## Foreword

MMWR Summary of Notifiable Diseases, United States, 1996

This publication contains summary tables of the official statistics for the reported occurrence of nationally notifiable diseases in the United States for 1996. These statistics are collected and compiled from reports to the National Notifiable Diseases Surveillance System (NNDSS), which is operated by CDC in collaboration with the Council of State and Territorial Epidemiologists (CSTE). Because the dates of onset and dates of diagnosis for notifiable diseases may not always be reported, these surveillance data are presented by the week that they were reported to CDC by public health officials in state and territorial health departments. These data are finalized and published in the MMWR Summary of Notifiable Diseases, United States for use by state and local health departments; schools of medicine and public health; communications media; local, state, and federal agencies; and other agencies or persons interested in following the trends of reportable diseases in the United States. The annual publication of the Summary also documents which diseases are considered national priorities for notification and the annual number of cases of such diseases.

Part 1 contains information regarding morbidity for each of the diseases considered nationally notifiable during 1996. The tables provide the number of cases of notifiable diseases reported to CDC for 1996, as well as the distribution of cases by month and geographic location, and by patient's age, sex, race, and Hispanic ethnicity. The data are final totals as of July 25, 1997, unless otherwise noted. Because no cases of anthrax were reported in the United States during 1996, this nationally notifiable disease does not appear in the tables in Part 1. Nationally notifiable diseases that are reportable in fewer than 40 states also do not appear in these tables. In all tables, leprosy is listed as Hansen disease, and tick-borne typhus fever is listed as Rocky Mountain spotted fever (RMSF).

Part 2 contains graphs and maps. These graphs and maps depict summary data for many of the notifiable diseases that are described in tabular form in Part 1.

Part 3 includes tables that list the number of cases of notifiable diseases reported to CDC since 1967. It also includes a table enumerating deaths associated with specified notifiable diseases reported to the National Center for Health Statistics, CDC, during 1986-1995.

## Background

As of January 1, 1996, 52 infectious diseases were designated as notifiable at the national level. A notifiable disease is one for which regular, frequent, and timely information regarding individual cases is considered necessary for the prevention and control of the disease. This section briefly summarizes the history of the reporting of nationally notifiable diseases in the United States.

In 1878, Congress authorized the U.S. Marine Hospital Service (i.e., the forerunner of the Public Health Service [PHS]) to collect morbidity reports regarding cholera, smallpox, plague, and yellow fever from U.S. consuls overseas; this information was to be used for instituting quarantine measures to prevent the introduction and spread of these diseases into the United States. In 1879, a specific Congressional appropriation was made for the collection and publication of reports of these notifiable diseases. The authority for weekly reporting and publication of these reports was expanded by Congress in 1893 to include data from states and municipal authorities. To increase the uniformity of the data, Congress enacted a law in 1902 directing the Surgeon General to provide forms for the collection and compilation of data and for the publication of reports at the national level. In 1912, state and territorial health authori-ties-in conjunction with PHS-recommended immediate telegraphic reporting of five infectious diseases and the monthly reporting, by letter, of 10 additional diseases. The first annual summary of The Notifiable Diseases in 1912 included reports of 10 diseases from 19 states, the District of Columbia, and Hawaii. By 1928, all states, the District of Columbia, Hawaii, and Puerto Rico were participating in national reporting of 29 specified diseases. At their annual meeting in 1950, the State and Territorial Health Officers authorized a conference of state and territorial epidemiologists whose purpose was to determine which diseases should be reported to PHS. In 1961, CDC assumed responsibility for the collection and publication of data concerning nationally notifiable diseases.

The list of nationally notifiable diseases is revised periodically. For example, a disease may be added to the list as a new pathogen emerges, or a disease may be deleted as its incidence declines. Public health officials at state health departments and CDC continue to collaborate in determining which diseases should be nationally notifiable; CSTE, with input from CDC, makes recommendations annually for additions and deletions to the list of nationally notifiable diseases. However, reporting of nationally notifiable diseases to CDC by the states is voluntary (for a complete list of all nationally reportable infectious diseases and other conditions, see World-Wide Web site http://www.cste.org). Reporting is currently mandated (i.e., by state legislation or regulation) only at the state level. The list of diseases that are considered notifiable, therefore, varies slightly by state. All states generally report the internationally quarantinable diseases (i.e., cholera, plague, and yellow fever) in compliance with the World Health Organization's International Health Regulations.

The 52 Infectious Diseases That Were Designated as Notifiable at the National Level During 1996

| Acquired immunodeficiency | Haemophilus influenzae, <br> syndrome | Rabies, animal <br> Anthrax |
| :--- | :--- | :--- |
| Botulive disease | Rabies, human |  |
| Botulism | Hansen disease (leprosy) | Rocky Mountain spotted fever |
| Brucellosis | Hantavirus pulmonary syndrome | Rubella |
| Chancroid* | Hemolytic uremic syndrome, | Salmonellosis* |
| Chlamydia trachomatis, | post-diarrheal | Shigellosis* |
| genital infection | Hepatitis A | Streptococcal disease, |
| Cholera | Hepatitis B | invasive, group A |
| Coccidioidomycosis* | Hepatitis, C/non-A, non-B | Streptococcus pneumoniae, |
| Congenital rubella syndrome | HIV infection, pediatric | Legionellosis |
| Congenital syphilis | Lyme disease | Streptococcalant toxic-shock |
| Cryptosporidiosis | Malaria | syndrome |
| Diphtheria | Measles (Rubeola) | Syphilis |
| Encephalitis, California | Meningococcal disease | Tetanus |
| Encephalitis, eastern equine | Mumps | Toxic-shock syndrome |
| Encephalitis, St. Louis | Pertussis | Trichinosis |
| Encephalitis, western equine | Plague | Tuberculosis |
| Escherichia coli O157:H7 | Poliomyelitis, paralytic | Typhoid fever |
| Gonorrhea | Yellow fever |  |

NOTE: Although varicella is not a nationally notifiable disease, the Council of State and Territorial Epidemiologists recommends reporting of cases of this disease to CDC.
*Not currently published in the MMWR weekly tables.

