25 **ABSTRACT**

26 Poultry eggs are a critical source of protein, vitamins, and minerals for people worldwide; facing
27 the current global egg shortage is a significant concern. The shortage results from various
28 factors, including avian flu outbreaks, changes in consumer demand, and supply chain
29 disruptions caused by the COVID-19 pandemic. The economic crisis caused by the pandemic has
30 also impacted the availability and affordability of eggs, particularly in low-income countries. The
31 global egg shortage has implications for public health, particularly for vulnerable populations
32 who rely on eggs for essential nutrients. One Health, an approach that recognizes the
33 interconnectedness of human, animal, and environmental health, provides a useful framework for
34 understanding and addressing the egg shortage. One Health approach to the egg shortage
35 involves collaboration between agriculture and environmental sectors to address the root causes
36 of the lack and ensure the sustainable production and distribution of eggs. Addressing the global
37 egg shortage requires a multifaceted approach considering the complex social, economic, and
38 environmental factors. One Health perspective offers a way to understand and address the
39 interconnected factors contributing to the shortage to ensure access to affordable, nutritious eggs
40 for all in a healthy way.

41 **KEY WORDS:** Egg shortage, Poultry supply chain, Influenza, Economic crisis, One Health
42 surveillance.

44 INTRODUCTION

45 Poultry eggs and meat are the most abundant and primary animal protein sources in the human
46 diet. The egg is regarded as a low-cost, entirely healthy food and a nutritional powerhouse. Both
47 egg whites and yolk are high in protein. It accounts for around 12.6% of an egg's consumable
48 portion. A, B, E, and K vitamins are also present in eggs. Additionally, eggs include significant
49 amounts of selenium, an antioxidant essential for thyroid, immunological, and mental health as
50 well as zinc, iron, vitamin D, B6 and B12 (Wang et al., 2017). The poultry industry is expanding
51 and becoming more industrialized in many world regions. Growth has been driven by an
52 expanding population, increased purchasing power, and urbanization (View of Major Problems
53 and Challenges of Egg Production and Marketing in Bangladesh, n.d.).

54 Throughout the previous two decades, the worldwide chicken and egg trade has increased, and
55 poultry meat and egg remain the most traded animal protein(AGRIS, n.d.). In the poultry sector,
56 egg production is being impeded by a major global scarcity. The cost of eggs and egg products is
57 growing due to Influenza, lack of supply, an increase in the cost of fuel, feed, and packing, and
58 the manufacturing cost, which are the main factors which lead to running short of eggs in several
59 countries(Egg Shortages and Price Increases Caused in Part by Bird Flu Outbreak - The New
60 York Times, n.d.). The increased cost of eggs results in a price increases for food and
61 confectionery products including eggs as a part of the product. Buyers will face additional
62 challenges as food prices rise. Since October 2021, about 21 million poultry cases have been
63 reported to the World Organization for Animal Health (WOAH, formerly known as the OIE) in
64 various parts of the world(Egg Prices on the Rise: The Effects of Animal Diseases – WOAH –
65 World Organisation for Animal Health, n.d.). Although avian flu is not a new threat, wild birds
66 don't typically get sick from the virus, but the current circulating strain seems more
67 virulent(Blagodatski et al., 2021). Highly pathogenic avian influenza (HPAI) or “bird flu” is the
68 chief culprit; it can spread swiftly from flock to flock and is fatal in hens. A global pandemic of
69 HPAI viruses of the H5 and H7 subtypes is a worldwide public health problems (Li et al., 2014)
70 and a significant economic loss in the chicken sector(Otte et al., 2008). The avian flu outbreak is
71 the worst in the history of the United States, United Kingdom (UK), and Europe the and also 27
72 European countries (EU). For the first time, it has across the Atlantic, reaching Canada and the
73 United States (USA), according to the Global food consumer form(Worldwide Egg Shortage

74 Due to Several Reasons Raises Prices in Global Supermarkets - Global Food Consumers Forum,
75 n.d.).

76 The price and shortage of eggs can have a significant impact on a nation's economy, particularly
77 in countries where eggs are a staple food and a significant source of protein for the
78 population(Henchion et al., 2017). As egg availability declines and costs rise, households that
79 depend on eggs as a primary protein source may find it difficult to purchase enough to meet their
80 nutritional needs. The shortage may severely impact poultry farmers, forcing them to slaughter
81 birds or reduce production. This could result in lower income for poultry producers and, as a
82 result, more economic hardship for their families. Therefore the ongoing crisis in the global egg
83 supply can also be regarded as “eggflation”.

