perceived; fuch works would find neither copyists nor readers.

It was then impossible that the sciences, arrived at a point in which the progrefs, and even the study of them were still difficult, should be able to support themfelves, and relift the current that bore them rapidly

towards their decline. Accordingly it ought not to altonish us that Christianity, though unable in the sequel to prevent their re-appearance in splendor, after the invention of printing, was at this period fufficiently powerful to accomplifh their ruin.

If we except the dramatic art, which flourished only in Athens, and must have been involved in her fall, and eloquence, which cannot breathe but in a free air, the language and literature of the Greeks preferved for a long time their luftre. Lucian and Plutarch would not difparage the age of Alexander. Rome, it is true, rofe to a level with Greece in poetry, eloquence, hiftory, and the art of treating with dignity, elegance and fascination, the dry subjects of philosophy and the sciences. Greece indeed had no poet, that evinced fo fully as Virgil, the idea of perfection, and no hiltorian to be compared with Tacitus. But this inftant of fplendor was followed by a fpeedy decline. From the time of Lucian, Rome had fcarcely any writers above barbarifm. Chryfostom still speaks the language of Demosthenes. We recognife no longer that of Cicero or of Livy, either in-Auftin, or even in Jerome, who has to plead in his excufe the influence of African barbarity.

The cause is, that at Rome the study of letters and love of the arts were never the real tafte of the people; that the transient perfection of its language was the work not of the national genius, but of a few individuals whom Greece had been the inftrument of forming. The caufe

K 2

,

is, that the Roman territory was always, as to letters, a foreign foil, to which an affiduous culture had been able to naturalife them, but where they must necessfarily degenerate the moment they were abandoned to themfelves.

The importance fo long affixed, in Greece and in Rome, to the tribune and the bar, increased in those countries the class of rhetoricians. Their labours have contributed to the progress of the art, of which they have developed the principles and fubileties. But they taught another art too much neglected by the moderns, and which at prefent it has been thought proper to tranffer from speeches for the tribune, to compositions for the prefs: I mean that of preparing with facility, and in a short space of time, discourses, which, from the arrangement of their parts, from the method confpicuous in them, from the graces with which they may be embellished, shall at least become supportable: I mean the art of being able to fpeak almost instantaneously, without fatiguing the auditors with a medley of ideas, or a diffuse flyle; without difgusting them with idle declamation, quaint conceits, nonfense and fopperies. How useful would be this art in every country where the functions of office, public duty, or private intereft may oblige men to speak and write, without having time to study their fpeeches or their compositions? its history is the more deferving our attention, as the moderns, to whom in the

mean time it must often be necessary, appear only to have known it on the fide of absurdity.

From the commencement of the epoch of which I fhall here terminate the delineation, manufcripts were tolerably numerous; but time had fpread over the performances of the first Greek writers a fufficient number of obfcurities, for the study of books and opinions, known by the name of erudition, to form an important portion of the occupations of the mind; and the Alexandrian library was crowded with grammarians and critics.

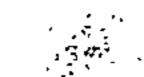

In what has been transmitted to us of their productions, we perceive a propensity in these critics to pro-

portion their degree of confidence and admiration of any book to its antiquity, and the difficulty of understanding and procuring it; a disposition to judge opinions not by themselves, not according to their merits, but from the names of their authors; to found their belief upon authority, rather than upon reason; in short, that false and destructive idea of the deterioration of the human race, and superiority of ancient periods. The solution and excuse of this error, an error in which the antiquarians of every country have had a greater or less share, are to be found in the importance which men affix to what has been the object of their attention, and called forth the energies of their mind.

The Greek and Roman antiquarians, and even their literati and philosophers, are chargeable with a total

neglect of that spirit of doubt which subjects to a rigorous investigation both saces, and the proofs that establish them. In reading their accounts of the hiltory of events or of manners, of the productions and phenomena of nature, or of the works and processes of the arts, we are altonished at the composure with which they relate the most palpable absurdities, and the most fulsome and difgusting prodigies. A hearfay or rumour which they found tacked to any event, was fufficient, they conceived, to fcreen them from the cenfure of childifh credulity. This indifference, which spoiled their study of history, and was an obstruction to their advancement in the knowledge of nature, is to be afcribed to the misfortune of the art of printing not being known. The certainty of our having collected, refpecting any fact, all the authorities for and against it, a facility in comparing the different testimonies, the opportunity of throwing light upon the fubject by the discussions to which that difference may give rife, are means of afcertaining truth which can only exift when it is possible to procure a great number of books, when copies of them may be indefinitely multiplied, and when no fear is entertained of giving them too extensive a circulation.

How were the relations and defcriptions of travellers, of which there frequently existed but a single copy, descriptions that were not subjected to public judgment, to acquire that stamp of authority, founded upon the circumstance of such judgment not having, and not

being able, to contradict them? Accordingly, every thing was recorded alike, becaufe it was impossible to afcertain with any certainty what was deferving of record. But we can have no right to affonishment at this practice of representing with equal confidence, and as founded upon equal authorities, facts the most natural, and miracles the most stupendous: the fame error is still inculcated in our schools as a principle of philosophy, while, in another sense, an over-weening incredulity leads us to reject without examination whatever appears to us to be out of nature; nor has the fcience in our days begun to exist, that can alone teach us to find, between these two extremes, the point at which reason directs us to stop.

#### SIXTH EPOCH.

# Decline of Learning, to its Restoration about the Period of the Crusades.

In the difaftrous epoch at which we are now arrived, we shall fee the human mind rapidly descending from the height to which it had raifed itself, while Ignorance marches in triumph, carrying with her, in one place, barbarian ferocity; in another, a more refined and accomplished cruelty; every where, corruption and perfidy. A glimmering of talents, fome faint sparks of greatness or benevolence of foul, will, with difficulty, be different amids the universal darkness. Theological reveries, superstitious delusions, are become the fole genius of man, religious intolerance his only morality; and Europe, crushed between facerdotal tyranny and military despotism, awaits, in blood and in tears, the moment when the revival of light shall reftore it to liberty, to humanity, and to virtue.

We shall divide the picture into two distinct parts. The first will embrace the West, where the decline was more rapid and more absolute, but where the light of reason is again to make its appearance, never more to be extinguished. The second will be confined to the

East, where the decline was more flow, and, for a long time, lefs univerfal, but where the day of reason has not yet dawned, that shall enlighten it, and enable it to break in pieces its chains.

Chriftian piety had fcarcely overthrown the altars of wictory, when the Welt became the prey of barbarians. They embraced the new religion, without adopting the language of the vanquifhed. This' the priefts alone preferved; but, from their ignorance and contempt for human learning, they exhibited none of those appearances which might have been expected from a perufal of the Latin books, particularly when they only were capable of reading them.

The illiterate character, and rude manners of the conquerors, are fufficiently known: meanwhile, it was in the midft of this ferocious flupidity that the deftruction of domeftic flavery took place; a flavery that had difgraced the beft days of Greece, when a country diftinguished for learning and liberty.

The rural flaves, ferfs of the glebe, cultivated the lands of the conquerors. By this opprefied clafs of men their houses were supplied with domestics, whose dependent fituation answered all the purposes of their pride or their caprice. Accordingly, the object of their wars was not flaves, but lands and colonies.

Beside, the domestic flaves which they found in the countries they invaded, were in a great measure either prisoners taken from some tribe of the victorious nation,

or the children of those prisoners. Many, at the moment of conquest, had sled, or else joined themselves to the army of the conquerors.

The principles of general fraternity, which conftituted a part of the Christian morals, also condemned flavery; and, as the priests faw no political reason for contradicting, in this particular, maxims that did honour to their cause, they contributed, by their discourses, to a downfall which otherwise events and manners would necessfarily have accomplished.

This change has proved the generative principle of a revolution in the destinies of mankind. To this men are indebted for the knowledge of true liberty. But its influence on the lot of individuals was at first almost insensible. We should form a very false idea of domestic flavery as it exifted at this period and among the ancients, if we compared it to that of our negroes. The Spartans, the grandees of Rome, and the fatraps of the East, were, no doubt, barbarous masters. Avarice displayed all its brutality in the labours of the mines: but, on the other hand, interest had almost every where softened the state of flavery in private families. The impunity granted for violences committed against the rural flave, was carried to a high pitch, fince the law had exactly fixed its price. His dependence was as great as that of the domeflic, without being compensated by the fame attentions. He was lefs perpetually under the eye of his mafter; but he was treated with a more lordly arrogance. The domestic

was a flave whom fortune had reduced to a condition, to which a fimilar fortune might one day reduce his mafter. The rural flave, on the contrary, was confidered as of a lower clafs, and in a flate of degradation.

It is principally, then, in its remote confequences that we must confider this annihilation of domestic flavery.

Thefe barbarian nations had all nearly the fame form of government, confifting of a common chief, called king, who, with a council, pronounced judgments, and gave decisions, that it would have been dangerous to delay; of an assembly of private chiefs, confulted upon all refolutions of a certain importance; and, lastly, of an assembly of the people, in which measures interesting to the general community were deliberated. The principal difference was the greater or lefs degree of authority affixed to thefe three powers, which were not diffinguished by the nature of their functions, but by the rank of affairs confided to them; and, above all, by the value of that rank in the minds of the majority of the citizens. Among the agricultural tribes of these barbarians, and particularly those who had already formed an establishment on a foreign territory, these constitutions had affumed a more regular and more folid form, than among pastoral tribes. The individuals of fuch tribes also were difperfed over the foil, and did not live, like the others, in encampments more or lefs numerous. The king therefore had not always an army affembled about his

X

perfon; and despotifm could not fo immediately follow upon conquest, as in the revolutions of Asia.

The victorious nation was thus not enflaved. At the fame time; these conquerors kept the towns, but without inhabiting them. As they were not held in awe by an armed force, no permanent force of that kind existing, they acquired a fort of power; and this power was a point of support for the liberty of the conquered nation.

Italy was often invaded by the barbarians; but they were able to form there no durable establishment, from its wealth continually exciting the avarice of new conquerors, and becaufe the Greeks entertained the hope, for a confiderable period, of uniting it to the empire. It was never, by any people, entirely or permanently fubdued. The Latin language, which was there the only language of the people, degenerated more flowly; and ignorance also was less complete, superstition less senseless, than in the other parts of the West. Rome, which acknowledged mafters only to change them, maintained a fort of independence. This city was the relidence of the chief of the religion. Accordingly, while in the East, subjected to a single prince, the clergy, fometimes governing, and fometimes confpiring against the emperors, supported despotism, though resisting the despot, and preferred availing themselves of the whole power of an absolute master, to disputing a part of it; we see them, on the contrary, in the West, united under a common head, erecting a power, the rival of that of

kings, and forming in these divided states a sort of diftinct and independent monarchy.

10

We shall exhibit this ruling city trying the experiment upon the universe of a new species of chains; its pontiffs fubjugating ignorant credulity by acts grofsly forged; mixing religion with all the transactions of civil life, to render them more subservient to their avarice or their pride; punishing by anathemas, from which the people shrunk with horror, the least opposition to their laws, the fmallest resistance of their absurd pretensions; having an army of monks in every state, ready, by their impositures, to enhance the terrors of superstition, thereby to feed the fiame of fanaticism; depriving nations of their worship and ceremonies upon which depended their religious hopes, to kindle civil war; disturbing all, to govern all; commanding in the name of God, treafon and perfidy, affaffination and parricide; making kings and warriors now the inflruments, and now the victims, of their revenge; disposing of force, but never possessing it; terrible to their enemies, but trembling before their own defenders; omnipotent to the very extremities of Europe, yet infulted with impunity at the foot even of their altars; finding in heaven the point upon which to fix the lever for moving the world, but without discovering on earth the regulator that is to direct and continue its motion at their will; in flort, erecting a Coloffus, but with legs of clay, that, after first oppressing Europe,

is afterwards to weary it, for a long period, with the weight of its ruins and fcattered fragments.

s

Conqueft had introduced into the Weft a tumultuous anarchy, in which the people groaned under the triple tyranny of kings, leaders of armies, and priefts; but this anarchy carried in its womb the feed of liberty. In this portion of Europe mult be comprehended the countries into which the Romans had not penetrated. Partaking of the general commotion, conquering and conquered in turn, having the fame origin, the fame manners as the conquerors of the empire, these people were confounded with them in the common mass. Their political state must have experienced the fame alterations, and

fellowed a similar route.

We shall give a sketch of the revolutions of this feodal anarchy: a name that may furnish an idea of its character.

Their legiflation was incoherent and barbarous. If we find in its records many laws apparently mild, this mildnefs was nothing elfe than an unjuft and privileged impunity. Meanwhile we trace among them fome inflitutions of a true temper, which, though as being intended to confecrate the rights of the oppreffor, were an additional outrage to the rights of men, yet tended to preferve fome feeble idea of thefe laft, and were deftined one day to ferve as an index to their recognition and reftoration.

-

In this legislation two fingular cultoms are observable, characteristic at once both of the infancy of nations, and the ignorance of the rude ages. A criminal might purchafe exemption from punishment by means of a fum of money fixed by law, which estimated the lives of men according to their dignity or their birth. Crimes were not confidered as a violation of the fecurity and rights of citizens, which the dread of punishment was to prevent, but as an outrage committed on an individual, which himfelf or his family might avenge, if they pleafed, but of which the law offered a more advantageous reparation. Men had fo little notion of afcertaining the proofs by which a fact might be fubstantiated, that it was thought a more fimple mode of proceeding to requeft of Heaven a miracle, whenever the question was to discriminate between guilt and innocence; and the fuccefs of a fuperflitious experiment; or the chance event of a combat, were regarded as the fureft means of detecting fallhood and arriving at the truth. With men who made no distinction between independence and liberty, the quarrels arising among. those who ruled over a portion, however finall, of the territory, must degenerate into private wars; and these wars extending from canton to canton, from village to village, habitually delivered up the whole furface of each country to all those horrors which, even in great invafions, are but transient, and in general wars defolate. only the frontiers.

-· Whenever tyranny aims at reducing the mais of a people to the will of one of its portions, the prejudices and ignorance of the victims are counted among the means of effecting it; it endeavours to compenfate, by the compression and activity of a smaller force for the superiority of real force, which, one might suppose, cannot fail to belong, at all times, to the majority of numbers. But the principal foundation of its hope, which however it can feldom attain, is that of establishing between the masters and slaves a real difference, which shall in a manner render nature herfelf an accomplice in the guilt of political inequality.

Such was, in remote periods, the art of the Eaftern

\*\*

priefts, who were at once kings, pontiffs, judges, aftronomers, furveyors, artifts and phyficians. But what they owed to the exclusive pofieffion of intellectual powers, the groffer tyrants of our weak progenitors obtained by their inftitutions and their warlike habits. Clothd with an impenetrable armour, fighting only upon horfes as invulnerable as themfelves, acquiring, by dint of a long and painful difcipline, the neceffary firength and addrefs for guiding and governing them, they might opprefs with this impunity and murder without rifk, an individual of the commonalty, too poor to purchafe thefe expensive accoutrements, and whofe youth, ncceffarily occupied by ufeful labours, could not have been devoted to military exercifes.

Thus the tyranny of the few acquired, by the practice of this mode of fighting, a real fuperiority of force, which must have excluded all idea of refistance, and which rendered for a long time fruitles even the efforts of defpair. Thus the equality of nature disappeared before this factitious inequality of strength.

The morality of this period, which it was the province of the priests alone to inculcate, comprehended those universal principles which no fect has overlooked: but it gave birth to a multitude of duties purely religious, and of imaginary fins. These duties were more strongly enforced than those of nature; and actions indifferent, lawful, and even virtuous, were cenfured and punished. with greater feverity than actual crimes. Meanwhile a momentary repentance, confecrated by the abfolution of a priest, opened the gates of heaven to the wicked; and donations to the church, with the observance of certain practices flattering to its pride, fufficed to atone for a life crowded with iniquity. Nor was this all: abfolutions were formed into a regular tariff. Care was taken to include in the catalogue of fins, all the degrees of human infirmity, from fimple defires, from the most | innocent indulgences of love, to the refinements and excelles of the molt intemperate debauchery. This was a frailty from which, it was well known, few were able to efcape; and was accordingly one of the most productive branches of the facerdotal commerce. There was even a hell of a limited duration invented, which priests had

the power of abridging, and from which they could grant difpenfations; a favour which they first obliged the living to purchase, and afterwards the relations or friends of the deceased. They fold so much land in heaven for an equal quantity of land upon earth; and they had the extreme modesty not to ask any thing to boot.

The manners of this epoch were unfortunately worthy of a fystem so pregnant with corruption, so rootedly depraved. Their nature may be learned from the progrefs of this very fystem itself; from the monks, fometimes inventing old miracles, sometimes fabricating new ones, and nourifhing with prodigies and fables the flupid ignorance of the people, whom they deceived in order to. rob them; from the doctors of the church, employing the little imagination they possessed in enriching their creed. with farther abfurdities, and exceeding, if possible, those which had been transmitted to them; from the priest, obliging princes to confign to the flames, not only the men who prefumed either to doubt any of their dogmas, or investigate their impostures, or blush for their crimes, but those who should depart for an instant from their blind obedience; and even theologists themselves, when they indulged in dreams different from those of the umpires of the church, enjoying most influence and control. Such, at this period, are the only traits which the manners of the West of Europe can furnish to the picture: of the human species.

In the Eaft, united under a fingle defpot, we shall observe a flower decline accompanying the gradual debility of the empire; the ignorance and depravity of every age advancing a few degrees above the ignorance and depravity of the preceding one; while riches diminish, the frontiers ally themselves more closely to the capital, revolutions become more frequent, and tyranny grows more dastardly and more cruel.

In following the hiftory of this empire, in reading the books that each age has produced, the most fuperficial and least attentive observer cannot avoid being struck with the resemblance we have mentioned.

The people there indulged themfelves more frequently in theological difputes. These accordingly occupy a more confiderable portion of its history, have a greater influence upon political events, and the dreams of priests acquire a fubtlety which the jealous of the West could as yet not attain. Religious intolerance was equally oppressive in both quarters of Europe; but, in the country we are confidering, its aspect was less ferocious.

Meanwhile the works of Photius evince that a tafte for rational study was not extinct. A few emperors, princes, and even some female sovereigns, are sound feeking laurels out of the boundaries of theological controvers, and deigning to cultivate human learning.

The Roman legiflation was but flowly corrupted by that mixture of bad laws which avarice and tyranny dic-

•

tated to the emperors, or which fuperstition extorted from their weakness. TheGreek language lost its purity and character; but it preferved its richness, its forms and its grammar; and the inhabitants of Constantinople could still read Homer and Sophocles, Thucydides and Plato. Anthemius explained the construction of the burning glasses of Archimedes, which Proclus employed with fuccess in the defence of the capital. Upon the fall of the empire, this city contained fome literary characters, who took refuge in Italy, and whose learning was useful to the progress of knowledge. Thus, even at this period, the East had not arrived at the last stage of ignorance; but at the fame time it furnished

no hope of a revival of letters. It became the prey of barbarians; the feeble remains of intellectual cultivation disappeared; and the genius of Greece still waits the hand of a deliverer.

At the extremities of Afia, and upon the confines of Africa, there existed a people, who, from its local fituation and its courage, escaped the conquests of the Perfians, of Alexander, and of the Romans. Of its numerous tribes, some derived their subsistence from agriculture, while others observed a pastoral life; all pursued commerce, and some addicted themselves to robbery. Having a similarity of origin, of language and of religious habits, they formed a great nation, the different parts of which, however, were held together by no political tie. Suddenly there started up among

them a man of an ardent enthulialm and most profound policy, born with the talents of a poet, as well as those of a warrior. This man conceived the bold project of uniting the Arabian tribes into one body, and he had the courage to execute it. To fucceed in imposing a chief upon a nation hitherto invincible, he began with erecting upon the ruins of the ancient worship a religion more refined. At once legislator, prophet, priest, judge, and general of the army, he was in possible of all the means of subjugating the mind; and he knew how to employ them with address, but at the fame time with comprehension and dignity.

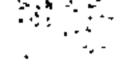

He promulgated a mais of fables, which he pretended to have received from heaven; but he alfo gained battles. Devotion and the pleafures of love divided his leifure. After enjoying for twenty years a power without bounds, and of which there exists no other example, he announced publicly, that, if he had committed any act of injustice, he was ready to make reparation. All were filent: one woman only had the boldness to claim a small sum of money. He died; and the enthustaff which he communicated to his people will be feen to change the face of three quarters of the globe.

7

٠.

The manners of the Arabians were mild and dignified; they admired and cultivated poetry : and when they reigned over the finest countries of Asia, and time had cooled the fever of fanaticism, a taste for literature

and the sciences mixed with their zeal for the propagation of religion, and abated their ardour for conquests. They studied Aristotle, whose works they translated. They cultivated astronomy, optics, all the branches of medicine, and enriched the fciences with fome new truths. To them we owe the general application of algebra, which was confined among the Greeks to a fingle class of questions. If the chimerical pursuit of a fecret for the transmutation of metals, and a draught for the perpetuating of life degraded their chymical refearches, they were the reftorers, or more properly fpeaking the inventors, of this science, which had hitherto been confounded with medicine and the fludyof the processes of the arts. Among them it appeared for the first time in its simple form, a strict analysis of bodies for the purpose of afcertaining their elements, a theory of the combinations of matter and the laws to which those combinations are subjected. The fciences were free, and to that freedom they owed their being able to revive fome sparks of the Grecian genius; but the people were fubjected to the unmitigated despotifm of religion. Accordingly this light shone for a few moments only to give place to a thicker darkness; and these labours of the Arabs would have been loft to the human race, if they had not ferved to prepare that more durable reftoration, of which the West will prefently exhibit to us the picture.

"We thus fee, for the fecond time, genius abondoning nations whom it had enlightened; but it was in this, as in the preceding inftance, from before tyranny and fuperstition that it was obliged to disappear. Born in Greece, by the fide of liberty, it was neither able to arrest the fall of that country, nor defend reason against the prejudices of the people already degraded by flavery. Born among the Arabs, in the midit of defpotifm, and, as it were, in the cradle of a fanatical religion, it has only, like the generous and brilliant character of that people, furnished a transient exception to the general laws of nature, that condemn to brutality and ignorance enflaved and fuperstitious nations.

1

But this fecond example ought not to terrify us refpesting the future; it should operate only as a warning upon our contemporaries not to neglect any means of preferving and augmenting knowledge, if they with either to become or to remain free; and to maintain their freedom, if they would not lofe the advantages which knowledge has procured them.

To the account of the labours of the Arabs, I shall fuggest the outlines of the fudden rife and precipitate fall of that nation, which, after reigning from the borders of the Atlantic ocean to the banks of the Indus, driven by the barbarians from the greater part of its conquests, retaining the rest only to exhibit therein the flocking fpectacle of a people degenerated to the loweft state of servitude, corruption and wretchedness, still М

occupies its ancient country, where it has preferved its manners, its fpirit and its character, and learned to regain and defend its former independence.

I shall add that the religion of Mahomet, the most fimple in its dogmas, the least absurd in its practices, above all others tolerant in its principles, seems to have condemned to an eternal flavery, to an incurable stupidity, all that vast portion of the earth in which it has extended its empire; while we are about to see the genius of science and liberty blaze forth anew under superstitions more absurd, and in the midst of the most barbarous intolerance. China exhibits a similar phenomenon, though the effects of this stupes pois pois have there been less

fatal.

### SEVENTH EPOCH.

From the first Progress of the Sciences about the Period of their Revival in the West, to the Invention of the Art of Printing.

A Variety of circumstances have concurred to: reftore by degrees that energy to the human mind, which from chains fo degrading and fo heavy, one might have. iuppofed was crushed forever.

The intolerance of priest, their eagerness to grasp at political power, their abominable avarice, their diffolute-manners, rendered more difgusting by their hypocrify, excited against them every honest heart, every unbiassed understanding, and every courageous character. It was impossible not to be struck with the contradictions between their dogmas, maxims and conduct, and those of the evangelist, from which their faith and fystem of morals had originated, and which they had been unable totally to conceal from the knowledge of the people.

Accordingly, powerful outcries were raised against them. In the centre of France whole provinces united. for the adoption of a more fimple doctrine, a purer syftem of Christianity, in which, subjected only to the . worship of a single Divinity, man was permitted to judge

from his own reafon, of what that Divinity had condefcended to reveal in the books faid to have emanated from him.

Fanatic armies, conducted by ambitious chiefs, laid wafte the provinces. Executioners, under the guidance of legates and priefts, put to death thofe whom the foldiers had fpared. A tribunal of monks was eftablifhed, with powers of condemning to the ftake whoever fhould be fufpected of making use of his reason.