## Data Sources

Provisional data concerning the reported occurrence of notifiable diseases are published weekly in MMWR. After each reporting year, staff in state health departments finalize reports of cases for that year with local or county health departments and reconcile the data with reports previously sent to CDC throughout the year; these data are compiled in final form in this summary. Notifiable disease reports (which are published in the annual MMWR Summary of Notifiable Diseases only after approval by the appropriate epidemiologist from each submitting state or territory) are the authoritative and archival counts of cases. Data published in MMWR Surveillance Summaries or other surveillance reports produced by CDC programs, which are useful for detailed epidemiologic analyses, may not agree exactly with data reported in the annual Summary of Notifiable Diseases because of differences in the timing of reports, the source of the data, and the use of different case definitions.

Data in this summary were derived primarily from reports transmitted to the Division of Public Health Surveillance and Informatics, Epidemiology Program Office, CDC, by the 50 state, two city, and five territorial health departments through the National Electronic Telecommunications System for Surveillance (NETSS). (For more information regarding NETSS and notifiable diseases, including case definitions for these conditions, see World-Wide Web site http://www.cdc.gov/epo/phs.htm.) Final data for other diseases are from the surveillance-program records of the following CDC programs (requests for further information regarding these data should be directed to the source specified):

## National Center for Health Statistics

Office of Vital and Health Statistics Systems (deaths from selected notifiable diseases)

## National Center for Infectious Diseases

Division of Bacterial and Mycotic Diseases (toxic-shock syndrome and laboratory data regarding botulism, Escherichia coli O157:H7, Salmonella, and Shigella)
Division of Vector-Borne Infectious Diseases (laboratory data regarding arboviral encephalitis)
Division of Viral and Rickettsial Diseases (animal rabies)
National Center for HIV, STD, and TB Prevention (NCHSTP)
Division of HIV/AIDS Prevention, Surveillance, and Epidemiology (acquired immunodeficiency syndrome [AIDS])
Division of Sexually Transmitted Diseases Prevention (chancroid, chlamydia, gonorrhea, and syphilis)
Division of Tuberculosis Elimination (tuberculosis)
National Immunization Program
Epidemiology and Surveillance Division (poliomyelitis)
Disease totals for the United States, unless otherwise stated, do not include data for American Samoa, Guam, Puerto Rico, the Virgin Islands, and the Commonwealth of the Northern Mariana Islands (CNMI). Disease totals from American Samoa were unavailable for 1996.

Population estimates for states are based on the July 1, 1996, post-censal estimates made by the U.S. Department of Commerce, Bureau of the Census, Population Division, Population Estimates Branch, PPL-57. Because these estimates are unavailable by age and sex for 1996, rates for reported disease occurrences by age group and among males and females use population totals from the 1995 post-censal estimates. Population estimates for territories are from the 1990 census, U.S. Department of Commerce, Bureau of the Census, Press Releases CB91-142, 242, 243, 263, and 276.

Rates in the 1996 Summary of Notifiable Diseases were based on data for the U.S. total-resident population. However, population data from states in which diseases were not notifiable or disease data were not available were excluded from rate calculations.

## Interpreting Data

The data reported in this summary are useful for analyzing disease trends and determining relative disease burdens. However, these data must be interpreted in light of reporting practices. Some diseases that cause severe clinical illness (e.g., plague or rabies), if diagnosed by a clinician, are most likely reported accurately. However, persons who have diseases that are clinically mild and infrequently associated with serious consequences (e.g., salmonellosis) may not even seek medical care from a health-care provider; even if these less severe diseases are diagnosed, they are less likely to be reported. The degree of completeness of reporting also is influenced by the diagnostic facilities that are available; the control measures that are in effect; the public awareness of a specific disease; and the interests, resources, and priorities of state and local officials responsible for disease control and public health surveillance. Finally, factors such as changes in the case definitions for public health surveillance, the introduction of new diagnostic tests, or the discovery of new disease entities may cause changes in disease reporting that are independent of the true incidence of disease.

Public health surveillance data are published for selected racial and ethnic population groups because these variables may be risk markers for certain notifiable diseases. Risk markers can identify potential risk factors for investigation in future studies. Data regarding race and ethnicity also can be useful for identifying groups to target for prevention efforts. However, caution must also be used when drawing conclusions from reported data relating to race and ethnicity. Among persons of certain races and ethnicities, there are likely to be differential patterns of access to health care, interest in seeking health care, and detection of disease that would lead to data that are not representative of disease incidence in these populations. In addition, not all data concerning race and ethnicity are collected uniformly for all diseases. For example, the Division of HIV/AIDS Prevention, Surveillance, and Epidemiology and the Division of Sexually Transmitted Diseases Prevention in NCHSTP collect information regarding race and ethnicity using a single variable. A person's racial and ethnic background is reported as either American Indian/Alaska Native, Asian/Pacific Islander, black non-Hispanic, white non-Hispanic, or Hispanic. Additionally, although the recommended standard for classifying a person's race or ethnicity is based on self-reporting, this procedure may not always be followed.

# Highlights for Selected Infectious Diseases 1996 

## Arboviral Encephalitis

The 1996 national total of 39 laboratory-confirmed California serogroup viral encephalitis cases (all of which were La Crosse encephalitis cases) represents a $95 \%$ increase over the 1995 total. This is the largest annual total of such cases reported since 1982. Reports from West Virginia and Ohio account for nearly $100 \%$ of the increase. Much of the increase in West Virginia may be attributable to the recent implementation of an active surveillance system for this disease. La Crosse encephalitis is endemic in the eastern United States, where it is associated with exposure to deciduous forests and Aedes triseriatus (the eastern treehole mosquito).