84 The general concept of One Health (OH) is widely accepted(Mackenzie & Jeggo, 2019). OH
85 underscores the need for a holistic and interdisciplinary approach to address the interconnected
86 challenges of influenza outbreaks and the global egg shortage. The transmission of Influenza
87 viruses between different species, such as birds, pigs, and humans, highlights the
88 interconnectedness of One Health(Debnath et al., 2021). For example, certain strains of Influenza
89 can originate in animals and then jump to humans, leading to outbreaks or pandemics. OH
90 approach can help to address these issues by identifying and addressing the underlying factors
91 that contribute to egg shortages or price increases, such as disease outbreaks in poultry farms or
92 disruptions in the supply chain.

93 Despite the poultry sector, especially eggs being an integral part of the economy; regrettably, the
94 price increase and scarcity have reduced consumer egg consumption. This study aims to
95 highlight the scarcity of eggs the world is facing now with the OH perspective and economic
96 crisis, which will enable us to explore the potentialities of this sub-sector.

97 **MATERIALS AND METHOD**

98 ***Research Design***

99 This market research study aimed to comprehensively analyze the Egg Food Market, focusing on
100 scarcity of eggs in the 10 countries of the world, in these countries egg inflation is caused due to
101 various factors including avian influenza, cage-free laws, effects of supply and demand and
102 supply chain difficulties. Hence, we employed a quantitative method to collect, analyze, and

103 interpret the egg food related data and provided the market scenario during the period of six
104 years.

105 ***Data Collection and processing***

106 This descriptive research was conducted from January 2018 to March 2023. The study
107 exclusively relied on secondary data, sourced from a diverse array of outlets, such as industry
108 reports, market databases, scholarly literature, governmental publications, and reputable online
109 resources. These data sources were chosen based on their pertinence, trustworthiness, and
110 completeness in offering insights into the Egg Food Market. The study encompassed the analysis
111 of ten countries where the egg shortage was greatly seen: United States, United Kingdom,
112 European Union (EU-27), Taiwan, Japan, India, Australia, Malaysia, and Jakarta.

113 ***Inclusion criteria***

114 To ensure the relevance and reliability of the secondary data, we employed specific selection
115 criteria: 1) studies focusing on the global egg supply chain, including production, distribution,
116 and consumption patterns 2) articles highlighting the impact of avian flu outbreaks on egg
117 production and the subsequent shortage in the global egg supply data covering the past six years
118 (from 2018 to 2023) to provide a current and comprehensive overview of market trends, 3)
119 articles exploring the impact of factors such as avian flu outbreaks, economic factors, and supply
120 chain disruptions on the availability and pricing of eggs, 4) Data sources with a reputation for
121 accuracy, objectivity, and credibility, 5) Data sets that aligned with the research objectives and
122 questions of this study.

123 **RESULTS**

124 ***Economic loss results from a global egg shortage.***

125 The egg industry is adaptable and agile, but a confluence of economic and environmental
126 circumstances in 2022 has made things difficult. Farmers will want to meet demand but confront
127 time constraints and cost pressures. The expense of living may rise as egg prices rise, which can
128 affect the purchasing power of the people and lead to inflation. In addition, if a country is reliant
129 on imports of eggs, then a shortage or price increase can create trade imbalances, as the cost of
130 importing eggs will increase. This can lead to a drain on foreign reserves and a weakening local
131 currency. Furthermore, the egg industry is an essential component of the agricultural sector. The
132 shortage of eggs can affect the livelihoods of farmers and suppliers, mainly if they rely on eggs
133 for their income. The price increase can also shift the demand for other food items and affect the

134 production of other agricultural products. Meanwhile, Eggs are a significant source of protein,
135 and a shortage or price increase can lead to malnutrition, particularly among the low-income
136 sections of the population. This can have a long-term impact on the health of the people and can
137 lead to increased healthcare costs. Overall, a scarcity and hike in the price of eggs can result in a
138 ripple effect on the economy, influencing various industries and causing significant harm to
139 underprivileged communities that depend on eggs as a fundamental source of sustenance. The
140 "eggflation" in many nations is illustrated country wise in the Figure 1.