Meanwhile they could not prevent a spirit of freedom and enquiry from making a filent and furtive progrefs. Crushed in one country, in which it had the temerity to fhew itfelf, in which, more than once, intolerant 'hypocrify kindled the most fanguinary wars, it started up, or spread secretly in another. It is seen at every interval, till the period, when, aided by the invention of the . prefs, it gained fufficient power to refcue a portion of Europe from the yoke of the court of Rome. Even already there existed a class of men, who, freed from the inglorious bondage of fuperstition, contented themfelves with fecretly indulging their contempt, or who at most went no farther than to cast upon it, fortuitoully as it were, some traits of a ridicule, which was by fo much the more striking on account of the uniform refpect with which they took care to clothe it. The pleafantry of the writer obtained favour for the boldnesses of his pen. They were feattered with moderation through works defined for the amufement of men of rank or of letters, and which never reached the mafs

of the people; for which reason they did not excite: the refentment of the bigot.

Frederic the fecond was fufpected of being whatour priefts of the eighteenth century have fince denominated a *philofopher*. He was accufed by the Pope, before all the nations of Europe, of having treated the religions of Mofes, Jefus, and Mahomet, as political fables. To his chancellor, Pierre des Vignes, was attributed the imaginary book of the Three Impoftors, which never had any exiftence but in the calumnics of fome, or the ingenious fportiveness of others, but of which the very title announced the existence of an opinion, the natural refult of an examination of these three creeds, which,

derived from the fame fource, were only a corruption of a lefs impure worship rendered by the most remote nations of antiquity to the universal foul of the world.

Our collections of traditional tales, and the Decameron of Bocace, are full of traits characteristic of this freedom of thought, this contempt of prejudices, this inclination to make them the fubject of secret and acrimonious derifion.

Thus we are furnished in this epoch, at one and the fame period, with tranquil fatirists of all degrees of fuperstition, and enthusiastical reformers of its grossest abuses; and the history of these obscure invectives, these protests in favour of the rights of reason, may be almost connected with that of the most modern disciples of the fchool of Alexandria.

•

We shall enquire if, when philosophical profelytism was attended with such peril, secret societies were not formed, whose object was to perpetuate, to spread silently and without risk, among some disciples and adepts, a few simple truths which might operate as a prefervative against prevailing prejudices.

We shall examine whether we ought not to rank in the number of such societies that celebrated order, which popes and kings confpired against with such meanness, and destroyed with so much barbarity.

Priest, either for self-defence, or to invent pretexts by which to cover their usurpations over the secular power, and to improve themselves in the art of forging pailages of fcripture, were under the necessity of applying themselves to study. Kings, on the other hand, to conduct with less difadvantage this war, in which the claims were made to reft upon authority and precedent, patromifed schools, that might furnish civilians, of whom they flood in need to be on an equality with the enemy. In these disputes between the clergy and the governments, between the clergy of each country and the fupreme head of the church, those of more honest minds, and of a more frank and liberal character, vindicated the cause of men against that of priest, the cause of the national clergy against the despotism of the foreign chief. They attacked abuses and usurpations, of which they attempted to unveil the origin. To us this boldness fcarcely appears at prefent superior to scrvile timidity;

# -135

we finile at feeing fuch a profusion of labour employed to prove what good fense alone was competent to have taught; but the truths to which I refer, at that time new, frequently decided the fate of a people: these men fought them with an independent mind; they defended them with firmnels; and to their influence is it to be afcribed that human reason began to recover the recollection of its rights and its liberty.

In the quarrels that took place between the kings and the nobles, the kings fecured the fupport of the principal towns, either by granting privileges, or by reftoring fome of the natural rights of max: they endeavoured, by means of emancipations, to increase the num-

ber of those who enjoyed the common right of citizens. And these men, re-born as it were to liberty, felt how much it behoved them, by the study of law and of history, to acquire a fund of information, an authority of opinion, that might serve to counterbalance the military power of the feodal tyranny.

The rivalship that existed between the emperors and the popes prevented Italy from uniting under a single master, and preferved there a great number of independent societies. In these petty states, it was necessary to add the power of persuasion to that of force, and to employ negociation as often as arms: and as this political war was founded, in reality, in a war of opinion, and as Italy had never absolutely loss its taste for study, this country may be confidered, respecting Europe, as a

•

15

feedplot of knowledge, inconfiderable indeed as yet, but which promifed a fpeedy and vigorous increase.

In fine, hurried on by religious enthusiafm, the western nations engaged in the conquest of places rendered holy, as it was faid, by the miracles and death of Christ: and this zeal, at the fame time that it was favourable to liberty, by weakening and impoverishing the nobles, extended the connection of the people of Europe with the Arabians, a connection which their mixture with Spain had before formed, and their commerce with. Pifa, Genoa, and Venice cemented. Their language was studied, their books were read, part of their difcoveries was acquired; and if the Europeans did not

foar above the point in which the fciences had been leftby the Arabians, they at least felt the ambition of rivaling them.

These wars, undertaken with superstitious views, ferved to destroy superstition. The spectacle of such as multitude of religions excited at length in men of sense a total indifference for creeds, alike impotent in refinings the passions, and curing the vices of mankind; a uniform contempt for that attachment, equally sincere, equally obstinate, of sectaries, to opinions contradictory to each other.

Republics were formed in Italy, of which fome were imitations of the Greek republies, while others attempted to reconcile the fervitude of a fubject people with the liberty and democratic equality of a fovereign one. In

•. .

Germany, in the north, some towns, obtaining almost entire independence, were governed by their own laws. In certain parts of Switzerland, the people threw off the chains both of feodal and of royal power. In almost all the great states imperfect constitutions sprung up, in which the authority of raifing fublidies, and of making new laws, was divided fometimes between the king, the nobles, the clergy and the people, and fometimes between the king, the barons and the commons; in which the people, though not yet exempt from a ftate of humiliation, were at least fecure from oppression; in which all that truly composed a nation were admitted to the right of defending its interests, and of being heard by those who had the regulation of its destiny. In England a celebrated act, folemnly fworn by the king, and great men of the realm, fecured the rights of the barons, and fome of the rights of men. Other nations, provinces, and even cities, obtained also charters of a similar nature, but less celebrated, and not fo ftrenuoufly defended. They are the origin of those declarations of rights, regarded at present by every enlightened mind as the basis of liberty; and of which the ancients neither had nor could have an idea, because their institutions were fullied by domestic flavery, because with them the right of citizenship was hereditary, or conferred by voluntary adoption, and becaufe they never arrived at the knowledge of rights which are inherent in the species, and belong with a strict equality to all mankind.

ς.1

In France, England, and other great nations, the people appeared defirous of refuming their true rights; but blinded by the fenfe of oppression, rather than enlightened by reason, the only fruit of its efforts were outrages, that were soon explated by acts of vengeance more barbarous, and particularly more unjust, and pillages accompanied with greater misery than either.

In England the principles of Wickliffe, the reformer, had given rife to one of these commotions, carried on under the direction of fome of his disciples, and which afforded a prefage of attempts, more fystematic and better combined, that would be made by the people under other reformers, and in a more enlightened age. The discovery of a manuscript of the Justinian code produced the revival of the study of jurisprudence, as well as of legislation, and ferved to render these lefs barbarous even among the people who knew how to derive profit from the difcovery, without treating the code as of facred obligation. The commerce of Pila, Genoa, Florence, Venice, fome cities of Belgia, and free towns of Germany, embraced the Mediterranean, the Baltic, and the coafts of the European ocean. The precious commodities of the Levant were fought by the merchants of those places in the ports of Egypt, and at the extremities of the Black Sea.

Polity, legislation, national economy, were not yet converted into sciences; the principles of them were

neither enquired after, investigated, nor developed; but as the mind began to be enlightened by experience, observations were collected tending to lead thereto, and men became versed in the interests that must cause the want of them to be felt.

Aristotle was only known at first by a translation of his works made from the Arabic. His philosophy, perfecuted at the beginning, foon gained footing in all the fchools. It introduced there no new light, but it gave more regularity, more method to that art of reafoning which theological difputes had called into existence. This scholastic discipline did not lead to the discovery of truth; it did not even serve for the difcullion and accurate valuation of its proofs, but it whetted the minds of men; and the tafte for fubtle diffinctions, the necessity of continually dividing and fubdividing ideas, of feizing their niceft shades, and expressing them in new words, the apparatus which was in the first instance employed to embarrass one's enemy in a dispute, or to escape from his toils, was the original fource of that philosophical analysis to which we have fince been to highly indebted for our intellectual progrefs.

To these disciplinarians we are indebted for the greater accuracy that may have been obtained respecting the Supreme Being and his attributes; respecting the distinction between the first cause, and the universe which it is supposed to govern; respecting the farther

diffinction between mind and matter; respecting the different senses that may be affixed to the word *liberty*; respecting the meaning of the word *creation*; respecting the manner of distinguishing from each other the different operations of the human mind, and of classing the ideas it forms of objects and their properties.

But this method could not fail to retard in the schools the advancement of the natural sciences. Accordingly the whole picture of these sciences at this period will be found merely to comprehend a few anatomical refearches; fome obfcure productions of chymiltry, employed in the difcovery of the grand fecret alone; a flight application to geometry and algebra, that fell fhort of the discoveries of the Arabians, and did not even extend to a complete understanding of the works of the ancients; and laftly, some astronomical studies and calculations, confined to the formation and improvement of tables, and depraved by an abfurd mixture of altrology. Meanwhile the mechanical arts began to approach the degree of perfection which they had preferved in Afia. In the fouthern countries of Europe the culture of filk was introduced; windmills as well as paper-mills were established; and the art of measuring time surpassed the bounds which it had acquired either among the Ancients or the Arabians.

In short, two important discoveries characterise this epoch. The property possessed by the loadstone, of pointing always to the same quarter of the heavens, a

property known to the Chinefe, and employed by them in steering their vessels, was also observed in Europe. The compass came into use, an instrument which gave activity to commerce, improved the art of navigation, suggested the idea of voyages to which we have fince owed the knowledge of a new world, and enabled man • to take a furvey of the whole extent of the globe on which he is placed. A chymist, by mixing an inflammable matter with faltpetre, difcovered the fecret of that powder which has produced fo unexpected a revolution in the art of war. Notwithstanding the terrible effect of fire-arms, in difperfing an army, they have rendered war less murderous, and its combatants less brutal. Military expeditions are more expensive; wealth can balance force; even the most warlike people feel the necessity of providing and fecuring the means of combating, by the acquisition of the riches of commerce and the arts. Polifhed nations have no longer any thing to apprehend from the blind courage of barbarian tribes. Great conquests, and the revolutions which follow, are become almost impossible. That superiority which an armour of iron, which the art of conducting a horse almost invulnerable from his accoutrements, of managing the lance, the club, or the fword, gave the nobility over the people, is completely done away: and the removal of this impediment to the liberty and real equality of mankind, is the refult Ν

of an invention, that, on the first glance, seemed to threaten the total extirpation of the human race.

- In Italy, the language arrived almost at its perfection about the fourteenth century. The style of Dante is often grand, precise, energetic. Boccace is graceful, fimple, and elegant. The ingenious and tender Petrarch has not yet become obsolete. In this country, whose happy climate nearly refembles that of Greece, the models of antiquity were studied; attempts were made to transfuse into the new language some of their beauties, and to produce new beauties of a fimilar flamp. Already fome productions gave reason to hope that, roused by the view of ancient monuments, infpired by those mute but eloquent lessons, genius was about, for the fecond time, to to embellish the existence of man, and provide for him those pure pleasures, the enjoyment of which is free to all, and becomes greater in proportion as it is participated. The reft of Europe followed at an humble diftance; but a taste for letters and poetry began at least to give a polish to languages that were still in a state almost of barbarity. The fame motives which had roufed the minds of men from their long lethargy, must also have directed their exertions. Reason could not be appealed to for the decision of questions, of which opposite interests had compelled the difcuffion. Religion, far from acknowledging its power, boafted of having fubjected and humbled it. · Politics confidered as just what had been confe-

·

crated by compact, by conftant practice, and ancient cuftoms.

No doubt was entertained that the rights of man were written in the book of nature, and that to confult any other would be to depart from and violate them. Meanwhile it was only in the facred books, in refpected authors, in the bulls of popes, in the referipts of kings, in registers of old ufages, and in the annals of the church, that maxims or examples were fought from which to infer those rights. The business was never to examine the intrinsic merits of a principle, but to interpret, to appreciate, to support or to annul by other texts those upon which it might be founded. A proposition was not adopted becaufe it was true, but becaufe it was written in this or that book, and had been embraced in fuch a country and fuch an age. Thus the authority of men was every where fubilituted for that of reason: books were much more studied than nature, and the opinions of antiquity obtained the preference over the phenomena of the universe. This bondage of the mind, in which men had not then the advantage of enlightened criticism, was still more detrimental to the progrefs of the human species, by corrupting the method of study, than by its immediate effects, And the ancients were yet too far from being equalled, to think of correcting or furpassing them.

Manners preferved, during this epoch, their corruption and ferocity; religious intolerance was even more

active; and civil difcords, and the inceffant wars of a crowd of petty fovereigns, fucceeded the invalions of the barbarians, and the peft, still more fatal, of fanguinary feuds. The gallantry indeed of the miniflers and the troubadours, the inflitution of orders of chivalry, profelling generofity and franknefs, devoting themselves to the maintenance of religion, the relief of the oppressed, and the fervice of the fair, were calculated to infuse into manners more mildness, decorum, and dignity. But the change, confined to courts and calles, reached not to the bulk of the people. There refulted from it a little more equality among the nobles, lefs perfidy and cruelty in their relations with each other; but their contempt for the people the infolence of their tyranny, their audacious robberies, continued the fame; and nations, oppressed as before, were as before ignorant, barbarous and corrupt. This poetical and military gallantry, this chivalry, derived in great measure from the Arabians, whose natural generofity long refifted in Spain fuperstition and despotifni, had doubtless their use : they diffused the feeds of humanity, which were destined in happier periods to exhibit their fruit; and it was the general character of this epoch, that it disposed the human mind for the revolution which the discovery of printing could not but introduce, and prepared the foil which the following ages were to cover with fo rich and fo abundant an harvest.

## EIGHTH EPOCH.

From the Invention of Printing, to the Period when the Sciences and Philosophy threw off the Yoke of Authority.

HOSE who have reflected but fuperficially upon the march of the human mind in the difcovery, whether of the truths of fcience, or of the proceffes of the arts, must be assonished that fo long a period should elapse between the knowledge of the art of taking impressions of drawings, and the difcovery of that of

printing characters...

Some engravers of plates had doubtlefs conceived this idea of the application of their art; but they were more ftruck with the difficulty of executing it, than with the advantages of fuccefs: and it is fortunate that they did not comprehend it in all its extent; fince priefts and kings would infaliably have united to flifle, from its birth, the enemy that was to unmafk their hypocrify, and hurl them from their thrones.

The prefs multiplies indefinitely, and at a fmall expence, copies of any work. Those who can read are hence enabled to furnish themselves with books fuitable to their taste and their wants; and this facility of exercising the talent of reading, has increased and propagated the defire of learning it. N 2

:

These multiplied copies, spreading themselves with greater rapidity, facts and discoveries not only acquire a more extensive publicity, but acquire it also in a shorter space of time. Knowledge has become the object of an active and universal commerce.

Printers were obliged to feek manufcripts, as we feek at prefent works of extraordinary genius. What was read before by a few individuals only, might now be perufed by a whole people, and ftrike almost at the fame instant every man that understood the fame language.

The means are acquired of addressing remote and dispersed nations. A new species of tribune is established,

from which are communicated imprefiions lefs lively, but at the fame time more folid and profound; from which is exercifed over the paffions an empire lefs tyrannical, but over reafon a power more certain and durable; where all the advantage is on the fide of truth, fince what the art may lofe in point of feduction, is more than counterbalanced by the illumination it conveys. A public opinion is formed, powerful by the number of those who fhate in it, energetic, because the motives that determine it act upon all minds at once, though at confiderable diffances from each other. A tribunal is erected in favour of reason and justice, independent of all human power, from the penetration of which it is difficult to conceal any thing, from whose verdict there is no escape.

7

--

New inventions, the hiftory of the first steps in the road to a discovery, the labours that prepare the way for it, the views that suggest the idea or give rise merely to the wish of pursuing it, these, communicating themfelves with celerity, furnish every individual with the united means which the efforts of all have been able to create, and genius appears to have more than doubled its powers.

Every new error is relifted from its birth; frequently attacked before it has diffeminated itfelf, it has not time to take root in the mind. Those which, imbibed from infancy, are identified in a manner with the reafon of every individual, and by the influence of hope or of terror endeared to the existence of weak understandings. have been shaken, from this circumstance alone, that it is now impossible to prevent: their discussion, impossible to conceal that they are capable of being examined and rejected, impossible they should withstand the progress of truths which, daily acquiring new light, must conclude at last with difplaying all the abfurdity of fuch errors. It is to the prefs we owe the poffibility of fpreading those publications which the emergency of the moment, or the transient fluctuations of opinion, may require, and of interesting thereby in any question, treated in a fingle point of view, whole communities of men reading and understanding the fame language.

All those means which render the progress of the human mind more easy, more rapid, more certain, are

also the benefits of the prefs. Without the instrumentality of this art, such books could not have been multiplied as are adapted to every class of readers, and every degree of instruction. To the prefs we owe those continued discussions which alone can enlighten doubtful questions; and fix upon an immoveable basis, truths too abstract, too fubtile, too remote from the prejudices of the people or the common opinion of the learned, not to be foon forgotten and loft. To the prefs we owe those books purely elementary, dictionaries, works in which are collected, with all their details, a multitude of facts, observations, and experiments, in which all their proofs are developed, all their difficulties investigated. To the prefs we owe those valuable compilations; containing fometimes all that has been difcovered, written, thought, upon a particular branch of fcience, and fometimes the refult of the annual labours of all the literati of a country. To the prefs we owe those tables, those catalogues, those pictures of every kind, of which fome exhibit a view of inductions which the mind could only have acquired by the most tedious operations; others prefent at will the fact, the difcovery, the number, the method, the object which we are defirous of afcertaining; while others again furnish, in a more commodious form and a more arranged order, the materials from which genius may fashion and derive new truths. To these benefits we shall have occasion to add others, when we proceed to analyle the effects that have

arifen from the fublitution of the vernacular tongue of seach country, in the room of the almost exclusive application, which had preceded, fo far as relates to the fciences, of one language, the common medium of communication between the learned of all nations.

In fhort, is it not the prefs that has freed the inftruction of the people from every political and religious chain? In vain might either despotism invade our schools; in vain might it attempt, by rigid infritutions, invariably to fix what truths shall be preferved in them, what errors inculcated on the mind; in vain might chairs, confectated to the moral inftruction of the prople, and the tuition of youth in philosophy and the feiences, be obliged to deliver no doctrines but such as are favourable to this double tyranny: the press can diffuse at the same time a pure and independent light. That instruction which is to be acquired from books in filence and folitude, can never be univerfally corrupted: a fingle corner of the carth free to commit their leaves to the prefs, would be a sufficient security. How admist that variety of productions, amidst that multitude of existing copies of the fame book, amidst impressions continually renewed, will to be possible to shut so closely all the doors of truth, as to leave no opening, no crack or crevice by which it may enter? If it was difficult even when the business was to destroy a few copies only of a manuscript, to prevent for ever its revival, when it was fufficient to proferibe a truth, or opinion, for a certain number of years to devote

it to eternal oblivion, is not this difficulty now rendered impossible, when it would require a vigilance inceffantly occupied, and an activity that should never slumber? And even should success attend the suppression of those too palpable truths, that wound directly the interests of inquifitors, how are others to be prevented from penetrating and fpreading, which include those proferibed truths without fuffering them to be perceived, which prepare the way, and must one day infallibly lead to them? Could it be done without obliging the perfonages in question to throw off that mask of hypocrify, the fall of which would prove no lefs fatal than truth itfelf to the reign of error? We shall accordingly see reason triumphing over these vain efforts: we shall see her in this war, a war continually reviving, and frequently cruel, fuccefsful alike against violence and stratagem; braving the flames, and refifting feduction; crushing in turn, under its mighty hand, both the fanatical hypocrify which requires for its dogmas a fincere adoration, and the political hypocrify imploring on its knees that it may be allowed to enjoy in peace the profit of errors, in which, if you will take its word, it is no lefs advantageous to the people than to itfelf, that they should for ever be plunged.

The invention of the art of printing nearly coincides with two other events, of which one has exercifed an immediate influence on the progrefs of knowledge, while the influence of the other on the deftiny of the whole

human species can never cease but with the species itself.

٦

I refer to the taking of Conftantinople by the Turks, and the difcovery both of the new world, and of the route which has opened to Europe a direct communication with the eaftern parts of Africa and Afia.

The Greek literati, flying from the fovereignty of the Tartars, fought an afylum in Italy. They acquired the ability of reading, in their original language, the poets, orators, hiftorians, philosophers, and antiquarians of Greece. They first furnished manufcripts, and soon after editions of the works of those authors. The veneration of the studious was no longer confined to what

they agreed in calling the doctrine of Aristotle. They studied this doctrine in his own writings. They ventured to investigate and oppose it. They contrasted him with Plato: and it was advancing a step towards throwing off the yoke, to acknowledge in themselves the right of choosing a master.

The perufal of Euclid, Archimedes, Diophantus, and Aristotle's philosophical book upon animals, rekindled the genius of natural philosophy and of geometry; while the antichristian opinions of philosophers awakened ideas that were almost extinct of the ancient prerogatives of human reason.

Intrepid individuals, instigated by the love of glory and a passion for discoveries, had extended for Europe

the bounds of the univerfe, had exhibited a new heaven, and opened to its view an unknown earth. Gama had penetrated into India, after having purfued with indefatigable patience the immenfe extent of the African coaffs; while Columbus, configning him to the waves of the Atlantic ocean, had reached that country, hitherto unknown, extending from the weft of Europe to the eaft of Afia.

If this paffion, whofe reftlefs activity, embracing at that period every object, gave promife of advantages highly important to the progrefs of the human fpecies, if a noble curiofity had animated the heroes of navigation, a mean and cruel avarice, a ftupid and brutal fanaticifm

governed the kings and robbers who were to reap the profits of their labour. The unfortunate beings who inhabited thefe new countries were not treated as men, becaufe they were not chriftians. This prejudice, more degrading to the tyrants than the victims, ftifled all fenfe of remorfe, and abandoned, without controul, to their inextinguifhable thirft for gold and for blood, whofe greedy and unfeeling men that Europe difgorged from her bofom. The bones of five millions of human beings have covered the wretched countries to which the Spaniards and Portugueze transported their avarice, their fuperfittion, and their fury. Thefe bones will plead to everlafting ages againft the doctrine of the political utility of religions, which is ftill able to find its apologifts in the world.

•

It is in this epoch only of the progress of the human mind, that man has arrived at the knowledge of the globe which ke inhabits; that he has been able to fludy, in all its countries, the species to which he belongs, modified by the continued influence of natural caufes, or focial inflitutions; that he has had an opportunity of observing the productions of the earth, or of the fea, in all temperatures and climates. And accordingly, among the happy confequences of the difcoveries in question, may be included the resources of every kind which those productions afford to mankind, and which, fo far from being exhausted, men have yet no idea of their extent; the truths which the knowledge of those objects may have added to the fciences, or the long received errors that may thereby have been deftroyed; the commercial adivity that has given new life to industry and navigation, and, by a necessary chain of connection, to all the arts and all the fciences: and lastly, the force that free nations have acquired from this activity by which to refift tyrants, and fubjected nations to break their chains, and free themfelves at least from feodal despotism. But these advantages will never explate what the difcoveries have cost to fuffering humanity, till the moment when Europe, abjuring the fordid and oppreflive fystem of commercial monopoly, shall acknowledge that men of other climates, equals and brothers by the will of nature, have never been formed to nourish the pride and avarice of

•

a few privileged nations; till, better informed refpecting its true interests, it shall invite all the people of the earth to participate in its independence, its liberty, and its illumination. Unfortunately, we have yet to learn whether this revolution will be the honourable fruit of the advancement of philosophy, or only, as we have hitherto seen, the shameful consequence of national jealoufy, and the enormous excesses of tyranny.

Till the prefent epoch the crimes of the priesthood had escaped with impunity. The cries of oppressed humanity, of violated reafon, had been stifled in flames and in blood. The spirit which dictated those cries was not extinct: but the filence occasioned by the operation of terror emboldened the priesthood to farther outrages. At last, the scandal of farming to the monks the privilege of felling in taverns and public places the expiation of fins, occasioned a new exlposion. Luther, holding in one hand the facred books, expofed with the other the right which the Pope had arrogated to himfelf of abfolving crimes and felling pardons; the infolent despotifm which he exercised over the bishops, for a long time his equals; the fraternal fupper of the primitive christians, converted, under the name of mas, into a species of magical incantation and an object of commerce; priests condemned to the crime of irrevocable celibacy; the fame cruel and fcandulous law extended to the monks and nuns with which pontifical ambition had inundated and polluted the church; all

the fecrets of the laity configned, by means of confession, to the intrigues and the passions of pries; God himself, in short, scarcely retaining a feeble share in the adorations bestowed in profusion upon bread, men, bones and statues.