## Coccidioidomycosis

From 1990 through 1995, the number of reported cases of coccidioidomycosis in Arizona increased by $144 \%$. To characterize the trends and impact of coccidioidomycosis in Arizona, the Arizona Department of Health Services analyzed surveillance, death-certificate, and hospital-discharge data. These data indicated that, during 19901995, coccidioidomycosis in Arizona disproportionately affected persons aged $\geq 65$ years and persons with HIV infection.

## Cryptosporidiosis

National reporting for cryptosporidiosis began in 1995 with 2,972 cases reported from 27 states. In 1996, a total of 2,426 cases were reported from 42 states. Because the diagnosis of cryptosporidiosis often is not considered, and because laboratories do not routinely test for Cryptosporidium infection, cryptosporidiosis continues to be underdiagnosed and underreported.

## Hantavirus Pulmonary Syndrome

Hantavirus pulmonary syndrome (HPS) is a pan-American viral zoonosis caused by Sin Nombre virus and other New World hantaviruses which, in the United States, include Bayou virus, Black Creek Canal virus, and New York-1 virus. The identified rodent reservoirs for Sin Nombre, New York-1, Black Creek Canal, and Bayou viruses are Peromyscus maniculatus (deer mouse), Peromyscus leucopus (white-footed mouse), Sigmodon hispidus (cotton rat), and Oryzomys palustris (rice rat), respectively. Cases of HPS have been identified in the continental United States, Canada, Argentina, Brazil, Chile, Paraguay, and Uruguay. As of May 1, 1997, national surveillance for HPS has identified 160 confirmed cases in 26 states (case-fatality rate: 47.5\%); 22 of these cases occurred during 1996.

## Hemolytic Uremic Syndrome

In the United States, nearly all cases of post-diarrheal hemolytic uremic syndrome (HUS) are caused by infection with Escherichia coli 0157:H7 or other Shiga toxinproducing organisms. During 1996, the first year of national reporting, 18 states reported 102 cases of post-diarrheal HUS. Median age of patients was 5 years (range: 1-79); 75\% of cases occurred from June through October.

## Hepatitis, viral

In 1996, the Advisory Committee on Immunization Practices (ACIP) issued recommendations for the prevention of hepatitis A through active or passive immunization (MMWR 1996;45[No. RR-15]). The report provides recommendations for use of the recently licensed hepatitis A vaccines (i.e., HAVRIX ${ }^{\circledR}$, manufactured by SmithKline Beecham Biologicals, and VAOTA ${ }^{\circledR}$, manufactured by Merck \& Company, Inc.). For communities with high rates of hepatitis A and periodic outbreaks (peak rates: 700 reported cases per 100,000 population), routine vaccination of children aged 2 years and catch-up vaccination of older children are recommended. To control outbreaks in communities with intermediate rates of hepatitis A (i.e., 50-200 reported cases per 100,000 population), vaccination programs targeting subpopulations with the highest rates of disease may be considered. In these communities, ongoing routine vaccination of young children should be implemented to prevent future outbreaks.

## HIV Infection in Children and Infants

In 1996, a total of 29 states conducted surveillance of human immunodeficiency virus (HIV) infection in children. These states reported 249 cases of HIV infection that had not progressed to acquired immunodeficiency syndrome (AIDS) and 184 cases of AIDS among children. During 1996, these states received 1,720 additional reports of children who were born to HIV-infected mothers but who require follow up with providers to determine their HIV infection status.

## Lyme Disease

In 1996, a total of 16,455 cases of Lyme disease were reported to CDC by 45 states and the District of Columbia (overall incidence: 6.2 per 100,000 population), representing a $41 \%$ increase from the 11,700 cases reported in 1995 and a $26 \%$ increase from the 13,043 cases reported in 1994. As in previous years, most cases were reported from the mid-Atlantic, northeast, and north-central regions. Eight states reported Lyme disease incidences that were higher than the overall national rate (Connecticut, 94.8; Rhode Island, 53.9; New York, 29.2; New Jersey, 27.4; Delaware, 23.9; Pennsylvania, 23.3; Maryland, 8.8; and Wisconsin, 7.7); these states accounted for 14,959 ( $91 \%$ ) of the nationally reported cases. In 1996, zero cases were reported from five states (i.e., Alaska, Arizona, Colorado, Montana, and South Dakota). The increase in reported Lyme disease cases in 1996 probably represents a combination of increased tick density in the northeastern United States, enhanced health-care provider awareness and reporting, and improved laboratory surveillance. In addition, case reporting has been enhanced through the availability of CDC resources for Lyme disease surveillance in eight states (i.e., Connecticut, Michigan, Minnesota, New Jersey, New York, Oregon, Rhode Island, and West Virginia).

## Plague

In 1996, five cases of plague among humans, two of which were fatal, were reported in the United States (two cases in Arizona, one in Colorado, and two in New Mexico). Both decedents had septicemic plague that was not diagnosed until after they died. One of the persons who died was infected through bites by infective prairie dog fleas; the other was infected by exposure to a pet cat with plague. These cases underscore the need for health-care providers in areas with endemic plague to maintain a high level of awareness about the risk for plague in their patients. Revised recommendations for the use of plague vaccine have been approved by ACIP and
published in MMWR (1996;45[No. RR-14]). During 1970-1995, a total of 341 cases of human plague (average: 13 cases per year) were reported in the United States. Of these cases, $80 \%$ occurred in the southwestern states of New Mexico, Arizona, and Colorado, $9 \%$ were reported from California, and nine other western states reported limited numbers of cases. Most likely modes of transmission were determined for 286 of these cases and included flea bite ( $\mathrm{n}=223 ; 78 \%$ ), direct contact with infected animals ( $\mathrm{n}=56 ; 20 \%$ ), and inhalation of respiratory droplets from infected animals ( $\mathrm{n}=7 ; 2 \%$ ). Five of the seven persons infected by inhalation were known to be exposed to infected domestic cats. The overall mortality was $15 \%$.