141 *United States*

142 The United States (USA) is facing an exacerbating scarcity of eggs caused by a combination of
143 factors, including the highest avian flu outbreak ever recorded globally and increasing fuel, feed,
144 and packaging costs. According to an article in The “New York Times”, Since the start of 2022,
145 HAI has killed around 58 million commercial and backyard flock birds spanning 47 states,
146 including approximately 44 million egg laying hens in the USA since the epidemic (Egg
147 Shortages and Price Increases Caused in Part by Bird Flu Outbreak - The New York Times, n.d.).
148 Consumer price index, according to the "U.S. Bureau of Labor Statistics", revised on January 12,
149 2023, egg prices have increased by up to 59.9% year on year. The average cost for a dozen large
150 Grade A eggs in the USA in January 2022 was \$1.929. The average price had risen to \$4.823 by
151 January. Nonetheless, it is gradually reducing to \$4.221 by February, but it is still high compared
152 to 2022(Bureau of Labor Statistics Data, n.d.).

153 *United Kingdom*

154 According to data from the British Free Range Egg Producers Association (BFREPA), with
155 about 38 million laying hens across the country, the United Kingdom (UK) is currently 92% self-
156 sufficient in eggs. Flock size had decreased from 44 million to around 36.7 million birds species
157 by November 2022(Egg Producers Continue to Quit on Weekly Basis, Sector Warns -
158 FarmingUK News, n.d.). According to government data, up to September 2022, in the third
159 quarter of 2022, egg packaging plants in the UK packed 213 million dozens of eggs. This
160 represents a 9.6% reduction from the third quarter of 2021 and a 4.1% decline from the second
161 quarter of 2022. The number of eggs processed at packing stations in the third quarter of 2022
162 declined by 9.6% from the same quarter in 2021(Historical Statistic Notices on UK Egg
163 Production and Prices, 2022 - GOV.UK, n.d.). After seasonal adjustment, the price of eggs in the

164 United Kingdom increased by 8.5% in January 2023 compared to December. While this was a
165 substantial and anticipated drop from December's commotion-causing 11.1% increase, it did
166 little to mitigate a staggering 79.1% year-over-year growth. (Egg Prices Continue to Climb at
167 Slower Pace alongside Other Food Consumed at Home, CPI Reveals, n.d.).

168 *European Union (EU-27)*

169 According to an article from Global Food Consumers' forum, egg prices in the EU have
170 increased by 75% in the previous six months due to supply issues. The 99% of French people
171 who eat eggs this year may eat fewer eggs by up to 10%. "Franceinfo" reports that beginning
172 September 2021, the cost of a box of six eggs has increased by 13 %. Farmers in France have
173 been forced to butcher over 770,000 animals due to the spread of avian flu. As a result, fewer
174 chickens are available to lay eggs, which leads to a decrease in egg production (Worldwide Egg
175 Shortage Due to Several Reasons Raises Prices in Global Supermarkets - Global Food
176 Consumers Forum, n.d.). According to a recent European Commission report released on
177 February 22 2023, grade A egg prices rose to 249.02 EUR/100 kg(Eggs, n.d.). According to an
178 article in "The Economic Times", Egg prices increased the most in the Czech Republic, climbing
179 85% year on year, followed by two other Central European countries, Hungary (80%) and
180 Slovakia (7%). Germany (79%) and Luxembourg (79%) were on the other end of the spectrum,
181 with both reporting 18% growth. (In the EU's Inflation Crisis, the Humble Egg Takes the Cake -
182 The Economic Times, n.d.). According to Assosia data, a pack of six Staveley Large Free Range
183 Eggs increased by 18.2% to £1.95 early this year, making a pack 30% more expensive than it
184 was at the start of 2022(Why Are Eggs So Expensive RN?, n.d.).