9

Luther announced to the altonished multitude, that these difgusting institutions formed no part of christianity, but on the contrary were its corruption and shame; and that, to be faithful to the religion of Jefus, it was first of all necessary to abjure that of his priest. He employed equally the arms of logic and erudition, and the no less powerful weapon of ridicule. He wrote at once in German and in Latin. It was no longer as in the days of the Abigenfes, or of John Hufs, whofe doctrine, unknown beyond the walls of their churches, was fo eafily calumniated. The German books of the new apostles penetrated at the fime time into every village of the empire, while their Latin productions roused all Europe from the shameful fleep into which superstition had plunged it. Those whose reason had outstripped the reformers, but whom fear had retained in filence; those who were tormented with Secret doubts, but which they trembled to avow even to their confciences; those who, more simple, were unasquainted with all the extent of theological abfurdities; who, having never reflected upon questions of controverfy, were aftonished to learn that they had the power of chusing between different opinions; entered eagerly

-

·1·56

into these discussions, upon which they conceived depended at once their temporal interests and their cternal felicity.

All the christian part of Europe, from Sweden to Italy, and from Hungary to Spain, was in an inftant covered with the partifans of the new doctrines; and the reformation would have delivered from the yoke of Rome all the nations that inhabited it, if the miftaken policy of certain princes had not relieved that very facerdotal fceptre which had fo frequently fallen upon the heads of kings.

This policy, which their fuccessors unhappily have yet not abjured, was to ruin their states by seeking to add 'to their, and to measure their power by the extent of their territory, rather than by the number of their fubjects. Thus, Charles the fifth and Francis the first, while contending for Italy, facrificed to the interest of keeping well with the pope, that superior interest of profiting by the advantages offered by the reformation to every country that should have the wifdom to adopt it. Perceiving that the princes of the empire were favourable to opinions calculated to augment their power and their wealth, the emperor became the partifan and supporter of the old abuses, actuated by the hope that a religious war would furnish an opportunity of invading their states, and destroying their independence; while Francis imagined that, by burning the protestants, and protecting at the fame time their leaders in Germany, he

-

I 57

should preferve the friendship of the Pope, without losing his valuable alles.

But this was not their only motive. Despotism has also its instinct; and that instinct suggested to these kings, that men, after fubjecting religious prejudices to the examination of reafon, would foon extend their enquiries to prejudices of another fort; that, enlightened upon the usurpations of popes, they might with at laft to be equally enlightened upon those of princes; and that the reform of ecclefialtical abuses, beneficial as it. was to royal power, might involve the reform of abufes, still more oppressive, upon which that power was found-Accordingly, no king of any confiderable nation ed. favoured voluntarily the party of the reformers. Henry the eighth, terrified at the pontifical anathema, joined in the perfecution against them. Edward and Elizabeth, unable to embrace popery without pronouncing themfelves usurpers, estalished in England the faith and worship that approached nearest to it. The protestant monarchs of Great Britain have indeed uniformly favoured. the catholic religion, whenever it has ceafed to threaten. them with a pretender to the crown.

In Sweden and Denmark, the effablishment of the religion of Luther was confidered by their kings only as a necessary precaution to fecure the expulsion of the catholic tyrant, to whose despotishment they fucceeded; and in the Prussian monarchy, founded by a philosophical prince, we already perceive his fuccessfor unable to  $Q_{2}$ .

ï58

difguise his fecret attachment to this religion, so dear to the hearts of fovereigns.

Religious intolerance was common to every fect, and communicated itfelf to all the governments. The papifts perfecuted the reformed communions; while thefe, pronouncing anathemas against each other, joined at the fame time against the anti-trinitarians, who, more consistent in their conduct, had tried every doctrine, if not by the touchstone of reason, at least by that of an enlightened criticism, and who did not see the necessity of freeing themselves from one species of absurdity, to fall into others equally difgusting.

This intolerance ferved the caufe of popery. For

a long time there had exifted in Europe, and effectially in Italy, a clafs of men who, rejecting every kind of fuperflition, indifferent alike to all modes of worfhip, governed only by reafon, regarded religion as of human invention, at which one might laugh in fecret, but towards which prudence and policy dictated an outward refpect.

This free-thinking affumed afterwards fuperior courage; and, while in the fchools the philosophy of Ariftotle, imperfectly understood, had been employed to improve the fubtleties of theology, and render ingenious what would naturally have borne the features of abfurdity, forme men of learning established upon his true doctrine a fystem destructive of every religious idea, in which the human foul was confidered only as a faculty

that vanished with life, and in which no other providence, no other ruler of the world was admitted than the neceffary laws of nature. This fystem was combated by the Platonists, whose sentiments, refembling what has since been called by the name of deism, were more terrifying still to facerdotal orthodoxy.

But the operation of punishment foon put a stop to this impolitic boldnefs. Italy and France were polluted with the blood of those martyrs to the freedom of thought. All fects, all governments, every fpecies of authority, inimical as they were to each other in every. point else, seemed to be of accord in granting no quarter to the exercise of reason. It was necessary to cover it with a veil, which, hiding it from the observation of tyrants might still permit it to be feen by the eye of philosophy. Accordingly the most timid caution was observed respecting this secret doctrine, which had never failed of numerous adherents. It had particularly been propagated among the heads of governments, as well as among those of the church; and, about the period of the reformation, the principles of religious Machiavelifm became the only creed of princes, of ministers, and of pontiffs. These opinions had even corrupted philosophy. What code of morals indeed was to be expected from a fystem of which one of the principles. is, that it is neceffary to fupport the morality of the people by falle pretences; that men of enlightened minds have a right to deceive

eftem, provided they impose only useful truths, and to retain them in chains from which they have themselves contrived to escape?

If the natural equality of mankind, the principal basis of its rights, be the foundation of all genuine morality, what could it hope from a philosophy, of which an open contempt of this equality and these rights is a distinguishing feature? This fame philosophy has contributed no doubt to the advancement of reason, whose reign it filently prepared; but so long as it was the only philosophy, its fole effect was to substitute hypocrify in the place of fanaticism, and to corrupt, at the fame time that it raised above prejudices, those

who prefided in the definy of flates.

Philofophers truly enlightened, ftrangers to ambition, who contented themfelves with undeceiving men gradually and with caution, but without fuffering themfelves at the fame time to confirm them in their errors, thefe philofophers would naturally have been inclined to embrace the reformation: but, deterred by the intolerance that every where difplayed itfelf the majority were of opinion that they ought not to expose themfelves to the inconveniences of change, when by fo doing, they would still be fubjected to similar restraint. As they must have continued to shew a respect for absurdities which they had already rejected, they faw no mighty advantage in having the number fomewhat diminiscut, they were fearful also of exposing themselves, by their abjuration,

to the appearance of a voluntary hypocrify; and thus, by perfevering in their attachment to the old religion, they strengthened it with the authority of their reputation. The fpirit which animated the reformers did not introduce a real freedom of fentiment. Each religion, in the country in which it prevailed, had no indulgence but for certain opinions. Meanwhile, as the different creeds were opposed to each other, few opinions existed that had not been attacked or supported in some part of Europe. The new communions had befide been obliged to relax a little from their dogmatical rigour. They could not, without the groffest contradiction, confine the right of examination within the pale of their own church, fince upon this right was founded the legitimacy of their feparation. If they refused to reftore to reafon its full liberty, they at least confented that its prison fhould be less confined : the chains were not broken, but they were rendered lefs burthenfome and more permanent. In short, in those countries where a single religion had found it impracticable to oppress all the others, there was established what the infolence of the ruling fect called by the name of toleration, that is, a permission, granted by some men to other men, to believe what their reafon adopts, to do what their confcience dictates to them, to pay to their common God the homage they think belt calculated to please him: and in thefe countries the tolerated doctrines might then be vindicated with more or less freedom.

We thus fee making its appearance in Europe a fort of freedom of thought, not for men, but for christians: and, if we except France, for christians only does it any where exist to this day.

But this intolerance obliged human reafon to feek the recovery of rights too long forgotten, or which rather had never been properly known and understood.

Ashamed at seeing the people oppressed, in the very fanctuary of their confeience, by kings, the fuperstitious or political flaves of the priesthood, some generous individuals dared at length to inveffigate the foundations of their power; and they revealed this grand truth to the world : that liberty is a bleffing which cannot be alienated; that no title, no convention in favour of tyranny, can bind a nation to a particular family; that magistrates, whatever may be their appellation, their functions, or their power, are the agents, not the mafters, of the people; that the people have the right of withdrawing an authority originating in themfelves alone, whenever that authority shall be abused, or shall cease to be thought useful to the interests of the community: and laftly, that they have the right to punish, as well as to cashier their fervants.

Such are the opinions which Althusius and Languet, and afterwards Needham and Harrington, boldly professed, and investigated thoroughly.

From deference to the age in which they lived, they too often build upon texts, authorites, and exam-

ples; and their opinions appear to have been the refult of the strength of their minds, and dignity of their characters, rather than of an accurate analysis of the true principles of focial order.

Meanwhile other philosophers, more timid, contented themfelves with establishing, between the people and kings, an exact reciprocity of duties and rights, and a mutual obligation to preferve inviolate fettled conventions. An hereditary magistrate might indeed be deposed or punished, but it was only upon his having infringed this facred contract, which was not the lefs binding on his family. This doctrine, which facrificed natural right, by bringing every thing under politive inflitution, was supported both by civilians and divines. It was favourable to powerful men, and to the projects of the ambitious, as it ftruck rather at the individual who might be invested with fovereignty, than at fovereignty itfelf. For this reafon it was almost generally embraced by reformilts, and adopted as a principle in political diffentions and revolutions. Hiftory exhibits few steps of actual progress towards liberty during this epoch; but we fee more order and efficacy in governments, and in nations a ftronger and particularly a more just fense of their rights. Laws are better combined; they appear lefs frequently to be the immature and shapeless production of circumstances and caprice; they are the offspring of men of learning, if

~~/

they cannot be faid as yet to be the children of philofophy.

The popular commotions and revolutions which agitated England, France, and the republics of Italy, attracted the notice of philosophers to that branch of politics which confists in observing and predicting the effects that the conflitution, laws and establishments of a country are likely to produce upon the liberty of the people, and the prosperity, strength, independence, and form of government of the state. Some, in imitation of Plato, as More, for instance, and Hobbes, deduced from general positions the plan of an entire system of focial order, and exhibited the model towards which

it was neceffary in practice continually to approach. Others, like Machiavel, fought, in a profound inveftigation of hiftorical facts, the rules by which were to be obtained the future maftery of nations.

The fcience of political economy did not, in this epoch, exift. Princes effimated not the number of men, but of foldiers, in the flate; finance was the mere art of plundering the people, without driving them to the defperation that fhould end in revolt; and governments paid no other attention to commerce but that of loading it with taxes, of reflricting it by privileges, or of difputing for its monopoly.

The nations of Europe, occupied by the common interests that should unite, or the opposite ones that

they conceived ought to divide them, felt the necessity of observing certain rules of conduct which, independently of treaties, were to operate in their pacific intercourse; while other rules, respected even in the midst of war, were calculated to foften its ferocity, to diminish its ravages, and to prevent at least unproductive and unnecessary calamities. I refer to the science of the law of nations: but these laws unfortunately were fought, not in reafon and nature, the only authorities that independent nations may acknowledge, but in established utages and the opinions of antiquity. The rights of humanity, justice towards individuals, were less confulted, in this bufinefs, than the ambition, the pride, and the avarice of governments. In this epoch we do not observe moralists interrogating the heart of man, analyfing his faculties and his feelings, thereby to difcover his nature, and the origin, law and fanction of his duiles. On the contrary, we fee them employing all the fubtlety of the fehools to difcover, respecting actions the lawfulness of which is uncertain, the precife limit where innocence ends, and fin is to begin; to afcertain what authority has the proper degree of weight to justify the practice of any of these dubious fort of actions; to affift them in claffing fins methodically, fometimes in genus and fpecies, and fometimes according to the respective heinousness of their nature; and lastly, to mark those in particular of which the commission of one only is sufficient to merit eternal damnation,

The fcience of morals, it is apparent, could not at that time have being, fince priefts alone enjoyed the privilege of being its interpreters and judges. Meanwhile, as a fkilful mechanic, by fludying an uncouth machine, frequently derives from it the idea of a new one, lefs imperfect and truly ufeful; fo did thefe very fubtleties lead to the difcovery, or affift in afcertaining the degree of moral turpitude of actions or their motives, the order and limits of our duties, as well as the principles that *fhould determine our choice whenever thefe duties fhall* appear to clafh.

The reformation, by destroying, in the countries in which it was embraced, confession, indulgences, and monks, refined the principles of morality, and rendered even manners less corrupt. It freed them from facerdotal expiations, that dangerous encouragement to vice, and from religious celibacy, the bane of every virtue, becaufe the enemy of the domestic virtues. This epoch, more than all the reft, was blotted and disfigured with acts of attrocious cruelty. It was the epoch of religious maffacres, holy wars, and the depopulation of the new world. There we fee established, the flavery of ancient periods, but a flavery more barbarous, more productive of crimes against nature: and that mercantile avidity, trafficking with the blood of men, felling them like other commodities, having first purchafed them by treafon, robbery or murder, and dragging them from one hemisphere to be devoted in another,

. .

amidft humiliation and outrages, to the tedious punifiment of a lingering, a cruel, but infallible destruction. At the fame time hypocrify covers Europe with executions at the stake, and associations. The monster, fanaticism, maddened by the wounds it has received, appears to redouble its fury, and hastens to burn its victims in heaps, fearful that reason might be approaching to deliver them from his hands.

Meanwhile we may observe some of those mild but intrepid virtues making their appearance, which are the honour and confolation of humanity. Hiftory furnifles names which may be pronounced without a blufh. A few unfullied and mighty minds, uniting fuperior talents to the dignity of their characters, relieve, here and there, these scenes of perfidy, of corruption, and of carnage. The picture of the human race is still too dreary for the philosopher to contemplate it without extreme mortification; but he no longer defpairs, fince the dawn of brighter hopes is exhibited to his view. The march of the sciences is rapid and brilliant. The Algebraic language becomes generalized, fimplified and perfected, or rather it is now only that it was truly formed. The first foundations of the general theory of equations are laid, the nature of the folutions which they give is afcertained, and those of the third and fourth degree are refolved.

The ingenious invention of logarithms, as abridging the operations of arithmetic; facilitates the application

of calculation to the various objects of nature and art, and thus extends the fphere of all those fciences in which a numerical process is one of the means of comparing the refults of an hypothesis or theory with the actual phenomena, and thus arriving at a diffinct knowledge of the laws of nature. In mathematics, in particular, the mere length and complication of the numerical process practically confidered, bring us, upon certain occasions, to a term beyond which neither time, opportunity, nor even the firetch of our faculties, can carry us; this term, had it not been for the happy intervention of logarithms, would have also been the term beyond which fcience could never pass, or the efforts of the proudest genius

proceed.

The law of the defcent of bodies was difcovered by Galileo, from which he had the ingenuity to deduce the theory of motion uniformly accelerated, and to calculate the curve defcribed by a body impelled into the air with a given velocity, and animated by a force conftantly acting upon it in parallel directions.

Copernicus revived the true fystem of the world, fo long buried in oblivion, destroyed, by the theory of apparent motions, what the fenses had found fo much difficulty in reconciling, and opposed the extreme fimplicity of the real motions resulting from this fystem, to the complication, bordering upon absurdity, of the Ptolemean hypothesis. The motions of the planets were better understood; and by the genius of Kepler were discovered

the forms of their orbits, and the eternal laws by which those orbits perform their evolutions.

Galileo, applying to aftronomy the recent difcovery. of telescopes, which he carried to greater perfection, opened to the view of mankind a new firmament. The: fpots which he observed on the disk of the fun led him. to the knowledge of its rotation, of which he afcertained. the precife period, and the laws by which it was performaed. He demonstrated the phases of Venus, and discovered the four fatellites that farround and accompany Jupiter in his immense orbit.

He also furnished an accurate mode of measuring; time, by the vibrations of a pendulum.

Thus man owes to Galileo the first mathematical. theory of a motion that is not at once uniform and rectilinear, as well as one of the mechanical laws of na-ture; while to Kepler he is indebted for the acquisition of one of those empirical laws, the discovery of which < has the double advantage of leading to the knowldge of the mechanical law of which they express the refult, and of fupplying fuch degrees of this knowledge as man. finds himfelf yet incapable of attaining.

The difcovery of the weight of the air, and of the circulation of the blood, diffinguish the progress of experimental philosophy, born in the school of Galilco,and of anatomy, already too far advanced not to form-afeience diffinct from that of medicine,

P. 2.

Natural hiftory, and chymistry, in spite of its chimerical hopes and its enigmatical language, as well as medicine and surgery, altonish us by the rapidity of their progress, though we are frequently mortified at the sight of the monstrous prejudices which these sciences still retain.

Without mentioning the works of Gefner and Agricola containing such a fund of real information, with so flight a mixture of scientific or popular errors, we obferve Bernard de Palissi fometimes displaying to us the quarries from which we derive the materials of our edifices; fometimes masses of flone that compose our mountains formed from the skeletons of sea animals, and authentic monuments of the ancient revolutions of the globe; and fometimes explaining how the waters, raifed from the fea by evaporation, reftored to the earth by rain,: ftopped by beds of clay, affembled in fnow upon the hills, fupply the eternal streams of rivers, brooks; and fountains: while John Rei discovered those combinations of air with metallic fubstances, which gave birth to the brilliant theories by which, within a few years, the bounds of chymistry have been so much extended.

In Italy the arts of epic poetry, painting and fculpture, arrived at a perfection unknown to the ancients. In France, Corneille evinced that the dramatic art was about to acquire a still nobler elevation; for whatever fuperiority the enthusiastical admirers of antiquity may suppose, perhaps with justice, the chefs-d'œuvres of its

• • first geniuses to posses, it is by no means difficult, by comparing their works with the productions of France and of Italy, for a rational enquirer to perceive the real progress which the art itself has attained in the hands of the moderns.

The Italian language was completely formed, and in those of other nations we see the marks of their ancient barbarism continually disappearing.

Men began to feel the utility of metaphyfics and grammar, and of acquiring the art of analyfing and explaining philosophically both the rules and the processes established by custom in the composition of words and phrafes.

We every where perceive, during this epoch, reafon and authority striving for the mastery, a contest that prepared and gave promise of the triumph of the former.

This alfo was the period aufpicious to the birth of that fpirit of criticism which alone can render erudition. truly productive. It was still necessary to examine, what had been done by the ancients; but men were aware that, however they might admire, they were entitled to judge them. Reason, which sometimes imported itself upon authority, and against which authority had been so frequently employed, was defirous of appreciating the value of the affistance she might derive therefrom, as well as the motive of the factifice that was demanded of her. Those who assure authority for, the basis of their opinions, and the guide of their con-

duct, felt how important it was that they should be fure of the strength of their arms, and not expose themselves. to the danger of having them broken to pieces upon the first attack of reason.

The habit of writing only in Latin upon the fciences, philosophy, jurifprudence, and even history, with a few exceptions, gradually yielded to the practice of employing the common language of the refpective country. And here we may examine what influence upon the progress of the human mind was produced by this change, which rendered the sciences more popular, but diminished the facility with which the learned wereable to follow them in their route; which caufed a book to be read by more individuals of inferior information in. a particular country, but by fewer enlightened minds: through Europe in general; which superfeded the necesfity of learning Latin in a great number of men defirous of instruction, without having the leifure or the means of founding the depths of erudition, but at the fame time: obliged the philosopher to confume more time in acquiring a knowledge of different languages... We may flow that, as it was impossible to make the Latin a vulgar tongue common to all Europe, the: continuance of the cultom of writing in it upon the: scienecs would have been attended with a transient: advantage only to those who studied them; that the existence of a fort of scientific language among the, learned of all nations, while the people of each indivi-

· ·

dual nation fpoke a different one, would have divided men into two claffes, would have perpetuated in the people prejudices and errors, would have placed an infurmountable impediment to true equality, to an equal use of the fame reason, to an equal knowledge of neceflary truths; and thus by stopping the progress of the mass of mankind, would have ended at last, as in the East, by putting a period to the advancement of the sciences themselves.

For a long time there had been no inftruction but in churches and cloifters.

The univerfities were still under the domination of the priefts. Compelled to refign to the civil authority a part of their influence, they retained it without the finallest defalcation, so far as related to the early instruction of youth, that instruction which is equally fought in all professions, and among all classes of mankind. Thus they pesses of the fost and flexible mind of the child, of the boy, and directed at their pleasure the first unfinished thoughts of man. To the fecularpower they left the fuperintendence of those studies which had for their object jurisforudence, medicine, so ficientifical analysis, literature and the humanities, the schools of which were less numerous, and received no pupils who were not already broken to the facerdotal yoke.

In reformed countries the clergy lost this influence. The common instruction, however, though dependent

on the government, did not ceafe to be directed by a theological fpirit; but it was no longer confined to members of the pricfthood. It ftill corrupted the minds of men by religious prejudices, but it did not bend them to the yoke of facerdotal authority; it ftill made fanatics, visionaries, fophist, but it no longer formed slaves for fuperstition.

Meanwhile education, being every where subjugated had corrupted every where the general understanding; by clogging the reafon of children with the weight of the religious prejudices of their country, and by stiffing in youth, deftined to a fuperior course of instruction, the fpirit of liberty by means of political prejudices. Left to himfelf, every man not only found between him and truth a close and terrible phalanx of the errors. of his country and age, but the most dangerous of those errors were in a manner already rendered perfonal to him. Before he could diffipate the errors of another, it was neceffary he should begin with afcertaining his own; before he combated the difficulties opposed by nature to the difcovery of truth, his understanding, fo to speak, was obliged to undergo a thorough repair. Instruction at this period conveyed fome knowledge; but to render it useful, the operation of refining must take place, to separate it from the drofs in which superstition and tyranny together had contrived to bury it.

We may show what obstacles, more or less powerful, these vices of education, those religious and contradictory

creeds, that influence of the different forms of government, oppofed to the progrefs of the human mind. It will be feen that this progrefs was by fo much the flower and unequal, in proportion as the objects of fpeculative enquiry intimately affected the flate of politics and religion; that philofophy, in its most general fenfe, as well as metaphysics, the truths of which were in direct hostility to every kind of fuperstition, were more obstinately retarded than political enquiry itself, the improvement of which was only dangerous to the authority of kings and aristocratic affemblies; and that the fame obfervation will equally apply to the fcience of material nature.

We may farther develope the other fources of this

inequality, as they may be traced in the objects of which each fcience treats, and the methods to which it has recourfe.

In the fame manner the fources of inequality and counteraction, which operate refpecting the very fame Icience in different countries, are alfo the joint effect of political and natural caufes. We may enquire, in this inequality, what it is that is to be afcribed to the different modes of religion, to the form of government, to the wealth of any nation, to its political importance, to its perfonal character, to its geographical fituation, to the events and vicifitudes it has experienced, in fine, to the accident which has produced in the midft of it any of those extraordinary men, whose influence, while

it extends over the whole human race, exercises itself with a double energy in a more restrained sphere.

We may diffinguish the progress of each science as it is in itself, which has no other limit than the number of truths it includes within its sphere, and the progress of a nation in each science, a progress which is regulated first by the number of men who are acquainted with its leading and most important truths, and next by the number and nature of the truths so known.

In fine, we are now come to that point of civilization, at which the people derive a profit from intellectual knowledge, not only by the fervices it reaps from men uncommonly instructed, but by means of having made of intellectual knowledge a fort of patrimony, and employing it directly and in its proper form to refift error, to anticipate or fupply their wants, to relieve themfelves from the ills of life, or take off the poignancy of these ills by the intervention of additional pleafure. The hiftory of the perfecutions to which the champions of liberty were exposed, during this epoch, ought not to be forgotten. These perfecutions will be found to extend from the truths of philosophy and politics to those of medicine, natural history and astronomy. In the eighth century an ignorant pope had perfected a deacon for contending that the earth was round, in opposition to the opinion of the rhetorical Saint Auslin. In the feventeenth, the ignorance of another pope, much more inexcuseable, delivered Galileo into the

`177

hands of the inquifition, accufed of having proved the diurnal and annual motion of the earth. The greateft genius that modern Italy has given to the fciences, overwhelmed with age and infirmities, was obliged to purchafe his releafe from punifhment and from prifon, by afking pardon of God for having taught men better to understand his works, and to admire him in the fimplicity of the eternal laws by which he governs the universe.

Meanwhile, fo great was the abfurdity of the theologians, that, in condescension to human understanding, they granted a permission to maintain the motion of the earth, at the fame time that they infifted that it should be only in the way of an hypothesis, and that the faith should receive no injury. The astronomers, on the other hand, did the exact opposite of this; they treated the motion of the earth as a reality, and fpoke of its immoveablenefs with a deference only hypothetical. The transition from the epoch we have been confidering to that which follows, has been diffinguished by three extraordinary perfonages, Bacon, Galileo, and Defcartes. Bacon has revealed the true method of fludying nature, by employing the three inftruments withwhich she has furnished us for the discovery of her fecrets, observation, experiment and calculation. He was desirous that the philosopher, placed in the midst of the universe, should, as a first and necessary step in his career, renounce every creed he had received, and even every notion he had formed, in order to create, as it

-

were, for himfelf, a new understanding, in which no idea should be admitted but what was precise, no opinion ; but what was just, no truth of which the degree of cer-.tainty or probability had not been fcrupuloufly weighed. But Bacon, though possessing in a most eminent degree the genius of philosophy, added not thereto the genius of the sciences; and these methods for the discovery of truth, of which he furnished no example, were admired by the learned, but produced no change in the march of the fciences.