## Yellow Fever

In July 1996, a 45-year-old resident of Tennessee planning a trip to Brazil elected not to drive to a nearby city for a recommended immunization with yellow fever (YF) vaccine at a World Health Organization designated Yellow Fever Vaccine Administration Center. After a 9-day fishing trip on the Amazon and Rio Negro rivers, he returned to Tennessee where he soon developed symptoms of fever, chills, headache, joint pains, and myalgias. His condition deteriorated further with development of a coagulopathy, bleeding from multiple sites, and shock. He died on the 6th day of hospitalization. YF virus was isolated from premortem serum specimens and was identified both by polymerase chain reaction and conventional virologic methods. This case was the first recognized and documented importation of YF into the United States since 1924.

## Non-Notifiable Diseases, 1996

## Cyclospora

In the spring and early summer of 1996, the largest reported outbreak of cyclosporiasis occurred in North America. A total of 1,465 cases were reported by 20 states and the District of Columbia in the United States and by two provinces in Canada. Of these cases, 725 ( $49.5 \%$ ) were associated with 55 events (e.g., luncheons) and the other $740(50.5 \%)$ were sporadic. Consumption of fresh raspberries from Guatemala was associated with illness.

## Dengue

Forty-four laboratory-confirmed cases of dengue were imported into the United States in 1996 and diagnosed at the CDC Dengue Branch. This number is a decrease from the unusually substantial number of cases reported in 1995 (i.e., 86 cases), which was associated with the occurrence of major outbreaks of dengue and dengue hemorrhagic fever (DHF) in most tropical countries of the Americas. However, the total number of dengue and DHF cases reported by Pan American Health Organization member countries in 1996 ( $n=250,707$ ) was only slightly lower than the total for 1995 ( $\mathrm{n}=284,483$ ). Most countries in the region, especially Central America and the Caribbean islands, reported a substantially lower incidence of dengue in 1996, but major
increases were noted in Brazil (with 175,751 cases reported), Mexico (20,687 cases), and Trinidad and Tobago (3,983 cases).

## Nosocomial enterococci

In the early 1990s, the percentage of nosocomial enterococci reported from intensive care units (ICUs) as being resistant to vancomycin substantially increased, from $7.1 \%$ in 1992 to $11.6 \%$ in 1993 and $13.8 \%$ in 1994; the increase leveled off in 1995 ( $12.8 \%$ ) but has continued its increase in 1996 ( $16.7 \%$ ). Data from the hospital-based National Nosocomial Infections Surveillance System also indicate that for isolates from outside ICUs, the percentage of resistant enterococci has continued to rise (i.e., from $2.8 \%$ in 1992 to $4.8 \%$ in 1993 and to $12.2 \%$ in 1996). This represents a shift in the hospital location of patients with vancomycin-resistant enterococcus (VRE).

## International Notes

## West Nile Fever

During the summer of 1996, a substantial epidemic (i.e., approximately 500 clinical cases, nearly 300 of them serologically confirmed) of West Nile fever occurred in Bucharest and southeastern Romania. Most recognized cases manifested as meningitis, encephalitis, or meningoencephalitis. Approximately $5 \%$ of confirmed cases were fatal, with the highest case-fatality ratios occurring among elderly persons. The abundant mosquito subspecies Culex pipiens pipiens, which prefers organically polluted water sources for reproduction, was implicated as the urban vector. West Nile virus is a mosquitoborne neurotropic flavivirus that occurs in parts of Africa, Asia, and Europe and is closely related antigenically to St. Louis encephalitis virus, which occurs in North America.

## O'nyong-nyong Fever

During the second half of 1996, an epidemic of o'nyong-nyong fever was documented in rural, south-central Uganda. This represents only the second recognized epidemic of this disease since its initial description in 1962. O'nyong-nyong virus is a mosquitoborne alphavirus that causes a febrile disease characterized by generalized, debilitating joint pains, and often the disease is accompanied by a maculopapular skin rash and lymphadenopathy. Fatalities are rare, but morbidity often is significant. The typical epidemic mosquito vectors are Anopheles funestus and An. gambiae, two of the region's major malaria vectors.

${ }^{\dagger}$ The total number of acquired immunodeficiency syndrome (AIDS) cases includes all cases reported to the Division of HIV/AIDS Prevention, Surveillance, and Epidemiology, National Center for HIV, STD, and TB Prevention (NCHSTP) through December 31, 1996. Reported cases for persons aged $\geq 65$ years have been incorporated in the 40-64 years age group.
${ }^{5}$ Age-related data are collected on aggregate forms different from those used for the number of reported cases. Therefore, the total cases reported on this table may differ slightly from other tables. Cases among persons aged <5 years are not shown because some of these may not be caused by sexual transmission; these cases are, however, included in the totals. Cases were updated through the Division of Sexually Transmitted Diseases Prevention, NCHSTP, as of June 13, 1997. Age-related data for 1996 are unavailable for chancroid and chlamydia.
${ }^{\text {I C Cases were }}$ updated through the Division of Tuberculosis Elimination, NCHSTP, as of May 28, 1997.

*July 1, 1996, post-censal population estimates were used to calculate rates. Rates are reported per 100,000 population.
${ }^{\dagger}$ The total number of acquired immunodeficiency syndrome (AIDS) cases includes all cases reported to the Division of HIV/AIDS Prevention, Surveillance, and Epidemiology, National Center for HIV, STD, and TB Prevention (NCHSTP) through §ecember 31, 1996
${ }^{\S}$ Cases were updated through the Division of Sexually Transmitted Diseases Prevention, NCHSTP, as of June 13, 1997
${ }^{1}$ Chlamydia refers to genital infections caused by C. trachomatis. The rates for men are not presented, because reporting for men is much more limited than for women.
*Cases were updated through the Division of Tuberculosis Elimination, NCHSTP, as of May 28, 1996.