185 *Taiwan*

186 Many countries are experiencing an egg shortage due to avian flu outbreaks, and Taiwan is also
187 experiencing a severe egg shortage these days. According to an article in "Taipei Times", by the
188 end of last year, the number of egg-laying hens in Taiwan had fallen from 45 million to 33
189 million(Egg Shortage Calls for Cooperation - Taipei Times, n.d.). The NT\$5 per kg price
190 increase will raise the wholesale price of duck eggs to a record high of NT\$80 per kg. According
191 to a CNA report updated on 5th march 2023, The price of locally sourced eggs in wholesale is
192 set to increase by NT\$3, moving from NT\$52 (equivalent to US\$1.70) to NT\$55 per catty (600
193 grams); it is a new high this month, Simultaneously, the farm gate price will also experience a

194 NT\$3 increase, reaching NT\$45.5 per catty; initially, it was NT\$42.5 starting on Thursday
195 (March 9) (Egg Prices in Taiwan Sizzle to All-Time High | Taiwan News | 2023-03-06 12:53:00,
196 n.d.; Egg Prices in Taiwan to Rise Again as Shortage Continues - Focus Taiwan, n.d.; Expatriate
197 Division, Taipei Economic and Trade Office, Jakarta, Indonesia – News, n.d.). Price increases
198 were implemented for the second time in a month due to an egg supply constraint. According to
199 the most recent Council of Agriculture (COA) statistics, daily egg output is 112,000 packages
200 (200 eggs per box), falling 500,000 to 800,000 eggs short of need. To address the short-term
201 supply shortfall, the COA launched an immediate operation in March to import five million eggs
202 from Australia.

203 *Japan*

204 An avian influenza outbreak and skyrocketing feed costs are behind a shortage of chicken eggs
205 in Japan that has led to increasing prices. Egg prices are rising due to a lack of supply. According
206 to a "Japan Times" story, the nation experienced its first incident in October 2022, and the
207 disease has spread to more than half of the nation's prefectures. Moreover, According to
208 economic research firm Teikoku Databank, the wholesale egg price per kilo more than
209 quadrupled to ¥327 in February (Rs. 197) from the previous year, Because of Tori-influenza,
210 also known as bird flu, throughout the rest of the world-Japan Times(Explained: After US and
211 UK, Why Japan Is Now Facing Egg Shortage, n.d.). Based on a survey conducted by the
212 agriculture ministry, covering 470 outlets nationwide in February, the average price of a 10-egg
213 carton was 262 yen (\$1.92). This marked an 8% increase compared to the previous month and a
214 25% rise compared to the average February prices in recent years. (Egg Prices on the Rise as 15
215 Million Birds Culled amid Avian Flu Scare | The Asahi Shimbun: Breaking News, Japan News
216 and Analysis, n.d.). By February 2023, the price of a 10-egg carton had more than doubled,
217 reaching 326 ¥ (High Egg Prices Are Hitting Japan (and Its Pancakes) - Unseen Japan, n.d.). On
218 March 2, the agriculture ministry claimed that 15.02 million birds had to be exterminated across
219 the country. The vast majority of these, 13.85 million, are laying hens.

220 *India*

221 In India, the Maharashtra animal husbandry department announced that the state is experiencing
222 an egg shortage. As per the report of PTI news, Maharashtra consumes around 2.25 crore eggs
223 per day and can generate 1 to 1.25 crore eggs per day. Hence, the state is experiencing a 1

224 million egg shortage daily(State Facing Shortage Of Eggs: Official | Aurangabad News - Times
225 of India, n.d.). According to The Associated Press, The average cost of a dozen eggs across the
226 country was \$3.59 (293.57) in November, up from \$1.72 (140.65) the previous year(This Indian
227 State Is Facing Shortage of 1 Crore Eggs per Day | Mint, n.d.). To manage the infection from the
228 previous year, over 43 million (4.3 crores) out of 58 million (5.8 crores) birds were culled. The
229 prices have increased by about 25-35 per cent in just 3-4 months. To meet the current demand,
230 eggs are being imported from Karnataka, Telangana, and Tamil Nadu.

231 *Australia*

232 Australia is facing a national egg scarcity, causing prices to rise and retail supplies to be in
233 limited supply. Numerous supermarkets limit the amount of cartons of eggs purchased by each
234 customer. Increased cost of food, employment charges, prices for electricity, and poor weather
235 (winter) are the primary reasons of shortages and price hikes in Australia. Many farmers hesitate
236 to raise output in an uncertain economic environment characterized by rising rates of debt and
237 costs. According to the recent report of Global product prices, the whole average price is 2.95
238 USD; in March 2023, it rose to USD 4.52(Australia - Eggs - Price, March 2023 |
239 GlobalProductPrices.Com, n.d.). The shortage of eggs in the market is due to reduced
240 production, and the pandemic avian influenza is the leading cause of the price rise.