Galileo had enriched them with the most useful and brilliant discoveries; he had taught by his own example the means of arriving at the knowledge of the laws of nature in a way fure and productive, in which men were not obliged to facrifice the hope of fuccefs to the fear of being milled. He founded the first fchool in which the fciences have been taught without a mixture of fuperflition, prejudice, or authority; in which every other means than experiment and calculation have been rigoroully proferibed; but confining himfelf exclusively to the mathematical and physical sciences, he was unable to communicate to the general mind that impulsion which it feemed to want.

This honour was referved for the daring and ingenious Descartes. Endowed with a master genius for the fciences, he joined example to precept, in exhibiting the method of finding and afcertaining truth. This method he applied to the difcovery of the laws of dioptrics, of the collifion of bodies, and finally of a new

1

Branch of mathematical science, calculated to extend and enlarge the bounds of all the other branches.

He wished to extend his method to every object of human intelligence; God, man, the universe, were in turn the fubject of his meditations. If, in the physical fciences, his march be less fure than that of Galileo, if his philosophy be less wary than that of Bacon, if he may be accused of not having sufficiently availed himfelf of the lessons of the one, and the example of the other, to diffrust his imagination, to interrogate nature by experiment alone, to have no faith but in calculation, to observe the universe, instead of instructing it, to study man instead of truiting to vague conjectures for a knowledge of his nature; yet the very boldnefs of his errors was infirumental to the progress of the human species. He gave activity to minds which the circumfpection of his rivals could not awake from their lethargy. He called upon men to throw off the yoke of authority, to acknowledge no influence but what reafon should avow : and he was obeyed, becaufe he subjected by his daring, and fascinated by his enthusiasm. The human mind was not yet free, but it knew that it was formed to be free. Those who perfilted in the desire of retaining it in its fetters, or who attempted to forge new ones, were under the necessity of proving that they ought to be imposed or retained, and it requires little penetration to forefee that from that period they would foon be broken in pieces.

•

- ·

### NINTH EPOCH.

From the Time of Descarles, to the Formation of the French Republic.

WE have feen human reafon forming itfelf flowly by the natural progrefs of civilization; fuperflition usurping dominion over it, thereby to corrupt it, and defpotifm degrading and stupefying the mental faculties by the operation of fear, and actual infliction of calamity.

One nation only escaped for a while this double influence. In that happy land, where liberty had kindled the torch of genius, the human mind, freed from the trammels of infancy, advanced towards truth with a firm and undaunted step. But conquest foon introduced tyranny, fure to be followed by superstition, its infeparable companion, and the whole race of man was re-plunged into darkness, destined, from appearance, to be eternal. The dawn, however, at length was observed to peep; the eyes, long condemned to obscurity, opened and shut their lids, inuring themselves gradually till they could gaze at the light, and genius

Υ

dared once again to shine forth upon the globe, from which, by fanaticism and barbarity, it so long had been banished.

We have feen reafon revolting at, and fhaking off part of its chains, and by the continual acquifition of new ftrength preparing and haftening the epoch of its liberty.

We have now to run through the period in which it compleated its emancipation; in which, fubjected still to a degree of bondage, it throws off, one by one, the remainder of its fetters; in which, free at length to purfue its course, it can no longer be stopped but by those obstacles, the occurrence of which is inevitable. upon every new progefs, as being the refult of the conformation of the mind itself, or of the connection which nature has established between our means of discovering truth, and the obflacles she opposes to our efforts. Religious intolerance had obliged feven of the Belgic provinces to throw off the yoke of Spain, and to form themselves into a federal republic. The fame cause had revived in England a spirit of liberty, which, tired of long and fanguinary commotions, fat down at last contented with a constitution, admired for a while by philosophers, but having at prefent no other support than national fuperfition and political hypocrify.

To facerdotal perfecution is it likewife to be afcribed that the Swedes had the fortitude to regain a portionof their rights.

- ·

2

Meanwhile, amidst the commotions occasioned by theological contest, France, Spain, Hungary and Bohemia faw the feeble remains of their liberty, or of what, at least, bore the semblance of liberty, totally vanish from their fight.

Even in countries faid to be free, it is in vain to look for that freedom which violates none of the natural rights of man, and which fecures their indefeasible possession and uncontrouled exercise. On the contrary, the liberty existing there, founded upon a positive right unequally shared, confers upon an individual prerogatives greater or lefs according to the town which he inhabits, .the class in which he is born, the fortune he possesses, or the trade he may exercise; and a concise picture of these fantastical distinctions in different nations, will furnish the best answer to those men who are still disposed to vindicate the advantage and neceffity of them. In these countries, however, civil and personal liberty are guaranteed by the laws. If man be not all that he ought to be, still the dignity of his nature is not totally degraded; some of his rights are at least acknowledged; it can no longer be faid of him that he is a flave, but only that he does not yet know how to become truly free.

In nations among whom, during the fame period, liberty may have incurred loffes more or lefs real, fo reftricted were the political rights enjoyed by the generality of the people, that the annihilation of the arifto-

eracy, almost despotic, under which they had groaned, feems to have been more than a compensation. They have lost the title of citizen, which inequality had nearly rendered illusory; but the quality of man has been more respected, and royal despotism has faved them from a state of feodal oppression, an oppression for much the more painful and humiliating, as the number and prefence of the tyrants are continually reviving the fentiment of it.

1.8.3

In nations partially free the laws muft neceffarily have improved, becaufe the interefts of those who hold therein the reins of power, are not in all cafes at variance with the general interests of the people; and they must also have improved in despotic states, either becaufe the interest of the public prosperity is sometimes confounded with that of the despot, or because, seeking to destroy the remains of authority in the nobles or the clergy, the despot himself thereby communicates to the laws a spirit of equality, of which the motive indeed was the establishment of an equality of flavery, but which has often been attended with falutary confequences.

We may here minutely explain the caufes which have produced in Europe that fpecies of defpotifm, of which neither the ages that preceded, nor the other quarters of the world, have furnished an example; a defpotifm almost abfolute, but which, restrained by opinion, influenced by the state of knowledge, and tempered in a manner by its own interest, has frequently contributed

•

to the progress of wealth, industry, instruction, and sometimes even to that of civil liberty.

The manners of men were meliorated by the mere decay of those prejudices which had kept alive their ferocity, by the influence of commerce and industry, the natural enemies of disorder and violence, from which wealth takes it flight, by the fear and terror occafioned by the recollection, still recent, of the barbarities of the preceding period, by a more general diffusion of the philosophical ideas of justice and equality, and lastly by the flow but fure effect of the progress of mental illumination.

Religious intolerance still survived; but it was:

merely in the way of precaution, as a homage to the prejudices of the people, or as a fafeguard against their inconstancy. It had lost its fiercest features. Executions at the stake, feldom reforted to, were replaced by other modes of directing religious opinions, which, if they frequently proved more arbitrary, were however less barbarous, till at length perfecution appeared only at intervals, and refulted chiefly from the inveteracy of former habit, or from temporary weakness and complaifance.

In every nation; and upon every fubject, the policy of government followed the fteps not only of opinion, but even of philosophy; it was however flowly, and with a fort of reluctance: and we shall always find that, in proportion as there exists a confiderable distance between ;

the point at which men of profound meditation arrive in the fcience of politics and morals, and that attained by the generality of thinking men, whofe fentiments, when imbibed by the multitude, form what is called the public opinion, fo thofe who direct the affairs of a nation, whatever may be its form of government, are uniformly feen below the level of this opinion; they walk in its path, they purfue its courfe; but it is with fo fluggifh a pace, that, fo far from outftripping, they never come up with it, and are always behind by a confiderable number of years, and by a portion, no lefs confiderable, of truths.

And now we arrive at the period when philofophy, the moft general and obvious effects of which we have before remarked, obtained an influence on the thinking clafs of men, and thefe on the people and their governments, that, ceafing any longer to be gradual, produced a revolution in the entire mafs of certain nations, and gave thereby a fecure pledge of the general revolution one day to follow that shall embrace the whole human species. After ages of error, after wandering in all the mazes of vague and defective theories, writers upon politics and the law of nations at length arrived at the knowledge of the true rights of man, which they deduced from this simple principle: that he is a being endowed with fenfation, capable of reasoning upon and understanding his interests, and of acquiring moral ideas.

They faw that the maintenance of his rights was the only object of political union, and that the perfection of the focial art confifted in preferving them with the moft entire equality, and in their fullest extent. They perceived that the means of fecuring the rights of the individual, confisting of general rules to be laid down in every community, the power of choosing these means, and determining these rules, could vess only in the majority of the community: and that for this reason, as it is impossible for any individual in this choice to follow the dictates of his own understanding, without subjecting that of others, the will of the majority is the only prineiple which can be followed by all, without infringing mpon the common equality.

Each individual may enter into a previous engagement to comply with the will of the majority, which by this engagement becomes unanimity; he can however bind nobody but himfelf, nor can he bind himfelf except fo far as the majority fhall not violate his individual rights, after having recognifed them.

Such are at once the rights of the majority over individuals, and the limits of these rights; such is the origin of that unanimity, which renders the engagement of the majority binding upon all; a bond that ceases to operate when, by the change of individuals, this species of unanimity ceases to exist. There are objects, no doubt, upon which the majority would pronounce perhaps oftener in favour of error and mischief, than in

favour of truth and happinefs; still the majority, and the majority only, can decide what are the objects which cannot properly be referred to its own decision; it can alone determine as to the individuals whose judgment it refolves to prefer to its own, and the method which these individuals are to purfue in the exercise of their judgment; in fine, it has also an indispensible authority of pronouncing whether the decisions of its officers have or have not wounded the rights of all.

From these simple principles men discovered the folly of former notions respecting the validity of contracts between a people and its magistrates, which it was suppofed could only be annulled by mutual confent, or by a violation of the conditions by one of the parties; as well as of another opinion, less fervile, but equally abfurd, that would chain a people for ever to the provifions of a conflitution when once established, as if the right of changing it were not the fecurity of every other right, as if human institutions, necessarily defective, and capable of improvement as we become enlightened, were to be condemned to an eternal monotony. Accordingly the governors of nations faw themselves obliged to renounce that falle and fubtle policy, which, forgetting that all men derive from nature an equality of rights, would fometimes measure the extent of those which it might think proper to grant by the fize of territory, the temperature of the elimate, the national character, the wealth of the people, the state of commerce

Ъ.

• 5

14

and industry; and sometimes cede them in unequal portions among the different classes of fociety, according to their birth, their fortune, or their profession, thereby creating contrary interests and jarring powers, in order afterwards to apply correctives, which, but for these institutions, would not be wanted, and which, after all, are inadequate to the end.

It was now no longer practicable to divide mankind into two species, one destined to govern, the other to obey, one to deceive, the other to be dupes: the doctrine was obliged univerfally to be acknowledged, that all have an equal right to be enlightened refpecting their interests, to share in the acquisition of truth, and that no

political authorities appointed by the people for the benefit of the people, can be entitled to retain them in ignorance and darknefs.

These principles, which were vindicated by the generous Sydney, at the expence of his blood, and to which Locke gave the authority of his name, were afterwards developed with greater force, precifion, and extent by Rouffeau, whose glory it is to have placed them among those truths henceforth impossible to be forgotten or difputed.

Man is subject to wants, and he has faculties to provide for them; and from the application of these faculties, differently modified and distributed, a mais of wealth is derived, destined to supply the wants of the community. But what are the principles by which the

formation or allotment, the prefervation or confumption, the increase or diminution of this wealth is governed? What are the laws of that equilibrium between 'the wants and refources of men which is continually tending to establish itself; and from which refults, on the one hand, a greater facility of providing for those wants, and of confequence an adequate portion of general felicity, when wealth increases, till it has reached its higheft degree of advancement; and on the other, as wealth diminishes, greater difficulties, and of confequence proportionate mifery and wretchednefs, till abstinence or depopulation shall have again restored the balance; How, in this aftonishing multiplicity of labours and their produce, of wants and refources; in this alarming, this terrible complication of interests, which connects the sublistence and well-being of an obscure individual with the generalfystem of focial existence, which renders him dependent on all the accidents of nature and every political event, and extends in a manner to the whole globe his faculty of experiencing privations or enjoyments; how is it that, in this feeming chaos, we still perceive, by a general law of the moral world, the efforts of each individual for himfelf conducing to the good of the whole, and, notwithstanding the open conflict of inimical interrefts, the public welfare requiring that each should und erstand his own interch, and be able to purfue it freely and uncontrouled? 215

•

٠,

Hence it appears to be one of the rights of man that he fhould employ his faculties, difpofe of his wealth, and provide for his wants in whatever manner he fhall think beft. The general interest of the fociety, fo far from restraining him in this respect, forbids, on the contrary, every such attempt; and in this department of public administration, the care of securing to every man the rights which he derives from nature, is the only found policy, the only controul which the general will can exercise over the individuals of the community.

But this principle acknowledged, there are still duties incumbent upon the administrators of the general will, the fovereign authority. It is for this authority to establish the regulations which are destined to afcertain, in exchanges of every kind, the weight, the bulk, the length, and quantity of things to be exchanged. It is for this authority to ordain a common standard of valuation, that may apply to all commodities and facilitate the calculation of their valuations and comparison, and which, bearing itself an intrinsic value, may be employed in all cafes as the medium of cxchange; a regulation without which commerce, reftrained to the mere operations of barter, cannot acquire the necessary aclivity. The growth of every year prefents us with a superą. erogatory value, which is deflined neither to remunerate the labour of which this growth is the fruit, nor to fupply the flock which is to fecure an equal and more abun-

dant growth in time to come. The possessor of this supererogatory value does not owe it immediately to his labour, and possessit independently of the daily and indifpenfible use of his faculties for the fupply of his wants. This supercrogatory growth is therefore the ftock to which the fovereign authority may have recourfe without injuring the rights of any, to supply the expences which are requisite for the fecurity of the state, its intrific tranquillity, the prefervation of the rights of all the exercise of the authorities instituted for the establithment or administration of law, in fine of the maintenance through all its branches of the public prosperity. There are certain operations, establishments, and inflitutions, beneficial to the community at large, which it is the 'office of the community to introduce, direct, and fuperintend, and which are calculated to fupply the defects of perfonal inclination, and to parry the ftruggle of opposite interests, whether for the improvement of agriculture, industry, and commerce; or to prevent or diminish the evils entailed on our nature, or those which accident is continually accumulating upon us. Till the commencement of the epoch we are now confidering, and even for fome time after, these objects had been abandoned to chance, to the rapacity of governments, to the artifices of pretenders, or to the prejudices and partial interests of the powerful classes of fociety; but a disciple of Descartes, the illustrious and unfortunate John de Witt, perceived how necessary it

•

was that political economy, like every other fcience, should be governed by the principles of philosophy and subjected to the rules of a rigid calculation.

It made however little progrefs, till the peace of Utrecht promifed to Europe a durable tranquillity. From this period, neglected as it had hitherto been, it became a fubject of almost general attention; and by Stuart, Smith, and particularly by the French economist, it was fuddenly elevated, at least as to precision and purity of principles, to a degree of perfection, not to have been expected after the long and total indifference which had prevailed upon the fubject.

The caufe however of fo unparalleled a progrefs is chiefly to be found in the advancement of that branch of philosophy comprehended in the term metaphysics, taking the word in its most extensive signification.

Defcartes had reflored this branch of philosophy to the dominion of reason. He perceived the propriety of deducing it from those simple and evident truths which are revealed to us by an investigation of the operations of the mind. But scarcely had he discovered this principle than his eager imagination led him to depart from it, and philosophy appeared for a time to have refumed its independence only to become the prey of new errors. At length Locke made himself master of the proper clew. He shewed that a precise and accurate analysis of ideas, reducing them to ideas earlier in their origin or more simple in their structure, was the only means

to avoid the being loft in a chaos of notions incomplete, incoherent, and undetermined, diforderly becaufe fuggested by accident, and afterwards entertained without reflecting on their nature.

He proved by this analyfis, that the whole circle of our ideas refules merely from the operations of our intellect upon the fenfations we have received, or more accurately fpeaking, are compounded of fenfations offering themfelves fimultaneoufly to the memory, and after fuch a manner, that the attention is fixed and the perception bounded to a particular branch or view of the fenfations themfelves.

He shewed that by taking one single word to repre-

fent one fingle idea, properly analifed and defined, we are enabled to recal conftantly the fame idea, that is, the fame fimultaneous refult of certain fimple ideas, and of confequence can introduce this idea into a train of reafoning without rifk of mifleading ourfelves.

On the contrary, if our words do not represent fixed and definite ideas, they will at different times fuggest different ideas to the mind and become the most fruitful source of error.

In fine, Locke was the first who ventured to preferibe the limits of the human understanding, or rather to determine the nature of the truths it can afcertain and the objects it can embrace.

It was not long before this method was adopted by philosophers in general, in treating of morals and poli-R, z:

•

tics, by which a degree of certainty was given to those feiences little inferior to that which obtained in the natural feiences admitting only of fuch conclusions as could be proved, feparating these from doubtful notions, and content to remain ignorant of whatever is out of the reach of human comprehension.

In the fame manner, by analyfing the faculty of experiencing pain and pleafure, men arrived at the origin of their notions of morality, and the foundation of those general principles which form the necessary and immutable laws of justice; and confequently discovered the proper motives of conforming their conduct to those laws, which, being deduced from the nature of our feeling, may not improperly be called our moral conflitution. The fame fystem became, in a manner, a general. inftrument of acquiring knowledge. It was employed. to afcertain the truths of natural philosophy, to try the facts of history, and to give laws to taste. In a word, the procefs of the human mind in every species of enquiry was regulated by this principle; and it is this latest effort of fcience which has placed an everlasting barrier. between the human race and the old mistakes of its infancy, that will for ever preferve us from a relapfe into. former ignorance, since it has prepared the means of undermining not only our present errors, but all those by which they may be replaced, and which will fucceed each other only to possels a seeble and temporary influ-

ence.

In Germany, however, a man of a vaft and profound genius laid the foundations of a new theory. His bold and ardent mind difdained to reft on the suppositions of a modest philosophy, which left in doubt those great questions of spiritual existence, the immortality of the foul, the free will of man and of God, and the existence of vice and mifery in a world framed by a being whole infinite wildom and goodnels might be supposed to banish them from his creation. Leibnitz cut the knot which a timid fystem had in -vain attempted to unloofe. He supposed the universe to be composed of atoms, which were fimple, eternal, and equal in their nature. He contended that the relative fituation of each of these atoms, with respect to every other, occafioned the qualities diffinguishing it from all others; the human foul, and the minutest particle of a mass of stone, being each of them equally one of these atoms, differing only in confequence of the refpective places they. occupy in the order of the universe. He maintained that, of all the possible combinations which could be formed of these atoms, an infinitely wife being had preferred, and could not but prefer, the most perfect; and that if, in that which exifis, we are afflicted with the presence of vice and misery, still there is no other possible combination that would not be productive of greater evils.

Such was the nature of this theory, which, supported by the countrymen of Leibnitz, retarded in that

•

part of the world the progress of philosophy. Meanwhile there flarted up in England an entire fect, who embraced with zeal, and defended with eloquence, the scheme of optimism: but, less acute and profound than Leibnitz, who founded his fystem upon the supposition of its being impossible, from his very nature, that an allwife being should plan any other universe than that which was best, they endeavoured to discover in the terraqueous part of the world the proofs of this perfection, and losing thereby the advantages which attach to this fystem confidered generally and in the abstract, they frequently fell into absurd and ridiculous reasonings.

Meanwhile, in Scotland, other philosophers, not-

perceiving that the analysis of the development of our actual faculties led to a principle which gave to the morality of our actions a basis fufficiently folid and purc, attributed to the human foul a new faculty, diffinct from those of fensation and reason, tho' at the fame time combining itself with them; of the existence of which they could advance no other proof, than that it was impossible to form a consistent theory without it. In the history of these opinions it will be seen, that, while they have proved injurious to the progress of philosophy itself, they have tended to give a more rapid and extensive fpread to ideas truly scientific, connected with philosophy.

Hitherto we have exhibited the flate of philosophy: only among men by whom it has in a manner been fludi-

₽

cd, inveftigated, and perfected. It remains to mark its influence on the general opinion, and to flow, that, while it arrived at the certain and infallible means of difcovering and recognifing truth, reafon at the fame time detected the delutions into which it had fo often been led by a refpect for authority or a mifguided imagination, and undermined those prejudices in the mass of individuals which had so long been the fcourge, at once corrupting and inflicting calamity upon the human species.

The period at length arrived when men no longer feared openly to avow the right, fo long withheld, and even unknown, of subjecting every opinion to the telt of reason, or, in other words, of employing, in their fearch after truth, the only means they poffels for its difcovery. Every man learned, with a degree of pride and exultation, that nature had not condemned him to fee with the eyes and to conform his judgment to the caprice. of another. The fuperstitions of antiquity accordingly. difappeared; and the debafement of reason to the shrine of fupernatural faith, was as rarely to be found in fociety. as in the circles of metaphysics and philosophy. A class of men speedily made their appearance in Europe, whole object was lefs to difcover and investigate truth, than to diffeminate it; who, purfuing prejudice. through all the haunts and afylums in which the clergy, the schools, governments, and privileged corporations had placed and protected it, made it their glory rather. to eradicate popular errors, than add to the flores of hu-

manknowledge; thus aiding indirectly the progress of mankind, but in a way neither less arduous, nor less beneficial,

In England, Collins and Bolingbroke, and in France, Bayle, Fontenelle, Montesquieu, and the refpective disciples of these celebrated men, combated on the fide of truth with all the weapons that learning, wit and genius, were able to furnish; assuming every shape, employing every tone, from the fublime and pathetic topleafantry and fatire, from the most laboured investigation to an interesting romance or a fugitive effay: accommodating truth to those eyes that were too weak to bear its effulgence; artfully carefling prejudice, the more cafily to ftrangle it; never aiming a direct blow at errors, never attacking more than one at a time, nor even that one in all its fortresses; sometimes soothing the enemies of reason, by prétending to require in religion but a partial toleration, in politics but a limited freedom; fiding with despotism, when their hostilities were directed against the priesthood, and with priests when their object was to unmalk the despot; fapping the principle of both these pests of human happiness, striking at the root of both these baneful trees, while apparently wishing for the reform only of glaring abuses and feemingly confining themselves to lopping off the exuberant branches; fometimes representing to the partifan's of liberty, that superstition, which covers despotism as with a coat of mail, is the first victim which ought to be facrificed, the first chain that ought to be broken; and fometimes.

-

denouncing it to tyrants as the true enemy of their power, and alarming them with recitals of its hypocritical confairacies and its fanguinary vengeance. Thefe writers, meanwhile, were uniform in their vindication of freedom of thinking and freedom of writing, as privileges upon which depended the falvation of mankind. They declaimed, without ceffation or wearinefs, against the crimes both of fanatics and tyrants, exposing every feature of severity, of cruelty, of oppression, whether in religion, in administration, in manners, or in laws; commanding kings, foldiers, magistrates and priests, in the name of truth and of nature, to respect the blood of mankind; calling upon them, with energy, to answer for the lives still profusely facrificed in the field of battle or by the infliction of punishments, or else to correct this inhuman policy, this murderous infeafibility; and lastly, in every place, and upon every occasion, rallying the friends of mankind with the cry of reason, toleration, and humanity. Such was this new philosophy. Accordingly to those numerous classes that exist by prejudice, that live upon error, and that, but for the credulity of the people, would be powerless and extinct, it became a common object of detellation. It was every where received, and every where perfecuted, having kings, priefts, nobles and magistrates among the number of its friends as well as of its enemies. Its leaders, however, had almost always the art to elude the pursuits of vengeance,

while they exposed themselves to hatred; and to forcent themselves from perfecution, while at the fame time they functionally different themselves not to lose the laurels of their glory.

It frequently happened that a government rewarded them with one hand, and with the other paid their enemies for calumniating them; proferibed them, yet was proud that fortune had honoured its dominions with their birth; punifhed their opinions, and at the fame time would have been assumed not to be supposed a convert thereto.