*The total number of acquired immunodeficiency syndrome (AIDS) cases includes all cases reported to the Division of HIV/AIDS Prevention, Surveillance, and Epidemiology, National Center for HIV, STD, and TB Prevention (NCHSTP) through December 31, 1996
Ethnicity is not stated and includes cases originally reported as American Indian or Alaskan Native and Asian or Pacific Islander.
Data concerning ethnicity are collected on aggregate forms different from those used for numbers of reported cases. Thus, the total number of cases reported on this table may differ slightly from other tables. Cases were updated through the Division of Sexually Transmitted Diseases Prevention, NCHSTP, as of June 13, 1997. Data regarding ethnicity for 1996 are unavailable for chancroid and chlamydia.
${ }^{\text {T}}$ Cases were updated through the Division of Tuberculosis Elimination, NCHSTP, as of May 28, 1997

## PART 2:

# Graphs and Maps <br> for Selected Notifiable Diseases in the United States 

ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) — reported cases, by quarter, United States,* 1985-1996

*Includes Guam, Puerto Rico, the U.S. Pacific Islands, and the U.S. Virgin Islands.
The expansion of the AIDS surveillance case definition in 1993 resulted in a substantial increase in reported cases during 1993 followed by declines in cases reported each year from 1994 through 1996. However, the number of reported AIDS cases in 1996 was substantially higher than the number reported in 1992, $\rightarrow \quad$ the year before the definition was changed.
$\stackrel{\rightharpoonup}{\infty}$ ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) - reported cases, per 100,000 population, United States and Puerto Rico, 1996*

*The denominator for Puerto Rico is based on extrapolations from U.S. Bureau of Census population data from 1990 and 1992 post-censal estimates.
In 1996, the highest rates of reported AIDS cases per 100,000 were in the northeastern, southeastern, and western states. Eighty-two percent of reported AIDS cases occurred among residents of large metropolitan areas (i.e., areas of $\geq 500,000$ persons).

ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) — reported pediatric cases,* United States and Puerto Rico, 1996

*Children and adolescents aged <13 years.
In 1996, the highest numbers of AIDS cases among children were reported in states that had the highest rates of reported AIDS cases (refer to the preceding figure).

N ARBOVIRAL INFECTIONS (of the central nervous system) - reported laboratory-confirmed cases caused by California serogroup viruses, by month of onset, United States, 1987-1996

[^1]ARBOVIRAL INFECTIONS (of the central nervous system) - reported laboratory-confirmed cases caused by eastern equine encephalitis virus, by month of onset, United States, 1987-1996

$\mathbf{N}$ Cases of eastern equine encephalomyelitis among humans, often associated with high mortality rates (i.e., $\mathbf{> 2 0 \%}$ ) and severe neurologic sequelae, occur sporadically in the eastern United States.

ARBOVIRAL INFECTIONS (of the central nervous system) - reported laboratory-confirmed cases caused by St. Louis encephalitis virus, by month of onset, United States, 1987-1996

ARBOVIRAL INFECTIONS (of the central nervous system) - reported laboratory-confirmed cases caused by western equine encephalitis virus, by month of onset, United States, 1987-1996

N The most recent epidemic of western equine encephalomyelitis occurred in Colorado in 1987.

* Data are not yet available for 1996.

Although they occur infrequently, outbreaks of foodborne botulism rapidly can kill many affected persons. Such outbreaks require prompt and effective communication between clinicians and public health officials.

BOTULISM (infant) — by year, United States, 1976-1996

[^2]N In the United States, nearly half of the reported cases of infant botulism occur in California.

N BRUCELLOSIS — by year, United States, 1966-1996

After peaking at more than 300 cases in 1975, the number of brucellosis cases has declined and, for the last 10 years, has remained relatively stable at approximately 100 cases per year.

CHLAMYDIA — reported cases among women, per 100,000 population, United States, 1996

v
In 1996, the chlamydia rate among women was 314.9 cases per 100,000 population. The rates for men are not presented, because reporting for men is more limited than it is for women.
$\approx$ CHOLERA — reported cases, United States and territories, 1996

In recent years, most of the cases of cholera diagnosed in the United States were acquired during travel to Latin America, Asia, and Africa.

DIPHTHERIA — by year, United States, 1966-1996

NOTE: DTP vaccine was licensed in 1949.
$\overline{\text { After a more than }} 8$-year interval without a documented domestically acquired infection with toxigenic $C$. diphtheriae, an endemic focus was found in an American Indian community in South Dakota in 1996; molecular data indicate ongoing endemicity since the 1970s (MMWR 1997;46:506-10).

The number of states in which E. coli $\mathrm{O} 157: \mathrm{H} 7$ infection is a notifiable disease increased from 39 in 1995 to 44 in 1996 . However, because $<60 \%$ of clinical laboratories routinely test all stools-or even all bloody stools-for E.coli $0157: \mathrm{H} 7$, many infections are not recognized or reported.

## ESCHERICHIA COLI O157:H7 — reported isolates,* United States, 1996

*Data from the Public Health Laboratory Information System (PHLIS).
$\underset{\boldsymbol{\omega}}{\boldsymbol{\omega}} \overline{\text { Only E. coli O157: }} \mathrm{H} 7$ isolates that are confirmed by a state public health laboratory are reported to PHLIS. Many public health laboratories are now able to subtype isolates using pulsed-field gel electrophoresis, a procedure that facilitates comparison of strains among states.

山 GONORRHEA — reported cases, per 100,000 population, United States, 1996

NOTE: The Year 2000 Objective is $\leq 100$ per 100,000 population.
The overall U.S. rate of gonorrhea in 1996 was 122.8 per 100,000 population; 27 states reported gonorrhea rates that were below the revised Healthy People 2000 national objective.