241 *Other Asian countries*

242 According to the department of statistics Malaysia (DOSM)(Department of Statistics Malaysia
243 Official Portal, n.d.), the chicken egg price is RM 6.56 per kg and RM 0.46 each in September
244 2022. According to CNA, Malaysia experienced an egg shortage of 157 million in November, up
245 from 118 million in October. For 30 grade A eggs, it used to cost less than RM11 (S\$3.35) a
246 tray. The price then increased to RM13.50- as per the report of Straits Times.

247 In Jakarta's, Indonesia's traditional markets, the cost of chicken eggs increased by 30% in June,
248 reaching 30,000 rupiahs per kg. A comparable rise has happened in Bogor and Bekasi, both in
249 West Java- according to an article in “The Star” and “The Jakarta Post”(Egg Prices Break All-
250 Time High, Industry Blames Bulk Social Aid Purchases - Economy - The Jakarta Post, n.d.;
251 Topic: Indonesia | The Star, n.d.).

252 *Outbreaks of Avian influenza in poultry birds*

253 Recent global outbreaks of HPAI have curtailed egg supplies in the face of increased demand,
254 fueling recent price rises. It continues to be a source of concern in the business, with marketers
255 struggling to keep sufficient stocks on hand to meet current demand. This has become a concern
256 in many countries, resulting in trade reductions and/or elimination for key importing and
257 exporting countries. As illustrated in figure 2, the EU, USA, and UK are experiencing one of
258 their greatest bird flu crises this year, with each market culling millions of birds (Avian Influenza
259 – WOAHA – World Organisation for Animal Health, n.d.) (Adlhoch, Fusaro, Gonzales, Kuiken,
260 Marangon, Niqueux, Staubach, Terregino, Aznar, et al., 2022; Agüero et al., 2023; Sidik, 2022).
261 Domestic poultry throughout Asia and Europe and isolated African outbreaks will be affected
262 from 2018 to 2021(Adlhoch, Fusaro, Gonzales, Kuiken, Marangon, Niqueux, Staubach,
263 Terregino, Guajardo, et al., 2022; Baek et al., 2021; Peyrot et al., 2022; Poen et al., 2019;
264 Verhagen et al., 2021).

265 The outbreaks from 2018 to 2021 witnessed the disease and fatality of a substantial number of
266 birds, often surpassing 10,000 individuals. Figure 2 clearly depicts the occurrence of Avian
267 Influenza (AI) in the USA, spanning from 07/2021 to 03/2023, with a noticeable decline in
268 recent times. In Asia, there was a significant surge in outbreaks from 07/2019 to 06/2020,
269 followed by minor fluctuations throughout 2021, culminating in a rapid decrease in 2023.
270 Conversely, Europe experienced a gradual increase in AI outbreaks from 2019 to 2020. In the
271 latter half of 2020, after a slight decrease, there was a substantial uptick in outbreaks from
272 12/2020 to 06/2022, followed by a marked decline by the end of 03/2023. On the other hand,
273 Africa exhibited a divergent pattern in the figures from 01/2018 to 01/2023. During this interval,
274 there was a sharp increase observed from 01/2022 to 06/2022, succeeded by a pronounced
275 decrease in AI outbreaks until 03/2023.

276 ***One Health***

277 One Health (OH) is a multidisciplinary strategy to preserving human, animal, and environmental
278 health through monitoring, prevention, and mitigation. OH's major purpose is to attain optimal
279 health and sustainability for humans, animals, and the environment.(Prata et al., 2022; Sharifi &
280 Karamouzian, 2014). Yet, due to the substantial distance between animal and human health,
281 multi-sectoral cooperation in surveillance and controlling new infectious diseases is difficult to
282 achieve. To close this gap, the EU and the USA have contributed money to encourage

283 interdisciplinary research under the OH paradigm, such as research on therapies for new zoonotic
284 diseases and early warning systems of animal risks to humans. Given the importance of the OH
285 strategy in minimizing the public health danger posed by new infectious diseases and current
286 international trends, its implementation through multi-sectoral collaborative initiatives should be
287 discussed regularly. It is crucial to continue investigating the epidemiology of human and avian
288 influenza circulation and hazards by implementing and strengthening an OH strategy for
289 influenza surveillance. In this regard, many organizations worked globally and regionally to
290 combat these epidemics and pandemics.