•

These opinions were shortly embraced by every enlightened mind. By fome they were openly avowed, by others concealed under an hypocrify more or lefs apparent, according to the timidity or firmness of their characters, and accordingly as they were influenced by the contending interests of their profession or their vanity. At length the pride of ranging on the fide of erudition became predominant; and fentiments were professed with the flightest caution, which, in the ages that preceded, had been concealed by the most profound diffimulátion. Look to the different countries of Europe into which, from the prevalence of the French language, become almost universal, it was impossible for the inquisitorist spirit of governments and priests to prevent this philosophy from penetracing, and we shall fee how rapid was its progrefs. Meanwhile we cannot overlook how

#### 20I

artfully tyranny and fuperflition employed against it all the arguments invented to prove the weakness and fallibility of human judgment, all the motives which the knowledge of man had been able to fuggest for mistrusting his fenses, for doubting and forutinizing his reason; thus converting scepticism itself into an instrument by which to aid the cause of credulity.

This admirable system, so simple in its principles, which confiders an unrestricted freedom as the furest encouragement to commerce and industry, which would free the people from the destructive pestilence, the humiliating yoke of those taxes apportioned with fo great inequality, levied with so improvident an expence, and often attended with circumstances of fuch attrocious barbarity, by fublituting in their room a mode of contribution at once equal and just, and of which the burthen would scarcely be feit; this theory, which connects the power and wealth of a flate with the happiness of individuals and a refpect for their rights, which unites by the bond of a common felicity the different classes into which focieties naturally divide themselves; this benevolent idea of a fraternity of the whole human race, of which no national interest shall ever more intervene to disturb the harmony; these principles, so attractive from the generous spirit that pervades them, as well as from their fimplicity and comprehension, were propagated with enthaliasm by the French economist.

٠

The fuccefs of thefe writers was lefs rapid and lefs general than that of the philofophers; they had to combat prejudices more refined, errors more fubtle. Frequently they were obliged to enlighten before they could undeceive, and to inftruct good fenfe before they could venture to appeal to it as their judge.

If, however, to the whole of their doctrine they gained but a finall number of converts; if the general nature and inflexibility of their principles were difcouraging to the minds of many; if they injured their caufe by affecting an obfcure and dogmatical flyle, by too much poftponing the interefits of political freedom to the freedom of commerce, and by infifting too magiflerially upon certain branches of their fyftem, which they had not fufficiently inveftigated; they neverthelefs fucceeded in rendering odious and contemptible that daftardly, that bafe and corrupt policy which places the profperity of a nation in the fubjection and impoverifhment of its neighbours, in the narrow views of a code of prohibitions, and in the petty calculations of a tyrannical revenue.

But the new truths with which genius had enriched philosophy and the science of political economy, adopted in a greater or less degree by men of enlightened underscandings, extended still farther their falutary influence.

The art of printing had been applied to fo many fugjeas, books had forapidly increased, they were fo admirably adapted to every tafte, every degree of information, and

every fituation of life, they afforded to eafy and frequently fo delightful an inftruction, they had opened to many doors to truth, which it was impossible ever to close again, that there was no longer a class or profession of mankind from whom the light of knowledge could absolutely be excluded. Accordingly, though there still remained a multitude of individuals condemned to a forced or voluntary ignorance, yet was the barrier between the enlightened and unenlightened portion of mankind nearly effaced, and an infensible gradation occupied the fpace which feparates the two extremes of genius and stupidity.

Thus there prevailed a general knowledge of the

natural rights of man; the opinion even that thefe rights are inalienable and impreferiptible; a decided partiality for freedom of thinking and writing; for the enfranchifement of industry and commerce; for the melioration of the condition of the people; for the repeal of penal statutes against religious nonconformists; for the abolition of torture and barbarous punishments; the defire of a milder fystem of criminal legislation; of a jurifprudence that should give to innocence a complete fecurity; of a civil code more simple, as well as more conformable to reason and justice; indifference as to systems of religion, considered at length as the offspring of superfition, or ranked in the number of political inventions; hatred of hypocrify and fanaticism; contempt for prejudices; and lastly, a zeal for the propagation of truth;

-

These principles, passing by degrees from the writings of philosophers into every class of society whose instruction was not confined to the catechism and the scriptures, became the common creed, the symbol and type of all men who were not idiots on the one hand, or, on the other, affertors of the policy of Machiavelism. In some countries these fentiments formed so nearly the general opinion, that the mass even of the people seemed ready to obey their dictates and act from their impulse.

The love of mankind, that is to fay, that active compassion which interests itself in all the afflictions of the human race, and regards with horror whatever, in public inflitutions, in the acts of government, or the purfuits of individuals, adds to the inevitable misfortunes of nature, was the necessary refult of these principles. It breathed in every work, it prevailed in every converfation, and its benign effects were already visible even in the laws and administration of countries subject to defpotifm. The philosophers of different nations embracing, in their meditations, the entire interests of man, without distinction of country, of colour, or of fect, formed, notwithstanding the difference of their fpeculative opinions, a firm and united phalanx against every defcription of error, every species of tyranny. Animated by the fentiment of universal philanthropy, they declaimed equally against injustice, whether existing in a foreign country, or exercised by their own country against a

foreign nation. They impeached in Europe the avidity which stained the shores of America, Africa, and Asia: with cruelty and crimes. The philosophers of France and England gloried in affaming the appellation, and fulfilling the duties, of *friends* to those very negroes whom their ignorant oppreffors difdained to rank in the class of men. The French writers bestowed the tribute of their praife on the toleration granted in Russia and Sweden, while Beccaria refuted in Italy the barbarous maxims of Gallic jurifprudence. The French alfo endeavoured to open the eyes of England respecting her commercial prejudices, and her fuperstitious reverence for the errors of her constitution; while the virtuous Howard remonstrated at the fame time with the French upon the cool barbarity which facrificed formany human victims in their prifons and hospitals. Neither the violence nor the corrupt arts of government, neither the intolerance of priest, nor even the prejudices of the people themselves, possessed any longer the fatal power of fupprelling the voice of truth; and nothing remained to forcen the enemies of reafon, or the oppreffors of liberty, from the fentence which was about to be pronounced upon them, by the unanimous fuffrage of Europe.

While the fabric of prejudice was thus tottering to its foundations, a fatal blow was given to it by a doctrine, of which Turgot, Price, and Priestley were the first and most illustricus advocates; it was the doctrine of  $S_2$ 

the infinite perfectibility of the human mind. The confideration of this opinion will fall under the tenth divifion of our work, where it will be developed with fufficient minutenels. But we shall embrace this opportunity of exposing the origin and progress of a false fystem of philosophy, to the overthrow of which the doctrine of the perfectibility of man is become fo necessary.

The fophiftical doctrine ro which I allude, derived its origin from the pride of some men, and the felfishnels of others. Its real, though concealed object, was to give duration to ignorance, and to prolong the reignof prejudice. The adherents of this doctrine, who have been numerous, sometimes attempted to delude the reafon by brilliant paradoxes, or to feduce it by the fpecious charms of an universal pyrrhonism. Sometimes they affumed the boldnefs peremptorily to declare, that the advancement of knowledge threatened the most fatal. confequences to human happiness and liberty; at other times they declaimed, with pompous enthuliafm, in. favour of an imaginary wildom and fublimity, that difdained the cold progress of analysis, and the tardy mechanical path of experience. Upon one occasion, theywere accultomed to speak of philosophy and the abstruse sciences as theories too subtle for the investigation of the human understanding, urged as we are by daily wants, and fubjected to the most fudden vicisitudes; at another, they treated them as a mass of blind and idle conjectures, the falle estimation of which was fure to-

difappear from the mind of a man habituated to life and experience. Inceffantly did they lament the decay and decrepitude of knowledge, in the midst of its most brikliant progress; the rapid degradation of the human species, at the moment that men were ready to affert their rights and truft to their own understandings; an approaching æra of barbarism, darkness and flavery, when evidence was for perpetually accumulating, that the revival of fuch an æra was no Ionger to be feared. They feemed humbled by the advances of their fpecies, either because they could not boast of having contributed to them, or because they faw themselves menaced with a. fpeedy termination of their influence or importance. In the meanwhile, a certain number of intellectual mountebanks, more skilful than those who desperately endeavoured to prop the edifice of declining fuperflition, attempted, out of the wreck of fuperstition, to erect a new religious creed which should no longer demand of our reason any more than a sort of formal submillion, and which indulged us with a perfect liberty of conscience, provided we would admit some slight fragment of incomprehensibility into our system. A fecond clafs of these mountebanks assayed to revive, by means of secret affociations, the forgotten mysteries of a fort of oriental theurgy. The errors of the people they \_\_\_\_ left undisturbed: upon their own disciples they entailed new dogmas and new terrors, and ventured to hope, bya process of cunning, to restore the ancient tyranny of

In the mean the facerdotal princes of India and Egypt. time, philosophy, leaning upon the pillar which science had prepared, smiled at their efforts, and faw one attempt vanish after another, as the waves retire from the foot of an immoveable rock.

By comparing the difpolition of the public mind, which I have already sketched, with the prevailing fyftems of government, we shall perceive, without difficulty, that an important revolution was inevitable, and that there were two ways only in which it could take place: cither the people themselves would establish a fystem of policy upon those principles of nature and reafon, which philosophy had rendered fo dear to their hearts; or government might haften to fuperfede this event, by reforming its vices, and governing its conduct by the public opinion. One of these revolutions would be more speedy, more radical, but also more tempestuous; the other lefs rapid, lefs complete, but more tranquil; in the one, liberty and happiness would be purchafed at the expence of transient evils; in the other, these evils would be avoided; but a part of the enjoyments necessary to a state of perfect freedom, would be retarded in its progress, perhaps, for a considerable period, though it would be impossible in the end that it should not arrive.

The corruption and ignorance of the rulers of nations have preferred, it seems, the former of these modes; and the fudden triumph of reafon and liberty has aven-| ged the human race.

The simple dictates of good sense had taught the inhabitants of the British colonies, that men born on the American fide of the Atlantic ocean had received from nature the fame rights as others born under the meridian of Greenwich, and that a difference of fixty-fix degrees of longitude could have no power of changing them. They understood, more perfectly perhaps than Europeans, what were the rights common to all the individuals of the human race; and among these they included the right of not paying any tax to which they had not confented. But the British Government, pretending to believe that God had created America, as well as Asia, for the gratification and good pleasure of the inhabitants of London, refolved to hold in bondage a fubject nation, fituated across the feas at the distance of three thousand miles, intending to make her the instrument in due time of enflaving the mother country itfelf. Accordingly, it commanded the fervile representatives of the people of England to violate the rights of America, by subjecting her to compulsory taxation. This injustice, she conceived, authorised her to dissolve every tie of connection, and she declared her independence. Then was observed, for the first time, the example of a great people throwing off at once every species of chains, and peaceably framing for itfelf the form of government and the laws which it judged would be most conducive to its happines; and as, from its geographical position, and its former political state, it was obliged to become a

federal nation, thirteen republican conflications were feen to grow up in its bolom, having for their balis a folemn recognition of the natural rights of man, and for their first object the prefervation of those rights through every department of the union.

If we examine the nature of these constitutions, we shall discover in what respect they were indebted to the progrefs of the political fciences, and what was the portion of error, refulting from the prejudices of education which formed its way into them: why, for inftance, the fimplicity of these constitutions is disfigured by the fyftem of a balance of powers; and why an identity of interests, rather than an equality of rights, is adopted as their principle. It is manifelt that this principle of identity of interests, when made the rule of political rights is not only a violation of fuch rights, with respect to those who are denied an equal share in the exercise of them, but that it ceases to exist the very instant it becomes an actual inequality. We infift the rather upon this, as it is the only dangerous error remaining, the only error respecting which men of enlightened minds want still to be undeceived. At the fame time, however, we fee realized in these republics an idea, at that time almost new even in theory; I mean the necessity of establishing by law a regular and peaceable mode of reforming the conffitutions themfelves, and of placing this business in other hands than those entrusted with the legislative power.

Meanwhile, in confequence of America declaring herself independent of the British government, a war enfued between the two enlightened nations, in which one contended for the natural rights of mankind, the other for that impious doctrine which fubjects these rights to prefcription, to political interests, and written conventions. The great caufe at iffue was tried, during this war, in the tribunal of opinion, and, as it were, before the allembled nations of mankind. The rights of men were freely investigated, and strenuously supported in writings which circulated from the banks of the Neva to those of the Guadalquivir. These discusfions penetrated into the most enflaved countries, into the most distant and retired hamlets. The simple inha-Litants were altonished to hear of rights belonging to them: they enquired into the nature and importance of those rights: they found that other men were in arms, to re-conquer or to defend them. In this state of things it could not be long before the transatlantic revolution must find its imitators in the European quarter of the world. And if there existed a country in which, from attachment to their caufe, the writings and principles of the Americans were more widely diffeminated than in any other part of Europe; a country at once the most enlightened, and the least free; in which philosophers had foared to the fublimest pitch of intellectual attainment, and the government was funk in the deepelt and most intolerable igno-

rance; where the fpirit of the laws was fo far below the general fpirit and illumination, that national pride and inveterate prejudice were alike afhamed of vindicating the old inflitutions: if, 1 fay, there exifted fuch a country, were not the people of that country defined by the very nature of things, to give the first impulse to this revolution, expected by the friends of humanity with fuch eager impatience, fuch ardent hope? Accordingly it was to commence with France.

The impolicy and unskilfulness of the French government hastened the event. It was guided by the hand of philosophy, and the populor force destroyed the obstacles that otherwise might have arrested its progress.

It was more complete, more entire than that of America, and of confequence was attended with greater convultions in the interior of the nation, becaufe the Americans, fatisfied with the code of civil and criminal legiflation which they had derived from England, having no corrupt fyftem of finance to reform, no feedal tyrannies, no hereditary diffinctions, no privileges of rich and powerful corporations, no fyftem of religious intolerance to deftroy, had only to direct their attention to the eftablifhment of new powers to be fubflituted in the place of those hitherto exercised over them by the British government. In these innovations there was nothing that extended to the mass of the people, nothing that altered the fubfifting relations formed between indi-

viduals: whereas the French revolution, for reafons exactly the reverfe, had to embrace the whole economy of fociety, to change every focial relation, to penetrate to the fmalleft link of the political chain, even to those individuals, who, living in peace upon their property, or by their industry, were equally unconnected with public commotions, whether by their opinions and their occupations, or by the interests of fortune, of ambition, or of glory.

The Americans, as they appeared only to combat against the tyrannical prejudices of the mother country, had for allies the rival powers of England; while other nations, jealous of the wealth, and difgusted at the pride of that country, aided, by their fecret afpirations, the triumph of justice: thus all Europe leagued, as it were, against the oppressor. The French, on the contrary, attacked at once the defpotisin of kings, the political inequality of conflitutions partially free, the pride and prerogatives of nobility, the domination, intolerance, and rapacity of priests, and the enormity of feodal claims, still respected in almost every nation in Europe; and accordingly the powers we have mentioned, united in favour of tyranny; and there appeared on the fide of the Gallic revolution the voice only of some enlightened fages, and the timid willies of certain oppressed nations: fuccours, meanwhile, of which all the artifices of calumny have been employed to deprive it.

'It would be eafy to show how much more pure, accurate, and profound, are the principles upon which the conflitution and laws of France have been formed, than those which directed the Americans, and how much more completely the authors have withdrawn themselves from the influence of a variety of prejudices; that the great basis of policy, the equality of rights, has never been superseded by that sictitious identity of interests, which has so often been made its feeble and hypocritical substitute; that the limits prescribed to political power have been put in the place of that specious balance which has fo long been admired; that we were the first to dare, in a great nation necessarily dispersed, and which cannot perfonally be assembled but in broken and numerous parcels, to maintain in the people their rights of fovereignty, the right of obeying no laws but those which, though originating in a representative authority, shall have received their last fanction from the nation itself, laws which, if they be found injurious to its rights or interests, the nation is always organized to reform by a regular act of its fovereign will. From the time when the genius of Defcartes impreffed on the minds of men that general impulse, which is the first principle of a revolution in the destiny of the Suman species, to the happy period of entire focial liberty, in which man has not been able to regain his natural independence till after having passed through a long feries of ages of misfortune and flavery, the view of

the progrefs of mathematical and physical science prefents to us an immense horizon, of which it is necessary to distribute and assort the several parts, whether we may be desirous of fully comprehending the whole, on of observing their mutual relations.

The application of algebra to geometry not only became the fruitful source of discoveries in both sciences, but they prove, from this striking example, how much the method of computation of magnitudes in general may be extended to all questions, the object of which confifts in measure and extension. Descartes first announced the truth, that they would be employed with equal success hercaster upon all objects susceptible of precise valuation; and this great difcovery, by flewing for the first time the ultimate purpose of these sciences, that is to fay, the strict calculation of every species of truth, afforded the hope of attaining this point, at the fame time that it exhibited the means. This difcovery was foon fucceeded by that of a new method of computing, which teaches us to find the ratios of the fucceflive increments or decrements of a  $\sim$ variable quantity, or to deduce the quantity itself when is this ratio is given ; whether the increments be fupposed. of finite magnitude, or their ratio be fought for the inflant only of their vanishment; a method which, being extended to all the combinations of variable magnitudes, and to all the hypotheses of their variations, leads to a determination, with regard to all things precifely menfu-

rable, of the ratios of their elements, or of the things themfelves, from the knowledge of those proportions which they mutually have, provided the ratios of their elements only be given.

We are indebted to Newton and Leibnitz for the invention of these methods; but the labours of the geometers of the preceding age prepared the way for this discovery. The progress of these sciences, which has been uninterrupted for more than a century, is the work, and establishes the reputation, of a number of men of genius. They prefent to the eyes of the philosopher, who is able to observe them, even though he may not follow their steps, a striking monument of the force of the human mind. When we explain the formation and principles of algebraic language, which alone is accurate and truly analytic; the nature of the technical processes of this fcience; and the comparison of these processes with the natural operations of the human mind, we may prove that, if this method be not itself a peculiar instrument in the science of quantity, it certainly includes the principles of an universal instrument applicable to all possible combinations of ideas.

Rational mechanics foon became a vaft and profound fcience. The true laws of the collifion of bodies, refpecting which Defcartes was deceived, were at length known.

Huyghens difcovered the laws of circular motions; and at the fame time he gives a method of determining the radius of curvature for every point of a given curve. By uniting both theories, Newton invented the theory of curve-lined motions, and applied it to those laws according to which Kepler had difcovered that the planets deferibe their elliptical orbits.

A planet, supposed to be projected into space at a given instant, with a given velocity and direction, will describe round the sun an ellipsis, by virtue of a force directed to that star, and proportional to the inverse. ratio of the squares of the distances. The same force retains the fatellites in their orbits round the primary planets: it pervades the whole fystem of heavenly bodics, and acts reciprocally between all their component. parts. The regularity of the planetary ellipses is disturbed, and the calculation precifely explains the very flighteft degrees of these perturbations. It is equally applicable: to the comets, and determines their orbits with fuch precision, as to foretel their return. The peculiar motion chlcrved in the axes of rotation of the earth and the moon, affords additional proof of the existence of this universal force. Lastly, it is the cause of the weight. of terrestrial bodies, in which effect it appears to be invariable, becaufe we have no means of obferving its' action at diffances from the centre, which are inflicientig remote from each other.

Thus we fee man has at last become acquainted, for the first time, with one of the physical laws of the universe. Hitherto it stands unparalleled, as does the glory of him who discovered it.

An hundred years of labour and investigation have confirmed this law, to which all the celestial phenomena are fubjected, with an accuracy which may be faid to be miraculous. Every time in which an apparent deviation has prefented itself, the transfert uncertainty has foon become a fubject of new triumph to the fcience.

The philofopher is, in almost every inflance, compelled to have recourse to the works of a man of genius for the fecret clue which led him to discovery; but here interest, inspired by admiration, has discovered and preferved anecdotes of the greatest value, fince they permit us to follow Newton step by step. They ferve to show how much the happy combinations of external events, or chance, unite with the efforts of genius in producing a great discovery, and how easily combinations of a less favourable nature might have retarded them, or referved them for other hands.

Eut Newton did more, perhaps, in favour of the progrefs of the human mind, than merely difcovering this general law of nature; he taught men to admit in natural philosophy no other theories but fuch as are precife, and fusceptible of calculation; which give an account not only of the existence of a phenomenon, but its quantity and extent. Nevertheles he was accused

**ξ** 

of reviving the occult qualities of the ancients, becaufe he had confined himfelf to refer the general caufe of celeftial appearances to a fimple fact, of which obfervation proved the incontestable reality; and this accufation is itfelf a proof how much the methods of the fciences still require to be enlightened by philosophy.

·• \* \*

A great number of problems in statics and dynamics had been fucceflively proposed and refolved, when Alembert discovered a general principle adequate to the determination of the motions of any number of points acted on by any forces, and connected by conditions. He foon extended the fame principle to finite bodies of a determinate figure; to those which, from elasticity or flexibility, are capable of changing their figure, but according to certain laws and preferving certain relations between their parts; and lastly to fluids themselves; whether they preferve the fame denfity, or exist in a state of expansibility. A new calculation was necessary to resolve these last questions; the means did not escape him, and mechanics at present form a science of pure calculation. These discoveries belong to the mathematical sciences; but the nature of the law of universal gravitation, or of these principles of mechanics, and the consequences which may thence be drawn and applied to the eternal order of the universe, belong to philosophy. We learn that all bodies are subject to necessary laws, which tend of themselves to produce or maintain an equilibri-

um, which causes or preferves the regularity of their motions.

The knowledge of those laws which govern the celestial phenomena, the discoveries of that mathematical analysis which leads to the most precise methods of calculating the appearances, the very unexpected degree of perfection to which optical and goniometrical instruments llave been brought, the precision of machines for measuring time, the more general talte for the sciences, which unites itself with the interest of governments, to multiply the number of aftronomers and observations; all these causes unite to secure the progress of astronomy. The heavens are enriched for the man of science with new ftars, and he applies his knowledge to determine and foretel with accuracy their politions and movements. Natural philosophy, gradually delivered. from the vague explanations of Descartes, in the same manner as it before was difembarraffed from the abfurdities of the schools, is now nothing more than the art of interrogating nature by experiment, for the purpose of afterwards deducing more general facts by computation.

The weight of the air is known and measured: it is known that the transmission of light is not inflantancous; its velocity is determined, with the effects which must refult from that velocity, as to the apparent position of the celestial bodies; and the decomposition of the folar rays into others of different refraogibility and colour.

The rainbow is explained, and the methods of caufing its colours to be produced or to disappear are subjected to calculation. Electricity, formerly confidered as the property of certain substances only, is now known to beone of the most general phenomena in the universe. The cause of thunder is no longer a secret; Franklin has taught the artift to change its course, and direct it at pleafure. New inftruments are employed to meafure the variations of weight and humidity in the atmosphere, and the temperature of all bodies. A new fcience, under the name of meteorology, teaches us to know, and fometimes to foretel, the atmospheric appearances of which it will hereafter disclose to us the unknown laws. While we prefent a sketch of these discoveries, we may remark how much the methods which have directed philosophers in their refearches are simplified and brought to perfection; how greatly the art of making experiments, and of constructing instruments, has successively become more accurate; fo that philosophy is not only enriched every day with new truths, but the truths already known have been more exactly afcertained; fo that not only an immenfe mafs of new facts have been observed and analysed, but the whole has been submitted in detail to methods of greater strictness.

Natural philosophy has been obliged to combat with the prejudices of the schools, and the attraction of general hypotheses, so seducing to indolence. Other obstacles retarded the progress of chemistry. It was imagi-

ned that this science ought to afford the secret of making gold, and that of rendering man immortal.

The effect of great interefts, is to render man fuperflitious. It was not fuppoled that fuch promifes, which flatter the two ftrongest passions of vulgar minds, and besides rouse that of acquiring glory, could be accomplished by ordinary means; and every thing which credulity or folly could ever invent of extravagance, feemed to unite in the minds of chemists.

But these chimeras gradually gave place to the mechanical philosophy of Descartes, which in its turn gave place to a chemistry truly experimental. 'The observation of those facts which accompany the mutual compofition and decomposition of bodies, the refearch into the laws of these operations, with the analysis of substances into elements of greater simplicity, acquire a degree of precision and strictness ever increasing. But to these advances of chemistry we must add others, which embrace the whole fystem of the science, and rather by extending the methods than immediately increasing the mass of truths, foretel and prepare a revolution of the happiest kind. Such has been the difcovery of new means of confining and examining those elastic fluids, which formerly were suffered to escape; a difcovery which, by permitting us to operate upon an entire clafs of new principles, and upon those already. known, reduced to a state which escaped our refearches, and by adding an element the more to almost every

• •

•

combination, has changed, as it were, the whole fystem of chemiltry. Such has been the formation of a language, in which the names denoting fubstances sometimes express the refemblance or differences of those which have a common element, and fometimes the class to which they belong. To these advantages we may add the use of a scientific method, wherein these substances are reprefented by characters analytically combined, and moreover capable of expressing the most common operations. and the general laws of affinity. And, again, this fcience is enriched by the use of all the means and all -the inftruments which philosophers have applied to compute with the utmost rigor the results of experiment; and lastly, by the application of the mathematics to the phenomena of chrystalization, and to the laws according to which the elements of certain bodies effect in their combination regular and constant forms. Men who long had posseffed no other knowledge than that of explaining by fuperstitious or philosophical reveries the formation of the earth, before they endeavoured to become acquainted with its parts, have at last perceived the necessity of studying with the most forupulous attention the furface of the ground, the internal parts of the earth into which necessity has urged men to penetrate, the substances there found, their fortuitous or regular distribution, and the disposition of the mailes they have formed by their union. They have learned to alcertain the effects of the flow and long continued

action of the waters of the fea, of rivers, and the effect of volcanic fires; to diffinguish those parts of the furface and exterior cruft of the globe, of which the inequalities, disposition, and frequently the materials themselves, are the work of these agents; from the other portion of the furface, formed for the most part of heterogeneous fubstances, bearing the marks of more ancient revolutions by agents with which we are yet acquainted.