GONORRHEA — by sex, United States, 1981-1996

$\underset{\boldsymbol{\omega}}{\boldsymbol{\omega}} \overline{\text { In 1996, the reported rate of gonorrhea in the United States continued to decline. Among men, the rate decreased from } 158.7 \text { per 100,000 population in } 1995}$ to 128.49 in 1996; among women, the rate decreased from 140.2 per 100,000 in 1995 to 119.5 in 1996.
$\underset{\underset{\sim}{\omega}}{\sim}$ GONORRHEA - by race and ethnicity, United States, 1981-1996

In 1996, gonorrhea rates decreased among all racial and ethnic groups. The only exception occurred among American Indians/Alaskan Natives (included in the "Other" race and ethnicity category).

HAEMOPHILUS INFLUENZAE, INVASIVE — by age group, United States, 1996

[^3]HANSEN DISEASE (LEPROSY) — by year, United States, 1966-1996

In 1996, a total of 112 cases of Hansen disease were reported in the United States. The number of cases peaked at 361 in 1985; since 1988, the number has remained relatively stable.

## HEPATITIS — by year, United States, 1966-1996

* The first hepatitis B vaccine was licensed June 1982.
* The first hepatitis B vaccine was licensed June 1982.
$\dagger$ Anti-HCV antibody test was available as of May 1990.
$\overline{\text { Non-A, non-B hepatitis is the most underreported type of hepatitis. Nonetheless, the increase observed in this type of hepatitis after } 1990 \text { is misleading because }}$ in some states, reported cases have included those among persons identified in routine screening programs who were positive for antibody to hepatitis $C$
virus but who did not have evidence of acute hepatitis.
${\underset{\infty}{\infty}}^{\infty}$ HEPATITIS A — reported cases, per 100,000 population, United States and territories, 1996

Since 1991, the number of reported cases of hepatitis A has increased nationwide. In 1996, the rate of hepatitis A in the western United States was threefold the average rate in other regions.

HEPATITIS B - reported cases, per 100,000 population, United States and territories, 1996

Hepatitis B continues to decline in most states, primarily because of a decrease in the number of cases among injecting-drug users and, to a lesser extent, among both homosexual men and heterosexuals of both sexes.

## f LEGIONELLOSIS — by year, United States, 1981-1996

LYME DISEASE — reported cases, per 100,000 population, United States and territories, 1996

In 1996, a total of 45 states and the District of Columbia reported 16,455 cases to $C D C$. This was the highest number reported since national surveillance began in 1982.

A MALARIA — by year, United States, 1966-1996

Since 1985, approximately 1,000 cases of imported malaria have been reported annually in the United States; recent immigrants and visitors accounted for 50\% of these cases.

MEASLES (rubeola) — by year, United States, 1961-1996

$\stackrel{\rightharpoonup}{\omega}$
In 1996, a total of 508 cases of measles were reported. The largest outbreaks occurred among school-aged children in states with partial or no requirements for school children to receive a second dose of measles-containing vaccine.

末
MENINGOCOCCAL DISEASE — by year, United States, 1966-1996

[^4] disease outbreaks, for which meningococcal vaccine is recommended, continue to occur. The ability to validate some aspects of recommendations for control of outbreaks is currently limited by incomplete reporting of serogroup information.

MUMPS — by year, United States, 1968-1996

NOTE: Mumps vaccine was licensed December 1967.
\& PERTUSSIS (whooping cough) — by year, United States, 1966-1996

NOTE: DTP vaccine was licensed in 1949.
Despite achieving high vaccination coverage with diphtheria-tetanus-pertussis vaccine among young children, reported pertussis incidence continues to display a 3-4 year periodicity. In 1996, the reported pertussis incidence was the highest since 1967.

PERTUSSIS (whooping cough) — by age group, United States, 1996

A Although the highest number of reported cases continues to be among children aged <1 year, pertussis cases among adolescents and adults increasingly are being reported to CDC. In 1996, $44 \%$ of all reported pertussis cases occurred among persons aged $\geq 10$ years.

क

In 1996, five cases of human plague, two of which were fatal, were reported in the United States (two in Arizona, one in Colorado, and two in New Mexico). Both decedents had septicemic plague that was not diagnosed until after they died.

POLIOMYELITIS (paralytic) — by year, United States, 1966-1996

NOTE: Inactivated vaccine was licensed in 1955. Oral vaccine was licensed in 1961.
Since 1980, a total of 143 of 145 confirmed cases of indigenously acquired paralytic poliomyelitis in the United States have been associated with oral polio vaccine. The remaining two cases were classified as indeterminate. In September 1996, CDC adopted the ACIP recommendations for a sequential vaccination vaccine. The remaining two cases were classified as indeterminate. In September 1996, CDC adopted the ACIP recommendations for a sequential vaccination

The number of psittacosis cases may vary from year to year because of periodic outbreaks. The apparent increase in cases during the late 1970s to mid-1980s may reflect greater application of diagnostic tests for Chlamydia sp. in patients with respiratory illness. The lower number of cases in recent years may reflect improved diagnostic testing for distinguishing C. psittaci from C. pneumoniae infections

RABIES - wild and domestic animals, by year, United States and Puerto Rico, 1966-1996

## ROCKY MOUNTAIN SPOTTED FEVER (RMSF) — by year, United States, 1966-1996

 어N

Increases in reported cases of Rocky Mountain spotted fever may reflect heightened awareness and surveillance for emerging tick-borne diseases (e.g., ehrlichiosis). Biological factors (e.g., increases in tick populations resulting from favorable environmental conditions) also could be involved in this resurgence.

RUBELLA (German measles) - by year, United States, 1966-1996

SALMONELLOSIS (excluding typhoid fever) — by year, United States, 1966-1996

Egg-associated Salmonella serotype Enteritidis is the most common Salmonella serotype in the country, accounting for $25 \%$ of all salmonellosis reported in humans.