291 For influenza, the World Health Organization (WHO), the Food and Agricultural Organization
292 (FAO), and the World Organization for Animal Health are the three international organizations
293 (OIE) primarily responsible for avian flu surveillance and management, and overseeing public
294 health, food safety, and animal health, respectively. (Chien, 2013). The 2010 Tripartite
295 Agreement Concept Note outlined a collaborative strategic direction for the three organizations
296 to pursue and their shared resolve to collaborate more closely in support of countries. FAO, OIE,
297 and WHO reiterated their commitment in 2017, highlighting advances in zoonotic influenza
298 prevention and control while committing to maintain this pace (OIE, FAO and WHO Enlarge
299 Their Collaboration Commitment to Face Health Challenges – WOAHA – World Organisation for
300 Animal Health, n.d.). The WHO's Global Influenza Programme (GIP) establishes global
301 influenza surveillance guidelines. Furthermore, GIP gathers and analyses global virological and
302 epidemiological influenza monitoring data (WHO EMRO | Influenza Surveillance | Influenza |
303 Health Topics, n.d.). Due to the constantly evolving nature of influenza viruses, the Global
304 Influenza Surveillance and Response System (GISRS) is also working to combat this threat. It is
305 a WHO-coordinated network of public health laboratories. GISRS (conducts continuous
306 surveillance of influenza viruses throughout the year. It observes the evolution of these viruses
307 and provides recommendations related to laboratory diagnostics, vaccinations, antiviral
308 susceptibility testing, and risk assessment. Moreover, GISRS serves as a global alert system to
309 identify influenza viruses that could potentially cause pandemics and also has broader
310 implications for emerging respiratory diseases like SARS-CoV and the Middle East respiratory
311 syndrome coronavirus. (MERS-CoV) (Global Influenza Strategy 2019–2030, n.d.) In addition,
312 Global Action Plan for Influenza Vaccines (GAP), it represents an all-encompassing plan to
313 eliminate worldwide shortages. and inequitable access to pandemic influenza vaccinations

314 through three primary approaches: increasing evidence-based seasonal vaccine usage, increasing
315 vaccine production capacity; and promoting research and development of more effective
316 vaccines (Geneva & Switzerland, n.d.). The country-wise surveillance system of OH is also
317 illustrated in Table 1.

318 **DISCUSSION**

319 The global egg shortage has emerged as a critical concern with far-reaching implications, and it
320 is crucial to understand the factors driving this crisis in egg availability. Our study aims to shed
321 light on the current global egg shortage, examining it through the lenses of the OH perspective
322 and the economic crises unfolding in different countries. Nonetheless, several factors, such as
323 avian influenza outbreaks, legislation promoting cage-free egg production, fluctuations in supply
324 and demand, and complications in the supply chain, have all played a role in the current egg
325 availability crisis.

326 One significant factor contributing to this shortage is the devastating impact of avian influenza,
327 particularly the highly pathogenic strains (HPAI), on poultry farms worldwide. After introducing
328 severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), seasonal influenza virus
329 circulation declined dramatically in 2020-21 but increased in 2021-22. This virus has caused the
330 culling of millions of birds, leading to a sharp decline in egg production and subsequently
331 driving up prices due to unrelenting demand (Uyeki et al., 2022).

332 Furthermore, the shift towards cage-free housing systems has gained momentum, especially in
333 the USA, as it is believed to offer improved living conditions for hens (Lin et al., 2017). By the
334 end of 2019, approximately 80% of table egg-laying chickens were raised in cage systems,
335 commonly known as conventional production. The remaining 20% were produced as specialty
336 eggs, with cage-free eggs being the most prevalent category among them. (Egg Industry Center,
337 2019). The significant advancement in cage-free production is due to (1) recent regulation
338 compelling farmers to transition from traditional to cage-free production and (2) pledges by huge
339 egg buyers such as McDonald's, Walmart, Starbucks, and more than 200 restaurants and
340 supermarkets to utilize cage-free products alone by 2025. (Markets Insider 2017). If the
341 commitments made by the participants are kept, around 75% of the laying eggs flock must be
342 cage-free by 2025. Most consumers are only willing to pay an extra \$0.30 per dozen for cage-
343 free eggs. Still, the average premium is \$1.16 per dozen, demonstrating that only a small fraction
344 of buyers are prepared to pay big profits for the cage-free label, and the market share for cage-