Minerals, vegetables, and animals are divided into various fpecies, of which the individuals differ by infenfible variations fcarcely conftant, or produced by caufes purely local. Many of these fpecies resemble each other by a greater or less number of common qualities, which

ferve to effablish fuccessive divisions regularly more and more extended. Naturalists have invented methods of classing the objects of fcience from determinate characters easily afcertained, the only means of avoiding confusion in the midst of this numberless multitude of individuals. These methods are, indeed, a real language, wherein each object is denoted by fome of its most conflant qualities, which, when known, are applicable to the discovery of the name which the article may bear in common language. These general languages, when well composed, likewise indicate, in each class of natural objects, the truly effential qualities which by their union cause a more or less perfect refemblance in the rest of their properties.

We have formerly feen the effects of that pride which magnifies in the eyes of men the objects of an exclusive fludy, and knowledge painfully acquired, which attaches to thefe methods an exaggerated degree of importance, and miftakes for fcience itfelf that which is nothing more than the dictionary and grammar of its real language. And fo likewife, by a contrary excefs, we have feen philofophers falfely degrade thefe fame methods, and confound them with arbitrary nomenclatures, as futile and laborious compilations.

The chemical analysis of the substances in the three great kingdoms of nature; the description of their external form; the exposition of their physical

qualities and ufual properties; the hiffory of the developement of organized bodies, animals, or plants; their nutrition and reproduction; the details of their organization; the anatomy of their various parts; the functions of each; the hiftory of the manners of animals and their induftry to procure food, defence, and habitation, or to feize their prey, or efcape from their enemies; the focieties of family or fpecies which are formed amongft them; that great mafs of truth to which we are led by meditating on the immenfe chain of organifed beings; the relation which fucceflive years produce from brute matter at the most feeble degree of organization, from organifed matter to that which affords the inft indications of fensibility and fpontaneous metion; and from this flation to that of man himfelf; the relation

•

of all these beings with him, whether relative to his wants, the analogies which bring him nearer to them, or the differences by which he is separated: such is the sketch prefented to the mind by modern natural history.

The phyfical man is himfelf the object of a feparate fcience, anatomy, which, in its general acceptation, includes phyfiology. This fcience, which a fuperftitious refpect for the dead had retardad, has taken advantage of the general difappearance of prejudice, and has happily oppofed the intereft of the prefervation of man, which has fecured it the patronage of men of eminence. Its progrefs has been fuch, that it feems in fome fort to

be at a fland, in the expectation of more perfect inftruments and new methods. It is nearly reduced to feek in the comparative anatomy of the parts of animals and man, in the organs common to the different fpecies, and the manner in which they exercise familar functions, those truths which the direct observation of the human frame appears to refuse. Almost every thing which the eye of the observer, affiled by the microscope, has been able to discover, is already afcertained. Anatomy appears to frand in need of experiments, fo useful to the progress of other feiences; but the nature of its object deprives it of this means, fo evidently necessary to its perfection.

The circulation of the blood was long fince known; but the difposition of the veffels which conveyed the

•

chyle to mix with it, and repair its loss; the existence of a gastric fluid which disposes the elements to the decomposition necessary to separate from organised matter, that portion which is proper to become alimilated with the living fluids; the changes undergone by the various parts and organs in the interval between conception and birth, and afterwards during the different ages of life; the diffinction between the parts posselling feusibility and those in which irritability only refides, a property difcovered by Haller, and common to almost every organic substance: these facts are the whole of what phyfielogy has been enabled to difcover, by indubitable observations, during this brilliant epoch; and these important truths may ferve as an apology for the numerous explanations, mechanical, chemical, and organical, which have fucceeded each other, and loaded this fcience with hypothefes destructive to its progress, and 7. dangerous when used as the ground of medical practice. To the outline of the fciences we may add that of the arts, which, being founded upon them, have advanced with greater certainty, and broken the fliackles of cuftom and common practice, which heretofore impeded their progrefs.

We may shew the influence which the progress of mechanics, of altronomy, of optics, and of the art of measuring time, has exercised on the art of constructing, moving, and directing vessels at sea. We may shew how greatly an increase of the number of obser-

vers, and a greater degree of accuracy in the altronomical determinations of politions, and in topographical methods, have at last produced an acquaintance with the furface of the globe, of which fo little was known at the end of the last century.

How greatly the mechanic arts, properly fo called, have given perfection to the proceffes of art in conftructing influments and machines in the practice of trade, and thefe laft have no lefs added force to rational mechanism and philosophy. These arts are also greatly indebted to the employment of first movers already known, with lefs of expence and loss, as well as to the invention of new principles of motion.

We have beheld architecture extend its refearches into the fcience of equilibriums and the theory of fluids, for the means of giving the molt commodious and leaft expensive form to arches, without fear of altering their folidity; and to oppofe against the effort of water a refistance computed with greater certainty; to direct the course of that fluid, and to employ it in canals with greater skill and fucces.

We have beheld the arts dependent on chymiltry enriched with new proceffes; the ancient methods have been fimplified, and cleared from ufelefs or noxious fubftances, and from abfurd or imperfect practices introduced from former rude trials; means have been invented to avert those frequently terrible dangers to which workmen were exposed. Thus it is that the application

of science has secured to us more of riches and enjoyment, with much less of painful facrifice or of regret.

In the mean time, chemistry, botany, and natural history, have very much enlightened the economical arts, and the culture of vegetables defined to fupply our wants; fuch as the art of fupporting, multiplying, and preferving domestic animals; the bringing their races to perfection, and meliorating their products; the art of preparing and preferving the productions of the earth, or those articles which are of animal product.

Surgery and pharmacy have become almost new arts, from the period when anatomy and chemistry have: offered them more enlightened and more certain direction.

The art of medicine, for in its practice it must be confidered as an art, is by this means delivered at least of its falfe theories, its pedantic jargon, its deftructive courfe of practice, and the fervile fubmission to the authority of men, or the doctrine of colleges; it is taught to depend only on experience. The means of this art have become multiplied, and their combination and application better known; and though it may be admitted that in fome parts its progress is merely of a negative kind, that is to fay, in the deftruction of dangerous practices and hurtful prejudices, yet the new methods of fludying chemical medicine, and of combining obfer-

vations, give us reason to expect more real and certain. advances.

We may endeavour more effectially to trace that practice of genius in the fciences which at one time defcends from an abftract and profound theory to learned and delicate applications; at another, fimplifying its means, and proportioning them to its wants, concludes by fpreading its advantages through the most ordinary practices; and at others again being rouzed by the wants of this fame courfe of art, it plunges into the most remote fpeculations, in fearch of refources which the ordinary flate of our knowledge must have refused. We may remark that those declamations which are

made against the utility of theories, even in the mostfimple arts, have never shewn any thing but the ignorance of the declaimers. We may prove that it is not to the profundity of these theories, but, on the contrary,to their imperfection, that we ought to attribute the inutility or unhappy effects of so many useles applications.

These observations will lead us to one general truth, that in all the arts the refults of theory are necessarily modified in practice; that certain fources of inaccuracy exist, which are really inevitable, of which our aim should be to render the effect infensible, without indulging the chimerical hope of removing them; that a great number of data relative to our wants, our means, our time, and our expences which are necessarily overlooked in the theory, must enter into the relative

problem of immediate and real practice; and that, laftly by introducing thefe requifites with that skill which truly constitutes the genius of the practical man, we may at the same time go beyond the narrow limits wherein prejudice against theory threatens to detain the arts, and prevent those errors into which an improper use of theory might lead us.

Those sciences which are remote from each other, cannot be extended without bringing them nearer, and forming points of contact between them.

An exposition of the progress of each science is sufficient to shew, that in several the intermediate application of numbers has been useful, as, in almost all, it has

been employed to give a greater degree of precifion to experiments and obfervations; and that the fciences are indebted to mechanics which has fupplied them with more perfect and more accurate influments. How much have the difcovery of microfcopes, and of meteorological influments contributed to the perfection of natural hiftory. How greatly is this fcience indebted to chemiftry, which, alone, has been fufficient to lead to a more profound knowledge of the objects it confiders, by difplaying their most intimate nature, and most effential properties—by shewing their composition and elements; while natural history offers to chymiftry fo many operations to execute, such a numerous fet of combinations formed by nature, the true elements of which require to be feparated, and some-

l

times difcovered, by an imitation of the natural procelfes: and, laftly, how great is the mutual affiftance afforded to each other by chymiftry and natural philofophy; and how greatly have anatomy and natural hiftory been already benefited by thefe feiences.

But we have yet exposed no more than a fmall. portion of the advantages which have been received, or may be expected, from these applications.

Many geometers have given us general methods of deducing, from obfervations of the empiric laws of phenomena, methods which extend to all the fciences; because they are in all cases capable of affording us the knowledge of the law of the fuccessive values of the

fame quantity, for a feries of inflants or politions; or that law according to which they are diffributed, or which is followed by the various properties and values of a finilar quality among a given number of objects.

Applications have already proved, that the science of combination may be successfully employed to difpose observations, in such a manner, that their relations, results, and sum may with more facility be seen.

The uses of the calculation of probabilities forctel how much they may be applied to advance the progrefs of other fciences; in one cafe, to determine the probability of extraordinary facts, and to shew whether they ought to be rejected, or whether, on the contrary, they ought to be verified; or in calculating the probability of the return of those facts which often prefent.

themfelves in the practice of the arts, and are not connected together in an order, yet confidered as a general law. Such, for example, in medicine, is the falutary effect of certain remedies, and the fuccefs of certain prefervatives. Thefe applications likewife flew us how great is the probability that a feries of phenomena flould refult from the intention of a thinking being ; whether this being depends on other co-existent, or antecedent phenomena; and how much ought to be attributed to the necessary and unknown cause denominated chance, a word the fense of which can only be known with precision by studying this method of computing.

The fciences have likewife taught us to afcertain

the feveral degrees of certainty to which we may hope to attain; the probability according to which we can adopt an opinion, and make it the bafis of our reafonings, without injuring the rights of found argument, and the rules of our conduct—without deficiency in prudence, or offence to juffice. They flew what are the advantages or difadvantages of various forms of election, and modes of decifion dependant on the plurality of voices; the different degrees of probability which may refult from fuch proceedings; the method which public intereft requires to be followed, according to the nature of each queftion; the means of obtaining it nearly with certainty, when the decifion is not abfolutely neceffary, or when the inconveniences of two conclusions being unequal, neither of them can become legitimate until

- ·

beneath this probability; or the affurance beforehand of most frequently obtaining this fame probability, when, on the contrary, a decision is necessary to be made, and the most feeble preponderance of probability is sufficient to produce a rule of practice.

Among the number of these applications we may likewise state, an examination of the probability of facts for the use of such as have not the power, or means, to support their conclusions upon their own observations; a probability which results either from the authority of witness, or the connection of those facts with others immediately observed.

How greatly have inquiries into the duration of

human life, and the influence in this refpect of fex, temperature, climate, profeffion, government, and habitudes of life; on the mortality which refults from different difeafes; the changes which population experiences; the extent of the action of different caufes which produce thefe changes; the manner of its diffribution, in each country, according to the age, fex, and occupation :---how greatly ufeful have thefe refearches been to the phyfical knowledge of man, to medicine, and to public economy.

How extensively have computations of this nature been applied for the establishment of annuitics, tontines, accumulating funds, benefit focieties, and chambers of assurance of every kind.

1 a. .

Is not the application of numbers also necessary to that part of the public economy which includes the theory of public measures, of coin, of banks and financial operations, and lastly, that of taxation, as established by law, and its real distribution, which fo frequently differs, in its effects on all the parts of the focial fystem. What a number of important questions in this fame fcience are there, which could not have been properly refolved without the knowledge acquired in natural history, agriculture, and the philosophy of vegetables, which influence the mechanical or chymical arts.

In a word, fuch has been the general progrefs of the fciences, that it may be faid there is not one which

can be confidered as to the whole extent of its principles and detail, without our being obliged to borrow the affiftance of all the others.

In prefenting this fketch both of the new facts which have enriched the feiences refpectively, and the advantages derived in each from the application of theories, or methods, which feem to belong more particularly to another department of knowledge, we may endeavour to afertain what is the nature and the limits of those truths to which observation, experience, or meditation, may lead us in each feience; we may likewife investigate what it is precifely that constitutes that talent of invention which is the first faculty of the human mind, and is known by the name of genius; by what operations the understanding may attain the diffeoveries it

purfues, or fometimes be led to others not fought, or even possible to have been foretold; we may shew how far the methods which lead to discovery may be exhausted, so that science may, in a certain respect, be at a stand, till new methods are invented to afford an additional instrument to genius, or to facilitate the use of those which cannot be employed without too great a confumption of time and fatigue.

If we confine ourfelves to exhibit the advantages deduced from the sciences in their immediate use or application to the arts, whether for the welfare of individuals or the profperity of nations, we shall have shewn only a small part of the benefits they afford. The most important perhaps is, that prejudice has been destroyed, and the human understanding in some fort rectified; after having been forced into a wrong direction by abfurd objects of belief, transmitted from generation to generation, taught at the misjudging period of infancy, and enforced with the terrors of superstition and the dread of tyranny. All the errors in politics and in morals are founded upon philosophical mistakes, which, themselves, are connected with physical errors. There does not exift any religious fystem, or supernatural extravagance, which is not founded on an ignorance of the laws of nature. The inventors and defenders of these absurdities could not forese the successive progress of the human mind. Being perfuaded that the men of their time

237 knew every thing, they would ever know, and would always believe that in which they then had fixed their faith; they confidently built their reveries upon the general opinions of their own country and their own age.

The progrefs of natural knowledge is yet more dcftructive of thefe errors, becaufe it frequently deflroys them without feeming to attack them, by attaching to thofe who obstinately defend them the degrading ridicule of ignorance.

At the fame time, the just habit of reasoning on the object of these sciences, the precise ideas which their methods afford, and the means of ascertaining or proving the truth, must naturally lead us to compare the fentiment which forces us to adhere to opinions founded on these real motives of credibility, and that which attaches us to our habitual prejudices, or forces us to yield to authority. This comparison is fufficient to teach us to missively believed, even when that belief was the most earnessly believed, even when that belief was the most earnessly and the most funcerely professed. When this discovery is once made, their destruction becomes much more speedy and certain.

Laftly, this progrefs of the physical fciences, which the paffions and interest do not interfere to disturb; wherein it is not thought that birth, profession, or appointment have given a right to judge what the individual is not in a situation to understand; this more

· · ·

certain progrefs cannot be obferved, unlefs enlightened men shall fearch in the other sciences to bring them continually together. This progrefs at every step exhibits the model they ought to follow; according to which they may form a judgment of their own efforts, afcertain the false steps they may have taken, preferve themselves from pyrrhonism as well as credulity, and from a blind mistrust or too extensive submission to the authorities even of men of reputation and knowledge.

The metaphysical analysis would, no doubt, lead to the same refults, but it would have afforded only abstract principles. In this method, the same abstract principles being put into action, are enlightened by

example, and fortified by fuccefs.

1-2

Until the prefent epoch, the fciences have been the patrimony only of a few; but they are already become common, and the moment approaches in which their elements, their principles, and their most fimple practice, will become really popular. Then it will be feen how truly universal their utility will be in their application to the arts, and their influence on the general rectitude of the mind.

We may trace the progrefs of European nations in the inftruction of children, or of men; a progrefs hitherto feeble, if we attend merely to the philosophical fystem of this instruction, which, in most parts, is still confined, to the prejudices of the schools; but very rayid is we confider the extent and nature of the

objects taught, which no longer comprehending any points of knowledge but fuch as are real, includes the elements of almost all the sciences; while men of all descriptions find in dictionaries, abridgments, and journals the information they require, though not always of the purest kind. We may examine the degree of utility refulting from oral instruction in the fciences, added to that which is immediately received by books and fludy; whether any advantage has refulted from the labour of compilation having become a real trade, a. means of fubfiltence, which has multiplied the number of inferior works, but has likewife multiplied the means of acquiring common knowledge to men of fmall information. We may mark the influence which learned focieties have exercifed on the progrefs of the human mind, a barrier which will long be useful to oppose against ignorant pretenders and false knowledge: and laftly, we may exhibit the hiftory of the encouragements given by governments to that progress, and the obstacles which have often been opposed to it in the fame country and at the fame period. We may shew what prejudices or principles of Machiavelism have directed them in this opposition to the advances of man towards truth; what views of interested policy, or even public good, have directed them when they have appeared, on the contrary, to be defirous of accelerating and protecting them.

The picture of the fine arts offers to our view refults of no less brilliancy. Music is become, in a certain respect, a new art; while the science of combination, and the application of numbers to the vibrations of fono-- rous bodies, and the ofcillations of the air, have enlightened its theory. The arts of defign, which formerly paffed from Italy to Flanders, Spain and France, elevated themfelves in this last country to the same degree that Italy carried them in the preceding epocha; where they have been supported with more reputation than in Italy itself. The art of our painters is that of Raphael and Carrachi. All the means of the art being preferved in the schools, are so far from being lost, that they have become more extended. Neverthel efs, it must be admitted, that too long a time has elapfed without producing a genius which may be compared to them, to admit of this long sterility being attributed to chance. It is not because the means of art are exhausted that great fuccels is really become difficult; it is not that nature has refused us organs equally perfect with those of the Italians of the fixth age; it is merely to the changes of politics and manners that we ought to attribute, not the decay of the art, but the mediocrity of its productions.

Literary productions (cultivated in Italy with lefs fuccefs but without having degenerated) have made fuch progrefs in the French language, as has acquired it the

•

honour of becoming, in some fort, the universal language of Europe.

The tragic art, in the hands of Corneille, Racine, and Voltaire, has been raifed, by fuccessive progress, to a perfection before unknown. The comic art is indebted to Moliere for having speedily arrived to an elevation not yet attained by any other people.

In England, from the commencement of the fame epoch, and in a still later time in Germany, language has been rendered more perfect. The art of poetry, as well as that of profe writing, have been subjected, though with less docility than in France, to the univerfal rules of reason and nature, which ought to direct

them. Thefe rules are equally true for all languages and all people, though the number of men has hitherto been few who have fucceeded in arriving at the knowledge of them, and rifing to the just and pure taste which refults from that knowledge. These rules presided over the compositions of Sophocles and Virgil, as well as those of Pope and Voltaire; they taught the Greeks and Romans, as well as the French, to be struck with the fame beauties, and shocked at the fame faults. We may also investigate what it is in each nation that has favoured or retarded the progress of these arts; by what causes the different kinds of poetry, or works in profe, have attained in the different countries a degree of perfection fo unequal; and how far these universal. rules may, without offending their own fundamental : X 2

principles, be modified by the manners and opinions of the people who are to poffers their productions, and even by the nature of the uses to which their different fpecies are defigned. Thus, for example, a tragedy daily recited before a fmall number of fpectators, in a theatre of confined extent, cannot follow the fame practical rules as a tragedy exhibited on an immenfe theatre, in the folemn feltivals to which a whole people was inyited. We may attempt to shew, that the rules of tafte possible the fame generality and the same constancy, though they are fusceptible of the fame modifications as the other laws of the moral and physical universe, when it is necessary to apply them to the immediate practice of

a common art.

We may fhew how far the art of printing, by multiplying and diffeminating even those works which are defigned to be publicly read or recited, transmit them to a number of readers incomparably greater than that of the auditors. We may shew how most of the important decisions by numerous affemblies, having been determined from the previous instruction their members had received by writing, there must have refuted in the art of persuasion among the ancients and among the moderns, differences in the rules, analogous to the effect intended to be produced and the means employed; and how, lastly, in the different species of knowledge, even with the ancients, certain works were for perusal only—fuch as those of

·

hiftory or philosophy. The facility which the invention of printing affords, to enter into a more extensive detail and more accurate developement, must have likewife influenced the fame rules.

The progrefs of philosophy and the sciences have extended and favoured those of letters, and these in their turn have ferved to render the study of the sciences more easy, and philosophy itself more popular. They have lent mutual assistance to each other, in spite of the efforts of ignorance and folly to difunite and render. them inimical. Erudition, which a refpect for human authority and ancient things seemed to have destined to support the cause of hurtful prejudices; this erudition has, nevertheless, assisted in destroying them, because the fciences and philosophy have enlightened it with a more legitimate criticism. It already knew the method of weighing authorities, and comparing them with each. other, but it has at length fubmitted them to the tribunal of reason; it had rejected the prodigies, absurd tales, and facts contrary to probability; but, by attacking the testimony upon which they were fupported, men have learned to reject them, in spite of the force of these witneffes, that they might give way to that evidence which the phylical or moral improbability of extraordinary facts might carry with them.

Hence it is feen that all the intellectual occupations of men, however differing in their object, their method, or the qualities of mind which they require, have con-

--

#### . 244

curred in the progress of human reason. It is the same with the entire fystem of the labours of men as with a well-composed work; of which the parts, though methodically distinct, must, nevertheless, be closely connected to form one single whole, and tend to one single object.

While we thus take a general view of the human fpecies, we may prove that the difcovery of true methods in all the sciences; the extent of the theories they include; their application to all the objects of nature, and all the wants of man; the lines of communication established between them; the great number of those who cultivate them; and, lastly, the multiplication of printing presses, are fufficient to assure us, that none of them will hereafter descend below the point to which it has been carried. We may flew that the principles of philosophy, the maxims of liberty, the knowledge of the true rights of man, and his real interest, are fpread over too many nations, and in each of those nations direct the opinions of too great a number of enlightened men, for them ever to fall again into oblivion. What fear can be entertained when we find that the two languages the most universally extended, are, likewife, the languages of two people who possels the most extended liberty; who have best known its principles. So that no confederacy of tyrants, nor any poffible combination of policy, can prevent the rights of reafon, as well as those of liberty, from being openlydefended in both languages.

But if it be true, as every profpect affures us, that the human race shall not again relapse into its ancient barbarity; if every thing ought to assure us against that pusillanimous and corrupt system which condemns man to eternal of cillations between truth and falsehood, liberty and fervitude, we must, at the fame time, perceive that. the light of information is spread over a small part only of our globe; and the number of those who posses real instruction, seems to vanish in the comparison with the mass of men configned over to ignorance and prejudice. We behold valt countries groaning under flavery, and prefenting nations in one place, degraded by the vices of civilization, fo corrupt as to impede the progrefs of man; and in others, still vegetating in the infancy of its early age. We perceive that the exertions of these last ages have done much for the progrefs of the human mind, but little for the perfection of the human species; much for the glory of man, fomewhat for his liberty, but fcarcely any thing yet for his happines. In a few directions, our eyes are struck with a dazzling light; but thick darkness still covers an immense horison. The mind of the philosopher reposes with satisfaction upon a fmall number of objects, but the spectacle of the stupidity, the flavery, the extravagance, and the barbarity of man, afflicts him still more strongly. The friend of humanity cannot receive unmixed pleafure but by abandon. ing himfelf to the endearing hope of the future.

Such are the objects which ought to enter into an. historical sketch of the progress of the human mind. We. may endeavour, while we hold them forward, to fhew more especially the influence of this progress upon the opinions and the welfare of the general mass of different nations, at the different epochas of their political existence; to shew what truths they have known, what errors have been destroyed, what virtuous habits contracted, what new developement of their faculties has eftablished a happier proportion between their powers and their wants: And, under an opposite point of view, what may be the prejudices to which they have been enflaved; what religious or political fuperstitions have been introduced; by what vices, of ignorance or defpotifm, they have been corrupted; and to what miferies, violence or their own degradation. have subjected them. Hitherto, political hiftory, as well as that of philofophy and the fciences, has been merely the 'hiftory of a few men. That which forms in truth the human fpecies, the mass of families, which subfift almost entirely upon their labour, has been forgotten; and even among that class of men who, devoted to public profeffions, act not for themfelves but for fociety; whole occupation it is to instruct, to govern, to defend, and to comfort other men, the chiefs only have fixed the attention of historians.

It is enough for the hiftory of individuals that facts be collected, but the hiftory of a mafs of men can be founded only on obfervations; and, in order to felect them, and to feize the effential traits, it is requifite the hiftorian fhould poffefs confiderable information, and no lefs of philosophy, to make a proper use of them.