SALMONELLA — serotype of isolate by year,* United States, 1971-1996

* Data from Public Health Laboratory Information System (PHLIS)

G SHIGELLOSIS - by year, United States, 1966-1996

SHIGELLA - species of isolate by year,* United States, 1971-1996

* Data from Public Health Laboratory Information System (PHLIS).
v $\begin{aligned} & \text { Community outbreaks of shigellosis attributable to Shigella sonnei often involve multiple child care centers and continue to be a substantial public health }\end{aligned}$

NOTE: The Year 2000 Objective is $\leq 4.0$ per 100,000 population.
In 1996, the U.S. rate of primary and secondary syphilis was 4.3 per 100,000 population. However, 34 states reported rates that were below the revised national Healthy People 2000 objective; 13 states reported fewer than five cases.

## SYPHILIS (primary and secondary) — by sex, United States, 1981-1996

In 1996, the rate of primary and secondary syphilis continued to decline. Among men, the rate decreased from 6.8 per 100,000 population in 1995 to 4.7 in 1996; among women, the rate decreased from 5.8 per 100,000 in 1995 to 4.0 in 1996.

ㅇ. SYPHILIS (primary and secondary) — by race and ethnicity, United States, 1981-1996

Since 1990, the reported rates of primary and secondary syphilis for all racial and ethnic groups have declined. In 1995, however, the rate for non-Hispanic blacks (i.e., 30.2 cases per 100,000 population) was 50 -fold greater than that for non-Hispanic whites.

CONGENITAL SYPHILIS — in infants <1 year of age, United States, 1966-1996

[^5]
## 옹 TETANUS — by year, United States, 1966-1996

NOTE: Tetanus toxoid was first available in 1933.
In the United States, the 1996 goal for the number of cases of tetanus disease among children and adolescents aged <15 years was zero. Of the 36 cases of tetanus reported in 1996, none occurred among children aged <15 years. Tetanus among persons aged $\leq 25$ years has been targeted for elimination within the United States by the year 2000.

TOXIC-SHOCK SYNDROME (TSS) — by quarter, United States, 1981-1996

* Includes only cases that meet the case definition for staphylococcal TSS. ${ }^{\dagger}$ TSS data was first available through NETSS in 1983.
The total number of TSS cases reported to CDC's National Center for Infectious Diseases from 1979 through 1996 was 5,296 (including definite and probable cases). Of all TSS cases reported during the last decade (i.e., from 1987 through 1996), $59 \%$ were not associated with menstruation. The case fatality rate of
non-menstrual cases was $5 \%$, which was significantly ( $\mathrm{p}<0.005$ ) higher than the case-fatality rate of cases associated with menstruation.
\& TRICHINOSIS - by year, United States, 1966-1996

In 1996, a total of 11 cases of trichinosis were reported, which is less than the mean of 40 cases reported during 1991-1995 (range: $21-64$ cases; median: 23 cases).

TUBERCULOSIS - reported cases, per 100,000 population, United States and territories, 1996

In 1995, a total of 19 states had tuberculosis rates of $\leq 3.5$ cases per 100,000 , which is the interim (e.g., year 2000) target for the elimination of tuberculosis by the year 2010.
\& TUBERCULOSIS - by year, United States, 1976-1996

TUBERCULOSIS — by year, among persons born in the United States and foreign-born persons, United States, 1986-1996

The number and percentage of tuberculosis cases among foreign-born persons in the United States have increased from 4,925 (21.6\%) in 1986 to $7,740(36.1 \%)$
in 1996 .

## TYPHOID FEVER — by year, United States, 1966-1996

\&

Antimicrobial resistance among S. typhi isolates has increased in recent years. In 1996, 17\% of isolates in the United States were resistant to trimethoprim/ sulfamethoxazole, ampicillin, and chloramphenicol.

VARICELLA (chickenpox) - reported cases, per 100,000 population, United States and territories, 1996

Varicella is not a nationally notifiable disease. This map reflects data from states where varicella is notifiable at the state level. Some states where varicella is not notifiable are conducting sentinel varicella surveillance.

## PART <br> 3:

## Historical <br> Summary <br> Tables

TABLE 1. NOTIFIABLE DISEASES - summary of reported cases, per 100,000 population, United States, 1987-1996

| Disease | 1987 | 1988 | 1989 | 1990 | 1991 | 1992 | 1993 | 1994 | 1995 | 1996 |

${ }^{*}$ Cutaneous diphtheria is no longer nationally notifiable.
${ }^{\dagger}$ Not previously notifiable nationally.
${ }^{\S}$ No cases with paralytic poliomyelitis due to wild-virus have been reported in the United States since 1979.
${ }^{\|}$Case data subsequent to 1974 are not comparable with earlier years because of changes in reporting criteria that became effective in 1975 .
**Last indigenous case of yellow fever was reported in 1911; before 1996, the last imported case was reported in 1924.

Numbers in ICD column refer to the category numbers listed in the Ninth Revision of the International Classification of Diseases, 1994. (The asterisks in the ICD column pertain to the
ICD code, not a footnote. They indicate that the numbers are not part of the ICD but were introduced for use in the United States.)
For 1983-1986, deaths are estimated from death certificates that mention conditions coded to deficiency of cell-mediated immunity (ICD-9 No.279.1). These numbers include other human immunodeficiency virus (HIV)-related deaths and other diseases classifiable as deficiencies of cell-mediated immunity.
Source: National Center for Health Statistics System, 1986-1995. Deaths are classified according to the Ninth Revision, ICD

## State and Territorial Epidemiologists and Laboratory Directors

State and Territorial Epidemiologists and Laboratory Directors are acknowledged for their contributions to CDC Surveillance Summaries. The epidemiologists listed below were in the positions shown as of July 1997, and the laboratory directors listed below were in the positions shown as of July 1997.