345 free eggs can expand above its current level even at prices as high as \$1.00 per dozen. (Lusk,
346 2019). This transition, driven in part by animal welfare legislation and commitments from major
347 egg buyers, has disrupted the traditional supply chain, with implications for egg prices. The
348 challenge lies in consumers' willingness to pay a premium for cage-free eggs, which has a ripple
349 effect on the price of conventional eggs.

350 The delicate balance between supply and demand is another critical element in the egg
351 availability equation. As the world's population grows, so does the demand for eggs and other
352 protein sources, resulting in the need for increased production. However, the gap between supply
353 and demand has widened, leading to shortages in some regions. To meet their needs, several
354 countries are now importing eggs from others, creating a complex global egg trade network. In
355 India, for example, there is an egg scarcity in Maharashtra; thus, the other states it is importing
356 eggs from Karnataka, Telangana, and Tamil Nadu. Similarly, on March 10, 2023, Taiwan began
357 importing eggs from eight countries, including the USA, Australia, Japan, Brazil, Turkey,
358 Thailand, the Philippines, and Malaysia. Furthermore, according to the Observatory of economic
359 complexity (OCE), the UK is also importing eggs from The USA (£506k or 27.9%), Spain
360 (£84.4k or 48.1%), and Poland (£33.3k or 20.1%) (in November 2022)(Eggs in United Kingdom
361 | OEC - The Observatory of Economic Complexity, n.d.), and Japan is also importing eggs from
362 Hong Kong (484 million), Singapore (14.5 million), Taiwan (4.75 million), and the USA
363 (251,000), and were primarily imported from China (19 million), Taiwan (13.8 million),
364 Germany (4.32 million), and the USA (1.58 million)(Eggs in Japan | OEC - The Observatory of
365 Economic Complexity, n.d.). In addition, in 2020, many countries experienced egg shortages due
366 to the coronavirus disease 2019 (COVID-19) pandemic, which disrupted supply chains and led to
367 changes in consumer demand. At the beginning of the pandemic, panic buying led to a surge in
368 egg demand, causing shortages in some areas. However, as lockdowns and economic disruptions
369 continued, demand for eggs declined, leading to oversupply in some regions and reduced
370 production in others.

371 Supply chain disruptions have further exacerbated the egg crisis. Complex supply chain
372 structures and shortages of essential supplies and transportation have made it challenging for
373 national egg producers to meet the growing demand, leading to price hikes and supply shortages.
374 Chicken mortality rates have added to this supply/demand conflict, leaving consumers facing
375 higher prices and, at times, empty shelves.

376 In essence, the production of eggs involves a highly intricate supply chain that extends beyond
377 just birds, feed, water, and land. The pandemic, with its impact on labor, construction costs, and
378 the severe outbreak of HPAI, has exposed unresolved supply chain issues in the egg sector.
379 Rising costs and the recent surge in avian influenza have further aggravated the egg shortage,
380 leaving us with a complex and multifaceted problem that necessitates comprehensive analysis
381 and innovative solutions.

382 **CONCLUSIONS**

383 The shortage and price increase of eggs can have a cascading effect on the economy, affecting
384 multiple sectors. It can be particularly devastating for low-income sections of the population who
385 rely on eggs as a primary source of nutrition. To address egg shortages, governments may take
386 actions such as importing eggs from other countries, providing subsidies to farmers, or
387 implementing policies to encourage increased production. Additionally, consumers may reduce
388 their egg consumption or switch to alternative protein sources during a shortage. The egg
389 scarcity has demonstrated to egg growers and food sector manufacturers that there is still much
390 opportunity for development and an overall requirement for domesticated and localized supply
391 chain fulfilment techniques. Importing eggs is not a solution for this type of shortage; every
392 country should employ some measures to control influenza as it directly linked with poultry, egg
393 and humans.