Again, these observations relate to common things, which ftrike the eyes of all, and which every one is capable himfelf of knowing when he thinks proper to attend to them. Hence the greater part have been collected by travellers and foreigners, because things very trivial in the place where they exist, have become an object of curiosity to ftrangers. Now it unfortunately happens, that these travellers are almost always inaccurate observers; they see objects with too much rapidity, through the medium of the prejudices of their own country, and not unfrequently by the eyes of the men of the country they run through: their conferences are held with such men as accident has connected them with; and the anfwer is, in almost every case, dictated by interest, party spirit, national pride, or ill-humour.

It is not alone, therefore, to the baleness of historians, as has been justly urged against those of monarchies, that we are to attribute the want of monuments from which we may trace this most important part of the history of men.

The defect cannot be supplied but very imperfectly by a knowledge of the laws, the practical principles of go-

vernment and public economy, or by that of religion and general prejudices.

In fact; the law as written, and the law as executed; the principles of those who govern, and the manner in which their action is modified by the genius of those who are governed; the institution fuch as it has flowed from the men who formed it, and fuch as it becomes when realized by practice; the religion of books, and that of the people; the apparent univerfality of prejudice, and the real reception which it obtains, may differ to fuch a degree, that the effects shall absolutely ceafe to correspond to these public and known causes. To this part of the hiltory of the human species, which is the most obscure, the most neglected, and for which facts offer us fo few materials, it is that we should more particularly attend in this outline; and whether an account be rendered of a new discovery, an important theory, a new fystem of laws, or a political revolution, the problem to be determined will confift in afcertaining what effects ought to have arisen from the will of the most numerous portion of each fociety. This is the true object of philosophy; because all the intermediate effects of these same causes can be considered only as means of acting, at least upon this portion, which truly conflitutes the mafs of the human race.

It is by arriving at this last link of the chain, that the observation of pass events, as well as the knowledge acquired by meditation, become truly useful. It is by

arriving at this term, that men learn to appreciate their real titles to reputation, or to enjoy, with a well-grounded pleafure, the progrefs of their reafon. Hence, alone, it is, that they can judge of the true improvement of the human fpecies.

The notion of referring every thing to this latter point, is dictated by justice and by reason; but it may be supposed to be without foundation. The supposition, nevertheless, is not true; and it will be enough if we prove it in this place by two striking examples.

The poffeffion of the common objects of confumption, however abundantly they may now fatisfy the wants of man; of those objects which the ground produces in confequence of human effort, is due to the continued exertions of industry, affisted by the light of the fciences; and thence it follows, from history, that this posseffion attaches itself to the gain of the battle of Salamis, without which the darkness of oriental despotism threatened to cover the whole of the earth. And, again, the accurate observation of the longitude, which preferves navigators from shipwreck, is indebted to a theory which, by a chain of truths, goes as far back as to discoveries made in the school of Plato, though buried for twenty centuries in perfect inutility.

Y

#### TENTH EPOCH.

# Future Progress of Mankind.

F man can predict, almost with certainty, those -appearances of which he understands the laws; if, even when the laws are unknown to him, experience or the past enables him to foresee, with considerable probability, future appearances; why fhould we fuppofe it a chimerical undertaking to delineate, with fome degree of truth, the picture of the future destiny of mankind from the refults of its hiftory ? The only foundation of faith in the natural sciences is the principle, that the general daws, known or unknown, which regulate the phenomena of the universe, are regular and constant; and why -should this principle, applicable to the other operations of nature, be lefs true when applied to the developement of the intellectual and moral faculties of man? In fhort, as opinions formed from experience, relative to the fame clafs of objects, are the only rule by which men of foundest understanding are governed in their conduct, why should the philosopher be proferibed from supporting his conjectures upon a similar basis, provided he attribute to them no greater certainty than the number, the confiftency, and the accuracy of actual observations shall authorise?

•

Our hopes, as to the future condition of the human species, may be reduced to three points: the destruction of inequality between different nations; the progress of equality in one and the same nation; and lastly, the real improvement of man.

Will not every nation one day arrive at the flate of civilization attained by those people who are most enlightened, most free, most exempt from prejudices, as the French, for instance, and the Anglo-Americans? Will not the flavery of countries subjected to kings, the barbarity of African tribes, and the ignorance of favages gradually vanish? Is there upon the face of the globea single spot the inhabitants of which are condemned by

nature never to enjoy liberty, never to exercise their reason?

Does the difference of knowledge, of means, and of wealth, obfervable hitherto in all civilized nations, between the claffes into which the people conflicutingthofe nations are divided; does that inequality, which the earlieft progrefs of fociety has augmented, or, to fpeak more properly, produced, belong to civilization itfelf, or to the imperfections of the focial order? Muft it not continually weaken, in order to give place to that actual equality, the chief end of the focial art, which diminifhing even the effects of the natural difference of the faculties, leaves no other inequality fubfifting but what is ufeful to the intereft of all, becaufe it will favour civilization, inftruction, and induftry, without drawing

after it either dependence, humiliation or poverty? In a word, will not men be continually verging towards that state, in which all will posses the requisite knowledge for conducting themfelves in the common affairs of life by their own reason, and of maintaining that reason uncontaminated by prejudices; in which they will understand their rights, and exercise them according to their opinion and their confcience; in which all will be able, by the developement of their faculties, to procure the certain means of providing for their wants; laftly, in which folly and wretchednefs will be accidents, happening only now and then, and not the habitual lot of a confiderable portion of fociety? In fine, may it not be expected that the human race will be meliorated by new difcoveries in the fciences and the arts, and, às an unavoidable confequence, in the means of individual and general profperity; by farther progress in the principles of conduct, and in moral practice; and lastly, by the real improvement of our faculties, moral, intellectual and phyfical, which may

be the refult either of the improvement of the inftruments which increase the power and direct the exercise of those faculties, or of the improvement of our natural organization itself ?

In examining the three queftions we have enumerated, we fhall find the ftrongeft reafons to believe, from paft experience, from obfervation of the progrefs which the fciences and civilization have hitherto made,

and from the analysis of the march of the human understanding, and the development of its faculties, that: nature has fixed no limits to our hopes.

If we take a furvey of the existing state of the globe, we shall perceive, in the first place, that in Europe the principles of the French conflitution are those of everyenlightened mind. We shall perceive that they are toowidely diffeminated, and too openly profeffed, for the efforts of tyrants and priefts to prevent them from penetrating by degrees into the miferable cottages of their flaves, where they will foon revive those embers of good fense, and rouse that filent indignation which the habit. of fuffering and terror have failed totally to extinguish. in the minds of the oppressed. If we next look at the different nations, we shall observe in each, particular obstacles opposing, or certain difpolitions favouring this revolution. We shall diffinguish some in which it will be effected, perhaps flowly, by the wildom of the respective governments; and others in which, rendered violent by refiftance, the governments themselves will necessarily be involved in its terrible and rapid motions.

Can it be fuppofed that either the wildom or the fenfelefs feuds of European nations, co-operating with: the flow but certain effects of the progrefs of their colonics, will not fhortly produce the independence of the entire new world; and that then, European population, lending its aid, will fail to civilize or caufe to difagrent;

even without conquest, those savage nations still occupying there immense tracts of country ?

Run through the hiftory of our projects and eftablifhments in Africa or in Afia, and you will fee our monopolies, our treachery, our fanguinary contempt for men of a different complexion or different creed, and the profelyting fury or the intrigues of our priefts, deftroying that fentiment of refpect and benevolence which the fuperiority of our information and the advantages of our commerce had at first obtained.

But the period is doubtless approaching, when, no Ionger exhibiting to the view of these people corruptors:

only or tyrants, we shall become to them instruments of benefit, and the generous champions of their redemption from bondage.

The cultivation of the fugar cane, which is now establishing itself in Africa, will put an end to the shameful robbery by which, for two centuries, that country has been depopulated and depraved.

Already, in Great Britain, fome friends of humanity have fet the example; and if its Machiavelian government, forced to refpect public reafon, has not dared to oppofe this measure, what may we not expect from the fame fpirit, when, after the reform of an object and venal conflictution, it shall become worthy of a humane and generous people? Will not France be easer to imitate enterprifes which the philanthropy and the true interest of Europe will equally have dictated? Spices

are already introduced into the French islands, Guianz, and fome English fettlements; and we shall foon witness the fall of that monopoly which the Dutch havesupported by such a complication of persidy, of oppression, and of crimes. The people of Europe will learn in time that exclusive and chartered companies are but as tax upon the respective nation, granted for the purpose of placing a new instrument in the hands of its government for the maintenance of tyranny.

Then will the inhabitants of the European quarter of the world, fatisfied with an unrestricted commerce, too enlightened as to their own rights to fport with the rights of others, refpect that independence which they have hitherto violated with fuch audacity. Then will their establishments, instead of being filled by the creatures of power, who, availing themselves of a place or: a privilege, haften, by rapine and perfidy, to amafs wealth, in order to purchase, on their return, honours and titles, be peopled with industrious men; feeking in those happy climates that ease and comfort which intheir native country eluded their purfuit. There will they be retained by liberty, ambition having loft itsallurements; and those settlements of robbers will then become colonies of citizens, by whom will be planted in Africa and Afia the principles and example of the freedom, reason, and illumination of Europe. To those monks also, who inculcate on the natives of the countries in question the most shameful superstitions

only, and who excite difguft by menacing them with a new tyranny, will fucceed men of integrity and benevolence, anxious to fpread among thefe people truths ufeful to their happinefs, and to enlighten them upon their interefts as well as their rights : for the love of truth is alfo a paffion ; and when it fhall have at home no grofs prejudices to combat, no degrading errors to diffipate, it will naturally extend its regards, and convey its efforts to remote and foreign climes.

Thefe immenfe countries will afford ample fcope for the gratification of this passion. In one place will be found a numerous people, who, to arrive at civilization, appear only to wait till we shall furnish them with the. means; and, who, treated as brothers by Europeans, would inftantly become their friends and difciples. Inanother will be feen nations crouching under the yoke. of facred defpots or flupid conquerors, and who, for fomany ages, have looked for fome friendly hand to deliver them: while a third will exhibit either tribes. nearly favage, excluded from the benefits of fuperior civilization by the feverity of their climate, which deters those who might otherwise be disposed to communicate these benefits from making the attempt; or else. conquering hordes, knowing no law but force, no trade but robbery. The advances of these two last: classes will be more flow, and accompanied with more fiequent storms; it may even happen that, reduced in. numbers in proportion as they fee themselves repelled

by civilized nations, they will in the end wholly difappear, or their fcanty remains become blended with their neighbours.

We might shew that these events will be the inevitable confequence not only of the progress of Europe, but of that freedom which the republic of France, as well as of America, have it in their power, and feel it to be their interest, to restore to the commerce of Africa and Afia: and that they must also necessarily refult alike, whether from the new policy of European nations, or their obstinate adherence to mercantile prejudices.

A fingle combination, a new invalion of Afia by the Tartars, might be fufficient to frustrate this revolution; but it may be shewn that such combination is henceforth impossible to be effected. Meanwhile every thing seems to be preparing the speedy downfal of the religions of the East, which, partaking of the abjectness of their ministers, left almost exclusively to the people, and, in the majority of countries, confidered by powerful men as political institutions only, no longer threaten to retain human reason in a state of hopeless bondage, and in the eternal shackles of infancy.

The march of these people will be less flow and more fure than ours has been, because they will derive from us that light which we have been obliged to discover, and because for them to acquire the simple truths and infallible methods which we have obtained after long

2.58.

wandering in the mazes of error, it will be fufficient to feize upon their developements and proofs in our difcourses and publications. If the progress of the Greeks was lost upon other nations, it was for want of a communication between the people; and to the tyrannical domination of the Romans must the whole blame be aferi-But, when mutual wants shall have drawn closer bed. the intercourse and ties of all mankind; when the most powerful nations shall have established into political principles equality between focieties as between individuals, and respect for the independence of feeble states, as well as compassion for ignorance and wretchedness; when to the maxims which bear heavily upon the fpring of the human faculties, those shall succeed which favour their action and energy, will there still be reason to fear that the globe will contain fpaces inaccessible to knowledge, or that the pride of defpotifm will be able to oppose barriers to truth that will long be infur--mountable. Then will arrive the moment in which the fun will observe in its course free nations only, acknowledging no other master than their reason; in which tyrants and flaves, priefts and their flupid or hypocritical inftruments, will no longer exift but in hiftory and upon the ftage; in which our only concern will be to lament their past victims and dupes, and, by the recollection of their horrid enormities, to exercife a vigilant circumspection, that we may be able inftantly to recognife and effectually.

to stifle by the force of reason, the seeds of superstition and tyranny, should they ever presume again to make their appearance upon the earth.

In tracing the hiftory of focieties we have had occafion to remark, that there frequently exifts a confiderable diffinction between the rights which the law acknowledges in the citizens of a flate, and those which they really enjoy; between the equality established by political institutions, and that which takes place between the individual members; and that to this disproportion was chiefly owing the destruction of liberty in the ancient republics, the storms which they had to encounter, and the weakness that furrendered them into the power

of foreign tyrants.

Three principal caufes may be affigned for these diffinctions: inequality of wealth, inequality of condition between him whose resources of subsistence are secured to himself and descendable to his family, and him whose resources are annihilated with the termination of his life, or rather of that part of his life in which he is capable of labour; and lastiy, inequality of instruction.

It will therefore behave us to flew, that these three kinds of real inequality must continually diminish; but without becoming absolutely extinct, fince they have natural and neceffary causes, which it would be absurd as well as dangerous to think of destroying; nor can we attempt even to destroy entirely their effects, without opening at the same time more fruitful fources of inequa-

lity, and giving to the rights of man a more direct and more fatal blow.

It is easy to prove that fortunes naturally tend to equality, and that their extreme disproportion either could not exift, or would quickly cease, if positive law had not introduced factitious means of amalling and perpetuating them; if an entire freedom of commerce and industry were brought forward to superfede the advantages which prohibitory laws and fifcal rights neceffarily give to the rich over the poor; if duties upon every fort of transfer and convention, if prohibitions to certain kinds, and the tedious and expensive formalities prefcribed to other kinds; if the uncertainty and expence attending their execution had not palfied the efforts of the poor, and fwallowed up their little accumulations; if political institutions had not laid certain prolific fources of opulence open to a few, and shut them against the many; if avarice, and the other prejudices incident to an advanced age, did not preside over marriages; in fine, if the fimplicity of our manners and the wifdom of our inftitutions were calculated to prevent riches from operating as the means of gratifying vanity or ambition, at the fame time that an ill-judged austerity, by forbidding us to render them a means of coflly pleafures, fhould not force us to preferve the wealth that had once been accumulated.

••

Let us compare, in the enlightened nations of Europe, the actual population with the extent of territory;

let us observe, amidst the spectacle of their culture and their industry, the way in which labour and the means of fubfistance are distributed, and we shall see that it will be impossible to maintain these means in the same extent, and of confequence to maintain the fame mafs of population, if any confiderable number of individuals ceafe to have, as now, nothing but their industry, and the pittance necessary to set it at work, or to render its profit equal to the fupplying their own wants and those of their family. But neither this industry, nor the scanty referve we have mentioned, can be perpetuated, except fo long as the life and health of each head of a family is perpetuated. Their little fortune therefore is at best an annuity, but in reality with features of precarioufnefs that an annuity wants: and from hence refults a molt important difference between this class of fociety and the clafs of men whole refources confift either of a landed income, or the interest of a capital, which depends little upon perfonal industry, and is therefore not subject to fimilar rifks.

There exifts then a neceffary caufe of inequality, of dependence, and even of penury, which menaces without ceafing the most numerous and active class of our focieties.

This inequality, however, may be in great measure deftroyed, by fetting chance against chance, in fecuring to him who attains old age a support, arising from his favings, but augmented by those of other persons, who,

-making a fimilar addition to a common flock, may hap-. pen to die before they shall have occasion to recur to it; in procuring, by a like regulation, an equal refource for women who may lofe their husbands, or children who may lofe their father; laftly, in preparing for those youths, who arrive at an age to be capable of working for themfelves, and of giving birth to a new family, the benefit of a capital fufficient to employ their industry, and increased at the expence of those whom premature death may cut off before they arrive at that period. To the application of mathematics to the probabilities of life and the interest of money, are we indebted for the hint of these means, already employed with some degree of fuccefs, though they have not been carried to fuch extent, or employed in fuch variety of forms, as would render them truly beneficial, not merely to a few families, but to the whole mass of society, which would thereby be relieved from that periodical ruin observable in a number of families, the ever-flowing fource of corruption and depravity. These establishments, which may be formed in the name of the focial power, and become one of its greatest benefits, might also be the refult of individual affociations, which may be inftituted without danger, when the principles by which the effablishments ought to be organifed, shall have become more popular, and the errors, by which a great number of fuch affociations have

. 263

.

been destroyed, shall cease to be an object of appre-

We may enumerate other means of fecuring the equality in queftion, either by preventing credit from continuing to be a privilege exclusively attached to large fortunes, without at the fame time placing it upon a lefs folid foundation; or by rendering the progress of industry and the activity of commerce more independent of the existence of great capitalists: and for these refources also we shall be indebted to the science of calculation.

The equality of inftruction we can hope to attain, and with which we ought to be fatisfied, is that which excludes every species of dependence, whether forced or voluntary. We may exhibit, in the actual flate of human knowledge, the eafy means by which this end may be attained even for these who can devote to fludy but a few years of infancy, and, in fublequent life, only fome occasional hours of leifure. We might shew, that by a happy choice of the subjects to be taught, and of the mode of inculcating them, the entire mafs of a people may be inftructed in every thing necessary for the purposes of domestic economy; for the transaction of their affairs; for the free developement of their induftry and their faculties; for the knowledge, exercise and protection of their rights; for a fease of their duties, and the power of difcharging them; for the capacity of judging both their own actions, and the actions of others, by their own understanding; for the acquisition of all the

delicate or dignified sentiments that are an honour to: humanity; for freeing themselves from a blind confidence. in those to whom they may entrust the care of their interests, and the security of their rights; for chusing and watching over them, fo as no longer to be the dupes of those popular errors that torment and way-lay the life of man with fuperstitious fears and chimerical hopes; for defending themfelves against prejudices by the fole energy of reason; in fine, for escaping from the delusions of imposture, which would spread fnares for their fortune, their health, their freedom of opinion and of conscience, under the pretext of enriching, of healing, and of faving them. The inhabitants of the fame country being then nolonger diffinguished among themselves by the alternate. use of a refined or a vulgar language; being equally governed by their own understandings; being no moreconfined to the mechanical knowledge of the proceffes of the arts, and the mere routine of a profession; no more dependent in the most trifling affairs, and for the flightest information, upon men of skill, who, by a necessary ascendancy, controul and govern, a real equality must be the refult; fince the difference of talents and information can no longer place a barrier between men whole fentiments, ideas, and phraseology are capable of being mutually understood, of whom the one part may defire to be instructed, but cannot need to be guided by the other; of whom the one part may delegate

to the other the office of a rational government, but cannot be forced to regard them with blind and unlimited confidence.

Then it is that this fuperiority will become an advantage even for those who do not partake of it, fince it will exift not as their enemy, but as their friend. The : natural difference of faculties between men whofe understandings have not been cultivated, produces, even : among favages, empirics and dupes, the one skilled in a delusion, the others easy to be deceived : the same difference will doubtlefs exift among a people where instruction shall be truly general; but it will be here between men of exalted understandings and men of found i minds, who can admire the radiance of knowledge, . without fuffering themfelves to be dazzled by it; be- -• tween talents and genius on the one hand, and on the • other the good fense that knows how to appreciate and enjoy them: and should this difference be even greater in the latter case, comparing the force and extent of the faculties only, still would the effects of it not be the lefs . imperceptible in the relations of men with each other, in . whatever is interesting to their independence or their. happinels. The different causes of equality we have enumerated do not act diffinctly and apart; they unite, they incorporate, they support one another; and from their combined influence refults an action proportionably forcible, fure, and conftant. If instruction become more equal,

 $\mathbf{Z}_{\cdot \mathbf{2}}$ 

industry thence acquires greater equality, and from industry the effect is communicated to fortunes; and equality of fortunes neceffarily contributes to that of instruction, while equality of nations, like that established between individuals, have also a mutual operation uponeach other.

In fine, instruction, properly directed, corrects the: natural inequality of the faculties, inflead of ftrengthening it, in like manner as good laws remedy the natural inequality of the means of subfistance; or as, in focieties whofe institutions shall have effected this equality, liberty, though subjected to a regular government, will be more extensive, more complete, than in the independence of favage life. Then has the focial art accomplished its end, that of securing and extending for all the enjoyment of the common rights which impartial nature has bequeathed to all. The advantages that must refult from the state of improvement, of which I have proved we may almost entertain the certain hope, can have no limit but the abfolute perfection of the human species, since, in proportion as different kinds of equality shall be established as to the various means of providing for our wants, as to a more univerfal instruction, and a more entire liberty, the more real will be this equality, and the nearer will it approach towards embracing every thing truly important to the happiness of mankind.

It is then by examining the progrellion and the laws = of this perfection, that we can alone arrive at the knowledge of the extent or boundary of our hopes.

It has never yet been supposed, that all the facts of nature, and all the means of acquiring precifion in the computation and analysis of those facts, and all the connections of objects with each other, and all the possible combinations of ideas, can be exhausted by the human : mind. The mere relations of magnitude, the combinations, quantity and extent of this idea alone, form already a fystem too immense for the mind of man ever to grafp the whole of it; a portion, more vaft than that which he may have penetrated, will always remain un- known to him. It has, however, been imagined, that, as man can know a part only of the objects which the nature of his intelligence permits him to investigate, he must at length reach the point at which, the number and complication of those he already knows having ab- forbed all his powers, farther progrefs will become abfo- ~ lutely impossible. But, in proportion as facts are multiplied, man 2 learns to clafs them, and reduce them to more general facts, at the same time that the instruments and methods . for observing them, and registering them with exactnefs, acquire a new precision: in proportion as relations more multifarious between a greater number of objects are difcovered, man continues to reduce them to relations of a wider denomination, to express them with

greater fimplicity, and to prefent them in a way which may enable a given strength of mind, with a given quantity of attention, to take in a greater number than before: in proportion as the understanding embraces more complicated combinations, a fimple mode of announcing these combinations renders them more easy to be treated. Hence it follows that truths, the discovery of which was accompanied with the most laborious efforts, and which at first could not be comprehended but by men of the severest attention, will after a time be unfolded and proved in methods that are not above the efforts of an ordinary capacity. And thus fhould the methods that led to new combinations be exhaufted, should their applications to questions, still unresolved, demand exertions greater than the time or the powers of the learned can bestow, more general methods, means more simple would foon come to their aid, and open a farther career to genius. The energy, the real extent of the human intellect may remain the fame; but the inffruments which it can employ will be multiplied and improved; but the language which fixes and determines the ideas will acquire more precision and compass; and it will not be here, as in the science of mechanics, where, to increase the force, we must diminish the velocity; on the contrary, the methods by which genius will arrive at the difcovery of new truths, augment at once both the force and zthe rapidity of its operations. -

\*

In a word, these changes being themfelves the neceffary confequences of additional progrefs in the knowledge of truths of detail, and the caufe which produces a demand for new refources, producing at the fame time the means of fupplying them, it follows that the actual mass of truths appertaining to the fciences of observation, calculation and experiment, may be perpetually augmented, and that without supposing the faculties of manto possible a force and activity, and a scope of action greater than before.

By applying these general reflections to the differ-ent sciences, we might exhibit, respecting each, examples of this progressive improvement, which would : remove all possibility of doubt as to the certainty of the further improvement that may be expected. We might indicate particularly in those which prejudice confiders as nearest to being exhausted, the marks of an almost certain and early advance. We might illustrate the extent, the precision, the unity which must be added to the fystem comprehending all human knowledge; by a more general and philosophical application of the science of calculation to the individual branches. of which that fystem is composed. We might shew how favourable to our hopes a more universal inftruction would prove, by which a greater number of individuals would acquire the elementary knowledge. that might infpire them with a tafte for a particular kind of fludy; and how much these hopes would :

be further heightened if this application to fludy were to be rendered flill more extensive by a more general eafe of circumflances. At prefent, in the most enlightened countries, fcarcely do one in fifty of those whom nature has bleffed with talents receive the necessary instruction for the development of them: how different would be the proportion in the case we are supposing? and of confequence how different the number of mendestined to extend the horizon of the fciences?

We might shew how much this equality of instruction, joined to the national equality we have supposed. to take place, would accelerate those fciences, the advancement of which depends upon observations repeated. in a greater number of inflances, and extending over a larger portion of territory; how much benefit would be derived therefrom to mineralogy, botany, zoology, and the doctrine of meteors; in fhort, how infinite the difference between the feeble means hitherto enjoyed by these sciences, and which yet have led to useful and important truths, and the magnitude of those which man would then have it in his power to employ. Lastly, we might prove that, from the advantage of being cultivated by a greater number of perfons, even the progress of those sciences, in which discoveries are the fruit of individual meditation; would, also, be confiderably advanced by means of minuter improvements, not requiring the strength of intellect, necessary for inventions, but that prefent themselves to the reflection of the least profound understandings.