| State/Territory | Epidemiologist |
| :---: | :---: |
| Alabama | John P. Lofgren, MD |
| Alaska | John P. Middaugh, MD |
| Arizona | Robert W. England, Jr, MD, MPH |
| Arkansas | Thomas C. McChesney, DVM |
| California | Stephen H. Waterman, MD, MPH |
| Colorado | Richard E. Hoffman, MD, MPH |
| Connecticut | James L. Hadler, MD, MPH |
| Delaware | A. LeRoy Hathcock, PhD |
| District of Columbia | Martin E. Levy, MD, MPH |
| Florida | Richard S. Hopkins, MD, MSPH |
| Georgia | Kathleen E. Toomey, MD, MPH |
| Hawaii | Richard L. Vogt, MD |
| Idaho | Christine G. Hahn, MD |
| Illinois | Byron J. Francis, MD, MPH |
| Indiana | Gregory K. Steele, DrPH, MPH |
| Iowa | M. Patricia Quinlisk, MD, MPH |
| Kansas | Gianfranco Pezzino, MD, MPH |
| Kentucky | Clarkson T. Palmer, MD, MPH (Acting) |
| Louisiana | Louise McFarland, DrPH |
| Maine | Kathleen F. Gensheimer, MD, MPH |
| Maryland | Diane M. Dwyer, MD, MPH |
| Massachusetts | Alfred DeMaria, Jr, MD |
| Michigan | Kenneth R. Wilcox, Jr, MD, DrPH |
| Minnesota | Michael T. Osterholm, PhD, MPH |
| Mississippi | Mary Currier, MD, MPH |
| Missouri | H. Denny Donnell, Jr, MD, MPH |
| Montana | Todd A. Damrow, PhD, MPH |
| Nebraska | Thomas J. Safranek, MD |
| Nevada | Randall L. Todd, DrPH |
| New Hampshire | Jesse Greenblatt, MD, MPH |
| New Jersey | Faye E. Sorhage, DVM, MPH (Acting) |
| New Mexico | C. Mack Sewell, DrPH, MS |
| New York City | Benjamin A. Mojica, MD, MPH |
| New York State | Perry F. Smith, MD |
| North Carolina | J. Michael Moser, MD, MPH |
| North Dakota | Larry A. Shireley, MS, MPH |
| Ohio | Thomas J. Halpin, MD, MPH |
| Oklahoma | J. Michael Crutcher, MD, MPH |
| Oregon | David W. Fleming, MD |
| Pennsylvania | James T. Rankin, Jr, DVM, PhD, MPH |
| Rhode Island | Utpala Bandyopadhyay, MD, MPH |
| South Carolina | James J. Gibson, MD, MPH |
| South Dakota | Susan E. Lance, DVM, PhD, MPH |
| Tennessee | William L. Moore, Jr, MD |
| Texas | Diane M. Simpson, MD, PhD |
| Utah | Craig R. Nichols, MPA |
| Vermont | Peter D. Galbraith, DMD, MPH |
| Virginia | Grayson B. Miller, Jr, MD, MPH |
| Washington | Paul A. Stehr-Green, DrPH, MPH |
| West Virginia | Loretta E. Haddy, MA, MS |
| Wisconsin | Jeffrey P. Davis, MD |
| Wyoming | Gayle L. Miller, DVM, MPH |
| American Samoa | Joseph Tufa, DSM |
| Federated States of Micronesia | Vacant |
| Guam | Robert L. Haddock, DVM, MPH |
| Marshall Islands | Tom D. Kijiner |
| Northern Mariana Islands | Jose L. Chong, MD |
| Palau | Jill McCready, MS, MPH |
| Puerto Rico | Carmen C. Deseda, MD, MPH |
| Virgin Islands | Jose Poblete, MD (Acting) |

## Laboratory Director

The Morbidity and Mortality Weekly Report (MMWR) Series is prepared by the Centers for Disease Control and Prevention (CDC) and is available on a paid subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402; telephone (202) 783-3238.

The data in the weekly MMWR are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday. Inquiries about the MMWR Series, including material to be considered for publication, should be directed to: Editor, MMWR Series, Mailstop C-08, Centers for Disease Control and Prevention, Atlanta, GA 30333; telephone (404) 332-4555.

All material in the MMWR Series is in the public domain and may be used and reprinted without special permission; citation as to source, however, is appreciated.

[^0]:    *The total number of acquired immunodeficiency syndrome (AIDS) cases includes all cases reported to the Division of HIV/AIDS Prevention, Surveillance, and Epidemiology, National Center for HIV, STD, and TB Prevention (NCHSTP) through December 31, 1996.
    ${ }^{\dagger}$ Includes cases originally reported as Hispanic: 10,865 for AIDS; 13,451 for gonorrhea; and 505 for syphilis, primary and secondary.
    ${ }^{\S}$ Data concerning race are collected on aggregate forms different from those used for numbers of reported cases. Thus, the total number of cases reported on this table may differ slightly from other tables. Cases were updated through the Division of Sexually Transmitted Diseases Prevention, NCHSTP, as of June 13, 1997. Data regarding race for 1996 are unavailable for chancroid and chlamydia.
    ${ }^{4}$ Cases were updated through the Division of Tuberculosis Elimination, NCHSTP, as of May 28, 1997

[^1]:    

[^2]:    * Data are not yet available for 1996.

[^3]:    Of 275 reported cases among children aged <5 years, the serotype was reported for only 141 ; of these, 38 cases ( $27 \%$ ) were type b, which is the only serotype $\boldsymbol{\omega}$ of $H$. influenzae disease that is preventable by vaccine. Lack of information on serotype prevented accurately determining whether most of these cases were vaccine-preventable or whether they represented vaccine failures.

[^4]:    The overall rate of meningococcal disease remained constant over the past year; the serogroup was reported for only $19 \%$ of cases. Serogroup $C$ meningococcal

[^5]:    The rate of congenital syphilis decreased from 47.4 cases per 100,000 live births in 1995 to 30.4 in 1996.
