

Figure S1. Signs and/or symptoms of the 19 healthcare workers (HCWs) with mild COVID-19 disease. Data are expressed as absolute number of HCWs reporting the sign or symptom..

Figure S2. Pairwise correlations between NtAb titers (expressed as ID₅₀) at the eight study points, age, gender (expressed as being of female gender) and having a symptomatic disease. Rank method of Spearman was applied. Only significant Rho coefficients are reported. Blue: positive correlations, red: negative correlations. NtAb: neutralizing antibodies; II: Time; ID₅₀: reciprocal value of the sample dilution that showed a 50% protection of virus cyto-pathic effect.