۰ ۰

If we pais to the progress of the arts, those arts particularly the theory of which depends on these very fame fciences, we shall find that it can have no inferior limits; that their processes are susceptible of the fame improvement, the fame simplifications, as the scientific methods; that instruments, machines, looms, will add every day to the capabilities and skill of man-will augment at once the excellence and precision of his works, while they will diminish the time and labour necessary for executing them; and that then will difappear the obstacles that shill oppose themselves to the progress in question, accidents which will be foressen and prevented; and lastly, the unhealthiness at prefent atten-

dant upon certain operations, habits and climates.

A fmaller portion of ground will then be made to produce a proportion of provisions of higher value or greater utility; a greater quantity of enjoyment will be procured at a fmaller expence of confumption; the fame manufactured or artificial commodity will be produced at a fmaller expence of raw materials, or will be ftronger and more durable; every foil will be appropriated to productions which will fatisfy a greater number of wants with the leaft labour, and taken in the fmalleft quantities. Thus the means of health and frugality will be encreafed, together with the inftruments in the arts of production, of curing commodities and manufacturing their produce, without demanding the facrifice of one enjoyment by the confumer.

Ð

Thus, not only the fame fpecies of ground will nourifh a greater number of individuals, but each individual, with a lefs quantity of labour, will labour more fuccefsfully, and be furrounded with greater conveniences.

It may, however, be demanded, whether, amidst this improvement in industry and happinefs, where the · wants and faculties of men will continually become better proportioned, each fuccessive generation possess more various flores, and of confequence in each generation the number of individuals be greatly increased; it may, I fay, be demanded, whether these principles of improvement and increase may not, by their continual operation, ultimately lead to degeneracy and deftruction? Whether the number of inhabitants in the universe at length exceeding the means of existence, there will not refult a continual decay of happiness and population, and a progress towards barbarism, or at least a fort of oscillation between good and evil? Will not this ofcilla-' tion, in societies arrived at this epoch, be a perennial fource of periodical calamity and diffres? In a word, do not these confiderations point out the limit at which all farther improvement will become impossible, and - confequently the perfectibility of man arrive at a period which in the immensity of ages it may attain, but which it can never pass?

There is, doubtless, no individual that does not perceive how very remote from us will be this period :

but must it one day arrive? It is equally impossible to pronounce on either fide refpecting an event, which can only be realized at an epoch when the human species will necessarily have acquired a degree of knowledge, of which our short-sighted understandings can fearcely form an idea. And who shall prefume to foretel to what perfection the art of converting the elements of life into substances sitted for our use, may, in a progression of ages, be brought?

But fuppoling the affirmative, suppoling it astually to take place, there would refult from it nothing alarming, either to the happiness of the human race, or its indefinite perfectibility; if we confider, that prior to this period the progrefs of reafon will have walked hand in hand with that of the sciences; that the absurd prejudices of superstition will have ceased to infuse into morality a harfhnefs that corrupts and degrades, instead of purifying and exalting it; that men will then know, that the duties they may be under relative to propagation will confift not in the question of giving cxistence to a greater number of beings, but happines; will have for their object, the general welfare of the human fpecies; of the fociety in which they live; of the family to which they are attached; and not the puerile idea of . encumbering the carth with useless and wretched mortals. Accordingly, there might then be a limit to the possible mass of provision, and of consequence to the greatest possible population, without that premature de-

ftruction, fo contrary to nature and to focial profperity, of a portion of the beings who may have received life, being the refult of those limits.

As the difcovery, or rather the accurate folution of the first principles of metaphysics, morals, and politics, is still recent; and as it has been preceded by the knowledge of a confiderable number of truths of detail, the prejudice, that they have thereby arrived at their highest point of improvement, becomes easily established in the mind; and men suppose that nothing remains to be done, because there are no longer any gross errors to deftroy, or fundamental truths to establish.

But it requires little penetration to perceive how imperfect is still the developement of the intellectual and moral faculties of man; how much fatther the fphere \_ of his duties, including therein the influence of his actions upon the welfare of his fellow creatures and of the fociety to which he belongs, may be extended by a more fixed, a more profound and more accurate obfervation of that influence; how many questions still remain to be folved, how many focial ties to be examined, before we can afcertain the precife catalogue of the individual rights of man, as well as of the rights which the focial flate confers upon the whole community with segard to each member. Have we even afcertained with any precision the limits of these rights, whether as they exift between different societies, or in any single society, over its members, in cases of division and hof-

.

tility; or, in fine, the rights of individuals, their fpontaneous unions in the cafe of a primitive formation, or their feparations when fcparation becomes neceffary ? If we pafs on to the theory which ought to direct the application of thefe principles, and ferve as the bafisof the focial art, do we not fee the neceffity of acquiring an exactnefs of which first truths, from their generalnature, are not fusceptible ? Are we fo far advanced as to confider justice, or a proved and acknowledged utility and not vague, uncertain, and arbitrary views of pretended political advantages, as the foundation of all inftitutions of law? Among the variety, almost infinite, of

275

possible systems, in which the general principles of equality and natural rights should be respected, have we yet fixed upon the precife rules of afcertaining with certainty those which best secure the prefervation of these rights, which afford the freest scope for their exercise and enjoyment, which promote most effectually the peace and welfare of individuals, and the strength, repose, and profperity of nations? The application of the arithmetic of combinations and probabilities to these sciences, promises an improvement by fo much the more confiderable, as it is the only means of giving to their refults an almost mathematical precision, and of appreciating thier degree of certainty or probability. The facts upon which these refults are built may, indeed, without calculation, and by a glance only, lead to some general truths; teach us whether

the effects produced by fuch a caufe have been favourable or the reverse : but if these facts have neither been counted nor estimated; if these effects have not been the object of an exact admeasurment, we cannot judge of the quantity of good or evil they contain : if the good or evil nearly balance each other, nay, if the difference be not confiderable, we cannot pronounce with certainty to which fide the balance inclines. Without the application of this arithmetic, it would be almost impossible to chufe, with found reafon, between two combinations proposing to themselves the fame end, when their advantages are not diffinguishable by any confiderable difference. In fine, without this alliance, these sciences would remain forever grofs and narrow, for want of inflruments of fufficient polifh to lay hold of the fubtility of truth-for want of machines fufficiently accurate to found the bottom of the well where it conceals its · wealth. Meanwhile this application, notwithstanding the happy efforts of certain geometers, is still, if I may fo fpeak, in its first rudiments; and to the following generations must it open a source of intelligence inexhaustible as calculation itself, or as the combinations, analogies, and facts that may be brought within the fphere of its operations.

There is another species of progress, appertaining to the sciences in question, equally important; I mean, the improvement of their language, at prefent so vague

and fo obscure. To this improvement must they owe the advantage of becoming popular, even in their first elements. Genius can triumph over these inaccuracies, as over other obstacles; it can recognise the features of truth, in fpite of the mask that conceals or dissigures But how is the man who can devote but a few them. leifure moments to instruction to do this? how is he to acquire and retain the most fimple truths, if they be difguifed by an inaccurate language? The fewer ideas : he is able to collect and combine, the more requifite it is that they be just and precise. He has no fund of truths stored up in his mind, by which to guard himself against error; nor is his understanding fo strengthened and refined by long exercise; that he can catch these feeble rays of light which efcape under the obfcure and ambiguous drefs of an imperfect and vicious phraseology. It will be impossible for men to become enlight. ened upon the nature and developement of their moral fentiments, upon the principles of morality, upon the motives for conforming their conduct tothose principles, and upon their interests, whether relative to their individual or focial capacity, without making, at the fame time, an advancement in moral practice, not lefs real than that of the fcience itself. Isnot a mistaken interest the most frequent cause of actions -\_ contrary to the general welfare? Is not the impetuofity · of our passions the continual refult, either of habits to · which we addict ourfelves from a falle calculation, or:

A a 2

of ignorance of the means by which to refift their first impulse, to divert, govern, and direct their action?

Is not the practice of reflecting upon our conduct; of trying it by the touchstone of reason and confcience; of exercifing those humane fentiments which blend our happiness with that of others, the necessary confequence of the well-directed study of morality, and of a greater equality in the conditions of the focial compact? Will not that confciousness of his own dignity, appertaining to the man who is free, that fystem of education built upon a more profound knowledge of our moral conftitution, render common to almost every man those principles of a strict and unfullied justice, those habitual propensities of an active and enlightened benevolence, of a delicate and generous fenfibility, of which nature has planted the feeds in our hearts, and which wait only for the genial influence of knowledge and liberty to expand and to fructify? In manner as the mathematical and phyfical fciences tend to improve the arts that are employed for our most simple wants, so is it not equally in the necessary order of nature that the moral and political sciences should exercise a similar influence upon the motives that direct our fentiments and our actions?

What is the object of the improvement of laws and public inftitutions, confequent upon the progrefs of these fciences, but to reconcile, to approximate, to blend and unite into one mass the common interest of each indivi-

dual with the common interest of all? What is the end of the social art, but to destroy the opposition between these two apparently jarring sentiments? And will not the constitution and laws of that country best accord with the intentions of reason and nature where the practice of virtue shall be least difficult, and the temptations to deviate from her paths least numerous and least powerful.

What vicious habit can be mentioned, what practice contrary to good faith, what crime even, the origin and first cause of which may not be traced in the legislation, institutions, and prejudices of the country in which we observe fuch habit, such practice, or such crime to be

committed ?

In fhort, does not the well-being, the profperity, refulting from the progrefs that will be made by the ufeful arts, in confequence of their being founded upon a found theory, refulting, alfo, from an improved legiflation, built upon the truths of the political fciences, naturally difpofe men to humanity, to benevolence, and to juffice? Do not all the obfervations, in fine, which we propofed to develope in this work prove, that the moral goodnefs of man, the neceffary confequence of his organization, is, like all his other faculties, fufceptible of an indefinite improvement? and that nature has connected, by a chain which cannot be broken, truth, happinefs, and virtue?

Among those causes of human improvement that are of most importance to the general welfare, must be included, the total annihilation of the prejudices which have established between the fexes an inequality of rights, fatal even to the party which it favours. In vain might we fearch for motives by which to justify this principle, in difference of physical organization, of intellect, or of moral fensibility. It had at first no other origin but abuse of strength, and all the attempts which have fince been made to support it are idlestrength.

And here we may obferve, how much the abolition of the ulages authorized by this prejudice, and of the

laws which it has dictated, would tend to augment the happinefs of families; to render common the virtues of domeftic life, the fountain-head of all the others; to favour inftruction, and, efpecially, to make it truly general, either becaufe it would be extended to both fexes with greater equality, or becaufe it cannot become general, even to men, without the concurrence of the mothers of families. Would not this homage, fo long in paying, to the divinities of equity and good fenfe, put an end to a too fertile principle of injuffice, cruelty, and crime, by fuperfeding the opposition hitherto maintained between that natural propensity, which is, of all others the most imperious, and the most difficult to fubdue, and the interest of man, or the duties of fociety? Would it not produce, what has hitherto been a

mere chimera, national manners of a nature mild and : pure, formed, not by imperious privations, by hypocritical appearances, by referves imposed by the fear of shame or religious terrors, but by habits freely contracted, infpired by nature and avowed by reafon?

The people being more enlightened, and having refumed the right of difpoling for themfelves of their blood and their treasure, will learn by degrees to regard war as the most dreadful of all calamities, the most terrible of all crimes. The first wars that will be fuperfeded, will be those into which the usurpers of fovereignty have hitherto drawn their subjects for the maintenance of rights pretendedly hereditary.

Nations will know; that they cannot become conquerors without lofing their freedom; that perpetual confederations are the only means of maintaining their independance; that their object should be security, and not power. By degrees commercial prejudices will die away; a false mercantile interest will lose the terrible power of imbuing the earth with blood, and of ruining nations under the idea of enriching them. As the people of different countries will at last be drawn into clofer intimacy, by the principles of politics and morality, as each, for its own advantage, will inviteforeigners to an equal participation of the benefits which it may have derived either from nature or its own industry, all the caufes which produce, envenom, and perpetuate national animofities, will one by one difappear,

• and will no more furnish to warlike infanity either fuel or pretext.

Inflitutions, better combined than those projects of perpetual peace which have occupied the leifure and confoled the heart of certain philosophers, will accelerate the progress of this fraternity of nations; and wars, like affassinations, will be ranked in the number of those · daring atrocities, humiliating and loathsome to nature; and which fix upon the country or the age whose annals are stained with them, an indelible opprobrium.

In fpeaking of the fine arts in Greece, in Italy, and in France, we have observed, that it is necessary to distinguish, in their productions, what really belongs to the progrefs of the art, and what is due only to the talent of the artift. And here let us enquire what progrefs may still be expected, whether, in confequence of the advancement of philosophy and the sciences, or from an additional store of more judicious and profound observations relative to the object, the effects and the means of these arts themselves; or lastly, from the removal of the prejudices that have contracted their fphere, and that still retain them in the shackles of authority, from which the fciences and philosophy have at length freed themfelves. Let us afk, whether, as has frequently been fuppofed, thefe means may be confidered as exhausled? or, if not exhausted, whether, because the most sublime and pathetic beauties have been fiezed; the most happy subjects treated; the most sim-

ple and striking combinations employed; the most prominent and general characters exhibited; the most energetic passions, their true expressions and genuine features deleniated; the most commanding truths, the most brilliant images displayed; that, therefore, the arts are condemned to an eternal and monotonous imitation of their first models?

283

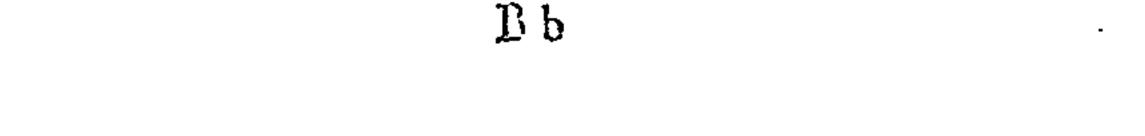

We shall perceive that this opinion is merely a prejudice, derived from the habit which exifts among men of letters and artifts of appreciating the merits of men, instead of giving themselves up to the enjoyment to be received from their works. The fecond-hand pleafure which arifes from comparing the productions of different .ages and countries, and from contemplating the energy and fuccels of the efforts of genius, will perhaps be loft; but, in the mean time, the pleafure arifing from the productions confidered in themfelves, and flowing from their absolute perfection, need not be less lively, though the improvement of the author may lefs excite our altonishment. In proportion as excellent productions shall multiply, every fuccessive generation of men will direct its attention to those which are the most perfect, and the reft will infenfibly fall into oblivion; while the more fimple and palpable traits, which were feized upon by those who first entered the field of invention, will not the lefs exift for our posterity, though they shall be found only in the latest productions.

The progress of the sciences secures the progress of the art of instruction, which again accelerates in its turn that of the fciences; and this reciprocal influence, the action of which is inceffantly increased, must be ranked in the number of the most prolific and powerful causes of the improvement of the human race. At present, a young man, upon finishing his studies and quitting our fchools, may know more of the principles of mathematics than Newton acquired by profound fludy, or difcovered by the force of his genius, and may exercise the inftrument of calculation with a readinefs which at that period was unknown. The fame observation, with certain refrictions, may be applied to all the fciences. In proportion as each shall advance, the means of compreffing, within a fmaller circle, the proofs of a greater number of truths, and of facilitating their comprehenfion, will equally advance. Thus, notwithstanding future degrees of progress, not only will men of equal genius find themfelves, at the fame period of life, upon a level with the actual state of science, but, respecting every generation, what may be acquired in a given space of time, by the fame strength of intellect and the fame degree of attention, will necessarily increase, and the elementary part of each fcience, that part which every man may attain, becoming more and more extended, will include, in a manner more complete, the knowledge necessary for the direction of every man in

the common occurrences of life, and for the free and independent exercise of his reason.

In the political sciences there is a description of truths, which particularly in free countries (that is, in all countries in certain generations), can only be useful when generally known and avowed. Thus, the influence of these fciences upon the freedom and prosperity of nations, must, in some fort, be measured by the number of those truths that, in confequence of elementary instruction, shall pervade the general mind : and thus, as the growing progress of this elementary instruction is connected with the necessary progress of the fciences, we may expect a melioration in the doctrines of the human race which may be regarded as indefinite, fince it can have no other limits than those of the two fpecies of progrefs on which it depends. We have still two other means of general application to confider, and which must influence at once both the improvement of the art of instruction and that of the sciences. One is a more extensive and more perfect adoption of what may be called technical methods; the other, the inflitution of an universal language.

By technical methods I understand, the art of uniting a great number of objects in an arranged and fystematic order, by which we may be enabled to perceive at a glance their bearings and connections, scize in an instant their combinations, and form from them the more readily new combinations.

### -286

Let us develope the principles, let us examine the utility of this art, as yet in its infancy, and we shall find that, when improved and perfected, we might derive from it, either the advantage of possessing within the narrow compass of a picture, what it would be often difficult for volumes to explain to us fo readily and fo well; or the means, still more valuable, of prefenting isolated facts in a disposition and view best calculated to give us their general refults. We shall perceive how, by means of a finall number of these pictures or tables, the use of which may be eafily learned, men who have not been able to appropriate fuch useful details and elementary knowledge as may apply to the purposes of common life, may turn to them at the shortest notice; and how elementary knowledge itfelf, in all those sciences where this knowledge is founded either upon a regular code of truths or a feries of obfervations and experiments, may hereby be facilitated. An universal language is that which expresses by figns, either the direct objects, or those well-defined collections conflituted of fimple and general ideas, which are to be found or may be introduced equally in the understandings of all mankind; or lastly, the general relations of these ideas, the operations of the human mind, the operations peculiar to any fcience, and the mode of process in the arts. Thus, such perfons as shall have become masters of these figns, the method of combining and the rules for confirating them, will

understand what is written in this language, and will read it with fimilar facility in the language of their owncountry, whatever it may happen to be.

It is apparent, that this language might be employed to explain either the theory of a fcience or the rules of an art; to give an account of a new experiment or a new obfervation, the acquisition of a fcientific truth, the invention of a method, or the discovery of a process; and that, like algebra, when obliged to make use of new figns, those already known would afford the means of afcertaining their value.

A language like this has not the inconvenience of a fcientific idiom, different from the vernacular tongue.

We have before obferved, that the ufe of fuch an idiom neceffarily divides focieties into two extremely unequal claffes; the one composed of men, understanding the language, and, therefore, in possible of the key to the fciences; the other of those who, incapable of learning it, find themfelves reduced almost to an absolute impossible of acquiring knowledge. On the contrary, the universal language we are fupposing, might be learned, like the language of algebra, with the fcience itself; the fign might be known at the fame instant with the object, the idea, or the operation which it expresses. He who, having attained the elements of a fcience, should wish to profecute farther his enquiries, would find in books, not only truths that he could understand, by means of those figns, of which he already knows the

value, but the explanation of the new figns of which he has need in order to afcend to higher truths.

It might be shown that the formation of such a language, if confined to the expressing of simple and precife propositions, like those which form the fystem of a science, or the practice of an art, would be the reverse of chimerical; that its execution, even at prefent, would be extremely practicable as to a great number of objects; and that the chief obftacle that would ftand in the way of extending it to others, would be the humiliating neceffity of acknowledging how few precife ideas, and accurately defined notions, underflood exactly in the fame fenfe by every mind, we really poffefs. It might be shown that this language, improving every day, acquiring inceffantly greater extent, would be the means of giving to every object that comes within the reach of human intelligence, a rigour, and precision, that would facilitate the knowledge of truth, and render error almost impossible. Then would the march of every fcience be as infallible as that of the mathematics, and the propositions of every fystem acquire, as far as nature will admit, geometrical demonstration and certainty.

All the caufes which contribute to the improvement of the human fpecies, all the means we have enumerated that infure its progrefs, must, from their very nature, exercise an influence always active, and acquire an extent for ever increasing. The proofs of this have

been exhibited, and from their developement in the work itfelf they will derive additional force : accordingly we may already conclude, that the perfectibility of man is indefinite. Meanwhile we have hitherto confidered him as poffeffing only the fame natural faculties, as endowed with the fame organization. How much greater would be the certainty, how much wider the compass of our hopes, could we prove that these natural faculties themselves, that this very organization, are also fusceptible of melioration? And this is the last question we shall examine.

The organic perfectibility or deterioration of the classes of the vegetable, or species of the animal kingdom, may be regarded as one of the general laws of nature.

This law extends itfelf to the human race; and it cannot be doubted that the progrefs of the fanative art, that the ufe of more wholefome food and more comfortable habitations, that a mode of life which fhall develope the phyfical powers by exercife, without at the fame time impairing them by excefs; in fine, that the deftruction of the two moft active caufes of deterioration, penury and wretchednefs on the one hand, and enormous wealth on the other, muft neceffarily tend to prolong the common duration of man's exiftence, and fecure him a more conftant health and a more robuft conflitution. It is manifell that the improvement of the = practice of medicine, become more efficacious in con-Bb 2

fequence of the progrefs of reafon and the focial order, must in the end put a period to transmissible or contagious diforders, as well to those general maladies refuling from climate, aliments, and the nature of certain occupations. Nor would- it be difficult to prove that this hope might be extended to almost every other malady, of which it is probable we shall hereafter difcover the most remote causes. Would it even be abfurd to suppose this quality of melioration in the human fpecies as susceptible of an indefinate advancement; to suppose that a period must one day arrive when death will be nothing more than the effect either of extraordinary accidents, or of the flow and gradual decay of the vital powers; and that the duration of the middle space, of the interval between the birth of man and this decay, will itself liave no assignable limit? Certainly man will not become immortal; but may not the distance between the moment in which he draws his first breath, and the common term when, in the course of nature, without malady or accident, he finds it impossible any longer to exist, be necessarily protracted? As we are now speaking of a progrefs that is capable of being reprefented with precision, by numerical quantities or by lines, we shall embrace the opportunity of explaining the two meanings that may be affixed to the word indefinite.

In reality, this middle term of life, which in proportion as men advance upon the ocean of futurity, we have 'supposed inceffantly to increase, may receive additions

either in conformity to a law by which, though approaching continually an illimitable extent, it could never possibly arrive at it; or a law by which, in the immensity of ages, it may acquire a greater extent than any determinate quantity whatever that may be assigned as its limit. In the latter cafe, this duration of life is indefinite in the strictest fense of the word, fince there exist no bounds on this fide of which it must necessfarily stop. And in the former, it is equally indefinite to us; if we cannot fix the term, it may for ever approach, but can never furpass; particularly if, knowing only that it can never flop, we are ignorant in which of the two fenfes the term indefinite is applicable to it : and this is pre-

cifely the state of the knowledge we have as yet acquired. relative to the perfectibility of the species.

Thus, in the inflance we are confidering, we are bound to believe that the mean duration of human life - will for ever increase, unless its increase be prevented by the physical revolutions of the fystem; but we cannot tell what is the bound which the duration of human life can never exceed; we cannot even tell, whether there be any circumstance in the laws of nature which has determined and laid down its limit.

But may not our physical faculties, the force, the fagacity, the acuteness of the senses, be numbered among the qualities, the individual improvement of which it will be practicable to transmit? An attention to the different breeds of domestic animals must lead us to adopt

-

#### 292`

the affirmative of this question, and a direct observation of the human species itself will be found to strengthen the opinion.

Lastly, may we not include in the fame circle the : intellectual and moral faculties? May not our parents, who transmit to us the advantages or defects of their conformation, and from whom we receive our features and shape, as well as our propensities to certain physical affections, transmit to us also that part of organization upon which intellect, strength of understanding, energy of foul or moral fenfibility depend? Is it not probable that education, by improving thefe qualities, will at the fame time have an influence upon, will modify and improve this organization itself? Analogy, an investigation of the human faculties, and even fome facts, appear to authorife these conjectures, and thereby to enlarge the baundary of our hopes. Such are the questions with which we shall terminate the last division of our work. And how admirably calculated is this view of the human race, emancipated from its chains, releafed alike from the dominion of chance, as well as from that of the enemies of its progrefs, and advancing with a firm and indeviate step in the paths of truth, to confole the philosopher lamenting the errors, the flagrant acts of injustice, the crimes with which the earth is still polluted? It is the contemplation of this profpect that rewards him for all his efforts to affift the progrefs of reafon and the eftablishment of liber-

ty. He dares to regard these efforts as a part of the eternal chain of the deftiny of mankind; and in this perfuafion he finds the true delight of virtue, the pleafure of having performed a durable fervice, which no vicifitude will ever destroy in a fatal operation calculated to restore the reign of prejudice and flavery. This fentiment is the afylum into which he retires, and to which the memory of his perfecutors cannot follow him: he unites himfelf in imagination with man reftored to his rights, delivered from oppression, and proceeding with rapid flrides in the path of happines; he forgets his own miffortunes while his thoughts are thus employed; he lives no longer to adverfity, calumny and malice, but becomes the affociate of these wifer and more fortunate beings whose enviable condition he so earnestly contributed to produce.

THE END.
